reported or suspected. Reimbursement for this request is subject to negotiation between NMFS and the Participant. Any photography, film and/or videotape of the stranding response use for educational or commercial purposes of stranding response by the Participant should include a credit, acknowledgment, or caption indicating that the stranding response was conducted under a Stranding Agreement between NMFS and the Participant under the authority of the MMPA. NMFS will not reproduce, modify, distribute, or publicly display the photograph, film and/or videotape without consent of the owner, unless required to release a copy under Federal law or order (such as the Freedom of Information Act).

13. By its nature, the handling of stranded marine mammals (dead or alive) is potentially a dangerous activity. The Participant shall indemnify and hold harmless the United States Government from any and all losses, damages, or liability -or claims therefore -on account of personal injury, death, or property damage of any nature whatsoever, arising out of the activities of the Participant, his/her/its employees, his/her/its qualified representatives, designees, subcontractors, volunteers, or agents. Liability for person(s) acting under this agreement is addressed in sections 406(a) and (b) of the MMPA [16 U.S.C. 1421(e)].
14. Provide accurate and honest information in all reports to NMFS.
15. Except where a longer period is specified (e.g., 15 years for rehabilitation cases, see Attachment D *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release – Standard for Rehabilitation Facilities*), maintain records upon which required reports are based for at least 3 years on-site.
16. Upon request by the NMFS Regional Administrator, allow the Regional Stranding Coordinator, other appropriate NMFS employees, or any other appropriate person duly designated by the Regional Administrator, to inspect the facilities and inspect and/or request records that pertain to stranding network activities.
17. Verbally report any right whale sightings that occur or are reported as part of their normal activities. See Attachment B for contact information.

Article III: Dead Animal Response

A. The Participant may take species of marine mammals under the MMPA for the purpose of dead animal investigation and response.

Subject to the conditions contained in this Agreement, the MMPA, and the implementing regulations, the Participant may take dead stranded marine mammals or parts there from for the collection of data on the health and health trends of wild populations, for the detection of marine mammal UMEs, for the detection of signs of human interaction, for research or education on marine mammal biology and life history, for the determination of cause of death, for the detection of human caused and natural mortality, or for other research as deemed appropriate by the NMFS. These activities specifically include: obtaining measurements and biological samples from dead stranded marine mammals; disposing, or assisting in the disposal, of dead stranded marine mammals at an appropriate landfill or other suitable location; and taking and transporting dead stranded or floating dead marine mammals, or parts there from, to facilities or individuals approved pursuant to 50 CFR. 216.22 for scientific research, maintenance in a properly curated, professionally accredited scientific collection, or for educational purposes.

B. Terms and Conditions for Dead Animal Response

1. Response

- a. The Participant shall respond as practicable to reports of dead stranded marine mammals within the geographic range or response specified under Article I, Number B.2. If the Participant is the closest and/or first responder, the Participant is considered to be the on-site coordinating organization and is in charge of all on-site activities. In certain circumstances such as a UME, mass stranding, or endangered marine mammal stranding, NMFS may implement the ICS structure and designate an on-site coordinator to be in charge of the event (see Article II C9). In all situations, the Participant will cooperate with Federal, state and local government officials and employees and other stranding network participants when responding to these strandings. If the Participant receives a verified report of a dead stranded marine mammal and does not have the capability to respond appropriately to the report, the Participant shall notify the NMFS Regional Stranding Coordinator and/or adjacent stranding network participants within 24 hours if feasible.
- b. If the Participant leaves a dead animal at the stranding site or in the case of a UME or mass stranding response, the Participant shall, if feasible, mark each animal with a tag or mark, such as roto-tags or grease stick, to assist with data collection and to prevent multiple reports on the same animal(s).

- c. If requested by NMFS Regional Stranding Coordinator and if feasible and practicable, the Participant will assist with stranding response in neighboring areas outside the Participant geographic range (specified in Article I B2).

2. Data Collection and Reporting. The Participant shall collect and provide the following information for each stranded marine mammal they respond to:

- a. Complete the NOAA Form 89-864, OMB #0648-0178 (the Marine Mammal Stranding Report - "Level A" Form) for each stranded marine mammal. Completed forms shall be sent to the NMFS Regional Stranding Coordinator via the NMFS National Marine Mammal Stranding Database or in writing (see Attachment B), no later than 30 days after responding to the stranding event. If requested by the NMFS Regional Stranding Coordinator and if feasible, the Participant shall provide preliminary data (verbal or written) from the Level A - Marine Mammal Stranding Report within 24 hours.
- b. As resources are available, collect additional Level B and Level C data.
- c. Notify the Regional Stranding Coordinator of the following cases within 24 hours or according to the specific reporting guidance provided by the Stranding Coordinator:
 - 1. possible or confirmed human interactions (including military activity),
 - 2. suspected UMEs,
 - 3. extralimital or out-of-habitat situations,
 - 4. mass stranding events and/or mass mortalities,
 - 5. large whale strandings, and
 - 6. any stranding involving endangered or threatened species or identified species of concern.
- d. In certain circumstances (e.g., listed or rare species stranding, UME, possible human interaction case, extralimital or out-of-habitat situation), the NMFS Regional Stranding Coordinator may request necropsies be conducted by a Necropsy Team Leader, or that additional and expedited reporting (verbal or written) of Level B and C data such as analytical results and necropsy reports if available. NMFS will not reproduce, modify, distribute, or publish the data without consent of the Participant unless required to release the data under Federal law or order (such as the Freedom of Information Act);
- e. Collect and make available any gear, debris, or other objects (e.g., bullets, arrows, net webbing, etc.) recovered from a stranded marine mammal that may be evidence of human interaction. The Participant must comply with chain of custody procedures

or any other instructions as specified and supported by NMFS Northeast Region and/or NMFS Office of Law Enforcement personnel.

3. **Parts Disposition.** Diagnostic parts, tissue samples, fluid specimens, parts or cells may be transferred to labs within the United States for diagnostic use without any additional authorizations. For non-diagnostic parts or samples:
 - a. **Retention:** Marine mammal parts may be retained by the Participant for education and/or research purposes, provided they are properly indicated in the "Specimen Disposition" field of NOAA Form 89-864, OMB #0648-0178 (the Marine Mammal Stranding Report - "Level A" Form). Parts and/or containers must be marked with the field identification number assigned by the Participant or by NMFS (i.e., NMFS registration number). Authorization to take parts from ESA listed species in the Northeast Region is currently provided under MMPA/ESA Permit No. 932-1489-09, as amended, issued to the NMFS Marine Mammal Health and Stranding Response Program Coordinator, and requires authorization and direction from the NMFS Regional Stranding Coordinator in the event of a stranding involving a threatened or endangered marine mammal, prior to any action by the Participant.
 - b. **Transfer:** Report to the NMFS Regional Administrator (See Attachment B) within 30 days of the stranding event, the transfer of any parts salvaged from the stranded marine mammal collected under this Agreement as required by 50 CFR 216.22 or 50 CFR 216.37. The Participant must provide the institution name where specimen materials have been deposited and ensure that the retained or transferred parts are marked with the field identification number or assigned NMFS Registration number in the "Specimen Disposition" field on the NOAA Form 89864, OMB #0648-0178 (the Marine Mammal Stranding Report - Level "A" Form) and ensure that retained or transferred parts are marked with the field identification number or the NMFS Registration Number. If parts are being transferred, the Participant must ensure the receiving institution is authorized by the NMFS Regional Administrator to receive marine mammal parts.
4. **Site cleanup.** The Participant shall make every reasonable effort to assist in the clean up of beach areas where their activities (e.g., necropsy or specimen collection) under this Agreement that may contribute to soiling of the site.

Article IV: Live Animal Response – First Response

A. The Participant may take species of marine mammals covered under the MMPA for the purpose of live stranding first response (initial assessment and care at the site of stranding and assist in the appropriate disposition of the animal), beach triage, beach release, temporary holding for assessment and triage, translocation and/or transportation to a NMFS authorized rehabilitation center within the Northeast Region.

1. The Participant must take live stranded marine mammals in a humane manner (as defined in 50 CFR 216.3, see Attachment A) for the protection or welfare of the marine mammal. If the animal dies during the course of response and/or investigation, then the terms and responsibilities contained in Article III of this Agreement become operative. In addition to the activities authorized in Articles I, II, and III, the Participant is authorized to implement the following activities under this article:
 - a. Take measurements and collecting blood or other diagnostic samples from live stranded marine mammals for health assessment.
 - b. Return live stranded marine mammals, as directed by the NMFS Regional Stranding Coordinator, to their natural habitat and tagging such animals.
 - c. Transport live stranded marine mammals for rescue and rehabilitation to a NMFS approved rehabilitation facility or temporary holding facility.
 - d. Perform humane euthanasia. Euthanasia shall only be performed by the attending veterinarian or by a person acting under the direction of the attending veterinarian and following approved guidelines such as those referenced in Attachment C (2007 Report of the American Veterinary Medical Association Panel on Euthanasia, 2nd Edition of the CRC Handbook of Marine Mammal Medicine, 2006 Journal of the American Association for Zoo Veterinarians). When using controlled drugs, such person(s) shall comply with all applicable state and Federal laws and regulations (i.e., registered with the Drug Enforcement Administration). Authorization for euthanasia of ESA-listed species provided under MMPA/ESA Permit No. 932-1489-09, as amended, and requires prior approval and direction from the NMFS Regional Stranding Coordinator.
2. This Agreement does not authorize any projects involving “intrusive research” (as defined in 50 CFR 216.3). Measurements or sampling for scientific research purposes (i.e., outside the scope of accepted diagnostic and treatment practices for the care of an animal) must be authorized under a NMFS MMPA/ESA scientific research permit.

B. Terms and Conditions for Live Stranding - First Response

1. Response

- a. The Participant shall respond to reports of live stranded marine mammals (Order Cetacea and Order Pinnipedia). If the Participant is the closest and/or first responder, the VAQS is considered to be the on-site coordinator and is in charge of all on-site activities. In certain circumstances such as a UME, mass stranding, or endangered marine mammal stranding, NMFS may implement the ICS structure and designate an on-site coordinator to be in charge of the event (see Article II C9). In all situations, the Participant will cooperate with Federal, state and local government officials and employees and other stranding network participants when responding to these strandings. If the Participant receives a verified report of a live stranded marine mammal and does not have the capability to respond appropriately to the report, the Participant shall notify the NMFS Regional Stranding Coordinator without delay. Also, if the NMFS Regional Stranding Coordinator receives a report of a live stranded marine mammal, the Regional Stranding Coordinator may contact the Participant to determine whether the Participant has the capability to respond to the stranding. If the Participant cannot respond in a timely manner, the NMFS Regional Stranding Coordinator may request another Stranding Network participant to respond.
- b. The Participant shall take all steps reasonably practicable under the circumstances to prevent further injury to any live stranded marine mammal, injury to any network personnel, volunteers, government personnel and the general public.
- c. The Participant shall tag or mark any animals that are immediately released to their natural habitat using a NMFS approved tag, such as one-bolt roto tag, cattle ear tags, or freeze branding. Application of other tagging methods must first be approved by the NMFS Regional Stranding Coordinator. Tagging and post-tagging activities are restricted to monitoring the success of marine mammals released to the wild. Any projects outside the scope of monitoring the success of a release must be authorized under a NMFS MMPA/ESA scientific research permit.
- d. If the Participant determines that it is necessary to temporarily hold or triage a stranded marine mammal at a separate site from the NMFS approved rehabilitation facility, the animal(s) cannot be moved until the Participant obtains verbal approval from the NMFS Regional Stranding Coordinator.

- e. Written documentation of the need for an interim location and written concurrence from the NMFS Regional Stranding Coordinator with any associated conditions must be provided at the earliest time practicable within 24 hours.
 - f. If the Participant considers responding to an “out-of-habitat” or free-swimming marine mammal in distress (e.g., entanglement), the Participant must first contact the NMFS Regional Stranding Coordinator for approval and discuss plans for live capture and/or needs for assistance. The NMFS Regional Stranding Coordinator may require a NMFS employee to be present at the time of capture.
 - g. The Participant shall follow the guidance provided by the Northeast Region in Attachment E, Disposition of Live Stranded Marine Mammals, and shall consult with the NMFS Stranding Coordinator and the attending veterinarian to make a determination regarding immediate release, rehabilitation, or euthanasia of live stranded marine mammals or cetaceans.
2. **Data Collection and Reporting.** The Participant shall collect and provide the following information for each stranded marine mammal they respond to:
- a. Complete the NOAA Form 89-864, OMB #0648-0178 (the Marine Mammal Stranding Report - “Level A” Form) for each stranded marine mammal. Completed forms shall be sent to the NMFS Regional Stranding Coordinator via the NMFS National Marine Mammal Stranding Database or in writing (see Attachment B), no later than 30 days after responding to the stranding event. If requested by the NMFS Regional Stranding Coordinator and if feasible, the Participant shall provide preliminary data (verbal or written) from the Level A - Marine Mammal Stranding Report within 24 hours.
 - b. If temporarily holding a stranded animal prior to transferring to a NMFS approved rehabilitation facility acting in accordance with this Article, the Participant shall complete the NOAA Form 89878, OMB # 0648-0178 (the Marine Mammal Rehabilitation Disposition Report). This report shall be sent to the NMFS Regional Stranding Coordinator via the NMFS National Marine Mammal Stranding Database or in writing (see Attachment B), no later than 30 days after responding to the stranding event. If requested by the NMFS Regional Stranding Coordinator and if feasible, the Participant shall provide preliminary data (verbal or written) from the Marine Mammal Rehabilitation Disposition Form within 24 hours.
 - c. As resources are available, collect additional Level B and Level C data.

- d. Notify the NMFS Regional Stranding Coordinator of the following cases within 24 hours or according to the specific reporting guidance provided by the Stranding Coordinator:
 - 1). possible or confirmed human interactions (including military activity),
 - 2). suspected UMEs,
 - 3). extralimital or out-of-habitat situations (see B.1.e. of this Article),
 - 4). mass stranding events and/or mass mortalities,
 - 5). large whale strandings, and
 - 6). any stranding involving endangered or threatened species or identified species of concern.
 - e. In certain circumstances (e.g., UME, possible human interaction case, extralimital or out-of-habitat situation), the NMFS Regional Stranding Coordinator may request additional and expedited reporting (verbal or written) of Level B and C data such as analytical results and necropsy reports if available. NMFS will not reproduce, modify, distribute, or publish the data without consent of the Participant unless required to release the data under Federal law or order (such as the Freedom of Information Act);
 - f. Collect and make available any gear, debris, or other objects (e.g., bullets, arrows, net webbing, etc.) recovered from a stranded marine mammal that may be evidence of human interaction. The Participant must comply with chain of custody procedures or any other instructions as specified and supported by NMFS Northeast Region and/or NMFS Office of Law Enforcement personnel.
4. **Site Cleanup.** The Participant shall make every reasonable effort to assist in the clean up of beach areas where their activities (e.g., euthanasia, necropsy, or specimen collection) under this Agreement.

Article V: Live Animal Response – Rehabilitation and Final Disposition

A. The Participant may take live stranded marine mammals in a humane manner with the goal of rehabilitation and release. If the animal dies during the course of rehabilitation, then the terms and responsibilities contained in Article III of this Agreement become operative. In addition to the activities authorized in Articles I, II, III, and IV of this Agreement and subject to the conditions contained in this Agreement, the MMPA, and the implementing regulations, the Participant is authorized to implement the following activities under this article:

1. In accordance with applicable regulations and NMFS guidelines and best practices, transfer marine mammals to another NMFS approved rehabilitation facility within the Northeast Region for:
 - a. release back to the wild;
 - b. temporary placement in a scientific research facility holding a current NMFS scientific research permit and a United States Department of Agriculture Animal and Plant Health Inspection Service (APHIS) Research License; or
 - c. permanent disposition at an authorized facility (i.e. holds an APHIS exhibitors license {7 U.S.C. 2131 *et seq.*}) after consultation with, and authorization by, the NMFS Office of Protected Resources Permits, Conservation and Education Division.
2. Conduct scientific research on stranded animals in a rehabilitation facility, only if the responsible individual has a NMFS scientific research permit and the facility holds an APHIS research license in accordance with the Animal Welfare Act (see 50 CFR 216.27 (c)(6)).
3. Return rehabilitated stranded marine mammals to their natural habitat. A decision regarding whether or not a marine mammal has the potential to be released must be made as early as possible during the rehabilitation period. Any marine mammal eligible for release must be released as early as possible and no later than six months after being taken for rehabilitation unless the attending veterinarian determines that: the marine mammal might adversely affect marine mammals in the wild; release is unlikely to be successful due to the physical condition and behavior of the marine mammal; or more time is needed to make a determination. Release plans must be submitted to the NMFS Regional Administrator at least 15 days prior to the release, unless advanced notice is waived by the NMFS Regional Administrator. The NMFS Regional Administrator may require the participant to provide additional information, modify the release plan, or dispose of the marine mammal in another manner (see 50 CFR 216.27(a) and the *NMFS/FWS Best*

Practices for Marine Mammal Stranding Response, Rehabilitation, and Release – Standards for Release.)

4. Tag rehabilitated stranded marine mammals, strictly for purposes of monitoring success of release to the wild using a NMFS approved tag, such as one-bolt roto-tag, cattle ear tags, or freeze branding. Application of other tagging methods must first be approved by the NMFS Regional Stranding Coordinator. Tagging and post-tagging activities are restricted to monitoring the success of marine mammals released to the wild. Any projects outside the scope of monitoring the success of a release must be authorized under a NMFS MMPA/ESA scientific research permit.
5. Perform humane euthanasia. Euthanasia shall only be performed by the attending veterinarian or by a person acting under the direction of the attending veterinarian and following approved guidelines such as those referenced in Attachment C (*2007 Report of the American Veterinary Medical Association Panel on Euthanasia, 2nd Edition of the CRC Handbook of Marine Mammal Medicine, 2006 Journal of the American Association for Zoo Veterinarians*). When using controlled drugs, such person(s) shall comply with all applicable state and Federal laws and regulations (i.e., registered with the Drug Enforcement Administration). Authorization for the euthanasia of ESA-listed species provided under MMPA/ESA Permit No. 932-1489-09, as amended, and requires prior approval and direction from the NMFS Regional Stranding Coordinator.

B. Terms and Conditions for Live Animal Response: Rehabilitation, Release, or Final Disposition Determination

1. Rehabilitation

- a. The Participant shall comply with laws, regulations, policies, and/or guidelines applicable to or promulgated by NMFS that apply to activities under this Agreement. The Participant must also have all applicable Federal, state, and local permits for rehabilitation facilities, and must comply with all Federal, state, and municipal laws related to operations of the facility.
- b. The Participant shall be responsible for the custody of any living marine mammal taken pursuant to this Article using standards for humane care and for practicing accepted medical evaluation and treatment as described in the *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release – Standard for Rehabilitation Facilities* (Attachment D).
- c. The Participant shall not exceed their maximum holding capacity for cetaceans and pinnipeds based on the minimum standard space requirements, the number of animals housed in each holding area, and the availability of qualified personnel as described in the *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release – Standard*

for Rehabilitation Facilities (Attachment D) unless a written waiver is first received from the NMFS Regional Administrator. The NMFS Regional Stranding Coordinator may offer assistance for relocating animals to another rehabilitation facility and in supporting decisions to euthanize when necessary. Other considerations for determining maximum holding capacity include:

- (1) On-site veterinary care, volunteer support, and experienced staff;
 - (2) Adequate food and medical supplies and medical test capabilities;
 - (3) Isolation for marine mammals;
 - (4) Adequate water quality;
 - (5) Limited public access; and
 - (6) Ability to maintain current, accurate and thorough records.
- d. The Participant shall follow contingency plans approved by NMFS for the care of marine mammals in rehabilitation during planned events (e.g., construction) or unexpected events such as mass strandings, UMEs, natural disasters (e.g., hurricanes, harmful algal blooms, El Niño), and/or hazardous waste spills.
 - e. The Participant shall isolate rehabilitating marine mammals from other wild or domestic animals and from any animal in permanent captivity.
 - f. The Participant shall prohibit the public display and training for performance of stranded rehabilitating marine mammals as required by 50 CFR 216.27(c)(5). This includes any aspect of a program involving interaction with the public.
 - g. The Participant shall follow any additional requirements for rehabilitation (e.g. isolation) and release prescribed by NMFS in consultation with the Working Group for Marine Mammal Unusual Mortality Events during a marine mammal UME, as recommended in the *National Contingency Plan for Response to Unusual Marine Mammal Mortality Events*; D.W. Wilkinson, NOAA Technical Memorandum NMFS-OPR-9, September 1996.
 - h. The Participant must temporarily refuse admittance of new cases of stranded marine mammals due to the severity of a disease outbreak when instructed by the NMFS Regional Stranding Coordinator, in consultation with the UME Working Group or other experts, if diseases of concern have been reported (e.g. diseases associated with a UME, or any emerging or zoonotic diseases).
 - i. The Participant shall not transfer a marine mammal being rehabilitated

under this Agreement to another facility without prior approval from the NMFS Regional Stranding Coordinator.

- j. If a marine mammal dies while in rehabilitation, Article III applies.

2. Release

- a. Release Recommendation. The Participant shall make a final written recommendation for each animal in rehabilitation as early as possible, and no more than six months after its date of rescue, for release or non-release determination to the NMFS Regional Administrator according to any applicable NMFS release guidelines and regulations including 50 CFR 216.27 (release, non-releasable, and disposition under special exception permits for rehabilitated marine mammals). This final recommendation shall include a release recommendation signed by the Participant's attending veterinarian, attesting that the marine mammal is medically and behaviorally suitable for release in accordance with the NMFS Standards for Release, and a concurrence signature from the Participant's Authorized Representative or Signatory of the Stranding Agreement (see Attachment D, *NMFS /FWS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release – Standards for Release*).
- b. Release Plan. If the Participant recommends release, a release plan must also be included with the final recommendation letter. This information must be submitted to and approved by the NMFS Regional Administrator at least 15 days prior to the release, unless advanced notice is waived by the NMFS Regional Administrator, as required by 50 CFR 216.27(a).

3. Data Collection and Reporting

- a. Diseases of Concern Reporting. The Participant shall notify immediately the NMFS Regional Stranding Coordinator upon learning of any diseases of concern (e.g., emerging, reportable, and/or zoonotic diseases) that are detected and/or confirmed that could be a potential hazard for public health or animal health (NMFS will provide guidance on Reportable Diseases);
- b. Disposition Reports. Upon release or other disposition of any marine mammal under this Article, the Participant shall complete the NOAA Form 89878, OMB # 0648-0178 (the Marine Mammal Rehabilitation Disposition Report Form). Completed forms shall be sent to the NMFS Regional Stranding Coordinator via the NMFS National Marine Mammal Stranding Database or in writing (see Attachment B), no later than 30 days after final disposition of the marine mammal. If requested by the NMFS Regional Stranding Coordinator and if feasible, the Participant shall provide preliminary data (verbal or written) from the Marine Mammal Rehabilitation Disposition Report within 24 hours.

- c. Annual Summary Reports. The Participant shall submit an annual report (due January 31 each year) summarizing the Participant's rehabilitation activities for the past calendar year. NMFS will not reproduce, modify, distribute, or publish the data without consent of the Participant unless required to release the data under Federal law or order (such as the Freedom of Information Act). The reports shall include the following for each animal in rehabilitation:
- i. Species and field number
 - ii. If the animal was released:
 - a. Date, location of release (latitude and longitude).
 - b. Type and specifics of post-release monitoring (roto-tag, satellite, etc.) and any roto-tag or freeze brand numbers used.
 - c. Photos if possible.
 - d. Duration of post-release monitoring.
 - e. Status of post-release monitoring.
 - f. Indications from monitoring relative to the success of the rehabilitation effort.
 - g. Disposition of tracking data if applicable.
 - iii. If the animal was transferred to permanent care:
 - a. Date of physical transport (if applicable).
 - b. Location of permanent care.
 - iv. If the animal was euthanized, provide the date of euthanasia.
 - v. If the animal died, provide the date of death.

Article VI: Good Standing Agreement

Northeast Region Marine Mammal Stranding Network Good Standing Agreement

To be considered in “good standing” the Northeast Marine Mammal Stranding Network Member (Network Member) must meet all of the following criteria:

General Criteria

- (1) If the Network Member is a designated Principal Investigator of an MMPA or Endangered Species Act (ESA) scientific research or enhancement permit holder, the applicant must have fulfilled all permit requirements, including but not limited to submission of all reports, and must have no pending or outstanding enforcement actions under the MMPA or ESA.
- (2) The Network Member must comply with the terms and responsibilities of its Stranding Agreement (SA), MMPA Section 109(h) authorization, or researcher authorization letter. This includes, but is not limited to, the following response and reporting requirements:
 - a. Timely (within 24 hours) response to all stranding reports in Network Member’s area of responsibility in accordance with SA;
 - b. Respond to stranding in an effective manner that protects both the health and safety of the responders and the stranded animals;
 - c. Timely (immediate) notification to NMFS regarding any unusual stranding circumstances (UME, out of habitat, large cetacean stranding, etc) according to the timelines as specified in the SA;
 - d. Adhere to the *Policies and Best Practices for Marine Mammal Stranding Response, Rehabilitation and Release*;
 - e. Reporting of stranding events to NMFS as specified in SA;
 - f. Submission of complete reports on basic or Level A data to the Regional Coordinator (includes investigator’s name, species, stranding location, number of animals, date and time of stranding and recovery, length and condition, and sex; marine mammal parts retention or transfer; annual reports) as specified in SA;
 - g. Collecting information or samples as necessary and as requested; and
 - h. Prompt notification to NMFS for any article of SA (or points above) with which the Network member cannot comply.
- (3) The Network Member must cooperate with NMFS in collecting and submitting Level B (supplementary information regarding sample collection related to life history and to the stranding event) and Level C (necropsy results) data and samples, when requested and within the requested timeframe.
- (4) The Network Member must have no current enforcement investigation for the ‘take’ of marine mammals in violation of the Marine Mammal Protection Act and Endangered Species Act.

- (5) The Network Member must have no record of a pending NMFS notice of violation(s) regarding the policies governing the goals and operations of the Stranding Network and Stranding Agreement, if applicable (e.g., probation, suspension, or termination).

Coordination and Cooperation Criteria

The following coordination/cooperation requirements must be satisfied:

- (1) Cooperation with state, local, and Federal officials;
- (2) Cooperation with state and local officials in the disposition of stranded marine mammals; and
- (3) Cooperation with other stranding network participants.

If the Network Member feels they are in danger of not being in “good standing”, please refer to *Communication Agreement*.

If NMFS determines a Network Member is in danger of not being in “good standing”:

1. The Network Member will receive a written warning from the Regional Administrator
2. The Network Member must reply to this warning within 30 days
3. The reply must include remediation efforts with a proposed timeline
4. Efforts and timeline must be agreed to by the Regional Administrator

If the Network Member fails to meet the timeline, and no further remediation letter is received from the Network Member, the Network Member will no longer be considered in “good standing”.

AGREEMENT

I have read and understand the conditions above for participating as a member of the Northeast Region Stranding Network. I agree to abide by all applicable provisions of the Good Standing Criteria established by National Marine Fisheries Service Northeast Region. By signing this agreement I understand and acknowledge the consequences of not complying with The Good Standing Criteria will lead to ineligibility for Prescott Grant funding and suspension or termination of the Stranding Network Member’s SA.

Article VII: Communications Agreement

Northeast Region Marine Mammal Stranding Program Communication Agreement

If the Northeast Marine Mammal Stranding Network Member (Network Member) foresees a problem or potential for non-compliance with their Stranding Agreement (SA), the Network Member will notify NOAA's National Marine Fisheries Service (NMFS) regional stranding staff immediately, no matter how small the problem. Should a Network Member foresee a problem or potential for non-compliance with their SA, the Network Member must:

1. Contact Marine Mammal Stranding Coordinator, or if not available;
 2. Contact Assistant Stranding Coordinator, or if not available;
 3. Contact Marine Mammal Stranding Data Assistant Coordinator.
- * If an emergency situation; call the Stranding HOTLINE: 866-755-6622**

If NMFS foresees a problem or potential for non-compliance with a Network Members SA, NMFS will provide a written warning to the Network Member (see Good Standing Criteria) and will work with the Network Member to identify the deficiency as:

1. Minor
2. Intermediate
3. Major

Minor Deficiency : a deficiency that will likely require little or no time to correct. Minor deficiencies have little impact on the operational capability of the Network Member and do not directly affect the rescue or care of live animals or the collection of data from live and dead animals.

Intermediate Deficiency : a deficiency that may require a short period of time to correct (less than 6 months) and require a small amount of resources (expense) to address. Intermediate deficiencies may cause the Network Member to become non-compliant with the NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release and may impact the operational capability of the Network Member. These deficiencies may also affect the rescue and care of live animals and data collection capabilities from live and dead stranded animals.

Major Deficiency : a deficiency that will require a prolonged period of time to correct (greater than 6 months) and require significant resources (expense) to address. Major deficiencies will cause the Network Member to become non-compliant with Federal, state and local laws and regulations as well as the NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release and will impact the operational capability of the Network Member. These deficiencies will likely be controversial and affect the

rescue and care of live animals and data collection capabilities from live and dead stranded animals.

The roles and responsibilities for each level of deficiency is as follows:

Minor Deficiency

Network Member responsibilities

1. Notify NMFS Regional Stranding Staff immediately
2. Submit remediation efforts within timeframe specified by NMFS
3. Work with NMFS on correcting the problem
4. Keep NMFS informed of progress on meeting deadline (if applicable)
5. Notify NMFS immediately if problem progresses or new issues develop
6. Submit report verifying steps taken to correct deficiency and future steps to prevent deficiency from reoccurring

NMFS responsibilities

1. NMFS staff will provide consultation to help correct problem if applicable
2. NMFS staff will develop timeline for corrective measures and consider an extension if requested

Intermediate Deficiency

Network Member responsibilities

1. Notify NMFS Regional Stranding Staff immediately
2. Develop an Action Plan to correct the problem, in consultation with NMFS
3. Keep NMFS informed of progress on meeting deadlines (if applicable)
4. Notify NMFS immediately if problem progresses or new issues develop
5. Seek guidance from NMFS staff or external experts
6. Submit report verifying steps taken to correct deficiency and future steps to prevent deficiency from reoccurring

NMFS responsibilities

1. NMFS staff will provide consultation to help correct problem if applicable
2. NMFS will develop a timeline for corrective measures and consider an extension if requested
3. NMFS staff will work with Network Member to identify cause of problem and identify solutions
4. Seek guidance from additional NMFS staff or external experts

Major Deficiency

Network Member responsibilities

1. Notify NMFS Regional Stranding Staff immediately
2. Develop an Action Plan to correct the problem, in consultation with NMFS
3. Keep NMFS informed of progress on meeting deadlines (if applicable)
4. Notify NMFS immediately if problem progresses or new issues develop
5. Seek guidance from NMFS staff or external experts
6. Convene other staff members to meet with NMFS to address problems: such as board members, attending veterinarians and veterinary technicians, upon request.
7. Provide requested data and files to NMFS as requested.
8. Submit report verifying steps taken to correct deficiency and future steps to prevent deficiency from reoccurring

NMFS responsibilities

1. NMFS staff will provide consultation to help correct problem if applicable
2. NMFS will develop a timeline for corrective measures and consider an extension if requested
3. NMFS staff will work with Network Member to identify cause of problem and identify solutions
4. Outside consultation from experts in the field may be sought to help address solutions to deficiencies
5. If applicable, NMFS staff will seek consultation of NOAA Office of Law Enforcement and General Council

If deadlines are disregarded without correction of deficiency, the Network member will be subject to disciplinary action: probation, suspension and/or termination (as outlined in the SA). NMFS will make every effort to notify the Network Member in writing of failure to comply with agreed upon remedies for deficiency. In cases of willfulness, or those in which public health, interest, or safety requires immediate attention, NMFS, Northeast Regional Administrator reserves the right to immediately suspend or terminate the Network Member's stranding agreement (as outlined in the SA).

AGREEMENT

I have read and understand the conditions above for participating as a member of the Northeast Region Stranding Network. I agree to abide by all applicable provisions of the Communication Agreement established by National Marine Fisheries Service Northeast Region.

Article VIII: Participant's Authorized Personnel

A. Personnel and Volunteers

Takings of marine mammals authorized in this Agreement may only be directed by the Participant's personnel and trained volunteers identified by the Participant in writing to the NMFS Regional Administrator. The Participant may use other (i.e., not previously identified to NMFS) volunteers to carry out activities in this Agreement only if they are under the close direction of previously identified trained personnel or volunteers. The Participant may not delegate authority to take marine mammals to another person except as provided in this article.

In the event of changes in key personnel, the prospective Participant shall notify the NMFS Regional Administrator in writing (see Attachment B) within 30 days and provide a description of the experience of new key personnel for review and approval by NMFS. New key personnel must meet the qualification terms identified in the *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release - Evaluation Criteria for a Marine Mammal Stranding Agreement* (Attachment D).

B. Untrained Citizens

If the Participant requests the assistance of untrained citizens (e.g., during a mass stranding), the Participant is responsible for the actions of those citizens during the response; must take precautions against injury or disease to those volunteer citizens; and must ensure that the citizens' actions do not cause unnecessary harassment of marine mammals.

Article IX: Rights of States and Local Governments

Rights of States and Local Governments

Nothing in this Agreement shall be construed to affect the rights or responsibilities of other Federal, state, or local government officials or employees acting in the course of their official duties with respect to taking of marine mammals in a humane manner (including euthanasia) for protection or welfare of the marine mammal, protection of public health and welfare or non-lethal removal of nuisance animals (MMPA section 109(h)).

Article X: Effective Dates, Renewal and Application Procedures

A. Effective Date

The terms of this Agreement shall become effective upon the signature by both VAQS and the NMFS Northeast Regional Administrator.

B. Period of Agreement

1. **Duration:** Unless terminated as provided in this Agreement, this Agreement shall expire at the end of the following applicable period:
 - 1 year for new Stranding Network Participants
 - 1 year for a Stranding Network Participant on probation
 - 3 years for a live animal responder and rehabilitator (Articles IV and V)
 - 6 years for a dead animal only responder (Article III only)
2. **Stranding Agreement Renewals:** No later than 90 days prior to the expiration date of this Agreement, NMFS will provide the Participant with a written notice of expiration, and prescribe information needed from the Participant for renewal (see *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release - Evaluation Criteria for a Marine Mammal Stranding Agreement*, Attachment D). No later than 60 days prior to the expiration date, the Participant shall indicate in writing to NMFS (see Contacts, Attachment B.) that a renewal of this Agreement is requested and shall provide the prescribed information. Following NMFS review of the submitted information to determine if Participant meets applicable requirements, the Agreement may be renewed if agreed to in writing by both parties.

If no written renewal request is received from the Participant, this Agreement becomes null and void upon the above expiration date.

3. **Denial of Stranding Agreement Renewal:** The decision to renew or deny a Stranding Agreement is solely at the discretion of the NMFS Regional Administrator and is not compelled by the Participant's adherence to the Stranding Agreement criteria. If the NMFS Regional Administrator denies a renewal request, the denial will be issued in writing by certified mail from the NMFS Regional Administrator to the Participant within 30 days of the Participant's submission of a completed application, and will be based upon the Regional Administrator's judgment of:
 - a. Past performance of the Participant;
 - b. Existing capabilities of the Participant; and
 - c. Geographic and programmatic needs of NMFS' stranding program.

A Stranding Agreement for which renewal is denied by the NMFS Regional Administrator becomes null and void upon the expiration date listed above.

Article XI: Review, Modification and Termination

A. Review

The NMFS Northeast Region ARA for Protected Resources shall review this Agreement from time to time for performance adequacy and effectiveness.

B. Modification

The Participant or the Northeast Regional Administrator may request a modification to the Stranding Agreement, including, but not limited to, procedural or administrative changes, such as a change in contact information, and a request for expansion or reduction of activities authorized by this Agreement. A request for authority for additional activities may require submission of information identified in Attachment D, *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release - Evaluation Criteria for a Marine Mammal Stranding Agreement*. Modifications and reductions in authority, as well as notice of issuance or denial of a request for increased authorizations, will be given in writing within 30 days of receipt of a completed request. The Participant and the NMFS Regional Administrator may determine that a new Stranding Agreement is warranted.

C. Suspension or Termination request by Participant

The Participant may request suspension of all or part of this Stranding Agreement for a stated period of time, or may terminate this Agreement, upon 30 days written notice to the NMFS Regional Administrator. Suspension of the authorization of activities at the request of the Participant may be given without prejudice to the reinstatement of authorization or renewal of a Stranding Agreement.

D. Non-Compliance with Stranding Agreement or Violations of Law by Participant

Except in cases of willfulness, or those in which public health, interest, or safety requires immediate suspension, or termination of this Agreement, NMFS shall provide the Participant with notice and an opportunity to correct any deficiencies within a time period specified by NMFS, in writing, if the Participant fails to satisfy the terms and condition of this Agreement or violates any laws, regulations, or guidelines applicable to this Agreement, or Federal, state or municipal laws related to stranding network operations. The NMFS Region may take the following actions based on the circumstances:

1. **Probation.** The Participant may be put on probation for up to three years if deficiencies are not corrected. The NMFS Regional Stranding Coordinator and the Participant will develop a timetable with reasonable and measurable milestones that must be achieved to correct deficiencies during the probation period. Probation requires annual reviews of the Participant's activities for up to three years.

A participant on probation may not be in “good standing” with the Stranding Network.

2. **Suspension.** The NMFS Regional Administrator may suspend the Participant’s authority, or any portion of their authority, as appropriate (e.g., suspend rehabilitation authority, but not live or dead animal response), with 30 days written notice, for up to 1 year or until NMFS is satisfied that all deficiencies and violations have been adequately addressed. A notice of suspension listing deficiencies and a timetable with reasonable and measurable milestones required to correct those deficiencies will be issued in writing, delivered in person or by certified mail, from the NMFS Regional Administrator if, in the judgment of the Regional Administrator, the Participant has:
 - a. Submitted false information or statements in applications or reports;
 - b. Not satisfied the terms and conditions of the Stranding Agreement;
 - c. Failed to correct deficiencies in a timely manner; or
 - d. Violated applicable Federal, state, or municipal laws, regulations, guidelines, or other requirements.

A participant on suspension is not in “good standing” with the Stranding Network.

3. **Immediate suspension.** The NMFS Regional Administrator may require immediate suspension of authorization under a Stranding Agreement, or any part of the Agreement, without prior notice if, in the judgment of the Regional Administrator, suspension is needed to protect marine resources, in cases of willfulness, or as otherwise required to protect public health, welfare, interest, or safety, (which includes interest in the welfare of marine mammals). During the suspension period, the NMFS Regional Stranding Coordinator may ask other Stranding Network participants to respond in the Participant’s area of geographic coverage. If the Participant’s Stranding Agreement is suspended while animals are in rehabilitation, NMFS reserves the right to either confiscate the animals or to arrange for another participant to take over rehabilitation or take custody of the animals. A written notice of immediate suspension will be issued in person or by certified mail.

A participant on immediate suspension is not in “good standing” with the Stranding Network.

4. **Termination.** The NMFS Regional Administrator may terminate this Agreement, or any part thereof, upon at least 30 days written notice to the Participant, delivered in person or by certified mail. The Agreement may be terminated for any reason, including the Participant’s:
 - a. Submission of false information or statements in applications or reports;

- b. Failure to satisfy the terms and conditions of the Stranding Agreement;
- c. Failure to correct deficiencies in a timely manner; or
- d. Violation of applicable Federal, state, or municipal laws, regulations, guidelines, or other requirements.

The NMFS Regional Stranding Coordinator may ask another Stranding Network participant to respond in the Participant's area of geographic coverage. If the Participant's Stranding Agreement is terminated while animals are in rehabilitation, NMFS reserves the right to either confiscate the animals or to arrange for another participant to take over rehabilitation of or to take custody of the animals.

Termination of the Agreement for any reason shall automatically terminate any designations by the Participant to any designee organizations under this Agreement.

Acceptance of Agreement

Pursuant to the terms and conditions described above in this Stranding Agreement between the Northeast Region and Virginia Aquarium & Marine Science Center the Participant is authorized:

- Under Article III to response to strandings of dead marine mammals (Order Cetacea and Order Pinnipedia);
- Under Article IV to provide first response to live stranded marine mammals;
- Under Article V to rehabilitate and release live stranded marine mammals (Order Pinnipedia).

THIS STRANDING AGREEMENT IS ENTERED INTO AND MADE EFFECTIVE THIS

In Reply Refer To:
FWS/Region 5/ES-TE

DEC 06 2013

Mr. John K. Bullard
Regional Administrator
National Marine Fisheries Service
1 Blackburn Drive
Gloucester, Massachusetts 01930

Dear Mr. Bullard:

This is in response to your application dated May 31, 2013, requesting renewal of your existing valid U.S. Fish and Wildlife Service (Service) endangered species recovery subpermit, which was issued on May 22, 2008 (enclosed). The subpermit was issued to the Northeast Region Sea Turtle Stranding and Salvage Network (STSSN) under the Service's Regional Endangered Species Recovery Permit #TE-697823 (Permit #TE-697823). The subpermit authorizes the National Oceanic and Atmospheric Administration (NOAA) National Marine Fisheries Service (NMFS), in its role as administrative coordinator for the Northeast Region STSSN, to continue scientific research activities and recovery activities to enhance the propagation and survival of endangered and threatened sea turtles as provided for in section 10(a)(1)(a) of the Endangered Species Act of 1973, as amended.

Your request is hereby approved, and your subpermit is renewed.

I. Covered Species

Green sea turtle (*Chelonia mydas*)
Kemp's ridley sea turtle (*Lepidochelys kempi*)
Hawksbill sea turtle (*Eretmochelys imbricate*)
Leatherback sea turtle (*Dermochelys coriacea*)
Loggerhead sea turtle (*Caretta caretta*)

II. Conditions

All of the terms and conditions remain the same except the following:

1. Additional Stranding Response Organization

Pursuant to Permit #TE-697823 and in response to NMFS' request, one additional organization is being added to the list of authorized Response Organizations contained in the May 22, 2008, letter of authorization. We understand that the Marine Mammals of Maine (MMoME) is a

DEC 10 2013

nonprofit marine animal stranding response organization located in Portland, Maine, and is well-situated geographically to provide sea turtle stranding response coverage along the Maine coast from Rockland south to the Maine-New Hampshire border, an area which is currently lacking a dedicated response organization. As a subpermittee to the Northeast Region STSSN, the MMoME is authorized to aid and/or possess any live stranded or injured sea turtles, to salvage any dead specimens or parts, and to conduct the other authorized activities contained in the May 22, 2008, letter of authorization, provided all necessary State permits are obtained.

2. Service Contacts

For the purpose of general compliance with the terms and conditions of this subpermit, the current Service contacts, mailing addresses, and telephone numbers are:

Chief, Division of Endangered Species
Attention: Permits Coordinator
Ecological Services
U.S. Fish and Wildlife Services
300 Westgate Center Drive
Hadley, Massachusetts 01035

Field Supervisor
New England Field Office
U. S. Fish and Wildlife Service
70 Commercial Street, Suite 300
Concord, New Hampshire 03301

The Chief, Division of Endangered Species, is Martin Miller. His contact information is: telephone 413-253-8615, electronic mail martin_miller@fws.gov

The New England Field Office Supervisor is Tom Chapman. His contact information is: telephone 603-223-2541, electronic mail tom_chapman@fws.gov

The Endangered Species Recovery Permit Coordinator is Deb Carter. Her contact information is: telephone 703-358-2402, electronic mail deb_carter@fws.gov

3. Reporting Requirements

In the event that it becomes necessary to euthanize a sea turtle, the subpermittee must contact Ms. Carter, the Service's Recovery Permits Coordinator prior to the procedure. If Ms. Carter cannot be reached, the subpermittee should provide Federal notification by leaving a message, including contact information, at the phone number or electronic mail address for Ms. Carter, provided above.

4. Reservation of Authority

The Service reserves its authority to amend the conditions of the subpermit, including the expiration date.

5. Expiration

In accordance with 50 Code of Federal Regulations 13.22(a), the expiration date of this subpermit is indefinite pending renewal of the Service's Regional Endangered Species Recovery Permit #TE-697823. After Permit #TE-697823 is renewed, we will provide a copy of it and an expiration date for this subpermit.

If you have any questions, please contact Tom Chapman, Supervisor, New England Field Office, at 603-223-2541, or Deb Carter, Regional Endangered Species Recovery Permits Coordinator, at 703-358-2402.

Sincerely,

Martin Miller
Chief, Division of Endangered Species

Threatened/Endangered Species Permit -- Standard Conditions

- **This permit, or a copy, must be carried by the above named individuals during collection activities.**
- **The permittee is required to submit to this Department a report of all specimens collected under this permit by the report due date. Report form may be found at <http://www.dgif.virginia.gov/permits/guide.asp>. FAILURE TO RETURN THIS REPORT WILL RESULT IN NON-ISSUANCE OF FUTURE PERMITS. If no activity occurs under this permit, an email should be sent to collectionpermits@dgif.virginia.gov containing the following statement: No activity occurred under Permit #insert permitID during insert year (i.e. 2006). Permit reports are due by January 31.**
- Permittee **MUST** notify VDGI within the seven (7) day period prior to EACH sampling event. Notification must be made via email to: collectionpermits@dgif.virginia.gov.
- This permit does not support any activities outside of those associated with the application and proposal submitted to and approved by DGIF.
- If incidental death or injury of threatened or endangered species occurs, the permittee is required to notify this Department at collectionpermits@dgif.virginia.gov within twenty-four (24) hours of occurrence.
- If incidental *collection and live release* of threatened or endangered species occurs *for species other than those authorized under this permit*, the permittee is required to notify this Department at collectionpermits@dgif.virginia.gov within four (4) working days. The following information must be reported: collector, date, species, location (county, quad, waterbody, and specific location, either in latitude and longitude to nearest second, or by way of a photocopied 7.5' topographic map), general habitat associations, and number collected.
- No species may be retained unless specifically authorized by this permit.
- All traps must be marked with the name and address of the trapper or an identification number issued by the Department (Code of Virginia §29.1-521.7). Steel foothold traps, Conibear-style body gripping traps, and snares must be marked with a nonferrous metal tag bearing this information (Virginia Administrative Code 4 VAC 15-40-170).
- All traps must be checked at least once a day and all captured animals removed, except completely submerged body-gripping traps which must be checked at least once every 72 hours (Code of Virginia §29.1-521.9).
- The permittee is required to report any incidences of wildlife deaths or diseases observed during the course of collection activities. Reports should be made to: collectionpermits@dgif.virginia.gov within seven (7) days.
- This permit satisfies only the Department's requirement for collection permits and is issued with the understanding that no collections will be made on federal, state, or private property without the prior approval and necessary permits from the landowners involved. The permittee is responsible for obtaining any additional permits required for collection.
- Sampling gear, boats, or trailers which have been used in states harboring zebra mussels must be cleaned and prepared following the guidelines specified in the attached summary prior to use in waters in the Commonwealth.
- For safety reasons, it is recommended that all permittees display at least 100 square inches of solid blaze orange material at shoulder level within body reach and visible from 360 degrees, especially during hunting season.

Acknowledgements

Thanks to the many people who make the sea turtle nesting program at NASO DNA a success no matter how many nests we have. Thanks to the morning patrollers, to the interns, student hires, and bio-techs who respond to strandings, keep up the ATVs, and do a million other things, and to the dedicated corps of nest-sitters who brave insects, sand and sleeplessness to safely escort vulnerable sea turtle hatchlings into the ocean and start them on their adventurous lives.

Introduction

Naval Air Station Oceana (NASO) and United States Fish & Wildlife Service Back Bay National Wildlife Refuge (BBNWR) work cooperatively to manage the sea turtle program at NASO Dam Neck Annex (NASO DNA). The guiding documents associated with this cooperative working partnership are the NASO DNA Integrated Natural Resources Management Plan (INRMP) mandated by the Sikes Act, the BBNWR Biological Opinion as amended on 25 May 2012, and the 2008 NASO & BBNWR nest relocation agreement.

NASO Natural Resources staff and authorized associates perform daily sea turtle patrols to locate nests, crawls, and strandings at NASO DNA and Virginia Army National Guard-Camp Pendleton (VAARNG-CP). For nests located on NASO DNA, NASO and BBNWR biologists collaboratively determine if a nest should be left in place (in situ) or relocated. Then the nest is either surrounded by an in situ predator enclosure or relocated within a buried cylindrical predator enclosure at the BBNWR designated nursery area. Hatchlings can self-release from in situ predator enclosures, and must be aided in releasing from relocation predator enclosures. In either case, nests are monitored when the estimated hatching date approaches.

Nests located on VAARNG-CP property will be collaboratively managed between BBNWR and VAARNG-CP biologists. NASO staff will notify both BBNWR and VAANG-CP biologists if a crawl is located on their property.

All turtle strandings on NASO DNA and VAARNG-CP will be reported to the VA Aquarium Stranding Team (VAST).

Nest Monitoring

After an appropriate length of incubation (40 days for Kemps Ridley and 50 days for Loggerhead and Green sea turtle nests), nests will be monitored via 2 daytime nest checks and overnight “nest sitting.” Day time checks will be made once in the morning and once in the afternoon. Nest sitting will occur from 8PM to 5AM. Day and night checks are looking to initially identify a cone shaped depression in the center of the nest and for evidence of prior/undocumented emergence. The time a depression is first seen is recorded on the Nest Sitting Log, as well as on the original Nest Data Sheet.

The majority of nests hatch out at night. Nest sitters prepare the path to the surf, count the hatchlings and protect the hatchlings from predators such as gulls, raccoons and foxes.

Nest-Sitting Guidelines

- **Tents:** A tent is provided as part of the nest-sitting kit. The tent should only be used in inclement weather and/or when mosquitoes are overly abundant. Please take down the tent and pack it with the other nest sitting supplies when you leave each morning.
- **Flashlights:** No white lights on beach after dark. Use flashlights with red filters/lens/light-bulbs or cover white light flashlights with red acetate, provided.
- **Radios/ MP3 players:** No open/public music. Please use headphones.
- **No cameras during or following hatching that utilize Flashes.** The flash is a big no-no, and if the turtles hatch, you will be really busy. Once any signs of emergence begin, please put cameras away. We can e-mail pictures of emerging turtles to you for a memento, if you like. **No pictures should be taken of any buildings or military training at any time.**
- **UNDER NO CIRCUMSTANCES IS ALCOHOL ALLOWED.**
- **NO** Unauthorized Guests. All nest-sitters **MUST** be signed up to provide this service with the Navy.
- Campfires are **NOT** permitted.
- If you smoke, make sure you pick up all cigarette butts.
- **Do not handle the hatchlings**, unless directed to do so by Michael Wright, Geralyn Mireles, or John Gallegos.
- If there is lightning, please get off the beach **IMMEDIATELY**. Sitting in a vehicle is much safer than sitting on the beach.
- Remember- **SAFETY ALWAYS COMES FIRST!** Be smart and safe out there. If you ever feel uncomfortable while nest-sitting because of weather, presence of unauthorized people, or for whatever reason, do what you need to do to feel safe (i.e., leave the nest site). If you cannot check the nest(s) every half hour at a minimum, please contact Michael Wright. If there is an **EMERGENCY**, especially if you feel like you are in danger, you may contact the Base Emergency Line 757-433-9111.
- These nests are in remote locations and access to restroom facilities is not immediately available. One person should remain at the nest site at all times. Nest sitters may access the dunes **ONLY** to relieve themselves. Be aware while working on NASO DNA even in the dunes, you may be being watched. If you enter the dune you must: bury your deposit; and cover/smooth out your tracks on the way out to discourage unauthorized dune access. There are restroom facilities available at the MWR Sea Mist Camp Ground. Depending on the nest location you may be able to walk to the camp ground via walking or you may need to walk to your/the vehicle and drive to the restroom. An access code to these restrooms will be provided.

Nest-Sitting Procedures

- 1) Drive your personal vehicle or government work vehicle, as appropriate to the NASO DNA Building 127 Natural Resources storage facility (prefabricated “stone” building), located in the North East corner adjacent to the dunes of the Building 127 parking lot, north of the Building 127 beach access, and pick up appropriate supplies. Storage facility key is located in a lockbox attached to the storage facility door. An access code will be provided to authorized individuals.
- 2) Ensure that you have all the required items before you leave to attend to the nest (cell phone, rake, data log, personal items, etc.)
- 3) Read the update in the front of the binder. Reread nest-sitting procedures, if necessary.
- 4) Drive to the closest beach access point (see attached map) to the nesting site and park your vehicle. **Ensure you place the Vehicle Parking Permit on the dashboard of your vehicle before you park and leave you vehicle to go nest sit.**
- 5) Carry all items to the nest-sitting area.
- 6) Nest is marked with reflectors, signs identifying the site as a sea turtle nest, and flagging tape placed in the immediate vicinity of the nest to help prevent nests from being run over by vehicles or inadvertently disturbed. A predator guard, constructed of galvanized fence wire with a rectangular mesh size of approximately 2 inches by 4 inches covers the nest.
- 7) **If you see a depression, or if hatchlings start to emerge**
 - a. Initiate calling the individuals on the phone list. 1st call Michael Wright, then GERALYN MIRELES, then John Gallegos, and then Ruth Boettcher. Since this will be after normal business hours utilize cell phone numbers. Ensure that you speak with Michael Wright directly. If you cannot reach her: leave a voice message with date, time, brief message, and phone numbers to call you back on; continue contacting the other individuals; attempt to contact Ms. Wright again; upon second attempt to contact Ms. Wright if you still cannot reach her contact the Conservation Law-enforcement Officer “Mac” McGrogan.
 - b. Note time of first emergence, and time of main emergence (“boil”, if there is one), number, etc. (binder, data sheets, pencils, watch) Err on the side of too many notes, rather than too few
 - c. Rake out tire ruts (rake, board) to make pathway to the ocean from the high tide line. (Recommend, conducting this action each night as the 1st duty of the night once on site.)
 - d. Ascertain that the hatchlings make it into water. If a hatchling turns upside down you may turn it back over. If it gets stuck in a rut for more than a few minutes, you can help it out. If one starts crawling parallel to the ocean for more than a few meters, you can redirect it, if a turtle gets snatched by a ghost crab you may attempt to retrieve it. Outside of these conditions, the hatchlings may not be handled without further approval from Navy or USFWS biologist.

- e. Patrol beach for $\frac{1}{4}$ mile to either side of release area after all have made it into water to make sure none were washed back in
- 8) Be sure to fill out the Sea-Turtle Nest Sitting Log
 - 9) **When you are ready to go home:**
 - a. Drive back to the NASO DNA Natural Resources Storage Facility.
 - b. Place all equipment back in the shed in their designated locations. Ensure you have returned the vehicle parking permit to the nest sitting toolbox for the next user.
 - c. If you have used up anything, make a note of it in the Nest Sitting binder so that a staff member can replace it for the next night.
 - d. Place the key back in the lock box, and ensure that the box is locked.
 - e. Drive safely, and get some well-deserved sleep!!!

Supplies

- **Navy provides:**
 1. Latex gloves of several sizes
 2. Flashlights covered with red acetate (or flashlight with other red lighting filter) and extra batteries
 3. Rake (leave in truck, sharp side down)
 4. Cell phone with numbers programmed into it
 5. List of phone numbers
 6. Binder with data sheets and log book
 7. Pencils, pens
 8. First aid kit
 9. Red acetate and tape
 10. Tent
 11. Vehicle Parking Permit
 12. Handheld Radios
- **Nest-sitter provides:**
 1. Watch
 2. Flashlight/headlamp for personal use
 3. Water & Snacks/Food
 4. Personal Protective Equipment (PPE): insect repellent, raincoat, hacket/warm clothing, etc.
 5. Chair, reading material, etc.
 6. Personal cell phone (optional and highly recommended in the event the Navy provided cell phone malfunctions)

Cell Phone Instructions

1. Push and Hold the End/Power button, located on the right side of the phone. The lettering on the button is red.
2. Select the contacts button, located on the top right side of the phone.
3. Utilize the up and down arrows to scroll through and highlight/shade the list of names in the contact list. Nesting sitting Points of Contacts will be preceded by

“#NS” and then the person’s last name (example: in the contacts list Michael Wright will show up as “#NS Wright”).

4. Select the appropriate highlighted/shaded name utilizing the OK button.
5. If the phone number is not highlighted, utilize the up and down arrows to scroll to and highlight/shade the phone number.
6. Select the send button located on the left side of the phone. The lettering on the button is green.
7. For Reference the phone number for this cell phone is 757-613-0320.

Important Phone Numbers

ON BASE EMERGENCIES/REPORTING ILLEGAL ACTIVITIES

- Call = 757-433-9111.

Navy Natural Resources:

- Natural Resources Specialist (NRS), Michael Wright = 757-433-3461(o); 757-373-8531(c)...contact regarding any hatching activity, if there are any emergencies, and if there are any signs of illegal nest tampering by humans, or if it appears the nest has been predated by wildlife.
- Conservation Law-Enforcement Officer (CLEO), Lawrence McGrogan = 757-433-2151(o); 757-635-5436(c)... contact regarding access issues and if there are any signs of illegal nest tampering by human and if you cannot get a hold of the NRS.
- Biological Science Technician (BST), Mark L. Edwards = 757-433-2151(o); 757-406-3764 (pc)...contact if you cannot get a hold of the NRS or the CLEO.
- Installation Environmental Program Director (IEPD), Terry Chamberlain, = 757-433-3437(o); 757-288-6005(c)...contact in case of an emergency, and if you were unable to get a hold of anyone listed above.

USFWS Back Bay National Wildlife Refuge:

- Main Office = 757-301-7329
- Refuge Biologist, Geralyn Mireles = 757-778-5828(c); 757-301-7329 xt 153 (o) ...contact regarding any hatching activity.
- Refuge Biologist, John Gallegos = 757-493-1870 (c); 757-301-7329 xt154 (o) ...contact regarding any hatching activity.
- Refuge Biologist, Chris Hernandez = 757-301-7329 xt158(o); 757-268-4640(c) ...contact if you cannot get a hold of Ms. Mireles or Mr. Gallegos regarding any hatching activity.

VA Dept. of Game and Inland Fisheries:

- VA State Sea Turtle Coordinator, Ruth Boettcher = 757-787-5911(o); 757-709-0766 (c) ...contact regarding any hatching activity.

Radio Instructions

Radios are for communication between you and the other nest sitter monitoring the nest and hatchlings that have emerged and are making their way to the water. Radios may be needed if someone is patrolling the ¼ mile distance looking for hatchlings, if someone is working near the surf while the other person is at the nest, if someone has taken a break and is not immediately available when hatching activity is observed, etc.

1. Turn the radio on by turning the volume knob.

2. Ensure the radios are on the same frequency. To adjust and check the frequency, push the menu button and scroll down to frequency.
3. To talk to one another, hold in the button on the left side of the radio and TALK into the radio. Do not put your mouth right on the radio or you will be difficult to hear.
4. When you finish talking, you must let go of the button in order to hear the other person.

Datasheets

(Current examples provided from 2012 season, datasheets will be updated with current season's data, when and if needed.)

USFWS Data Sheet for Crawls & Nest Relocations:

Nest#3

Nest# 3
Crawl# 3

DATA SHEET FOR CRAWLS & NEST RELOCATIONS

I. General Information (weather, time, tide level, wind speed, location, etc.)

Date 6/15/2012 Tide height 2" MLLW Estimated air temperature 71 F

General weather conditions (ie. % cloud cover, rainfall) No rain

Wind speed & direction 13 mph NE (3:00 pm)

Location of crawl (~, include markers) Dam Neck Naval Air Station, end of Bldg # 127, 30 yards south of South Beach Access.

Latitude of Crawl N 36 degrees 46'28.861" Longitude of Crawl W 75 degrees 57'16.259"

II. Parties Involved

Refuge: John Gallegos, Chris Hernandez, Geralyn Mireles, Camille Sims, Lee Ann Barger, Samantha Smith.

Dam Neck: Michael Wright and Terry Chamberlain

III. Data to be collected for Each Set of Tracks

Crawl # (ie. 1,2, 3,...) 3 Time crawl detected Visitors saw turtle digging nest between 2:30 – 3:00 pm Date 6/15/2012

Track measurements: (from where first visible near surf to nest site or end of crawl)

Length of incoming tracks (m) 23.12 m Width of incoming tracks (cm) 87 cm, 87 cm

Length of outgoing tracks (m) 21.59 m Width of outgoing tracks (cm) 78.5 cm, 87 cm

Flipper impressions alternate or opposite ALT Were tracks prominent? some, footprints throughout tracks

Distance from center of disturbed nesting area to toe of dunes 0 (on toe of dunes)

Topographical feature at end of tracks (CIRCLE area on diagram) Located at # 4 on graph

Was a nest found? Yes false nest? _____ false crawl only? _____

IV. Data to be collected for Each Nest (measurements of nest, egg #, etc.)

Original Nest Data:

NEST CAVITY

Nest # (ie. 1, 2, 3, ...) 3 Crawl# 3
Time nest excavated _____ until _____
Width of disturbed nesting area 122 cm
Length of disturbed nesting area 130.5 cm
Nest cavity width at widest pt. _____
Nest cavity length at longest pt. _____
Total # eggs _____
 #damaged eggs _____
 # broken or predated eggs _____
Temperature of soil in nest cavity _____

Notes: The distance from the ground surface to top nest depth was 38 cm. Nest was left “in -situ”.

An outer protective cage was placed over nest. One egg was removed from nest for a genetic analysis of parentage of sea turtle nesting. The couple, who saw the turtle digging, took pictures and sent them to the Virginia Aquarium Standing Team, who identified the turtle as a Kemp’s ridley. Refuge staff met Dam Neck personnel at 7:00 pm and finish data collection and placing protective cage at 8:15 pm.

Relocated Nest Data: Nest left “in-situ”

NEST CAVITY

Time nest reburied _____ until _____
Temperature of soil in nest cavity _____
Air temperature (C) _____

unhatched eggs hatched later at Visitor's Center _____

storage location of dead hatchlings (if not disposed of) _____

Date	Time Hatchlings discovered	# of Hatchlings	AirTemp/ Soil Temp	Weather Conditions	Time of Hatchling Release	# of Hatchlings Released	Status of Hatchlings	Weather Conditions and Type of Tide (incoming or outgoing)
Total # of Hatchlings				Total # of Hatchlings Released				

VI. Additional Comments and Observations (diagram of tracks and nest, opinions, etc.)

Attach photos or slides and brief narrative for each nest/ hatch.

Two SeaMist Camp Ground campers, Doug and Yvonne Gilbert, saw and reported the nesting sea turtle. They took photos which confirmed that the turtle was a Kemps Ridley (VAST, USFWS, VDGIF, and Navy all concurred). Turtle had a healed damaged carapace. Campers reported that turtle was on beach digging between 1430-1500 and was gone, back in the water, by 1530.

Those Notified:

Base Watch Captain, Lt. Glass.

VA Aquarium Stranding Team

USFWS-BBNWR Biologists

VDGIF-SeaTurtle Coordinator

Base Conservation Law-enforcement Officer

Base Natural Resources Specialist/NRS (rec'd ~1615)

Installation Environmental Program Director/IEPD

NRS on site ~1700. IEPD on site ~ 1800. USFWS on site ~1900.

NRS confirmed crawl was not a hoax and notified USFWS so that they would respond and bring all appropriate equipment.

Date of first hatchling emergence (if first emergence was seen *after* midnight, record that day's date; if first emergence was seen *before* midnight, record the next day's date) _____

Date of last hatchling emergence (if last emergence was seen *after* midnight, record that day's date; if last emergence was seen *before* midnight, record the next day's date) _____

Nest inventory date: _____ Excavated by: _____

Perform the following steps to assist with the determination of the nest's hatch success rate:

- To obtain number of hatched eggs, separate whole eggshells (>50%) from pieces (<50%); only count whole eggshells (each whole eggshell represents one hatched egg):
- Add together the number of unhatched eggs and pipped eggs with dead hatchlings to obtain the total number of unhatched eggs:
- Count the # of dead hatchlings that emerged from eggs but did not leave the nest:
- Count the # of live hatchlings that emerged from eggs but did not leave the nest, irrespective of their condition.

Lighting Assessment

WHAT ARE LIGHTING INSPECTIONS?

During a lighting inspection, a complete census is made of the number, types, locations, and custodians of artificial light sources that emit light visible from the beach. The goal of lighting inspections is to locate lighting problems and to identify the property owner, manager, caretaker, or tenant who can modify the lighting or turn it off.

WHICH LIGHTS CAUSE PROBLEMS?

Although the attributes that can make a light source harmful to sea turtles are complex, a simple rule has proven to be useful in identifying problem lighting under a variety of conditions:

An artificial light source is likely to cause problems for sea turtles if light from the source can be seen by an observer standing anywhere on the nesting beach.

If light can be seen by an observer on the beach, then the light is reaching the beach and can affect sea turtles. If any glowing portion of a luminaire (including the lamp, globe, or reflector) is directly visible from the beach, then this source is likely to be a problem for sea turtles. But light may also reach the beach indirectly by reflecting off buildings or trees that are visible from the beach. Bright or numerous sources, especially those directed upward, will illuminate sea mist and low clouds, creating a distinct glow visible from the beach. This “urban skyglow” is common over brightly lighted areas. Although some indirect lighting may be perceived as nonpoint-source light pollution, contributing light sources can be readily identified and include sources that are poorly directed or are directed upward. Indirect lighting can originate far from the beach.

Although most of the light that sea turtles can detect can also be seen by humans, observers should realize that some sources, particularly those emitting near-ultraviolet and violet light (e.g., bug-zapper lights, white electric-discharge lighting) will appear brighter to sea turtles than to humans. A human is also considerably taller than a hatchling; however, an observer on the dry beach who crouches to the level of a hatchling may miss some lighting that will affect turtles. Because of the way that some lights are partially hidden by the dune, a standing observer is more likely to see light that is visible to hatchlings and nesting turtles in the swash zone.

HOW SHOULD LIGHTING INSPECTIONS BE CONDUCTED?

Lighting inspections to identify problem light sources may be conducted either under the purview of a lighting ordinance or independently. In either case, goals and methods should be similar.

GATHER BACKGROUND INFORMATION

Before walking the beach in search of lighting, it is important to identify the boundaries of the area to be inspected. For inspections that are part of lighting ordinance enforcement efforts, the jurisdictional boundaries of the sponsoring local government should be determined. It will help to have a list that includes the name, owner, and address of each property within inspection area

so that custodians of problem lighting can be identified. Plat maps or aerial photographs will help surveyors orient themselves on heavily developed beaches.

PRELIMINARY DAYTIME INSPECTIONS

An advantage to conducting lighting inspections during the day is that surveyors will be better able to judge their exact location than they would be able to at night. Preliminary daytime inspections are especially important on beaches that have restricted access at night. Property owners are also more likely to be available during the day than at night to discuss strategies for dealing with problem lighting at their sites.

A disadvantage to daytime inspections is that fixtures that are not directly visible from the beach will be difficult to identify as problems. Moreover, some light sources that can be seen from the beach in daylight may be kept off at night and thus present no problems. For these reasons, daytime inspections are not a substitute for nighttime inspections. Descriptions of light sources identified during daytime inspections should be detailed enough so that anyone can locate the lighting. In addition to a general description of each luminaire (e.g., HPS floodlight directed seaward at top northeast corner of the building at 123 Ocean Street), photographs or sketches of the lighting may be necessary. Descriptions should also include an assessment of how the specific lighting problem can be resolved (e.g., needs turning off; should be redirected 90° to the east). These detailed descriptions will show property owners exactly which luminaires need what remedy.

NIGHTTIME INSPECTIONS

Surveyors orienting themselves on the beach at night will benefit from notes made during daytime surveys. During nighttime lighting inspections, a surveyor walks the length of the nesting beach looking for light from artificial sources. There are two general categories of artificial lighting that observers are likely to detect:

1. **Direct lighting.** A luminaire is considered to be direct lighting if some glowing element of the luminaire (e.g., the globe, lamp [bulb], reflector) is visible to an observer on the beach. A source not visible from one location may be visible from another farther down the beach. When direct lighting is observed, notes should be made of the number, lamp type (discernable by color), style of fixture, mounting (pole, porch, *etc.*), and location (street address, apartment number, or pole identification number) of the luminaire(s). If exact locations of problem sources were not determined during preliminary daytime surveys, this should be done during daylight soon after the nighttime survey. Photographing light sources (using long exposure times) is often helpful.

2. **Indirect lighting.** A luminaire is considered to be indirect lighting if it is not visible from the beach but illuminates an object (e.g., building, wall, tree) that is visible from the beach. Any object on the dune that appears to glow is probably being lighted by an indirect source. When possible, notes should be made of the number, lamp type, fixture style, and mounting of an indirect-lighting source. Minimally, notes should be taken that would allow a surveyor to find the lighting during a follow-up daytime inspection (for instance, which building wall is illuminated

and from what angle?).

WHEN SHOULD LIGHTING INSPECTIONS BE CONDUCTED?

Because problem lighting will be most visible on the darkest nights, lighting inspections are ideally conducted when there is no moon visible. Except for a few nights near the time of the full moon, each night of the month has periods when there is no moon visible. Early-evening lighting inspections (probably the time of night most convenient for inspectors) are best conducted during the period of two to 14 days following the full moon. Although most lighting problems will be visible on moonlit nights, some problems, especially those involving indirect lighting, will be difficult to detect on bright nights.

A set of daytime and nighttime lighting inspections before the nesting season and a minimum of three additional nighttime inspections during the nesting-hatching season are recommended. The first set of day and night inspections should take place just before nesting begins. The hope is that managers, tenants, and owners made aware of lighting problems will alter or replace lights before they can affect sea turtles. A follow-up nighttime lighting inspection should be made approximately two weeks after the first inspection so that remaining problems can be identified. During the nesting-hatching season, lighting problems that seemed to have been remedied may reappear because owners have been forgetful or because ownership has changed. For this reason, two midseason lighting inspections are recommended. The first of these should take place approximately two months after the beginning of the nesting season, which is about when hatchlings begin to emerge from nests. To verify that lighting problems have been resolved, another follow-up inspection should be conducted approximately one week after the first midseason inspection.

WHO SHOULD CONDUCT LIGHTING INSPECTIONS?

Although no specific authority is required to conduct lighting inspections, property managers, tenants, and owners are more likely to be receptive if the individual making recommendations represent a recognized conservation group, research consultant, or government agency. When local ordinances regulate beach lighting, local government code-enforcement agents should conduct lighting inspections and contact the public about resolving problems.

WHAT SHOULD BE DONE WITH INFORMATION FROM LIGHTING INSPECTIONS?

Although lighting surveys serve as a way for conservationists to assess the extent of lighting problems on a particular nesting beach, the principal goal of those conducting lighting inspections should be to ensure that lighting problems are resolved. To resolve lighting problems, property managers, tenants, and owners should be given the information they need to make proper alterations to light sources. This information should include details on the location and description of problem lights, as well as on how the lighting problem can be solved. One should also be prepared to discuss the details of how lighting affects sea turtles. Understanding the nature of the problem will motivate people more than simply being told what to do.

Lighting Survey Form

The lighting survey must be conducted to include a landward view from the seaward most extent of the beach profile. The survey must occur after 9 p.m. The survey must follow standard techniques for such a survey and include the number and type of visible lights, location of lights and photo documentation.

Date: _____

Location (name of beach): _____

Contact information of person conducting the lighting survey: _____

1 **2. BACKGROUND INFORMATION**

2 **a. Contractor**

3 GMI-AECOM Joint Venture
4 6850 Versar Center #201
5 Springfield, Virginia 22151

6 **b. Contract Number**

7 N62470-13-D-8017, TO WE04

8 **c. Project Name**

9 Lighting Survey and Biological Assessment for Sea Turtle Nest Management at Joint Expeditionary Base
10 Little Creek Fort Story, Virginia Beach, VA

11 **d. Brief Project Description of Work**

12 The GMI-AECOM JV is subcontracting this task order to Versar, Inc.

13 The purpose of this survey is to conduct artificial lighting surveys along the beaches of Naval Air Station
14 Oceana-Dam Neck Annex (NASO-DNA) and Virginia Army National Guard Camp Pendleton (VAANG-
15 CP) in Virginia Beach, VA. These lighting surveys will document all observable lighting sources from
16 installation beaches.

17 Versar would utilize a group of experienced scientists in performing the tasks specified in the SOW for
18 performing a survey of artificial lighting sources that may impact sea turtle nesting on installation
19 beaches. The project team’s experience includes extensive biological and ecological work throughout the
20 southeast. Versar’s technical approach will be to adhere closely to the SOW as described in the contract.
21 Specifically, we will adhere to all guidance and complete each task as directed in order to successfully
22 complete surveys for each installation. The project areas for NASO-DNA and VAANG-CP are shown in
23 Figures 1 and 2, respectively. A total of five surveys will be conducted at each location. The following
24 steps will be undertaken to perform lighting surveys at each installation:

- 25 1. The plans and maps developed for each installation survey plan will be used by the surveyors to
26 assist in determining potential light sources and identifying survey boundaries.
- 27 2. Each installation survey will begin with a daytime survey. Day time surveys allow surveyors a
28 first look to help with orientation at night and allows for the identification of potential light
29 sources to be sought at night.
- 30 a. Daytime surveys will occur both along the beach face and behind the rear dunes in order
31 to identify potential light source locations that will be sought out during night surveys.
- 32 b. Identification of potential light sources will be sufficiently detailed (location and type) so
33 that they can be easily located during night surveys.
- 34 3. Nighttime surveys will consist of at least two surveyors walking the beach at night along the
35 water line in the swash zone.
- 36 a. Surveys will be conducted 2 to 14 days following a full moon. See Table 1 for the full
37 moon calendar and survey opportunities. The PM will coordinate all visits with the NTR

- 1 and IR at least three weeks in advance to ensure beach access and entry to restricted
2 areas, if necessary, to obtain coordinates.
- 3 b. The first nighttime survey will be conducted prior to the nesting season which begins
4 early summer.
- 5 c. Three subsequent surveys will occur during the nesting (May – September) and hatching
6 season (approximately 55 – 80 days after eggs are laid).
- 7 d. Both direct and indirect light sources will be identified. Identification will consist of the
8 classification of the type of light source with GPS coordinates of the actual light source.
9 Survey forms will also document building number, parking area, or other identifier of the
10 location on the installation. The number of lights, type, color and potential disruption (as
11 reviewed in Witherington and Martin [2003]) will be included in the survey forms.
- 12 4. The windows for surveys is provided in Table 1. Specific dates will be coordinated with the
13 Installation Representatives (IR) and the Naval Technical Representative (NTR).
- 14 Hazards associated with the activities conducted under this scope of work include hazards encountered
15 with exposure from being outdoors; encounters with wildlife; trips and falls; and working in close
16 proximity to the water. Section 10, Risk Management Processes, of this APP discusses the associated
17 hazards involved with each activity and an activity hazard analysis (AHA).

18 **Table 1. Lighting Survey Windows**

Survey	Survey Window
Initial (Pre-nesting) Daytime Survey	30 Mar - 3 Apr
Initial (Pre-nesting) Night Survey (Night Survey 1)	13-17 April
Midseason Nesting/Hatching Survey (Night Survey 2)	4-8 Jun
Midseason Nesting/Hatching Survey (Night Survey 3)	12-16 Jun
Final Nesting/Hatching Survey (Night Survey 4)	31 Aug – 4 Sep

3. STATEMENT OF SAFETY AND HEALTH POLICY

The personal safety and health of each employee of the Versar Team is of primary importance. The prevention of work-induced injuries and illness is of such importance that it will be given precedence over operating productivity whenever necessary. To the greatest degree possible, management will provide all training, mechanical, and physical facilities required for personal safety and health in keeping with the highest standards of the industry.

The Versar Team will maintain a safety and health program conforming to the best practices of organizations within the environmental and construction services. To be successful, such a program must embody the proper attitudes toward injury and illness prevention on the part of both supervisors and employees. It also requires cooperation in all safety and health matters, not only between supervisor and employee, but also between each employee and his or her fellow workers. Only through such a cooperative effort can a safety record in the best interest of all be established and preserved.

The objective is a safety and health program that will reduce the number of disabling injuries and illnesses to an absolute minimum, not merely in keeping with, but surpassing, the best experience of other similar operations.

The Versar Team safety and health program includes:

- Providing mechanical and physical safeguards to the maximum extent possible;

- Conducting a program of safety and health inspections to find and eliminate unsafe working conditions or practices; to control health hazards; and to comply fully with the safety and health standards for every job;
- Training all employees in good safety and health practices;
- Providing necessary personal protective equipment (PPE) and instructions for its use and care;
- Developing and enforcing safety and health rules; and requiring that employees cooperate with these rules as a condition of employment;
- Investigating, promptly and thoroughly, every accident to find out what caused it and to correct the problem so that it will not happen again; and
- Recognizing and awarding outstanding safety service or performance.

The Versar Team recognizes that the responsibilities for safety and health are shared:

- The company is responsible for leadership of the safety and health program, for its effectiveness and improvement, and for providing the safeguards required to ensure safe conditions;
- The person responsible for administration of the company safety program is the Company President. Some items in the safety program may be delegated to others, but the primary responsibility remains with this person.
- Supervisors are responsible for developing the proper attitudes toward safety and health in themselves and in those they supervise and for ensuring that all operations are performed with the utmost regard for the safety and health of all personnel involved, including themselves.

Employees are responsible for cooperation with all aspects of the safety and health program, including compliance with all rules and regulations, and for continuously practicing safety while performing their duties.

4. RESPONSIBILITIES AND LINE OF AUTHORITY

a. Statement of Employer’s Ultimate Responsibility for Implementation of Safety and Occupational Health Program

The provisions of this Accident Prevention Program (APP) along with the applicable regulations issued by governmental entities will be strictly adhered to by site personnel and visitors. Each subcontractor will be held accountable for the safe and healthful performance of work by each of their employees, subcontractors, or support personnel who may enter the site. It is Versar’s policy to ensure that every reasonable precaution is taken to prevent accidents. Always use the safety equipment provided for your protection. Unsafe conditions, unsafe practices, property damage or personal injuries, regardless of how slight, must be reported to your supervisor immediately.

b. Identification and Accountability of Personnel Responsible at Corporate and Project Level

(1) GMI-AECOM JV

John Ouellette, Program Manager

(2) Versar

Mark Housand, Safety Officer
Brian Bishop, Project Manager

c. Requirements that No Work Shall be performed unless a Designated Competent Person is Present of the Job Site

The services outlined in Section 2 require specific skills sets and no services will be rendered without a trained, competent person present. All services are provided with a minimum of two employees present.

d. Requirements of Pre-task Safety and Health Analysis

Every employee is required to go through an on-sight safety briefing outlining daily tasks, equipment needs, and specific hazards that may be encountered during the course of daily activities. Additionally, employees are not allowed to operate any specific equipment without being briefed by the owner and illustrating competency with said item. This includes establishing corporate requirements that each employee discloses any health concerns that would impact their ability to operate equipment and perform assigned tasks.

e. Lines of Authority

(1) Project Manager

In effectively executing their safety responsibilities, project managers will:

- Familiarize themselves with the safety program and ensure its effective implementation.
- Be aware of all safety considerations when introducing a new process, procedure, machine or material to the workplace.
- Give maximum support to all programs and committees whose function is to promote safety and health.
- Actively participate in safety activities as required.
- Review serious accidents to ensure that proper reports are completed, and appropriate action is taken to prevent recurrences.

(2) Foremen (Crew Lead)

In effectively executing their safety responsibilities, foremen will:

- Familiarize themselves with company safety policies, programs and procedures.
- Provide appropriate safety training to employees prior to the assignment of duties.
- Consistently and fairly enforce all company safety rules.
- Investigate injuries to determine cause, and then take action to prevent recurrence.
- See that all injuries, no matter how minor, are treated immediately and referred to the front office to ensure prompt reporting to the insurance carrier.
- Inspect work areas often to detect unsafe conditions and work practices. Use company self-inspection checklists as required.

(3) All Employees

Employee responsibilities for safety include the following:

- Adhere to all safety rules and regulations.
- Wear appropriate safety equipment as required.
- Maintain equipment in good condition, with all safety guards in place when in operation.
- Report all injuries and near misses, no matter how minor, immediately to their supervisor, safety personnel or management.
- Encourage coworkers to work safely.
- Report unsafe acts and conditions to their supervisor, safety personnel, or management.
- Halt site operations in the event of an emergency or to correct unsafe work practices.
- Notifying emergency response personnel in the event of an emergency; and
- Review this APP.

f. Policy Regarding Noncompliance

Employees who fail to comply with safety rules will be subject to disciplinary action up to and including termination. Supervisors will follow the normal disciplinary procedures as follows:

- 1. Verbal counseling - must be documented in the employee's personnel file.
- 2. Written warning - outlining nature of offense and necessary corrective action.
- 3. Suspension without pay - one (1) working day without pay - the third step or a separate disciplinary action resulting from a serious violation.
- 4. Termination - if an employee is to be terminated, specific and documented communication between the supervisor and the employee must occur.

g. Procedures for Holding Managers and Supervisors Accountable to Safety

Supervisors will be subject to disciplinary action for the following reasons:

- Repeated safety rule violation by their department employees.
- Failure to provide adequate training prior to job assignment.
- Failure to report accidents and provide medical attention to employees injured at work.
- Failure to control unsafe conditions or work practices.
- Failure to maintain good housekeeping standards and cleanliness in their departments.

Supervisors who fail to maintain high standards of safety within their departments will be demoted or terminated after three documented warnings have been levied during any calendar year.

5. SUBCONTRACTORS AND SUPPLIERS

a. Identification of Subcontractors

Versar
6850 Versar Center
Springfield, VA 22151
(703) 750-3000

Virginia Aquarium & Marine Science Center
717 General Booth Blvd
Virginia Beach, VA 23451
(757) 385-3474

b. Safety Responsibilities of Subcontractors

Subcontractors and suppliers shall comply with all applicable federal, state, and local laws, rules, regulations, and orders in effect on the date of this order, including, but not limited to the following, as amended: (a) the Fair Labor Standards Act of 1938; (b) the Federal Occupational Safety and Health Act of 1970 (OSHA); (c) the Toxic Substances Control Act of 1976; (d) the Walsh-Healy Public Contracts Act; and (e) any other federal law concerning labor relations, nondiscrimination in employment, minimum wages, overtime compensation, and hours of employment. Seller agrees to indemnify and hold Contractor harmless against any loss or liability due to Seller’s violation or noncompliance with such regulations. Upon Contractor’s request, Seller shall furnish evidence demonstrating such compliance.

6. TRAINING

a. Requirements for New Employees

Each subcontractor or department manager must employ a program for new employee acclimation and orientation, including current employees who are reassigned and directed towards familiarization with:

- Safety rules, procedures and standards with which compliance is expected
- Inherent hazards of the job and surroundings
- Safe work methods, motions and habits
- Emergency procedures, alarms and telephone numbers related to reporting injury, illness, fire and other catastrophes
- Physical layout of the properties, including exits, emergency signal devices, first-aid facilities, and fire extinguishers and other emergency equipment
- PPE required on the job including its maintenance and proper use
- Safety committees, safety meetings, and safety educational materials.

While on-site, the Project Manager will brief all newly arriving workers and visitors to aid in protecting their safety. The training will familiarize personnel with hazards associated with the site and associated controls, describe work zone boundaries and access and exit procedures, explain emergency procedures, and describe the use of PPE required during activities on the site. The briefing will include a review of the requirements of this APP including the safety checklists in Appendix A.

b. Mandatory Training and Certifications Applicable to this Project

There are no mandatory or certifications required for this project.

c. Procedures for Periodic Safety and Health Training

Annual refresher training is required, even if there has been no change in a worker's job tasks.

d. Emergency Response Training

When a medical facility or physician is not accessible within five minutes of an injury to a group of two or more employees for the treatment of injuries, a minimum of two representatives, on site at all times, will be certified in both first aid and cardiopulmonary resuscitation. Certifications are contained Appendix B.

7. SAFETY AND HEALTH INSPECTIONS

a. Internal Inspections

Inspections should be performed by personnel who have been trained in recognizing hazards that have a tendency to “slip out” of controls designed to reduce employee exposure to them. All inspections should be documented in writing, and where hazards are identified, corrective actions should be developed as soon as possible, based on the severity of the hazard involved.

(1) Mechanical Equipment

The two general classifications are “frequent” and “periodic.”

- Frequent inspection: Daily to monthly intervals.
- Periodic inspection: 1- to 12-month intervals, or as specifically recommended by the manufacturer.

The operator should check the following items daily:

- All control mechanisms for maladjustment interfering with proper operation
- Deterioration or leakage in air or hydraulic systems if applicable
- All safety devices for malfunction

The following items should be checked weekly or monthly, depending on how much the equipment is used:

- All control mechanisms for excessive wear of components and contamination by lubricants or other foreign matter.
- Electrical apparatus for malfunctioning, signs of excessive deterioration, dirt, and moisture accumulation.

Complete inspections of all mechanical equipment must be performed at periodic intervals depending upon its activity, severity of service, and environment or as specifically indicated below. These inspections have to include all “frequent” inspection items and in addition, items such as the following:

- Loose bolts or rivets
- Worn, cracked, or distorted parts such as pins, bearings, shafts, gears, rollers and locking devices
- Excessive wear on brake and clutch system parts, linings, pawls, and ratchets
- Gasoline, diesel, electric, or other power plants for improper performance or noncompliance with safety requirements
- Excessive wear of chain-drive sprockets and excessive chain stretch
- Travel steering, braking, and locking devices, for malfunction

c. Immediate Notification of Major Events

Immediate (8 hour) reporting to OSHA is required under 29 CFR 1904 if a fatality or catastrophe (3 or more people sent to the hospital with injuries that require an overnight stay) occurs. This reporting is done only by the Versar Safety Officer or Project Manager. All other personal injuries requiring first aid or resulting in lost time will be recorded on an OSHA Form 300 by the manager/project manager.

The following require immediate accident notification:

- A fatal injury
- A permanent total disability
- A permanent partial disability
- The hospitalization of three or more people resulting from a single occurrence
- Property damage of \$200,000 or more.

The investigation and reporting of occupational injuries, illnesses and dangerous occurrences is essential for project management to be able to take the steps necessary to avoid additional injuries or illnesses. A complete investigation will provide information regarding the elements of the incident and the process by which they came together to cause the injury, illness, or dangerous occurrence. By identifying the elements and processes, further incidents can be avoided. Timely reporting also permits project contractors to remain in compliance with OSHA recordkeeping regulations.

9. PLANS REQUIRED BY THE SAFETY MANUAL

a. Emergency Response Plans

(1) Spill Plans

In the event of a chemical spill, the company who caused the spill is responsible for prompt and proper clean-up. It is also their responsibility to have spill control and PPE appropriate for the chemicals being handled readily available.

The following are general guidelines to be followed for a chemical spill.

- Immediately alert area occupants and supervisor, and evacuate the area, if necessary.
- If there is a fire or medical attention is needed, contact the installation SPOC.
- Attend to any people who may be contaminated. Contaminated clothing must be removed immediately and the skin flushed with water for no less than fifteen minutes.
- If a volatile, flammable material is spilled, immediately warn everyone, control sources of ignition and ventilate the area.
- Don PPE, as appropriate to the hazards. Refer to the Material Safety Data Sheet or other references for information.
- Consider the need for respiratory protection. The use of a respirator or self-contained breathing apparatus requires specialized training and medical surveillance. Never enter a contaminated atmosphere without protection or use a respirator without training. If respiratory protection is

used, be sure there is another person outside the spill area in communication, in case of an emergency.

Using the list below, determine the extent and type of spill. If the spill is large, if there has been a release to the environment the company will contact the POC at the installation immediately

<u>Category Size</u>	<u>Response / Treatment Materials</u>
Small up to 300cc	Chemical treatment or absorption neutralization or absorption spill kit
Medium 300 cc - 5 liters	Absorption spill kit
Large more than 5 liters	Call public safety outside help

Loose spill control materials should be distributed over the entire spill area, working from the outside, circling to the inside. This reduces the chance of splash or spread of the spilled chemical. Bulk absorbents and many spill pillows do not work with hydrofluoric acid. POWERSORB (by 3M) products and their equivalent will handle hydrofluoric acid. Specialized hydrofluoric acid kits also are available. Many neutralizers for acids or bases have a color change indicator to show when neutralization is complete.

When spilled materials have been absorbed, use brush and scoop to place materials in an appropriate container. Polyethylene bags may be used for small spills. Five gallon pails or 20 gallon drums with polyethylene liners may be appropriate for larger quantities. Complete a hazardous waste sticker, identifying the material as Spill Debris involving the given chemical, and affix onto the container. Spill control materials will probably need to be disposed of as hazardous waste. Decontaminate the surface where the spill occurred using a mild detergent and water, when appropriate. Report all spills to your supervisor or the manager/principal manager, installation POC, and ESA project manager. A certified hazardous waste disposal company must be contacted to pick up and dispose of the contained material. The installation Environmental Regulated Waste Manager's signature is required the accompanying waster manifest, which is required with every disposal shipment for the base.

(2) Firefighting Plan

MAINTENANCE

The Project Manager will ensure that equipment is maintained according to manufacturers' specifications. The project manager will also comply with requirements of the National Fire Protection Association (NFPA) codes for specific equipment. Only properly trained individuals shall perform maintenance work.

GOOD HOUSEKEEPING

To limit the risk of fires, employees shall take the following precautions:

- Minimize the storage of combustible materials
- Make sure that all exit routes are kept free of obstructions
- Dispose of combustible waste in covered, airtight, metal containers
- Use and store flammable materials in well-ventilated areas away from ignition sources
- Use only nonflammable cleaning products

- Keep incompatible (i.e., chemically reactive) substances away from each other
- Perform “hot work” (i.e., welding or working with an open flame or other ignition sources) in controlled and well-ventilated areas
- Keep equipment in good working order (i.e., inspect electrical wiring and appliances regularly and keep motors and machine tools free of dust and grease)
- Ensure that heating units are safeguarded
- Report all fuel leaks immediately
- Repair and clean up flammable liquid leaks immediately
- Keep work areas free of dust, lint, sawdust, scraps, and similar material.

EXTINGUISHERS

Know the location of the nearest fire extinguisher and how to operate it. Know the type of the fire on which it should be used by checking and reading the label. Be aware that certain toxic gases or vapors may be generated by a fire.

A carbon dioxide, dry chemical or equivalent fire extinguisher is kept in the cab or vicinity of all mechanical equipment.

Fire extinguishers of the proper type and size must be within 30 feet of each open flame operation that is performed. Return all extinguishers for servicing promptly after any use.

COMBUSTIBLE AND FLAMMABLE MATERIALS

The project manager shall regularly evaluate the presence of combustible materials at the job site. Certain types of substances can ignite at relatively low temperatures or pose a risk of catastrophic explosion if ignited. Such substances obviously require special care and handling.

1. Class A combustibles.

These include common combustible materials (wood, paper, cloth, rubber, and plastics) that can act as fuel and are found in non-specialized areas such as offices.

To handle Class A combustibles safely:

- a. Dispose of waste daily.
- b. Keep trash in metal-lined receptacles with tight-fitting covers (metal wastebaskets that are emptied every day do not need to be covered).
- c. Keep work areas clean and free of fuel paths that could allow a fire to spread.
- d. Keep combustibles away from accidental ignition sources, such as hot plates, soldering irons, or other heat- or spark-producing devices.
- e. Store paper stock in metal cabinets.
- f. Store rags in metal bins with self-closing lids.

- g. Do not order excessive amounts of combustibles.
- h. Make frequent inspections to anticipate fires before they start.

Water, multi-purpose dry chemical (ABC), and halon 1211 are approved fire extinguishing agents for Class A combustibles.

2. Class B combustibles.

These include flammable and combustible liquids (oils, greases, tars, oil-based paints, and lacquers), flammable gases, and flammable aerosols.

To handle Class B combustibles safely:

- a. Use only approved pumps, taking suction from the top, to dispense liquids from tanks, drums, barrels, or similar containers (or use approved self-closing valves or faucets).
- b. Do not dispense Class B flammable liquids into containers unless the nozzle and container are electrically interconnected by contact or by a bonding wire. Either the tank or container must be grounded.
- c. Store, handle, and use Class B combustibles only in approved locations where vapors are prevented from reaching ignition sources such as heating or electric equipment, open flames, or mechanical or electric sparks.
- d. Do not use a flammable liquid as a cleaning agent inside a building (the only exception is in a closed machine approved for cleaning with flammable liquids).
- e. Do not use, handle, or store Class B combustibles near exits, stairs, or any other areas normally used as exits.
- f. Do not weld, cut, grind, or use unsafe electrical appliances or equipment near Class B combustibles.
- g. Do not generate heat, allow an open flame, or smoke near Class B combustibles.
- h. Know the location of and how to use the nearest portable fire extinguisher rated for Class B fire.

Water should not be used to extinguish Class B fires caused by flammable liquids. Water can cause the burning liquid to spread, making the fire worse. To extinguish a fire caused by flammable liquids, exclude the air around the burning liquid. The following fire-extinguishing agents are approved for Class B combustibles: carbon dioxide, multi-purpose dry chemical (ABC), halon 1301, and halon 1211. (NOTE: Halon has been determined to be an ozone-depleting substance and is no longer being manufactured. Existing systems using halon can be kept in place.)

SMOKING

Smoking is prohibited in all company buildings, vehicles, and equipment. Certain outdoor areas may also be designated as no smoking areas. The areas in which smoking is prohibited outdoors will be identified by NO SMOKING signs.

STRIKE ANYWHERE matches are not permitted. On certain projects, permits are required for welding, burning, or other types of open flames.

(3) Employees working alone

Employees working alone shall be provided an effective means of emergency communication. This may be cellular phone, two-way radio or other acceptable means. The selected means of communication must be readily available and must be in working condition.

(4) Posting of Emergency Phone Numbers

Emergency telephone numbers and reporting instructions for ambulance, physician, hospital, fire, and police will be conspicuously and clearly posted at the work site.

(5) Medical Support

If the incident is serious/life threatening, the contractor is to **contact the JEBLCFS Emergency Dispatch Center at 757-443-9111 for the installation emergency dispatch**. In the event of an onsite incident that results in a need for first aid care, the closest hospital with acute care facilities to JEB Little Creek is Bon Secours DePaul Medical Center in Norfolk and the closest to JEB Fort Story is Sentara Princess Anna in Virginia Beach. To reach off-site hospitals, follow the driving directions in Appendix D.

Following an accident/injury or near miss, work will immediately stop and the POC will be contacted. Emergency contact information is located in Table 2. The POC will then contact the Safety Office to respond/document the incident. No work shall take place until the Installation Safety Office turns the site back over to the contractors.

Table 2. Emergency Contacts

Contact	Person or Agency	Telephone No.
Dam Neck Annex POC	Michael Wright	Office: (757) 433-3461 Cell: (757) 373-8531
Dam Neck Annex Emergency Dispatch		(757) 492-6911
Camp Pendleton POCs	Ken Oristaglio 1st Sgt Carter	Office: (434) 298-6416 Cell: (434) 264-4929 Cell: (434) 294-2100
Camp Pendleton Emergency Dispatch	Main Gate	911 757-491-5144
Off-base Hospital (Fort Story): Sentara Princess Anna	2025 Glenn Mitchell Dr, Virginia Beach, VA 23456	(757) 507-1000
Poison Control Center	Directs to appropriate state center	(800) 222-1222
NAVFAC MIDLANT NTR	Jessica Bassi	
GMI-AECOM JV Program Manager	John Ouellette	(757) 265-2901
Versar Project Manager	Brian Bishop	(757) 265-2903

Contact	Person or Agency	Telephone No.
Virginia Aquarium	Mark Swingle	(757) 384-3474

The above table shall be posted in a prominent location at the work area.

b. Plan for Prevention of Alcohol and Drug Abuse

While working the site, no personnel assigned to this project may use, possess, distribute, sell, or be under the influence of alcohol or engage in the unlawful manufacture, distribution, dispensation, possession, or use of illegal drugs. Violations of this policy may lead to disciplinary actions, up to and including immediate and permanent prohibition of the individual(s) from performing work on this project.

The policy to be implemented at this project site will involve drug testing for cause or suspicion. This means that any individual assigned to this project, who is observed behaving in such a manner that leads the project manager to suspect he or she is under the influence of alcohol or illegal drugs, will be immediately directed to stop work and report to the project manager. The individual under suspicion will be escorted off of the site and asked to submit to testing for illegal substances and alcohol. Individuals who agree to be tested will be provided transportation to an appropriate medical facility for evaluation. Individuals who decline to be tested will be provided transportation to their nearby residence or lodging and directed not to return to the project. Those who test positive for use of illegal substances may not return to the project until such time as they can demonstrate no further use of the substances.

Individuals with questions or concerns about substance dependency or abuse may wish to discuss these matters with their employer, supervisor, or appropriate resources in the community. The intent of this policy is to offer a helping hand to project personnel who suffer from the illness of addiction and to encourage those personnel to pursue recovery. The clear message is that continued drug use or alcohol abuse is incompatible with continuing work on this project. Any employee under a physician's treatment and taking prescribed narcotics or any medication that may prevent one being ready, willing and able to safely perform position duties shall provide a medical clearance statement to his supervisor.

c. Drinking Water Provisions, Toilet and Washing Facilities

All employees will either bring or Versar will provide an adequate supply of drinking water. The closest restroom and washing facilities on Dam Neck Annex are located behind the dunes in Bldg 153, which is located across the parking lot from the Shifting Sands Beach Club (Appendix E). On Camp Pendleton, portable latrines are located directly behind the dunes.

d. Health Hazard Control Program

Operations, materials, and equipment involving potential exposure to hazardous or toxic agents or environments shall be evaluated by the manager and project manager for each activity. Based on the scope of work outlined in Section 2, neither company anticipates operating equipment or using materials that may construed as health hazards to perform these tasks.

e. Heat/Cold Stress Monitoring plan

The following guidelines will be followed to prevent heat related injury:

1. Drinking water shall be made available to employees and employees encouraged to frequently drink small amounts, e.g., one cup every 15-20 minutes; the water shall be kept reasonably cool.
2. Tool box training in hot environments shall include training on the symptoms of heat related problems, contributing factors to heat related injuries, and prevention techniques.
3. When possible, work should be scheduled for cooler periods during the day.
4. Individuals shall be encouraged to take breaks in a cooler location, and use cooling devices as necessary, such as cooling vests, to prevent heat related injury.
5. A buddy system shall be established to encourage fluid intake and watch for symptoms of heat related injury.
6. The foreman shall monitor those individuals who have had a previous heat-related injury, are known to be on medication, or exhibits signs of possibly having consumed large amounts of alcohol in the previous 24 hours for signs, or indicating symptoms of heat related injuries.
7. Individuals who are not acclimatized shall be allowed additional breaks. The period and number should be determined by the SSHO and provided to the supervisor and employee for implementation.

Cold weather sheltering and clothing requirements include:

1. If wind chill is a factor at a work location, the cooling effect of the wind shall be reduced by shielding the work area or requiring employees to wear an outer windbreak layer garment.
2. An AHA and/or PHA shall be prepared as an attachment to the site-specific, cold-stress monitoring plan and shall identify specific controls to minimize employee exposure to extreme cold.
3. Extremities, ears, toes, and nose shall be protected from extreme cold by proper clothing such as hats, gloves, masks, etc.
4. Employees whose clothing may become wet shall wear an outer layer of clothing that is impermeable to water.
5. Outer garments must provide for ventilation to prevent wetting of inner clothing by sweat.
6. If clothing is wet, the employee shall change into dry clothes before entering a cold environment.
7. Employees shall change socks and removable felt insoles at regular daily intervals or shall use vapor barrier boots.
8. Due to the added danger of cold injury due to evaporative cooling, employees handling evaporative liquid (such as gasoline, alcohol, or cleaning fluids) at air temperatures below 40 °F (4 °C) shall take precautions to avoid soaking of clothing or contact with skin.

f. Contingency Plan for Severe Weather

When there are warnings or indications of impending severe weather (heavy rains, thunderstorms, damaging winds, tornados, hurricanes, floods, lightning, etc.), weather conditions shall be monitored using a weather station that is part of the National Oceanic and Atmospheric Administration (NOAA) weather radio all hazards network or similar notification system. Appropriate precautions shall be taken to protect personnel and property from the effects of the severe weather.

Notification of inclement weather in progress after working hours will be done by phone. Notifying employees at this time can assist management in letting workers know if and when to report to work.

10. RISK MANAGEMENT PROCESS

a. Standard Safe Work Practices

(1) General

The following general safe work practices will be followed:

- Eating, drinking, chewing gum or tobacco, and smoking are prohibited in the Work Zone.
- Spillage shall be prevented, to the extent possible. In the event that spillage occurs, the liquid shall be contained, if possible.
- Field crewmembers shall use all their senses to alert themselves to potentially dangerous situations (i.e., presence of strong, irritating, or nauseating odors).
- Field crew members shall be familiar with the physical characteristics of the site, including:
 - Wind direction in relation to the ground Work Zone
 - Accessibility to associates, equipment, and vehicles
 - Communications
 - Site access
 - Nearest water sources
 - Routes and procedures to be used during emergencies.
- All wastes generated during activities at the site must be disposed of as directed by the Project Manager.

(2) Personal Protective Equipment

Personnel Protective Equipment (PPE) is worn to minimize exposure to serious workplace injuries and illnesses. Injuries and illnesses may result from contact with chemical, radiological, physical, electrical, mechanical, or other workplace hazards. PPE include items such as gloves, safety glasses and shoes, earplugs or muffs, hard hats, respirators, or coveralls, vests and full body suits. PPE should be of sound design and construction, and well maintained.

- Work clothing - Minimum Requirements.
 - Employees shall wear clothing suitable for the weather however minimum requirements for work shall be short-sleeve shirt, long pants (excessively long or baggy pants are prohibited) and leather work shoes.
 - If analysis determines that safety-toed (or other protective) footwear is necessary (i.e., mowing, weedeating, chain saw use, etc.), they shall be worn. The Navy has requested that safety-toed shoes be worn while performing duties on these installations.
- Eye and Face Protection.
 - Eye and face protection shall be worn as determined by an analysis of the operations being performed
 - However, all involved in chain saw use, chipping, stump grinding, pruning operations, grass mowing, weedeating and blowing operations shall be provided safety eyewear (Z87.1) as a minimum.

- **Hearing Protection.**
 - Hearing protection must be worn by all those exposed to high noise activities (to include grass mowing and trimming, chainsaw operations, tree chipping, stump grinding and pruning). Ear plugs are required when working near operating beach replenishment equipment on Dam Neck Annex.
- **Head Protection.**
 - Hard hats shall comply with ANSI Z89.1 and shall be worn by all workers when a head hazard exists.
 - At a minimum, hard hats shall be worn when performing chain saw use, chipping, stump grinding, pruning operations, grass mowing, weedeating, and blowing operations.
 - Hard hats are required when working within the beach replenishment area on Dam Neck Annex.
- High Visibility Apparel shall comply with ANSI/ISEA 107, Class 2 requirements at a minimum and shall be worn by all workers exposed to vehicular or equipment traffic.
- Protective Leg chaps shall be worn by all chainsaw operators.
- Gloves of the proper type shall be worn by persons involved in activities that expose the hands to cuts, abrasions, punctures, burns and chemical irritants.
- If work is being performed around water and drowning is a hazard, PFDs must be provided and worn as appropriate.

(3) Machine Guards and Safety devices.

- Power tools must have appropriate guards and safety devices in place and operational.

(4) Buddy System

Workers will conduct all site activities with a buddy who is able to:

- Provide his or her partner with assistance.
- Observe his or her partner for signs of heat exposure.
- Notify the project manager if emergency help is needed.

b. Site Hazards and Standard Operation Procedures

(1) Noise

Noise, or unwanted sound, is one of the most pervasive occupational health problems. It is a by-product of many industrial processes.

Hearing protection is required of all field personnel throughout the course of this project when noise generating activities (e.g. saw cutting) are taking place. Exposure to high levels of noise causes hearing loss and may cause other harmful health effects as well. The extent of damage depends primarily on the intensity of the noise and the duration of the exposure.

Noise-induced hearing loss can be temporary or permanent. Temporary hearing loss results from short-term exposures to noise, with normal hearing returning after period of rest. Generally, prolonged exposure to high noise levels over a period of time gradually causes permanent damage.

Hearing protection will be provided to all workers exposed to 8-hour time-weighted average (TWA) noise levels of 85 dB or above. Employees must wear hearing protectors:

- For any period exceeding 6 months from the time they are first exposed to 8-hour TWA noise levels of 85 dB or above, until they receive their baseline audiograms if these tests are delayed due to mobile test van scheduling;
- If they have incurred standard threshold shifts that demonstrate they are susceptible to noise; and
- If they are exposed to noise over the permissible exposure limit of 90 dB over an 8-hour TWA.

(2) Venomous Snakebites

Of the 8,000 people bitten by snakes annually in the United States, fewer than 12 die. Most deaths occur because the victim has an allergic reaction, weakened body systems, or because too much time passes before the victim receives medical care. Reactions from snakebites are aggravated by acute fear and anxiety. Other factors that affect the severity of local and general reactions include: the amount of venom injected and the speed of absorption of venom into the victim's circulation; the size of the victim; protection from clothing including shoes and gloves; quick antivenin therapy; and location of the bite.

Elaborate care for a snakebite is usually unnecessary because in most cases the victim can reach professional medical care within 30 minutes. The most important step in first aid procedures is to transport the victim to the hospital quickly. Meanwhile, take action with the first aid procedures listed below.

First Aid for Snakebite:

- Call EMS (Emergency Medical System) for a victim of snakebite.
- Keep the victim calm. Monitor airway, breathing, and circulation.
- Wash the wound and keep the affected part still. Splint a bitten arm or leg. Keep the affected area lower than the heart to slow down the progress of the venom from the bite site to the heart.
- **Do not apply ice, do not cut the wound, and do not apply a tourniquet.** If in a remote area, contact EMS via radio, then carry the victim or have him or her walk slowly.

Other factors to consider in providing first aid treatment:

- Shock - Keep the victim lying down and comfortable if possible, and maintain his or her body temperature.
- Breathing and Pulse - Constantly monitor airway, breathing, and respiration. Administer artificial resuscitation or CPR if needed.
- Observing the Snake - If feasible without injuring additional persons, observe and take notes of the size, color, and markings of the snake.
- Medications - Do not give the victim alcohol, sedatives, aspirin, or any other medication while transferring to the medical facility.

Other Hazardous Bites

Mosquitoes

West Nile Virus has been spreading quickly throughout the United States, especially in areas with higher mosquito populations. Although this disease has been affecting immuno-compromised individuals, it is best to protect oneself against mosquito bites, which can carry other diseases besides the West Nile Virus.

Repellents containing DEET have been shown to be effective against mosquitoes when applied to exposed skin. Using a repellent with a higher percentage of DEET does not mean that one's protection is better, just that it will last longer. The Federal Centers for Disease Control and Prevention (CDC) has stated that a product containing an approximately 25% concentration lasts an average of five hours, whereas a product with much less DEET will last for one or two hours. Concentrations over 50% do not increase the length of protection.

When using DEET, be cautious against:

- Applying the product indoors. Apply the repellent outdoors and use sparingly.
- Spraying the product directly in one's face. Rather apply to your hands and rub the material on your face, but not on your mouth or around your eyes.
- Do not apply to cuts, irritated skin, or beneath clothing.

Products containing Permethrin, such as Permanone, have been effective when applied directly to clothing. Apply products specified for use on clothing outdoors. Do not apply it to your skin.

The CDC recently announced that products containing two other repellents — the chemical picaridin and natural oil of lemon eucalyptus — are also effective in repelling mosquitoes. In using these for Mosquito control, however, be aware that they are not alternatives to DEET when it comes to battling deer ticks that spread Lyme disease.

If feasible, control the amount of standing water on the site, emptying containers with accumulated water so as not to provide a breeding ground for mosquito larvae. Non-registered pesticides are available to kill larvae in pools of standing water if it is feasible to exercise this level of control over the surroundings.

Be cautious if spraying an insecticide inside a closed space such as in a construction trailer or inside the cab of an excavator or other piece of construction equipment. A toxic environment can quickly be created. Use pesticide sparingly and vacate the space for a short period of time immediately after application to allow the material to settle out of the air.

Spiders

Spiders in the United States are generally harmless, with two notable exceptions: the Black Widow spider (*Latrodectus Mactans*) and the Brown Recluse or violin spider (*Lox Osceles Reclusa*).

The symptoms of such a spider bite are: slight local reaction, severe pain produced by nerve toxin, profuse sweating, nausea, painful cramps in abdominal muscles, and difficulty in breathing and speaking. Victims recover in almost all cases, but an occasional death is reported. The bite of a Black Widow spider is the more painful and often the more deadly of the two.

Field personnel shall exercise caution when lifting covers off manholes or sumps or rummaging through wood, rock, or brush piles, etc. since both the Black Widow and Brown Recluse spiders are typically found in these areas.

(3) General First Aid for Poisonous Insect Bites

1. Minor Bites and Stings

- Cold applications.
- Soothing lotions, such as calamine.

2. Severe Reactions

- Give artificial respiration if indicated.
- Apply a constricting band above the injection site on the victim's arm or leg (between the site and the heart). Do not apply tightly. You should be able to slip your index finger under the band when it is in place.
- Keep the affected part down, below the level of the victim's heart.
- If medical care is readily available, leave the band in place; otherwise, remove it after 30 minutes.
- Apply ice contained in a towel or plastic bag, or cold cloths, to the site of the sting or bite.
- Give home medicine, such as aspirin, for pain.
- If the victim has a history of allergic reactions to insect bites or is subject to attacks of hay fever or asthma, or if he or she is not promptly relieved of symptoms, call a physician or take the victim immediately to the nearest location where medical treatment is available. In a highly sensitive person, do not wait for symptoms to appear, since delay can be fatal.
- In case of a bee sting, remove and discard the stinging apparatus and venom sac.

(4) Tick-borne Diseases

Lyme Disease

Lyme disease is an illness caused by a bacterium, which may be transmitted by the bite of a tick (*Ixodes scapularis*), commonly, referred to as the "Deer Tick." The tick is about the size of a sesame seed, as distinguished from the Dog Tick, which is significantly larger. The Deer Tick is principally found along the Atlantic coast, living in grassy and wooded areas, and feeds on mammals such as mice, shrews, birds, raccoons, opossums, deer, and humans. Not all ticks are infected with the bacterium, however. When an infected tick bites, the bacterium is passed into the bloodstream of the host, where it multiplies. The various stages and symptoms of the disease are well recognized and, if detected early, can be treated with antibiotics.

Removal of ticks is best accomplished using small tweezers. Do not squeeze the tick's body. Grasp it where the mouth parts enter the skin and tug gently, but not firmly, until it releases its hold on the skin. Save the tick in a jar labeled with the date, body location of the bite, and the place where it may have been acquired. Wipe the bite thoroughly with an antiseptic and seek medical attention as soon as possible.

The illness typically occurs in the summer and is characterized by a slowly expanding red rash, which develops a few days to a few weeks after the bite of an infected tick. This may be accompanied by flu-like symptoms along with headache, stiff neck, fever, muscle aches, and/or general malaise. At this stage

treatment by a physician is usually effective; but, if left alone, these early symptoms may disappear and more serious problems may follow. The most common late symptom of the untreated disease is arthritis. Other problems that may occur include meningitis and neurological and cardiac abnormalities. It is important to note that some people do not get the characteristic rash but progress directly to the later manifestations. Treatment of later symptoms is more difficult than early symptoms and is not always successful.

When in an area suspected of harboring ticks (grassy, bushy, or woodland area) the following precautions can minimize the chances of being bitten by a tick:

1. Wear long pants and long-sleeved shirts that fit tightly at the ankles and wrists.
2. Wear light colored clothing so ticks can be easily spotted.
3. Wearing tick repellents may be useful.
4. Inspect clothing frequently while in tick habitat.
5. Inspect your head and body thoroughly when you return from the field.
6. Remove any attached ticks by tugging with tweezers where the tick's mouth parts enter the skin. Do not squeeze or crush it.

Rocky Mountain Spotted Fever

In the United States this tick-borne disease is primarily transmitted by infected Dog Tick (*Dermacentor variabilis*). It is important to note that the Dog Tick is significantly larger than the Deer Tick. Nearly all cases of infection occur in the spring and summer, generally several days after exposure to infected ticks. The onset of illness is abrupt and often accompanied by high fever, headache, chills, and severe weakness. After the fourth day of fever, victims develop a spotted pink rash that usually starts on the hands and feet and gradually extends to most of the body. As with Lyme disease, early detection and treatment significantly reduces the severity of illness. The disease responds to antibiotic therapy with tetracycline or chloramphenicol.

(5) Poisonous Plants

Characteristic Reactions

The majority of skin reactions following contact with offending plants is allergic in nature and characterized by general symptoms of headache and fever, itching, redness, and a rash.

Some of the most common and most severe allergic reactions result from contact with plants of the Poison Ivy group including Poison Oak and Poison Sumac. The most distinctive features of Poison Ivy and Poison Oak are their leaves, which are composed of three leaflets each. Both plants also have greenish-white flowers and berries that grow in clusters. Such plants produce a severe rash characterized by redness, blisters, swelling, and intense burning and itching. The victim can also develop a high fever and become very ill. Ordinarily, the rash begins within a few hours after exposure, but it may be delayed for 24 to 48 hours.

First Aid Procedure

1. Remove contaminated clothing.
2. Wash all exposed areas thoroughly with soap and water, followed by rubbing alcohol.
3. Apply calamine or other soothing skin lotion if the rash is mild.
4. Seek medical advice if a severe reaction occurs, or if there is a known history of previous sensitivity.

c. Activity Hazard Analyses

Tabular Activity Hazard Analysis (AHA) is presented here to prescribe hazards and controls associated with the work on the site. The AHAs are prepared based upon a review of the planned work on the site and the recognized physical and biological hazards associated with the work. The AHAs for this project are contained in Appendix F.

Appendix A
Job Safety Checklists

This page intentionally left blank

Pre-Job Hazard Survey

A Tailgate Meeting is required every day before starting work in order to identify and minimize HAZARDS on the job. PLEASE place a check mark in the box next to each of the following HAZARDS that are most relevant to this particular job and DISCUSS them. Keep a copy of the completed form in an office file.

Date ____ Crew Leader _____ Job Location _____
Type of job _____

HAZARD

- day of the week
- extreme weather conditions
- inexperienced personnel
- improper use of PPE
- distance to electrical conductors
- terrain
- noise levels
- new equipment
- obstacles
- traffic control

- moving/lifting heavy objects
- chemicals
- (Other)

DISCUSS

- more accidents on Mon, Fri, & bef/aft holidays & vacation days
- frost bite, heat exhaustion, effect on driving their ability to detect hazardous conditions
- head, eye, hearing, foot, hand, leg injuries
- direct and/or indirect contact
- slips, trips, and falls
- necessity of hand signals
- proper use and maintenance
- overhead and/or ground level
- being struck, protection of the work area, cones & signs
- proper techniques and/or equipment
- contact with or exposure to

Crew members' signatures:

New Employee Safety Checklist

Employee: _____ Department: _____

Date Hired: _____ Supervisor: _____

Supervisor: Check off each item as you discuss it with the new employee prior to having that employee start work.

1. Employee provided company safety policy statement and safety rule. _____
2. Explained functions of company safety committee. _____
3. Reviewed injury-reporting procedures. _____
4. Issued safety equipment - glasses, ear plugs, respirator, etc., and explained use and care. _____
5. Reviewed lock-out and tag procedures. _____
6. Reviewed safe lifting procedures. _____
7. Will forklift training be required? If yes, when _____ _____
8. Reviewed housekeeping and clean-up procedures. _____
9. Located first aid kits/medical service provider(s)/hospital. _____
10. Reviewed hazard communication program, location of material safety data sheets, and how to read an MSDS _____
11. Reviewed evacuation procedures and any specific duties. _____
12. Does the employee understand the above? _____

I acknowledge that information on the above subjects was furnished to me during my orientation.

Employees Signature _____ Department _____

I have instructed the above named employee in the fundamentals of safety practices.

Supervisor's Signature _____ Date _____

L. Work Activity at Time of Accident

M. Personal Protective Equipment?

- (1) Available & Used
- (2) Not Required
- (3) Available & not used
- (4) Not Related to mishap
- (5) Wrong PPE for job
- (6) List Type(s) used:

5. Injury/Illness/Fatality Information:

A. Severity of Illness/Injury	B. Estimated Days Lost	C. Estimated Days Hospitalized	D. Estimated Days Restricted Duty
E. List Body Part(s) Affected	F. Nature of Illness/Injury	G. Type and Source of Injury/Illness: (1) Type: (2) Source:	

6. A. Accident Description (Describe in your own words) (Use additional paper if necessary)

- B. Who provided first aid and/or cleanup of mishap site?
- C. Any blood borne pathogen exposure by other than EMT's? If so who?
- D. Was site secured and witness interviews taken immediately?
- E. List OSHA and EM 385-1-1 standards/requirements that were violated?

7. Causal Factors (Explain yes answers on a supplementary sheet)	YES	NO
Design - Was design of facility, workplace, or equipment a factor?		
Inspection/Maintenance - Were inspection & maintenance procedures a factor?		
Persons Physical Condition - In your opinion, was the physical condition of the person a factor?		
Operating Procedures - Were operating procedures a factor?		
Job Practices - Were any job safety/health practices not followed when the accident occurred?		
Human Factors - Did any human factors such as size or strength of person etc. contribute to the accident?		

Environmental Factors - Did heat, cold, dust, sun, glare, etc., contribute to the accident?		
Chemical & Physical Agent Factors - Did exposure to chemical agents, such as dust, fumes, mists, vapors or physical agents such as noise, radiation, etc., contribute to the accident?		
Office Factors - Did office setting such as lifting office furniture, carrying, stopping, etc., contribute to the accident?		
Support Factors - Were inappropriate tools/resources provided to properly perform the activity task?		
Personal Protective Equipment - Did the improper selection, use, or maintenance of personal protective equipment contribute to the accident?		
Drugs/Alcohol - In your opinion, were drugs or alcohol a factor?		
Activity Hazard Analysis - Was the lack of an adequate (IAW EM 385-1-1 Sec 01.A.09) Activity Hazard Analysis a contributing factor? - Was it site specific and address the type of work/operations performed when the mishap occurred?		
Management - Did the lack of adequate supervision contribute to the accident? - Was inadequate information provided at pre-con meeting?		
8. Training:		
A. Was/were person(s) trained to perform activity/task?		
B. Type of training?		
C. Date of most recent formal training? / /		D. List topics discussed
9. Fully Explain What Allowed or Caused The Accident, Include Direct and Indirect Causes:		
A. Direct Cause		
B. Indirect Cause		
C. Action(s) taken to prevent re-occurrences or provide on-going corrective actions		
D. Corrective Action Dates		

(1) Beginning (Mo/Da/Yr) _____	(2) Anticipated Completion Date (Mo/Da/Yr) _____	
10. OSHA		
A. Date OSHA was notified _____	C. Date of OSHA Citation _____	
B. Date OSHA Investigated _____	D. \$ Amount of Penalties: _____	
11. Report Preparer:		
Print Name & Title of Supervisor Completing Report: _____

OSHA's Form 301 Injury and Illness Incident Report

Attention: This form contains information relating to employee health and must be used in a manner that protects the confidentiality of employees to the extent possible while the information is being used for occupational safety and health purposes.

Revised approval OSHA 301 (2)

This *Injury and Illness Incident Report* is one of the forms you must fill out when a recordable work-related injury or illness has occurred. Together with the *Log of Work-Related Injuries and Illnesses* and the accompanying *Summary*, these forms help the employer and OSHA develop a picture of the extent and severity of work-related incidents.

Within 7 calendar days after you receive information that a recordable work-related injury or illness has occurred, you must fill out this form or an equivalent. Some state workers' compensation, insurance, or other reports may be acceptable substitutes. To be considered an equivalent form, any substitute must contain all the information asked for on this form.

According to Public Law 91-596 and 29 CFR 304, OSHA's recordkeeping rule, you must keep this form on file for 5 years following the year to which it pertains.

If you need additional copies of this form, you may photocopy and use as many as you need.

Completed by _____
 Title _____
 Date () - () - ()

Information about the employee

- 1) Full name _____
- 2) Street _____
 City _____ State _____ ZIP _____
- 3) Date of birth _____
- 4) Date hired _____
- 5) Male
 Female

Information about the physician or other health care professional

- 6) Name of physician or other health care professional _____
- 7) If treatment was given away from the workplace, where was it given?
 Facility _____
 Street _____
 City _____ State _____ ZIP _____
- 8) Was employee treated in an emergency room?
 Yes
 No
- 9) Was employee hospitalized overnight as an inpatient?
 Yes
 No

Information about the case

- 10) Case number from the Log _____ (Obtain the case number from the Log after you finish this case.)
- 11) Date of injury or illness () / () / ()
- 12) Time employee began work _____ AM / PM
- 13) Time of exit _____ AM / PM Check if time cannot be determined
- 14) **What was the employee doing just before the incident occurred?** Describe the activity, as well as tools, equipment, or material the employee was using. Be specific. Examples: "climbing a ladder to carry roof materials"; "spraying chlorine from hand sprayer"; "daily computer key-entry."
- 15) **What happened?** Tell us how the injury occurred. Examples: "When ladder slipped on wet floor, I fell 20 feet"; "Worker was sprayed with chlorine when gasket broke during replacement"; "Worker developed soreness in wrist over time."
- 16) **What was the injury or illness?** Tell us the part of the body that was affected and how it was affected—more specific than "hurt," "pain," or "sore." Examples: "strained back"; "chemical burn, hand"; "tunnel syndrome."
- 17) **What object or substance directly harmed the employee?** Examples: "concrete floor"; "chlorine (radia) area sign." If this question does not apply to the incident, leave it blank.
- 18) **If the employee died, when did death occur?** Date of death _____

		RAC Chart					
		E = Extremely High Risk					
		H = High Risk					
		M = Moderate Risk					
		L = Low Risk					
Job Steps	Hazards	Controls				RAC	
General Safety	Slips, Trips and Falls	Use caution and pay particular attention to uneven and rough terrain while working on the site.				M	
	Muscle strain/ Back strain	Stretch muscles prior to working. Use proper methods for digging. Wear gloves. Stop work to rest if feeling strain or fatigue.				M	
	Wildlife	Avoid contact with wildlife. In case of animal bite, perform first aid and seek medical attention for bites from mammals or reptiles (snakes and lizards).				L	
	Insects	Utilize insecticide with DEET to eliminate mosquito bites, West Nile Virus and Lyme Disease. Treat clothing with Permethrin and allow appropriate amount of drying time prior to wearing the clothes.				M	
	Venomous Insect Stings/Bites	For minor stings/bites carefully remove stinger (if necessary) and wash area; apply dressing and cold pack. If the person seems to be having an allergic or anaphylactic reaction call 911 or Installation Emergency Response number.				M	
Walking on uneven ground	Trips, falls, sprains, broken bones, lacerations and contusions	Be observant while walking. Use sturdy leather work boots with ankle support and non-slip soles Slopes of 30 degrees or greater will be avoided. Climbing up or down vertical areas will be avoided				L	
Working near water	Stay cognizant of surf zone	Do not enter the water, stay cognizant of tides and surf Stay within eye sight of partner Wear high visibility vests				L	
Working at night	Hit by vehicles	Be observant while walking. Stay clear of oncoming traffic Wear high visibility vests				M	
Weather Hazards	Hypothermia	Watch for shivering, altered mental status. Care for life-threatening problems, get patient to a warm place if possible, remove wet clothing, warm patient slowly.				M	
	Heat Stress	Adjust work schedule to cooler hours of the day; Sufficient fluid intake; Monitor employees for heat related illness.				M	
	Sun Exposure	Besides head protection, use sunscreen of SPF 30 rating or better as protection against UVA and UVB. Reapply sunscreen often. Sunscreen should be no more than one year old. Wear sunglasses to protect eyes from UV exposure.				M	
Construction Areas	Struck by equipment, noise	Be observant Attend specialized orientation training Wear required PPE while inside construction zone				M	
Equipment to be Used		Training Requirements/Competent or Qualified			Inspection Requirements		
Long pants, shirt with sleeves		Only trained and authorized persons will use excavation equipment and power tools.			Pre-operation inspection on front end loader		
Hard hat, steel-toed boots, hearing protection is construction zones							
High visibility vests							
Designated Competent/Qualified Person(s):							
Brian Bishop							
Chris Lotts

NASO DNA Restricted Access Coordination Area

Survey Area 1

Survey Area 2

Maneuver Training Area

Firing Range

Survey Area 3, with 3 potential subsections (A-north, B-center, C-south)

Firing Range

Firing Range

South of Red Line = Escort Required and must report to Building 301 via the installation main gate off of Dam Neck Blvd. Photo are NOT authorized in this area. Only under VERY special conditions will photos be authorized. DO NOT bring cameras, phones with cameras, IPads or other items with Camera like capabilities into this area. ***If you identify a must photo opportunity (e.g., T&E species) in a no PHOTO zone, take a point location and contact Mike Wright immediately.***

North of Red Line = An escort is NOT required and access to this area may be obtained via the Birdneck Road Gate. Photos are authorized in this area for individuals who obtain a photo authorization letter.

Orange Polygon is a Drone Launch Range. When active the beach will be posted with signs and lookout personnel that will deny access. Individuals can check to see if the range is active or is preparing to be active, before the range goes "hot" sometimes they will let personnel on official business access until they go "hot." There are also red flags posted on the two roads that surround the White Polygon that indicate the range is active.

Survey Area 4

Survey area 5

White Polygon is UXO Area. No Access without appropriately trained Explosive Safety Officer on site. Navy does not supply ESOs.

Attachment 2 Artificial Light Source and Fixture Descriptions

Source: Witherington, B. and R. E. Martin. 2003. Understanding, Assessing, and Resolving Light-Pollution Problem on Sea Turtle Nesting Beaches. FMRI Technical Report TR-2 Third Edition, Revised. Florida Fish and Wildlife Conservation Commission.

APPENDIX A

The following is a list of artificial light sources grouped by the level of disruption they are likely to cause sea turtles. The criteria used to group the sources came from studies of physiological spectral sensitivity (Granda and O'Shea, 1972), hatchling orientation with respect to laboratory light sources (Mrosovsky and Carr, 1967; Mrosovsky and Shettleworth, 1968; Mrosovsky, 1972; Witherington and Bjorndal, 1991a; Witherington, 1992b) and commercial light sources (Dickerson and Nelson, 1988, 1989; Witherington, 1989; Witherington and Bjorndal, 1991b; Ferreira *et al.*, 1992; Nelson, 1992; Witherington, 1992b), and spectral profiles of commonly used lamps (Anonymous, 1983; Rossotti, 1983; Anonymous, 1989; Witherington and Bjorndal, 1991b). Effects are described as being extremely disruptive, highly disruptive, moderately disruptive, or minimally disruptive.

White, broad-spectrum, short-arc lighting (*extremely disruptive*).—These light sources include xenon and mercury arc lamps and are the brightest and highest-energy light sources commonly used. They emit wavelengths rather evenly across the visible spectrum (which is why they appear white) and in the ultraviolet spectrum as well. They are used principally for temporary, intense lighting needs.

White, broad-spectrum, electric-discharge lighting (*extremely disruptive*).—Mercury-vapor, metal-halide, and fluorescent-tube lighting are included in this group. Like sources in the preceding group, these sources emit wavelengths across the visible spectrum. They are used both indoors and outdoors. Fluorescent-tube lighting is becoming more common as an indoor source and is frequently used to light porches and outdoor signs.

Color-phosphor and tinted-fluorescent lighting ("blacklight" ultraviolet, violet, blue, green, and mixtures of these colors) (*extremely disruptive*).—As revealed to some extent by their colors, these electric-discharge tube lamps emit light principally in the short-wavelength end of the visible spectrum. The so-called "blacklight"-type fluorescent tubes, however, emit much of their light in the near-ultraviolet region. These blacklight tubes appear as a dim violet color to humans but are very disruptive to sea turtle hatchlings. Blacklights are often used as insect attractants in insect-electrocuting "bug-zappers." Tubes of other colors are principally used for decorative applications.

White, broad-spectrum, incandescent lighting (*extremely disruptive*).—Light emitted from incandescent sources comes from a glowing filament. This group includes quartz-tungsten-halogen and simple tungsten-filament sources. Without tinting, these sources emit wavelengths throughout the visible spectrum but less so in the short-wavelength end of the spectrum than the sources described above. Incandescent sources are commonly used as outdoor

floodlights, as indoor lighting (*i.e.*, the common light bulb), and as transient lighting (flashlights, lanterns, and electric torches).

Color-tinted incandescent lighting (blue and green) (*extremely disruptive*).—These colored sources are tinted so that they emit principally short-wavelength light; they are often used in decorative applications.

White, pressurized-fuel, glowing-element lanterns (*extremely disruptive*).—These portable lanterns are used for camping, fishing, and other transient nighttime activities.

High-pressure sodium vapor (HPS) lighting (*highly disruptive*).—HPS sources emit light with minor wavelength peaks in the blue and green regions and major peaks in the yellow and orange regions of the visible spectrum. The color of HPS sources is whitish golden to peach. Although less disruptive than the broad-spectrum white sources above, HPS is one of the most commonly used outdoor light sources in the USA and many other countries and is one of the most common causes of hatchling misorientation and mortality.

Open fires (*moderately to highly disruptive*).—Although fires are temporary light sources and emit less short-wavelength light than the sources above, they have been documented as a significant source of hatchling mortality. Unlike other attractive light sources, fires can kill hatchlings quickly (hatchlings are known to crawl into fires and die). The size and temperature of a fire determines how attractive it is to hatchlings.

Yellow-phosphor and amber-tinted fluorescent lighting and red tubes (*moderately disruptive*).—Yellow and amber fluorescent tubes emit principally red, yellow, and green wavelengths but do not exclude light in the blue region of the spectrum as well as yellow incandescent bulbs do. Yellow and amber fluorescent tubes are not generally marketed as "bug lights." Although they are more disruptive to

sea turtles than yellow incandescent bulbs, yellow and amber fluorescents are far better than white or other colored tubes for use near nesting beaches. However, the hue of these yellow fluorescent lamps varies between manufacturers and can have a varied effect on sea-finding in hatchlings. Red tubes are typically used for decoration and can be of two types: red (or reddish), phosphor-fluorescent tubes and red, neon tubes. Reddish or red-purple fluorescent tubes can be very disruptive, depending upon the amount of short-wavelength light that they emit (purplish lights emit both blue and red light). Neon tubes are covered below.

Lamps with yellow or orange dichroic long-pass filters (*minimally to moderately disruptive*).—Because these filters are very good at attenuating short wavelengths, the type of lamp used with them matters little. Consequently, these filters may allow the use of lamps like metal-halide and HPS that have small and easily focused elements. These lamps can be used in more directional fixtures in order to reduce stray light. Dichroic filters are not standard off-the-shelf accessories for commercial fixtures but they have been used in some outdoor applications near nesting beaches.

Color-tinted incandescent lighting (yellow and red) (*minimally to moderately disruptive*).—Yellow or amber incandescent light bulbs (bug lights) are generally only weakly attractive to hatchlings for the same reason that they attract few insects — they emit little short-wavelength light. Although they are minimally disruptive for the most part, bug lights can interfere with sea-finding if they are numerous, of high wattage, or close to the nesting beach. Red-tinted incandescent sources are more variable in color than bug lights. Some red sources can turn purple or pinkish over time (an indication of greater short-wavelength emission) and become more attractive to hatchlings.

Low-pressure sodium vapor (LPS) lighting (*minimally disruptive*).—LPS is by far the least disruptive light source among those commonly used. LPS sources emit a light that is pure (monochromatic) yellow, a region of the spectrum that is only weakly attractive or even aversive (at higher intensities for loggerheads only) to orienting hatchlings. Because

LPS sources have poor color rendition, they are used principally for outdoor applications.

Red light-emitting diode (LED) lighting (*minimally disruptive*).—LEDs are miniature lamps that are not commonly used outdoors. In the future, LEDs may be used to a greater extent as sign lighting and pathway lighting. Red LEDs come close to being ideal for use near sea turtle nesting beaches. Red LEDs emit a pure-red light that does not vary in color over the life of the lamp, and because they are small, they light only a limited area. They are easy to hide from the beach and have a very long life. Green and amber LEDs are marketed but are much less preferred than red.

Neon tubes (*minimally disruptive*).—True neon tubes (not tinted tubes) are a pure-red light source. At present, neon is used almost exclusively for decorative purposes. Neon tubes can be difficult to shield, but their color makes them minimally disruptive. Potential applications include pathway and ground-level lighting.

Transient light sources (flashlights, electric torches, flash photography) (*disruptive characteristics vary*).—This lighting is placed in a separate category because it is generally in use for relatively short time periods. Most of these sources have white incandescent lamps and can be expected to affect sea turtles as the incandescent sources above do. Transient sources are well-known disruptors of sea-finding behavior in hatchlings and adults, but researchers are less certain about how transient sources may affect nesting turtles or those emerging from the ocean to nest. Many workers in the field believe that flashlights and flashes from cameras can turn emerging turtles back to the sea and alter the behavior of nesting turtles. Until additional evidence suggests otherwise, transient light sources should be used sparingly on sea turtle nesting beaches. If handheld lighting is to be used, deep-red filters should be fastened over the lens of the source. Red light appears much brighter to humans than it does to sea turtles and does not degrade the night vision of people using it. People using red light are able to acclimate to the dark, and most are surprised by how well they can see by starlight and moonlight alone.

APPENDIX E

Diagrams of common lighting fixtures showing mounting position, light distribution, and overall suitability for use near sea turtle nesting beaches. For purposes of recommending suitable mounting distances from nesting beaches, the crest of the primary dune is considered to be the landward limit of the beach. Fixtures are assessed for their suitability in minimizing direct and indirect lighting of the beach. For all fixtures, glowing portions of luminaires (including reflectors and globes) should not be visible from the nesting beach.

WALL-MOUNTED AREA LIGHTING

MOUNTING SUITABILITY:

Poor. Very poor when mounted on upper stories.

DIRECTIONAL SUITABILITY:

Poor.

OVERALL SUITABILITY:

Poor. Not suitable for the beach sides of buildings.

WALL-MOUNTED AREA LIGHTING, "WALL PAK"

MOUNTING SUITABILITY:

Poor. Very poor when mounted on upper stories.

DIRECTIONAL SUITABILITY:

Poor.

OVERALL SUITABILITY:

Poor. Not suitable for the beach sides of buildings.

DECORATIVE CUBE LIGHT

MOUNTING SUITABILITY:

Fair if mounted at heights lower than 2 m. Poor if mounted higher.

DIRECTIONAL SUITABILITY:

Very poor.

OVERALL SUITABILITY:

Very poor. This fixture is difficult to shield and should not be used near nesting beaches.

POLE-MOUNTED FLOODLIGHTING WITH FULL VISOR

MOUNTING SUITABILITY:

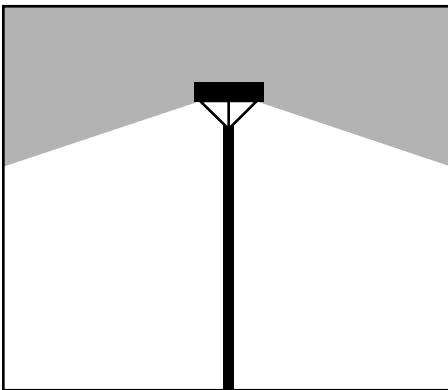

Good if directed downward and away from the beach.

DIRECTIONAL SUITABILITY:

Good.

OVERALL SUITABILITY:

Good if directed downward and away from the nesting beach and if light does not illuminate objects visible from the beach.

POLE-TOP-MOUNTED CUTOFF LIGHTING, "SHOEBOX" FIXTURE

MOUNTING SUITABILITY:

Good to poor, depending on mounting height. Mounting height should be no more than 5 m within 100 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Fair to good, as determined by reflectors.

OVERALL SUITABILITY:

Fair to good when mounting heights are low.

DECORATIVE GLOBE LIGHT

MOUNTING SUITABILITY:

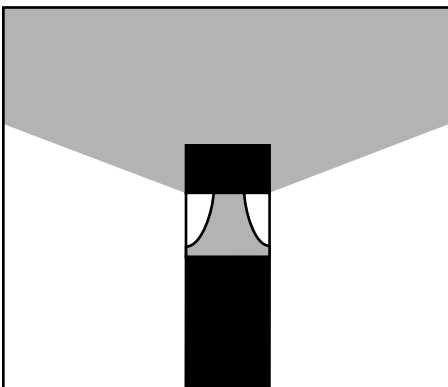

Fair if mounted at heights lower than 2 m. Poor if mounted higher.

DIRECTIONAL SUITABILITY:

Very poor.

OVERALL SUITABILITY:

Very poor. This fixture is difficult to shield and should not be used near nesting beaches.

LIGHTING BOLLARD WITH HIDDEN LAMP

MOUNTING SUITABILITY:

Good if mounting height is near 1 m.

DIRECTIONAL SUITABILITY:

Poor to fair.

OVERALL SUITABILITY:

Fair. Good if additional shields on the beach side of the fixture are used.

LOW-LEVEL “MUSHROOM” LIGHTING

MOUNTING SUITABILITY:

Good if mounted at foot level.

DIRECTIONAL SUITABILITY:

Poor.

OVERALL SUITABILITY:

Fair. Good to excellent if used so that vegetation and topography block its light from the beach.

LOW-LEVEL “TIER” LIGHTING

MOUNTING SUITABILITY:

Good if mounted at foot level.

DIRECTIONAL SUITABILITY:

Poor but can be good if the fixture has louvers that eliminate lateral light.

OVERALL SUITABILITY:

Fair. Good to excellent if used so that vegetation and topography block its light from the beach.

LIGHTING BOLLARD WITH LOUVERS

MOUNTING SUITABILITY:

Good if mounting height is near 1 m.

DIRECTIONAL SUITABILITY:

Good.

OVERALL SUITABILITY:

Good.

GROUND-MOUNTED FLOODLIGHTING

MOUNTING SUITABILITY:

Poor, because of its upward aim.

DIRECTIONAL SUITABILITY:

Fair to good.

OVERALL SUITABILITY:

Fair to poor if directed away from the beach. Very poor if directed toward the beach.

POLE-MOUNTED FLOODLIGHTING

MOUNTING SUITABILITY:

Fair if directed downward and away from the beach.

DIRECTIONAL SUITABILITY:

Fair to good.

OVERALL SUITABILITY:

Fair to good if aimed downward and directly away from the nesting beach and if light does not illuminate objects visible from the beach. Otherwise, poor to very poor.

ARM-MOUNTED AREA LIGHTING, "OPEN-BOTTOM" OR "BARN LIGHT" FIXTURE

MOUNTING SUITABILITY:

Poor to very poor, depending upon mounting height. Should not be mounted higher than 5 m within 150 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Poor if unshielded. Fair if shielded.

OVERALL SUITABILITY:

Poor.

ARM-MOUNTED AREA LIGHTING, DECORATIVE "PENDANT" FIXTURE

MOUNTING SUITABILITY:

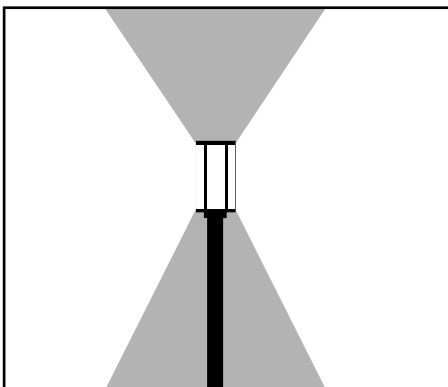

Poor to very poor, depending upon mounting height. Should not be mounted higher than 5 m within 150 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Poor. Difficult to shield properly.

OVERALL SUITABILITY:

Poor.

DECORATIVE "CARRIAGE" LIGHTING

MOUNTING SUITABILITY:

Fair if mounted at heights lower than 2 m. Poor if mounted higher.

DIRECTIONAL SUITABILITY:

Very poor. Fair if properly shielded.

OVERALL SUITABILITY:

Poor.

ARM-MOUNTED CUTOFF LIGHTING, "SHOEBOX" FIXTURE

MOUNTING SUITABILITY:

Good to poor, depending on mounting height. Mounting height should be no more than 5 m within 100 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Fair to good, as determined by reflectors.

OVERALL SUITABILITY:

Fair to good when mounting heights are low and fixtures are aimed directly downward.

ARM-MOUNTED AREA LIGHTING, "COBRAHEAD" FIXTURE

MOUNTING SUITABILITY:

Poor to very poor, depending on mounting height. Mounting height should be no more than 5 m within 150 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Poor. Difficult to shield properly.

OVERALL SUITABILITY:

Poor.

ARM-MOUNTED AREA LIGHTING, "FLAT-FACE" CUTOFF FIXTURE

MOUNTING SUITABILITY:

Good to poor, depending on pole height. Mounting height should be no more than 5 m within 100 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Fair to good, as determined by reflectors.

OVERALL SUITABILITY:

Fair to good when mounting heights are low.

SIGN LIGHTING, BOTTOM-UP STYLE

MOUNTING SUITABILITY:

Poor, because of its potential for producing uplight scatter.

DIRECTIONAL SUITABILITY:

Poor to good.

OVERALL SUITABILITY:

Poor. Signs near nesting beaches should be lighted from the top down. In no case should lighted signs be visible from the beach.

SIGN LIGHTING, TOP-DOWN STYLE

MOUNTING SUITABILITY:

Good.

DIRECTIONAL SUITABILITY:

Poor to good.

OVERALL SUITABILITY:

Generally good if the sign is not visible from the beach and if the lighting is well aimed.

ARM-MOUNTED AREA LIGHTING, FIXTURES WITH REFRACTING GLOBES OR CONVEX LENSES

MOUNTING SUITABILITY:

Poor to very poor, depending upon mounting height. Mounting height should be no more than 5 m within 150 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Poor. Fair to good if shielded properly.

OVERALL SUITABILITY:

Poor.

CEILING-MOUNTED AREA LIGHTING, FIXTURES WITH REFRACTING GLOBES OR CONVEX LENSES

MOUNTING SUITABILITY:

Poor if mounted on the beach sides of buildings or on upper stories. Good if shielded from the beach by buildings.

DIRECTIONAL SUITABILITY:

Poor.

OVERALL SUITABILITY:

Poor to fair, depending upon mounting location.

CEILING-RECESSED DOWNLIGHTING WITH BAFFLES TO ELIMINATE LATERAL LIGHT

MOUNTING SUITABILITY:

Good to excellent when mounted in lower-story ceilings and soffits.

DIRECTIONAL SUITABILITY:

Excellent.

OVERALL SUITABILITY:

Good to excellent.

**WALL-MOUNTED AREA LIGHTING,
“JELLY-JAR” PORCH LIGHT FIXTURE**

MOUNTING SUITABILITY:

Poor. Very poor when mounted on upper stories.

DIRECTIONAL SUITABILITY:

Poor.

OVERALL SUITABILITY:

Poor.

LINEAR TUBE LIGHTING

MOUNTING SUITABILITY:

Excellent if mounted at foot level.

DIRECTIONAL SUITABILITY:

Fair to poor, but this lighting is of concern only if mounted high or if large numbers of high-wattage (>3 W) lamps are used.

OVERALL SUITABILITY:

Excellent if low-wattage strips are used sparingly in recessed areas.

LOUVERED STEP LIGHTING

MOUNTING SUITABILITY:

Excellent if mounted at foot level.

DIRECTIONAL SUITABILITY:

Excellent.

OVERALL SUITABILITY:

Excellent.

WALL-MOUNTED DOWNLIGHTING

MOUNTING SUITABILITY:

Good to excellent when mounted on lower-story walls.

DIRECTIONAL SUITABILITY:

Excellent.

OVERALL SUITABILITY:

Good to excellent.

APPENDIX F

Diagrams depicting solutions to two common lighting problems near sea turtle nesting beaches:
balcony or porch lighting and parking-lot lighting.

POOR

Poorly directed balcony lighting can cause problems on sea turtle nesting beaches.

BETTER

Completely shielding fixtures with a sheet of metal flashing can reduce stray light reaching the beach.

BEST

Louvered step lighting is one of the best ways to light balconies that are visible from nesting beaches.

POOR

Poorly directed parking lot lighting can cause problems on sea turtle nesting beaches.

BETTER

Fixtures with 90° cutoff angles can reduce the amount of stray light reaching the beach.

MUCH BETTER

Fully hooded floods can direct light accurately and reduce stray light even more.

BEST

Low-mounted, louvered bollard fixtures are the best way to light parking lots near nesting beaches.

Appendix K

Nest Management Units of NASO Dam Neck Annex

NASO DNA Sea Turtle Nest Management Reference Map (Rev Aug 2015)

Legend

 Installation Boundary Line

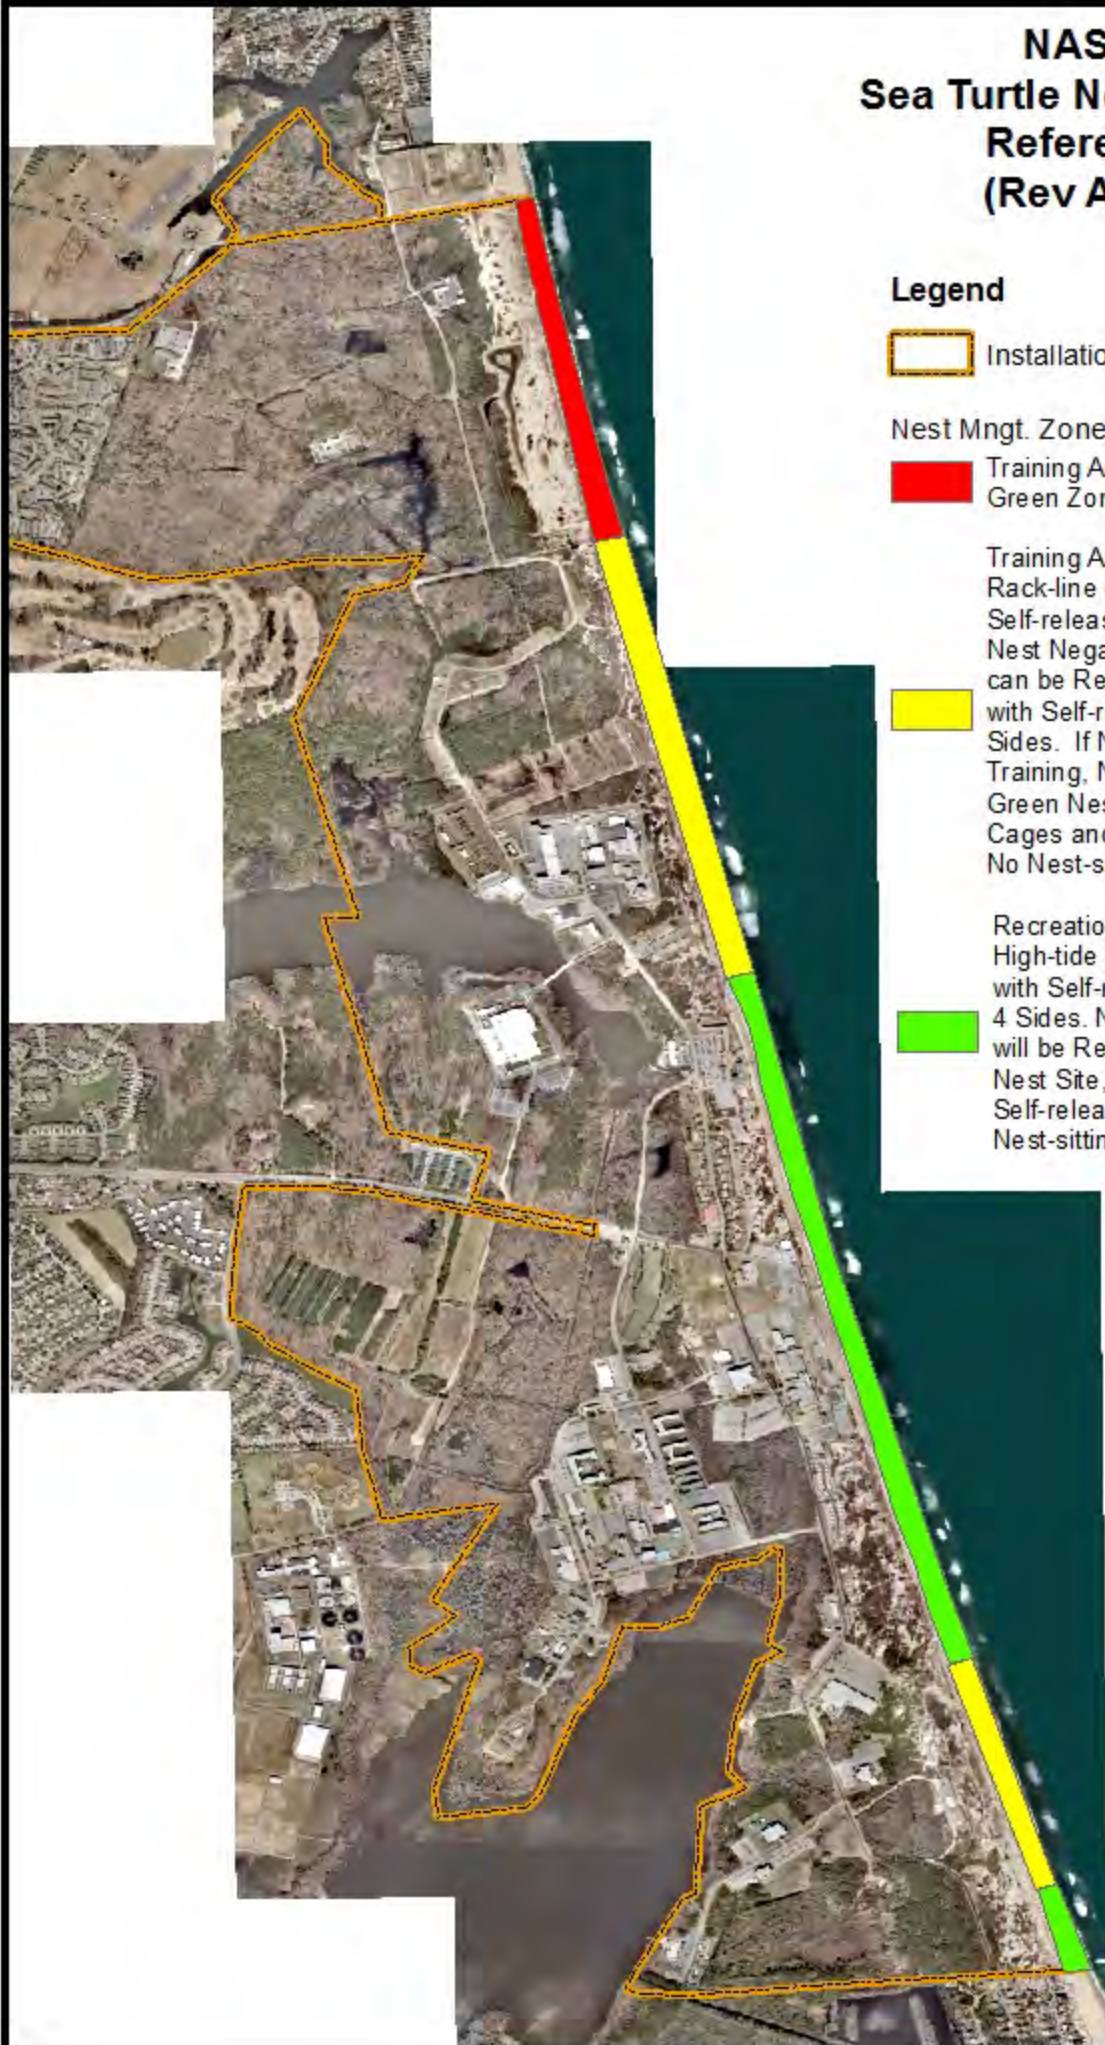

Nest Mngt. Zones

 Training Area. Nests to be Relocated to a Green Zone.

Training Area. Nest Above High-tide Rack-line can be Left in Place with Self-release Cage and Posts on All 4 Sides. Nest Negatively-Inhibiting Training Routes can be Relocated West, Closer to Duneline, with Self-release Cage and Posts on All 4 Sides. If Number of Nests Negatively Inhibit Training, New Nests will be Relocated to Green Nest Mngt. Zones with Self-release Cages and Posts on All 4 Sides. No Nest-sitting.

 Training Area. Nest Above High-tide Rack-line can be Left in Place with Self-release Cage and Posts on All 4 Sides. Nest below High-tide Rack-line will be Relocated Due West of the Original Nest Site, Above the Rack-line with Self-release Cage and Posts on All 4 Sides. Nest-sitting is Authorized.

Recreational Use Area. Nest Above High-tide Rack-line can be Left in Place with Self-release Cage and Posts on All 4 Sides. Nest below High-tide Rack-line will be Relocated Due West of the Original Nest Site, Above the Rack-line with Self-release Cage and Posts on All 4 Sides. Nest-sitting is Authorized.

Appendix L

Project Review SOP

Review each project proposed in the INRMP or by the installation or tenant of the installation (Env. Checklist Reviews, Site Approval Reviews, Site Work Induction Board Project Reviews, Work Permits, etc.) for potential concerns associated with Sea Turtles.

Federally Listed Threatened and Endangered Sea turtles utilize the beaches and nearshore environment of NASO Dam Neck Annex. These species are influenced/impacted by lights utilized at night. During the months of Apr-Sept no Bright Lights should be utilized at night to avoid conflicts with Nesting or hatching Sea Turtles at night. If light utilization is required at night at this facility, lights should be outfitted with devices to minimize eastwardly shine and direct the glow of the light downwards not outward. Lighting should be kept to a minimum and not exceed the current glow/intensity currently seen from the beach/ocean.

A lighting Assessment is to be awarded in FY15 along with a total Sea Turtle Biological Assessment (BA) for the 4 miles of NASO DNA beach front property. A programmatic USFWS Biological Opinion (BO) is anticipated to be received pending submittal of the BA. The lighting assessment will be inserted into Appendix J of this document (Sea Turtle SOP). The BO will be added to Appendix A of this document (Sea Turtle SOP). The information and materials in Appendix J and A will be utilized as appropriate to advise facilities management of existing facility modifications that need to be made and for advising requirements for future projects on the installation to maintain compliance under the endangered species act.

Training missions and recreational beach utilization during breeding season.

All individuals conducting training in the LCAC training area of the installation should receive training on sea turtle and sea turtle crawl identification. If a turtle or crawl is observed, the activity should stop, the Installation Natural Resources Manager (INRM) should be notified immediately via the Command Duty Officer, and the activity should not resume until the INRM has cleared the site for training to continue.

Nesting sea turtle surveys are conducted on all NASO DNA beaches (4 miles) each day during sea turtle nesting season (15 May - 31 Aug annually). Surveys start 1/2 hour before sunrise and typically end (if nothing is found) 1 to 2 hours later. If a sea turtle nest/crawl is found it must be cordoned off and USFWS (until Navy obtains appropriate permits) must come to collect biological data and relocate the nest if conditions dictate that relocation is warranted; otherwise the nest is caged, marked and left on site (and monitored each day until it has hatched).

These surveys allow us to clear the beaches to allow maximum training opportunities within the constraints of the law.

Daily sand smoothing activities (e.g., MWR beach clean-up) should occur immediately after the NASO Environmental Staff has completed their patrol and cleared the beach for daily use. No smoothing activities are authorized from dusk until morning turtle patrols are completed daily from 15 May - 31 Aug, unless prior coordination and authorizations have been made with the CO's designated INRM.

Fires are not authorized on the beach at Night, from May - October.

Outdoor lighting should be kept to a minimum at Night, from May-October. Use of lighting on the beach should be restricted to red-light conditions (e.g., red lenses, or white lights that have been covered with red film/tape), unless there is an emergency.

Department of the Navy. 2016. Lighting surveys for sea turtle nest management, Naval Air Station Oceana – Dam Neck Annex and Virginia Army National Guard Camp Pendleton, Virginia Beach, Virginia. Draft report. Prepared for Naval Facilities Engineering Command, Mid-Atlantic Region by GMI-AECOM Joint Venture; Versar, Inc.; Azura Consulting, LLC; and Virginia Aquarium & Marine Science Center Foundation.

EXECUTIVE SUMMARY

Artificial night lighting is known to negatively impact many wildlife species and can lead to changes in orientation, disorientation, and attraction or repulsion from illuminated areas. Light pollution along shorelines is particularly detrimental to sea turtles which almost exclusively nest and hatch at night. Artificial illumination on or near nesting beaches can deter adult females from emerging from the water, affect nest site selection, disrupt the seaward orientation of adult females after nesting, and disrupt the seaward orientation of hatchlings after emergence from the nest.

Five federally threatened or endangered sea turtle species are known to occur in the Chesapeake Bay and along the Virginia coastline: the leatherback (*Dermochelys coriacea*), loggerhead (*Caretta caretta*), Kemp's ridley (*Lepidochelys kempii*), green (*Chelonia mydas*), and hawksbill (*Eretmochelys imbricata*) turtles. Sea turtles occur in Virginia waters from May through October or early November although a few strandings have been recorded as early as April and as late as December. Nesting occurs during the spring and summer months, particularly June, July, and August. Loggerhead and Kemp's ridley turtles have nested on Naval Air Station Oceana – Dam Neck Annex (NASO-DNA). One green turtle nest has been recorded on Sandbridge Beach just south of NASO-DNA. No sea turtle nests have been documented on Virginia Army National Guard – Camp Pendleton (VAARNG-CP).

Daytime and nighttime surveys were conducted on NASO-DNA and VAARNG-CP from April through October 2015 to identify artificial lighting sources that emit light visible from the beaches of these installations. Surveys were conducted along the beach face and behind the rear dunes to locate direct light sources (e.g., lamps, globes, reflectors) and indirect lights that reflect off buildings and other objects.

A total of 236 direct, indirect, and other light sources expected to have an impact if turned on were visible from the beaches on NASO-DNA, while 3 sources were visible from VAARNG-CP beaches. Expected light sources are those that were not on at the time of surveys, but it was determined to be reasonably certain that when on they would produce either a direct or indirect impact. These were classified as “Direct-if on” if the fixtures could be seen from the beach or “Indirect-if on” if factors such as their height and proximity to the beach, they were located near similar light sources that were classified as indirect, or it was apparent that they would likely illuminate structures that were visible from the beach. An additional 36 light sources were identified on NASO-DNA that were relatively close to beaches but their specific impact could not be determined. These lights were not on during surveys and were either located in areas that had no other lights turned on to use as a frame of reference or the light intensity was not known in order to determine if they would produce enough light to illuminate adjacent building walls or other objects that are visible over the dunes.

The majority of light sources identified at NASO-DNA were elevated fixtures such as street, parking lot, and stadium lights around sports fields that rise above the dunes and scatter light over a wide area. Other sources included wall-mounted area and flood lights located on upper levels of buildings and areas of concentrated light sources that created localized sky glow. Common lamp types included high-pressure sodium lamps and white broad-spectrum lamps; both lamp types are known to be highly or extremely disruptive to sea turtles. The lights identified at VAARNG-CP included two lights that indirectly illuminated the upper wall and roof peak of a building on the leased Croatan Beach property and a solar flood lamp that illuminated a United States flag mounted on a fence post on the northern base boundary.

Based on the results of the lighting surveys, it is recommended that NASO-DNA and VAARNG-CP develop and implement comprehensive management strategies to minimize the potential impacts of artificial light sources on sea turtles at each installation. An effective strategy would include protocols for eliminating unnecessary lights, minimizing lighting from outdoor and indoor sources, using alternative long-wavelength light sources, using light screens, and enhancing dune profiles. Both installations should also consider the recommendations presented in this report for future additions or replacement of lighting fixtures near the beach.

INTRODUCTION

The presence of artificial night lighting is known to negatively impact many wildlife species. Ecological light pollution can lead to changes in orientation, disorientation, and attraction or repulsion from an area having an altered light environment (Longcore and Rich 2004). These changes may affect the foraging, reproduction, migration, and communication behaviors of individual species, and the cumulative behavioral changes caused by artificial night lighting on competition and predation may disrupt entire ecosystems (Longcore and Rich 2004). Coastal light pollution is particularly detrimental to sea turtles which almost exclusively nest and hatch at night (Witherington and Martin 2003), although Kemp's ridleys (*Lepidochelys kempii*) and some populations of hawksbills (*Eretmochelys imbricata*) nesting during daylight hours (DON 2015, Plotkin 2007, Brooke and Garnett 1983).

Adult female turtles exhibit a general behavioral pattern during the nesting process. They emerge from the surf zone and typically move to a location between the high-tide line and the primary dune (Witherington and Martin 2003). The female turtle prepares the nest site by digging away the surface sand to create a "body pit" and then digs an "egg cavity" within the body pit. She deposits eggs within the egg cavity and covers the eggs with sand. After the eggs have been buried, the turtle will camouflage the nest by casting sand with her front flippers over the buried nest. After the nest has been completed, the female turtle typically returns to the sea. These activities and the decisions of timing, duration, and accuracy of the behaviors are affected greatly by external stimuli, such as human activity and visible artificial light (Witherington and Martin 2003). Artificial illumination on or near nesting beaches can affect nesting females and hatchlings. After emerging from the nests, sea turtle hatchlings move rapidly toward the sea to avoid predation; they seem to use mainly visual cues and are attracted to the brightest area within

their field of view and move away from elevated dark silhouettes (Salmon et al. 1992). Artificial lights on nesting beaches can deter adult females from emerging from the water, affect nest site selection, disrupt the seaward orientation of adult females after nesting, and disrupt the seaward orientation of hatchlings after emergence from the nest (Witherington and Bjorndal 1991, Witherington 1992, Witherington and Martin 2003, Tuxbury and Salmon 2005, Brei et al. 2014, Rivas et al. 2015).

Five sea turtle species are known to occur in the Chesapeake Bay and along the Virginia coastline: the leatherback (*Dermochelys coriacea*), loggerhead (*Caretta caretta*), Kemp's ridley, green (*Chelonia mydas*), and hawksbill turtles. All sea turtles are designated as either threatened or endangered under the Endangered Species Act. Sea turtles occur in Virginia waters from May through October or early November although a few strandings have been recorded as early as April and as late as December (Byles 1988, Keinath 1993, Coles 1999). Most of the sea turtles found in the Bay are either immature loggerhead or Kemp's ridley turtles utilizing the bay as a seasonal foraging ground (Lutcavage and Musick 1985, Musick 1988). The Bay is considered an important developmental habitat for juvenile loggerhead turtles (Musick and Limpus 1997, Mansfield et al. 2009). Leatherback and green turtles occur less frequently, and hawksbill turtles are considered extremely rare in Virginia waters. Reports of hawksbills in Virginia include three strandings in the Bay and one along the coast of Virginia north of the mouth of the Bay (Keinath et al. 1991, VIMS 2008, Barco and Swingle 2014).

Sea turtle nesting habitat in Virginia includes beaches along the Atlantic side of the Eastern Shore and beaches south of the Chesapeake Bay mouth from the Virginia Beach oceanfront to the Virginia/North Carolina border. Nesting occurs during the spring and summer months, particularly June, July, and August (Virginia Department of Game and Inland Fisheries [VDGIF]

data). The loggerhead is the only turtle species that nests regularly on Virginia's beaches; approximately 5 to 15 nests are reported annually along Virginia's ocean-facing beaches (Barco and Swingle 2014). Based on VDGIF nesting data between 2000 and 2014, the dates of the earliest and latest reported loggerhead nest in Virginia were 15 May 2006 and 2 September 2013, respectively. Only two Kemp's ridley nests have been recorded in Virginia: one on Naval Air Station Oceana - Dam Neck Annex (NASO-DNA) in June 2012 and one on False Cape State Park near the North Carolina/Virginia border in July 2014 (Boettcher 2015). One green turtle nest was recorded in Virginia in August 2005 (Boettcher 2015).

Loggerhead and Kemp's ridley turtles have been documented to nest at NASO-DNA. Records maintained by the VDGIF, United States Fish and Wildlife Service, and the Navy include two loggerhead nests, one Kemp's ridley nest, and five loggerhead false crawls on NASO-DNA between 1970 and 2014. The loggerhead nests were recorded in 1992 and 2002; the false crawls were in 2002 and 2014 (VDGIF data; Navy data). The Kemp's ridley nest was documented in June 2012 (VDGIF data) and was the first successful hatching of this species in Virginia (DON 2015). One green turtle nest was recorded on Sandbridge Beach just south of NASO-DNA in August 2005 and was subsequently moved to Back Bay National Wildlife Refuge (VDGIF data). One loggerhead nest was documented at Virginia Army National Guard – Camp Pendleton (VAARNG-CP) in August 2015 (R. Boettcher, VDGIF, unpublished data). This is the first confirmed sea turtle nest to be documented on VAARNG-CP.

Because artificial illumination on or near the beaches of NASO-DNA and VAARNG-CP can affect nesting females and hatchlings, lighting surveys were conducted to identify artificial lighting sources that emit light visible from the beaches of these installations. Potentially problematic lighting may include direct light sources (e.g., lamps, globes, reflectors) that are

visible by surveyors and indirect lights that reflect off buildings and are visible from the beach. Light sources that illuminate mist or low clouds may also interfere with sea turtle nesting and hatching behavior (Witherington and Martin 2003).

NAVAL AIR STATION OCEANA - DAM NECK ANNEX SURVEY AREA

NASO-DNA is located in the tidewater area of southeastern Virginia in the southeastern portion of the City of Virginia Beach (Figure 1). This installation is situated along the Atlantic Ocean and has approximately 6.4 kilometers (km; 4.0 continuous miles [mi]) of primary and secondary coastal dune habitat. (DON 2015). The beaches and dunes on NASO-DNA encompass about 77 hectares (164 acres) of dune protection area consisting of undeveloped primary and secondary dunes, natural communities, potential habitat for the federally listed piping plover and red knot, and habitat for several state-listed rare species. The northern and southern shorelines of NASO-DNA and facilities that are adjacent to the shoreline and could be potential sources of light are shown on Figures 2 and 3, respectively.

METHODS

Desktop Analysis

A desktop analysis was performed using Navy-provided geographic information system (GIS) layers and aerial imagery of base boundaries, the coastline, and facilities (e.g., buildings, roads, parking lots) and utilities that may generate either direct or indirect light that is visible from the beach. A quarter-mile buffer from the shoreline inland was overlaid on the aerial images so that surveyors could focus on sources that had the highest potential to be a source of direct or indirect

Figure 1. Geographic location of Naval Air Station Oceana - Dam Neck Annex

Figure 2. Naval Air Station Oceana - Dam Neck Annex Survey Area (north)

Figure 3. Naval Air Station Oceana - Dam Neck Annex Survey Area (south)

light. Based on this desktop analysis, both areas of interest for the field surveys and light sources outside of these areas were identified. Surveyors used the aerial images to orient themselves on the beach and identify the potential light sources observed from the beach.

Initial Daytime Surveys

Daytime surveys were conducted along the beach face and behind the rear dunes. These surveys allowed the surveyors to familiarize themselves with the areas to be surveyed at night and identify the likely sources of light to be investigated at night. During the beach surveys, surveyors walked just above the swash zone¹ looking inland to identify potential light sources (e.g., street lights, security lights, buildings) and noted their findings for follow up during surveys behind the dunes. The region behind the dunes was surveyed by evaluating the facilities and utilities identified during the beach surveys and the desktop analysis. The primary focus were those facilities and utilities surveyors identified during the beach survey, those closest to the beach, as well as those thought to have the highest potential to produce direct or indirect light visible from the beach. All potential sources of light were documented by noting the building number and/or its global positioning system (GPS) location and type of fixture. GPS coordinates were recorded using a Trimble GeoXT™ handheld (Datum WGS 1894; Latitude/longitude; sub-meter accuracy in real time; 50 centimeter accuracy post processed; Position Dilution of Precision [PDOP] – 8 resulting in a lowest acceptable distance error of 10 meters). Surveyors obtained a reference photograph for each fixture type and recorded the photograph number to document potential light sources. A predicted impact was assigned to each light (i.e., direct or indirect) if a reasonable certainty existed to potentially impact sea turtles. Other potential light

¹ Swash zone is the thin layer of water that remains of a wave as it rolls up the beach and loses energy.

sources were identified by location that were less likely to impact sea turtles for verification during nighttime surveys.

Daytime surveys at NASO-DNA occurred on 1 and 3 April 2015 between the hours of 0800 and 1600. Surveys were divided into several separate events due to the requirement for escorts into some locations, the number and locations of usable beach access points, and unplanned interruptions. Surveys on 1 April 2015 began at the north end of the base from the north firing range guard shack access (see Figure 2). Surveyors walked south until reaching the central firing range guard shack. Because the southern Naval Special Warfare Development Group (NSWDG) firing range was being utilized, surveyors returned north and continued up the beach until reaching the NASO-DNA and VAARNG-CP installation boundaries. At this point, they returned to the beach access at the north firing range guard shack. Upon completion of this portion of the beach survey, the facilities and utilities within the NSWDG compound were assessed, particularly the perimeter security lighting and facilities visible or adjacent to the beach (i.e., Buildings 309, 310, 311, 313, 350, 368, 382, TPS9, and TPS10) (Appendix A, Maps 2 and 3).

The second portion of the beach survey on 1 April 2015 started at the beach access point located at Building 187. Surveyors walked northwards to the south firing range guard shack (see Figure 2). Since the range was still active, they turned south and continued the survey to the NASO-DNA southern boundary and then turned north and returned to the beach access at Building 187. The surveys behind the dunes started at Building 187 and then moved to Buildings 225 and 241 since these facilities are visible from the beach. The parking lot lighting for these facilities was also assessed due to the number of lighting fixtures and their proximity to the beach. After surveying these locations, the picnic pavilion just north of Building 187 and the pavilion near Building 187's parking lot (Building 1738) were assessed. The survey continued south through

the Morale, Welfare, and Recreation rental cottages located adjacent to the dunes (between Buildings 187 and 241). The last areas evaluated on 1 April were the ball fields located on either side of Regulus Avenue near Building 180.

The daytime beach surveys continued at NASO-DNA on 3 April 2015 was conducted between the central and south firing range guard shacks that was not assessed on 1 April. They returned to the NSWDC compound to assess the facilities and utilities identified during the beach survey and to obtain additional location data and pictures for facilities and utilities. The new facilities under construction south of the compound were also assessed; these included Buildings 370, 383, 384, and 385. The aprons and/or parking areas for these new facilities were also assessed. Upon completion of the NSWDC compound, the surveyors assessed all of Viking Avenue, Buildings 102 and 127 and their parking areas, and Buildings 420 and 430 and their parking areas. Buildings 475 and 404 at the south end of the base were also assessed. They completed the base survey by evaluating the Marine Air Control Squadron (MACS) 24 compound at the north end of NASO-DNA and focusing on the large radar dome visible from the beach.

Nighttime Surveys

The intent of the nighttime surveys was to identify the light sources that are visible on NASO-DNA beaches with the potential to impact sea turtles and classify them as either direct or indirect light sources. Four nighttime surveys were conducted: one during the pre-nesting season, two during nesting season, and one at the end of nesting season and the beginning of hatching. Surveys occurred within 2 to 14 days after a full moon and started after 2100 hours Eastern Standard Time. The specific dates of each survey are provided below.

The same basic procedures described for daytime procedures were followed for nighttime surveys although specific routes changed due to access schedules for different facilities.

Surveyors walked just above the swash line looking inland to identify sources and impact of lights visible from the beach. Afterwards, the surveys continued inland. During inland surveys, surveyors located the sources identified during the beach survey and characterized them by the observed impact, type of fixture, type of light, and specific location of the light source. Where possible, coordinates for all light sources were collected using a Trimble GeoXT™ handheld (Datum WGS 1894; Latitude/longitude; sub-meter accuracy in real time; 50 centimeter accuracy post processed; PDOP – 8 resulting in a lowest acceptable distance error of 10 meters). In cases where it was not possible to collect GPS coordinates (e.g., location not accessible, location blocked satellite acquisition), surveyors either used the map on the GPS to estimate the location of the light and document coordinates or marked the light source locations on survey maps and documented them in data collection sheets.

Pre-nesting Season Surveys

Pre-nesting nighttime surveys at NASO-DNA occurred on 14 and 15 April 2015 between 2100 and 0400 hours. The nighttime survey on 14 April 2015 began at the Building 187 beach access. Surveyors walked north until reaching the south firing range guard shack. Since beach replenishment activities were taking place at this time, they were restricted to walking directly in front of the foredune to avoid equipment for approximately 1,000 meters (m) (3,208 feet [ft]) to just north of Building 225. At this point, they turned south and surveyed to the NASO-DNA southern boundary and then turned north and returned to the beach access at Building 187. The surveys behind the dunes started at Building 187 and the parking lot and moved north to Viking Avenue and Building 102 and 127 and their parking areas. They completed the southern portion of the base at Building 475; assessed Buildings 241, 225, and 226 and their parking areas; and finished this survey event by collecting data for the ball field lights.

The nighttime survey on 15 April 2015 began at the MACS-24 compound where the radar dome visible from the beach was assessed. Afterwards, some additional information on light sources at Building 187 was obtained. The NSWDG escort met the surveyors at midnight to survey the beach area adjacent to the NSWDG compound between the north and the south firing range guard shacks (see Figure 2) and collect data for the NSWDG facilities and utilities that were identified as direct and indirect lighting. They focused on perimeter security lighting and beach-facing light sources. The new facilities being constructed in the NSWDG compound were also assessed, and although the majority of the lights of these facilities were not on, data for these potential light sources were collected.

Nesting Season Surveys

Two nesting season surveys were conducted (one on 5 June 2015 and the other on 12 June 2015) to document any changes or additions to light sources, particularly as a result of new construction in the NSWDG compound and from the change in beach length from the beach replenishment that was completed in April. Maps generated from the pre-nesting nighttime survey data were used to identify new and changed impacts. Surveys started at 2100 hours on both nights and ended at 0200 and 0030 hours the mornings of 6 and 13 June, respectively. Surveys on both nights started on the beach at the north firing range guard shack beach access (see Figure 2). Surveyors walked south, ending at the south firing range guard shack and returned to the access point. Afterwards, the surveyors entered the NSWDG compound to assess the new or changed light sources identified during the beach survey and documented the observed impact, type of fixture, type of light, and specific location of the light source.

The southern portion of the beach was accessed from the Building 187 beach access. Surveyors walked south to the southern installation boundary, returned north ending at the south firing

range guard shack. The portion of the beach north of NSWWDG was accessed from the VAARNG-CP beach access at the end of Range Road. Surveyors walked south to the north firing range guard shack and returned to the VAARNG-CP beach. After completing the beach surveys, surveyors located and documented any new or changed light sources identified from the beach surveys.

Post-nesting/Hatching Season Surveys

Due to limited access, two surveys were required to complete the post-nesting/hatching season survey for all of the NASO-DNA beaches. The majority of these beach survey was accomplished on 11 September 2015. This survey started at 2100 hours and ended at 0200 hours. Due to escort scheduling necessities, this survey started in the MACS-24 compound (Building 921). Data from previous surveys were verified to ensure nothing had changed from previous surveys.

After completing MACS-24, the surveyors began the beach survey at NSWWDG at 2300 hours, accessing the beach at the north firing range guard shack (see Figure 2). The same route was taken as before, walking south to the south firing range guard shack and returning to the access point. After completing the NSWWDG beach, surveyors assessed new or changed sources identified during beach surveys and documented the observed impact, type of fixture, type of light, and specific location of the light source.

The southern portion of the beach was also surveyed on 11 September 2015. As with past surveys, starting at the Building 187 beach access, walking south to the southern installation boundary, returning north and ending at the south firing range guard shack.

The northern portion of NASO-DNA beach could not be accessed on 11 September and was completed on 10 October 2015. Access to this portion of the beach was gained from the VAARNG-CP beach access. As with past surveys, surveyors walked south to the north firing

range guard shack and returned to the VAARNG-CP beach. Inland surveys included locating and documenting light sources that had changed or were not seen during previous surveys.

RESULTS

The results presented here are the culmination of all surveys. The number of light sources identified varied between each survey event. This was due to factors such as the beach replenishment that added several hundred feet new beach and altered the perspective of surveyors, the addition of several new light sources from the construction of new facilities in the NSWDC compound, the variation of lights that were lit at the time of surveys, and weather events (e.g., rain, mist, and fog) that may have either obscured or enhanced light sources. Of the data collected using the Trimble GeoXT™ handheld, 84 percent of all points were accurate to within less than 1 meter, 98 percent were accurate to within less than 5 meters, and 100 percent were accurate to within less than 9 meters.

A total of 236 direct, indirect, and other light sources expected to have an impact if turned on were identified during surveys on NASO-DNA (Table 1). Most (101) of the artificial lights visible from the beach were direct light sources. An additional 54 light sources identified as indirect either constituted a glow that could be seen above the dunes or illuminated structures, such as building walls, that were visible from the beach. A total of 81 light sources were categorized as either “Direct-if on” or “Indirect-if on”. Those classified as “Direct-if on” were not on at the time of nighttime surveys, but the fixtures could be seen from the beach. Those classified as “Indirect-if on” were not on during the nighttime surveys and were classified due to factors such as: their height and proximity to the beach, they were located near similar light sources that were classified as indirect, or it was apparent that they would likely illuminate structures that were visible from the beach. The cumulative data for the light sources identified

on NASO-DNA with a direct, indirect, or expected impact if on are included in Appendix B, Table B-1.

An additional 36 light sources were identified on NASO-DNA that were not on at the time of surveys and whose potential impact could not be determined (Appendix B, Table B-2). These lights were relatively close to the beach but were either located in areas that had no other lights turned on to use as a frame of reference or the light intensity was not known in order to determine if they would produce enough light to illuminate adjacent building walls or other objects that are visible over the dunes.

Overall, the arm-mounted area – cobrahead fixture varieties (Figure 4) and arm-mounted cutoff – shoebox varieties (Figure 5) often used for street and parking illumination were the most numerous light source fixtures (Table 1). Beach-facing windows (39) were identified most often as a source of direct light; this was followed by the arm-mounted cutoff – shoebox (18) and wall-mounted area “wall pak” lighting (14) (Figures 5 and 6, respectively). In addition, the ball field lighting (Figure 7) would contribute a significant amount of direct lighting when in use.

Reference photographs of the light fixtures identified at NASO-DNA can be found in Appendix C.

Figure 7. The pole-mounted stadium lighting arrays identified at Naval Air Station Oceana – Dam Neck Annex.

The most common lamp type identified as producing light visible from the beach was high-pressure sodium (HPS) lamps, with 39 direct and 37 indirect sources identified (Table 2). These lamps produce a distinctive gold-peach colored light (Figure 8). White, broad-spectrum lights were the second most identified lamp type; these typically consisted of metal-halide, fluorescent, incandescent, and light-emitting diode (LED) lamps. Although not in use at the time of the surveys, 13 of the 16 ball field lights were classified as “likely to be white, broad-spectrum lamps” because 3 of the 16 ball field light arrays were identified as having metal-halide lamps in Navy-provided utility data and the older stadium lighting typically use metal-halide lamps (General Electric n.d.). In addition, there were 41 sources of interior lights documented, 38 of which are located at Building 241.

Eighty-one light sources that were not on at the time of surveys were identified as expected to have either a “Direct – if on” or “Indirect – if on” (Table 2). The lamp types of 27 could be

determined from Navy-supplied data or the fixture was positioned so that the lamp could be seen and identified. The remaining 54 lamp-types that were not on but expected to have an impact could not be determined.

Table 2. Observed or expected impact and observed lamp types at Naval Air Station Oceana – Dam Neck Annex

Overall, the majority of observed and potential light sources identified at NASO-DNA were within the NSWDC compound and also included the new NSWDC facilities currently being constructed (Table 3; Appendix A, Maps 2 and 3). Perimeter security and parking lighting composed most of the light sources identified within the NSWDC compound area. The NSWDC compound also contained the greatest number of indirect light sources. Building 241 had the

second greatest number of light sources due to the number of windows that are visible above the dunes, followed by Building 187 (Shifting Sands Club) and Building 127 and their surrounding parking areas (Figure 9; Appendix A, Maps 3 and 4). When in use, the stadium lights could add up to 16 sources of direct light. Due to their proximity to the dunes and height of the lights, Buildings 187, 127, and 465A had light sources that could be seen over the greatest distance at the time of the surveys (Figure 10). An additional table that details the type of fixture and lamp type and its observed or expected impacts by location is contained in Appendix D.

DISCUSSION

Light pollution on or near beaches can reduce the reproductive success of sea turtles by disrupting the behaviors of nesting females and hatchlings. Artificial lights on nesting beaches can deter adult females from emerging from the water, affect nest site selection, disrupt the seaward orientation of adult females after nesting, and disrupt the seaward orientation of

hatchlings after emergence from the nest (Witherington and Bjorndal 1991, Witherington 1992, Witherington and Martin 2003, Tuxbury and Salmon 2005, Brei et al. 2014, Rivas et al. 2015).

During the surveys, surveyors identified a variety of lighting sources that contribute to the direct and indirect artificial light visible or that would likely be visible from NASO-DNA beaches. The majority of these sources were on elevated fixtures such as street, parking lot, and stadium lighting (see Table 1). These sources rise above the dunes and scatter light over a wide area. Other sources included wall-mounted area and flood lights located on upper levels of buildings and areas of concentrated light sources that created localized sky glow.

The best method of solving light pollution is to manage the light rather than eliminating it (Witherington and Martin 2003). The principal sources of light that cause problems for sea turtles is that which “spills over” onto the beach from the areas that are intended to be illuminated. Managing this spillage can resolve many of the impacts identified during the surveys.

There is no set criteria for the acceptable level of light intensity to mitigate potential impacts to turtles; factors such as the level of natural light and the availability of other visual clues such as dunes and vegetation vary widely, and the amount of artificial lighting that may interfere with nesting or disorient hatchlings differs greatly from one location to the next (Witherington and Martin 2003). The most effective mitigation method is to minimize the amount of artificial light as much as possible using the best available technology. NASO-DNA should undertake a comprehensive management strategy to minimize the potential impacts of the 236 direct, indirect, and other light sources expected to have an impact on sea turtles identified at this installation. An effective strategy for managing light includes eliminating unnecessary lights,

minimizing lighting from outdoor and indoor sources, using alternative long-wavelength light sources, using light screens, and enhancing dune profiles (Witherington and Martin 2003).

General Recommendations

The general recommendations listed below should be considered individually or together based on the need, type, intensity, and orientation of the light source without compromising safety and security. Some of the changes discussed below can reduce the impact to beaches and are illustrated on Figure 11. These measures should also be considered for any future construction of facilities near the beach.

Figure 11. Examples illustrating the results of strategies to reduce and change light sources to minimize impacts to sea turtles.

Eliminating Unnecessary Lights

All of the direct, indirect, and potential light sources identified during these surveys should be evaluated based on their effectiveness and the lighting needs of this installation. Reducing the

use of lights is the easiest and least expensive method to reduce the amount of light visible from the beach. This may be an option in some areas of NASO-DNA although safety and security requiring the use of artificial lighting must remain a priority in certain areas of the base. Where possible, unnecessary light sources should be eliminated. Unnecessary light sources may include those that illuminate areas which do not require security and areas that are vacant and do not have foot traffic, as well as decorative light sources and those light sources that provide more than adequate lighting for a particular function (Witherington and Martin 2003).

Minimizing Lighting from Outdoor Sources

The simplest method to reduce the impact of artificial lighting on sea turtles is to prevent light from reaching the beach although this is not always a practical solution. Fixtures that are directly visible from the beach can be realigned, modified, repositioned, or shielded to keep light from reaching the beach (Florida Power & Light Company 1998). The following is a list of recommended solutions compiled from the Florida Fish and Wildlife Conservation Commission (2011), Witherington and Martin (2003), and Florida Power & Light (1998) to minimize the amount of light reaching the beach from existing light sources:

1. Turn off lights that are not essential for safety or security. This is the simplest and less expensive method to minimize light trespass onto beach areas. Lighting only needs to be turned off during the nesting and hatching season.
2. Reduce the wattage of the lamps used to the lowest level necessary to fulfill the purpose for the light and remain within the manufacture's guidelines. This will reduce the amount of light emitted and, subsequently, reaching the beach.
3. Reposition luminaires to better focus the light to where it is most needed.

4. Substitute high-watt, multidirectional luminaires with low-watt, directional luminaires that are directed away from the beach.
5. Install shields on light sources that are sufficiently opaque, large, and positioned to prevent light from reaching the beach.
6. Recess light sources and position them to direct the light downward and away from the beach.
7. Reduce the height of pole- and arm-mounted luminaires. The lower a light source is mounted, the less area it will illuminate. In addition, lower-mounted luminaires may also be better shielded by dunes, vegetation, and buildings.
8. Take advantage of natural light screens, such as dunes and vegetation, to shield luminaires.
9. Install timers or motion detectors so that the light is illuminated only when it is most needed. These are relatively inexpensive solutions, yet they have some limitations in their use and efficacy. Timers are minimally effective since nesting and hatching can take place throughout the night and should be set to turn off early in the evening. Motion detectors can be a better solution than timers, but they should not be used in high traffic areas visible from the beach and can only be used with incandescent lighting. If used, motion detectors work well with yellow bug-light bulbs.

Minimizing Lighting from Indoor Sources

Indoor lighting that is visible from the beach, such as that identified from Buildings 241, 382, 383, 923, and the firing range guard shacks, also has the potential to disrupt sea turtle nesting and hatching. These sources are typically from buildings located close to the beach with windows that are visible above the dunes. Indoor lighting that trespasses onto the beach is easily

eliminated and typically involves a few simple and inexpensive methods. Lights in rooms that are not in use should be turned off, and lamps can be repositioned away from windows that are visible from the beach. Windows that are visible from the beach can be tinted to reduce the amount of light passing through the glass using either manufactured tinted glass or with applied film. Installing and closing opaque curtains or blinds and closing them after dark can block a majority of light that might otherwise trespass onto beaches.

Using Alternative Long-Wavelength Light Sources

As previously discussed, it is not always practical to eliminate all light sources that are visible from the beach. In these instances, steps should be considered to minimize the use of light sources that produce the most disruptive wavelengths of light. In areas where light is needed in areas close to the beach, the use of long-wave length light sources should be considered (Florida Power & Light Company 1998).

The most common lamp type identified during the lighting surveys as producing light visible from the beach was HPS lamps. A total of 76 sources of this type of light were observed, 39 of which were identified as direct impacts. Based on studies on physiological spectral sensitivity, hatchling orientation with respect to laboratory and commercial light sources, and spectral profiles of commonly used lamps, HPS light sources are thought to be highly disruptive to sea turtles. Although less disruptive than the white, broad-spectrum sources, HPS is one of the most common causes of hatchling disorientation and mortality (Witherington and Martin 2003).

Nineteen direct white, broad-spectrum lighting sources were observed and up to an additional twenty-one would have direct impacts if turned on. White, broad-spectrum lights are known to be extremely disruptive to sea turtles (Witherington and Martin 2003).

The use of alternative light sources in place of these HPS and white, broad-spectrum light sources should be evaluated. Alternative light sources which are known to be minimally disruptive to sea turtles include low-pressure sodium (LPS) vapor lighting, yellow filters, yellow or amber incandescent light bulbs (bug lights), and red, orange, or amber LED lighting (Witherington and Martin 2003; FWC 2011). These types of light bulbs and sources are on the Florida Fish and Wildlife Conservation Commission's (FWC) list of approved sea turtle lighting (FWC 2011). The FWC (2011) approves lamps that produce light that measures greater than 560 nanometers (nm) for sources visible from and adjacent to turtle nesting beaches. Acceptable lamps include:

- LPS 18w and 35w;
- red, orange, or amber LED (true red, orange, or amber diodes, NOT filters);
- true red neon; and
- other lighting sources that produce light of 560 nm or longer.

The installation or replacement of luminaire lens on the typical arm-mounted cutoff and cobrahead fixture typically used as street and parking lot lighting should also be considered. Examples include replacing existing clear lens and dropdown globes with yellow, dichroic “long-pass” filters that exclude short wavelengths well and are less likely to degrade overtime. If dichroic filters are considered, they should filter all wavelengths (have a stopband) below 520 nm.

Enhancing Dune Profile and Using Light Screens

Natural dune systems are highly variable; dunes grow, shrink, and move in the direction of prevailing winds over time (Broome 2002). Dune systems may have areas with large dunes and

small, low dunes only a few hundred yards away. In addition, foredunes often contain natural gaps such as blowouts and overwash passes.

As reviewed in Witherington and Martin (2003), several researchers have found that improper orientation is exacerbated when the dune profile is low or sparsely vegetated. The dune silhouette may influence hatchling behavior by providing visual cues, shielding light, or both since hatchlings tend to move away from darkly silhouetted objects. In areas that may have a low dune profile, restoring dunes to be similar in appearance to the preexisting or adjacent natural dunes may be an option to provide more natural orientation cues for hatchlings. This method may be considered in locations such as old, unused beach access points or in areas where erosion has reduced the profile to an extent that it no longer provides sufficient visual cues for sea turtle hatchlings.

Small areas can be restored using methods such as planting native pioneer dune vegetation (e.g., American beachgrass, sea oats, and bitter panicum) and installing sand fencing (Broome 2002). If the restoration of larger areas is considered, methods such as bulldozing and dredging may be necessary. It must be noted, however, that any dune manipulation should be carefully considered and planned. Sand fencing should not be installed in areas where turtles may nest. Moreover, dune restoration typically requires several years of continuous actions. For example, dune building with sand fencing requires the installation of an additional rows of fencing over several years, placing new fencing at the seaward dune toe when the preceding fence is filled approximately two-thirds high (O'Connell 2008). The use of bulldozing and dredging are expensive and can be extremely damaging to the coastal environment (Broome 2002). In addition, large dune building projects may affect adjacent ecology by changing the micro-climate and negatively impacting plant communities (O'Connell 2008).

Light screens may be considered to prevent beachfront lighting from shining directly on the beach, created from vegetation buffers, natural features, or artificial screens such as shade cloth and privacy fencing. Light screens, also known as ground level barriers, are used extensively in Florida to block existing light sources and are required in accordance with coastal city and county ordinances. Ground level barriers should be placed so that they do not interfere with nesting sea turtles or hatchlings or cause short- or long-term damage to the beach-dune system. Artificial screens would only be necessary during nesting and hatching season or until vegetation has become tall and dense enough to block the light (Martin 2000).

Specific Recommendations

One of the greatest challenges will be mitigating the impacts of the stadium lighting identified at the NASO-DNA ball fields. This light source is located within 120 m (400 ft) of the beach (Appendix A, Map 3). This lighting uses intense, white, broad-spectrum lamps that are mounted on tall poles, many of which are directly visible from the beach. In addition, the glow created from stadium lighting can affect nesting beaches many kilometers away (Witherington and Martin 2003). This lighting is only used for short durations, however, typically in the evening for sporting events and in the pre-dawn hours when some of the fields are used for physical training. Visors and louvers can be installed that direct light down onto the fields and reduce the amount of upward and lateral light. It may also be possible to replace the metal-halide lamps that produce the extremely disruptive white, broad-spectrum light with less disruptive lamps, reduce the wattage of the bulbs, and redirect and lower the lights that are most visible on the beach.

The perimeter lighting around the NSWDC compound is currently unshielded, with flood lighting aimed relatively upward (Figure 12) which increases the amount of light that reaches the beach and illuminates building walls that are visible from the beach (Appendix A, Map 2). In

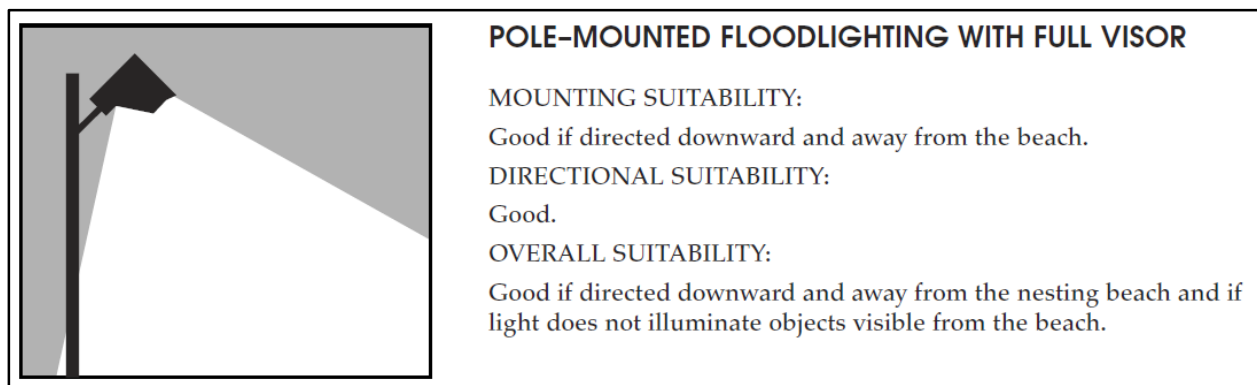

order to mitigate the impact from these lights, lamps could be directed downward with hoods installed to limit the amount of light visible from the beach and illuminating the upper portion of building walls (Figure 13). Similarly, these methods could also be undertaken with the pole-mounted flood lights identified in the Building 187 and 127 parking lots (see Appendix A, Maps 3 and 4). At Building 465A, changing the lamps to those with a lower wattage and less disruptive wavelength, redirecting or shielding the fixtures, or replacing with better focused luminaries to direct the light where it is most needed would decrease the impact to the beach. When lighting is required on the pad adjacent to Building 465A, the installation of hooded flood lamps or mobile lighting, placed on the eastern edge of the pad and directed downward and inland should be considered.

Figure 12. Perimeter flood lighting used at Naval Air Station Oceana – Dam Neck Annex, Naval Special Warfare Development Group Compound

To mitigate the impact of the direct light sources on Building 187 (see Figure 9), the lights on the upper level deck area should be replaced with fixtures such as louvered step lighting, wall-mounted downlighting, or ceiling-recessed downlighting. Because these lights are on upper floors visible above the dunes, louvered step lighting (Figure 14a) mounted a maximum of 30 centimeters (12 inches) from the floor would be the most effective at reducing the amount of light generated from the upper deck area. While wall-mounted downlighting or recessed

downlighting (Figure 14b and 14c) would be an improvement over the wall-mounted area lighting currently installed and more easily installed than louvered step lighting, these fixture types are not optimal since they would still be directly visible from the beach. If installed, light from recessed or wall-mounted downlighting could be further mitigated with the use of low-watt lamps that produce light with wavelengths greater than 560 nm. See Figure 11 for an example of the results similar actions.

Figure 14. a) Louvered step lighting, b) wall-mounted downlighting, and c) recessed downlighting

The impact of the arm-mounted cobrahead and cutoff shoebox fixtures that are widely used for street and parking lot lighting at several locations on NASO-DNA such as those lights located on

the beachside of roadways and the parking lots located around Buildings 127, 187, 225, and 241 (Appendix A, Maps 3 and 4). Impacts from these lights could be reduced using several of the methods described by Florida Power & Light Company (1998). The specific measures considered would be dependent on the purpose of the light, fixture type, lamp wattage, distance of the fixture from the beach, and the linear extent and height of natural (i.e., dunes and vegetation) or man-made structures between the light and the beach. Prior to performing any alternatives, they should be reviewed by civil engineers to ensure lights would continue to meet roadway safety standards.

The higher a fixture is mounted, the greater potential for its light to impact beaches. Reducing the mounting height of fixtures often resolves problems from fixtures that are relatively distant for the beach. Reducing the mounting height should also be given first consideration for those light close to the beach and then combined with other alternatives to reduce the amount of light impacting the beach to the lowest amount that is safely possible. In addition, cobrahead fixtures with drop globe fixtures (Figure 15) should be replaced with cutoff or hooded fixtures that compress the lighting footprint by concentrating the light on the targeted roadway or parking lot.

Source: Witherington and Martin 2003

Figure 15. Arm-mounted area lighting with cobrahead fixture and dropdown globe

Changing reflectors or the lamp socket position within the existing fixture would change the way light is distributed away from the source. If uniformity of light distribution of an area can be altered without compromising safety or security, adjusting fixtures to produce a long longitudinal pattern would require fewer lights to illuminate an area or street fixtures should be configured to have good backside cutoff properties, and changing reflectors should be considered. The distance light travels across the roadway parallel to the mounting arm of the fixture refers to its transverse distribution and is dependent on the type of reflector within the fixture (Figure 16). It is preferable to install Type I, II, and III reflectors in street lights facing the ocean due to their narrow transverse properties. Type II and III reflectors in fixtures facing away from the beach may be sufficient to prevent direct illumination of the beach depending on their height and distance from the beach. Other methods that should be considered include adding a dark non-reflective internal shield to reduce the lighting footprint and amount of light cast toward the beach and aligning the mounting angle of the fixture away from the beach. Additional consideration could be given to replacing the parking area lights that are immediately adjacent to the dunes with either fully hooded fixtures or low-mounted, louvered bollard fixtures to reduce the amount of light trespass onto nesting beaches (Figure 17).

It was noted during the post-nesting/hatching survey that six fixtures within and adjacent to the Shifting Sands Club (Building 187) parking lot had been changed over to arm-mounted area “cobrahead” LED fixtures. These fixtures produce white, broad spectrum light. The type of LEDs installed in these fixtures should be determined. The type of LEDs that are currently most commonly used have high concentration of blue wavelength light and a correlated color temperature (CCT) of 5,500 Kelvins (K), termed as blue-rich white light (BRWL) LEDs (International Dark Sky Association 2010a, b). Manufacturers have started producing LEDs with

lower CCT values (2,600 – 4,100 K) that produce light with a lower fraction of light in the blue wavelength. If it is determined that new street and parking lot fixtures contain BRLW LEDs, consideration should be given to replace through attrition BRWL LEDs with high-efficiency, low CCT bright white LEDs that produce light with a lower fraction of their energy in the blue wavelength. (400 – 475 nm). It has also been found that LEDs under 3,700 K emit and broader range of frequencies that improves color rendition and produces less glare than higher CCT LEDs (International Dark Sky Association 2010a, b).

Figure 16. Light distribution patterns (lighting footprints) for street lights with different types of reflectors.

Source: Witherington and Martin 2003

Figure 17. Louvered, low-mounted bollard fixtures for parking area lights immediately adjacent to dunes

Prior to any additional construction or improvements to facilities that are adjacent to the beach in which light sources are replaced or installed, planners should consult resources that identify sea turtle friendly lighting such as the following:

VIRGINIA ARMY NATIONAL GUARD - CAMP PENDLETON SURVEY AREA

VAARNG-CP is located in the tidewater area of southeastern Virginia in the southeastern portion of the City of Virginia Beach (Figure 18). VAARNG-CP is just north of NASO-DNA, is situated along the Atlantic Ocean, and has approximately 0.23 mi (0.37 km) of intertidal beach and primary and secondary coastal dune habitat that is continuous with NASO-DNA beaches (VAARNG 2004). The beaches on VAARNG-CP contain favorable habitats for the federally listed sea turtle species and several state-listed rare plant species (VAARNG 2004). The shoreline of VAARNG-CP and adjacent facilities that could be potential sources of light are shown on Figure 19.

METHODS

Desktop Analysis

A desktop analysis was performed using Navy-provided GIS layers and aerial imagery of base boundaries, the coastline, and facilities (e.g., buildings, roads, parking lots) and utilities that have the potential to generate either direct or indirect light that may be visible from the beach. A quarter-mile buffer from the shoreline inland was overlaid on the aerial images in order to focus on sources that had the highest potential to be a source of direct or indirect light. Areas of interest for the field surveys were identified based on the results of the desktop analysis, but no light sources outside of these areas were excluded from consideration. Maps were used during the surveys to orient surveyors on the beach and assist in the identification of potential light sources observed from the beach.

Figure 18. Virginia Army National Guard Camp Pendleton

Figure 19. Virginia Army National Guard – Camp Pendleton survey area

Initial Daytime Surveys

Daytime surveys were conducted both along the beach face and behind the rear dunes and allowed the surveyors to familiarize themselves with the areas to be surveyed at night and identify likely sources of light to be investigated at night. During the beach surveys, surveyors walked just above the swash line looking inland to identify potential light sources (e.g., street lights, security lights, buildings) and noted their findings for follow up during the surveys behind the dunes. During these dune surveys, they evaluated the facilities and utilities identified during the beach surveys and the desktop analysis. The primary focus was on those facilities and utilities identified during the beach survey, those closest to the beach, as well as those thought to have the highest potential to produce direct or indirect light visible from the beach. All potential sources of light were documented by noting the building number and/or its GPS location and type of fixture. Location coordinates were collected using a Trimble GeoXT™ handheld (Datum WGS 1984; Latitude/longitude; sub-meter accuracy in real time; 50 centimeter accuracy post processed; PDOP – 8 resulting in a lowest acceptable distance error of 10 meters). Surveyors also reference photographs of light fixtures and recorded the photograph number to document potential light sources. A predicted impact (i.e., direct or indirect) was also noted if it seemed reasonably certain.

Surveyors conducted the daytime survey at VAARNG-CP on 3 April 2014 at approximately 1400 hours. They accessed the beach at the public beach access located at the end of Rifle Range Road and began the beach survey at the NASO-DNA and VAARNG-CP installation boundary and walked north until reaching the installation's northern boundary and then returned to the starting point. Inland surveys were conducted at the rifle range.

Nighttime Surveys

The intent of the nighttime surveys was to identify the light sources that are visible on VAARNG-CP beaches with the potential to impact sea turtles and classify them as either direct or indirect light sources. Four nighttime surveys were conducted: one during the pre-nesting season, two during nesting season, and one at the end of nesting season and the beginning of hatching. Surveys occurred within 2 to 14 days after a full moon and started after 2100 hours Eastern Standard Time (EST). The specific dates of each survey are provided below.

The same basic procedures described for daytime procedures were followed for nighttime surveys although specific routes changed due to access schedules for different facilities.

Surveyors walked just above the swash zone looking inland to identify sources and impact of lights visible from the beach. Afterwards, the surveys continued inland. During inland surveys, surveyors located the sources identified during the beach survey and characterized them by the observed impact, type of fixture, type of light, and specific location of the light source. Where possible, coordinates for all light sources were collected using a Trimble GeoXT™ handheld (Datum WGS 1894; Latitude/longitude; sub-meter accuracy in real time; 50 centimeter accuracy post processed; PDOP – 8 resulting in a lowest acceptable distance error of 10 meters). In cases where it was not possible to collect GPS coordinates (e.g., location not accessible, location blocked satellite acquisition), surveyors either used the map on the GPS to estimate the location of the light and document coordinates or marked the light source locations on survey maps and documented them in data collection sheets.

Pre-nesting Season Surveys

Pre-nesting nighttime surveys at VAARNG-CP were conducted on 15 April 2015 from 2200-2230 hours. The same basic procedures described for daytime procedures were followed.

Nighttime beach surveys focused on identifying the inland locations of direct and indirect light sources visible from the beach. The beach was accessed from the same location as the daytime survey, and surveyors followed the same route. During the inland surveys, they located the sources identified during the beach survey and characterized them by the observed impact, type of fixture, type of light, and specific location of the light source.

Nesting Season Surveys

Nesting season nighttime surveys were conducted on 6 June 2015 and again on 12 June 2015. These surveys were accomplished to document any changes or additions to light sources on VAARNG-CP from the pre-nesting surveys. Maps generated from the pre-nesting nighttime survey data were used to identify new and changed impacts. The survey on 6 June started at approximately 0100 hours and lasted an hour. The 12 June survey began at approximately 2330 hours and was completed at 0030 hours on 13 June. The survey route followed the same route as that of the pre-nesting survey.

Post-nesting/Hatching Season Surveys

The post-nesting/hatching season survey was accomplished on 10 October 2015 starting at 0030 hours and lasted approximately 1 hour. The beach survey began on the northern portion of VAARNG-CP beach leased to the City of Virginia Beach and was completed at the installation boundary with NASO-DNA. Surveyors used maps generated from previous surveys to identify any changes that may have occurred from previous surveys. Any lights that were identified from beach surveys were located and characterized by observed impact, type of fixture, type of light, and specific location of the light source.

RESULTS

Three light sources on VAARNG-CP are visible from the beach, one direct and two indirect (Table 4; Appendix A, Map 6). No light sources were noted at the firing range that is adjacent to the beach and this location does not have electricity. The restroom facility on the Croatan Beach parking (land leased to the City of Virginia Beach) has two wall-mounted area lights (Figure 20) that illuminate the northern upper wall and roof peak the building. This light is only visible through the dune cut through with the beach access boardwalk. In addition, the fence that marks the northern boundary of the leased Croatan property has a small, solar-powered LED flood lamp mounted on one of the fence post that illuminates a small United States flag mounted on an adjacent post (Figure 21). Of the data collected using the Trimble GeoXT™ handheld, 84 percent of all points were accurate to within less than 1 meter, 98 percent were accurate to within less than 5 meters, and 100 percent were accurate to within less than 9 meters.

The other light sources visible from VAARNG-CP beaches included the off-base residential areas on the northern edge of the base (Figure 22) and the top of the radar dome located in the MACS-24 compound on NASO-DNA.

Table 4. Location, fixture type and observed impacts of light sources identified on Virginia Army National Guard – Camp Pendleton

DISCUSSION

Light pollution on or near beaches can reduce the reproductive success of sea turtles by disrupting the behaviors of nesting females and hatchlings. Artificial lights on nesting beaches can deter adult females from emerging from the water, affect nest site selection, disrupt the seaward orientation of adult females after nesting, and disrupt the seaward orientation of hatchlings after emergence from the nest (Witherington and Bjorndal 1991, Witherington 1992, Witherington and Martin 2003, Tuxbury and Salmon 2005, Brei et al. 2014, Rivas et al. 2015).

During the surveys, surveyors identified three lighting sources that contribute to the direct and indirect artificial light visible from VAARNG-CP beaches. These sources were elevated fixtures on building walls and fence posts (see Table 4). Two sources contributed to indirect light, illuminating the upper portion of the restroom facilities on Croatan Beach. One light source was installed on a fence post used to mark the beach boundary.

The best method of solving light pollution is to manage the light rather than eliminating it (Witherington and Martin 2003). The principal sources of light that cause problems for sea turtles is that which “spills over” onto the beach from the areas that are intended to be illuminated. Managing this spillage can resolve many of the impacts identified during the surveys.

There is no set criteria for the acceptable level of light intensity to mitigate potential impacts to turtles; factors such as the level of natural light and the availability of other visual clues such as dunes and vegetation vary widely, and the amount of artificial lighting that may interfere with nesting or disorient hatchlings differs greatly from one location to the next (Witherington and Martin 2003). The most effective mitigation method is to minimize the amount of artificial light as much as possible using the best available technology.

General Recommendations

The general measures listed below should be considered individually or together based on the need, type, intensity, and orientation of the light source without compromising safety and security. How these types of changes to adjust the amount and type of light can reduce the impact to beaches are illustrated on Figure 23. These measures should also be considered for any future construction of facilities near the beach such as at the rifle range or the beach access.

Figure 23. Examples illustrating the results of strategies to reduce and change light sources to minimize impacts to sea turtles.

Eliminating Unnecessary Lights

The direct and indirect light sources should be evaluated based on their effectiveness and the lighting needs of this installation. Reducing the use of lights is the easiest and least expensive method to reduce the amount of light visible from the beach, although safety and security requiring the use of artificial lighting must remain a priority. Where possible, unnecessary light

sources should be eliminated. Unnecessary light sources may include those that illuminate areas which do not require security and areas that are vacant and do not have foot traffic, as well as decorative light sources and those light sources that provide more than adequate lighting for a particular function (Witherington and Martin 2003).

Minimizing Lighting from Outdoor Sources

The simplest method to reduce the impact of artificial lighting on sea turtles is to prevent light from reaching the beach although this is not always a practical solution. Fixtures that are directly visible from the beach can be realigned, modified, repositioned, or shielded to keep light from reaching the beach (Florida Power & Light Company 1998). The following is a list of recommended solutions compiled from the Florida Fish and Wildlife Conservation Commission (2011), Witherington and Martin (2003), and Florida Power & Light (1998) to minimize the amount of light reaching the beach from existing light sources:

1. Turn off lights that are not essential for safety or security. This is the simplest and less expensive method to minimize light trespass onto beach areas. Lighting only needs to be turned off during the nesting and hatching season.
2. Reduce the wattage of the lamps used to the lowest level necessary to fulfill the purpose for the light and remain within the manufacture's guidelines. This will reduce the amount of light emitted and, subsequently, reaching the beach.
3. Reposition luminaires to better focus the light to where it is most needed.
4. Substitute high-watt, multidirectional luminaires with low-watt, directional luminaires that are directed away from the beach.
5. Install shields on light sources that are sufficiently opaque, large, and positioned to prevent light from reaching the beach.

6. Recess light sources and position them to direct the light downward and away from the beach.
7. Reduce the height of pole-mounted and arm-mounted luminaires. The lower a light source is mounted, the less area it will illuminate. In addition, lower-mounted luminaires may also be better shielded by dunes, vegetation, and buildings.
8. Take advantage of natural light screens, such as dunes and vegetation, to shield luminaires.
9. Install timers or motion detectors so that the light is illuminated only when it is most needed. These are relatively inexpensive solutions, yet they have some limitations in their use and efficacy. Timers are minimally effective since nesting and hatching can take place throughout the night and should be set to turn off early in the evening. Motion detectors can be a better solution than timers, but they should not be used in high traffic areas visible from the beach and can only be used with incandescent lighting. If used, motion detectors work well with yellow bug-light bulbs.

Minimizing Lighting from Indoor Sources

Indoor lighting that is visible from the beach also has the potential to disrupt sea turtle nesting and hatching. These sources are typically from buildings located close to the beach with windows that are visible above the dunes. Indoor lighting that trespasses onto the beach is easily eliminated and typically involves a few simple and inexpensive methods. Lights in rooms that are not in use should be turned off, and lamps can be repositioned away from windows that are visible from the beach. Windows that are visible from the beach can be tinted to reduce the amount of light passing through the glass using either manufactured tinted glass or with applied

film. Installing and closing opaque curtains or blinds and closing them after dark can block a majority of light that might otherwise trespass onto beaches.

Using Alternative Long-Wavelength Light Sources

As previously discussed, it is not always practical to eliminate all light sources that are visible from the beach. In these instances, steps should be considered to minimize the use of light sources that produce the most disruptive wavelengths of light. In areas where light is needed in areas close to the beach, the use of long-wave length light sources should be considered (Florida Power & Light Company 1998).

Based on studies on physiological spectral sensitivity, hatchling orientation with respect to laboratory and commercial light sources, and spectral profiles of commonly used lamps, white, broad-spectrum lights are known to be extremely disruptive and HPS light sources are thought to be highly disruptive to sea turtles (Witherington and Martin 2003).

The use of alternative light sources in place of these HPS and white, broad-spectrum light sources should be evaluated. Alternative light sources which are known to be minimally disruptive to sea turtles include LPS vapor lighting, yellow filters, yellow or amber incandescent light bulbs (bug lights), and red, orange, or amber LED lighting (Witherington and Martin 2003; FWC 2011). These types of light bulbs and sources are on the Florida Fish and Wildlife Conservation Commission's list of approved sea turtle lighting (FWC 2011). The Florida Wildlife Commission (2011) approves lamps that produce light that measures greater than 560 nanometers (nm) for sources visible from and adjacent to turtle nesting beaches. Acceptable lamps include:

- LPS 18w and 35w;
- red, orange, or amber LED (true red, orange, or amber diodes, NOT filters);

- true red neon; and
- other lighting sources that produce light of 560 nm or longer.

Enhancing Dune Profile and Using Light Screens

Natural dune systems are highly variable, dunes grow, shrink, and are shaped by wind and water (Brome 2002). Dune systems may have areas with large dunes and small, low dunes only a few hundred yards away. In addition, foredunes often contain natural gaps such as blowouts and overwash passes.

As reviewed in Witherington and Martin (2003), several researchers have found that improper orientation is exacerbated when the dune profile is low or sparsely vegetated. The dune silhouette may influence hatchling behavior by providing visual cues, shielding light, or both since hatchlings tend to move away from darkly silhouetted objects. In areas that may have a low dune profile, restoring dunes to be similar in appearance to the preexisting or adjacent natural dunes may be an option to provide more natural orientation cues for hatchlings. This method may be considered in locations such as old, unused beach access points or in areas where erosion has reduced the profile to an extent that it no longer provides sufficient visual cues for sea turtle hatchlings.

Small areas can be restored using methods such as planting native pioneer dune vegetation (e.g., American beachgrass, sea oats, and bitter panicum) and installing sand fencing (Broome 2002). If the restoration of larger areas is considered, methods such as bulldozing and dredging may be necessary. It must be noted, however, that any dune manipulation should be carefully considered and planned. Sand fencing should not be installed in areas where turtles may nest. Moreover, dune restoration typically requires several years of continuous actions. For example, dune building with sand fencing requires the installation of an additional row of fencing over several

years, placing new fencing at the seaward dune toe when the preceding fence is filled approximately two-thirds high (O'Connell 2008). The use of bulldozing and dredging are expensive and can be extremely damaging to the coastal environment (Broome 2002). In addition, large dune building projects may affect adjacent ecology by changing the micro-climate and negatively impacting plant communities (O'Connell 2008).

Light screens may be considered to prevent beachfront lighting from shining directly on the beach, created from vegetation buffers, natural features, or artificial screens such as shade cloth and privacy fencing. Light screens, also known as ground level barriers, are used extensively in Florida to block existing light sources and are required in accordance with coastal city and county ordinances. Ground level barriers should be placed so that they do not interfere with nesting sea turtles or hatchlings or cause short- or long-term damage to the beach-dune system. Artificial screens would only be necessary during nesting and hatching season or until vegetation has become tall and dense enough to block the light (Martin 2000).

Specific Recommendations

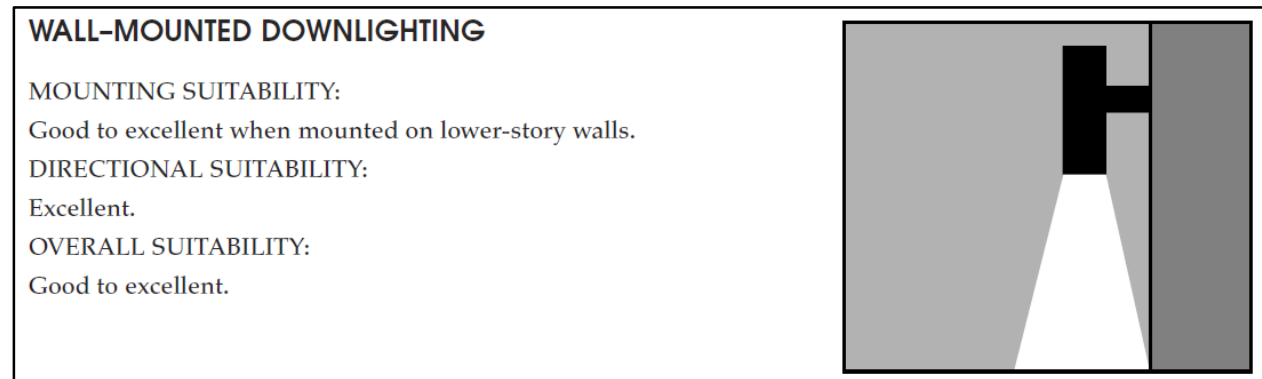

If the solar-powered LED lamp on the fence post cannot be removed, consideration should be given to move and reorient the fixture so that the light is directed at an upward angle and away from the water. A shield could also be used to focus the light only on the intended area. Even though this light does not shine on the beach, its location in the swash zone of the beach may disrupt hatchling dispersal and cause them to linger in the glow, thus increasing mortality from predation.

The indirect light from the restroom facility in the Croatan Beach parking lot is only visible on a very narrow portion of the beach. In order to reduce this impact, downlighting should be considered in place of the wall-mounted area lights (Figure 24). This would eliminate the light

that is illuminating the upper wall and roof peak. Any change made to these lights would likely need to be coordinated through the City of Virginia Beach.

Prior to any improvements to facilities at the firing range or beach access in which light sources are replaced or installed, planners should consult resources that identify sea turtle friendly lighting such as the following:

Ball fields	DNA92	36°46'52.929"	75°57'34.198"	Pole-mounted stadium lighting arrays	1	6969	Direct- if on	White, broad-spectrum	Visible from beach. Lamp type obtained from Navy utility data
Ball fields	DNA93	36°46'51.857"	75°57'33.822"	Pole-mounted stadium lighting arrays	1	6969	Direct- if on	White, broad-spectrum	Visible from beach. Lamp type obtained from Navy utility data
Ball fields	DNA94	36°46'51.958"	75°57'31.937"	Pole-mounted stadium lighting arrays	1	6969	Direct- if on	White, broad-spectrum	Visible from beach. Lamp type obtained from Navy utility data
Ball fields	DNA95	36°46'53.157"	75°57'30.352"	Pole-mounted stadium lighting arrays	1	6969	Direct- if on	Likely white, broad-spectrum	Fixture is visible from the beach. Navy data indicates the lamps in some of the stadium lighting are mercury vapor. Mercury vapor lamps produce white, broad-spectrum light. If any lights have been upgraded, they may contain high pressure sodium lamps.

Table B-5. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Observed and Expected Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference Photo Number	Observed or Expected Impact	Lamp Type	Other Remarks
Ball fields	DNA96	36°46'51.366"	75°57'36.478"	Pole-mounted stadium lighting arrays	1	6969	Direct- if on	Likely white, broad-spectrum	Fixture is visible from the beach. Navy data indicates the lamps in some of the stadium lighting are mercury vapor. Mercury vapor lamps produce white, broad-spectrum light. If any lights have been upgraded, they may contain high pressure sodium lamps.
Ball fields	DNA97	36°46'51.448"	75°57'35.693"	Pole-mounted stadium lighting arrays	1	6969	Direct- if on	Likely white, broad-spectrum	Fixture is visible from the beach. Navy data indicates the lamps in some of the stadium lighting are mercury vapor. Mercury vapor lamps produce white, broad-spectrum light. If any lights have been upgraded, they may contain high pressure sodium lamps.
Ball fields	DNA98	36°46'51.888"	75°57'35.342"	Pole-mounted stadium lighting arrays	1	6969	Direct- if on	Likely white, broad-spectrum	Fixture is visible from the beach. Navy data indicates the lamps in some of the stadium lighting are mercury vapor. Mercury vapor lamps produce white, broad-spectrum light. If any lights have been upgraded, they may contain high pressure sodium lamps.
Ball fields	DNA99	36°46'52.587"	75°57'35.614"	Pole-mounted stadium lighting arrays	1	6969	Direct- if on	Likely white, broad-spectrum	Fixture is visible from the beach. Navy data indicates the lamps in some of the stadium lighting are mercury vapor. Mercury vapor lamps produce white, broad-spectrum light. If any lights have been upgraded, they may contain high pressure sodium lamps.
Beach Access (North end of Regulus Avenue)	DNA1	36°48'17.271"	75°57'50.516"	Pole-mounted flood	1	1125	Direct- if on	Not on	Broken, fixture was lying on the ground. Would be direct if repaired.
Building 102	DNA218	36°46'49.550"	75°57'29.684"	Wall-mounted area "Wall pak"	1	7017	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 102	DNA219	36°46'49.297"	75°57'29.561"	Wall-mounted area "Wall pak"	1	7017	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 102	DNA220	36°46'48.721"	75°57'29.227"	Wall-mounted area "Wall pak"	1	7017	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 102	DNA221	36°46'48.890"	75°57'28.366"	Wall-mounted area "Wall pak"	1	7017	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 102	DNA222	36°46'48.770"	75°57'28.084"	Wall-mounted area "Wall pak"	1	7017	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 102	DNA223	36°46'48.385"	75°57'27.940"	Wall-mounted area "Wall pak"	1	7017	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 102 parking	DNA84	36°46'50.116"	75°57'29.305"	Arm-mounted area - cobrahead	1	6972	Direct	Gold-peach, indicative of HPS	
Building 102 parking	DNA88a	36°46'49.376"	75°57'32.655"	Arm-mounted area - cobrahead (double)	1	7015	Indirect	Gold-peach, indicative of HPS	
Building 102 parking	DNA88b	36°46'49.658"	75°57'31.625"	Arm-mounted area - cobrahead (double)	1	7015	Indirect	Gold-peach, indicative of HPS	

Table B-5. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Observed and Expected Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference Photo Number	Observed or Expected Impact	Lamp Type	Other Remarks
Building 127	DNA229	36°46'39.928"	75°57'24.572"	Wall-mounted flood	1	7021	Direct	Gold-peach, indicative of HPS	East facing. Lights located along roof edge. This area of the building is behind a fence with no access, point estimated from GPS map.
Building 127	DNA230	36°46'40.507"	75°57'25.495"	Wall-mounted flood	1	7022	Direct	Gold-peach, indicative of HPS	East facing. Lights located along roof edge. This area of the building is behind a fence with no access, point estimated from GPS map.
Building 127	DNA231	36°46'41.035"	75°57'25.626"	Wall-mounted flood	1	7022	Direct	Gold-peach, indicative of HPS	East facing. Lights located along roof edge. This area of the building is behind a fence with no access, point estimated from GPS map.
Building 127	DNA232	36°46'45.622"	75°57'26.945"	Wall-mounted flood	1	7026 / 7100	Direct	Gold-peach, indicative of HPS	East facing. Lights located along roof edge. This area of the building is behind a fence with no access, point estimated from GPS map.
Building 127	DNA233	36°46'46.624"	75°57'27.142"	Wall-mounted flood	1	7026 / 7100	Direct	Gold-peach, indicative of HPS	East facing. Lights located along roof edge. This area of the building is behind a fence with no access, point estimated from GPS map.
Building 127	DNA234	36°46'39.400"	75°57'24.491"	Wall-mounted flood	1	7026 / 7100	Direct	gold-peach, indicative of HPS	South facing. Lights located along roof edge, point estimated from GPS map.
Building 127 parking	DNA72	36°46'39.841"	75°57'23.260"	Arm-mounted area - cobrahead	1	6972	Direct	Gold-peach, indicative of HPS	
Building 127 parking	DNA73	36°46'38.559"	75°57'22.769"	Arm-mounted area - cobrahead	1	6972	Direct	Gold-peach, indicative of HPS	
Building 127 parking	DNA74	36°46'39.074"	75°57'21.543"	Pole-mounted flood (double)	1	7028	Direct- if on	Not on	Fixtures visible from beach.
Building 127 parking	DNA75	36°46'40.111"	75°57'21.921"	Pole-mounted flood (double)	1	7028	Direct- if on	Not on	Fixtures visible from beach.
Building 127 parking	DNA76	36°46'41.128"	75°57'22.265"	Pole-mounted flood (double)	1	7028	Direct- if on	Not on	Fixtures visible from beach.
Building 127 parking	DNA77	36°46'38.617"	75°57'24.292"	Arm-mounted area - cobrahead (flat faced)	1	7099	Direct	White, broad-spectrum	
Building 127 parking	DNA78	36°46'38.274"	75°57'25.619"	Arm-mounted area - cobrahead (flat faced)	1	7099	Indirect	White, broad-spectrum	
Building 127 parking	DNA79	36°46'37.143"	75°57'25.187"	Arm-mounted area - cobrahead	1	6972	Indirect	Gold-peach, indicative of HPS	
Building 127 parking	DNA80	36°46'36.536"	75°57'25.558"	Arm-mounted area - cobrahead	1	6972	Indirect	Gold-peach, indicative of HPS	
Building 127 parking	DNA81	36°46'37.355"	75°57'26.453"	Arm-mounted area - cobrahead	1	6972	Indirect	Gold-peach, indicative of HPS	

Table B-5. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Observed and Expected Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference Photo Number	Observed or Expected Impact	Lamp Type	Other Remarks
Building 127 parking	DNA82	36°46'38.501"	75°57'26.923"	Arm-mounted area - cobrahead (flat faced)	1	7099	Indirect	White, broad-spectrum	
Building 127 parking	DNA83	36°46'37.462"	75°57'23.957"	Arm-mounted cutoff - shoebox (double)	1	7014 / 7101	Indirect	Gold-peach, indicative of HPS	
Building 127 tower	DNA194	36°46'42.943"	75°57'25.197"	Red marker	1	Example B	Direct	Red lens	Located near tower top, could not photograph due to height and angle
Building 132/114 parking	DNA209	36°46'50.217"	75°57'25.467"	Arm-mounted area - cobrahead	1	7454	Direct- if on	Not on	Fixture visible from beach.
Building 132/114 parking	DNA210	36°46'49.261"	75°57'25.396"	Arm-mounted area - cobrahead (flat faced)	1	7456	Direct- if on	Not on	Fixture visible from beach.
Building 132/114 parking	DNA211	36°46'50.493"	75°57'26.611"	Arm-mounted area - cobrahead	1	7454	Direct- if on	Not on	Fixture visible from beach.
Building 132/114 parking	DNA212	36°46'49.394"	75°57'26.486"	Arm-mounted area - cobrahead (flat faced)	1	7456	Direct- if on	Not on	Fixture visible from beach.
Building 132/114 parking	DNA213	36°46'48.543"	75°57'26.065"	Arm-mounted area - cobrahead (flat faced)	1	7456	Direct- if on	Not on	Fixture visible from beach.
Building 153 parking	DNA208	36°46'52.785"	75°57'26.438"	Arm-mounted area - cobrahead (flat faced) Solar	1	7013 / 7449	Direct- if on	Not on	Fixture visible from beach.
Building 153 parking	DNA64	36°46'53.874"	75°57'26.713"	Arm-mounted area - cobrahead (flat faced) Solar	1	7013	Direct- if on	Not on	Fixtures visible from beach.
Building 170	DNA214	36°46'47.461"	75°57'24.623"	Pole-mounted flood (double)	1	7028	Direct- if on	Not on	Fixture visible from beach.
Building 170	DNA215	36°46'46.781"	75°57'25.311"	Arm-mounted area - cobrahead (flat faced)	1	7456	Direct- if on	Not on	Fixture visible from beach.
Building 170	DNA216	36°46'43.088"	75°57'23.569"	Arm-mounted area - cobrahead	1	7454	Direct- if on	Not on	Fixture visible from beach.
Building 170	DNA235	36°46'41.527"	75°57'23.006"	Arm-mounted area - cobrahead	1	7454	Indirect- if on	Not on	
Building 183 Parking	DNA183	36°46'51.294"	75°57'25.774"	Arm-mounted area - cobrahead	1	7454	Direct- if on	Not on	Fixture visible from beach.

Table B-5. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Observed and Expected Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference Photo Number	Observed or Expected Impact	Lamp Type	Other Remarks
Building 183 Parking	DNA184	36°46'51.402"	75°57'27.082"	Arm-mounted area - cobrahead	1	7454	Direct- if on	Not on	Fixture visible from beach.
Building 187	DNA130	36°46'57.427"	75°57'27.915"	Wall-mounted area "Wall pak"	1	6949 / 7096	Direct	White, broad-spectrum	South facing
Building 187	DNA131	36°46'57.501"	75°57'27.712"	Wall-mounted area "Wall pak"	1	6949 / 7096	Direct	White, broad-spectrum	South facing
Building 187	DNA132	36°46'57.810"	75°57'27.512"	Wall-mounted area "Wall pak"	1	6948 / 7097	Direct	White, broad-spectrum	East facing
Building 187	DNA133	36°46'57.986"	75°57'27.549"	Wall-mounted area "Wall pak"	1	6948 / 7097	Direct	White, broad-spectrum	East facing
Building 187	DNA134	36°46'58.184"	75°57'27.625"	Wall-mounted area "Wall pak"	1	6948	Direct- if on	Not on	East facing, fixture visible from the beach
Building 187	DNA135	36°46'58.399"	75°57'27.698"	Wall-mounted area "Wall pak"	1	6948 / 7097	Direct	White, broad-spectrum	East facing
Building 187	DNA136	36°46'58.624"	75°57'27.777"	Wall-mounted area "Wall pak"	1	6948 / 7097	Direct	White, broad-spectrum	East facing
Building 187	DNA137	36°46'58.844"	75°57'27.835"	Wall-mounted area "Wall pak"	1	6948 / 7097	Direct	White, broad-spectrum	East facing
Building 187	DNA224	36°46'59.591"	75°57'28.300"	Wall-mounted area "Wall pak"	1	6950	Direct- if on	Not on	East facing and visible from beach. Fixture is located close to building upper deck.
Building 187	DNA225	36°46'57.504"	75°57'28.405"	Wall-mounted area "Wall pak"	1	6949 / 7096	Direct	Gold-peach, indicative of HPS	South facing. Fixture is located under building upper deck.
Building 187 parking	DNA182	36°46'55.250"	75°57'27.159"	Arm-mounted area - cobrahead (flat faced) LED	1	7458	Direct	White, broad-spectrum LED	
Building 187 parking	DNA207	36°46'56.524"	75°57'29.319"	Arm-mounted area - cobrahead (double)	1	7015	Indirect	White, broad-spectrum LED	
Building 187 parking	DNA57	36°46'59.180"	75°57'30.931"	Pole-mounted flood	1	6965	Indirect- if on	Not on	Likely indirect due to height of fixture and proximity to dune.
Building 187 parking	DNA58	36°46'58.064"	75°57'29.879"	Arm-mounted area - cobrahead (flat faced; double) LED	1	7447 / 7457	Indirect	White, broad-spectrum LED	

Table B-5. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Observed and Expected Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference Photo Number	Observed or Expected Impact	Lamp Type	Other Remarks
Building 187 parking	DNA59	36°46'57.276"	75°57'31.211"	Arm-mounted area - cobrahead (flat faced) LED	1	7458	Indirect	White, broad-spectrum LED	
Building 187 parking	DNA60	36°46'55.437"	75°57'30.488"	Arm-mounted area - cobrahead (flat faced; double) LED	1	7447 / 7457	Indirect	White, broad-spectrum LED	
Building 187 parking	DNA61	36°46'54.938"	75°57'28.780"	Arm-mounted area - cobrahead (flat faced) LED	1	7458	Indirect	White, broad-spectrum LED	
Building 187 parking	DNA62	36°46'56.978"	75°57'27.855"	Arm-mounted area - cobrahead (flat faced) LED	1	7458	Direct	White, broad-spectrum LED	Was not visible until completion of beach replenishment
Building 187 parking	DNA63	36°46'54.763"	75°57'26.985"	Arm-mounted area - cobrahead (flat faced) Solar	1	7013	Direct- if on	Not on	Fixtures visible from beach.
Building 187 patio	DNA236	36°46'57.810"	75°57'27.512"	Ceiling mounted fluorescent tubes	2	6968	Indirect	White, broad-spectrum, fluorescent tubes	Lights located under the upper deck and immediately adjacent to the rear dune and at enough height to illuminate upper edge of dune.
Building 187 pavilion	DNA55	36°47'01.086"	75°57'29.750"	Arm-mounted flood	1	6967	Indirect- if on	Not on	Broken. Likely indirect due to height of fixture and proximity to dune.
Building 187 pavilion	DNA56	36°47'00.241"	75°57'29.375"	Arm-mounted cutoff - shoebox	1	6961	Direct	Gold-peach, indicative of HPS	
Building 225	DNA4	36°47'20.051"	75°57'34.282"	Wall-mounted area "Wall pak"	1	6948	Indirect- if on	Not on	Likely indirect due to height of fixture and proximity to dune.
Building 225	DNA6	36°47'21.473"	75°57'35.080"	Wall-mounted flood	1	6957	Indirect- if on	Not on	Likely HPS. Likely indirect due to height of fixture and proximity to dune.
Building 225 parking	DNA116	36°47'19.929"	75°57'36.088"	Arm-mounted cutoff - shoebox (double)	1	7014	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 225 parking	DNA117	36°47'20.021"	75°57'36.606"	Arm-mounted cutoff - shoebox (double)	1	7014 / 7105	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 225 parking	DNA118	36°47'22.014"	75°57'36.886"	Arm-mounted cutoff - shoebox (double)	1	7014	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 225 parking	DNA119	36°47'21.900"	75°57'38.321"	Arm-mounted cutoff - shoebox (double)	1	7014	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 225 parking	DNA120	36°47'20.918"	75°57'38.159"	Arm-mounted cutoff - shoebox (double)	1	7014	Direct	Gold-peach, indicative of HPS	Not visible from beach

Table B-5. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Observed and Expected Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference Photo Number	Observed or Expected Impact	Lamp Type	Other Remarks
Building 225 parking	DNA121	36°47'23.991"	75°57'35.965"	Arm-mounted area - cobrahead (flat faced) Solar	1	7013	Indirect- if on	Not on	Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Building 225 Parking	DNA52	36°47'24.026"	75°57'37.073"	Arm-mounted area - cobrahead	1	6972	Indirect	Gold-peach, indicative of HPS	
Building 225 Parking	DNA53	36°47'24.443"	75°57'38.393"	Arm-mounted area - cobrahead	1	6972	Indirect	Gold-peach, indicative of HPS	
Building 225 Parking	DNA54	36°47'24.425"	75°57'39.571"	Arm-mounted area - cobrahead	1	6972	Indirect	Gold-peach, indicative of HPS	
Building 241	DNA227	36°47'18.612"	75°57'33.740"	Beach facing windows	38	None	Direct	Interior lights	No photos of building windows were taken.
Building 241	DNA228	36°47'17.738"	75°57'33.439"	Pole-mounted cutoff, round	1	6951	Indirect- if on	Not on	
Building 241	DNA7	36°47'19.366"	75°57'33.654"	Pole-mounted cutoff, round	1	6951 / 7103	Indirect	Gold-peach, indicative of HPS	Behind dune
Building 241	DNA8	36°47'18.041"	75°57'33.314"	Wall-mounted area	2	6958	Indirect	White, broad-spectrum (likely incandescent)	Likely white, broad-spectrum incandescent
Building 241	DNA9	36°47'17.537"	75°57'33.606"	Wall-mounted area	2	6958	Indirect	White, broad-spectrum (likely incandescent)	Likely white, broad-spectrum incandescent
Building 241 parking	DNA105	36°47'12.892"	75°57'33.909"	Arm-mounted area - cobrahead (flat faced) Solar	1	6959	Indirect- if on	Not on	Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Building 241 parking	DNA106	36°47'13.853"	75°57'34.114"	Arm-mounted area - cobrahead (flat faced) Solar	1	6959	Indirect- if on	Not on	Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Building 241 parking	DNA107	36°47'14.994"	75°57'34.391"	Arm-mounted area - cobrahead (flat faced) Solar	1	6959	Indirect- if on	Not on	Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Building 241 parking	DNA108	36°47'15.781"	75°57'34.373"	Arm-mounted area - cobrahead (flat faced) Solar	1	6959	Indirect- if on	Not on	Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Building 241 parking	DNA109	36°47'16.728"	75°57'34.310"	Arm-mounted area - cobrahead (flat faced) Solar	1	6959	Indirect- if on	Not on	Due to height of fixture and proximity to dunes, indirect light from source may be visible.

Table B-5. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Observed and Expected Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference Photo Number	Observed or Expected Impact	Lamp Type	Other Remarks
Building 241 parking	DNA110	36°47'17.079"	75°57'34.459"	Pole-mounted cutoff, round	1	6951 / 7103	Indirect	Gold-peach, indicative of HPS	
Building 241 parking	DNA111	36°47'17.239"	75°57'33.831"	Pole-mounted cutoff, round	1	6951 / 7103	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 241 parking	DNA112	36°47'17.430"	75°57'35.117"	Pole-mounted cutoff, round	1	6951 / 7104	Indirect	White, broad-spectrum	
Building 241 parking	DNA115	36°47'17.892"	75°57'36.646"	Arm-mounted area - cobrahead (double)	1	7015	Direct	Gold-peach, indicative of HPS	Was not visible until completion of beach replenishment
Building 241 parking	DNA193	36°47'18.620"	75°57'33.619"	Pole-mounted cutoff, round	1	6951	Indirect- if on	Not on	
Building 310	DNA166	36°47'43.068"	75°57'44.905"	Wall-mounted flood	3	1148	Indirect	Gold-peach, indicative of HPS	East facing. Cluster of three flood lights.
Building 310	DNA167	36°47'43.262"	75°57'44.938"	Wall-mounted area "Wall pak"	1	1147	Indirect	Gold-peach, indicative of HPS	East facing
Building 310	DNA168	36°47'43.383"	75°57'45.364"	Wall-mounted area "Wall pak"	1	1146	Indirect	Gold-peach, indicative of HPS	
Building 310	DNA169	36°47'43.974"	75°57'45.550"	Wall-mounted area "Wall pak"	1	1148	Indirect	Gold-peach, indicative of HPS	East facing
Building 310	DNA171	36°47'45.347"	75°57'45.590"	Wall-mounted area "Wall pak"	1	1149	Indirect	White, broad-spectrum	
Building 310	DNA189	36°47'45.378"	75°57'45.978"	Wall-mounted area "Wall pak"	1	1149	Indirect	White, broad-spectrum	Light illuminates building wall visible from beach.
Building 310	DNA190	36°47'45.618"	75°57'46.471"	Wall-mounted area "Wall pak"	1	1149	Indirect	White, broad-spectrum	Light illuminates building wall visible from beach.
Building 310 (rock wall)	DNA241	36°47'45.616"	75°57'46.235"	Wall-mounted area "Wall pak"	1	None	Direct- if on	Not on	Fixture visible from the beach. Fixture located near the top of the rock wall, about four stories high. Too distant for a photograph.
Building 350	DNA163a	36°47'38.085"	75°57'44.279"	Wall-mounted area "Wall pak"	1	1139	Indirect	Gold-peach, indicative of HPS	East facing
Building 350	DNA163b	36°47'38.306"	75°57'44.117"	Wall-mounted area "Wall pak"	1	1139	Indirect	Gold-peach, indicative of HPS	East facing
Building 350 parking	DNA162	36°47'37.664"	75°57'46.726"	Arm-mounted cutoff - shoebox	1	1161	Indirect	Gold-peach, indicative of HPS	

Table B-5. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Observed and Expected Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference Photo Number	Observed or Expected Impact	Lamp Type	Other Remarks
Building 404 parking	DNA196	36°45'38.840"	75°57'05.230"	Arm-mounted area - cobrahead	1	6972	Indirect	Gold-peach, indicative of HPS	
Building 404 Gate Guard Building.	DNA195	36°45'39.296"	75°57'06.156"	Wall-mounted flood lamp	4	Example A	Indirect- if on	White, broad-spectrum	Missed photo.
Building 465A	DNA185	36°46'11.249"	75°57'14.387"	Wall-mounted flood	1	7451	Direct	Gold-peach, indicative of HPS	
Building 465A	DNA186	36°46'11.478"	75°57'14.162"	Wall-mounted flood	1	7451	Direct	Gold-peach, indicative of HPS	
Building 465A	DNA187	36°46'11.425"	75°57'14.453"	Wall-mounted flood lamp	1	7452	Direct	Yellow, halogen lamp	
Building 465A	DNA188	36°46'11.538"	75°57'14.360"	Wall-mounted flood lamp	1	7452	Direct	Yellow, halogen lamp	
Building 293	DNA226a	36°48'44.005"	75°58'05.133"	Dome skylight	1	None	Direct	Interior lights	Faint, minimal. Skylights located on top, center of dome. No photos showing building were taken.
Building 293	DNA226b	36°48'44.005"	75°58'05.133"	Red marker	1	Example B	Direct- if on	Red lens	Top mounted lights, fixture visible from beach. Unable to obtain a photograph.
Buildings 384/385	DNA36	36°47'27.773"	75°57'41.120"	Arm-mounted cutoff - shoebox	1	1166	Indirect- if on	Not on	New construction. Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Buildings 384/385	DNA37	36°47'27.194"	75°57'41.333"	Arm-mounted cutoff - shoebox	1	1166	Indirect- if on	Not on	New construction. Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Buildings 384/385	DNA38	36°47'26.707"	75°57'41.353"	Arm-mounted cutoff - shoebox	1	1166	Indirect- if on	Not on	New construction. Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Buildings 384/385	DNA39	36°47'26.708"	75°57'41.354"	Arm-mounted cutoff - shoebox	1	1166	Indirect- if on	Not on	New construction. Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Buildings 384/385	DNA40	36°47'25.377"	75°57'40.533"	Arm-mounted cutoff - shoebox	1	1166	Indirect- if on	Not on	New construction. Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Buildings 384/385	DNA45	36°47'29.143"	75°57'42.676"	Arm-mounted cutoff - shoebox	1	1166	Indirect- if on	Not on	New construction. Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Buildings 384/385	DNA46	36°47'29.464"	75°57'43.444"	Arm-mounted cutoff - shoebox	1	1166	Indirect- if on	Not on	New construction. Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Buildings 384/385	DNA47	36°47'28.612"	75°57'43.616"	Arm-mounted cutoff - shoebox	1	1166	Indirect- if on	Not on	New construction. Due to height of fixture and proximity to dunes, indirect light from source may be visible.

Table B-5. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Observed and Expected Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference Photo Number	Observed or Expected Impact	Lamp Type	Other Remarks
Building 382	DNA178	36°47'47.475"	75°57'45.955"	Beach facing windows	1	None	Direct- if on	Not on	Interior lights were not on during surveys, however, upper floor windows are visible from beach. No photos of building windows were taken.
Building 382 perimeter	DNA15	36°47'45.915"	75°57'47.452"	Arm-mounted cutoff - shoebox	1	1154	Direct	Gold-peach, indicative of HPS	
Building 382 perimeter	DNA176	36°47'46.240"	75°57'47.465"	Arm-mounted cutoff - shoebox	1	1154	Direct	Gold-peach, indicative of HPS	
Building 382 perimeter	DNA21	36°47'46.110"	75°57'45.889"	Arm-mounted cutoff - shoebox	1	1154	Direct	Gold-peach, indicative of HPS	
Building 370 parking	DNA23	36°47'36.437"	75°57'46.690"	Arm-mounted cutoff - shoebox (double)	1	1164	Indirect- if on	Not on	Likely white, broad-spectrum as other new parking lights in this area. Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Building 370 parking	DNA24	36°47'35.737"	75°57'47.474"	Arm-mounted cutoff - shoebox (double)	1	1164	Indirect- if on	Not on	Likely white, broad-spectrum as other new parking lights in this area. Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Building 370 parking	DNA25	36°47'34.213"	75°57'47.148"	Arm-mounted cutoff - shoebox (double)	1	1164	Indirect- if on	Not on	Likely white, broad-spectrum as other new parking lights in this area. Due to height of fixture and proximity to dunes, indirect light from source may be visible.
Building 370 parking	DNA26	36°47'33.795"	75°57'45.115"	Arm-mounted cutoff - shoebox (double)	1	1164 / 10930	Direct	White, broad-spectrum	Visible due to beach replenishment
Building 370 parking	DNA27	36°47'34.732"	75°57'44.411"	Arm-mounted cutoff - shoebox (double)	1	1164 / 10930	Direct	White, broad-spectrum	Visible due to beach replenishment
Building 370 parking	DNA28	36°47'35.681"	75°57'43.923"	Arm-mounted cutoff - shoebox (double)	1	1164 / 10930	Direct	White, broad-spectrum	Visible due to beach replenishment
Building 370 parking	DNA29	36°47'36.432"	75°57'44.149"	Arm-mounted cutoff - shoebox (double)	1	1164 / 10930	Direct	White, broad-spectrum	Visible due to beach replenishment
Building 370 parking	DNA30	36°47'36.905"	75°57'45.497"	Arm-mounted cutoff - shoebox (double)	1	1164 / 10930	Direct	White, broad-spectrum	Visible due to beach replenishment
Building 383	DNA180	36°47'27.618"	75°57'38.164"	Beach facing windows	1	None	Direct	Interior lights	Interior lights were not on during surveys, however, upper floor windows are visible from beach. No photos of building windows were taken.
Building 383 parking	DNA138	36°47'25.377"	75°57'40.166"	Arm-mounted cutoff - shoebox	1	1166 / 10931	Direct	White, broad-spectrum	
Building 383 parking	DNA139	36°47'25.341"	75°57'39.275"	Arm-mounted cutoff - shoebox	1	1166 / 10931	Direct	White, broad-spectrum	New construction

Table B-6. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Unknown Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference photo number	Observed or Expected Impact	Lamp Type	Other Remarks
Building 225	DNA3	36°47'20.035	75°57'34.110	Wall mounted area decorative carriage (large)	7	6952 / 6953	Unknown	Not on	Incandescent bulb. Unknown if enough light is produced for indirect lighting.
Building 474	DNA197	36°45'47.677"	75°57'07.561"	Wall mounted area "Wall pak"	1	7036	Unknown	Not on	East facing. Fixtures located several floors high. Potential impact unknown, fixture is not visible from the beach but may illuminate the wall visible from the beach when on.
Building 474	DNA199	36°45'47.906	75°57'07.671	Wall mounted area "Wall pak"	1	7037	Unknown	Not on	Northwest facing. Fixtures located several floors high. Potential impact unknown, fixture is not visible from the beach but may illuminate the wall visible from the beach when on.
MACS 24 perimeter	DNA200	36°48'46.718"	75°58'05.976"	Arm mounted cutoff - shoebox	1	7038	Unknown	Not on	Fixtures are not visible from the beach, but these lights are at a height and may be close enough to the dunes to provide indirect lighting.
MACS 24 perimeter	DNA201	36°48'46.456"	75°58'07.116"	Arm mounted cutoff - shoebox	1	7038	Unknown	Not on	Fixtures are not visible from the beach, but these lights are at a height and may be close enough to the dunes to provide indirect lighting.
MACS 24 perimeter	DNA202	36°48'43.598"	75°58'05.511"	Arm mounted cutoff - shoebox	1	7038	Unknown	Not on	Fixtures are not visible from the beach, but these lights are at a height and may be close enough to the dunes to provide indirect lighting.
MACS 24 perimeter	DNA203	36°48'43.395"	75°58'06.261"	Arm mounted cutoff - shoebox	1	7038	Unknown	Not on	Fixtures are not visible from the beach, but these lights are at a height and may be close enough to the dunes to provide indirect lighting.
MACS 24 perimeter	DNA204	36°48'43.367"	75°58'07.470"	Arm mounted cutoff - shoebox	1	7038	Unknown	Not on	Fixtures are not visible from the beach, but these lights are at a height and may be close enough to the dunes to provide indirect lighting.
MACS 24 perimeter	DNA205	36°48'45.978"	75°58'08.820"	Arm mounted cutoff - shoebox	1	7038	Unknown	Not on	Fixtures are not visible from the beach, but these lights are at a height and may be close enough to the dunes to provide indirect lighting.
MACS 24 perimeter	DNA206	36°48'44.460"	75°58'07.967"	Arm mounted cutoff - shoebox	1	7038	Unknown	Not on	Fixtures are not visible from the beach, but these lights are at a height and may be close enough to the dunes to provide indirect lighting.
NSWDG Firing Range (Batt Rd)	DNA142	36°47'50.287	75°57'50.982	Pole mounted cutoff shoebox	1	1154	Unknown	Not on	Fixtures are on elevated poles and located approximately 1,000 ft from shoreline. Impact unknown, but may be at a height and close enough to provide indirect lighting.
NSWDG Firing Range (Batt Rd)	DNA143	36°47'49.467	75°57'53.160	Pole mounted flood	1	1169	Unknown	Not on	Fixtures are on elevated poles and located approximately 1,000 ft from shoreline. Impact unknown, but may be at a height and close enough to provide indirect lighting.

Table B-6. Naval Air Station Oceana – Dam Neck Annex Lighting Survey Data Sheet Unknown Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference photo number	Observed or Expected Impact	Lamp Type	Other Remarks
NSWDG Firing Range (Batt Rd)	DNA144	36°47'50.289	75°57'50.984	Pole mounted flood (double)	1	1170	Unknown	Not on	Fixtures are on elevated poles and located approximately 1,000 ft from shoreline. Impact unknown, but may be at a height and close enough to provide indirect lighting.
Building 382 perimeter	DNA175	36°47'46.055	75°57'47.465	Arm mounted cutoff - shoebox	1	1154	Unknown	Not on	Fixtures are on elevated poles. Impact unknown, but may at a height and close enough to dunes to provide indirect lighting.
Building 382 perimeter	DNA16	36°47'46.721	75°57'48.936	Arm mounted cutoff - shoebox	1	1154	Unknown	Not on	Fixtures are on elevated poles. Impact unknown, but may at a height and close enough to dunes to provide indirect lighting.
Building 382 perimeter	DNA19	36°47'47.700	75°57'45.691	Arm mounted cutoff - shoebox	1	1154	Unknown	Not on	Fixtures are on elevated poles. Impact unknown, but may at a height and close enough to dunes to provide indirect lighting.
Buildings 384/385	DNA217	36°47'28.486"	75°57'41.857	Ceiling mounted area	14	P1020162	Unknown	Not on	These are ceiling mounted down lighting that is partially shielded by an overhang, however, they are elevated and are clustered relatively close together. Unable to determine potential impact, this will depend on lamp type and intensity.

Table B-7. Virginia Army National Guard – Camp Pendleton Lighting Survey Data Sheet Observed and Expected Impacts

Location of Light	GPS Pt Designation	Latitude (N)	Longitude (W)	Description of Light	Quantity	Reference photo number	Observed or Expected Impact	Lamp Type	Other Remarks
Camp Pendleton North Boundary	DNA239	36°49'07.158"	75°58'00.156"	Solar flood lamp	1	7460	Direct	White, broad-spectrum LED	Located on boundary fence piling directed out towards the ocean. Used to illuminate a U.S. flag mounted on an adjacent piling.
Croatan Beach parking restrooms	DNA240a	36°49'04.392"	75°58'04.601"	Wall-mounted area "Wall pak"	1	7463	Indirect	Gold-peach, indicative of HPS	Northern peak of roof and side is visible through the dune crossing boardwalk.
Croatan Beach parking restrooms	DNA240b	36°49'04.350"	75°58'04.826"	Wall mounted area "Wall pak"	1	7464	Indirect	White, broad-spectrum	Northern peak of roof and side is visible through the dune crossing boardwalk.

Location	Fixture Type	Photograph Number ²
Ball fields	Pole-mounted stadium lighting arrays	6969
Beach Access	Pole-mounted flood	1125
Building 102	Wall-mounted area "Wall pak"	7017
Building 102 parking	Arm-mounted area - cobrahead	6972
	Arm-mounted area - cobrahead (double)	7015
Building 127	Wall-mounted flood	7021, 7022, 7026, 7100
Building 127 parking	Arm-mounted area - cobrahead	6972
	Arm-mounted area - cobrahead (flat faced)	7099
	Pole-mounted flood (double)	7028
	Arm-mounted cutoff – shoebox (double)	7014, 7101
Building 127 tower	Red marked light	Example B
Building 132/114 parking	Arm-mounted area - cobrahead	7454
	Arm-mounted area - cobrahead (flat faced)	7456
Building 153 parking	Arm-mounted area - cobrahead (flat faced) Solar	7013 / 7449
Building 170	Arm-mounted area - cobrahead	7454
	Arm-mounted area - cobrahead (flat faced)	7456
	Pole-mounted flood (double)	7028
Building 183 parking	Arm-mounted area - cobrahead	7454
Building 187	Wall-mounted area "Wall pak"	6948, 6949, 6950, 7096, 7097
Building 187 parking	Arm-mounted area - cobrahead (double)	7015
	Arm-mounted area - cobrahead (flat faced) light-emitting diode (LED)	7458
	Arm-mounted area - cobrahead (flat faced; double) LED	7447, 7457
	Pole-mounted flood	6965

² The reference photographs are in numerical order and are provided on pages C-7 through C-18.

Location	Fixture Type	Photograph Number ²
	Arm-mounted area - cobrahead (flat faced) Solar	7013
Building 187 patio	Ceiling mounted fluorescent tubes	6968
Building 187 pavilion	Arm-mounted cutoff - shoebox	6961
	Arm-mounted flood	6967
Building 225	Wall-mounted area "Wall pak"	6948
	Wall-mounted flood	6957
	Wall-mounted area decorative carriage (large)	6952, 6953
Building 225 Parking	Arm-mounted area - cobrahead	6972
	Arm-mounted area - cobrahead (flat faced) solar	7013
	Arm-mounted cutoff - shoebox (double)	7014, 7105
Building 241	Pole-mounted cutoff, round	6951, 7103
	Wall-mounted area	6958
Building 241 parking	Arm-mounted area - cobrahead (flat faced) solar	6959
	Pole-mounted cutoff, round	6951, 7103, 7104
	Arm-mounted area - cobrahead (double)	7015
Building 404	Arm-mounted area - cobrahead	6972
Building 404 Gate Building	Wall-mounted flood lamp	Example A
Building 465A	Wall-mounted flood	7451
	Wall-mounted flood lamp	7452
Building 474	Wall-mounted area "Wall pak"	7036, 7037
MACS-24 perimeter	Arm-mounted cutoff - shoebox	7038

Location	Fixture Type	Photograph Number ²
MACS-24 dome	Red marker light	Example B
NSWDG Building 310	Wall-mounted flood (group of three)	1148
	Wall-mounted area "Wall pak"	1146, 1147, 1149
NSWDG Building 350	Wall-mounted area "Wall pak"	1139
NSWDG Building 350 parking	Arm-mounted cutoff - shoebox	1161
NSWDG firing range (Batt road)	Pole-mounted cutoff - shoebox	1154
	Pole-mounted flood	1169
	Pole-mounted flood (double)	1170
NSWDG New Entry Control	Arm-mounted cutoff - shoebox	1166
	Ceiling mounted area	P1020162
NSWDG K9 facility perimeter	Arm-mounted cutoff - shoebox	1154
NSWDG New N10 facility parking	Arm-mounted cutoff - shoebox (double)	1164, 10930
NSWDG New shipping and receiving - parking	Arm-mounted cutoff - shoebox	1166, 10931
NSWDG perimeter	Pole-mounted flood - 2 per pole	1130, 1142
NSWDG Range guard shack	Pole-mounted strobe - solar	1165
NSWDG TPS9	Wall-mounted area "Wall pak"	1131
NSWDG TPS10	Wall-mounted area "Wall pak"	1147
Regulus Ave (at Viking)	Arm-mounted area - cobrahead	6972
Viking Ave	Arm-mounted area - cobrahead	6972
Regulus Ave at New Entry Control	Arm-mounted cutoff - shoebox	7012

Appendix C

Sea Turtle Data Sources

Numerous federal, state, non-profit, and academic research efforts have been conducted to obtain records of sea turtles in Virginia. We compiled a variety of records, including sightings, strandings, bycatch, nests, and false crawls, to describe the occurrence of sea turtles on and near military installations in the Virginia Beach area. The sources of these data are summarized in **Table C-1**. Summaries of the occurrence records for each turtle species near the Action Area are provided in **Tables C-2 through C-6**. These records are shown in **Figures 5-12** in Section 3.0.

**Table C-1
Data Sources for Sea Turtle Occurrence Records included in this Biological Assessment**

Dataset	Year(s)
Shipboard Sighting Surveys	
US Navy Marine Species Monitoring Program	
Norfolk/VA Beach Photo-ID Surveys	2012-2013
Norfolk/VA Beach MINEX Vessel Surveys	2012-2013
Norfolk/VA Beach Inshore Vessel Surveys	2012-2013
North Atlantic Right Whale Consortium (NARWC) Database	1762-2001
CETAP Shipboard Survey	1978-1982
Aerial Sighting Surveys	
VA and MD Sea Turtle Research and Conservation Initiative Aerial Survey ¹	2011-2013
VA CZM Wind Energy Area Aerial Surveys ¹	2012-2014
NMFS-SEFSC Mid-Atlantic <i>Tursiops</i> Surveys (MATS)	1995; 2002
North Atlantic Right Whale Consortium (NARWC) Database	1762-2001
CETAP Aerial Survey	1978-1982
NMFS-NEFSC Twin Otter Aerial Survey	2004
Strandings	
NMFS-NEFSC Sea Turtle Mapping and Information System	1980-1997
Sea Turtle Stranding and Salvage Network (STSSN) ²	1998-2015
Nests/False Crawls	
Virginia Department of Game and Inland Fisheries (VDGIF) Nesting/False Crawl Database	1970-2015
US Navy VA Installation Nesting/False Crawl Database	2002-2014
Published Literature	
Keinath et al.	1991
Musick et al.	1988
Swingle et al.	2007

¹ Data provided by the Virginia Aquarium and Marine Science Foundation

² Note that stranding data from 2006 and 2007 were not included in the STSSN database provided because data from these years have not been reviewed yet.

Appendix D

Construction and Placement of Predator-Proof Nest Cages

When a nest is at high risk of predation and flat a piece of screening is not enough of a deterrent to keep predators such as foxes, pigs and coyotes from digging into the nest, the eggs and pre-emergent hatchlings may be protected by placing a self-releasing cage over the nest (Figure 1). The cages should provide enough room for all hatchlings to completely emerge from the sand and be made of 2 in. x 4 in. mesh fencing (welded wire or some other strong bendable material). The 4" width of the mesh must be parallel to the surface of the sand.

Methods and Placement

Cut one piece of 36 in. x 96 in. and two pieces of 30 in. x 36 in. welded wire fencing. Shape the fencing pieces to create the cage and flanges as shown in Figure 1. Use plastic zip ties to attach the two short side pieces to the long piece that forms the top and two sides.

Cages are to be centered exactly over the egg chamber to make it less likely that mammalian predators will burrow to the eggs from the side of the cage, and to make sure that any anchoring stakes placed along the edges of the cage will not enter the egg chamber. Most cages are anchored by burying the outward pointing flanges (Figure 1) about one foot under the sand's surface. Center the cage over the egg chamber and trace the edges of the cage in the sand. The cage should be oriented so that the opposing sides of the cage are either parallel or perpendicular to the shoreline. Remove the cage and the temporary egg chamber marker, and carefully dig a one foot deep trench along the tracing of the edges of the cage. Place the cage into the trench and fill the trench with sand. When completed, the sand around the cage and over the egg chamber should be at the original level. Because cages may become partially or completely dislodged, they must be checked regularly.

Naval Station Norfolk Chambers Field

Chambers Field consists of a heliport, twelve helpads, and an 8,000-foot runway. Commissioned in 1918, Chambers Field supports transport, surveillance, helicopters, and attack aircraft. Its current inventory includes: the E-2 Hawkeye, the C-12 Super King Air, the C-2 Greyhound, the CH-46 Sea Knight, the CH-53 Sea Dragon, and the H-60 Seahawk. In addition, Chambers Field is home to the Air Mobility Command (AMC) Passenger and Air Cargo Terminal located on the south side of the airfield. The AMC Terminal processes 8,000 passengers per month and more than 2,000 tons of cargo each month for military missions worldwide. The passengers and cargo are transported on L-1011, 747, C-5, C-17, 767, 757, C-40, and other military and civilian aircraft.

NS Norfolk Chambers Field is located within Class D airspace, which encompasses an area within a 4.3-nautical-mile (nm) radius of the center of NS Norfolk that extends upward to, but not including, 2,000 feet above ground level (AGL). The pattern altitude at Chambers Field is 1,000 feet.

Hours of Operation

NAS Oceana, NS Norfolk Chambers Field, and NALF Fentress are open 24 hours a day, and aircraft operations are frequently conducted at night and on weekends. NAS Oceana's Web site, <https://cnic.navy.mil/Oceana/>, publishes expected hours of operations for NALF Fentress on a monthly basis. This schedule is subject to change due to a variety of factors, including weather and world situation.

Note: The boundaries of the Noise Zones and Accident Potential Zones (APZs) represented on this brochure have not changed from those represented on the AICUZ Pamphlet published by the U.S. Navy in 1999.

Disclaimer: The Norfolk International Airport noise contours were provided by airport authority and have been added to the map for informational uses only. They are not part of the Naval Station (NS) Norfolk Chambers Field Air Installations Compatible Use Zones (AICUZ Study) or part of the Hampton Roads Joint Land Use Study (JLUS). For further information on the Norfolk International noise contours, please contact the Norfolk Airport Authority at (757) 857-3351.

JLUS/AICUZ Planning Map

Joint Land Use Study (JLUS)

The JLUS for the Hampton Roads region was initiated in 2004 as part of the Department of Defense (DoD) nationwide JLUS program. It addresses land use compatibility issues among three jurisdictions – the cities of Virginia Beach, Chesapeake, and Norfolk – surrounding the three Navy airfields in the region. The objective of the Hampton Roads JLUS is to provide recommendations regarding compatible land development policy and implementation responding to the Navy's air mission in the region. For more information on JLUS, refer to the study, 2005 Hampton Roads JLUS Report, located at <http://www.hrpdc.org/JLUS/JLUS.asp> or at local libraries or the city planning department.

AICUZ Program

Overview
All airports attract development. People who work at the airport want to live nearby, and businesses are established to cater to the airport and its employees. As development encroaches upon the airfield, more people experience the noise and other impacts associated with aircraft operations.

The Noise Control Act of 1972 declared that it is the policy of the United States to promote an environment for all Americans free from noise that jeopardizes their health or welfare. This act also excluded military weapons or equipment that are designed for combat use. In response to the Noise Control Act of 1972, the Department of Defense (DoD) established the Air Installations Compatible Use Zones (AICUZ) Program to balance the need for aircraft operations and community concerns. Individual services, in turn, adopted the program. The Navy's guidance on AICUZ may be found in Chief of Naval Operations Instruction (OPNAVINST) 11010.36C and is available for viewing on the Navy's web site of directives, <http://doni.daps.dla.mil/Directives/11000%20Facilities%20and%20Land%20Management%20Ashore/11-00%20Facilities%20and%20Activities%20Ashore%20Support/11010.36C.pdf>. The goal of the AICUZ Program is to protect the health, safety, and welfare of those living near a military airport while preserving operational assurance for the flying mission. AICUZ guidelines define zones of high noise and accident potential and recommend uses compatible within these zones. Local governments are encouraged to apply these guidelines in their land-use decision-making processes.

Noise Zones
Under the AICUZ Program, DoD provides noise zones as a planning tool for local planning agencies. Noise exposure is measured using the day-night average sound level (DNL). For a detailed discussion of DNL, refer to the Noise Metrics section. The DNL contours on the AICUZ maps reflect the noise exposure in the surrounding communities and the fact that noise impacts diminish with distance from the airfield. DNL contours do not reflect the noise of individual aircraft events. DNL contours are used to assess average long-term noise exposure rather than the impact of a single event.

Accident Potential Zones
The DoD provides Accident Potential Zones (APZs) as a planning tool to local land use agencies. APZs are areas where an aircraft accident is likely to occur if one occurs. They do not reflect the probability of an accident. APZs follow arrival, departure, and pattern flight tracks and are based upon analysis of historical data. The AICUZ map defines three APZs – the Clear Zone, APZ 1, and APZ 2. The Clear Zone extends 3,000 feet beyond the runway and has the highest potential for accidents. APZ 1 extends 5,000 feet beyond the Clear Zone, and APZ 2 extends 7,000 feet beyond APZ 1. If an accident occurs, it is more likely to occur in APZ 1 than APZ 2 and more likely to occur in the Clear Zone than in either APZ 1 or APZ 2.

As stated above, APZs follow arrival, departure, and pattern flight tracks. APZs are not roadways in the sky. Weather conditions, wind, pilot technique, and other air traffic will cause some lateral deviation within the landing pattern around an airport.

Compatible Development

Certain land uses are not compatible with military flight operations. Modifications to proposed land developments near the airfield can help resolve concerns between the community and the military. In general, DoD recommends that noise-sensitive uses (e.g., houses, churches, amphitheaters, etc.) be placed outside the high noise zones, that people-intensive uses (e.g., regional shopping malls, theaters, etc.) not be placed in APZs, and that sound-attenuating methods be incorporated into building design and construction. For further information on local land use guidelines, please consult the appropriate city planning department. The DoD recommendations are intended to serve only as guidelines. Local governments alone are responsible for regulating land use.

Land use development should be compatible with noise zones and APZs around a military airfield. Although the military can serve in an advisory capacity, local governments control development beyond the boundaries of the military airfields. Table 1 shows the Navy's recommendations for land use development in noise zones and APZs. Further information on land use guidelines is available in the 2005 Hampton Roads JLUS Report and the OPNAVINST 11010.36C.

Development should also be compatible with flight safety. The Federal Aviation Administration (FAA) and the DoD encourage local communities to restrict development or land uses that could endanger aircraft in the vicinity of the airfield, including:

- Lighting (direct or reflected) that would impair pilot vision;
- Towers, tall structures, and vegetation that penetrate navigable airspace or are to be constructed near the airfield;
- Uses that would generate smoke, steam, or dust;
- Uses that would attract birds, especially waterfowl; and
- Uses that would produce electromagnetic interference with aircraft communication, navigation, or other electrical systems.

The FAA and the DoD established height standards within aircraft approach and departure zones for military and commercial airfields. These standards are presented in the U.S. Code of Federal Regulations, Title 14, Part 77, "Objects Affecting Navigable Airspace." The cities of Virginia Beach, Chesapeake, and Norfolk review building permits in the approach and departure zones to ensure compliance with these height standards. **The FAA must be notified of any development that is not consistent with the height standards.**

Real Estate Disclosure
Most areas of Hampton Roads, to a greater or lesser extent, experience aircraft noise and overflight. Property owners, renters, and lessees need to be aware of whether their property is located within a noise zone or APZ. Virginia law requires that any person marketing property for sale, rental, or lease within a noise zone or APZ provide written disclosure to all prospective purchasers, renters, or lessees that such property is located within a noise zone or APZ. The Hampton Roads REALTORS® Association also encourages its members to provide written disclosure in all real estate transactions and advise their clients to verify whether property is located within a noise zone or APZ, especially in property transactions with non-members.

Restrictive Easements
The Navy owns restrictive easements on 3,680 acres of land near NAS Oceana and 8,780 acres near NALF Fentress. These easements restrict new incompatible development and certain uses of existing property, as outlined in the specific easement, near the airfields. All of the easements are recorded to deed in Virginia Beach or Chesapeake.

Noise Zones
The appropriate noise zone from the list below should be included in all real estate disclosure documents:

- Greater than 75 DNL
- 70 to 75 DNL
- 65 to 70 DNL
- Less than 65 DNL

Accident Potential Zones
The appropriate APZ from the list below should be included in all real estate disclosure documents:

- Clear Zone
- APZ 1
- APZ 2
- None (outside APZs)

Noise contours and APZs are subject to change. The noise contours and APZs will be periodically updated in association with mission changes at the airfield and/or master plan updates. Questions concerning details relating to AICUZ easements or the location of a particular property within a noise zone or APZ should be directed to the NAS Oceana AICUZ office. Questions pertaining to AICUZ-related provisions of local government policies and ordinances should be directed to the planning office of the appropriate locality.

Federal Housing Administration (FHA) and Department of Veterans Affairs (VA) mortgage guarantee eligibility may be affected for homes in certain noise zones and APZs. Contact the FHA or VA for more information.

The City of Virginia Beach's eMapping web site allows users to locate properties on a map by entering an address, street name, or geographic parcel identification number (GPIN). This tool provides property-specific information, including:

- AICUZ Noise/APZ Maps
- Floodplains and Flood Zones
- Real Estate Assessments
- Virginia Beach Land Records
- School Locations

To find more information about AICUZ and access the eMapping site, go to <http://www.vbgov.com/aicuz>.

The City of Chesapeake also has a web site that provides a substantial amount of background information on various related topics. This information can be found at: <http://cityofchesapeake.net/services/dep/par/planning/index.shtml>. This useful web site provides such information as:

- NALF Fentress AICUZ Noise Zone Map
- NALF Fentress Navy Purchased Easement Map
- 2026 City Land Use Plan
- 2050 City Master Transportation Plan
- Chesapeake Open Space and Agriculture Preservation Program
- Citywide Floodplain Maps

Noise Metrics

Noise is unwanted sound. Sound is all around us; sound becomes noise when it interferes with normal activities such as sleep or conversation. The main sources of noise at airfields are flight operations, which include take-offs, landings, touch-and-go operations, and engine maintenance activities. A discussion of how the effect of noise on the environment is quantitatively measured is provided below.

Decibels (dB)
A dB is a logarithmic unit that measures the intensity, or loudness, of sound. A sound level of 0 dB is approximately the threshold of human hearing and is barely audible under extremely quiet listening conditions. Normal speech has a sound level of approximately 60 dB. Sound levels of about 130 dB are felt in the human ear as discomfort and pain.

In measuring community noise, sound frequency is taken into account by adjusting the very high and very low frequencies to approximate the human ear's lower sensitivity to those frequencies. This is called "A-weighting" and is commonly used in measuring community noise levels. An A-weighted decibel (abbreviated dBA) is a unit of sound pressure with a greater intensity than the ambient, or background, sound pressures that best reflect the range of human hearing. Table 2 shows the typical A-weighted sound levels of common sounds and noise environments. The minimum change in sound level of individual events that the average human ear can detect is about 3 dB. On average, a person perceives a change in sound level of about 10 dB as a doubling of the sound's loudness.

Day-Night Average Sound Level (DNL)
The DNL noise metric is based on the number of aircraft operations that occur on an average annual day or average busy day over a 24-hour period. The DNL includes a 10 dB adjustment, or penalty, for aircraft noise occurring between 10:00 pm and 7:00 am because people are more sensitive to noise during normal sleeping hours, when background noise levels are lower. DNL has become the standard metric used by many government agencies and organizations, including the U.S. Environmental Protection Agency (EPA) and FAA, for assessing aircraft noise. The DNL for the community is depicted as a series of contours that connect points of equal value, usually in 5 dB increments. DNL noise contours for NAS Oceana, NALF Fentress, and Chambers Field are shown on the maps included in this pamphlet. Noise contours are not exact measurements. Noise levels inside a contour may be similar to those outside a contour line because the change in noise levels occurs gradually.

Sound Exposure Level (SEL)
SEL is a composite metric that represents both the intensity of a sound and its duration. Individual time-varying noise events (e.g., aircraft overflights) have two main characteristics—a sound level that changes throughout the event and a period of time during which the event is heard. The SEL provides a measure of the net impact of the entire acoustic event, but it does not directly represent the sound level heard at any given time. During an aircraft flyover, it would include both the maximum noise levels and the lower decibel levels produced during onset and recess periods of the overflight. SEL values may exceed the peak noise for an event. Table 3 presents representative SEL values for aircraft on approach, departure, and in the Field Carrier Landing Practice (FCLP) or touch-and-go pattern.

Table 2 TYPICAL A-WEIGHTED SOUND LEVELS OF COMMON SOUNDS AND NOISE ENVIRONMENTS

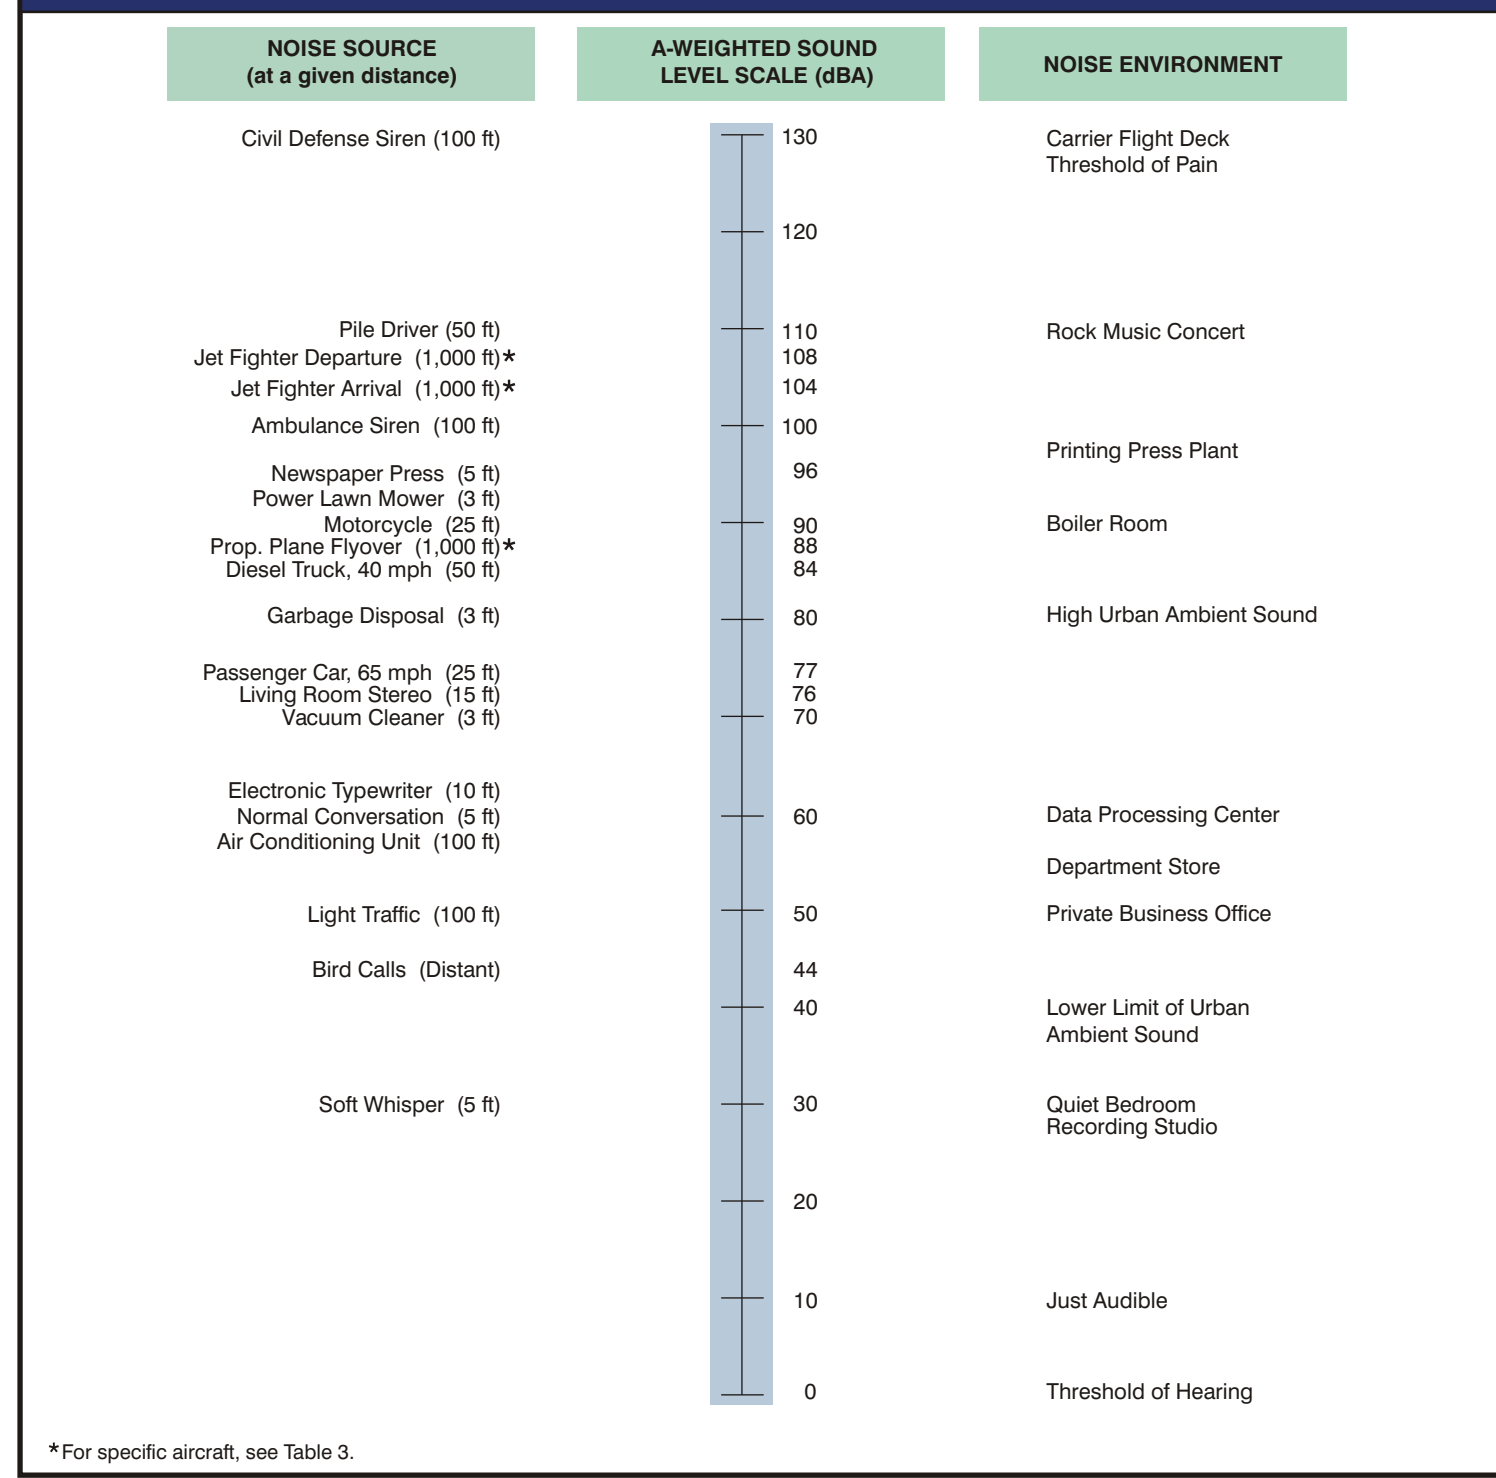

Table 3 Comparison of Representative SEL Values (dB) for Aircraft on Approach, Departure, and in the FCLP or Touch-and-Go Pattern

Operation	Altitude (ft AGL)	F-14 B/D	F/A-18 C/D	F/A-18 E/F	E-2/C-2	C-5A	H-60	H-53
Approach	1,000	87	109	114	82	110	85	97
Departure	1,000	108	117	117	94	114	79	96
FCLP*								
	1,000	95	108	113	87	109	83	92
	800	97	109	115	89	109	86	93

* FCLP or touch-and-go pattern altitude reflects the highest altitude of the downwind leg of the pattern.
SEL values for helicopters is given for level flight.

Hampton Roads Joint Land Use Study (JLUS)/ Air Installations Compatible Use Zones (AICUZ) Planning Map

For Naval Air Station Oceana
Apollo Soucek Field
Virginia Beach, Virginia

Including Naval Auxiliary Landing Field Fentress
Chesapeake, Virginia

Naval Station Norfolk
Chambers Field
Norfolk, Virginia

This brochure is the product of the Joint Land Use Study prepared under sponsorship of the Hampton Roads Planning District Commission and the cities of Virginia Beach, Chesapeake, and Norfolk. Technical information was provided by the U.S. Navy for the JLUS effort.

This planning map was prepared under contract with the Hampton Roads Planning District Commission with financial support from the Office of Economic Adjustment, Department of Defense. The content reflects the views of the Hampton Roads Planning District Commission and the jurisdictions involved and does not necessarily reflect the views of the Office of Economic Adjustment.

2005; Revised 2010

NAS Oceana Apollo Soucek Field

In 1940, the Navy acquired the land that would eventually become Naval Air Station (NAS) Oceana. At that time, the surrounding area was mainly farmland. NAS Oceana has grown to become one of the largest and most advanced air stations in the world, with an area of 5,331 acres and an additional 3,680 acres in restrictive easements. Its runways, measuring 8,000 feet and 12,000 feet, are designed for high-performance aircraft. NAS Oceana's primary mission is to train and deploy the Navy's East Coast Strike/Fighter squadrons—the F-14 Tomcats (until their retirement in 2006) and the F/A-18 Hornets and Super Hornets.

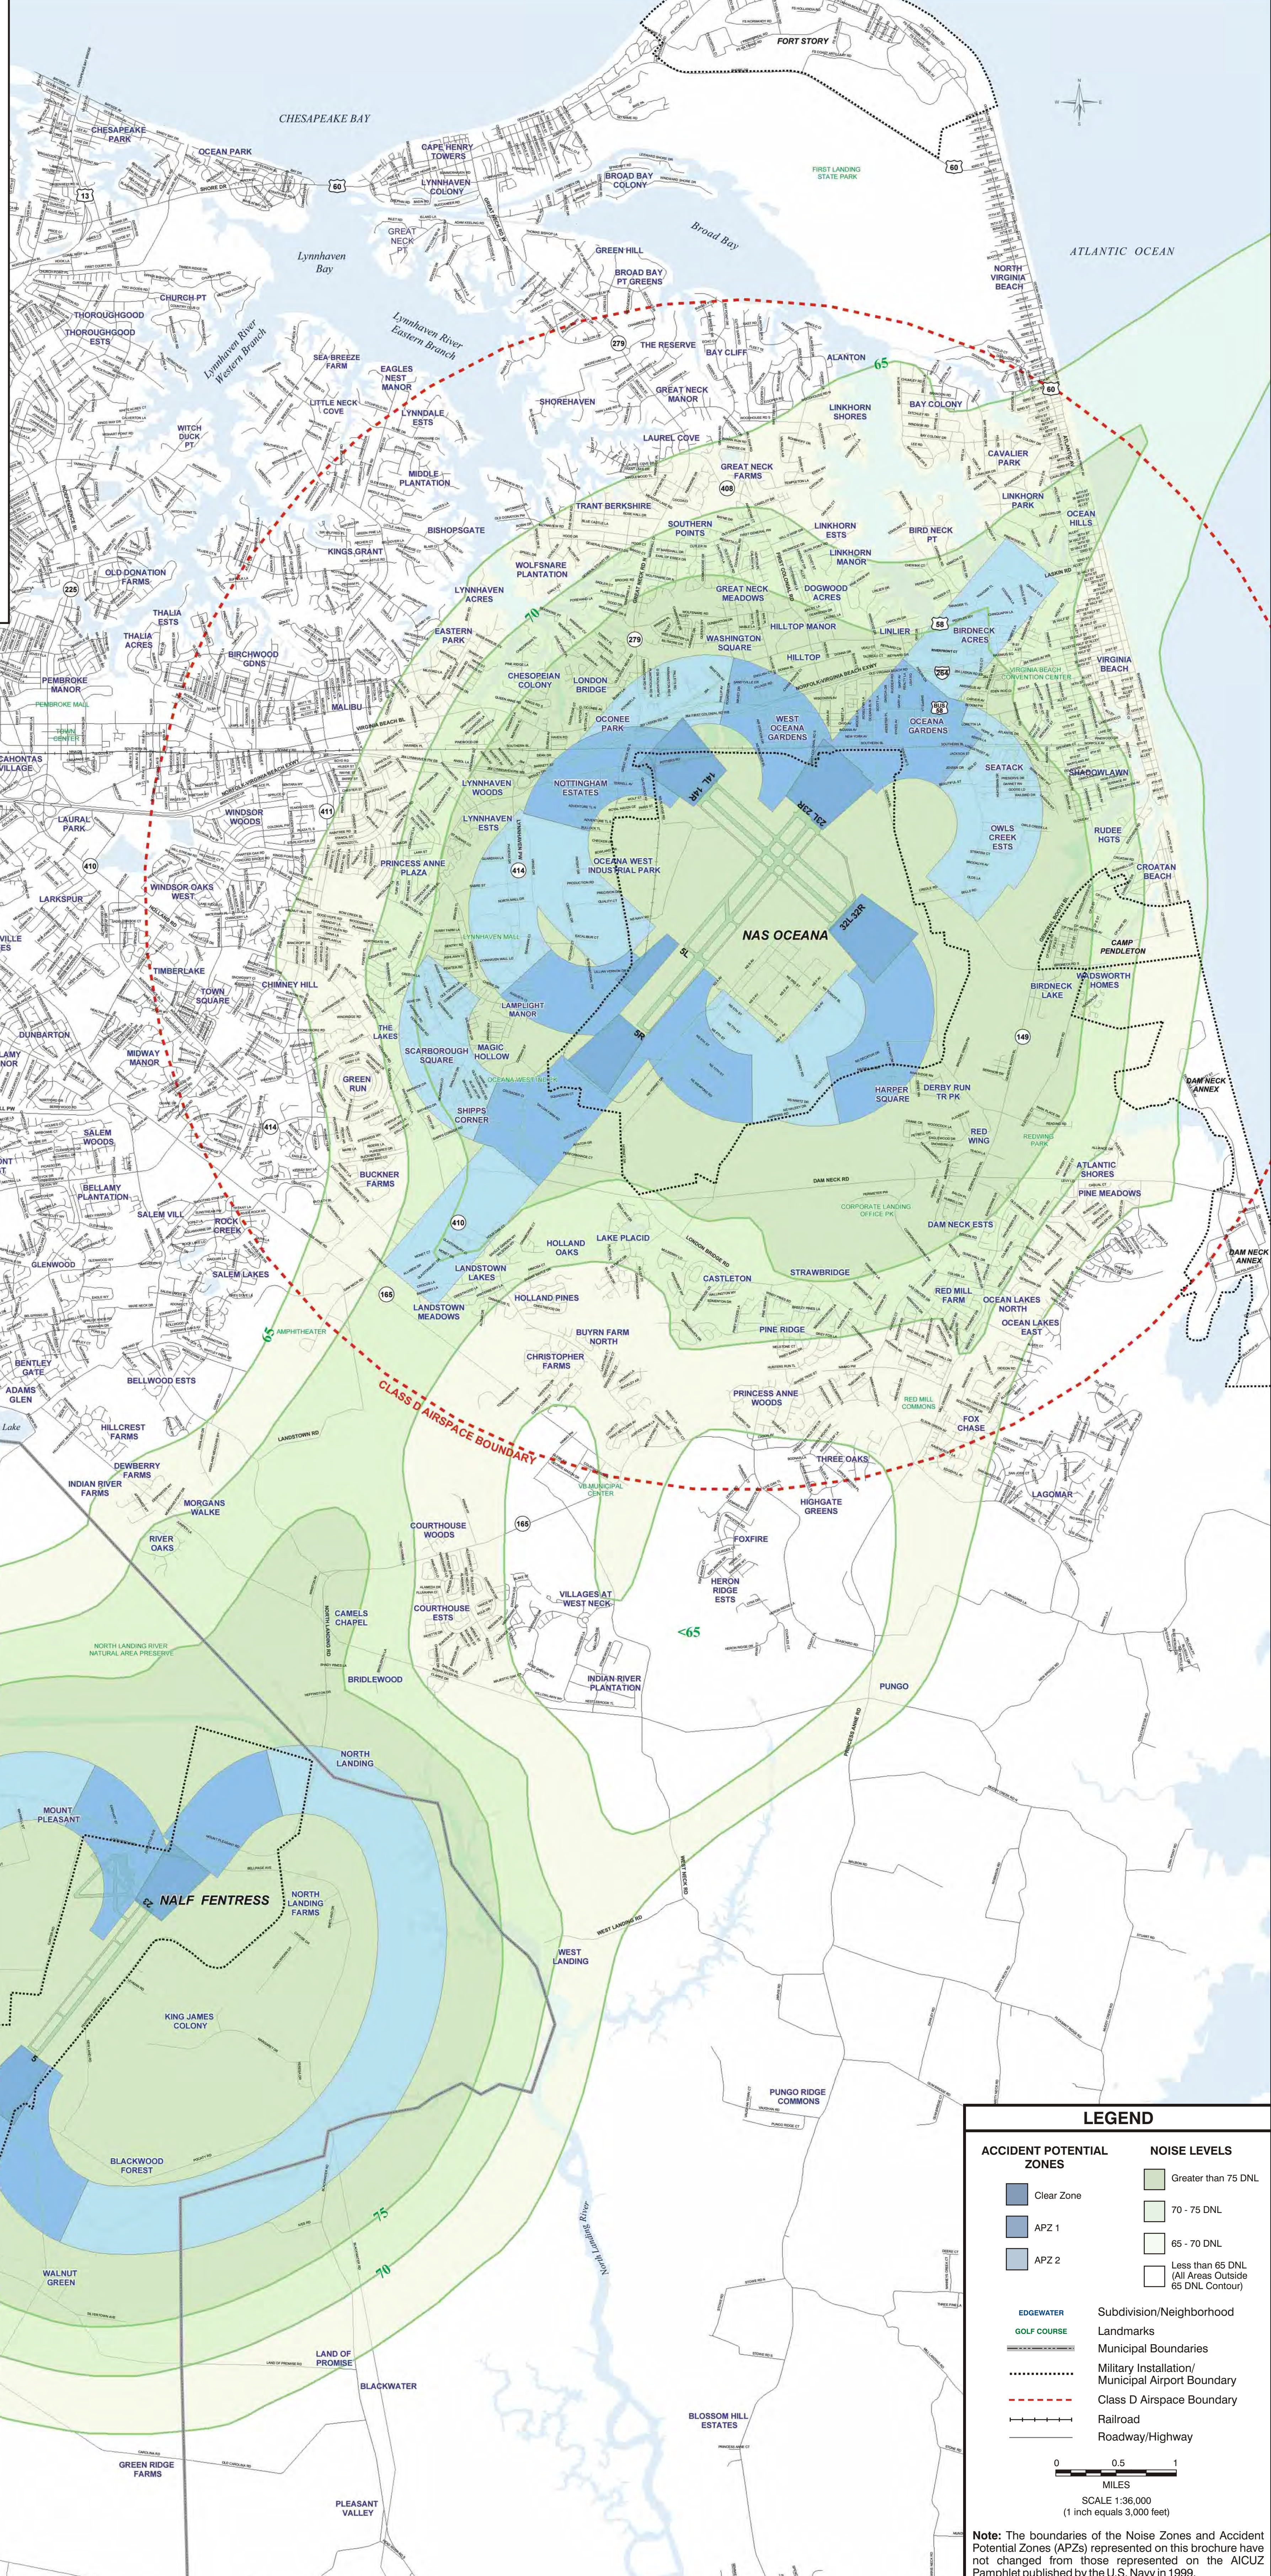

The airspace under control tower jurisdiction and immediately adjacent to the runways is defined by the FAA as "Class D" airspace. At NAS Oceana, Class D is that airspace from the surface to 2,500 feet above ground level within a 5-mile radius from the center of the airport. The pattern altitude at NAS Oceana is 1,000 feet. Flight operations that are conducted into and out of NAS Oceana as part of the typical training syllabus for flight crews include departures, arrivals, touch-and-go landings, practice radar approaches, flights to and from NALF Fentress, and flights to and from offshore training areas. **Flights operating within NAS Oceana's Class D airspace may be routed anywhere within the 5-mile radius at an altitude above 1,000 feet, or lower when necessary for takeoff or landing.**

NALF Fentress

The Naval Auxiliary Landing Field (NALF) Fentress is located approximately 7 miles southwest of NAS Oceana. It was established in 1940 and comprises 2,560 acres, with an additional 8,780 acres in restrictive easements. NALF Fentress has one 8,000-foot runway equipped to simulate an aircraft carrier flight deck. Squadrons stationed at NAS Oceana and NS Norfolk Chambers Field utilize NALF Fentress for Field Carrier Landing Practice (FCLP) operations. These operations are intended to familiarize pilots with carrier landings and must be conducted under both daytime and nighttime operational conditions. Prior to deployments, the local community may experience increased operations as pilots complete training exercises. The pattern altitude at NALF Fentress is 800 feet.

Hours of Operation

NAS Oceana, NS Norfolk Chambers Field, and NALF Fentress are open 24 hours a day, and aircraft operations are frequently conducted at night and on weekends. NAS Oceana's Web site, www.nasoceana.navy.mil, publishes expected hours of operations for NALF Fentress on a monthly basis. This schedule is subject to change due to a variety of factors, including weather and world situation.

Transects for offshore survey option 1

This option involves five survey transects, running perpendicular to the beach, that are approximately six to seven kilometers long and one kilometer apart.

Transects for offshore survey option 2

This option involves ten survey transects, running perpendicular to the beach, that are approximately 20 to 30 kilometers long and five kilometers apart.

JOINT VENTURE
GMI AECOM

6850 Versar Center #201
Springfield, Virginia 22151

Revised 6 May 2015

1.0 WHY GMI-AECOM JV?

- Geo-Marine, Inc.-AECOM Joint Venture (GMI-AECOM JV) provides unique capacity to conduct shipboard and nearshore surveys. We own and operate the equipment required for the various types of surveys. GMI-AECOM JV maintains and operates an assortment of small crafts for environmental sampling and monitoring projects. Principal among these are the 21-foot (ft) research vessel R/V Polgar and the 25-ft R/V Integrity. Both vessels are equipped with a cuddy cabin for equipment storage, a wheel house for all-weather sampling, a mast and boom assembly with a 12-volt electric winch capable of fish-trawling, clam-dredging, and deployment and retrieval of benthic grab-samplers, and meters.
- The GMI-AECOM JV benthic laboratory has gained a national reputation in monitoring and assessing water and habitat quality through collecting, processing, and analyzing thousands of sediment samples and the communities of benthic organisms they support. This reputation is built on 30 years of benthic sampling and analysis support to the federal, state, and local agencies and private entities.
- Specifically for this technical proposal, GMI-AECOM JV has brought together a team of experts possessing all the skills, equipment, and experience needed to complete the survey and a timely and cost-efficient manner.
- GMI-AECOM JV has worked with the Navy in project areas subject to military operations requiring strict access and safety protocols. We have integrated this coordination into our culture of safety and require all field personnel to be trained in First Aid and CPR.

2.0 TECHNICAL PROPOSAL

2.1 Background

The purpose of this task order is to add additional installations to the ongoing study to survey the nearshore and marine environments of the installations specified. These surveys will provide a comprehensive report listing all flora and fauna, habitat types including shoreline type and anthropogenic features, and water quality information. The installations to be surveyed include Naval Air Station Oceana (NASO) and NASO Dam Neck Annex (NASO-DNA), located in Virginia Beach, VA, and Naval Weapons Station Yorktown (NWSY), Cheatham Annex (CAX), and Yorktown Fuel Terminal (YFT) located in Yorktown, VA. The resulting report and data will aid in ensuring compliance with applicable federal, state, and local statutes and regulations, and with Department of Defense policies, instructions, and guidance. The period of performance for this order shall be from project award to 30 December 2016. Additional areas and installations may be added to the Contract through a modification should funds become available in future fiscal years. These include ranges in the adjacent marine environment at NASO-DNA, as well as the nearshore environments at Naval Station Newport (NAVSTA NPT), and Naval Weapons Station Earle (NWSE).

2.2 Technical Approach

The Scope of Work (SOW) identifies Tasks 1 through 3 and Optional Tasks 1 through 4 which correspond to several installations as follows:

Task 1. NASO (Owl's Creek) Nearshore Survey and Report

Task 2. NASO-DNA Nearshore Survey and Report

Task 3. NWSY, CAX, and YFT Nearshore Survey and Report

Option 1: NASO-DNA Range One Marine Survey and Report

Option 2: NASO-DNA Range Two Marine Survey and Report

Option 3: NAVSTA NPT Nearshore Survey and Report

Option 4: NWSE Nearshore Survey and Report

Because the subtasks are nearly identical for each installation, we will discuss our approach for each subtask below which will be adjusted and applied to each installation as appropriate.

Subtask 1 - Prior to conducting any field collections, the GMI-AECOM JV team will conduct a desktop analysis by obtaining historical surveys and data developed by natural resource agencies, applicable Biological Assessments/Biological Opinions and by reviewing each naval installation's Integrated Natural Resource Management Plan. Potential sampling stations will be selected based on reviews of National Oceanic and Atmospheric Administration (NOAA) bathymetry data in coordination with the Naval Technical Representative (NTR) and Installation Representatives (IR).

Subtask 2 - GMI-AECOM JV team's survey plan, generally outlined in this proposal, will be further developed in coordination with the NTR, IRs, and the applicable natural resources agencies to ensure the study plan includes all important habitats, describes all data collection methods, and provides a survey plan that can be repeated in subsequent surveys to quantitatively evaluate changes in environmental conditions.

Subtask 3 – Prior to all field collections, a base-specific health and safety plan will be developed. Our plan will be submitted to the Navy for review and approval, and in needed adjustments will be made prior to fieldwork. In addition, our team will coordinate with the IR to assess the need for a security or Rapid Gate pass, so that when field surveys do commence, we will have no delays.

The GMI-AECOM JV team will conduct surveys of the nearshore environment in accordance with the survey plan and utilizing staff experienced in surveying for all taxonomical groups and all habitats pertinent to the site. GMI-AECOM JV will secure all necessary permits and licenses to complete the work. GMI-AECOM JV routinely acquires scientific collection permits from state Natural Resource Agencies, including Virginia. The process entails filling out state specific collect permit forms and paying a nominal fee to process the application. Our staff maintains a list of state agency staff contacts who process these forms which we renew annually. In addition, we have coordinated with the Virginia Institute of Marine Science (VIMS), and will work with Dr. Mary Fabrizio and her lab who holds all federal T&E permits that would be needed for this study, including Atlantic sturgeon. We will have at least one representative of her lab that is covered by her

permits present with us during all surveys to ensure proper handling and care of T&E species collected, as well as ensure we meet all required protocols. For marine mammal surveys, a take permit will be required. Fortunately, the GMI-AECOM JV currently holds an active permit with NOAA that encompasses this survey area. Through the IR, we will contact NOAA and alert them to the survey efforts and provide all needed data for NOAA to allow the surveys to take place. This permit also covers all five sea turtle species that occur in the region.

Fish – The GMI-AECOM JV team will survey fish populations inhabiting nearshore habitats using a combination of plankton tows, mid-water trawls, bottom trawls and beach seines. At each installation, the GMI-AECOM JV team predetermine survey sites based on research and aerial photographs. Plankton tows will be conducted first before the water is disturbed by boat use and other sampling gear. The plankton tows are used primarily for the collection of larval fish, however, this method is also effective for collection of small fish residing in the water column. Upon arrival at the predetermined survey locations (marked with GPS coordinates to allow for repetition), the tow will be deployed and pulled for one minute parallel. At the end of the tow, the samples will be preserved and transported to our in-house processing lab for enumeration and identification. Three plankton tows will be performed at each site during all survey events. Although larval fish are most prevalent in the fall and spring, annual collection provides a more complete summary of the resident and transient fishes inhabiting the area and their various life stages.

For mid-water and bottom trawls, upon arrival at the survey site, a 25' experimental research trawl with 3/4" stretch mesh wings, lined with a 1/4" stretch bag, will be deployed off the R/V Integrity to collect benthic fish and larger macro-invertebrates. The trawl will be pulled parallel to shore for 3 minutes at a speed that will allow for optimal collection. Start and end points of each survey will be marked with GPS coordinates to allow for repetition and calculation of total distance towed. At the end of each pull, the trawl will be retrieved, and all fauna will be identified to the lowest possible taxon, enumerated, and released. A representative sub-sample of organisms collected will be measured to the closest millimeter. This survey method will be repeated at each location until all 6 samples for both surveys are collected. In restricted areas, or those potentially littered with UXO, we will increase the number of plankton tows and beach seines to assess the fisheries populations in the area. It is possible that gill nets could be used to collect data as well, however, feasibility of deployment and sea conditions may make this method difficult. Video cameras may also be used for fish census, however, if water quality is poor, the video will provide little data. Another option may be to conduct mid-water trawls, to collect samples in the water column, but depending on depth, this method may not be practical. Each method will be assessed and used as site conditions dictate.

Both plankton tow and trawl surveys will be conducted from GMI-AECOM JV's 25' flagship research vessel, the R/V Integrity, which is equipped with a small boat J-frame, Furuno GPS, Radar, and mechanical winch capable of lifting up to 500 lbs.

Following the plankton tow and trawl surveys, we will conduct six beach seines. As with the other gear, we will arrive at predetermined survey locations, we will deploy a 150', ¼" mesh net with a fishing height of 6 ft and a central bag. Using our 18 ft john boat, crews will anchor one end of the net onshore and deploy the net off the back of the boat. Crews will set the net against the flow of the tide to ensure the net does not collapse as it is being pulled in. Once the net is retrieved, we will quickly identify and enumerate all species collected to the lowest taxon possible.

Marine Mammals – Marine Mammal surveys in the nearshore environment are difficult to conduct using standard protocols. Most surveys protocols have been established for offshore areas, using large vessels, and covering large areas. However, the GMI-AECOM JV has experience conducting nearshore marine mammal surveys on the east using a small platform boat and similar methods to offshore protocols. In addition, we have teamed with Virginia Aquarium and Marine Science Center Foundation for these surveys. They have their own vessels and experienced observers to help the GMI-AECOM JV perform this task.

To meet the needs of the Navy, we will develop a systematic survey plan for running transects perpendicular to shore at a set distance to ensure we survey the entire project area (Example: See Appendix 1). Although the maps in the Appendix show 5 and 10 transects per range, we will follow the statement of work and perform 4 in Option 1 and 8 in Option 2. The boat will have a boat captain and three NOAA approved marine mammal/sea turtle observers. One will be the data recorder and the other two will be observing the survey area using binoculars. Each sighting will be recorded, and data will include species, number, behavior, and location. Because these surveys and subsequent sightings are difficult, especially from a small vessel, species level identification may not always be possible, however, we will identify each animal to the lowest taxon possible. These surveys will not allow us to develop density or abundance estimates for the various species encountered, but it will provide a good foundation for the species using the area and behaviors noted, such as feeding, breeding, etc.

We will conduct nearshore surveys during each season, however, because these visual surveys require certain sea conditions, as well as good visibility (no rain, fog, etc), we may have survey events where weather precludes us from completing surveys as designed. We will make every effort to collect as much data and carefully choose survey times based on sound weather and sea forecasts to allow for maximum data collection.

The above mentioned approach for marine mammal surveys can be used for all locations except for the NASP-DNA Range 2. The size of this site, as well as the distance from shore, requires a different approach for safe, proper surveys. The Aquarium has a 45' vessel that can be used for these surveys, allowing the team to survey this offshore area properly. Assuming good weather and sea conditions, we estimate roughly 3 days to complete transects for this range. If for any reason ship-based surveys are not acceptable in this area due to training or other issues, we can also perform aerial surveys. We can use standard fixed wing aircraft to systematically cover the survey area by flying transects both perpendicular and

parallel to shore to ensure 100% survey area coverage. We will use a pilot with aerial survey experience, as well as trained aerial observers to expedite the data collection. We will follow standard NOAA protocols for these types of surveys. These surveys will only require one day, with less costs than ship-based surveys. Depending on what method will be approved, we can adjust costs, however, we are building costs for this proposal using the ship-based method. As will all marine mammal surveys that require a NOAA permit, all methods and approaches must be approved by NOAA, therefore, the approach mentioned above may be modified after consultation with NOAA.

State and Federally Listed Threatened and Endangered Species - All field collections of biota and marine mammal observations will note any state or federally listed threatened and endangered species or proposed species. Our state issued scientific collection permit will be sufficient authorization to conduct fisheries surveys and our NOAA permit allows us to survey the marine mammal and sea turtle species. If listed or proposed fisheries species are collected, it will be noted and immediately released unharmed. ESA specific collection permits are limited to only a few specialized researchers. While Dr. Mary Fabrizio and her lab will assist us with some species, we assume additional subcontracts and schedules would need to be completed with an appropriate ESA permit holder to accompany the collection team is not included in our budget.

Benthic Habitat, Species and Sediment Characteristics – Benthic samples will be collected by field crews aboard the R/V Integrity using a Young Modified Van Veen sampler. Crews will navigate to a predetermined waypoint and record GPS coordinates as the Young sampler is dropped twice to the bottom. The first grab will be sieved through a 500 micron screen and then transferred to a 10% buffered formalin solution. A second sediment sample will be collected and the top layers will be collected, placed on ice for TOC/Grainsize analysis. Samples will then be transported to GMI-AECOM JV Laboratories for sorting and identification of all macro-invertebrate and other analyses. Four benthic collections will be taken in the intertidal habits and four samples in the deeper sub-tidal habitats each season to describe community composition. Location of the benthic grab samples will be carefully coordinated with the IR to ensure surveys are not conducted in areas of UXO or other concerns.

Submerged Aquatic Vegetation (SAV) - Surveys for the presence and distribution of SAV and upland vegetation will be done once in the fall season during peak SAV biomass. Surveys will be conducted using a combination of boat reconnaissance, recent aerial photographs (if available), groundtruthing, and shoreline-based visual surveys. We selected the fall season for SAV surveys to ensure the work will be conducted at the highest standing stock and highest water clarity (i.e., lower algal blooms).

Using our 18ft John Boat, we will determine the boundaries of SAV within each project site and mark them with GPS coordinates. For extremely shallow areas where boat use is impractical, we will mark boundaries on foot. The SAV areas located will be described in terms of species and diversity. If water quality is

sufficient, we can make these determinations visually from the boat, however, it may be necessary to put to collect this data using video cameras, however, this will be subject to approvals based on photography permits and may be limited or not allowed at some installations. Videos and still photographs will be analyzed to assess species present and make estimations of diversity and composition. .

Intertidal Flora and Fauna – The in-water portion of this community will be characterized in the shallow water benthic grabs, the SAV surveys, and beach seine sampling. However, for upland flora and fauna surveys, experienced coastal biologists will run transects from the inland most portion of the beach habit to shore and document vegetation and animal species encountered. The number of transects per site will be based upon the diversity of terrain and habitats in the area. For sites that are more homogenous, six transects will be run. For the sites that are more diverse, additional transects will be needed to accurately assess the area. The surveys will be conducted in late summer for vegetation communities, however, we will also conduct these during the spring season adequately assess fauna populations.

Water Quality - In-situ water quality conditions during all activities will be collected using a calibrated Yellow Springs Instruments (YSI) 6600 series sonde equipped to log dissolve oxygen, pH, conductivity, and turbidity. Water quality will be measured at all benthic grab stations (eight per season and installation) using a calibrated water quality meter to measure salinity, dissolved oxygen, pH, conductivity, turbidity, and temperature. Whole water samples will also be collected using an alpha water sampler to test for nitrogen, nitrate/nitrite, and phosphorus concentrations, and total suspended solids (TSS) using a National Environmental Laboratory Accreditation Program (NELAP)-certified analytical laboratory. A decontaminated sampler will be rinsed with local ambient water and then dropped to a predetermined depth, a messenger weight will be used to activate the sampler. After collection, samples will be decanted from the bottle and preserved on ice before laboratory analysis.

GMI-AECOM JV's field crew will conduct fish, benthic organisms, and water quality sampling for one week at each facility. Each facility will be surveyed in the spring, summer, fall and early winter months. SAV and Intertidal Flora and Fauna will be conducted as a stand-alone survey entailing 4 field days and a crew of 2 for each facility. Additionally, the marine mammal surveys may be stand-alone surveys as well. We will combine where we can, but due to weather restrictions, separate surveys may be required.

Task 3 Reporting:

1) Monthly progress reports will be prepared for each installation including tables that denotes the funds spent per month, per fiscal year, with a total for each fiscal year and an overall total for all fiscal years. These reports shall be provided to both the NTR and the IR. Progress reports shall be submitted electronically on a monthly basis. The progress reports will be submitted electronically as a Word attachment. The progress reports will be dated and sent to the NTR and IRs on the 10th day of each month. Each report will include a detailed account of work accomplished at each installation, estimated percentage of work completed, and costs to date. Each subsequent report will include work from

previous months and any past or future potential issues. Activities planned for the following month will be incorporated into the report. Progress report structure and information required will be amended as requested by the Government.

2) Draft survey plans for each installation will be submitted within 45 days of the Kickoff meeting. GMI-AECOM JV will prepare a plan for each installation summarizing all field survey methodologies and schedules. The plans will be concise reports that describe in detail the protocols that will be used to conduct the surveys in each location, the research vessels and survey equipment that will be utilized during the surveys, the procedures to ensure that the survey equipment is calibrated and functioning correctly, detailed descriptions and schedule of survey activities, and an outline of the data analysis methods. GMI-AECOM JV will provide one (1) electronic copy of each installation's draft plan to the NTR and will provide each IR with one (1) electronic copy of our installation specific plan.

3) Final survey plans for each installation will be sub each installation shall have its own plan.

4) Draft nearshore survey reports will be prepared or each installation that will include GIS data and maps for review.

Draft and final reports will have the following format: all reports will be submitted on 8 1/2 by 11 inch paper with folded maps or tables, as appropriate. All originals will be reproducible by black and white xerography and copies bound, and in digital format. Pages will be printed double-sided to conserve paper. Hard copy documents will be labeled on the front and spine of the documents. Labels will include project title, installation(s) included, and date finalized. The report will include the following sections:

i. Title Page

- Title, date, Contract and task order number and location

ii. Sub-title Page

- Title
- Prepared by listing with affiliations
- Prepared for listing Agreement number and date
- Recommended citation

iii. Executive Summary (background, purpose, findings, conclusion, recommendations)

iv. Table of Contents

- Table of contents
- List of tables
- List of figures (photos are considered figures)
- List of appendices
- List of acronyms

v. Introduction

- This section will include an overview of the project and relevant background information and will clearly state the project's purpose and objectives.

vi. Survey Area

- This section will provide a description in sufficient detail of each survey area/region. Maps of sufficient scale will be included to delineate the location of each species/study area.

vii. Methods

- This section will include detailed information describing how and when the work was accomplished. This section will be drafted so installation/contract personnel will be able to replicate the survey by reading what is in this section. The methods used will be structured and repeatable for future efforts. Survey routes/transects will be documented through GPS and provided to the NTR and IR as a separate GIS layer.

viii. Results

- Results will include, but not be limited to, all data requirements and any extensive data sets will be presented in appendices as appropriate. Results will be presented in text, tables, and figures and will include text describing survey results.

ix. Discussion

- The discussion will be relevant to the purpose of the project and discuss the significance of the results presented. The discussion will summarize sampling results and comment on the analyses.

x. Literature Cited

xi. Appendices (as appropriate)

5) After receiving collective comments from Navy reviewer a final nearshore survey report will be prepared for each installation including survey locations established w/ accompanying GIS route coverage. Final Reports and other text documents will be provided in Microsoft Word format AND Adobe Portable Document Format (PDF). Spreadsheet files will be provided in Microsoft Excel format. Databases will be provided in Microsoft Access format, unless specified otherwise, as approved by the NTR. Prior to database development, we will provide the Government with a Technical Approach Document for approval, which will describe our technical approach to designing and developing the database. All text, spreadsheet, and database files, and any videos will be delivered on external DVDs. In addition, all digital photographs taken during the project fieldwork will be submitted DVDs. All images will be labeled with the title of the image, the location of photograph, date, and photographers' name.

Two digitized copies of all raw field data resulting from the analysis of biological sampling will be submitted, one to the NTR and one to the IR. The format for the raw field data will be external CD/DVD.

All digital files, databases, source data acquired for this project, final hard-copy products, and related materials, including that furnished by the Government, will become the property of the Navy. All materials purchased under this task order will be considered Navy property. All materials will be inventoried and provided to Navy either upon request or at the completion of the project.

Task 3 Geographic Information System Data:

Geographic Information System (GIS) data deliverables will conform to current Navy adaptation of the Spatial Data Standards for Facilities, Infrastructure, and Environment (SDSFIE) version 3.01 format. GIS data will be natively collected using the WGS84 (D_WGS_84) datum, in the WGS 1984 geographic coordinate system (GCS_WGS_84),

using meters as the standard unit of measurement. All data will be submitted in both a raw and post-processed form. ArcGIS metadata shall be completed and included in an XML format, in accordance with the FGDC Content Standard for Digital Geospatial Metadata.

3.0 PROJECT SCHEDULE AND DELIVERABLES

GMI-AECOM JV will utilize the following milestone schedule as a guide with the final schedule to be determined upon contract award. All dates are approximate until the "notice to proceed" is given to GMI-AECOM JV.

Deliverable	No. Copies	Due Date
Kickoff Meeting (to be held via teleconference)	N/A	Within 2 weeks of award of task order
Draft Survey Plans for all six Installations	Electronic	Within 45 days of kickoff meeting
Final Survey Plans for all six Installations	Electronic	Within 2 weeks of receipt of Navy comments
Progress Reports	Electronic	Monthly
Draft Nearshore Reports with Draft Geographic Information Systems (GIS) Deliverables for all six Installations	Electronic	31 Oct 2016
Final Nearshore Reports with GIS Deliverables for all installations	3 Hard Copies and 3 CDs/DVDs of Report and GIS Deliverables. 2 sets of DVDs with all photos and/or videos taken throughout the life of the project.	15 DEC 2016

4.0 PROJECT TEAM RESUMES AND EXPERIENCE

The GMI-AECOM JV team is uniquely qualified to complete the nearshore surveys at the various installations based upon our experience staff and past performance. Experience summaries for key team personnel and several past projects are presented below.

4.1 Key Personnel

Mr. William Burton

Mr. Burton has supervised multiple fisheries surveys throughout the Mid-Atlantic region including surveys conducted off the coasts of New Jersey, Delaware and North Carolina. For the United States Army Corps of Engineers (USACE) Philadelphia District, he conducted fish trawling and video sled surveys of bottom biological features at sand borrow sites slated for beach nourishment projects. All sampling was geo-referenced and the video images were reviewed in the laboratory to provide counts of fish, benthic organisms, and physical features of the borrow area. GIS data layers were created to map important biological features of the sand borrow site. These surveys were further enhanced by benthic infaunal grab sampling used to describe the community composition and abundance. For the Minerals Management Service (MMS; now Bureau of Ocean Energy Management), Mr. Burton conducted a 3-year study of fish use on offshore sand shoals and nearby flat reference bottom areas. Mr. Burton has also used remotely operated vehicles (VideoRay[®]) to survey and assess the fish community use of shipwrecks off the coast of New Jersey for the Philadelphia District of the USACE. The District tasked Mr. Burton to quantify the biological productivity of the shipwrecks as artificial reefs in the event they were buried with sand during a planned beach nourishment project.

Mr. John Ouellette

Mr. Ouellette has over 18 years of experience managing and coordinating research and conservation activities in the United States and worldwide. In his capacity as the GMI-AECOM JV Program Manager for the Naval Facilities Engineering Command Atlantic Biological Indefinite Delivery, Indefinite Contract #N62470-13-D-8017, Mr. Ouellette routinely works to assist project managers to monitor schedules, maintain financial performance, publish reports, ensure accurate and reliable results (quality assurance/quality control [QA/QC]), and administer staff/resource needs. Over his career Mr. Ouellette has worked closely with over 35 relevant government agencies, non-governmental organizations, academic institutions, and corporations in six countries to address a myriad of issues pertaining to the conservation and management of threatened and endangered species, species of interest, human-wildlife interactions, and epidemiology of enzootic diseases.

Ms. Lisa Scott

Ms. Scott specializes in the use of benthic macroinvertebrate communities as tools for impact assessment and biological monitoring. She has more than 30 years' experience in the processing and identification of benthic organisms collected from estuaries, freshwater systems, and coastal regions from eastern states including from Maine to Florida and from regions of the Gulf of Mexico. On average, she supervises the processing of more than 1500 biological samples and 1000 sediment samples in the laboratory each year. Ms. Scott has considerable expertise in laboratory QA/QC protocols and was principally responsible for the development and use of a QA/QC plan that served as the blueprint for the laboratory QA/QC requirements for the Environmental Protection Agency's Estuary Monitoring and Assessment Program, the Mid-Atlantic Integrative Assessment Program, and is currently part of NOAA's National Coastal Assessment Program. She is the curator of the Versar reference collection that includes over 1000 benthic taxa. She was instrumental in developing a comprehensive list of over 1700 benthic taxa representing all species identified from samples collected along the east and gulf coasts and

includes life history characteristics such as feeding type, whether the species is epifauna or infauna, and whether the species is considered an opportunistic or equilibrium species.

Mr. David Wong

Mr. Wong is a Senior Taxonomist with extensive experience in fish identification from both freshwater and marine habitats in the Mid-Atlantic region. Mr. Wong also has research and field experience in oceanic trawling, gillnetting, and fish identification; constructing water quality monitoring stations, conducting chemical and biological sampling, monitoring storm and non-storm events for watershed assessment, laboratory analysis, data analysis, staining procedures, and benthic processing. Mr. Wong has a wealth of project experience. He conducted biological surveys in the lower Christina River (Wilmington, Delaware) to examine the effect of dredging operations on the migration and spawning of anadromous fish in the river; he assisted in radiotelemetry tagging and monitoring of Alosids in the river and was responsible for collecting adult fish with gillnets; and, as a fisheries biologist for the USACE, Wilmington District, he was responsible for a fish community assessment of the beaches in Dare County, North Carolina.

Ms. Jodi Dew-Baxter

Ms. Dew-Baxter has more than 12 years of experience in data analysis and database development as well as data compilation, statistical analysis, modeling, computer programming in SAS, Visual Basic, and R, and webpage maintenance and design. She is the primary analyst for various nearshore survey projects for National Oceanic and Atmospheric Administration, Chesapeake Bay Office, Maryland Department of Natural Resources, USACE Philadelphia District and Wilmington District, and National Park Service (NPS). Some examples of work performed by Ms. Dew-Baxter include a long-term benthic survey project, bottom habitat characterization surveys, and assessment of the ecological impact of beach renourishment. Ms. Dew-Baxter will be responsible for developing an Access geodatabase to house all data collected, conducting QA/QC on data entry, and performing data and statistical analysis on the data.

Mr. Ryan Corbin

Mr. Corbin has research and field experience in the following areas: oceanic and estuarine trawling, seining, sampling with Fyke nets, electrofishing, plankton and ichthyoplankton sampling, benthic macroinvertebrate and sediment sampling and sediment classification, finfish tagging, finfish and crustacean identification, water quality assessment, and laboratory and data analysis. Mr. Corbin has a proficient background in taxonomic field identification of marine, estuarine, and freshwater fishes and crustaceans of the Mid-Atlantic Bight. Mr. Corbin has knowledge of geographic information systems (GIS) and how it can be applied to fisheries and ecosystem management, including the incorporation of a differential global positioning system into trawling operations for the purpose of generating trawl logs. Mr. Corbin also possesses the skills needed to maintain and analyze ecological data sets with both general and advanced statistical methods. Mr. Corbin can trailer and operate vessels up to 25 ft in length. Mr. Corbin has conducted benthic surveys within the nearshore (0.5 miles) ocean habitat off of Assateague Island and Ocean City, Maryland, to characterize the habitats and benthic communities. The type of biological sampling that Mr. Corbin conducted for these projects included the use of benthic grabs to collect sediment and invertebrate species, and trawling using a 25-ft semi-balloon otter trawl. Benthic samples were sieved in the field and organisms were preserved in a solution of formalin and brought back for laboratory species identifications and enumeration. Sediment

samples were also collected at all sites for grain size and total organic carbon analyses. All specimens collected in trawling operations were identified and enumerated in the field and returned back to the ocean as quickly as possible. Water quality data was also gathered at all stations for these projects.

4.2 Previous Experience

Essential Fish Habitat Study (2001-2010) \$500,000.

Versar conducted a study for the Department of Interior's MMS in support of efforts to identify environmentally-acceptable offshore sand resources for coastal beach restoration programs in the Mid-Atlantic Bight (MAB). The purpose of this study was to assess the ecological value of potential sand resources off the coasts of Delaware and Maryland. As ongoing and proposed beach restoration projects along the east coast of the United States deplete nearshore sand resources, efforts to identify new potential sand resources have moved farther offshore onto the continental shelf region of the Exclusive Economic Zone (EEZ) (3 to 200 miles from shore). The management of all mineral resources within the EEZ, including sand, gravel, and shell, falls under the jurisdiction of the MMS, and, as stewards of these resources, the MMS must comply with relevant federal laws to ensure any use of sand resources does not adversely affect marine biological resources.

In collaboration with Maryland and Delaware Geological Survey, the MMS identified four specific sand shoals off the coast of Maryland and Delaware as potential resources for long-term sand mining. The specific shoals were Shoal B, Shoal D, Fenwick Island Shoal, and Weaver Shoal. Recognizing that shoals may provide important habitat to specific marine communities and that sand mining activities could have negative impacts to those communities, the MMS contracted Versar to design and implement a study that would define the marine communities residing at the shoals, and assess the ecological value of the shoals. The results from this study will be used as a guide for future beach nourishment activities.

Underwater Video Sled

Using several analysis techniques, the results of this study documented significant seasonal variations in species composition and species abundances at the shoals and flat-bottom reference sites in this region of the MAB. Yearly variations in species abundance occur, but overall the seasonal patterns of species assemblages are constant. The results also determined day/night differences in fish species using the shoals and flat bottom areas based on the net and bioacoustic survey data. Differences are apparent in the species composition using the shoals and flat-bottom areas during the day, with generally higher species numbers at the flat-bottom sites. Because the net and hydroacoustic data indicated somewhat different patterns of fish use at the shoals, the recommendations to MMS were to adhere to the precautionary approach until further data, such as nighttime net survey

Client Contact and Phone Number: Roger Amato, Bureau of Ocean Energy Management, 703-787-1296

Assateague Island National Seashore Atlantic Subtidal and Beach Benthic Resource Inventory (NPS). \$113,685 and Maryland Coastal Zone Management Benthic Habitat Assessment (MD CZM). \$81,818.

This project combined the data collected from a comprehensive sonar mapping survey conducted by the Maryland Geological Survey (MGS) with biological data collected by Versar to and develop spatially explicit characterizations of coastal habitats and associated living resources. The inventory of biological resources associated with MGS mapped bottom types were conducted using a combination of benthic grab samples and trawls. Biological sampling was conducted over a period of 3 years during two separate sampling events between 2011 and 2013. Each sampling event consisted of conducting 36 benthic grabs (72 total) and 12 trawls (24 total) allocated among four strata (bottom types) delineated by the MGS from the interpretation of sonar survey data.

Sampling for macrobenthos at each site consisted of two grab samples, one for macrobenthos and one for sediment characterization. A Young-modified van Veen grab sampler with a surface sampling area of 0.04 square meters was used at all sites. The Young grab penetrates the sediment to a maximum depth of 10 centimeters (cm); penetration was recorded for each sample. Samples penetrating less than 7 cm were discarded and retaken. Samples were processed on the vessel and preserved for future analyses. In the laboratory, samples were washed in tap water through

nested 0.5- and 1.0-millimeter (mm) mesh screen sieves and processed by placing small amounts of sample material and water in sorting Petri dishes and examined through a binocular stereoscope at 10X magnification. All organisms except the meiofauna (e.g., nematodes and copepods) were sorted into major taxonomic groups, stored in 70 percent ethanol, and subsequently counted and identified to species level whenever possible. Ash-free dry weight biomass was determined for each species by drying (60°C), weighing, and then ashing (500°C) the organisms for 4 hours in a muffle furnace. Grain size was analyzed by wet sieving over nested 0.0625-, 0.125-, 0.25-, 0.50-, 1.00-, 2.00-, and 4.00-mm mesh metal wire screens. Various amounts of sediment (50-200 grams [g]) were used according to the coarseness of the material. Organic carbon was calculated as a percentage of weight loss upon ignition after drying (60°C), weighing, and then ashing (500°C) a small amount of sediment for hours in a muffle furnace.

Trawls were conducted in each of the four strata using a 7.6-meter (m) semi-balloon otter trawl with a 4-cm stretch mesh body fitted with a 3-mm stretch mesh liner in the cod-end. Trawling was conducted during the day from Versar's 7.6-m research vessel, the "R/V Integrity". Trawls were deployed over the stern of the vessel and towed on the seafloor for 6 to 10 minutes at a speed between 1.5 and 2.0 knots. Trawls were conducted parallel to the depth contour so that intra-trawl depths remained consistent. The vessel position and heading was logged on a shipboard computer at 2-second intervals to determine the approximate distance each trawl was towed. Organisms collected in trawls were placed into a large tub of seawater for sorting and documentation when a trawl was retrieved. Fish and invertebrate species were identified to the lowest practical taxon, counted, and a subset of 25 specimens of each species were measured to the nearest millimeter standard length. When jellies or SAV were present, the volume of each

was approximated. Shells and other natural debris were also documented when present in trawls. All living organisms and natural debris were released once the trawl content had been thoroughly sorted.

Benthic macroinvertebrate data were analyzed to identify patterns in species composition and abundance and biomass distribution using cluster analysis and non-metric multidimensional scaling ordination procedures in PRIMER and Nodal Analysis. Species collected in trawls were summarized and presented by bottom type. Community characteristics discovered from grab and trawl data were combined on fact sheets that described both physical and biological community attributes associated with each of the primary bottom types delineated by the MGS.

A Determination of Habitat Preferences of Fish Communities Residing in Mesohaline Habitats of Chesapeake Bay (NOAA Chesapeake Bay Office). \$485,167.

Fish community sampling was conducted using two primary gear types. Shoreline habitats were sampled using 61-m seines, and deeper benthic fish communities were sampled using 7.5-m trawl nets. Sampling was conducted seasonally in spring (April-June), summer (July-September), and autumn (October-November). To determine differences in habitat use within the diel cycle, sampling with both gears occurred during the day and at night. Daytime samples were collected 1.5 hours after sunrise to 1.5 hours before sunset and night samples were collected 1.5 hours after sunset to 1.5 hours before sunrise.

Trawl Specific Methods

Once the trawl was deployed, starting global positioning system (GPS) coordinates, depth, and time were recorded on the datasheet. The duration of a trawl sample was 6 minutes from the time the trawl was set to the beginning of retrieval. Trawl transects were kept within the habitat being sampled, and sample areas could be moved to allow for the trawl to occur in the desired habitat, or if depth or underwater obstructions posed a problem. If a station was moved, a note was made on the datasheet. Trawls were also conducted into the current whenever possible, and the direction of the trawl, and current and wind relation, were noted on the datasheet. Finally, any pieces of habitat collected in the trawl were noted on the datasheet. At the end of the trawl, the ending GPS coordinates, depth, and time were recorded on the datasheet. Once the trawl was retrieved, the contents were emptied from the cod end into a large plastic tub half-full of saltwater for sorting. Any information regarding by-catch was also recorded on the datasheet.

Seine Specific Methods

The seine was set by boat in a semi-circle around the habitat being sampled. Once the seine was retrieved such that all organisms were within the bag, the net was consolidated until all organisms were restricted to a confined portion of the bag, making sorting easier later. The seine was then draped over the back of the skiff, making sure that all organisms remained in the water; this step ensured that all organisms incurred the least amount of stress as possible. The sample was then sorted as described above, and all data was recorded on the datasheet. Once all organisms had been sorted and recorded, site-specific habitat data was recorded, as well as the width of the seine (feet) on shore, the distance from shore to the bag buoy (feet), depth of the water at the bag (feet), and the GPS coordinates at the bag.

5.0 ASSUMPTIONS

To complete the tasks as outlined in this document and within the given project schedule, the following assumptions must be met:

- Reasonable access to the project areas will be provided by the Government to allow for a sufficient quantity of surveys and the work to proceed according to the schedule.
- Scientific permits will be secured in a timely manner without impacting schedule.
- Fish will be adequately surveyed using trawls and seines. Alternative methods of equivalent cost may be considered, where necessary.
- Acoustic surveys are not required for marine mammal surveys.
- All marine mammal surveys will be conducted from small vessels or shore using standard visual aids such as scopes or binoculars.
- Sea turtles will be recorded, including species, location, and time of day if observed.
- SAV will be surveyed through visual observation and aerial photography. In water mapping, using divers is not required.
- Winter sampling will be conducted early to avoid icing and seasonal sampling at all bases will be conducted in consecutive weeks with each survey season.
- Water quality parameters will include salinity, dissolved oxygen, pH, conductivity, turbidity, temperature, nitrogen, nitrate/nitrite, and phosphorus concentrations, and TSS. Any additional parameters will require additional funding.
- If the government requires substantial changes to the survey methodologies described in this proposal, then additional costs may be required; however, alternative methods of equivalent cost may be considered, where necessary.

6.0 COST PROPOSAL

Based on comments received on GMI-AECOM JV's original 9 March 2015 proposal and budget, we have increased the costs of our proposal to provide more extensive surveys to ensure the data needs of the Navy are met. For the stand-alone Flora and Fauna survey we have added 2 full survey days for crew of 2 staff and associated travel costs. We have also increased the hours of the Task Order Manager, and GIS Analyst per facility to provide more labor to develop specific study plans, project oversight, client interactions, and to better meet the database and GIS requirements for the program. The amended cost proposal is in the added pages below the original proposal. Costs include costs for services provided by VIMS and the Virginia Aquarium.

1.0 INTRODUCTION

Tetra Tech, Inc. (Tetra Tech) was contracted by the U.S. Department of the Navy (Navy), Naval Facilities Engineering Command Atlantic (NAVFAC Atlantic) to conduct a Dune Delineation at Naval Air Station Oceana (NASO) Dam Neck Annex (DNA). NASO DNA is located in the southeast section of the City of Virginia Beach, Virginia (Figure 1).

1.1 BACKGROUND AND REGULATION

Coastal dune systems provide important physical and ecological functions for estuarine species as well as adjacent communities. These functions or “services” include providing important habitat for flora and fauna, hazard protection in the form of erosion and storm protection, sand replenishment, and improved water quality (VIMS 2009). The physical processes involved in the creation and maintenance of coastal dune systems include three key components: sand, water, and wind. Wind and water act together to transport sand along and across the shoreline. Sand that is deposited on beaches during periods of low energy wave action is moved inland via aeolian (wind-driven) transport. Vegetation that has taken hold within the rack line just above the intertidal zone or on existing dunes trap the sand and thus begins or continues the formation of a dune (Hardaway et al. 2003).

In many areas of coastal Virginia, human activities along coasts and shorelines have directly and indirectly hindered the natural processes that create and maintain these important ecosystems, thereby compromising their ability to perform important ecological services. Activities such as dredging and shoreline hardening limit the amount of sand available for dune creation and maintenance (VIMS 2009). Other activities such as recreation and development often destroy or alter vegetation resulting in destabilization of the dune and accelerated erosion.

Recognition of the importance of coastal dunes and their vulnerabilities to human activities was the impetus for passage of the Coastal Primary Sand Dune Protection Act of 1980, now called the Coastal Primary Sand Dune and Beach Act (Act). The Act, including modifications made in 2008¹, provides definitions for a beach and coastal primary dune, and the features that meet these definitions receive protection under the Act. The 2008 modifications authorize all local governments of Tidewater Virginia to administer the Act; this responsibility is most often delegated to the local wetland board to administer. If a coastal locality chooses not to administer the Act, the local wetland board or Virginia Marine Resources Commission (VMRC) may regulate development affecting dunes and beaches in that area. Broadly, the Act prohibits any permanent alterations of or construction upon coastal primary sand dunes that impair the natural functions of or physically alter the contour of the dune, or destroy vegetation growing on the dune. However, the local wetland board or VMRC may permit activities that fail to meet these standards if it is found that the proposed activities will result in no significant adverse ecological impacts or are necessary and consistent with the public interest.

¹The General Assembly of Virginia enacted the Coastal Primary Sand Dune Protection Act in 1980. The Act was originally codified in Code §62.1-13.21 to -13.28. In 2008, the Act was recodified as Coastal Primary Sand Dunes and Beaches in Code §28.2-1400 to -1420.

It is often difficult to quantitatively assess the loss or degradation of values provided by coastal primary sand dunes (e.g., flood and erosion protection) from proposed development. The consequences of altering natural dunes are, to some extent, dependent upon the dune location and its role in protection and beach replenishment; thus decisions regarding proposed development are made on a case-by-case basis. However, a scale of alterations from most to least severe follows (adapted from VMRC 1993):

1. Leveling dunes (i.e., obliterating the buffering capability provided by the natural levee of the dune and its source of sand).
2. Displacing dunes to a more seaward or landward location, which can expose the dune to more wave action, breach the dune line, and cause a loss of sand.
3. Building on the beach backshore (seaward of the dune), which can reduce dune elevation, interfere with wind patterns, or result in pedestrian traffic over the dune.
4. Introducing pedestrian or vehicular traffic across the dune (e.g., that alter the dune's contour or destroy dune vegetation).
5. Building on the dune crest (foreface), which will likely result in changes to the dune contours, sand removal, and an increase in pedestrian traffic over the dune.
6. Building on the dune backface, particularly if significant amounts of material are excavated.

The Act is a state-level regulation. However, noncompliance with the Act could jeopardize Coastal Zone Consistency under the National Environmental Policy Act (NEPA). The Act is part of Virginia's Coastal Zone Management Act which falls under regulation of the Federal Coastal Zone Management Act. NEPA Section 6.200 *The Environmental Impact Statement* includes the following subsection:

(d) Coastal zone management. The Coastal Zone Management Act, 16 U.S.C. 1451 et seq., requires that all Federal activities in coastal areas be consistent with approved State Coastal Zone Management Programs, to the maximum extent possible. If an EPA action may affect a coastal zone area, the responsible official shall assess the impact of the action on the coastal zone. If the action significantly affects the coastal zone area and the State has an approved coastal zone management program, a consistency determination shall be sought in accordance with procedures promulgated by the Office of Coastal Zone Management in 15 CFR part 930.

Although secondary dunes are not regulated under the Act, they are considered an important component of dune complexes. Secondary dunes function as estuarine edge habitat and provide important habitat for coastal plain flora and fauna. In addition, these areas provide natural upland erosion control thereby protecting adjacent upland property (Varnell and Hardaway 2002).

1.2 PURPOSE

The dune systems at NASO DNA provide important training areas for conducting military exercises. These dune systems simultaneously support habitat for flora and fauna (including some uncommon and rare species and communities), as well as storm protection for the developed areas that are located behind the dunes. Effective management of the dune system must begin with locating and mapping the existing primary and secondary dunes. This information would augment existing dune management plans and allow for prioritization of restoration activities to ensure sustainable, multiple-use management of these sensitive habitats.

1.3 REPORT ORGANIZATION

This report is organized into the following sections:

- **Section 1.0 Introduction** – Describes the Project overview, discusses the background and regulation of dune resources, and describes the Project objectives.
- **Section 2.0 Description of the Study Area** – Describes the coastal area that is the focus of the Project at NASO DNA.
- **Section 3.0 Dune Delineation Methods** – Outlines the survey methodology, including pre-field activities and on-site surveys.
- **Section 4.0 Dune Delineation Results** – Summarizes the results of the field efforts.
- **Section 5.0 Discussion** – Provides a discussion of the results of the dune delineation.
- **Section 6.0 General Recommendations** – Provides a preliminary assessment of existing and recommended dune restoration and protection activities.
- **Section 7.0 Conclusions** – Summarizes the overall conclusions.
- **Section 8.0 References** – Provides a complete list of references used during the field survey effort and in preparation of this report.

2.0 DESCRIPTION OF THE STUDY AREA

2.1 INSTALLATION SETTING AND LAND USE

NASO DNA is located along the Atlantic coast in the City of Virginia Beach, Virginia (Figure 1). It encompasses approximately 1,372 acres and is bordered by the City of Virginia Beach, private property, and Hampton Roads Sanitation District property to the west, the community of Sandbridge to the south, Virginia Army National Guard Camp Pendleton to the north, and the Atlantic Ocean to the east (Navy 2006). The surrounding land area is densely developed with residential, commercial and industrial developments, and recreational facilities.

2.2 DUNE DELINEATION SURVEY AREA

The survey area for the dune delineation field effort included the dune complexes at NASO DNA. The dune complex at NASO DNA abuts approximately 4 miles of beach area and the Atlantic Ocean to the east.

2.3 CLIMATE

NASO DNA is located in an area where temperature extremes are moderated by the Atlantic Ocean. The climate summary in Table 1 includes data recorded at the Southeast Regional Climate Center at the Norfolk Airport from 1946 to 2012. The average yearly temperature is 60 degrees Fahrenheit (°F) (16 degrees Celsius [°C]) (Table 3). The average winter temperature (December through February) is approximately 42 °F (6 °C), and the average growing season temperature (March through November) is approximately 66 °F (19 °C). January is the coldest month with an average low of 32.6 °F (0.3 °C), and July is the warmest month with an average high of 87.4 °F (30.8 °C). The average growing season (daily minimum temperatures higher than 32 °F [0 °C] for a light frost) lasts approximately 250 days from the middle of March to late November. The average annual precipitation is approximately 45.7 inches (in) (116.1 centimeters [cm]) with maximum monthly precipitation occurring in late summer. The prevailing wind is from the southwest in summer and north and northeast in winter. Monthly tide data for 2013 show that the highest high tides occurred in November with an average of 2.13 feet above Mean Sea Level (MSL) and the lowest low tide levels occurred December and January with averages of 1.3 and 1.36 feet below MSL, respectively (Table 2). During hurricane events that typically occur from June through September, torrential rainfall may accompany winds greater than 75 miles per hour (121 kilometers per hour).

2.4 SOILS

The dune survey area at NASO DNA encompasses six soil map units: Beaches; Newhan fine sands, 2–30 percent slopes; Newhan–Corolla Fine Sands, 0–15 percent slopes; Corolla Fine Sands; Corolla-Duckston Fine Sands; and Duckston Fine Sands (USDA SCS 1985) (Figure 2a and Figure 2b). The Beaches map unit is a miscellaneous area that includes the shore areas bordering the Atlantic Ocean. These areas are flooded regularly during daily tidal cycles. The most abundant soil component throughout the survey area is the Duckston Fine Sand. These soils occur immediately landward of the Beaches unit in most areas. Small areas of Newhan–Corolla Fine Sands and Newhan Fine Sand are found along the edge of the survey area to the west of the NASO DNA survey area.

2.5 TOPOGRAPHY

The elevation within the NASO DNA survey area ranges from MSL along the beach on the east side of NASO DNA to 27 feet above MSL (Figure 3a and Figure 3b). The highest point within the dune survey area occurs at the south end of NASO DNA.

3.0 METHODS

Field delineations of the landward edges of primary and secondary dunes were led by biologists from Kerr Environmental Services, Inc. and assisted by a Tetra Tech biologist. Primary dunes in NASO DNA were identified and mapped using the three parameters that are set forth in the Act and listed below.

1. **Substance** – a mound of unconsolidated sandy soil contiguous to mean high water (MHW).
2. **Morphology** – landward and lateral limits are marked by a change in grade from >10 percent to <10 percent.
3. **Character** – primary dunes must support specific plant species or communities, which are named in the Act and include: American beach grass (*Ammophila breviligulata*); beach heather (*Hudsonia tomentosa*); dune bean (*Strophostyles* spp.); dusty miller (*Artemisia stelleriana*); saltmeadow hay (*Spartina patens*); seabeach sandwort (*Hockenya peploides*); sea oats (*Uniola paniculata*); sea rocket (*Cakile edentula*); seaside goldenrod (*Solidago sempervirens*); short dune grass (*Panicum amarum*); Japanese sedge (*Carex kobomugi*); Virginia pine (*Pinus virginiana*); and broom sedge (*Andropogon virginicus*).

The landward boundaries of secondary dunes were identified as the convergence of the maritime grassland communities and communities dominated by woody species such as maritime forest or woodland communities. Although secondary dunes are not regulated under the Act, they are considered an important component of dune complexes. The primary and secondary dunes that were delineated as part of this field effort are collectively referred to as Dune Protection Areas (DPAs).

The front of the primary dune was hand digitized in the Arc GIS environment using high quality aerial photographs provided by ESRI World Imagery (Imagery Date: 11/27/2010). The digitized boundary corresponds to the seaward edge of the dune vegetation. The landward boundaries of the primary and secondary dunes were located and mapped using Trimble GEO XH Geoplotter 6000 Series Global Positioning System (GPS). Tetra Tech followed Trimble's specifications for collecting data and post processing for submeter accuracy.

4.0 RESULTS

The primary and secondary dunes at NASO DNA were delineated on 8–11 June 2013. The DPA encompasses 165 acres including 39 acres of primary dune and 126 acres of secondary dune (Figures 4a–4e). Primary dunes were documented along the entire length (100 percent) of shoreline at the installation with a total length of 21,124 feet. Approximately 4500 feet of the primary dune includes a manmade dune constructed of a hard, rock core with sand and native dune vegetation placed on top. Five noncontiguous sections of secondary dune were delineated with a total length of 17,449 feet.

Numerous multi-use access routes were observed that run perpendicular to the shoreline. These routes—most of them approximately 10–15 feet wide—appeared to be used by vehicles and pedestrians for beach access from points landward of the DPA. In addition to the direct access routes, circuitous paths wind through the dunes and were particularly abundant in the secondary dunes located east of Beach Cottage Court (Figure 4c.).

Seven boardwalks have been constructed as alternative access points across the primary dunes and are located in the central and southern sections of the installation. The boardwalks are all well-constructed, sturdy features that elevate foot traffic above the dunes via concrete pillars.

5.0 DISCUSSION

Natural, stable, dune systems possess relatively continuous primary and secondary dunes. Therefore, one way to assess the condition of dune systems in an anthropomorphically disturbed area relative to an undisturbed system is to compare the length of intact primary and secondary dunes to that of areas lacking secondary dunes. As such, the NASO DNA DPA was broken into segments based on the presence of primary or primary and secondary dune. Therefore, a dune segment is a continuous section of dune that is bounded by a change dune type present (i.e., change from an area with primary and secondary dunes to an areas with primary dunes and no secondary dune). These results are compared to the results of dune delineations completed at two nearby installations, Joint Expeditionary Base Little Creek (JEBLC) and Joint Expeditionary Base Little Creek – Fort Story (JEBLC FS). JEBLC is located in Norfolk and the City of Virginia Beach and JEBLC FS is entirely within the City of Virginia Beach (Navy 2012). Photographs of the NASO DNA dune system are provided in Appendix A.

Compared to JEBLC and JEBLC FS, NASO DNA had the greatest amount of shoreline and the most contiguous (100 percent) dune system (Table 3 and Table 4). NASO DNA also possessed the greatest average length of dune system containing only primary dune (no secondary dune). The majority of the primary dune only areas correspond to the constructed dune that is present in the middle section of the DPA. While the width of area with just primary dune is generally comparable to the width of similar sections at the other two installations, the NASO DNA primary dune is more regular in shape due to its man-made origin.

NASO DNA had fewer segments with both primary and secondary dunes but these segments had a greater average length per segment than at JEBLC or JEBLC FS. NASO DNA has the lowest overall percentage at 83 percent of the total dune length with both primary and secondary dune, compared to the percentage of total length at JEBLC and JEBLC FS with 92 percent and 93 percent, respectively. However, when comparing the percent of DPA containing both primary and secondary dune relative to the entire installation shoreline, NASO DNA was similar to the other two installations due to the fact that 100 percent of its shoreline contained dune while dunes were present along less than the entire length of shoreline at JEBLC and JEBLC FS.

Table 3. Dune Protection Area (DPA) Overview, NASO DNA, JEBLC, and JEBLC FS, Virginia.

Installation Name	Total Area of DPA (acres)	Area of Primary Dune (acres)	Length of Primary Dune (feet)	Area of Secondary Dune ^a (acres)	Length of Secondary Dune (feet)
NASO DNA	164	39	21,124	126	17,449
JEBLC	58	17	13,840	41 ^a	12,690
JEBLC FS	76	23	15,472	53 ^a	14,406

^aA slightly different method was used to map the secondary dunes during the delineations at JEB LC and JEB FS (Navy 2012). For the purpose of comparison, the combined areas within the secondary dunes and the secondary dune field at those installations are analogous to the secondary dune area at NASO DNA.

Table 4. Dune Delineation Summary and Comparison Table, NASO DNA, JEBLC, and JEBLC FS, Virginia.

Installation Name	Total Shore Length (ft)	Total Dune Length (ft)	Total Dune Length (%)	Primary Dune Only					Primary & Secondary Dunes				
				No. Dune Segments	Total Length (ft)	Total Length of Dune (%)	Total Length of Shoreline (%)	Average Site Length (ft)	No. Dune Segments	Total Length (ft)	Total Length of Dune (%)	Total Length of Shoreline (%)	Average Site Length (ft)
NASO DNA	21,124	21,124	100	3	3,676	17	17	1,224	4	17,449	83	83	4,362
JEBLC	15,220	13,840	91	5	1,150	8	8	230	14	12,690	92	83	916

^aPercent of total dune length.

The primary dunes at NASO DNA occur as one contiguous segment. However, the secondary dune area exhibits evidence of anthropomorphic disturbance including development within backdune areas, multiple beach access routes oriented perpendicular to shore, and training routes that meander throughout dunes. The access routes currently do not appear to hinder the dunes ecological properties, as they are vegetated and likely stable. However, the training routes in the northern portion of NASO DNA have created a disturbance through the secondary dune field that has altered the dune contours and destroy dune vegetation.

Furthermore, development such as existing buildings, active construction sites, recreational areas and parking lots occur throughout the secondary dunes. The absence of secondary dunes provides easier access for pedestrians making the primary dunes vulnerable to trampling and traversing by foot traffic. In addition, infrastructure that is built in the backdune area is at higher risk from storm surge via breaches of the primary dune.

Similar to NASO DNA, the DPAs at JEBLC and JEBLC FS face related issues. At JEBLC, erosion of the numerous beach access routes has resulted in a DPA that is comprised of dune fragments. Meandering training routes and excavations have resulted in an atypical dune surface, patchy vegetation, and large areas of bare sand. JEBLC FS appears to be more intact and exhibits longer sections of vegetated and stable dunes than those present at JEBLC. Although the conditions at NASO DNA at the time of the survey appeared to be more similar to JEBLC FS in that it possessed a less fragmented dune system as well as intact communities of stabilizing dune vegetation, the conditions at JEBLC may be a good indication of potential future conditions. Despite efforts to prohibit unauthorized access (e.g., no-entry signs and fencing) the presence of some non-designated pathways in the DPA suggests that additional enforcement of regulations could be strengthened. If the access routes and training paths within the dunes remain unchecked, the forces of wind and water may create a degraded and fragmented dune system that would make installation infrastructure vulnerable to damage to future storm surges.

However, differences between the two installations also exist. Unlike NASO DNA, JEBLC and JEBLC FS have shoreline protection structures including revetments and breakwaters. As with most shoreline hardening projects, the revetment was built to protect infrastructure behind it from a rapidly eroding shoreline. However the presence of the revetment may be starving the adjacent remnant dunes landward of it of sand. Several sections of the DPAs at JEBLC and JEBLC FS are exhibiting evidence of considerable erosion in recent years. It is difficult to ascertain the exact cause of the erosion. Possible causes may include sand starvation caused by the shoreline protection structures up drift, wave action exacerbated by sea level rise, storm surge damage from past storms, or some combination of these factors. Although there are currently no areas in NASO DNA's DPA that are experiencing high rates of erosion similar to that which is occurring at JEBLC and JEBLC FS, removal of secondary dunes could increase the primary dunes vulnerability and overtime eliminate a necessary sand source for stability.

This page intentionally left blank.

6.0 GENERAL RECOMMENDATIONS

In addition to mapping primary and secondary dunes at NASO DNA, potential problem areas were noted to the extent that it did not interfere with the primary goal of dune delineation. Problem areas within the boundary of the DPA that exhibited signs of recent or historic disturbance causing varying degrees of erosion to the dune and therefore would benefit from the implementation of restoration and/or protection measures.

The following sections describe dune restoration and protection activities that are currently being employed, as well as general dune restoration and protection options that could be implemented at NASO DNA. These recommendations are preliminary in nature and should be used as a guide for future restoration and protection objectives.

6.1 CURRENT RESTORATION AND PROTECTION ACTIVITIES

There are two general types of techniques used to protect shorelines from the eroding forces of waves and wind: structural and non-structural. Structural protection measures include hard, fixed features such as revetments and bulkheads. Structural techniques can work against the natural dynamism of dunes, specifically by interrupting natural sediment transport (VIMS 2009). However, non-structural techniques such as sand fencing and beach nourishment work with these processes to rebuild dunes. An example of a combined structural and non-structural technique includes constructed dunes with a hardened core. These dunes are usually linear in appearance and horizontal movement over time is limited due to the immobile core. However, such dune features are often capable of supporting healthy plant and animal communities and aeolian transport between the dune and surrounding area facilitates development of a somewhat natural appearance over time. The dune system at NASO DNA has approximately 1-mile of underlying hardened core that is considered have successfully naturalized.

The Navy is currently utilizing several nonstructural techniques at NASO DNA. These techniques include exclusion signs and sand-trapping measures (sand fencing and strategically placed discarded Christmas trees). The signs are located throughout the secondary dune areas and the sand-trapping measures are located along the seaward side of the primary dunes in an area at the southern end of NASO DNA. Furthermore, there is at least one authorized access route located mid-way in the DPA that was constructed at an angle less than exactly perpendicular to the shoreline. The angle reduces the risk of erosion that is associated with access routes situated perpendicular to shorelines. In addition to these efforts, other areas within the DPA may benefit from implementing similar restoration techniques.

6.2 DUNE RESTORATION AND PROTECTION OPTIONS

It is recommended that a thorough assessment of the NASO DNA dunes is completed to identify and prioritize all problem areas. Once the inventory of problem areas is complete, a combination of restoration techniques can be prescribed for each area. The following sections describe examples of nonstructural dune restoration and protection techniques that are feasible within the DPAs at NASO DNA.

6.2.1 Exclusion and Informational Signage

Currently, basic signage does exist at various locations throughout the primary and secondary dune systems, but they are often remnants of older signs. Replacing the signage and providing additional details will increase public awareness of the DPA. A combination of “Access Prohibited” and informative signage should be placed throughout the NASO DNA DPA. The “Access Prohibited” signs should be placed at any location that provides unimpeded access to the DPA by pedestrians and/or vehicles but is not a designated route. In general, fewer well used routes are preferred to multiple routes. The informative signage or kiosks should be located in areas that receive high volumes of pedestrian traffic such as at the beach access areas. These kiosks should provide information on dune ecosystems, emphasizing the important role they play protecting the installation infrastructure and in providing habitat for wildlife, and why walking and driving vehicles through them weaken the dunes.

6.2.2 Sand Trapping Techniques

Sand fencing is one of the most frequently utilized methods of dune restoration due to the relative ease of installation, cost effectiveness, and the fact that they are one of the few structures allowed seaward of dunes in many regions (Nordstrom 2008). This technique can be used to create dunes, restore breaches, or bolster existing dunes by making them broader or taller.

Sand fences can be constructed from a variety of material but are most often made from individual tree branches anchored in the sand, wooden slat fencing, and plastic or biodegradable jute fabric attached to wooden fence poles. Results of a study that evaluated the effectiveness of several types of sand fence materials and configurations indicate that jute fabric performs as well as common wood sand fencing before the onset of degradation at 12–18 months post-installation (Miller et al. 2001). Using a biodegradable material such as jute fabric and/or wooden fence posts would be beneficial at NASO DNA for several reasons. Replacing the metal stakes with wood poles reduces the safety hazard created by metal stakes; these stakes can become partially exposed when dunes shift or they rust and break, often less than 1 foot above the ground. Such partially exposed or broken stakes are very difficult to see when surrounded by vegetation and create a serious safety hazard. Other benefits to using biodegradable materials include lessening the human footprint, particularly if several successive levels of dune fencing are erected to restore dunes. Sand fence materials that do not break down over time litter the landscape with wood debris, wire, and metal stakes. Also, sand fencing that is not biodegradable and is left in place may impede burrowing animals that inhabit the restored dunes. Jute fabric is also readily available and can be ordered from erosion control materials suppliers.

There is little consensus on what is the most effective sand fence configuration (Miller et al. 2001). A single row of fencing installed straight and parallel to shore is the most common configuration and is effective at low wind speeds. However, the resulting dune may have a slope that is too steep for planting to be successful (Nordstrom 2008). Paired sets of straight sand fence, spaced at distances apart of four times the fence height, may be more efficient for high wind speeds and create dunes with a broader base and a lower slope that are more conducive to planting (CERC 1984 and Nordstrom 2008). Zigzag configurations in single or double rows may be more effective in areas with strong alongshore winds (Nordstrom 2008). However, some studies suggest that other configurations hold no advantage over the typical straight and parallel

to shore fence (Miller et al. 2001). Finally, creating gaps in long lengths of sand fencing provide access for fauna and lessen the possible barrier effect (Nordstrom 2008).

All sand fencing should be inspected on an annual basis, at a minimum. Fencing should be maintained by removing any parts that do not appear to be functioning as intended, are in disrepair, or pose a physical hazard. Buried sand fencing should not be unearthed as this will destabilize the restored dune. Routine inspection and maintenance is critical to the functioning of the sand fencing as well as the safety of people that traverse the dunes.

Discarded Christmas trees may be used alone or in combination with sand fencing. Christmas trees placed behind sand fencing may increase the rate of entrapment, and Christmas trees used alone may also successfully entrap sand. However, if the trees are not anchored they are susceptible to being repositioned—most likely by strong winds—into an orientation that renders them ineffective. As with sand fencing, Christmas trees that are installed to restore dunes should be inspected regularly to ensure they are functioning as intended.

6.2.3 Dune Reconstruction

At nearly any location where sand fencing is recommended, the creation or repair of existing dunes can be hastened by reconstruction. This also may be an attractive alternative where past restoration attempts using sand fence have not had success due to an insufficient volume of aeolian transport. Reconstruction entails the placement of clean sand from external, upland soils using heavy equipment. Such a resource-intensive technique may be a viable option where the protective dunes are substantially impaired and the infrastructure landward of the site is at high risk from storm surge. Dunes that are created in this manner are often berm-like and lack the natural undulations and surface diversity of natural dunes. However, actions can be taken when contouring the reconstructed dune to increase surface variability, thereby increasing resemblance in habitat function and appearance to natural dunes (Nordstrom 2008). Material used in dune reconstruction should comprise well-sorted sands, and great care should be taken to ensure it is free of undesirable organisms such as nonnative plant species.

6.2.4 Native Species Planting

Planting bare or sparsely vegetated sand with native plant species is an important step in dune restoration and/or reconstruction because it hastens the recolonization process. The roots of vegetation trap sand, stabilizing the dune. Plantings may be useful in areas of the DPA where vegetation is sparse. General guidelines for establishing vegetation on dunes are provided in Appendix B.

Plant species that occur in dune habitat have adapted tolerances to the harsh conditions that occur in the beach/dune environment. Some of the stresses that these plants must endure include salt spray, sand burial, high light intensity, high temperatures, strong winds, and poor soil conditions (Nordstrom 2008). The species that are selected for any given planting area should be chosen according to the position with the DPA. For example, American beach grass is a common inhabitant of the highly dynamic primary dunes at NASO DNA. This plant is most vigorous in areas of abundant sand deposition and may deteriorate as deposition decreases (van der Putten and Peters 1995). Later successional species should be selected in areas less prone to sand

deposition such as the landward slope of protected primary dunes or on secondary dunes. Planting may include a single species used to stabilize the dune sufficiently, allowing the natural recolonization of species present nearby. However, planting two or more species will diversify the vegetation and may improve long-term viability of the site (Woodhouse et al. 1977).

Based on the species that are currently present within the DPAs at NASO DNA, American beach grass, sea oats, bitter seabeach grass, and beach panic grass are appropriate species to plant in active primary dune restoration areas. Saltmeadow cordgrass, broomsedge, beach panic grass, and seaside goldenrod are feasible species for less active areas such as secondary dune restoration sites. Planting activities should occur between November and March (O'Connell 2008).

7.0 CONCLUSIONS

The dunes at NASO DNA exhibit evidence of disturbance including multiple beach access routes oriented perpendicular to shore, training routes that meander throughout dunes, and development in secondary dunes areas. Although the primary dunes have remained intact as one contiguous segment, vehicular and pedestrian impacts are threatening the stability of the primary dunes and development activities have fragmented the secondary dunes.

Preliminary recommendations for dune restoration and protection at NASO DNA include conducting a thorough assessment of the DPA to inventory and prioritize problem areas. Once these areas are identified nonstructural techniques can be implemented to protect and restore, and/or bolster the existing dunes. Four general types of nonstructural restoration and protection measures are recommended, including installing exclusion and informational signage, erecting sand trapping measures, reconstructing the dunes, and planting native dune vegetation. The overall goal of restoration activities at NASO DNA would be to create and maintain more extensive and more stable dunes. This can only be accomplished by minimizing the number of beach access roads and restoring or bolstering the primary and secondary dunes. Maintaining an intact dune system at NASO DNA will provide greater protection for the installation infrastructure over time, as well as provide an important ecological habitat to this highly developed region.

APPENDIX B

General Planting Guidance

DUNE REVEGETATION GUIDANCE AND RECOMMENDATIONS

1. BACKGROUND

This dune revegetation guidance was originally developed in support of a comprehensive dune restoration and protection plan for use by JEB Little Creek – Fort Story natural resource managers as part of the sustainable, multiple-use management of sensitive coastal dune ecosystems. However, the information herein is directly applicable to NASO DNA as the overall goal of restoration activities is to create more extensive and more stable dunes.

Planting bare or sparsely vegetated sand with native plant species is recognized as an important step in dune restoration and/or reconstruction because it hastens the recolonization process, and the roots of vegetation help stabilize the dune by trapping sand. Plantings may be particularly useful in areas where vegetation is sparse. However, before undergoing resource-intensive revegetation efforts, one must determine why the dune is eroding or why sand cannot accumulate to form a dune. For example, a dense stand of trees may have eliminated sand-trapping plants, or a jetty across a littoral zone may be causing beach erosion. Removing the cause is sometimes all that is needed to allow natural revegetation (Craig 1984).

Coastal dunes have three general vegetation zones that are largely based on soil salinity: frontal (primary), backdune (secondary), and forest. Each can vary in width or may even be entirely absent from a coastal dune system, and they can also overlap; sharp distinctions between zones are usually absent (Williams 2007). This set of recommendations will focus only on grassland species recommended for use in primary and secondary dune reconstruction and stabilization.

Landward of the highest tides and closest to the ocean and beach, primary dunes are stabilized by the sand trapping action of a few species of plants adapted to extreme conditions including high levels of salt spray, continuous winds, large amounts of windblown sand, and other environmental factors that continuously impact these frontal zone species (Rogers and Nash 2003, Williams 2007). Coastal dune plants must also be able to survive in soils that are low in nutrients and moisture and experience severe fluctuations in temperature and ocean overwash. The specific attributes developed to help dune species survive and thrive in these harsh environments include high growth rates, dense root systems, low profiles, and high flower and seed production rates. Landward of the primary dune area, the secondary dune supports less salt tolerant grasses and forbs as well as shrubs and some trees (Williams 2007).

2. GENERAL PLANTING GUIDANCE

Following is general planting guidance that pertains to all grassland species including recommended planting times, spacing and depth, fertilization, irrigation, maintenance, and other relevant information. Species-specific guidance can be found in Section 3.

- **Plant during the correct season.** Most species will establish best when planted early in their planting windows.

- Because seed is often difficult to acquire and seed quality can be poor, most coastal sites are stabilized using **vegetative transplants**, either potted plants (plants in 2- to 4-inch pots are adequate for most stabilization and building work), bareroot plants, or culms (Williams 2007). Be sure to obtain healthy seedlings that have not been allowed to dry out.
- **Planting tools:** A shovel, dibble, or spade can be used for hand planting. Large, flat sites can be planted more efficiently using a tractor-drawn transplanter with plows that create furrows 8–15 inches deep (Williams 2007).
- Storm tides and waves prevent vegetation from growing, so vegetation should be planted at least 100 feet landward of mean high water. If a **100-foot buffer** is not possible, begin dune restoration the farthest possible distance landward from mean high water and the average seasonal storm inundation area (O’Connell 2008).
- **Spacing:**
 - Areas being planted should be a minimum of 10-feet wide, though wider extents may be required on more severely eroded sites. When replanting existing dunes suffering from storm damage, start planting on the unvegetated dune face if the scarp has collapsed; if the scarp has not collapsed, plant at the base of the dune. Plant as far landward as possible on flat overwashed areas (Williams 2007).
 - Spacing between rows varies from 1 to 3 feet. Closer rows provide more rapid cover, but the cost is higher as a result of increased vegetation and labor needs.
 - Plant spacing depends on the desired location of maximum sand accumulation (more dense plant spacing [e.g., 12 inches] captures more sand more quickly), elevation, the number of plants available, and the presence of protected shorebird habitat (less dense plantings are generally required in rare, threatened, and endangered shorebird habitat areas—generally 36 inches—if planting is allowed at all) (O’Connell 2008). Plant spacing ranges from 1 to 3 feet within each row, but is typically 18 inches for 1- to 4-inch-potted plants or bareroot plugs and stolons of comparable size (Williams 2007).
 - One suggested planting pattern is to have the closest plant spacing, 12 x 12 inches, as far landward as possible; after a few rows of this spacing, increase the spacing to 18–24 inches for several rows. To finish, the rows closest to the ocean would be planted at the 3-foot spacing. This would allow more sand to blow toward the back where plants are densest, which would build the dune the highest and fastest toward the back (Williams 2007).
- Regardless of spacing, **stagger plants** in adjacent rows to prevent open aisles (lined up spaces between plants), which are more susceptible to erosion (Williams 2007).
- **Plant in moist sand**, ideally following a good rain. If the sand is dry when planting, irrigate the seedlings and the surrounding sand as they are placed in the hole. A water adsorbing polymer gel product (e.g., Terrasorb®, Stock-osorb®) can also be placed in the hole prior to planting (use between 8 and 12 ounces of hydrated gel per transplant) (Williams 2007).

- **Plant at the correct depth:** Failure to plant deep enough is the most common cause of plant death. In general, grasses should be planted with the rootball 8 inches below the soil surface. Care should be taken to fill the hole completely with firmly packed soil to eliminate any air pockets around the roots (Williams 2007).
- **Fertilization:** Fertilize as recommended; initial fertilization is usually best done at, or within 30 days of, planting. Applying fertilizer over planted areas in the first year usually helps the plants establish quickly. When adding fertilizer at planting, use only time-released fertilizer that will not burn plant roots, especially in warmer months (do not fertilize in the peak hot season when the plant is heat stressed) (Rogers and Nash 2003). Time-release fertilizer is also recommended because fertilizer can leach through the porous sand and pollute groundwater or nearby bays and estuaries causing water quality problems (O'Connell 2008). Be cautious not to overfertilize; dune plants are adapted to low-nutrient, sandy soils.
- **Irrigation:** Irrigation is advisable, where practical, on all dune plantings to ensure sufficient moisture during initial establishment. However, excessive irrigation rinses salt spray off the leaves and out of the soil, which allows other species to compete with dune vegetation. Therefore, regular irrigation or fixed irrigation systems are not recommended, and irrigation should not be used after stands are established (Rogers and Nash 2003).
- **Maintenance:** Native dune species should require little maintenance after establishment. Sites should be monitored for invasive species and weeded as necessary. Additionally, all sites should be protected as much as possible from foot and vehicular traffic using a combination of signs, fencing, and dune crossover structures (Williams 2007).

3. RECOMMENDED SPECIES FOR DUNE REVEGETATION

In the mid- to south-Atlantic, grassland species commonly used in primary dune revegetation efforts include American beachgrass (*Ammophila breviligulata*), sea oats (*Uniola paniculata*), and bitter panicum (*Panicum amarum*) and one of its subspecies bitter seabeach grass (*Panicum amarum* ssp. *amarum*). Saltmeadow cordgrass (*Spartina patens*) and beach panicgrass (*Panicum amarum* ssp. *amarulum*) are commonly used to restore secondary dune sites. All of these grassland species were frequently observed at NASO DNA and are recommended for the revegetation of coastal dunes on the installation.

Whenever possible, several species should be used in dune revegetation, particularly on primary dunes; a good rule of thumb is to include three or more frontal zone species whenever possible. Dune restoration plantings should try to mirror the species diversity found nearby to provide food and shelter for coastal wildlife in addition to dune stabilization (Williams 2007).

Climate is the primary factor limiting the range of frontal zone coastal dune plant species. Along the mid-Atlantic coast, the dunes between the Chesapeake Bay and Cape Lookout, North Carolina are the approximate transition zone for several species. Sea oats prefer the warmer climate found south of this area and appear to be limited by cold temperatures in their northern range, whereas American beachgrass is the dominant species north of the transition zone and tend to be stressed by the hotter, dryer conditions found farther south. Also, while the native geographical range of a coastal species may extend for hundreds of miles along the Atlantic

coastline, plants from one end may not adapt well at the other end of their native habitat. For example, research has demonstrated that the genetic makeup of sea oats—which influences plant hardiness, vigor, seed production, temperature tolerance, growth rate and reproduction—differs among populations. Local plants are usually best adapted to the climate where they were first grown since they take years to evolve. Therefore, it is always best to obtain dune plants grown from seeds or parent material originating as close as possible to the beach where they will be planted; if possible, acquire seedlings or transplants that were grown from seeds or cuttings originating within a 100-mile radius of the beach being revegetated (Rogers and Nash 2003).

PRIMARY DUNE SPECIES

American beachgrass (*Ammophila breviligulata*)

- The ‘Cape’ variety is the most recent variety developed (in 1970) and is now the dominant dune building plant along the north Atlantic coast. Its nearly perfect performance and ease of establishment has made this the only species extensively planted on coastal sand dunes—particularly the primary dune—from Maine to North Carolina (O’Connell 2008). That being said, the ‘Hatteras’ variety, which is characterized by early vigor, was developed by the North Carolina Agricultural Experiment Station and is better adapted to southern climates (Miller and Peterson 2000).
- Avoid using a pure stand of American beachgrass in warmer climates. Including sea oats within the beachgrass allows the sea oats to become the primary vegetation if the beachgrass begins to have problems. Bitter panicum can also be randomly mixed with the beachgrass (Rogers and Nash 2003).
- This species is generally planted 12 inches, 18 inches, 24 inches, or 36 inches apart. Space plants 18 x 18 inches unless wind erosion is severe, then reduce spacing to 12 x 12 inches. A spacing of 24 x 24 inches is suitable on very stable areas where wind is not a factor. Stagger the plantings in alternate rows (ideally, a minimum of 10 rows) to provide maximum erosion control.
- Plant two to three culms per hole (though USDA NRCS [2003] states that planting more than two stems per hole does not appear to be more beneficial and in some cases may even be detrimental to plant survival).
- Culms must be planted 8–10 inches deep in moist sand to prevent drying out and being blown out by the wind.
- Plant spacing densities can be the same throughout a project area or, if space allows, can be graduated from dense spacing landward to gradually wider spacing moving seaward. This method will begin dune formation in the landwardmost area and will grow the dune seaward, resulting in a wide stable dune.
- Optimum planting season for American Beachgrass in the Mid-Atlantic region is October 1 to March 30 (Miller and Peterson 2000).
- Apply fertilizer 30 days after planting, but preferably no earlier than April 1.

Sea oats (*Uniola paniculata*)

- Sea oats is the most widely recognized plant on coastal dunes throughout the southern Atlantic coastal region and is one of the most important species on primary. This grass provides the best long-term stability for coastal dunes when planted in its native range, which includes the Virginia coast. Sea oats tolerates the harsh conditions of the frontal zone and are capable of trapping large quantities of sand during their first growing season (Rogers and Nash 2003).
- Sea oats is relatively slow to establish, so planting faster growing companion species such as bitter panicum or other desirable pioneering species is recommended (Fine no date).
- Because sea oats is a warm-season perennial grass, seedlings may be planted during the warmer months of April through September, though early spring planting is recommended since the best time for planting is after a rainfall when the sand is sufficiently moist. When planted in the spring and early summer months, seedlings will grow robustly if properly fertilized and watered at planting, if necessary (Rogers and Nash 2003).
- Healthy seedlings that are between 15 and 24 inches tall can be found at local nurseries. Seedlings should be placed at least 8 inches deep in moist sand (don't worry about planting the seedlings too deep as planting too shallow often results in poor survival).
- Including one teaspoon (or a tablet) of a time-release fertilizer in the planting hole will boost the new plant's growth and expansion (Rogers and Nash 2003).

Bitter panicum, bitter panicgrass (*Panicum amarum*)

- Bitter panicum is a widely adapted perennial grass ideally suited for stabilizing the primary dunes of coastal beaches. This species actually establishes more easily than sea oats. Its tall, straight stems and leaves reduce wind speeds and allow sand to collect, and its extensive fibrous root and rhizome system stabilizes and holds sand in place (Williams 2007). It also works well in combination with other dune species, as mentioned previously (Rogers and Nash 2003).
- The Brooksville Plant Materials Center has released two cultivars of bitter panicum, 'Northpa' and 'Southpa.' Northpa is from a collection from North Carolina and is better suited to Virginia's coastal areas (Williams 2007).
- Plant potted plants and bareroot plants in staggered rows 2–3 feet apart, with plants 2 feet apart in each row and planted 8–10 inches deep in moist sand (USDA NRCS 1996a). Like sea oats, rooted cuttings respond well to one teaspoon of a time-release fertilizer added to the bottom of the planting hole (Rogers and Nash 2003).
- Bury unrooted stems end to end in trenches 2–3 feet apart and 6–8 inches deep, leaving the top 6–10 inches of the stem exposed (Rogers and Nash 2003, USDA NRCS 1996a).
- Plant unrooted cuttings three per hole in staggered rows 2–3 feet apart with holes 2 feet apart in each row (USDA NRCS 1996a).

- Plant cuttings in the late fall, potted plants in the late winter or early spring, and young tillers in the late spring (the beginning of rainy season) (USDA NRCS 1996a). Rhizomes planted in the early spring have a better chance of survival than those planted during the summer heat.

Bitter seabeach grass (*Panicum amarum ssp. amarum*)

- Bitter seabeach grass is a subspecies of bitter panicum and is also considered appropriate to plant in active primary dune restoration areas. Refer to the species profile for bitter panicum for planting guidance.

SECONDARY DUNE SPECIES

Saltmeadow cordgrass, marshhay cordgrass (*Spartina patens*)

- Saltmeadow cordgrass is highly adapted to backdune areas with less windblown sand. It prefers moist sites but is fairly drought tolerant and will grow in drier areas. The grass also has a very high salt tolerance, and the seeds will germinate in saline soils where the seeds of other dune species will not survive. Saltmeadow cordgrass can therefore be planted in low areas subject to washover and flooding by salt water (Rogers and Nash 2003).
- Because saltmeadow cordgrass is a warm-season perennial, it can be planted from the spring through the summer, though early spring planting is most recommended (Rogers and Nash 2003). Potted plants or bareroot planting stock from vigorous, uncrowded stands (5–10 stems per transplant) can be planted (USDA 1996b), though containerized plants are preferred for coastal dune sites (Williams 2007).
- Plant cordgrass landward of the dunes, 12–24 inches apart, depending on the site severity, and 6–8 inches or deeper in moist sand (USDA 1996b, Rogers and Nash 2003).
- These plants respond well to fertilization. To get the plants off to a healthy start, incorporate one teaspoon of time-released fertilizer into the planting (Rogers and Nash 2003).

Beach panicgrass, coastal panicgrass (*Panicum amarum ssp. amarulum*)

- This subspecies of bitter panicum, also called ‘Atlantic’ coastal panicgrass, is a tall, robust, warm-season grass with strong seedling vigor (USDA 1982). It can be used to stabilize windblown sand and beach replenishment projects, as well as to create new dune systems (USDA NRCS 1996c). The variety originated from a naturally occurring stand located at the Back Bay Wildlife Refuge just south of NASO DNA.
- Coastal panicgrass will perform well on droughty, very sandy sites, but when established on sand dunes it will only survive where other species have initially stabilized the location. It will tolerate moderate saline overspray and pH as low as 5.0. It does not tolerate large sand deposits (USDA NRCS 2002).
- It can be propagated by seed or vegetative divisions, and is the only species known to be successfully established on mid-Atlantic sand dunes by direct seeding. It is best to sow from early spring until May (USDA NRCS 2002).

- Seeds can be planted 2 inches deep in dune sand; surface seeding on sand dunes will not produce successful stands (USDA 1982). Adequate rainfall following germination influences seedling survival (Craig 1984).
- If sands shift and cover newly planted seeds more than 2 inches deep, their emergence may be obstructed (USDA NRCS 2002).
- Refer to the species profile for bitter panicum for potted and bareroot planting guidance.

4. ADDITIONAL INFORMATION

- Sand trapping devices such as sand fences or brush matting can be included in the revegetation/stabilization plans when appropriate. Sand fences are used primarily to build frontal dunes where the use of sand fences is more effective than vegetation alone in building the dune in width and/or height (Williams 2007).
- Other dune revegetation efforts have found that even moderate storms eroded newly rebuilt dunes when reconstruction and revegetation were focused on the frontal dune scarp. In other words, dune rebuilding was taking place too far seaward to provide adequate protection and longevity. The revised procedure for frontal dunes reconstruction following storms is to rebuild the backside of the frontal dune, not the seaward side, an approach that works together with landward migrating barrier beach processes (O'Connell 2008).
- One must determine if enough wind-blown sand is available to naturally rebuild the dune. The nearby accumulation of sand around sand fences or the general condition of adjacent dunes can indicate this availability (3–8 foot or higher dunes in the interdune or backdune areas, with rolling sand surfaces and moderate to dense vegetation, are a sign of available wind-blown sand). If wind-blown sand is not available, clean sand of compatible grain size can be imported for dune reconstruction, and sand fencing and plantings can occur after the imported sand is shaped (O'Connell 2008).
 - Through experimentation, a Massachusetts-based organization developed an effective method to rebuild an artificial dune on Duxbury Beach by covering imported quarry sand with approximately 6 inches of native dune sand. Vegetation was then planted on the natural sand layer to create a natural appearing dune.

EXECUTIVE SUMMARY

The purpose of this study is to characterize the invasive plant species community within Naval Air Station Oceana Dam Neck Annex (NASO DNA). This report serves to supplement other vegetation surveys conducted on site. The findings in this report can be used to guide natural resource management, and to supplement natural resource assessments and other environmental planning documents, such as Integrated Natural Resources Management Plans and Environmental Assessments.

The survey focused on 14 species which were identified as high-priority invasive species. These priority species were identified based on a survey questionnaire completed by natural resource managers in the area. A total of 240 plots were surveyed for their invasive species community composition at NASO DNA using a method developed by Tetra Tech and its subcontractor. Invasive plant species were documented in 163 (68 percent [%]) of the plots surveyed at NASO DNA, and high-priority species were recorded in 158 (66%) of the total number of plots surveyed. The abundance of high-priority and non-target invasive species was highest in the northern reaches of the base, north of South Birdneck Road, and the central portion of the base between Tartar Avenue and Redwing Lake.

A total of 16 invasive plant species were identified within the NASO DNA survey plots, including six high-priority species. Japanese honeysuckle (*Lonicera japonica*) was the most abundant species, occurring in 47% of the survey plots, followed by Japanese stilt grass (*Microstegium vimineum*) at 38%, Chinese privet (*Ligustrum sinense*) at 12%, alligator weed (*Alternanthera philoxeroides*) at 3% and Johnson-grass (*Sorghum halepense*) at 2%. In addition, approximately 160 plots or populations of common reed (*Phragmites australis*) totaling approximately 17.9 acres (7.2 hectares) were recorded at NASO DNA. Mimosa (*Albizia julibrissin*) was not recorded in any of the survey plots, but is known to occur on the Installation (M. Wright, personal communication, 18 February 2014).

Eight (8) of the high-priority invasive plant species were not observed at NASO DNA: beach vitex (*Vitex rotundifolia*), Chinese wisteria (*Wisteria sinensis*), European water-milfoil (*Myriophyllum spicatum*), kudzu (*Pueraria montana*), mimosa, princess tree (*Paulownia tomentosa*), tall fescue (*Festuca elatior* [*F. pratensis*]), and tree-of-heaven (*Ailanthus altissima*).

The 16 invasive plant species observed during the survey are typical of the Virginia coastal plain in Virginia (Virginia Department of Conservation and Recreation [VDNR] 2009). In addition to the priority species, 10 other invasive species were identified. The additional species were autumn olive (*Elaeagnus umbellata*), border privet (*Ligustrum obtusifolium*), Chinese lespedeza (*Lespedeza cuneata*), common dayflower (*Commelina communis*), English ivy (*Hedera helix*), gill-over-the-ground (*Glechoma hederacea*), multiflora rose (*Rosa multiflora*), pampas grass (*Cortaderia selloana*), Parrot feather milfoil (*Myriophyllum aquaticum*), and thorny elaeagnus (*Elaeagnus pungens*).

1.0 INTRODUCTION

Tetra Tech, Inc. (Tetra Tech) presents this *Invasive Species Inventory Survey for Naval Air Station Oceana Dam Neck Annex, Virginia Beach, Virginia* to the United States (US) Department of the Navy (Navy), Naval Facilities Engineering Command (NAVFAC) Mid-Atlantic. This report was prepared for Naval Air Station Oceana Dam Neck Annex (NASO DNA or the Installation) in accordance with Task Order WE39 under Contract N62470-08-D-1008. Similar reports were completed for three other installations as part of this Task Order (i.e., Naval Air Station Oceana [NAS Oceana] located in Virginia Beach, Virginia; Naval Auxiliary Landing Field [NALF] Fentress in Chesapeake, Virginia; and Naval Support Activity Hampton Roads Northwest Annex [NSAHR NWA] located in Chesapeake, Virginia and Currituck County, North Carolina) (Figure 1).

NASO DNA is a part of NAS Oceana, but is considered separately from the main portion of NAS Oceana for this Task Order.

NASO DNA provides training in special warfare, ordnance, overland assault, beach assault, and tactical air operations radar. The mission of the Installation is to provide quality education and training to sailors in specified combat systems operation and maintenance, specialized skills training, training systems support to operational and systems commands, and to perform other functions and tasks as directed by higher authority. More than 5,600 instructors, students, and support personnel live or work at NASO DNA daily. The major tenant commands associated with NASO DNA include: Commander Undersea Surveillance; Naval Education and Training Command, Center for Personal and Professional Development; Center for Surface Combat Systems Unit; NASO DNA Command Staff; Tactical Training Group, Atlantic; Distributed Training Center, Atlantic; Galley; Marine Air Control Squadron 24; Navy and Marine Corps Intelligence Training Center Marine Detachment; Maritime Civil Affairs and Security Training Command; Marine Corps Intelligence Schools; Medical/Dental Clinic; Maritime Intelligence Fusion Center, Atlantic; Navy Region Mid-Atlantic Fleet Readiness Morale, Welfare & Recreation & Child & Youth Programs; NAVFAC Mid-Atlantic Public Works Department; Combat Direction Systems Activity; Navy Expeditionary Intelligence Command; Navy Exchange Service Command; Navy Federal Credit Union; Navy and Marine Corps Intelligence Training Center; Naval Ocean Processing Facility; Naval Surface Warfare Center Port Hueneme Division, Virginia Beach Detachment; Naval Special Warfare Development Group; Tactical Training Group, Atlantic; Training Support Center Hampton Roads; Naval Air Warfare Center, Aircraft Division, Atlantic Targets & Marine Operations; and Commander Navy Region Mid Atlantic Fire Station #8 (NAVFAC Atlantic 2006 and Wright 2013).

In addition to training and mission activities, NASO DNA is managed for hunting, fishing, trapping, and other recreational and non-consumptive uses (NAVFAC Atlantic 2006).

Invasive species—including plants, animals, and microorganisms—are defined as “an alien species whose introduction does or is likely to cause economic or environmental harm or harm to human health” (National Invasive Species Act [Executive Order 13112]). Invasive species can pose a potential threat to NASO DNA’s natural resources, real property, and human health and safety; as well as interfere with military operations and readiness. Many of these invasive plants can overwhelm and cover native plants, cut off the light and nutrients that native plants need to

survive, and reduce plant species diversity, which, in turn, can impact wildlife populations and decrease crop yields and forest productivity. Invasive species can alter ecosystem processes, crack concrete, and potentially spread disease or have health effects for humans or animals (National Invasive Species Council 2008).

For these and other reasons, the Department of Defense (DoD) and Federal and state governments have instituted policies and guidance (such as Executive Order 13112) to prevent and control invasive species.

1.1 PURPOSE

The purpose of this Task Order was to develop an invasive plant species inventory for each of the four Navy installations: NAS Oceana, NASO DNA, NALF Fentress, and NSAHR NWA (Figure 1).

This report focuses on the invasive plants at NASO DNA. Companion reports prepared for NAS Oceana, NALF Fentress, and NSAHR NWA document invasive species at each of those installations.

1.2 OBJECTIVE & GOALS

The objectives of this Task Order were to develop a structured and repeatable monitoring protocol that could be used to survey invasive species on the Installation; plan, coordinate, and conduct the invasive plant inventory surveys; and map the locations of invasive flora populations using a handheld global positioning system (GPS) receiver and Geographic Information System (GIS). The specific goals of the Task Order were to conduct surveys for those species identified as high-priority invasive plant species, including a specific focus on mapping populations of common reed (*Phragmites australis*), hereafter referred to as *Phragmites*, which is a species of special interest for the installations in the Hampton Roads area.

1.3 MONITORING AREA

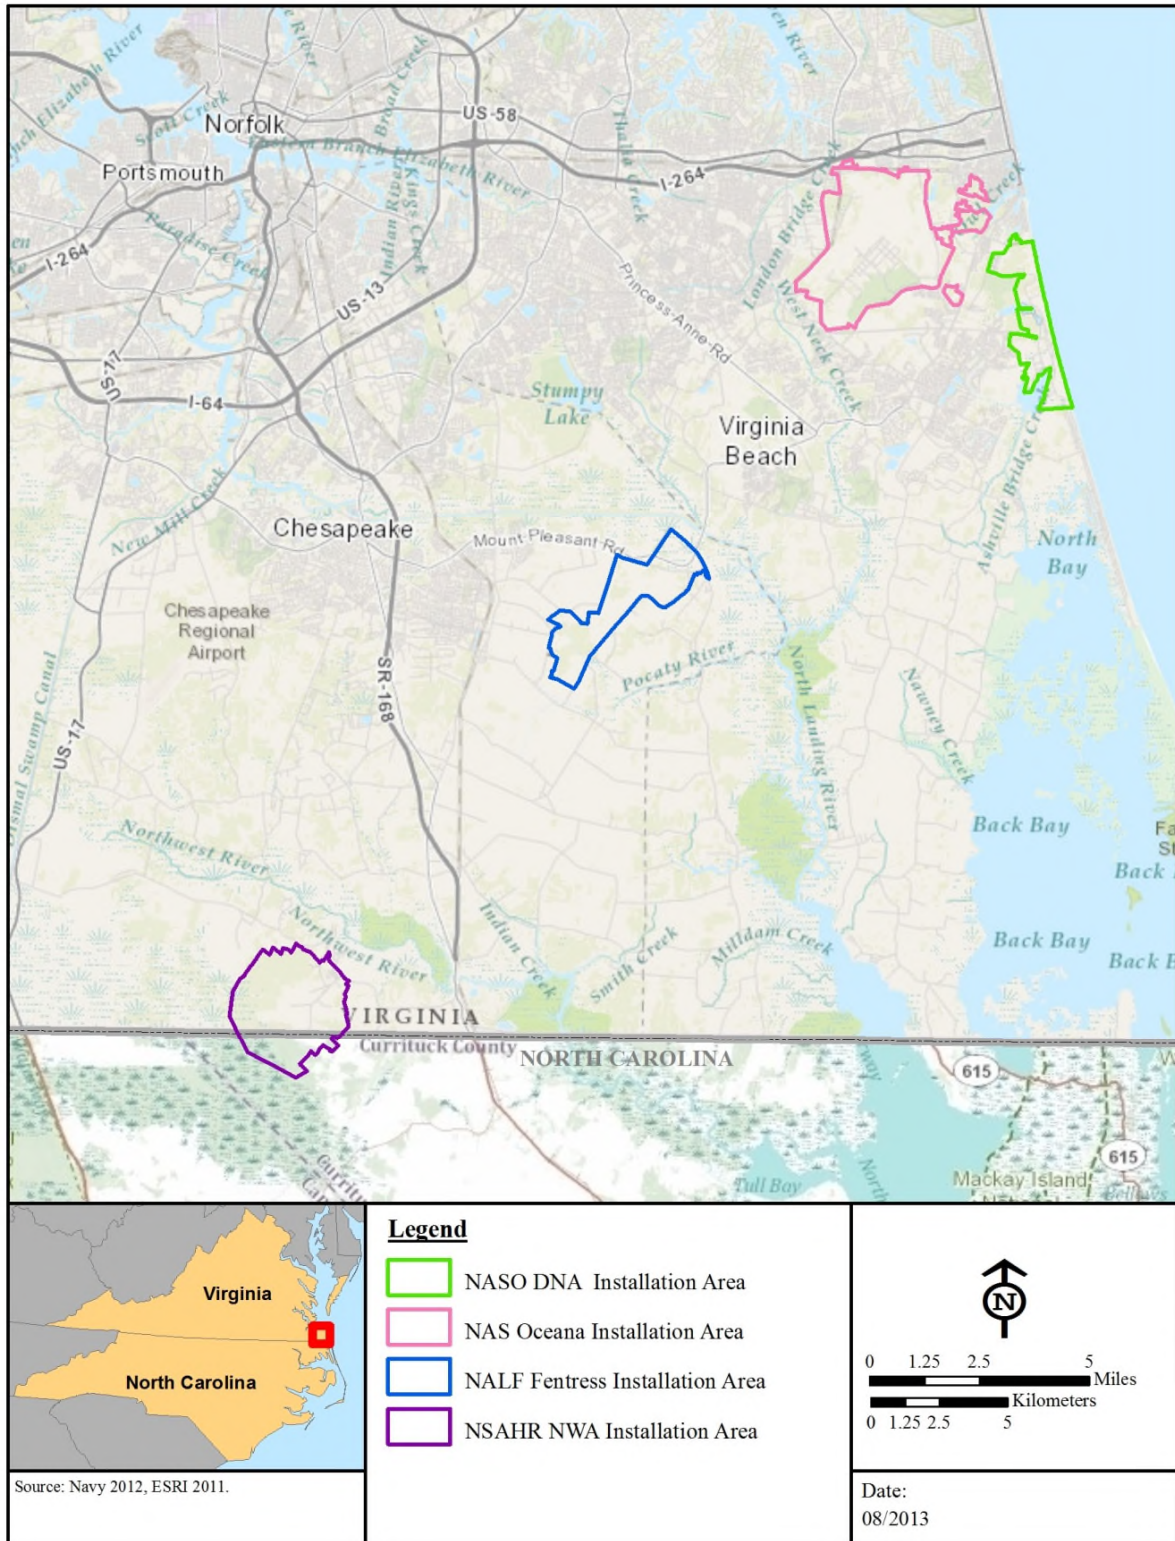

NASO DNA encompasses approximately 1,830 acres (741 hectares)¹ and is located in the southeastern portion of the City of Virginia Beach, Virginia (Figure 2).

The topography of NASO DNA is characterized as generally flat with low relief and elevations ranging from 0 to 27 feet (0 to 8.2 meters) above mean sea level (NAVFAC Atlantic 2006). The majority of the Installation occupies a basin behind (west of) the primary and secondary dunes, with an elevation of less than 5 feet (1.5 meters) above mean sea level.

The Installation includes developed operational areas, and undeveloped land managed for forest products, agriculture, and wildlife values. NASO DNA is the only installation of the four survey areas included in this Task Order that includes beach front property. The Installation includes approximately four miles (6.4 kilometers) of ocean beach and primary and secondary coastal

¹ The current total Installation acreage, as provided by the Navy Real Estate Office, is 1,919 acres (777 hectares). Total acreage based on Navy GIS data for the Installation, which is used throughout this document for natural resources summary purposes, is 1,830 acres (741 hectares).

Figure 1. Overview of Project Area for NAS Oceana, NASO DNA, NALF Fentress, and NSAHR NWA in Virginia and North Carolina.

dune habitat. A portion of the survey area (approximately 390 acres [157.8 hectares]) is composed of pre-existing developed areas including impermeable surface, buildings, mowed lawns, shade trees, and ornamental trees and shrubs. The remainder of the survey area is forested wetlands dominated by a mix of hardwood species or a mix of pine and hardwood and non-forested marshes (NAVFAC Atlantic 2006). The Installation also includes marshes, open water waterbodies, portions of Redwing Lake, and approximately two-thirds of the shoreline of Lake Tecumseh.

This page intentionally left blank.

2.0 METHODS

2.1 BACKGROUND

The preliminary focus of this Task Order was to conduct the initial research, planning, and coordination necessary to conduct invasive plant inventory surveys. Preliminary involvement included a kick-off meeting, desktop research, coordination with the Installation’s Natural Resources Manager (NRM) and Navy Technical Representative (NTR), identification of stakeholders, a stakeholder survey, the selection of high-priority invasive plant species, site visit reconnaissance, and development of an invasive plant inventory survey methodology.

The final list of 14 high-priority invasive plant species (Table 1) was selected based on the desktop research, survey questionnaire responses, and input from the NRM and NTR (Appendix A provides more details of this specific task). Field surveys focused on these high-priority invasive plant species; however, field teams also documented non-target invasive plant species that were observed during field surveys. Additional information on the preliminary tasks for this project can be found in Appendix A.

Table 1. High-Priority Invasive Plant Species to Be Surveyed at NASO DNA.

Species	Scientific Name
Alligator weed	<i>Alternanthera philoxeroides</i>
Beach vitex	<i>Vitex rotundifolia</i>
Chinese privet	<i>Ligustrum sinense</i>
Chinese wisteria	<i>Wisteria sinensis</i>
European water-milfoil	<i>Myriophyllum spicatum</i>
Japanese honeysuckle	<i>Lonicera japonica</i>
Japanese stilt grass	<i>Microstegium vimineum</i>
Johnson-grass	<i>Sorghum halepense</i>
Kudzu	<i>Pueraria montana</i>
Mimosa	<i>Albizia julibrissin</i>
<i>Phragmites</i> or common reed	<i>Phragmites australis</i>
Princess tree	<i>Paulownia tomentosa</i>
Tall fescue	<i>Festuca elatior</i> [<i>F. pratensis</i>]
Tree-of-heaven	<i>Ailanthus altissima</i>

Previous invasive species survey and treatment efforts at NASO DNA were conducted in association with a 2006 Supplemental Environmental Assessment (EA), which was developed for the control of *Phragmites* and kudzu at 15 Naval installations in the Hampton Roads region. Prior to that, an EA was developed in 2002 for four of the region’s installations, titled *Environmental Assessment for Control of Invasive Plant Species at Naval Air Station Oceana, Naval Air Station Oceana – Dam Neck Annex, Naval Amphibious Base Little Creek, Naval Surface Warfare Center Dahlgren, and Naval Station Norfolk, Virginia* (NAVFAC Atlantic 2002). Invasive species management was addressed in the 2006 Integrated Natural Resources

Management Plan (INRMP) for NASO DNA (NAVFAC Atlantic 2006), and will be addressed in the 2013/2014 updated INRMP.

In addition, several invasive plant surveys and treatment efforts have already been conducted at Naval installations in the Hampton Roads area. *Phragmites* was mapped at NAS Oceana, NASO DNA, NALF Fentress, and NSAHR NWA in 2008 and 2009, and later treated by aerial spraying each year between 2006 and 2011. Ground-based treatment focused on *Phragmites* and kudzu was also performed at NASO DNA from 2006 to the present (Wright 2013).

2.2 INVASIVE SPECIES INVENTORY SURVEY AT NASO DNA

Tetra Tech utilized an adaptive survey methodology developed specifically for the Navy and this Task Order to maximize the level of effort and determine what the greatest opportunities for managing invasive plant are, while at the same time ensuring compliance with applicable Federal, state, and local statutes and regulations; including DoD policies, instructions, and guidance. Although it is not intended to be a fine-scaled inventory, this survey methodology was created to have a high degree of confidence. In addition, specialized methods were used to map populations of *Phragmites*, which is a priority species of special interest. This methodology was approved by the NRM and NTR prior to its application.

This approach was designed to complement national efforts to manage invasive plants through “early detection and rapid response,” and to produce data on invasive plant populations at each installation that can be used to prioritize efforts and guide future management and monitoring of selected invasive plant species. Non-invasive naturalized or weedy species, such as greenbrier (*Smilax* sp.) and buckthorn (*Rhamnus/Frangula* spp.) were excluded from the survey.

2.2.1 A Focused, Adaptive, and Systematic Survey Methodology

Tetra Tech used a focused, adaptive, and systematic invasive plant inventory survey methodology to survey populations of invasive plant species. The surveys focused on the 14 high-priority invasive plant species identified through consultation with local, state, and federal stakeholders (Appendix A).

NASO DNA was systematically surveyed using base plot spacing of approximately 150 meters-by-150 meters (492 feet-by-492 feet) along transects, with additional plots added to sample landscape features such as habitat edges, roads, ditches, etc. Transects and plot spacing were determined in the field based on parcel boundaries, habitat types, spreading vectors, and other conditions in order to create a representative survey of the site, according to the field team’s best professional judgment (BPJ). This allowed the field team to create an understanding of the overall invasive plant distribution while capturing information about invasive plant populations located in or near disturbed areas which may not occur within the systematic plots. Paved areas, the built environment/urban areas, and actively managed areas were excluded from the survey.

2.2.2 Transects and Plot Selection

The initial data point (i.e., plot) for each transect was recorded 5 meters (16.4 feet) from the edge of a parcel, in order to capture the edge habitat. Five (5)-meter-radius plots were evaluated at 150-meter intervals along transects following the cardinal directions (i.e., north, south, east, or

west) to the extent practical. Surveyors continued along transects, recording plots, until two subsequent plots were recorded without any of the priority invasive species. In large, homogenous parcels, once two sequential plots without any priority species were found along the transect, it was assumed that invasive species would not be present further into the parcel, and a new transect was initiated at the edge of the habitat.

Invasive plant distribution is often closely associated with roads, trails, habitat edges, and disturbed areas, rather than being evenly distributed. Therefore, when a feature such as a small ditch, road, or edge habitat was crossed that had one of the priority invasive species—but the feature did not coincide with the 150-meter plot spacing—then the field team used its BPJ to determine whether to add an additional supplemental plot. This did not trigger a new transect line of plots along that feature and the survey continued with the original transect spacing. If the same feature was crossed again on a different transect line, a plot was only collected if one of the priority invasive species was observed again; but in the absence of a high-priority invasive species, plot spacing continued to follow the transect spacing.

Several secondary protocols were also implemented, based on BPJ for the following types of conditions:

Identical Plots – In the event that two sequential plots along the same transect had identical priority invasive species and had similar composition of invasive species, where similar habitat extended for a substantial distance from that plot or extended beyond the project boundary, field personnel assumed that this composition of invasive species was consistent for this habitat type, and did not collect additional plots along that transect line.

Small Parcels – In small parcels, the 150-meter spacing between plots was adjusted based on BPJ to ensure proper coverage of the parcel. Additional plots were added, as needed.

Very Small Parcels (transects less than 150 meters) – A plot was surveyed as close to the center of the parcel as possible, and any invasive species identified while navigating to the center of the parcel were noted. Similar to the protocol described for *Small Parcels*, BPJ was employed in selecting the plot location.

Ditches – Plots were collected at 150-meter intervals along the length of main ditches. Plots were centered along the long axis of the ditch. A 5-meter radius plot was used, consistent with the other plots.

Dunes – Plots were spaced at 150-meter intervals or greater if no invasive species were encountered. Points were selected that targeted edge effects, because habitat edges are the most likely locations for invasive species. Additional plots were added and plot spacing was adjusted, as needed, to ensure proper coverage of the narrow dune area.

2.2.3 Data Collection at Plots

Plot observations were recorded in field notes and later transcribed into a Microsoft Excel spreadsheet (Appendix B. Invasive Plant Species Survey Field Summary Data). The types of plot information collected included: the date, plot number, a codified list of the high-priority invasive species observed, the abundance/coverage and density of each species, and GPS location of the plot (see Section 2.2.4 for a description of GPS data collection methodology). The level of

infestation, patch shape (i.e., point, linear, patch, or mix), current spreading vectors, and additional comments were also recorded in the field notes.

Practicality of data collection in the field was more conducive to entering data in a tabular format, and therefore resulted in a more effective data collection method. The benefit of using this tabular format enabled the data to be easily sorted or reorganized to answer different needs.

Plots that were inaccessible due to site conditions were surveyed using an offset from where a corresponding GPS point could be collected (additional information can be found in the discussion of Inaccessible Stands of *Phragmites* in Section 2.2.4).

Areas containing *Phragmites* were of particular interest to the Installation. Therefore, a specialized methodology was implemented when *Phragmites* patch size exceeded the 5-meter-radius plot size (see Section 2.2.4). When a patch of *Phragmites* was less than or equal to the 5-meter-radius plot size, a single point was taken and triggered the protocol for a plot, as described above.

In recognition of the seasonality of some invasive plant species, the field survey team returned to NASO DNA in 2013 to verify the presence of any additional invasive that occurred outside of the initial assessment period.

Weekly survey information (e.g., team members, survey area, etc.) and additional comments were recorded and submitted with the monthly progress report submitted to the Navy.

2.2.3.1 Photographic Record

Representative photographs were taken to help characterize the invasive plant communities, or to document any interesting or unique features that were relevant to invasive species mapping. For representative plot photos, photographs were taken of the plot looking toward the plot center. Basic information about the photograph (i.e., the date, photographer's name, photo number, and direction) was recorded in the field notes. A photographic record is included in Appendix C of this report.

2.2.3.2 GPS Data Collection

The location of each plot was recorded with a handheld GPS receiver. The field team used a Trimble GEO6000 XH GPS unit provided by Tetra Tech that had sub-meter accuracy (after differential correction). Data was collected in UTM Zone 18N, WGS 84 format. GPS points were collected in the plot center whenever possible. However, in locations where a GPS point could not be taken at the plot center (e.g., because of accessibility issues), an offset GPS point was taken away from the plot center. Information about the GPS point was collected using the BPJ of distance and compass bearing to the plot center.

2.2.4 Phragmites Mapping and Documentation

Occurrences of *Phragmites* within plots were recorded following the procedures described above. In addition, *Phragmites* populations (e.g., stands) were recorded and mapped based on the following protocols:

Stands Greater Than 5 Meters in Radius – The boundary of a *Phragmites* stand was delineated by collecting GPS points in order to map the total area of the *Phragmites* stand.

Linear Stands Greater Than 10 Meters in Length – GPS points were collected at each end of the linear area, and an approximate width was recorded. Additional GPS points were collected as necessary to delineate the polygon boundary.

Inaccessible Stands of Phragmites – Stands of *Phragmites* that were inaccessible or very difficult to access due to site conditions, were noted and described in the field notes. Portions of a *Phragmites* stand that could be GPSed accurately were mapped using the methodology described above, and the remaining approximate location and boundary of these stands were mapped digitally.

2.2.5 Additional Observations

Additional observations made during the field survey were noted, such as observations of invasive wildlife species (e.g., fire ants) and wildlife damage. Furthermore, sightings of Federally or state protected species were reported to the NRM and NTR.

2.2.6 Field Survey Personnel and Equipment

The field survey was performed by a team of two highly-skilled personnel from Carolina Silvics, Inc. (Carolina Silvics) of Edenton, North Carolina, with periodic assistance from a Tetra Tech environmental scientist. Carolina Silvics specializes in invasive species surveys and assessments; and they are familiar with the regional conditions.

The field team was equipped with the list of high-priority invasive plant species, field maps, a camera, a field notebook, miscellaneous field gear (e.g., personal protective equipment, compass, etc.), and a handheld Trimble GEO6000 XH (or equivalent) GPS unit.

2.2.7 Field Data Form Post-Processing

Field notes were entered into an electronic data file (i.e. Microsoft Excel) and submitted by the field survey team to Tetra Tech, along with photographs and weekly progress reports (the summarized field notes are provided in Appendix B).

2.2.8 GPS Data Post-Processing

GPS data was downloaded directly from the GPS unit onto a computer each day by the field crew using Trimble Pathfinder software, without any editing or modifications. These data files were sent via email to Tetra Tech's GIS team. Tetra Tech then post-processed the GPS data and converted and managed the data in a GIS geodatabase.

Additional data considered part of the metadata (such as county, state, scientific name, etc.) were later added by Tetra Tech as part of the post-processing effort.

All geospatial data was created and submitted in accordance with the GIS Data Deliverable Specifications in the Scope of Work (NAVFAC Mid-Atlantic 2012), including the current

NAVFAC GIS Data Guide GIS Data Deliverable Specifications (United States Navy 3.0 Data Model, Environmental Section, May 2012).

2.2.9 Geographic Information System Data

The GPS data collected in the field were incorporated and managed in a GIS using Environmental Systems Research Institute (ESRI) ArcGIS Desktop 9.3.1 software. GIS data was used to create the representative maps of invasive species distribution included in Section 3 Results.

2.3 QUALITY CONTROL

Several layers of quality control were built into the methodology to ensure complete and accurate data and reporting. The field team reviewed GPS data, field data, and field notes prior to submitting the material to Tetra Tech each week. Tetra Tech's GIS Team Leader or GIS Analyst reviewed the GPS data submitted by the field survey team for accuracy and completeness. The Tetra Tech Task Order Manager reviewed the digital displays of field data collected for completeness, and provided feedback to the field team on data gaps or where clarification was needed. GPS data and weekly reports provided regular updates of which areas were completed, and which areas remained to be surveyed. Data were analyzed by a Tetra Tech environmental scientist familiar with the Project. A Tetra Tech Technical Editor provided editorial review of the Draft and Final reports. Tetra Tech's Task Order Manager oversaw all work performed for the Project, and provided Quality Assurance/Quality Control and overall administrative and technical oversight.

Planning and coordination were coordinated or reviewed by the NRM and/or NTR; and monthly progress reports were submitted to the Navy on a regular basis. The Navy also reviewed and commented on the Draft Report.

3.0 RESULTS

3.1 INVASIVE SPECIES SURVEY AT NASO DNA

3.1.1 Survey Dates and Effort at NASO DNA

Tetra Tech's field team initiated the invasive plant inventory survey at NASO DNA on 18 September 2012 and continued field surveys until 16 October 2012. Surveys resumed in the spring on 25 April 2013 and continued until 26 June 2013.

3.1.2 Invasive Plant Species Survey Results

Invasive plant species were widespread at NASO DNA. A total of 240 plots were surveyed at NASO DNA (Figure 3). Invasive plants were documented in 163 (68%) of the plots surveyed (Figure 4 [a larger version of this figure is included in Appendix D]). Many of the plots were occupied by more than one invasive species. High-priority species were recorded in 158 (66%) of the total number of plots. Relevant geospatial data (including GPS data and metadata) have been submitted to the Navy along with this report.

3.1.2.1 Overall Character of Invasive Plants at NASO DNA

Table 2 summarizes the percentage of plots containing invasive plants by species. A total of 16 invasive plant species were identified, including six of the 14 high-priority species. Of the high-priority species, Japanese honeysuckle was the most frequently recorded species, occurring in 47 percent (%) of the survey plots, followed by Japanese stilt grass (38%), Chinese privet (12%), alligator weed (3%) and Johnson-grass (2%). In addition, approximately 160 plots or populations of *Phragmites* totaling an estimated 17.9 acres (7.2 hectares) were recorded at NASO DNA (Figure 4 and Figure 10). The largest population of *Phragmites* covered approximately 2 acres adjacent to Redwing Lake. Mimosa was not recorded in any of the surveyed plots, but the Installation's Natural Resources Manager confirmed the presence of mimosa on the Installation (M. Wright, personal communication, 18 February 2014).

Eight (8) of the high-priority species were not observed during the survey: beach vitex, Chinese wisteria, European water-milfoil, kudzu, mimosa, princess tree, tall fescue, and tree-of-heaven.

Ten (10) non-target invasive plant species were also documented during the survey: autumn olive (*Elaeagnus umbellata*), border privet (*Ligustrum obtusifolium*), Chinese lespedeza (*Lespedeza cuneata*), common dayflower (*Commelina communis*), English ivy (*Hedera helix*), gill-over-the-ground (*Glechoma hederacea*), multiflora rose (*Rosa multiflora*), pampas grass (*Cortaderia selleana*), Parrot feather milfoil (*Myriophyllum aquaticum*), and thorny elaeagnus (*Elaeagnus pungens*). Chinese lespedeza, the most common non-priority species, was only recorded in 8% of the plots.

Most plots occupied by invasive plants were patches (94%), as opposed to linear stands (4%), points, or a mixture of patch shapes. Approximately 55% of the plots were characterized as having a moderate level of infestation (which includes more than 30% desirable species in the plot), as opposed to a monotypic stand (1%) of an invasive species or a plot that had a large-scale infestation (37%). Plots with invasive species were most often located within edge habitat (66%) or forested areas (22%). Invasive species were most commonly found along roads and paths

(34% and 10%, respectively), which often act as vectors for spreading invasive plant seeds and plant fragments.

The abundance of high-priority and non-target invasive species was highest in the northern reaches of the base, north of South Birdneck Road, and the central portion of the base between Tartar Avenue and Redwing Lake. Most of the plots in the dune habitat had no invasive plants.

Characteristics and distribution of each of the invasive plant species are described in the following subsections (APWG 2010, IPAMS date unknown, IPANE date unknown, IPAUS 2013, NAISN 2013).

Table 2. Number and Percent of Plots Containing Invasive Plant Species at NASO DNA.

Common Name	Scientific Name	Number of Plots Containing Invasive Species	Percent of Plots Containing Invasive Species ¹
Alligator weed ²	<i>Alternanthera philoxeroides</i>	8	3
Autumn olive	<i>Elaeagnus umbellata</i>	10	4
Border privet	<i>Ligustrum obtusifolium</i>	2	1
Chinese lespedeza	<i>Lespedeza cuneata</i>	20	8
Chinese privet	<i>Ligustrum sinense</i>	28	12
Common dayflower	<i>Commelina communis</i>	12	5
English ivy	<i>Hedera helix</i>	6	3
Gill-over-the-ground	<i>Glechoma hederacea</i>	1	0
Japanese honeysuckle	<i>Lonicera japonica</i>	113	47
Japanese stilt grass	<i>Microstegium vimineum</i>	92	38
Johnson-grass	<i>Sorghum halepense</i>	5	2
Multiflora rose	<i>Rosa multiflora</i>	1	<1
Pampas grass	<i>Cortaderia selloana</i>	1	<1
Parrot feather milfoil	<i>Myriophyllum aquaticum</i>	1	<1
<i>Phragmites</i> or common reed	<i>Phragmites australis</i>	36 ³	15 ³
Thorny elaeagnus	<i>Elaeagnus pungens</i>	8	3
None	None	77	32

¹ Percentage of plots was calculated by dividing the number of plots with observed presence of each invasive species by the total number of plots in the NASO DNA survey area.

² Highlighted species represent high-priority species.

³ There are more populations of *Phragmites* than indicated by the number of plots in this table. Plot points were generally not recorded in stands of *Phragmites* greater than 5 meters in radius, which were mapped as polygons instead (see Figure 3 and Section 2.2.4).

Figure 3. Map of Invasive Flora Survey Plots and *Phragmites* Stands, NASO DNA.

Figure 4. Distribution of Invasive Plant Species at NASO DNA.

3.1.2.2 *Alligator Weed*

Photo by Dwight McKinney, Carolina Silvics.

Alligator weed (*Alternanthera philoxeroides*) (also known as alligatorweed, pig weed, and *Achyranthes philoxeroides* [Mart.] Standl) is an aquatic plant that invades shallow open water habitats, wetlands, streams, ponds, and shorelines. It is often found in lakes, ponds, estuaries, and irrigation canals; but can also be found growing on dry land. Alligator weed can form thick mats that displace native vegetation, clog waterways, and interfere with agriculture, drainage, and irrigation. Dense mats can also lead to flooding and limit access to waterbodies. It spreads by animals or water, and can reproduce vegetatively from plant fragments that develop into entirely new plants, making it difficult to effectively eradicate. The terrestrial form can develop a massive rhizomatous root system (IPAMS date unknown).

Alligator weed was documented in eight plots (3%) on NASO DNA, and was distributed in isolated plots (Figure 5).

Figure 5. Distribution of Alligator Weed at NASO DNA.

3.1.2.3 *Beach Vitex*

Photo by Randy Westbrook, U.S. Geological Survey. Available from the National Agricultural Library, Agricultural Research Service, U.S. Department of Agriculture.
http://www.invasivespeciesinfo.gov/plants/beachvitex_child.shtml.
Accessed 27 December 2013.

Beach vitex (*Vitex rotundifolia*) is a deciduous woody vine that typically grows in seashore and nearshore habitats. It produces runners that allow the species to spread rapidly once established. It was commonly used for erosion control in seashore areas. However, it has spread rapidly and crowds out native species and can disrupt sea turtle nesting habitat. It spreads through prolific seed production, as well as from vegetative fragments which are dispersed by wind and water. It is also spread when planted as an ornamental plant (IPAMS date unknown).

There were no documented cases of beach vitex found on NASO DNA.

3.1.2.4 *Chinese Privet*

Photo by James H. Miller and Ted Bodner, Southern Weed Science Society, Bugwood.org. <http://www.invasive.org/browse/detail.cfm?imgnum=2307074>. Accessed 03 February 2014. Last updated 10 November 2008.

Chinese privet (*Ligustrum sinense*) is a deciduous tree or shrub that typically grows up to 7 feet tall. It is used for ornamental plantings and has spread throughout the southeastern United States where it has become naturalized. New plants can grow from seeds, as well as from root and stump sprouts. The seeds are eaten and spread by birds and other wildlife (IPAMS date unknown).

Chinese privet was documented in 28 (12%) of surveyed plots, and was distributed throughout the Installation. There was a concentration of plots in the northern forested block, with more isolated occurrences throughout the Installation (Figure 6).

Figure 6. Distribution of Chinese Privet at NASO DNA.

3.1.2.5 *Chinese Wisteria*

Photo by Kari Metcalf, Tetra Tech.

Chinese wisteria (*Wisteria sinensis*) is a woody, deciduous, perennial vine. Introduced from China in the early 1800s, it has become a popular flowering vine in home gardens. It grows rapidly, is difficult to eradicate, and can strangle or disfigure other species. The seeds, leaves, and fruit are toxic (IPAMS date unknown).

There were no documented cases of Chinese wisteria found on NASO DNA.

3.1.2.6 *European Water-milfoil*

Photo by Alison Fox, University of Florida, Bugwood.org.
<http://www.invasive.org/browse/detail.cfm?imgnum=1624031>.
Accessed 3 February 2014. Last Updated 02 November 2010.

European water-milfoil (*Myriophyllum spicatum*), also known as Eurasian watermilfoil, is an emergent, herbaceous aquatic plant. It forms dense canopies on the water surface that can interfere with recreational activities, and it competes with native plants. European water-milfoil has been known to invade lakes, rivers, and other fresh to brackish water bodies across North America. It commonly invades waterbodies with little to no established aquatic plants but will also crowd out other native species with dense mats. It spreads mainly vegetatively from plant fragments that can be dispersed by animals or by boats and trailers, when not adequately cleaned (IPAMS date unknown).

There were no documented cases of European water-milfoil found on NASO DNA.

3.1.2.7 *Japanese Honeysuckle*

Photo by John D. Byrd, Mississippi State University. Available from the National Agricultural Library, Agricultural Research Service, U.S. Department of Agriculture.
http://www.invasivespeciesinfo.gov/plants/honeysuckle_child.shtml. Accessed 27 December 2013.

Japanese honeysuckle (*Lonicera japonica*) is a species of vine or bush that can quickly spread via tiny fruit seeds. Japanese honeysuckle is often sold in nurseries for its ability to act as an effective ground cover and because it has strong sweet-smelling flowers. However, it can overwhelm and/or displace native plants. Common spreading mechanisms or vectors include birds and other wildlife that consume the fruits and then disperse the seeds. It can also spread vegetatively (IPAMS date unknown).

Japanese honeysuckle was the most abundant of any invasive plant species found at NASO DNA. It occupied 113 (47%) of the plots, and was widely distributed across the Installation (Figure 7). The central portion of the base surrounding Redwing Lake was the only area not impacted by Japanese honeysuckle.

Figure 7. Distribution of Japanese Honeysuckle at NASO DNA.

3.1.2.8 *Japanese Stilt Grass*

Photo by Chuck Barger, University of Georgia. Available from the National Agricultural Library, Agricultural Research Service, U.S. Department of Agriculture.
http://www.invasivespeciesinfo.gov/plants/stiltgrass_child.shtml. Accessed 27 December 2013.

Japanese stilt grass (*Microstegium vimineum*), also known as *Eulalia viminea* (Trin.) Kuntze, is an annual grass that is common throughout many types of habitats, including along roads, floodplains and other disturbed areas. Japanese stilt grass was accidentally introduced in the early 1900s and has since spread throughout the southeastern United States. Its invasive nature suppresses growth of native plant communities, alters insect communities, and slows plant succession, thereby altering nutrient cycling. Its dominance is promoted by local deer populations that feed on native species but avoid Japanese stilt grass, reducing competition for the invasive species (IPAUS 2013).

Japanese stilt grass occupied 92 plots (38%). It was distributed widely across the Installation (Figure 8). Japanese stilt grass dominated much of the northern portions of the base, as well as areas west of Terrier Avenue, and sporadic areas in the southern extent of the base.

Figure 8. Distribution of Japanese Stilt Grass at NASO DNA.

3.1.2.9 *Johnson-grass*

Photo by Bonnie Harper-Lore, Federal Highway Administration. Available from the National Agricultural Library, Agricultural Research Service, U.S. Department of Agriculture. http://www.invasivespeciesinfo.gov/plants/johnsongrass_child.shtml. Accessed 27 December 2013.

Johnson-grass (*Sorghum halepense*) is a grass commonly found in crop fields, pastures, right-of-ways, forest edges and along stream banks. It was often used for forage and to stop erosion, but its ability to grow and spread quickly can disrupt cash crops and native plants. It can be found throughout the US and is known as a noxious weed throughout Virginia. It can also cause cyanide poisoning in livestock. It spreads by seed and rhizomes, which can be dispersed by equipment and moving soils (IPAMS date unknown).

Johnson-grass was the least abundant of the high-priority species found at NASO DNA, occupying only five (2%) of the plots surveyed.

Figure 9. Distribution of Johnson-grass at NASO DNA.

3.1.2.10 *Kudzu*

Photo by Dwight McKinney, Carolina Silvics.

Kudzu (*Pueraria montana*), also known as Japanese arrowroot, is a vine in the pea plant family. Kudzu's ability to rapidly climb, coil, and trail over native trees and shrubs allows it to overwhelm and kill other plants where it has invaded. Kudzu spreads through runners that root new plants and by rhizomes and seeds. As a legume, it has been used to enhance soil and for erosion control, and it is also able to be used as forage materials for livestock in the southeastern US. The seeds and stem segments are dispersed by animals, wind, water, and human activity (IPAMS date unknown).

There were no documented cases of kudzu found on NASO DNA.

3.1.2.11 *Mimosa*

Photo by Famartin. Available from Wikimedia Commons.
http://en.wikipedia.org/wiki/File:Closeup_of_Albizia_julibrissin_foliage,_flowers_and_immature_fruits_in_Ewing,_New_Jersey_on_August_26th_2013.JPG. Accessed 27 December 2013.

Mimosa (*Albizia julibrissin*), is a small, deciduous tree species. Silky flowers led mimosa to become a popular ornamental species in parks and gardens. It can be found from New York to Missouri and south to Florida. Susceptible to a fungal disease that causes vascular wilt, it is now rarely recommended as an ornamental planting in the US (NAISN 2013).

Mimosa was not identified during the survey; however, the Installation's Natural Resources Manager confirmed the presence of mimosa on the Installation (M. Wright, personal communication, 18 February 2014).

3.1.2.12 *Phragmites*

Photo by Dwight McKinney, Carolina Silvics.

Common reed (*Phragmites australis*), also known as *Phragmites communis*, is a large, invasive perennial grass that can be found throughout the United States. It grows quickly and forms extensive, and often monotypic, stands that overwhelms other wetland species. Common spreading mechanisms or vectors have been attributed to nutrient enrichment and an increase in soil disturbance associated with coastal development. It is also a significant problem in freshwater systems, and is difficult to eradicate once it becomes established (IP AUS 2013).

Approximately 160 populations, or stands, of *Phragmites* were documented at NASO DNA, including stands greater than the 5 meter-radius plots (shown as polygons in Figure 10). The total area occupied by *Phragmites* was estimated to be 17.9 acres. *Phragmites* dominates many of the wet areas and inland shorelines of the Installation. The largest population of *Phragmites* covered approximately 2 acres adjacent to Redwing Lake.

Figure 10. Distribution of *Phragmites* at NASO DNA.

3.1.2.13 *Princess Tree*

Photo by James H. Miller, USDA, Forest Service. Available from the National Agricultural Library, Agricultural Research Service, U.S. Department of Agriculture.
http://www.invasivespeciesinfo.gov/plants/printree_child.shtml.
Accessed 27 December 2013.

Princess tree (*Paulownia tomentosa*) is a deciduous tree native to China. Princess tree is cultivated as an ornamental in parks and gardens. A single tree can produce 20 million seeds per year. The seeds are dispersed through wind and water and once established, the species is tolerant of pollution and various soil types. The ability of this species to survive has contributed to its invasive status in the eastern US (IPANE date unknown).

There were no documented cases of princess tree found on NASO DNA.

3.1.2.14 *Tall fescue*

Photo by Kristian Peters. Available from http://en.wikipedia.org/wiki/File:Festuca_pratensis.jpeg. Available from Wikimedia Commons. Accessed 27 December 2013.

Tall fescue (*Festuca elatior* [*F. pratensis*]) is a perennial bunchgrass that often grows in tufts in meadows, roadsides, old pastures, and riversides. Tall fescue prefers moist, rich soils, particularly loamy soils. It was used as an ornamental grass and can be an important forage crop (NAISN 2013).

There were no documented cases of tall fescue found on NASO DNA.

3.1.2.15 *Tree-of-heaven*

Photo by Lindsay Eiser. Tetra Tech, Inc.

Tree-of-heaven (*Ailanthus altissima*), also known as *Ailanthus glandulosa* Desf. is a deciduous tree native to China and Taiwan. It is a fast-growing tree that can reach approximately 50 feet in height in 25 years. First brought to the US in 1784, it was used extensively as an ornamental plant. It thrives as an opportunistic tree because of its ability to colonize disturbed areas quickly and to suppress competition via allelopathic chemicals. A single tree can produce more than 300,000 wind-dispersed seeds each year. It also spreads by root sprouts. It is considered a noxious weed throughout the US (IPAMS date unknown).

There were no documented cases of tree-of-heaven on NASO DNA.

3.1.3 Other Non-High-Priority Invasive Plant Species

Ten (10) other non-target invasive plant species were observed during the invasive species surveys at NASO DNA.

Autumn olive (*Elaeagnus umbellata*) is a deciduous shrub or small tree with large fruit that is spread by birds (IPANE date unknown). Autumn olive was recorded in 10 plots (4%).

Border privet (*Ligustrum obtusifolium*) is an evergreen shrub that can form dense thickets. The fruits are consumed and spread by birds (APWG 2010). Border privet was observed in two plots (1%).

Chinese lespedeza or sericea (*Lespedeza cuneata*) is a perennial herb with branching stems that grow from a taproot. Chinese lespedeza reduces the abundance and diversity of native plants and can make the area less attractive to wildlife (NAISN 2013). Chinese lespedeza was the most common non-target species documented at NASO DNA, but still only occupied 20 (8%) of the surveyed plots.

Chinese lespedeza (*Lespedeza cuneata*). Photo by Dwight McKinney, Carolina Silvics.

Common dayflower (*Commelina communis*), which is also known as Asiatic dayflower, is an herbaceous annual plant in the dayflower family. Considered an invasive weed, the VDCR calls it an “occasional invasive” meaning it will not affect ecosystem processes, but may alter the plant community composition. In areas where it has been introduced, the common dayflower can be found along field edges, woods, and marshes, as well as occasionally penetrating into woods (NAISN 2013). Common dayflower was observed in 12 (5%) of the plots at NASO DNA.

English ivy (*Hedera helix*). Photo by Dwight McKinney, Carolina Silvics.

English ivy (*Hedera helix*) is a species of climbing, evergreen vine. English ivy is an introduced species commonly found in gardens, tree trunks, and other habitats. Its ability to quickly shade out hedges, trees and ground vegetation have made it a nuisance plant (IPAMS date unknown). English ivy was recorded in six plots (3%).

Gill-over-the-ground (*Glechoma hederacea*), also known as ground ivy, is an evergreen vine that spreads readily by rhizomes or seeds. It is also an aggressive weed in lawns. It can tolerate shady or sunny conditions, and forms dense populations. Gill-over-the-ground was observed in just one plot (less than 1%).

Multiflora rose (*Rosa multiflora*) is a perennial vine or shrub that can form dense hedges, and can also be a vector for a viral disease that infects native rose species (IPAMS date unknown). Multiflora rose was recorded in one plot (less than 1%).

Pampas grass (*Cortaderia selloana*) is a grass species that forms large clumps. It can interfere with forestry operations and slow the growth of seedlings. It also poses a fire hazard. It is spread as an ornamental plant or is spread by seed. Pampas grass occurred in one plot (less than 1%).

Parrot feather milfoil (*Myriophyllum aquaticum*), is an invasive aquatic plant that can block waterways and provide habitat for mosquito larvae. It can reproduce and spread vegetatively (IPAMS date unknown). Parrot feather milfoil was recorded in one plot (less than 1%).

Pampas grass (*Cortaderia selloana*). Photo by Dwight McKinney, Carolina Silvics.

Thorny elaeagnus (*Elaeagnus pungens*), also known as thorny olive, is a perennial shrub or vine that forms dense thickets that displace native plants and can be a barrier to human or animal activity. It is spread when planted as an ornamental, and the fruit is eaten and disseminated by wildlife (IPAMS date unknown). Thorny elaeagnus was documented in eight (3%) of the plots at NASO DNA.

3.1.4 Additional Observations

Continued observations were made in the spring of 2013, following the full site survey. This provided an additional quality measure to ensure that any early and or late blooming species were included in the survey. Results of the springtime survey yielded no additional species present that were not initially identified during the fall 2012 survey period.

No other additional wildlife observations were made during the NASO DNA survey.

3.2 INVASIVE PLANT SPECIES MANAGEMENT

Invasive plant species can interfere with military operations and readiness, kill or shade out native plants, impact fish and wildlife and their habitats, or have negative economic impacts on crop yields and forest productivity. Invasive plants can also pose serious health risks for military and civilian personnel. Therefore, the focus of pest management at NASO DNA is to prevent interference with military operations and preparedness by protecting infrastructure, real property, and human health and safety.

There are a variety of policies, regulations, and resources available for developing management strategies to eradicate or control invasive plants.

Invasive species management plans and actions shall be developed and pursued in accordance with:

- OPNAVINST 6250.4c, Navy Pest Management Programs;
- Executive Order (EO) 13112 Invasive Species;
- DoD Instruction 4150.07;
- other Navy policies and instructions; and
- federal and state regulations for invasive species management, pesticide use, health and safety regulations, etc.

In accordance with OPNAVINST 6250.4c, it is the Navy's policy to use an integrated pest management (IPM) approach to control pests, including invasive plants. IPM "may include techniques such as education, habitat modification, biological control, genetic control, cultural control, mechanical control, physical control, regulatory control, and where necessary, the judicious use of least-hazardous pesticides. Pesticides, when needed, shall be selected consistent with IPM principles in order to minimize negative impacts on human health and the environment" (OPNAVINST 6250.4C, p.1).

Together with the principles of Early Detection and Rapid Response (National Invasive Species Council 2008), the goals of invasive species management include:

- preventing the introduction and spread of invasive species;
- early detection and rapid response to new populations of invasive species;
- controlling or eradicating existing invasive plant populations;
- regular monitoring to detect new populations, assess management efforts, and prevent the re-establishment of invasive plants;
- managing invasive plants and treatment efforts through adaptive management;
- providing for the restoration of native species and habitats that have been invaded;
- promoting public education on invasive species; and
- collaboration.

The Navy has existing management plans for invasive plants and other resources available. The Navy developed an EA to control common reed on a number of installations in the region, including NASO DNA (NAVFAC Atlantic 2002); and a Pesticide Compliance and Pest Management Plan (NAVFAC Atlantic 2003), which describes requirements, resources, responsibilities, and procedures for pest management throughout the region. Additional information on invasive species on NASO DNA is included in the 2006 INRMP for NASO DNA (NAVFAC Atlantic 2006) and the draft 2013/2014 updated INRMP (NAVFAC Atlantic 2014).

Other useful resources are listed in the Invasive Plant Species pamphlet developed for this Task Order (Appendix E).

APPENDIX A

Additional Project Background and Stakeholder Survey Questionnaire

This page intentionally left blank.

Kick-off Meeting

The Project Kick-off Meeting was conducted on 13 July 2012 via conference call. The meeting was attended by the NTR, Mr. Emmett Carawan; the IR/NASO DNA Natural Resources Specialist, Ms. Michael Wright; Tetra Tech's Project Manager, Ms. Sarah Watts; and Deputy Project Manager, Mr. Brad Agius. The Task Order schedule, survey priorities, Installation access and protocols, GIS data, photography restrictions, potential stakeholders, and fieldwork were reviewed and discussed during the meeting.

Stakeholder Survey Questionnaire

Creation of the high-priority species list began with by identifying potential stakeholders – experts and organizations familiar with invasive species issues and management who could help refine the list of potential high-priority invasive floral species. At the recommendation of the Navy, Tetra Tech conducted a preliminary consultation with David Bishop, USFWS Regional Invasive Species Biologist at Back Bay National Wildlife Refuge. Mr. Bishop provided recommendations for stakeholders and input on the invasive species likely to be present at all of the four Installations. The stakeholders list was comprised of regulatory agencies such as U.S. Fish and Wildlife Service (USFWS), U.S. Department of Agriculture (USDA), Virginia Department of Game and Inland Fisheries (VDGIF) and Virginia Department of Conservation and Recreation (VDCR); private groups; and other experts. A preliminary stakeholder list was submitted to the IR and NTR on 3 August 2012 for review and comment. The stakeholder list was subsequently expanded and refined to include a total of 26 individuals from 21 Federal, state, and local regulatory agencies, private organizations, and individuals selected from a list of approximately 60 people or organizations that have expertise in invasive plant species (Table 1).

Table 1. Stakeholders and Experts Contacted for Task 1B of Task Order WE39.

Agency / Organization	Contact
Back Bay National Wildlife Refuge	David Bishop
Back Bay Restoration Foundation	Mary Tilton
Barney Environmental	Jason Barney
City of Virginia Beach	Clay Bernick, Environmental Manager
North Carolina Department of Agriculture	Rick Iverson
North Carolina Invasive Species Advisory Committee	Gene Cross, Division Director
North Carolina Wildlife Resources Commission	Shannon Deaton, Program Manager Chris Turner
Old Dominion University	Troy Savage
South Atlantic Landscape Conservation Cooperative	Ken McDermond
The Nature Conservancy	Judy Dunscomb, Chief Scientist
The Nature Conservancy, Southern Rivers Program	Brian van Eerden
USFWS Great Dismal Swamp National Wildlife Refuge	Chris Lowie, Refuge Manager Don Schwab, Wildlife Biologist

Virginia Department of Conservation & Recreation	Kevin Heffernan
Virginia Department of Game and Inland Fisheries	Aaron Proctor Amy Ewing
Virginia Natural Heritage Program	Darren Loomis
Virginia Tech / NRCS	Bob Glennon

Following identification of the stakeholders, a preliminary list of invasive species was taken from the VDCR's Natural Heritage database list of *Invasive Alien Plant Species in Virginia* (VDCR 2009), and a list of 12 highly invasive species found in Virginia (VDCR 2010). (Note that non-invasive naturalized or weedy species, such as greenbrier [*Smilax* sp.] and buckthorn [*Rhamnus/Frangula* spp.] were excluded from consideration.) This list was refined by narrowing it to only those species known or likely to occur in the Coastal Plain where the four Installations are located, or which were ranked as highly or moderately invasive on the *Invasive Alien Plant Species in Virginia* list.

A written Stakeholder Survey Questionnaire (Figure 1) with four closed- and open-ended questions was sent via email in August and September 2012 to the 26 people on the stakeholder list (Table 1). The questionnaire asked the stakeholders what species were most likely to occur or become established at the Installations, which species posed the greatest risk to natural resources, and which species presented the greatest opportunity for being managed or controlled. The results of the stakeholder responses were summarized, and along with complete results, were submitted in a memorandum to the Navy on 18 September 2012.

Figure 1. Stakeholder Survey Questionnaire

Stakeholder Communication for Invasive Species Inventories

On behalf of the US Navy, Naval Facilities Engineering Command, Mid-Atlantic, Tetra Tech is seeking input on invasive plant species for four installations: Naval Air Station (NAS) Oceana and NAS Oceana Dam Neck Annex located in Virginia Beach, Virginia; Naval Auxiliary Landing Field (NALF) Fentress in Chesapeake, Virginia; and Naval Support Activity Hampton Roads (NSAHR) Northwest Annex located in Chesapeake, Virginia and Currituck County, North Carolina (Project Area). The Project Area is located in the Coastal Plain of southeastern Virginia and northeastern North Carolina and covers more than 13,000 acres. A large portion of the Project Area is forested, wetland, or undeveloped land managed for forest products, agriculture, and wildlife values.

We are seeking your help by asking four questions to refine the list of what invasive plant species are present or pose the greatest risk of becoming established, in order to prioritize efforts and determine what the greatest opportunities for managing invasive species are. You have been selected because of your expertise and/or local experience.

We have conducted an initial screening and developed a preliminary list of invasive floral species that may be present at the four installations based on the Virginia Department of Conservation and Recreation's Natural Heritage database list of Invasive Alien Plant Species in Virginia¹, and a list of 12 highly invasive species found in Virginia.ⁱⁱ Based on this screening, Tetra Tech developed the following preliminary list of invasive floral species for the four installations, on which we request your input.

Please return your responses to brian.rod@tetrattech.com no later than August 24, 2012.

Please feel free to contact me at 207.329.8882 if you have any questions.

Invasive Plant Species Presence and Risk

Please select the invasive plant species that are most likely to be present at one or more of the installations or which pose the greatest risk of becoming established.

Site Visit

The reconnaissance site visit was conducted at the four installations on 28–30 August 2012 by the IR/NAS Oceana Natural Resources Specialist, Ms. Michael Wright, and representatives from the Tetra Tech team (the Project Manager, Ms. Sarah Watts; Field Technician, Ms. Lindsey Staszak; and Mr. Dwight McKinney from Carolina Silvics, Inc. of Edenton, North Carolina, the subcontractor selected to conduct the invasive plant surveys). The NTR, Mr. Emmett Carawan, joined the participants during the third day of the site visit reconnaissance (30 August 2012).

The site visit reconnaissance finalized the list of high-priority invasive flora; and tested and refined the draft invasive plant survey methodology, field procedures, and health and safety policies that were later incorporated into the Work Plan. The Work Plan, approved by the IR and NTR, includes the invasive plant species survey methodology (summarized in Section 2.2), survey schedule, access protocols, and Health & Safety Plan for the field surveys.

APPENDIX B

Invasive Plant Species Survey Field Summary Data

This page intentionally left blank.

Invasive Species Inventory Survey for Naval Air Station Oceana, Dam Neck Annex

Plot Characteristics: Summary Plot Statistics, Patch Shape, Level of Infestation, and Spreading Vectors

Summary Plot Statistics	Number	Percentage
Total Number of Plots	240	
Number of Invasive Species at NASO DNA	16	
Number of High-priority Species at NASO DNA	6	
Number of Plots with High-priority Species	158	66
Number of Plots with Invasive Species Observed (including Non-priority Species)	163	68

Patch Shape	Number of Plots	Percentage
Point	2	1
Linear	6	4
Patch	154	94
Mix	1	1

Level of Infestation	Number of Plots	Percentage
New &/or Small Infestation	35	21
Moderate with >30% Desirable Species	90	55
Large-scale with <30% Desirable Species	37	23
Monoculture of Invasive Species	1	1

Spreading Vector	Number of Plots	Percentage
Road	55	34
Path	16	10
Parking Lot	6	4
Fenceline	5	3
Lake	5	3
Lawn	5	3
Pond	5	3
Canal	4	2
Range	4	2

Common invasive plants at:

Naval Air Station Oceana

NASO Dam Neck Annex

Naval Auxiliary Landing Field Fentress

Naval Support Activity Hampton Roads
Northwest Annex (NSAHR NWA)

The purpose of this brochure is to provide a basic understanding of the most common invasive plants occurring at four Navy installations in the Hampton Roads region, the threats they pose, and what you can do to help control and prevent their spread.

what are invasive species?

Invasive species are plants, animals, or micro-organisms that are non-native and are likely to cause economic or environmental harm or harm to human health. They are often spread by wind, wildlife, and intentional or unintentional actions.

The Department of Defense and other Federal and state agencies have instituted policies and guidelines to prevent and control the introduction and spread of invasive species.

why are invasive plants a problem?

Invasive species can interfere with military operations and readiness, kill or shade out native plants, harm fish and wildlife and their habitats, and have negative economic impacts on crop yields and forest productivity. Furthermore, invasive species are a threat to availability of training areas, increase risk of wildfire, and can pose serious health and safety issues for people.

Economic losses and control costs have been estimated to exceed \$120 billion per year (Pimentel et al. 2005)

what you can do about invasive plants

You can help stop invasive plants by identifying these species and taking actions to prevent their introduction and spread:

- Learn about the invasive species that are in your area and what is being done about them
- Be able to identify invasive plants
- Report new invasive species and infestations to the Natural Resources Manager
- Remove invasive plants from your property
- Plant non-invasive plants on your property
- Clean boats and trailers, off-road vehicles, boots, waders, and other pathways of spread to stop hitchhiking invasive species
- Use certified "weed-free" forage, firewood, hay, mulch, and soil
- Volunteer for organized efforts to remove invasive species from natural areas and support organizations that work with invasive species

Natural Resources Managers need your help to prevent and contain the spread of these invaders.

Early Detection and Rapid Response (EDRR) is critical to identify new areas of infestation, rapidly respond, and increase the chances of success.

The Department of Defense is a leader in natural resources management and controlling invasive species.

1.0 INTRODUCTION

Tetra Tech, Inc. (Tetra Tech) was contracted by the U.S. Department of the Navy (Navy), Naval Facilities Engineering Command Mid-Atlantic (NAVFAC Mid-Atlantic) to conduct a Department of Defense (DoD) Coordinated Bird Monitoring study at Naval Air Station Oceana Dam Neck Annex (NASO DNA or Base/installation), Virginia Beach, Virginia. The Project tasks include: (1) planning, coordination, research, and site visit; (2) winter 2013 resident survey; (3) spring 2013 breeding survey; (4) summer 2013 resident survey; (5) fall 2013 migration survey; and (6) reporting including a draft and final report and installation avian species list. The project was designed to provide the Base with a better understanding of avian diversity at NASO DNA and establish protocols and recommendations for future monitoring. The report and data will aid in ensuring compliance with applicable DoD policies, instructions, and guidance.

1.1 BACKGROUND

NASO DNA provides a variety of habitats and open space for a wide range of avian species. These include several migratory as well as resident avian populations that provide important ecological services and are important indicators of ecosystem health. A large portion of avian species at NASO DNA are protected under the Migratory Bird Treaty Act (MBTA) and under Executive Order (EO) 13186, Responsibilities of Federal Agencies to Protect Migratory Birds. Some species also have additional protection under the Endangered Species Act (ESA) and/or the Bald & Golden Eagle Protection Act (BAGEPA). It is the responsibilities of federal agencies, including the DoD, to protect migratory birds and support and contribute to the goals and efforts of regional migratory and game bird conservation programs.

Several comprehensive conservation plans for migratory birds have been developed for landbirds, shorebirds, and waterbirds in Virginia. Within the guidance of EO 13186 these plans provide the structure, conservation priorities, goals, and objectives for various avian species and their habitats at NASO DNA. Plans that are applicable to NASO DNA include:

- DoD Coordinated Bird Monitoring Plan
- Partners in Flight, North American Land Bird Conservation Plan
- Partners in Flight, Bird Conservation Plan for the South Atlantic Coastal Plain
- North American Waterfowl Management Plan
- US Shorebird Conservation Plan
- North American Waterbird Conservation Plan
- Virginia Bird Conservation Initiative
- Virginia Wildlife Action Plan
- South Atlantic Migratory Bird Initiative
- North American Bird Conservation Initiative

The DoD is subject to several regulations establishing responsibilities for monitoring migratory birds. The Sikes Act requires all military installations with significant natural resources to prepare and implement Integrated Natural Resources Management Plans (INRMPs) that guide conservation and long-term management of natural resources. The National Environmental Policy Act (NEPA) requires federal agencies to evaluate and disclose potential environmental impacts of proposed actions. This requires bird populations to be monitored and status established. In 2006, DoD signed an Memorandum of Understanding with the US Fish and

Wildlife Service (USFWS) under which DoD will identify and monitor migratory species that could be affected by military activities.

As a result of the MBTA and direction of EO 13186, the DoD established the Coordinated Bird Monitoring (CBM) plan to provide a comprehensive approach for assisting the DoD in fulfilling its responsibilities in regards to avian populations. The plan establishes goals and objectives for monitoring birds, describes the DoD's role in large-scale monitoring programs, provides guidelines on selection of field methods and data management, and identifies additional actions that would help DoD biologists.

1.2 PURPOSE AND OBJECTIVES

Purpose: NASO DNA is obligated to carry out programs for the conservation of migratory birds that may occur on Base properties. This project is part of the overall migratory bird conservation program at NASO DNA and is designed to help ensure ecosystems upon which the migratory birds depend are appropriately managed to support biodiversity and ecological integrity of the Base. Meeting these requirements along with providing a conservation management program supports the Navy mission of ensuring healthy lands for long-term use of installations for military training and readiness activities.

NASO DNA parcels provide important training areas for conducting military exercises. These lands simultaneously support habitat for flora and fauna, including birds. Effective management of the avian population begins with collecting baseline ecological data on the species occupying the Base as well as densities and seasonal use. This information can be incorporated into management plans that can be used by natural resource managers to provide a sustainable, multiple-use management strategy for migratory birds. Migratory bird surveys and breeding bird counts provide a strong, statistically valid framework for detecting trends in bird populations and assist managers in meeting their bird conservation goals. The primary purpose of the monitoring study was to contribute to the baseline bird data and develop a comprehensive bird species list, as well as provide the methods, protocols, and recommendations for future study.

Goal: Implement a DoD Coordinated Bird Monitoring study designed to contribute to the understanding of the avian communities at NASO DNA.

Objectives:

1. Establish point count, area search, and hawk watch survey locations;
2. Establish methods and protocols designed to facilitate future study;
3. Implement monitoring during fall migration, winter resident, spring breeding and summer resident seasons;
4. Summarize and report monitoring data;
5. Use monitoring, existing data, and expert analysis to develop a comprehensive list of birds of NASO DNA; and,
6. Develop recommendations based on results and observations.

2.0 MONITORING AREA

2.1 INSTALLATION SETTING AND LAND USE

NASO DNA is located in the southeastern portion of the City of Virginia Beach, Virginia (Figure 1). It encompasses 1,372 acres and is bounded by the VA Army National Guard – Camp Pendelton to the north, the Atlantic Ocean to the east, the community of Sandbridge to the south, and Virginia Beach to the west. Land use surrounding the Base includes industrial, commercial, residential, recreational, and agricultural though most of the agricultural lands are rapidly being converted to residential and recreational developments. Urban/developed is the most common land use on the Base. Most of the remaining landscapes on Base include beaches and dunes, and upland and wetland forests that are dominated by hardwood species or a mix of pine and hardwood.

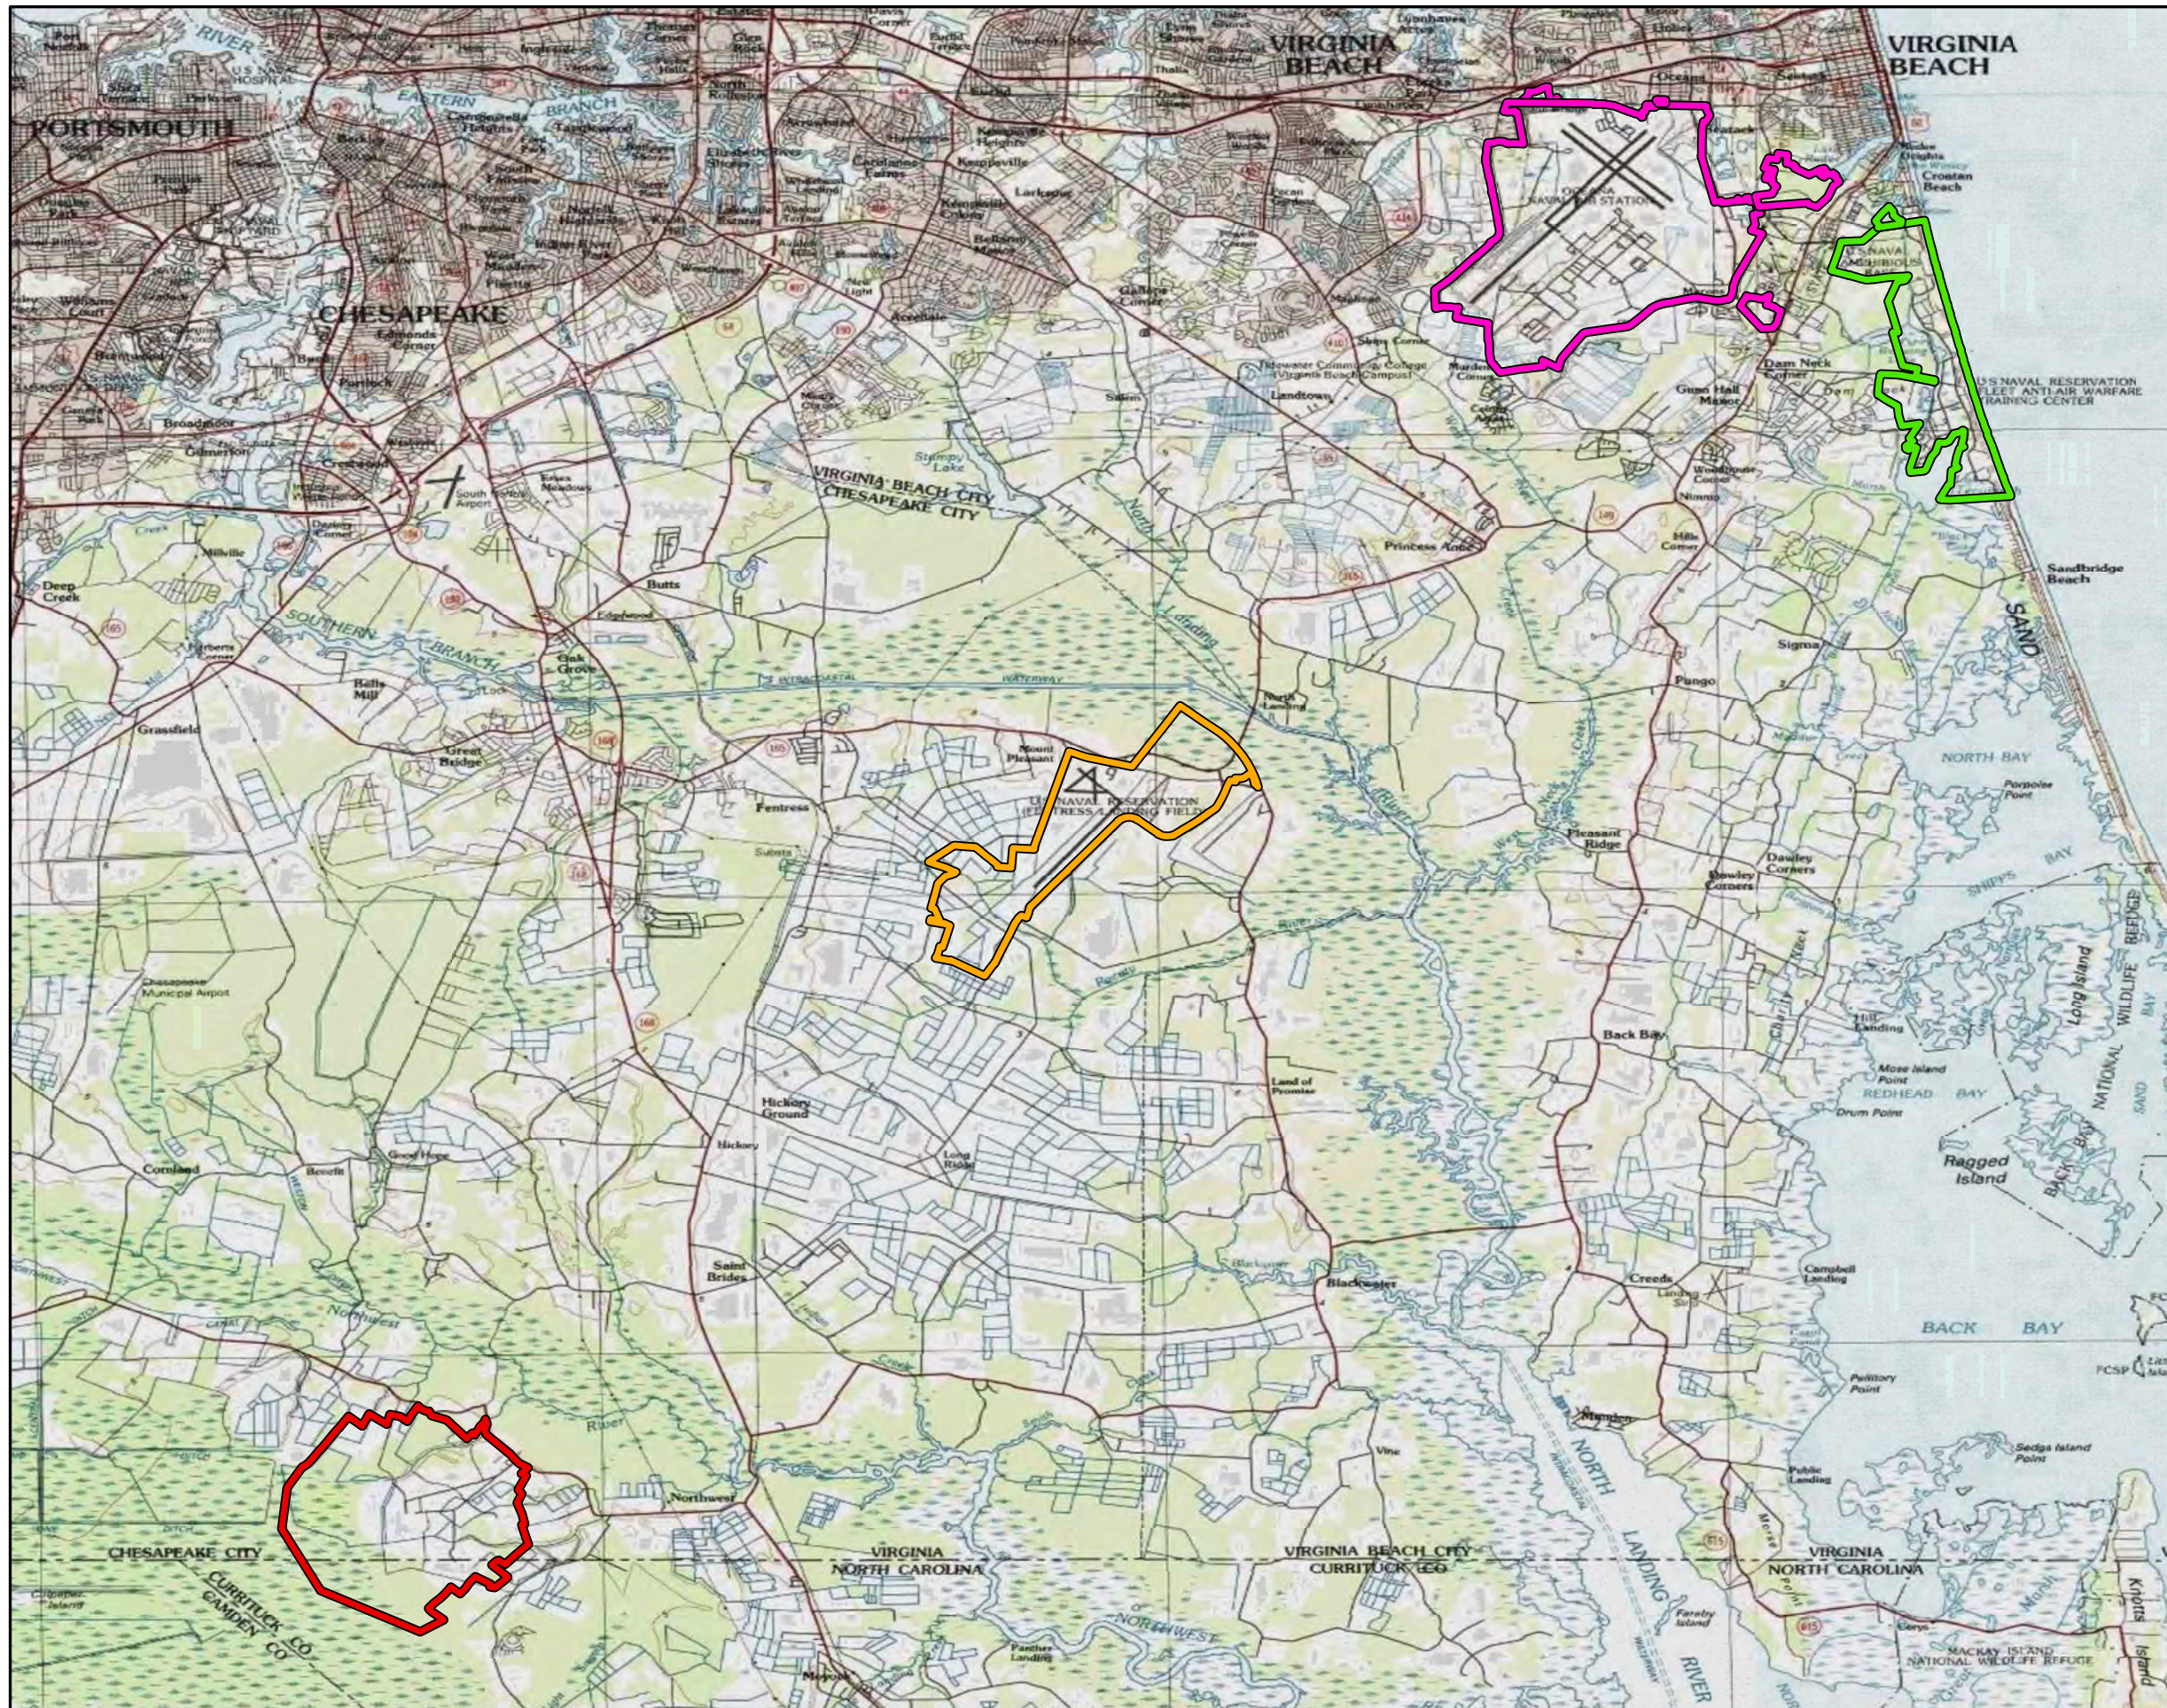

Due to the intense level of development in the region, NASO DNA and the other coastal military installations are extremely important to the region's ecology. These bases, along with First Landing State Park to the north and Back Bay National Wildlife Refuge to the south, support the few remaining tracts of undeveloped dune ecosystems along the Virginia coast. NASO DNA has nearly four continuous miles of primary and secondary coastal dune habitat and other habitat types important to avian species.

2.2 ECOLOGICAL COMMUNITY GROUPS

Several ecological community groups have been listed as occurring at NASO DNA. These communities provide potential forage and nesting habitat for a wide diversity of avian species, including species representative of nearly every classification order of birds. Detailed descriptions of these are provided within the Base's INRMP (US Navy 2014).

- Beach and Foredune
- Maritime Dune Woodlands
- Maritime Evergreen Forests
- Maritime Dune Grasslands
- Maritime Scrub
- Interdune Wetlands
- Hardwood Forests
- Mixed Forests
- Pine Forests (both managed and unmanaged)
- Early Successional Habitats

In addition to the above mentioned communities there are several other habitats noted for the Base. They include: open ocean, palustrine forest wetlands, palustrine scrub-shrub wetlands, palustrine emergent wetlands, lakes, ponds, streams, canals, drainage ditches, maintained open areas (lawns), and developed areas. The significant ecological community groups include maritime upland forest, maritime dune woodland, and interdunal pond.

2.3 STUDY AREA

The Study Area includes the entirety of NASO DNA and a portion of Camp Pendleton, as well as near shore ocean areas as depicted in Figure 1. As a result of difficulty in accessing some areas of the facility due to security restrictions, military operations, and public use activities, not all areas were surveyed. However, the study area was defined as the entire Base as this effort ultimately is a compilation of a variety of sources to determine the bird species occurring at NASO DNA, including the formal surveys described within this report.

3.0 METHODS

The primary objective of the study was to develop a comprehensive bird species list for NASO DNA. To reach this objective, the DoD CBM plan recommends using a combination of expert analysis, existing data, and field survey (Bart 2005, Bart et al. 2012). Field survey can be implemented using a variety of methods including area searches, fixed-radius point counts, distance point counts, double observer, removal methods, species-specific survey (e.g., species of concern, hawk watch), and mark and recapture methods (Bart et al. 2012). For this study, field survey efforts included distance point counts, hawk watches, and area searches. The results of the monitoring were combined with expert analysis and existing information (e.g., eBird observation data, Breeding Bird Atlas [BBA] data, Monitoring Avian Productivity and Survivorship [MAPS] data, and NASO DNA INRMP) to develop a bird species list for NASO DNA. Specific methods are outlined in the following sections.

3.1 PRE-FIELD PLANNING

Desktop review of NASO DNA aerial, land cover, and soils maps combined with INRMP review, expert knowledge of “good birding” areas, conversations with Base biologist regarding management objectives, and on-the-ground site reconnaissance were used to establish survey locations. Point counts were set-up along routes designed to be surveyed in a single survey morning within a specified time frame. An initial site visit resulted in GPS located survey point count locations and survey polygons for area searches. Survey field maps and GPS locations were then provided to field teams for easy relocation and navigation in the field.

3.2 SURVEY PERIODS

To document annual bird use of the Base by a variety of family groups, the study involved four (4) survey periods occurring in the fall, winter, spring (or breeding) and summer seasons. In most cases surveys were replicated within these seasons to capture seasonal variability. The survey periods were defined as follows (with the understanding that some species do breed outside of the defined “breeding” period identified below):

Fall	September 1 – October 31
Winter	January 1 – January 31
Breeding	April 1 – May 31
Summer	June 1 – July 31

3.3 SURVEY PROTOCOLS

Distance Point Counts: A distance point count consists of standing at a predetermined location and recording bird observations, and distances to those observations, for a set period of time.

For this study the period of time was set at 5 minutes. The number of individual birds of each species, and distance to the observation (auditory or visual) was estimated and recorded on the Avian Survey Data Form (Appendix A). Distances were recorded to facilitate future analysis as this attribute can be important in estimating densities. Specific instructions on recording each observation and its attributes are provided within the data form instructions included in Appendix A. Diurnal counts were conducted between sunrise and four hours after sunrise (fall and winter), or between 30 minutes prior to and three and a half hours after sunrise (spring and summer). Nocturnal counts, which were associated with the May full moon, were all conducted beginning at least 1/2 hour after sunset up to one hour before sunrise. All nocturnal counts were conducted when the moon was above the horizon and skies were clear or mostly clear. Such weather conditions are conducive to increased levels of vocalizing by chuck-will's-widows, eastern whip-poor-wills, and owls, and may induce nighttime singing by diurnal species such as some sparrows, cuckoos, night-herons, and wrens. Nocturnal point counts included broadcast of owl calls at the end of each 5 minute count.

Upon arrival at point count location observers waited for 2 minutes before recording birds to allow birds to acclimate to the disturbance of the approach as well as the observers presence. Weather conditions were noted on each data form, however, surveys were not conducted during rain, under windy conditions (i.e., > 10 mph), or when hearing was significantly impaired due to installation activities (e.g., aircraft maneuvers). With the exception of nocturnal surveys (which included the use of owl broadcast calls) observers did not use sounds to attract birds to the point or induce calling. No "spishing", "squeaking", recorded calls, or any other methods that encourage birds to alter their behavior were used.

During the survey it was determined that 20, 5-minute points could typically be surveyed in a single morning. Most point counts were approximately 600 meters from the closest adjacent point count; however, a few were located closer than this. Point counts were established in a variety of habitats and soil types representative of the Base. During the nocturnal surveys, every other station (i.e. point) was sampled to avoid duplicate observations as nocturnal birds can be heard at greater distances due to loud vocalizations (i.e., owls, goatsuckers) and lower ambient noise levels at night.

Point counts were conducted throughout NASO DNA (Figure 2). Where possible, points were situated to capture several habitats and land uses within one point location in an effort to capture avian activity in a broad range of land uses, vegetative communities, soil types, and topographic locations. This approach ensured that habitats of virtually all birds on Base would be captured, and is intended to facilitate the evaluation of potential impacts of future management activities on avian populations. Ecological communities targeted with point counts included ocean; beach and dune; hardwood, conifer and mixed wood forest; grassland and old field; scrub shrub; freshwater, and to a much lesser extent brackish wetlands; lakes, ponds, canals and drainage ditches; maintained lawns and fields; and, developed areas.

The point counts were established in one group or route to facilitate survey organization. The route was designed to be finished within 3.5 hours after ½ hour before the published sunrise during the breeding season. The point count station locations and frequency of survey are provided in the results section.

Hawk Watches: Hawk watch points were established using local expert experience and in areas that provided the best views of migrating hawks (Figure 3). Hawk watch points were surveyed during the fall survey period only (September thru October). Points were surveyed multiple times for a 2 hour window between two and one-half and four and a half hours after sunrise. Observations were recorded on the Avian Survey Data Form (Appendix A). Weather conditions were noted on each data form; however surveys were not conducted during rain events. This type survey was not hampered by wind or loud installation activities.

Area Searches: Area searches were established by local expert experience and were located primarily in areas with unique habitats or over large, inaccessible areas such as water bodies or inundated wetlands. Ecological communities targeted by area searches included a relatively large freshwater marsh located on the northern section of the installation in the Lovett's Marsh area, a portion of the 261 acre Lake Tecumseh, and the dune/beach and near shore community along the Base (Figure 3). Area searches were conducted from single observation points or by meandering through habitat within defined polygons. Area search methods allow the observers more flexibility in surveying a variety of habitats, especially those near and over water. Visual and/or auditory observations were recorded on the Avian Survey Data Form (Appendix A). During each survey observations were made until no new species could be recorded for the area.

Most of the species searched for during the area searches are water birds, shorebirds, or birds that utilize open areas and dunes; thus area search surveys were not limited to the early morning, but were conducted at various times during the day. At least one breeding season area search event was scheduled between 30 minutes before the published sunrise and 3.5 hours after the published sunrise and utilized broadcast calls in an effort to target secretive marsh species. The area search locations and frequency of survey are provided in the results section.

Additional area searches were conducted in areas along the ocean shoreline of NASO DNA, including areas within firing range training areas (when access was permissible). These surveys differed from area searches in that they targeted shorebird and coastal species and were conducted for at least 4-hours in total survey time. Each survey was conducted anytime between published sunrise and sunset in a single day, but some were spread out over 2-days due to training area access issues. Surveyors meandered along the shoreline and used elevated areas for viewing the beach and near shore zones for target species. Observations were recorded on the Avian Survey Data Form (Attachment A).

Weather conditions were noted on each data form; however surveys were not conducted when it was raining. [This type survey was not hampered by wind or loud installation activities.] No "spishing", "squeaking", recorded calls, or any other methods that encourage birds to alter their behavior were used. However, the flushing of birds was allowed due to the nature of the survey.

Incidental Observations: Incidental observations were only recorded for sensitive species with the potential to occur at NASO DNA as listed in Table 1. Incidental observations were species observed out-side of the formal surveys; such as between point counts or while driving on Base. Incidental observations were recorded on the Avian Survey Data Form (Appendix A). In addition, all incidental observations were located using a hand-held GPS and the location recorded on the data form.

Table 1. Sensitive Species Watch List for Avian Species List Study at NASO DNA.

Scientific Name	Common Name	Federal Status	State Status
<i>Accipiter gentilis</i>	Northern goshawk	Species of Concern	Not Listed
<i>Aegolius acadicus</i>	Northern saw-whet owl	Not Listed	Special Concern
<i>Ammodramus caudacutus</i>	Saltmarsh sharp-tailed	Not Listed	Special Concern
<i>Ammodramus henslowii</i>	Henslow's sparrow	Not Listed	Threatened
<i>Ardea alba</i>	Great egret	Not Listed	Special Concern
<i>Asio otus</i>	Long-eared owl	Not Listed	Special Concern
<i>Bartramia longicauda</i>	Upland Sandpiper	Not Listed	Threatened
<i>Calidris canutus</i>	Red knot	Candidate	Not Listed
<i>Catharus guttatus</i>	Hermit thrush	Not Listed	Special Concern
<i>Certhia americana</i>	Brown creeper	Not Listed	Special Concern
<i>Charadrius melodus</i>	Piping Plover	Threatened	Threatened
<i>Charadrius wilsonia</i>	Wilson's Plover	Species of Concern	Endangered
<i>Circus cyaneus</i>	Northern harrier	Not Listed	Special Concern
<i>Cistothorus platensis</i>	Sedge wren	Not Listed	Special Concern
<i>Egretta caerulea</i>	Little blue heron	Not Listed	Special Concern
<i>Egretta tricolor</i>	Tricolored heron	Not Listed	Special Concern
<i>Empidonax alnorum</i>	Alder flycatcher	Not listed	Special Concern
<i>Empidonax flaviventris</i>	Yellow-bellied flycatcher	Not Listed	Special Concern
<i>Falco peregrinus</i>	American peregrine falcon	Not Listed	Threatened
<i>Gallinula galeata</i>	Common gallinule	Not Listed	Special Concern
<i>Gelochelidon nilotica</i>	Gull-billed Tern	Species of Concern	Threatened
<i>Geothlypis philadelphia</i>	Mourning warbler	Not Listed	Special Concern
<i>Haemorhous purpureus</i>	Purple finch	Not Listed	Special Concern
<i>Haliaeetus leucocephalus</i>	Bald Eagle	Species of Concern	Not Listed
<i>Hydroprogne caspia</i>	Caspian tern	Not Listed	Special Concern
<i>Lanius ludovicianus migrans</i>	Migrant loggerhead shrike	Species of Concern	Not Listed
<i>Laterallus jamaicensis</i>	Black rail	Species of Concern	Endangered
<i>Limnothlypis swainsonii</i>	Swainson's warbler	Not Listed	Special Concern
<i>Loxia curvirostra</i>	Red crossbill	Not Listed	Special Concern
<i>Nyctanassa violacea</i>	Yellow-crowned night-heron	Not Listed	Special Concern
<i>Pelecanus occidentalis</i>	Brown pelican	Not Listed	Special Concern
<i>Peucaea aestivalis</i>	Bachman's Sparrow	Species of Concern	Threatened

<i>Picoides borealis</i>	Red-cockaded Woodpecker	Endangered	Endangered
<i>Plegadis falcinellus</i>	Glossy ibis	Not Listed	Special Concern
<i>Regulus satrapa</i>	Golden-crowned kinglet	Not Listed	Special Concern
<i>Setophaga cerulea</i>	Cerulean warbler	Species of Concern	Not Listed
<i>Setophaga kirtlandii</i>	Kirtland's warbler	Endangered	Endangered
<i>Setophaga magnolia</i>	Magnolia warbler	Not Listed	Special Concern
<i>Sitta canadensis</i>	Red-breasted nuthatch	Not Listed	Special Concern
<i>Spiza americana</i>	Dickcissel	Not Listed	Special Concern
<i>Sterna dougallii</i>	Roseate tern	Endangered	Endangered
<i>Sterna forsterii</i>	Forster's tern	Not Listed	Special Concern
<i>Sternula antillarum</i>	Least tern	Not Listed	Special Concern
<i>Thalasseus sandvicensis</i>	Sandwich tern	Not Listed	Special Concern
<i>Thryomanes bewickii</i>	Bewick's wren	Not Listed	Endangered
<i>Troglodytes hiemalis</i>	Winter wren	Not Listed	Special Concern
<i>Tyto alba</i>	Barn owl	Not Listed	Special Concern
<i>Vermivora bachmanii</i>	Bachman's warbler	Endangered	Endangered
<i>Vermivora chrysoptera</i>	Golden-winged warbler	Not Listed	Special Concern

3.4 EXPERT ANALYSIS

Principal Environmental Biologist, Stacie L. Grove, is a Professional Wetland Scientist, Certified Wildlife Biologist, and specialist in avian ecology and identification. Ms. Grove has spent her entire professional career focusing on bird-related research and assessments, and has conducted avian work from the east coast to west. Her expertise includes species-specific surveys for federal and state-listed birds at numerous locations throughout the United States, peregrine falcon reintroduction work for the US Fish and Wildlife Service, assessments of avian habitat use in coastal areas of New York and New Jersey for the US Army Corps of Engineers, as well as mist-netting and avian research to assess song bird and wading bird populations in Delaware, Maine, Massachusetts, and New Jersey for Manomet Center for Conservation Sciences (aka Manomet Bird Observatory). Ms. Grove has provided environmental services throughout the east coast and is very familiar with the Base's habitats and birds. She participated in all field survey events performed on the base, and was key in developing and reviewing the checklist of birds for NASO DNA as provided herein.

Biologist Benjamin Griffith has spent nearly all of his life immersed in the study of birds. Prior to college and continuing throughout his career he has participated in approximately 60 Christmas bird counts, as well as dozens of additional bird counts, censuses, and monitoring projects in 14 states. Mr. Griffith has served as a seasonal editor for a state ornithological journal, an executive board member for a chapter of New Hampshire Audubon, and has been a member of the New Hampshire bird records evaluation committee since 2010. This expertise proved invaluable to developing and reviewing the checklist of birds for NASO DNA.

3.5 CHECKLIST DEVELOPMENT

One of the objectives of the study was to develop a comprehensive checklist for the birds of NASO DNA (Appendix D). Five facets of data and review were used to develop the checklist and included:

- Direct observations recorded during this study;
- Virginia eBird data for Virginia Beach 2009-2013 (eBird 2013);
- Virginia BBA data (BBA Explorer 2014);
- The MAPS Program Annual Reports, 1989-2003 for the PEND (Camp Pendleton) Station (Michel et al. 2006), and
- Regional expert review and abundance category assignment.

Other avian data sets for the region were referenced as a cross check, including Virginia Breeding Bird Survey Data (VA BBS 2014) and Christmas Bird Count Data, but these provided less meaningful information; primarily because the geographic scope of the data was too large to make meaningful correlations to the Base, was not in a particularly useful format, or the species were sufficiently captured in the eBird data. The MAPS data was more project area specific with the monitoring station occurring on the northern parcel of NASO Dam Neck (formerly referred to as Camp Pendleton or South Virginia Beach Annex) and recorded from 1995-2002. The MAPS data also provided estimates of abundance to further assist with checklist development.

The checklist was designed after those developed for a variety of locations by the United States Geological Survey's (USGS's) Northern Prairie Wildlife Research Center and closely follows that of the 2007 checklist developed for Virginia (Rottenborn and Brinkley 2007). As

recommended by the USGS, *A Proposed Format for Local Bird Checklists* (Andrews et. al. 1992) was also used as a helpful guide. The checklist included the following USGS abundance categories and nesting annotation for the four survey periods listed in Section 3.2:

- a - abundant: common species that is very numerous
- c - common: certain to be seen in suitable habitat
- u - uncommon: present but not certain to be seen
- o - occasional: seen only a few times during a season
- r - rare: seen at intervals of 2 to 5 years
- x - extremely rare: species highly unlikely to occur
- * - breeds/nests on study area

The observations recorded for this study, the species lists downloaded from the eBird (eBird 2013) website, Virginia BBA data, and MAP results were evaluated and combined as appropriate to develop a list of birds likely to occur on NASO DNA properties. Species were included on the list if confirmed on the installation through 2012-2013 avian survey efforts, were documented within the same BBA atlas block, were reported on at least 2 eBird checklists for Virginia Beach within the past 5-years AND had a frequency of occurrence on eBird checklists of ≥ 0.15 percent (%) in at least one season (spring, summer, fall, winter) of the year. The combined list was then manually reviewed by Stacie Grove and Audubon Bird Record Committee Reviewer, Benjamin Griffith, and species were further added or eliminated based on an evaluation of eBird frequency data, habitat availability on the Base, and their local knowledge and expertise. Ms. Grove and Mr. Griffith also were responsible for evaluating eBird and Virginia BBA data to assign the seasonal abundance categories, and to note if particular species are known to breed in Virginia Beach. Seasonal abundance categories were assigned based primarily on eBird frequency data (e.g., percent of records submitted on which the species observed) as follows: a = 25%, c = 10%, u = 3%, o = 0.6%, r = 0.15%.

3.6 DATA STORAGE AND ANALYSIS

All observations were recorded on the Avian Survey Data Form (Appendix A). A Microsoft Access (Microsoft Inc., Redmond, WA) database was created to facilitate data entry, storage, and analysis. Data entry forms within the database mirrored the field form and contained pull down menus and quality control features to ensure accurate data entry. The database is also equipped with other quality control tools such as filters and range searches that allowed for user initiated data entry checks. The database was used to initiate analysis queries as needed to present the results herein. The database entry forms, quality controls, and queries were designed to allow for future use during similar studies.

Geospatial data was collected via handheld Garmin Global Positioning System (GPS) units (Garmin Inc., Olathe, KS) and stored within ArcGIS for incorporation into the installation's GIS Database. The GPS units used (GPSMAP 60CSx or Oregon Series) are not capable of submeter data collection, however, points were only collected with accuracies displayed on these GPS units that was less than 5 meters. Established point counts and area polygons, as well as recorded locations of sensitive species were converted to ArcGIS (ESRI Inc., Redlands, CA) shape files and submitted to the Base in accordance with all geospatial standards. All points and polygons were appropriately attributed with point labels and/or species name. Metadata (e.g., abstract, purpose, contacts) was also prepared for all appropriate fields for each ArcGIS shape file submittal.

4.0 RESULTS

4.1 DISTANCE POINT COUNT SURVEY

One distance point count route was established throughout ecological communities of the Base and named Route 1 (DNPC). A total of 20 points were surveyed during each replication of the route during the four survey periods, however, due to access issues, some of the replications had less than the 20 points surveyed. Tables 2 and 3 summarize the distance point count effort and Figure 2 depicts the locations of the point count stations. Table B1 in Appendix B provides the distance point count location data.

Approximately 1,439 observations were recorded during the point count surveys. A total of 122 species were recorded across all seasons (Table 4). The breeding survey recorded the most species at 89, followed by winter (62), fall (58), and then summer (50) (Table 4). The first replicate for all seasons combined recorded 96 species and the additional replicates added 26 species. During the breeding season the first replicate recorded 61 species and the remaining

replications added 28 species. Replication 3 during the breeding season consisted of only a nocturnal survey. The nocturnal survey recorded one species, the Eastern screech-owl. All breeding season point counts were surveyed between April 8 and May 24, 2013. Table C1 in Appendix C provides a list of species observed during the distance point count surveys, species are grouped by order.

4.2 AREA SEARCH SURVEY

Four area searches were conducted and included meandering surveys of the dune/beach and near shore community, and surveys of wetlands and lake/lakeshore habitats from observation points along the resources (Figure 3). In accordance with the pre-planning efforts, shorebird surveys were not conducted in the winter and hawk watch surveys were only conducted in the fall. These area searches and the frequency of survey are summarized in Table 2. Table B1 in Appendix B provides the center location data for each of the area searches.

Approximately 667 observations recorded 133 species during the area search surveys (Table 4). The breeding survey recorded the most species at 115, followed by fall (43), then winter and summer (both 42) (Table 4). The first replicate for all seasons recorded 84 species and the additional replicates added 31 species. During the breeding season the first replicate recorded 64 species and the remaining replications added 51 species. During the fall season the first replicate recorded 26 species and the remaining replications added 17 species. All breeding season areas searches were surveyed between April 8 and May 24, 2013. Table C1 in Appendix C provides a list of species observed during the area search surveys, species are grouped by order.

4.3 HAWK WATCH SURVEY

Hawk watches were performed during the fall season at one observation station over two replications (Table 2 and Figure 3). Table B1 in Appendix B provides the hawk watch station location data. Observation periods lasted for approximately 2 hours. The hawk watches recorded 21 observations of 5 species (Table 4). Of the 5 species, 3 were raptors (i.e., hawks, eagles, falcons, and vultures). The initial replication of the survey resulted in an observation of 4 species. Table C1 in Appendix C provides a list of species observed during the hawk watch surveys, species are grouped by order.

4.4 INCIDENTAL OBSERVATIONS

Throughout the study surveyors noted incidental observations of birds of special concern listed on Table 1. Four species were observed incidentally, and include (number of individuals): Bald Eagle (n=1), Forster's Tern (n=1), Golden-crowned Kinglet (n=1), and Red-breasted Nuthatch (n=1). These values represent only observations that occurred specifically as incidental observations; they do not include observations within regular surveys. All four of these species were also observed during the formal surveys.

4.5 OTHER NOTABLE OBSERVATIONS

Other notable observations included the presence of a potential heron rookery on the west shoreline of the marsh/pond (designated DNAS03) within DEVGRU (development group facilities in the northern portion of the Base), a radio-tagged bald eagle flying over the north end of the Base, and dozens of active osprey nests (located primarily on utility poles) throughout the Base. Also of interest, was the observation of a northern river otter (*Lontra canadensis*) within a pond adjacent to point count station DNPC14. Numerous dead seabirds were found on the beaches along the Base during early surveys in early April including nine common loons, six brown pelicans, and one northern gannet. Unusually high seabird mortality was noted at various locations along the east coast in March and April 2013.

4.6 TAXONOMIC SUMMARY

The 159 species observed during the 2013 monitoring effort represented 17 taxonomic orders (Table 5). Passeriformes (perching birds) was represented by the most species (n = 75) and the second most (n = 25) species was represented by Charadriiformes (plovers, sandpipers, and rails). Breeding and summer surveys noted the most number of passerines. Winter surveys were important to document the species richness of Anseriformes (ducks, geese, and swans).

Table 5. Number of Species by Taxonomic Order for Avian Species List Study at NASO DNA (2013).

Taxonomic Order	Order Description	Fall	Winter	Breeding	Summer	All
Anseriformes	Ducks, Geese, and Swans	6	19	12	1	22
Galliformes	Grouse, Quail, and Allies	0	0	0	0	0
Gaviiformes	Loons	1	2	2	0	2

4.8 CHECKLIST OF BIRDS

This study documented 159 species through direct visual or auditory observation. The greatest diversity was observed in the spring (breeding) with 133 species, and the fewest recorded during the summer with 66 species (Table 4). The list of 159 species was reviewed by Stacie Grove and Benjamin Griffith and compared to eBird and BBA data to further add species likely to occur at NASO DNA that were not observed during this effort or previous studies on the Base. Ms. Grove and Mr. Griffith also annotated each species with seasonal abundance categories and breeding status based on local knowledge and expertise. The final checklist, as presented in Table D1 in Appendix D, is comprised of 275 species, 63 of which are likely to breed at NASO DNA. Species are grouped by order within the checklist. Species that may breed in the region, but are unlikely to breed on the facility due to lack of suitable breeding habitat were not identified as potential breeding species. The species checklist is the first of its kind developed

for NASO DNA and is considered a working list that should be reviewed and updated at regular intervals (e.g., every 5 to 10 years).

5.0 DISCUSSION

Overall Effort

NASO DNA provides forest, beach, dune, freshwater, ocean, and wetland habitats and open space for a wide variety of avian species. This study represents the most concentrated effort to survey for and document the species richness of birds and their likelihood of occurrence at NASO DNA. Through a combination of field survey, information from other studies, and expert analysis, a list of 275 avian species was developed for the Base (Appendix D). The 2006 INRMP for NASO DNA reported 167 species observed during various bird surveys. In addition to the species list, estimates of seasonal abundance/occurrence and breeding status are provided. Of the 275 species listed, 63 are likely to breed at NASO DNA.

This study not only provides the foundation for the understanding of the existing environment as it relates to the avian community, it used DoD coordinate bird monitoring guidance to establish the methods and protocols to facilitate future monitoring. The combination of point count, area search, and hawk watch surveys across four seasons resulted in the observation of 159 species. Whereas, the implementation of just one method would have resulted in a significant decrease in species detections which would be further reduced if multiple seasons were not surveyed (Table 4). The variety of methods recommended by the guidance was important in capturing the diversity of species, as well as allowing for easy replication.

Overall, the breeding period survey, which also included the period of spring migration, provided the highest number of species (133). The winter and fall surveys were next with 74 and 72 species respectively, with the summer surveys the least at 66 species (Table 4). The difference in species numbers among survey periods demonstrates the importance of multiple surveys throughout the year in documenting the presence of a wide variety of species. The area search methods were found to be valuable to the study, capturing 11 more species than the point count surveys and several sensitive/rarer species not observed during other methods. This result is expected as the area search methods allow the observers more flexibility in surveying a variety of habitats, especially those near and over water.

As recommended within the DoD coordinated bird monitoring guidance, other studies and tools were used to further develop the Base's avian species list. The most valuable data sets included BBA and eBird data. eBird, a relatively new tool to the birding community, has revolutionized the way that the birding community reports and accesses information about birds. Launched in 2002 by the Cornell Lab of Ornithology and National Audubon Society, eBird provides rich data sources for basic information on bird abundance and distribution. eBird utilizes a real-time, easy to access and use web-based (and smart phone compatible) interface that allows birders to record bird observations. Many eBird portals are managed and maintained by local partner conservation organizations. In this way eBird targets specific audiences with the highest level of local birding expertise to encourage them to include their bird sightings in eBird. All data entered into eBird is checked by an automated data quality filter which was developed by regional avian experts. Unusual records that are flagged by the filters are then reviewed by local experts before submissions are included in the eBird database.

The BBA data for Virginia was collected by local birders between 1985 and 1989 and was also used to support the checklist. The atlas survey blocks are based on subdivisions of USGS 7.5 minute quadrangles and are especially useful in documenting breeding season avian observations within a relatively small geographic area. Although BBA surveys have not been performed in the area of the Base since the late 1980's, the robust data set (collected by thousands of reputable birders over several consecutive breeding seasons), provides a wealth of information on the birds that have been known to breed in the area, and would be expected to still utilize the area. These tools proved invaluable in developing the avian species lists for the Base and confirming accounts for the species.

The consultation with local birders and experts (as recommended within the DoD guidance), is an important phase to developing a comprehensive species list and proved invaluable to this process. Ms. Grove and a local reputable birder from the Virginia Beach Audobon Society participated in all surveys conducted on Base. In addition, her expertise and that of Audubon records committee member Benjamin Griffith, were integral in developing the Base-specific species list, evaluating eBird and BBA records, and providing seasonal use and abundance category estimates for all 275 species. The species checklist provided in Appendix D is the first of its kind developed for NASO DNA.

Given the overall species list of 275 species, and only 159 (58%) observed during the field surveys, it is important to note that despite the thorough effort, there are limitations of field surveys to capture a large number of species, particularly those that are rare or uncommon. Of the 116 species not observed during this study, 114 (99%) are considered to be rare (43%), occasional visitors (31%), or uncommon (25%) species at NASO DNA (Appendix D). Other factors such as the survey locations, seasonal variability in abundance, limitations in survey methods, and high public/military use of many of the habitat areas surveyed (i.e., training areas, beaches, lakes), will influence detectability of certain species. Further study is recommended to investigate the use of other types of survey methods, as well as expansion of survey areas and time in the field. Also species-specific surveys for sensitive species at risk would help focus conservation efforts.

The seasonal checklist provided in Appendix D is useful for providing a comprehensive list of birds that are likely or have the potential to occur on Base or in its near shore waters during certain times of the year. However it should be noted that the format does have its limitations, especially in coastal areas where migration is apparent almost every week of the year. The status for a given period (e.g. fall, winter, breeding, summer) is to be considered the average status for the season. There are many cases in which the status of a species at the beginning or end of a season may be very different from its average status during that season. Furthermore, migration may occur in short pulses within a season. A migrant that is listed as uncommon for a season may be very common for a short period within that season. Finally, many species (especially warblers) will pass over the Base during their annual spring and fall migrations between breeding and wintering grounds. They typically would not use areas of the Base during these migrations, but weather, stress, and food availability can cause birds to land in areas they normally would not use, and they may remain there for relatively long periods. Species that might otherwise not be expected in the area and therefore not include on the NASO DNA species list, may occur on Base from time to time under certain conditions.

It should also be stressed that many bird populations are in constant flux and some changes may have nothing to do with habitat. During most winters, razorbills occur primarily far to the north of Virginia. However, there was a major southward movement of razorbills during December of 2012 and January of 2013. Between 2008 and 2012, the high count of razorbill in eBird for Virginia was 27 (eBird 2014). During January of 2013 as many as 453 razorbills were reported to eBird in a single day, and the 2013 surveys captured some of these off the beaches of Dam Neck Annex. This "irruption" was recorded as far south as the Florida Keys and Louisiana. It is unclear what caused the irruption or if this event is likely to re-occur, but irruptive events such as these are not all that uncommon. Studies such as these will be valuable to monitoring such trends.

Bird occurrences are also subject to change in response to habitat changes, whether such habitat changes are anthropogenic or natural. For instance, the area surrounding point count stations 12, 13, and 14 of NASO DNA is actively managed through periodic mowing and tree harvesting to provide hunting opportunities. The area is comprised of approximately 100 foot wide strips of conifer and mixed wood forest which are bisected by 50 to 200 foot wide patches of old field habitat (some of which includes emergent wetland). Intact mature forest surrounds most of the managed area making this part of the largest tract of intact forest on Base and extending well to the north and south of the Base. Two species were encountered in the managed habitats and were not found elsewhere on the Base; eastern screech owl and eastern whip-poor-will. These species are considered rare, exemplifying how important a diversity of habitats and structure are to maintaining avian populations.

Bird behavior also plays an important part in the development of a species list. Secretive species with low-detectability such as marsh birds and nocturnal species often go undetected. Although field surveys did include efforts to detect marsh birds and nocturnal species, the secretive nature of these species typically requires a more intensive and focused effort than were including in this study. Of the fifteen species that are typically considered secretive and that could occur in the general vicinity of the Base (e.g., barn owl, barred owl, great horned owl, eastern screech owl, common nighthawk, Chuck-will's widow, eastern whip-poor-will, American bittern, least bittern, clapper rail, king rail, Virginia rail, Sora, and American woodcock), only three were encountered on the 2013 survey (Chuck-will's widow, eastern whip-poor-will, and eastern screech owl). The relatively small and fragmented habitats on Base may not be suitable as breeding habitat for some of these secretive, and also uncommon to rare, species. But many are known to occur in suitable habitats in the vicinity of the Base, and could potentially be found on NASO DNA. More intensive surveys for marsh birds and crepuscular/nocturnal species are recommended to target these species which are especially difficult to detect.

More focused surveys in other areas of the Base could also add to the understanding of the birdlife of NASO DNA. For example, two active great blue heron nest sites and several additional large stick nests were noted in large trees within an inaccessible area of a freshwater marsh on the DEVGRU site; suggesting that the area hosts a heron/egret rookery. This area was surveyed on several occasions, but security access restrictions and inaccessibility to most areas of the marsh limited the survey effort. Given the characteristics of the marsh, it is likely that the area would also provide habitat for secretive marsh species. In addition, a more focused survey of buildings and associated infrastructure would help to better understand use by osprey and other raptors. Several incidental observations of raptors on buildings were noted during the

survey effort. Several large stick nests (unknown species) and at least five active osprey nests were observed on utility poles on Base.

Finally, survey timing is also a factor for consideration in expanding knowledge of avian use of the Base, particularly in high use areas. Most, but not all, of the area searches along beaches were conducted during the day when beach use was high. Observations of people and dogs (most of which were off leash) were noted during nearly every survey event, regardless of the season. Portions of the firing range beach area were the exception. However, beach surveys were not performed there consistently due to access restrictions. Efforts to survey high use areas during periods of less activity (especially early morning hours) is recommended.

Point Counts

The locations of the point counts and established route appeared to provide adequate coverage for monitoring species occurrences, especially during the breeding season. The point count method relies heavily on vocalizations as the form of detection and during the breeding season the birds are most vocal and singing the song that is most identifiable to the species. The majority of birds within the listening area can be detected within the 5 minute point count, allowing the observer to quickly move on to another area. This method allows for the coverage of large areas within a short period of time. The point counts alone during the breeding season accounted for 89 species of 122 species detected by this method for all seasons (Table 4). The approach taken was necessary to make the effort comparable to other NAVFAC baseline bird studies, repeatable, and to provide as much base-wide coverage as possible to develop a baseline species list.

The replication of survey within a season was found to be important to detecting greater species numbers. For point counts, the breeding season count increased from 61 to 89 species after the initial replication and detected one nocturnal species undetected during the diurnal surveys. The fall period species count also increased from 44 to 58 after the initial replication. Replication of the survey was able to detect the variability of arrivals within a season and capture those birds who may not be calling during normal survey hours.

Breeding season surveys may include some winter birds and migrants and can lead to erroneous conclusions regarding the breeding status of the species. However, forgoing early spring surveys because of this is not recommended, since this problem can be accommodated with the incorporation of expert knowledge and replicate surveys into the study. The value of the early to mid-April first replication for the area and point count searches was important to developing the overall species lists.

Area Searches

A general purpose of most area searches was to complement the point count routes, especially in areas that were difficult to access and survey or likely to contain species that are generally difficult to detect during a typical point count survey window. Area searches were used to gain more information about the use of beaches, dunes and the near shore zone, marshes, and large water bodies such as Lake Tecumseh. As stated earlier, the area search methods were found to be valuable to the study, recording 11 more species than point count surveys. Area searches can be conducted over larger areas, survey a variety of habitats (especially those near and over water), surveyed for longer periods of time, and do not rely heavily on vocalization as the primary form of detection. These aspects were found to be most important during the non-

breeding seasons when vocalizations are reduced and direct observations are often needed to document presence. The incorporation of sea and water bird watch areas, walking routes located nearby coastal areas, and the general survey of habitats not captured by traditional point counts contributed to the greater number of species observed using this method. In general the areas searched surveyed in this study provided a good compliment of the habitats at NASO DNA, and no changes are recommended.

Hawk Watches

The primary purpose of the hawk watch was to provide information about the passage of daytime migrating raptor species, although other species such as swallows, woodpeckers, and blue jays were noted as well if not previously documented during other daily survey efforts (i.e., point counts and area searches). The hawk watch station recorded 3 raptor species. Each of these were also documented on either point counts, area searches, or incidentally during a given survey period. In general, the hawk watches did not add significant value to the survey effort. Surveys were too infrequent, not situated at ideal locations (the facility itself is not within a key raptor migration route), and surveys were not timed to specifically target known mass raptor movement events (which can vary in timing and duration annually). However, the survey did document movements of snow geese, which were not identified by any other survey method. The number of surveys and frequency were determined by the scope of work/budget. Fixed hawk points are generally used as a count method in key migratory pathways where large movements of migratory hawks are known to take place. Dam Neck does not occur within one of these key pathways. The point selected offered the best view/coverage available for this installation.

Sensitive Species

Sensitive species were not targeted using species-specific survey efforts. However, 16 were documented during point counts and area searches (Table 6). Five of the species were encountered in forest habitat, seven were documented on or above beach/dune/ocean habitat, and three were encountered in freshwater marsh or lakeshore marsh habitat. In addition, yellow-crowned night heron were observed in marsh habitat and on the beach. One of the bald eagle sightings in the north end of the Base was a juvenile wearing a radio tag. Preliminary discussions with staff from the Center for Conservation Biology (CCB) seem to indicate the bird is part of an ongoing CCB eagle study.

Several other species, considered rare for the NASO DNA area, were also identified during the survey. These species are not listed or species of special concern, but are typically very unlikely to be seen given the location and habitats of the Base. Species included broad-winged hawk, eastern screech-owl, Chuck-will's-widow, Eastern whip-poor-will, Acadian flycatcher, Kentucky warbler, scarlet tanager, and evening grosbeak.

Summary

NASO DNA is noteworthy for its coastal location between First Landing State Park to the north and Back Bay National Wildlife Refuge to the south; two of the few remaining tracts of undeveloped dune ecosystems along the Virginia coast. The Base is surrounded by development and in fact is fairly developed itself, yet offers a relatively rich diversity of habitats, including ocean; beach and dune; hardwood, conifer and mixed wood forest; grassland and old field; scrub shrub; freshwater, and to a much lesser extent brackish wetlands; lakes, ponds, canals and drainage ditches; maintained lawns and fields; and, developed areas.

Although this study and data from nearby areas have provided much needed information regarding the birdlife likely to be present on NASO DNA, there is certainly more to learn, particularly regarding rare species, listed species, and those with low detectability. These species are by their nature and limited numbers difficult to document without intensive and species-specific focused surveys.

NASO DNA is obligated to carry out programs for the conservation of migratory birds that may occur on installation properties. Information from this study can be used to contribute to management plans designed to provide sustainable, integrated management strategies for migratory birds in support of the Navy's mission of ensuring healthy lands for long-term use of installations for military training and readiness activities. The primary purpose of the monitoring study was to contribute to NASO DNA's baseline bird dataset and develop a comprehensive bird species list, as well as provide the methods and protocols for future study. In summary, we believe the project successfully implemented a DoD CBM study that met the project's stated purpose and goals (Section 1.2). Notable outcomes from the study include the following:

1. Over the course of four seasons, 2,237 observations of 159 species were recorded using DoD CBM plan recommended techniques and guidance.
2. 20 point count stations, 5 area search polygons, and 1 hawk watch location were established.
3. Nocturnal and shorebird surveys were conducted during the breeding season.
4. Results were combined with existing data and expert analysis to develop a comprehensive list of 275 birds of NASO DNA including seasonal abundance / occurrence estimates.
5. Recommendations for future studies are provided.

6.0 RECOMMENDATIONS

This study represents the first comprehensive effort to survey for and document the species richness of birds and their likelihood of occurrence at NASO DNA. During the planning phase, as well as during project implementation and analysis of results, positive outcomes were noted and data gaps and lessons learned were documented. Based on these activities the following recommendations are provided:

1. The DoD established Coordinated Bird Monitoring plan provided valuable guidance in regards to study design. Continue to consult the program's guidance in regards to the selection of field methods and data management to meet future goals and objectives.
2. Desktop and field reconnaissance performed by qualified ornithologists to establish survey locations was an important planning phase in meeting project objectives, and should be included in any future survey planning.
3. All point count, area search, and hawk watch points established for this study were found valuable in adding species to the overall count. Long-term monitoring at the Base, especially during the breeding season, will be important to monitor population trends.
4. If any point counts or area searches are added in future surveys, additional sites within the restricted access areas of the installation (DEVGRU and Marine Air Corps Station 24) should be investigated.

5. Future point counts and area searches should consider focusing on targeting species with low-detectability such as marsh birds and nocturnal species.
6. Future surveys of beaches and other high use areas should target times of least human activity.
7. Survey during the four seasons was found to be valuable, however if future surveys are to be limited, summer surveys were found to be the least informative adding no species to the 159 observed for the other three seasons. Winter surveys should focus on wintering waterfowl, winter migrants, and shorebirds and less on inland point count and areas searches.
8. Fall area searches provided great value to the study, observing 43 of the 72 species observed for this season. However, if a reduction in effort is necessary for future efforts, point counts could be performed in the spring with area searches performed (and possibly expanded) during the fall and winter seasons.
9. Replication of surveys within season was found to be important to capturing within season variability. Approximately 25% of the species would not have been detected without within season replication.
10. In terms of documenting passing migrants during the hawk watches, future surveys should be expanded to ensure multiple replications occur in late August, September, and late October, and are timed appropriately to cover peak migration movements.
11. Fall surveys did not begin until September 20, a late August or early September replication of the fall surveys should be considered to capture early fall migrants.
12. Nocturnal surveys should be expanded (multiple replicates) during the breeding season.
13. Owls tend to breed earlier than most other bird species. Nocturnal surveys to target owls should be conducted early in the breeding season (e.g., February - early April) and should continue with the use of broadcast calls.
14. Species-specific surveys should be considered and implemented as necessary to document key species of interest, to facilitate land use planning, and to meet management goals.
15. The data form and database developed for this project were found to facilitate data collection, entry, management, and analysis and should be utilized and modified as needed to accommodate future efforts.
16. Incorporation of previous studies and field efforts such as BBA and eBird data were valuable to contributing to the overall species list. eBird data should be assessed as needed to complement future studies on Base. Consideration should be given to including the data collected from this and future Base avian studies into eBird, particularly since the Base is not generally accessible to most birders for inclusion in the eBird data set.
17. The consultation with local birders and experts was important to all phases of the study, from planning to recommendations, and should be included in future studies and avian management planning.

18. It is recommended that this study be supported with continued monitoring efforts as well as additional species-specific, population, and habitat studies as needed to facilitate the development of science-based avian management plans and for use in NASO DNA land management decision making processes (e.g., NEPA).

APPENDIX A
Avian Survey Data Form

AVIAN SURVEY DATA FORM INSTRUCTIONS

The following instructions provide specific details for filling out the data form to provide consistency in recording survey data.

- **One data sheet per 5 minute point**
- **One data sheet per hawk point (time will vary, no less than 2 hours)**
- **One data sheet per area search (time will vary)**
- **One data sheet per shorebird survey (time will vary)**
- **One data sheet per day for incidental observations made outside of any of the standardize surveys (point count, hawk, area searches)**

Header Information

Date: Month/day/year (e.g., 4/15/10).

Observer (circle one): First initial, last name (e.g., J. Smith).

Site Location (circle one): Identify the installation surveys were conducted on.

Survey Period (circle one): Winter=December 1–February 28; Breeding=March 1–May 31; Summer=June 1–August 31; Fall=September 1–November 30.

Replicate (circle one): Indicate which replicate of the survey period was performed.

Survey Type (circle one): Point, Hawk, Area, Incidental, Shorebird, or enter information in space provided for specialized surveys.

Calls Used (circle one): Indicate whether marsh bird, owl or no playback was used to elicit responses during the survey.

Route/Point: Record point ID, area search ID, hawk watch ID, shorebird ID, or location information.

Start and End Time: Record the start and end times for each survey. Record in military time (e.g., 0600 = 6 am, 1300 = 1 pm).

Temp.: Record as Fahrenheit.

Clouds (circle one): Cloudy, Mostly Cloudy, Partly Cloudy, Mostly Clear, Clear.

Precip: Rain, provide percent of time of survey it was precipitating (e.g. rain (80%)).

Wind: Use the Beaufort Wind Scale below and record the average Force rating number.

Other: Record other weather variables relevant to the survey effectiveness. For example, if weather conditions deteriorate during a survey causing the survey to be ended early.

Noise: H = noise affecting detections for > 50% of survey, M = affecting detections for 25 to 50% of survey, L = affecting detections for 1 to < 25% of survey, N = detections not affected by noise. Also, identify the primary source(s) of the noise.

Observation Information

Species: Alpha bird banding code (e.g., Cooper's hawk = COHA).

Time: Record the time the individual or group was **first** observed. No need to record time on point counts.

Number: Record the number of each species observed, estimate the number for large groups of birds or large flocks that may fly over for long periods.

Observation Type: Record these attributes for observation type: S=Singing, SP=Singing, pair observed, C=Calling, V=Visual, D=Drumming, G=Group, F=Fly Over. You can use a combination of these to describe the observation (VF= visual fly over).

Sex/Age: AF = Adult Female, AM=Adult Male, IM=Immature Male, IF=Immature Female, UF= Female Unknown age, UM=Male unknown age, I=Immature, sex unknown, UA=unknown adult, sex unknown, UK=Unknown, LF= Flock of mixed sexes and/or ages (e.g., 3 immature northern harriers observed, record I+I+I).

Distance (meters): Record category for the following estimated distances to the observation: 1= 0 to 50 2=50 to 100 3=100 to 150 4= > 150 5=Flyover.

Location: Only fill out for incidental observations recorded outside formal surveys and for sensitive species (list to be provided) sighted during non-point count surveys. Record using a GPS or estimate the lat and long for observations you cannot get to (i.e., long distance, water, or flyover observations).

GPSed (Y): Record "Y" to indicate "Yes" if a GPS point was recorded for this observation. A GPS location is to be taken for all ESA listed species, listed species of concern, and species of interest identified by NAVFAC. List will be provided prior to survey.

Notes: Use this space to record other relevant details not captured elsewhere on the data form. Other details may include behavioral notes, color band observations (recorded from top to bottom and from left to right), and documentation of any photos taken. Rare species observations can be described here as well. Use a blank sheet of paper if needed to add additional notes.

Field Book: Use your personal field log book to note/document all other noteworthy observations such as rare wildlife and logistical problems (copies will be requested).

Force	Beaufort Wind Scale			Name	Conditions on Land
	knots	km/h	mi/h		
0	< 1	< 2	< 1	Calm	Smoke rises vertically.
1	1-3	1-5	1-4	Light air	Smoke drifts and leaves rustle.
2	4-6	6-11	5-7	Light breeze	Wind felt on face.
3	7-10	12-19	8-11	Gentle breeze	Flags extended, leaves move.
4	11-16	20-29	12-18	Moderate breeze	Dust and small branches move.
5	17-21	30-39	19-24	Fresh breeze	Small trees begin to sway.
6	22-27	40-50	25-31	Strong breeze	Large branches move, wires whistle, umbrellas are difficult to control.
7	28-33	51-61	32-38	Near gale	Whole trees in motion, inconvenience in walking.
8	34-40	62-74	39-46	Gale	Difficult to walk against wind. Twigs and small branches blown off trees.
9	41-47	76-87	47-54	Strong gale	Minor structural damage may occur (shingles blown off roofs).
10	48-55	88-102	55-63	Storm	Trees uprooted, structural damage likely.
11	56-63	103-118	64-73	Violent storm	Widespread damage to structures.
12	64+	119+	74+	Hurricane	Severe structural damage to buildings, wide spread devastation.

APPENDIX C
2013 Survey Species List

Table C1. Distance Point Count, Area Search, and Hawk Watch Species List for Avian Species List Study at NASO DNA (2013).				
Scientific Name	Common Name	Distance Point Count	Area Search	Hawk Watch
Accipitriformes (Hawks, Kites, Eagles, and Allies)				
<i>Accipiter cooperii</i>	Cooper's Hawk	✓	✓	
<i>Accipiter striatus</i>	Sharp-shinned Hawk		✓	
<i>Buteo jamaicensis</i>	Red-tailed Hawk	✓		✓
<i>Buteo lineatus</i>	Red-shouldered Hawk	✓	✓	
<i>Buteo platypterus</i>	Broad-winged Hawk		✓	
<i>Cathartes aura</i>	Turkey Vulture	✓	✓	✓
<i>Haliaeetus leucocephalus</i>	Bald Eagle	✓	✓	
<i>Pandion haliaetus</i>	Osprey	✓	✓	✓
Anseriformes (Ducks, Geese, and Swans)				
<i>Aix sponsa</i>	Wood Duck	✓	✓	
<i>Anas acuta</i>	Northern Pintail		✓	
<i>Anas americana</i>	American Wigeon	✓		
<i>Anas clypeata</i>	Northern Shoveler	✓		
<i>Anas crecca</i>	Green-winged Teal	✓	✓	
<i>Anas discors</i>	Blue-winged Teal		✓	
<i>Anas platyrhynchos</i>	Mallard	✓	✓	
<i>Anas rubripes</i>	American Black Duck	✓	✓	
<i>Anas strepera</i>	Gadwall	✓	✓	
<i>Aythya affinis</i>	Lesser Scaup		✓	
<i>Aythya americana</i>	Redhead	✓	✓	
<i>Aythya collaris</i>	Ring-necked Duck	✓	✓	
<i>Aythya marila</i>	Greater Scaup	✓		
<i>Branta canadensis</i>	Canada Goose	✓	✓	
<i>Bucephala albeola</i>	Bufflehead		✓	
<i>Chen caerulescens</i>	Snow Goose			✓
<i>Clangula hyemalis</i>	Long-tailed Duck		✓	
<i>Lophodytes cucullatus</i>	Hooded Merganser	✓	✓	
<i>Melanitta americana</i>	Black Scoter		✓	
<i>Melanitta perspicillata</i>	Surf Scoter		✓	
<i>Mergus serrator</i>	Red-breasted Merganser	✓	✓	
<i>Oxyura jamaicensis</i>	Ruddy Duck	✓	✓	
Apodiformes (Swifts and Hummingbirds)				
<i>Archilochus colubris</i>	Ruby-throated Hummingbird	✓	✓	
<i>Chaetura pelagica</i>	Chimney Swift	✓	✓	
Caprimulgiformes (Nightjars)				
<i>Antrostomus carolinensis</i>	Chuck-will's-widow	✓		

Table C1. Distance Point Count, Area Search, and Hawk Watch Species List for Avian Species List Study at NASO DNA (2013).				
Scientific Name	Common Name	Distance Point Count	Area Search	Hawk Watch
<i>Antrostomus vociferus</i>	Eastern Whip-poor-will	✓		
Charadriiformes (Plovers, Sandpipers, and Allies)				
<i>Actitis macularius</i>	Spotted Sandpiper		✓	
<i>Alca torda</i>	Razorbill		✓	
<i>Arenaria interpres</i>	Ruddy Turnstone		✓	
<i>Calidris alba</i>	Sanderling	✓	✓	
<i>Charadrius melodus</i>	Piping Plover		✓	
<i>Charadrius semipalmatus</i>	Semipalmated Plover		✓	
<i>Charadrius vociferus</i>	Killdeer	✓	✓	
<i>Chroicocephalus philadelphia</i>	Bonaparte's Gull	✓	✓	
<i>Gallinago delicata</i>	Wilson's Snipe	✓	✓	
<i>Hydroprogne caspia</i>	Caspian Tern		✓	
<i>Larus argentatus</i>	Herring Gull	✓	✓	
<i>Larus delawarensis</i>	Ring-billed Gull	✓	✓	
<i>Larus fuscus</i>	Lesser Black-backed Gull		✓	
<i>Larus marinus</i>	Great Black-backed Gull	✓	✓	
<i>Leucophaeus atricilla</i>	Laughing Gull	✓	✓	
<i>Numenius phaeopus</i>	Whimbrel		✓	
<i>Pluvialis squatarola</i>	Black-bellied Plover		✓	
<i>Rynchops niger</i>	Black Skimmer		✓	
<i>Sterna forsteri</i>	Forster's Tern		✓	
<i>Sterna hirundo</i>	Common Tern	✓	✓	
<i>Sternula antillarum</i>	Least Tern		✓	
<i>Thalasseus maximus</i>	Royal Tern	✓	✓	
<i>Thalasseus sandvicensis</i>	Sandwich Tern		✓	
<i>Tringa melanoleuca</i>	Greater Yellowlegs	✓	✓	
<i>Tringa semipalmata</i>	Willet		✓	
Columbiformes (Pigeons and Doves)				
<i>Columba livia</i>	Rock Pigeon		✓	
<i>Zenaida macroura</i>	Mourning Dove	✓	✓	
Coraciiformes (Kingfishers and Allies)				
<i>Megaceryle alcyon</i>	Belted Kingfisher	✓	✓	
Cuculiformes (Cuckoos)				
<i>Coccyzus americanus</i>	Yellow-billed Cuckoo	✓	✓	
Falconiformes (Caracaras and Falcons)				
<i>Falco sparverius</i>	American Kestrel	✓		
Gaviiformes (Loons)				

Table C1. Distance Point Count, Area Search, and Hawk Watch Species List for Avian Species List Study at NASO DNA (2013).				
Scientific Name	Common Name	Distance Point Count	Area Search	Hawk Watch
<i>Gavia immer</i>	Common Loon	✓	✓	
<i>Gavia stellata</i>	Red-throated Loon	✓	✓	
Gruiformes (Cranes and Rails)				
<i>Fulica americana</i>	American Coot	✓	✓	
<i>Gallinula galeata</i>	Common Gallinule		✓	
Passeriformes (Perching Birds)				
<i>Agelaius phoeniceus</i>	Red-winged Blackbird	✓	✓	
<i>Baeolophus bicolor</i>	Tufted Titmouse	✓	✓	
<i>Bombycilla cedrorum</i>	Cedar Waxwing	✓	✓	
<i>Cardinalis cardinalis</i>	Northern Cardinal	✓	✓	
<i>Carpodacus mexicanus</i>	House Finch	✓	✓	
<i>Catharus bicknelli</i>	Bicknell's Thrush		✓	
<i>Catharus guttatus</i>	Hermit Thrush	✓		
<i>Certhia americana</i>	Brown Creeper	✓	✓	
<i>Coccothraustes vespertinus</i>	Evening Grosbeak	✓		
<i>Contopus virens</i>	Eastern Wood-Pewee	✓	✓	
<i>Corvus brachyrhynchos</i>	American Crow	✓	✓	
<i>Corvus ossifragus</i>	Fish Crow	✓	✓	
<i>Cyanocitta cristata</i>	Blue Jay	✓	✓	
<i>Dumetella carolinensis</i>	Gray Catbird	✓	✓	
<i>Empidonax vireescens</i>	Acadian Flycatcher	✓		
<i>Geothlypis formosa</i>	Kentucky Warbler	✓		
<i>Geothlypis trichas</i>	Common Yellowthroat	✓	✓	
<i>Haemorhous purpureus</i>	Purple Finch	✓		
<i>Helmitheros vermivorum</i>	Worm-eating Warbler		✓	
<i>Hirundo rustica</i>	Barn Swallow	✓	✓	
<i>Hylocichla mustelina</i>	Wood Thrush	✓		
<i>Icterus galbula</i>	Baltimore Oriole	✓		
<i>Junco hyemalis</i>	Dark-eyed Junco		✓	
<i>Melospiza georgiana</i>	Swamp Sparrow		✓	
<i>Melospiza melodia</i>	Song Sparrow	✓		
<i>Mimus polyglottos</i>	Northern Mockingbird	✓	✓	
<i>Mniotilta varia</i>	Black-and-white Warbler	✓		
<i>Molothrus ater</i>	Brown-headed Cowbird	✓	✓	
<i>Myiarchus crinitus</i>	Great Crested Flycatcher	✓	✓	
<i>Parkesia noveboracensis</i>	Northern Waterthrush	✓	✓	
<i>Passerculus sandwichensis</i>	Savannah Sparrow		✓	

Table C1. Distance Point Count, Area Search, and Hawk Watch Species List for Avian Species List Study at NASO DNA (2013).				
Scientific Name	Common Name	Distance Point Count	Area Search	Hawk Watch
<i>Passerina caerulea</i>	Blue Grosbeak	✓	✓	
<i>Passerina cyanea</i>	Indigo Bunting	✓	✓	
<i>Pipilo erythrophthalmus</i>	Eastern Towhee	✓	✓	
<i>Piranga olivacea</i>	Scarlet Tanager	✓		
<i>Piranga rubra</i>	Summer Tanager	✓		
<i>Poecile atricapillus</i>	Black-capped Chickadee	✓		
<i>Poecile carolinensis</i>	Carolina Chickadee	✓	✓	
<i>Polioptila caerulea</i>	Blue-gray Gnatcatcher	✓	✓	
<i>Progne subis</i>	Purple Martin	✓	✓	
<i>Protonotaria citrea</i>	Prothonotary Warbler	✓		
<i>Quiscalus quiscula</i>	Common Grackle	✓	✓	
<i>Regulus calendula</i>	Ruby-crowned Kinglet	✓		
<i>Regulus satrapa</i>	Golden-crowned Kinglet	✓	✓	
<i>Riparia riparia</i>	Bank Swallow	✓	✓	
<i>Sayornis phoebe</i>	Eastern Phoebe	✓	✓	
<i>Seiurus aurocapilla</i>	Ovenbird	✓	✓	
<i>Setophaga americana</i>	Northern Parula	✓	✓	
<i>Setophaga coronata</i>	Yellow-rumped Warbler	✓	✓	
<i>Setophaga discolor</i>	Prairie Warbler	✓	✓	
<i>Setophaga palmarum</i>	Palm Warbler	✓		
<i>Setophaga pinus</i>	Pine Warbler	✓	✓	
<i>Setophaga ruticilla</i>	American Redstart	✓	✓	
<i>Setophaga striata</i>	Blackpoll Warbler		✓	
<i>Sialia sialis</i>	Eastern Bluebird	✓	✓	
<i>Sitta canadensis</i>	Red-breasted Nuthatch	✓		
<i>Sitta pusilla</i>	Brown-headed Nuthatch	✓	✓	
<i>Spinus tristis</i>	American Goldfinch	✓	✓	
<i>Spizella passerina</i>	Chipping Sparrow	✓	✓	
<i>Spizella pusilla</i>	Field Sparrow	✓	✓	
<i>Stelgidopteryx serripennis</i>	Northern Rough-winged Swallow	✓	✓	
<i>Sturnus vulgaris</i>	European Starling	✓	✓	
<i>Tachycineta bicolor</i>	Tree Swallow	✓	✓	✓
<i>Thryothorus ludovicianus</i>	Carolina Wren	✓	✓	
<i>Toxostoma rufum</i>	Brown Thrasher	✓	✓	
<i>Turdus migratorius</i>	American Robin	✓	✓	
<i>Tyrannus tyrannus</i>	Eastern Kingbird	✓	✓	
<i>Vireo griseus</i>	White-eyed Vireo	✓	✓	

Table C1. Distance Point Count, Area Search, and Hawk Watch Species List for Avian Species List Study at NASO DNA (2013).				
Scientific Name	Common Name	Distance Point Count	Area Search	Hawk Watch
<i>Vireo olivaceus</i>	Red-eyed Vireo	✓	✓	
<i>Vireo solitarius</i>	Blue-headed Vireo	✓		
<i>Zonotrichia albicollis</i>	White-throated Sparrow	✓	✓	
Pelicaniformes (Pelicans, Herons, Ibises, and Allies)				
<i>Ardea alba</i>	Great Egret	✓	✓	
<i>Ardea herodias</i>	Great Blue Heron	✓	✓	
<i>Butorides virescens</i>	Green Heron	✓	✓	
<i>Egretta caerulea</i>	Little Blue Heron		✓	
<i>Egretta thula</i>	Snowy Egret		✓	
<i>Nyctanassa violacea</i>	Yellow-crowned Night-heron	✓	✓	
<i>Pelecanus occidentalis</i>	Brown Pelican	✓	✓	
Piciformes (Woodpeckers)				
<i>Colaptes a. auratus</i>	Northern (Yellow-shafted) Flicker	✓	✓	
<i>Dryocopus pileatus</i>	Pileated Woodpecker	✓	✓	
<i>Melanerpes carolinus</i>	Red-bellied Woodpecker	✓	✓	
<i>Melanerpes erythrocephalus</i>	Red-headed Woodpecker		✓	
<i>Picoides pubescens</i>	Downy Woodpecker	✓	✓	
<i>Picoides villosus</i>	Hairy Woodpecker	✓	✓	
<i>Sphyrapicus varius</i>	Yellow-bellied Sapsucker	✓		
Podicipediformes (Grebes)				
<i>Podiceps auritus</i>	Horned Grebe		✓	
<i>Podiceps grisegena</i>	Red-necked Grebe	✓	✓	
<i>Podilymbus podiceps</i>	Pied-billed Grebe	✓	✓	
Strigiformes (Owls)				
<i>Megascops asio</i>	Eastern Screech-Owl	✓		
Suliformes (Frigatebirds, Boobies, Cormorants, Darters, and Allies)				
<i>Morus bassanus</i>	Northern Gannet	✓	✓	
<i>Phalacrocorax auritus</i>	Double-crested Cormorant	✓	✓	

APPENDIX D
Checklist of Birds for
NASO DNA

Table D1. Checklist of Birds for NASO DNA (rev. February 2014).

Scientific Name	Common Name	Mar-May	Jun-Aug	Sep-Nov	Dec-Feb	Observed (✓)

<i>Phalacrocorax carbo</i>	Great Cormorant	o	x	o	u	

a - abundant: common species that is very numerous
c - common: certain to be seen in suitable habitat

u - uncommon: present but not certain to be seen

o - occasional: seen only a few times during a season

r - rare: seen at intervals of 2 to 5 years

x - extremely rare: species highly unlikely to occur

* - nests on study area

 - species observed during 2013 DoD coordinated bird monitoring survey

1.0 INTRODUCTION

Tetra Tech, Inc. (Tetra Tech) was contracted by the U.S. Department of the Navy (Navy), Naval Facilities Engineering Command Mid-Atlantic (NAVFAC Mid-Atlantic) to conduct nuisance wildlife species surveys and develop a management plan for the control of these species at Naval Air Station Oceana Dam Neck Annex (NASO DNA) (Figure 1).

Virginia Department of Game and Inland Fisheries (VDGIF) lists the house mouse (*Mus musculus*), Norway rat (*Rattus norvegicus*), black rat (*Rattus rattus*), coyote (*Canis latrans*), feral hog (*Sus scrofa*), nutria (*Myocastor coypus*), woodchuck (*Marmota monax*), European starling (*Sturnus vulgaris*), English (house) sparrow (*Passer domesticus*), and pigeon (rock dove) (*Columba livia*) as nuisance species (Virginia Administrative Code [VA Code] 4VAC15-20-160 and Code of Virginia §§ 29.1-100 and 29.1-501). VDGIF regulates the control and taking of nuisance species. In consultation with NAVFAC Mid-Atlantic and installation biologists, the primary nuisance wildlife species of interest/concern with a known presence at NASO DNA are the coyote and the nutria.

In addition to the nutria's listing as a nuisance species under the VA Code, the nutria is also considered to be a non-native invasive species by the U.S. Department of Agriculture (USDA) and its impacts on ecosystems and the human environment have led to establishment of the Federal Nutria Eradication and Control Act of 2003. Executive Orders (EO) 11987, *Exotic Organisms*, and EO 13112, *Invasive Species*, address the control of invasive, non-native species on federal facilities. EO 11987 specifically restricts the introduction of harmful exotic species into native ecosystems, whereas EO 13112 requires federal facilities, to the extent practicable and permitted by law, to perform the following activities:

- Prevent the introduction of invasive species;
- Detect and control invasive species;
- Accurately monitor invasive species populations;
- Provide for restoration of native species and habitats that have been invaded by invasive species;
- Promote public education on invasive species;
- Conduct research on invasive species to prevent their introduction and provide for environmentally sound control; and
- Prevent authorization, funding, or implementing actions that are likely to cause or promote the introduction or spread of invasive species.

To date there have been no formal surveys, inventories, or assessments conducted for the coyote or nutria at NASO DNA. Aside from general nuisance wildlife guidance provided within the installation's Integrated Natural Resources Management Plan (INRMP) (Navy 2014), coyote or nutria specific management plans designed for the installation do not exist. This report documents the first survey for coyote and nutria at NASO DNA.

1.1 PURPOSE, GOALS, AND OBJECTIVES

NASO DNA provides important training areas for military exercises. The control and management of threats, such as nuisance species, on those exercises is critical to the military mission. Managing NASO DNA to reduce the impacts to military training and natural

resources caused by nuisance species presents significant challenges. Nuisance species can have a negative impact on the integrity of installation ecosystems and directly impact military operations. Coyotes can present an airstrike hazard and may cause conflicts with humans and pets. Nutria may affect the natural hydrology of an area or damage hydrology management facilities on installations. Nutria are also known to be detrimental to wetland ecosystems, which may support endangered and native species. These negative impacts can result in a loss of biodiversity critical to supporting healthy lands that are essential for long-term use of installations for military training and readiness activities.

The goal of this study is to conduct surveys for coyote and nutria presence and distribution to provide baseline information at NASO DNA. The information gathered and presented in this study will be used to develop a management plan that presents management opportunities, alternatives, and recommendations designed to alleviate these potential negative impacts and pressures on military training while integrating ecosystem management.

The objectives are as follows:

1. Design and present detailed methods so studies can be repeated and results compared.
2. Inventory/study coyote density and present results.
3. Inventory/study nutria habitat and occupation and present results.
4. Discuss the results and provide recommendations for future study.

Coordinate System: UTM, NAD 83, Zone 18N

2.0 INSTALLATION SETTING AND LAND USE

NASO DNA is located in the southeastern portion of the City of Virginia Beach (see Figure 1) encompasses approximately 1,900 acres (ac) (769 hectares [ha]). Several other military installations including Joint Expeditionary Base Little Creek – Fort Story and NAS Oceana are also located in Virginia Beach. The surrounding land uses include industrial, commercial, residential, recreational, and agricultural. The mission of NASO DNA is to provide quality education and training in specified combat systems operation and maintenance, specialized skills training, training systems support to operational and systems commands, and to perform other functions and tasks as directed by higher authority. This installation description is taken from the INRMP (Navy 2014), which provides much more detailed information on the physical and biological resources.

2.1 CLIMATE

The temperature extremes at NASO DNA are moderated by the Atlantic Ocean. The average yearly temperature is 60 degrees Fahrenheit (°F) (16 degrees Celsius [°C]) (Table 1). The average winter temperature (December through February) is 42 °F (6 °C), and the average growing season temperature (March through November) is 66 °F (19 °C). January is the coldest month with an average low of 32.6 °F (0.3 °C), and July is the warmest month with an average high of 87.4 °F (30.8 °C). The average growing season (daily minimum temperatures higher than 32 °F [0 °C] for a light frost) lasts approximately 250 days from the middle of March to late November. The average annual precipitation is 45.7 inches (in) (116.1 centimeters [cm]). The average wind speed is 10 miles (mi) per hour (16 kilometers [km] per hour). During hurricane events (typically June through September) torrential rainfall may accompany winds greater than 75 mi per hour (121 km per hour).

2.2 PHYSIOGRAPHY

NASO DNA is located in Virginia's outer Atlantic Coastal Plain physiographic province, which is defined by the Fall Line to the west and the North American Continental Shelf approximately 62 mi (100 km) offshore. The Fall Line is a low, east-facing escarpment that marks the boundary between hard metamorphic rocks of the Appalachian Piedmont to the west and the softer, sedimentary rocks that characterize the Coastal Plain. The Coastal Plain is a geologically young province that was formed by several cycles of sea level rising and lowering associated with glaciation events. This province is characterized by relatively flat topography that gently slopes towards the Atlantic Ocean.

2.3 TOPOGRAPHY

The topography of NASO DNA is nearly level, with elevations ranging between sea level and 20 feet (ft) (6 meters [m]) above mean sea level. The largest portion of the land lies in a low basin behind the primary and secondary dunes and has an elevation of less than 5 ft (2 m) above mean sea level.

2.4 SOILS

Approximately half of the soils on NASO DNA have severely constrains for development. These restrictive soils include the Newhan-Duckston-Corolla association of the beaches and dunes and the very poorly drained, flood-prone Backbay-Nawney association in the marshes and swamps. The hydric soils at NASO DNA are Acredale silt loam, Backbay mucky peat, Chapanoke silt loam, Duckston fine sand, Nawney silt loam, Nimmo loam, and Tomotley loam. Most (59 percent) of the soils at NASO DNA are hydric. The Munden and Tetotum soils are considered prime farmland if drained because of their wetness.

3.0 TARGET SPECIES DESCRIPTIONS

VDGIF designated coyote and nutria, as well as the house mouse, Norway rat, black rat, feral hog, woodchuck, European starling, English sparrow, and pigeon as nuisance species under VA Code 4VAC15-20-160. All have a known presence at NASO DNA, except for the feral hog. The coyote and the nutria were determined to have the greatest potential to negatively impact the military mission and were the focus of this study.

3.1 COYOTE

The coyote is native to North America and Virginia, with expansion into Virginia only occurring within the past 30 years after extirpation in the early 1900s. Populations in Virginia are now well established with coyotes reported from every county and city in the state (Mastro 2011).

Coyotes are sexually dimorphic with larger males (average 16.2 kg recorded for Virginia) than females (average 13.4 kg recorded for Virginia). Pelage is highly variable throughout its range, but usually the back and sides are a greyish color. The underbelly is typically whitish (Mastro 2011).

In most areas, long-term monogamous pair bonding and mating occurs in January and February. Birth occurs from March – April and litter size varies greatly with most reported averages ranging from three to four. Coyote den sites are found in steep banks, rock ledges, brush-covered slopes, thickets, hollow logs, and above-ground depressions, as well as out buildings, crawl spaces, and areas under porches and decks. Adults supply food until July and pups typically are able to forage independently by August. Young disperse in late fall to winter, and are capable of breeding in their first season (Mastro 2011).

Coyote home-range size is extremely variable and is influenced by habitat, geography, food availability, and season. The home range of coyotes may range from 1,000 to 25,000 ac. There is currently no published data on home-range sizes in the mid-Atlantic region (Mastro 2011).

The coyote is a habitat generalist and is known to occur and thrive in a wide variety of habitats. Being primarily nocturnal and secretive during the daytime hours, coyote habitats are typically associated with the presence of dense cover. Small mammals and deer make up the majority of their diet, although vegetation and fruits are often listed as food items. Coyotes are opportunistic feeders and will also take advantage of carrion, livestock, and pets (Mastro 2011).

As a nuisance species, the coyote may be taken at any time (except on Sunday by use of a gun, firearm or other weapon) without limit. The Navy obtains a Kill Permit from VDGIF to be able to take coyote on NASO DNA any day of the year due to human health and safety concerns. The coyote is primarily classified as a nuisance species because of economic impacts due to preying on domestic livestock, game animals, and pets (Code of Virginia, Title 29.1, Chapter 1, Article 2). Other factors such as a potential rabies vector and interaction with humans add to its nuisance status.

3.2 NUTRIA

Nutria is a large aquatic rodent, weighing up to 22 pounds. The fur is typically a reddish or greyish brown. The visible incisors are a vibrant yellow-orange, and the whiskers are thick and grey. The tail is not thickly furred and is mostly round in cross-section (D'Elia 1999). Nutria are

often confused with similar aquatic species, the muskrat (*Ondatra zibethicus*), North American beaver (*Castor canadensis*), and sometimes the northern river otter (*Lutra canadensis*).

The historical habitat of the nutria is southern South America. Fur farm escapees and intentional releases into the wild have allowed this species to populate the coastal regions of the United States. Local habitats include any slow water systems, including most perennial systems in Virginia. Areas that have high densities of emergent vegetation are preferred. They can be found in fresh and saline water systems (D'Elia, 1999).

Breeding occurs throughout the year. Litter size varies between two and 11; the gestation period is approximately four months. The young are precocial, leaving the nest or burrow and feeding on solids within one day of birth. Sexual maturity is reached at approximately six months. Nutria are known for platform and nest construction, usually several inches out of the water or in dense vegetation (VFWIS 2013b).

As a nuisance species, nutria can be trapped year round for eradication. The nutria is listed as a nuisance species primarily due to their non-native and invasive status. Due to the recent introduction of the species into the area, there are no evolved or adapted predators. Nutria often burrow into stream banks and destroy large areas of cropland and wetland vegetation. This loss of vegetation and increased erosion reduces critical habitat for many species, including sensitive plant species, shorebirds, and waterfowl (MDNR, n.d.).

4.0 SURVEY METHODS

The coyote survey was designed to obtain an index of coyote abundance, due to a wide-variety of habitats used and difficulty of direct observations. The nutria surveys inventoried and documented potential habitat and occupied habitat, due to the species specific habitat requirements. The NASO DNA game warden was consulted for survey recommendations. Both surveys were designed to be repeatable and therefore comparable if future surveys are conducted. In accordance with VDGIF regulations, Tetra Tech applied for and received a permit for visual surveys for coyote and nutria. A copy of the permit is provided in Appendix A.

4.1 COYOTE

The coyote is known for its wariness, cleverness, and secretive behaviors. Despite being relatively abundant throughout the United States, this nocturnal species is more often heard howling than seen. Without direct observation as a survey method, coyote abundance is typically assessed via indirect surveys focused on deriving an index of abundance (e.g., catch per unit effort). One common method used to survey predators is to establish a scent station baited with food or mating pheromone lures. The traditional scent station uses a track plate dusted with a substrate designed to document the tracks of the target animal(s).

The traditional scent station technique is highly susceptible to damage during weather events, sensitive to disturbance, requires multiple surveyor visitations, and tracks are often difficult to assess as the number of visitors and visitations is unknown. With the advent of remote sensing trail camera technology scent stations can be enhanced with noise- and flash-less infrared motion triggered cameras removing the inherent difficulties of working with track plates. The camera allows for reliability, less maintenance, wider range of coverage, recording of multiple visits, identification of unique visitors, and recording of non-target species.

The following sections outline methods used to implement NASO DNA's first formal coyote survey.

4.1.1 Site Selection

A biologist performed a desktop evaluation of available habitats at NASO DNA. This initial phase of the survey included review of aerial imagery of sufficient detail to depict roads; trails; paved areas; runways; and forested, shrub-shrub, pasture, and agricultural habitats. In addition, other Navy provided data layers such as aquatic resources, significant habitats, and restricted areas were used to further assess available habitats.

Preliminary placement of the scent station locations was based on aerial imagery assessments that were later field evaluated and finalized. Stations were placed at locations across the installations to provide a sampling within all regions north, south, east, and west. These preliminary locations focused on a variety of habitats, as coyote were expected to occur almost anywhere on the installation. Large wetland and inundated areas were avoided.

Eleven station locations were finalized during the field reconnaissance and camera scent station setup stage. During this phase, a biologist navigated to the preliminary scent station locations and reviewed their suitability. Potential for theft was also evaluated and the local area had to be free of any construction activities. Acceptable sites did not need to show field sign of coyote use and

were generally placed within 100 feet of the desktop location. The final station locations were located using a Trimble GeoXH Global Positioning Receiver (GPS). The final station locations are presented in Table 2 and Figure 2. Photos of all station setups are available in Appendix B.

4.1.2 Setup and Equipment

Camera selection was challenging due to the variety of brand and models available. After evaluation of features necessary for the study, the 2012 Moultrie M80-BLX was chosen to best fit the application (Appendix C). This model was selected due to the infrared “black flash” feature that animals are unable to see and the absence of the light-emitting diode for the camera to focus. Each camera was set to take a burst of four pictures when triggered, with a five second delay between triggers. Photo resolution was set to “high” and the motion freeze setting was on for maximum photo clarity. Eleven cameras were purchased to run a desired minimum of 10 stations (the 11th camera was installed in case of malfunction/theft). Stations were numbered consecutively and equipped with 16 gigabyte memory cards.

Although the cameras were purchased new for the study, they were placed in the field at an off-installation location to lessen the “new package” scent two months prior to deployment. At the installation locations, cameras were attached to a tree at a height of 4–5 ft. This height was used to take the camera out of the line of sight of the coyotes and help remove any potential camera scent from “nose level”. Cameras were then pointed slightly downward and focused on a scent station located 10–15 ft from the camera tree.

Both bait and lure (attractants) were used at each station. The type of attractants chosen was a result of conversations with experts at Kaatz Brothers Lures shop. The *Kellens Red Label Extreme Predator* bait was used due to its similarity with probable food sources of coyote in the area (i.e., muskrat). It is designed to attract all predators and omnivores, and is designed to withstand inclement weather (Kaatz Brothers Lures 2007a). The *Kaatz Brothers Karac Coyote Gland Lure* was chosen as a breeding season lure. This lure is designed to attract territorial males and females investigating a potential mate (Kaatz Brothers Lures 2007b). Approximately 1.5 tablespoons of lure and 1 tablespoon of bait was smeared over the target at each station.

Boundary from Navy 2013. Coyote data, TT 2013.

Coordinate System: UTM, NAD 83, Zone 18N

Based on the recommendation of bait and lure experts, a rock, log, stump or similar natural feature that “stood out” in the general vicinity was used for the scent station target. These types of natural features are often used for territorial and breeding marking posts by canine predators. Efforts were made to disturb the area as little as possible and each station was setup by a single field biologist.

Notes and photographs of the station and surrounding habitats were recorded. The presence of coyote sign in the general vicinity of the station was also noted, but field sign was not used to determine station location. The field biologist triggered the camera to ensure proper working order when the recording period started. Set-up of each station ranged from 15–25 minutes, excluding travel to the site. A typical station setup is depicted in Exhibit 1.

Exhibit 1. General Scent Station Setup

4.1.3 Sampling Period

The survey was scheduled to coincide with the coyote breeding season, which in Virginia occurs between January and February. Breeding season lures and baits are most effective during this time frame when the animals are on the move in search of mates and food sources are limited.

The cameras were deployed for six camera days (24-hour periods). The duration of survey would allow the scent of the lure to diffuse and the scent of the surveyor to dissipate. According to scent and lure experts, coyote visits were expected within six days as coyotes would likely have cycled through their homerange during this time frame. Additional discussions with these experts about re-baiting resulted in varied opinions and recommendations. It was decided that after three camera days a random sequence generator would choose five cameras to re-bait/re-lure. The other five were not visited or re-baited during the six days. Cameras were not checked during the re-baiting to minimized human scent distribution. Cameras were picked up after the sixth day (24-hour periods) and the memory card information was downloaded to a laptop computer.

4.2 NUTRIA

Similar to the coyote, the nutria is primarily a nocturnal species, which limits the effectiveness of direct observation surveys. However, unlike the coyote, nutria have specific habitat requisites; therefore, the nutria survey focused on mapping potential habitat and documenting occupancy. A better understanding of the level of available habitat as well as the variance in occupancy will allow managers to better control this species.

4.2.1 Desktop Evaluation

A biologist performed a desktop evaluation of available habitats at NASO DNA. Based on nutria habitat requisites, all emergent wetlands and non-forested streams were preliminarily identified as potential habitat. The initial phase of this survey included review of NASO DNA aerial imagery and other Navy provided data layers such as wetland areas, wetland classifications, streams, stream classifications, and significant habitats.

Tetra Tech used NASO DNA Geographic Information System (GIS) data layers from the most recent wetland delineation of all wetlands and streams performed in 2012 to facilitate the desktop mapping. GIS was used to buffer the mapped palustrine emergent wetlands (Cowardin et al. 1983) by 50 ft and all streams and ditches by 25 ft to create polygons of potential habitat. A draft potential habitat map was then created.

4.2.2 Local Expert Review

Tetra Tech consulted with local USDA nutria experts, Tim Linder and Taylor Austin, to further review the draft potential habitat map. All of the surface waters were considered habitat in the original desktop review for conducting the field survey, but after meeting with the USDA experts some of ditches and streams were deleted because there was no connection to other habitats or the quality was not considered by the experts as suitable. Areas not considered to be viable habitat by these experts were removed from the survey polygons and the draft map was modified and finalized for field survey. The interim map is not included in the report to avoid confusion with the final map of potential nutria habitat.

4.2.3 Field Survey

All potential habitats derived from the desktop and expert evaluations were field surveyed to: 1) confirm that the polygon accurately identified the area as potential habitat and the extents of the polygon were appropriately depicted, and 2) search for nutria and nutria field sign to assess occupancy. All potential habitats were searched by biologist walking throughout the areas for nutria sighting, track, den, run, path, scat, slide (Exhibit 2), and eat-out area. A sighting is an actual visual observation of a nutria. A track is a nutria footprint. A den is a cavity area dug into the side of the bank with a rounded opening where nutria could feasibly nest. A run is a path made from continual use, a linear corridor where vegetation was broken and smashed from repeated travel. A path is a travel lane through floating debris that is made from continual use, similar to a run but in water. Scat is diagnostic fecal droppings. A slide is a linear pattern indicating a "slide" from top of bank to a waterbody. A nutria eat-out is an area denuded of ground vegetation. All nutria field sign locations and general use area polygons were recorded with a Trimble GeoXH GPS. Field maps were also annotated with any adjustments to the potential habitat polygons. High quality nutria habitat at NASO DNA is depicted in Exhibit 3.

Exhibit 2. Common Nutria Run or Slide.

Exhibit 3. High Quality Nutria Habitat.

5.0 RESULTS

Field surveys for coyote and nutria were conducted between January 16 and February 15, 2013. The scope of the study was to collect baseline information on populations to identify needs for further, more in-depth surveys. This was considered the most cost-effective step towards identifying nuisance wildlife issues on the installation.

The weather was unseasonably cold and no significant precipitation occurred during the surveys. The data collected and reported are camera photographs, potential nutria habitat identified with assistance from USDA experts, and observations of nutria field sign (e.g., tracks). Field observations were recorded using photographs or annotated in the GIS.

5.1 COYOTE

Eleven remote camera scent stations were installed at NASO DNA on January 22 and allowed to record activity for six camera days (see Figure 2). Two additional cameras were deployed on January 23 and 24. Weather during the sampling period is provided in Table 3. Cameras were retrieved on January 28, 29, and 30. Four of the cameras (02, 06, 07, and 08) were placed with coyote tracks in the vicinity and one (11) had scat located adjacent. Only one area was found with tracks or scat, and four cameras were placed in the area (cameras 04, 05, 08, and 09). Seven cameras (02, 05, 06, 08, 09, 10, and 11) were re-baited after the third night. Two of the 11 cameras recorded at least a single coyote visit during the survey period. Two coyotes were caught on camera and the detection index was 0.035. A summary of the survey results is provided in Table 4. As presented in Table 5, other recorded species included raccoon (*Procyon lotor*), red fox (*Vulpes vulpes*), Virginia opossum (*Didelphus virginiana*) and white-tailed deer (*Odocoileus virginiana*). All coyote and some non-target species photographs (one per sequence) are presented in Appendix B.

5.2 NUTRIA

With the aid of local experts, the draft potential habitat map was revised to identify those areas targeted for field survey. All of the surface waters on NASO DNA were initially considered potential nutria habitat, but after meeting with the USDA experts, some of ditches and streams were deleted because there was no connection to other habitats or the quality was not considered by the experts as suitable. Approximately 286 ac (115 ha) of habitat were field surveyed to verify its designation as potential habitat and investigate nutria occupancy. Using field results to further refine the draft map and create the final potential habitat map, it was determined that approximately 88 ac (25 ha) would be classified as potential nutria habitat at NASO DNA.

Figure 3 depicts potential nutria habitat as mapped in 2013. The majority of the potential habitat is in the form of slow moving, vegetated drainage ditches with perennial or intermittent flow. The drainage ditches are primarily comprised of palustrine emergent vegetation dominated by *Juncus*, *Cyperus*, *Carex*, *Scirpus*, *Polygonum*, and *Ludwigia*. Several pictures of typical nutria habitat at NASO DNA are provided in Appendix B.

Sightings (actual visual observation of nutria) were made at one location during the survey and some indirect evidence of nutria occupation was observed (Figure 3). A run was observed in the southwest corner of the installation; very hard ground prevented identification of tracks to confirm the species using the run. No other field signs of nutria occurrence were observed. No significant damage to vegetation or ditch/stream banks was observed.

6.0 DISCUSSION

NASO DNA provides habitats and open space for a wide variety of wildlife species, including nuisance species. Nuisance species can have a negative impact on the integrity of installation ecosystems and directly impact military operations. These negative impacts can result in a loss of biodiversity critical to supporting healthy lands and essential for long-term use of installations for military readiness. NASO DNA provides important training areas for military exercises and the control and management of threats, such as nuisance species, on those exercises could be critical to the military mission. Managing NASO DNA to reduce the impacts to military training and natural resources caused by nuisance species could present significant challenges.

This study represents the most concentrated effort to date to survey for and document nuisance wildlife species at NASO DNA. Through a combination of field survey and expert analysis, coyote and nutria were studied to gain baseline information regarding their abundance and distribution. Coyote and nutria were targeted from 10 nuisance species listed under VA Code 4VAC15-20-160 due to their likelihood to be present, potential to cause significant harm to installation ecosystems, and potential to interfere with the military mission. This study provides a foundation for the understanding of the existing environment as it relates to coyote and nutria, and an outline of the basic and established methods and protocols to facilitate future study and comparison. Permanent scent station locations were established in GIS for the camera station survey and resulted in a coyote/night index that can be used to analyze trends. The nutria study resulted in a potential habitat map documented in GIS and occupancy analysis that can also be compared to future replicated efforts.

The results of this study provide baseline information on the current understanding of the coyote and nutria at NASO DNA. The information gathered and presented under this study will be used to assist in the development of a management plan that presents management opportunities, alternatives, and recommendations designed to alleviate potential pressures on military training while integrating ecosystem management. The NASO DNA natural resources personnel may need to conduct future surveys to monitor the change in coyote and nutria presence, and take management actions as necessary to minimize adverse impacts to natural resources and the military mission.

6.1 COYOTE

6.1.1 Methods

The desktop analysis and expert consultation proved to be efficient and effective for selection of locations and methods to survey coyote presence and distribution. Documentation of the locations with GPS and GIS will facilitate replication of future surveys for comparisons to the baseline study. The wide distribution of sample locations at NASO DNA fulfilled the fundamental requirement of sampling—that the sampling sites should be representative of the study area (Rowcliffe et al. 2008). Atwood et al. (2004) found that coyotes in fragmented habitats used corridors (wooded ravines, ditches, etc.) effectively to travel between suburban and rural areas. It was also noted that coyotes were able to tolerate relatively high levels of human activity where substantial protective cover is available. These findings seem to be consistent with the habitats and human disturbances at NASO DNA.

Photographic rates from animal-triggered camera traps have been widely used as an index to abundance, density, or diversity (Hughson et al. 2010). Considerations in sampling include alteration of animal behavior from human activity, scent, and camera presence; assumption of equal detectability for animals; and sampling period. Using photographic rates as indices must be analyzed carefully because of the difficulty in resolving multiple photographs of a single animal, or group of animals, and variation in detectability. Selection of camera models is also an important consideration because the variability between models can range widely (Swann et al. 2004).

The survey was conducted in January – February to coincide with the coyote breeding season and because the expert consultations indicated that breeding season lures and baits are most effective during this time frame. Larrucea et al. (2007) found that camera surveys conducted in March–April and July–August had the greatest success of photo-captures for adults and juveniles, respectively. They concluded that cameras should be allowed to run 24 hours/day, and samples should be taken during every season of the year.

The addition of bait and lure attractants was expected to enhance the probability of recording coyote observations at NASO DNA. However, only two of the re-baited stations yielded coyote detections. The re-baited stations yielded more animal sequences than the other sites. Rebaiting may not be necessary during future studies.

Larrucea et al. (2007) found that scenting stations did not improve capture success in a coyote study using camera traps. They also found that unequal detectability of individuals can bias the data and that animal behavior is important to consider when using remote cameras. Alpha males avoided cameras more than juveniles and were underrepresented in the data; alpha males were never photographed at sites with human activity or on roads. Characteristics of camera locations, such as amount of human activity, being on roads versus trails, and habitat type, also influenced the number of photo-captures. Reduced photo-captures indicated that coyotes avoided cameras that were setup along narrow game trails.

6.1.2 Results

The NASO DNA study resulted in a coyote detection index of 0.035, which can be used for comparison to future studies to determine changes in the occurrence of coyotes. The cameras did not capture coyotes at close enough intervals to definitively say there is more than one coyote on NASO DNA. It is likely, however, that there are several, due to the distribution around the installation of successful scent stations. Although no coyotes were observed in the northern end of NASO DNA, it is likely that there are coyotes in that area. There are extensive connections to wooded areas and a golf course that could serve as travel corridors within the home range of a pack of coyotes. The data indicate that low numbers of coyote may be present at NASO DNA.

Using camera traps as a survey method was successful in revealing the presence of coyotes at NASO DNA and in providing an index of abundance based on frequency of occurrence (percent of camera nights recording coyotes). Given that this is the first time the study was implemented, comparisons or insights into abundance is limited. Surveys with camera traps can be combined with other techniques such as telemetry to estimate population density and understand how coyotes use habitats in relation to urban environments. However, specific study design is required to avoid bias and meet the assumptions required for statistical analysis. The following paragraphs describe studies that provide insight into the complexity of using camera traps to

study coyotes. Considerations for study design should be included in further studies of coyotes. Further studies could include increasing sample size and other criteria (i.e., surveying in March–April and July–August periods for photo-capture of adults and juveniles) required to use the data for abundance estimates.

A common method of estimating populations of elusive terrestrial mammals, such as the coyote, using camera-trap data is with capture–recapture analysis. This method relies on the recognition of individuals in the study population (Foster and Harmsen 2012). Rowcliffe et al. (2008) developed a method for density estimation using camera traps without the need for individual recognition. By modeling the process of contact between animals and cameras, Rowcliffe et al. (2008) estimated density from the trapping rate, the speed of movement of the target species, and the distance and angle at which the camera sensor detects the animal. However, the model assumes that animals move randomly and independently of one another, and that cameras are placed randomly.

Gipson and Kamler (2003) found that trap density and placement were critical factors in camera trap studies of coyotes because not accounting for different trap densities in core and peripheral areas could affect population density estimates and thus bias the results. Mackenzie et al. (2002) found that solely using frequency of occurrence as an index to abundance does not account for other variables critical to the estimation. Changes in the index may result from random variations or changes in detectability.

Stanley and Royle (2005) developed a Poisson distribution model that allows useful information to be extracted from indirect detection indices, such as the data obtained from use of scent stations, when the data are converted to binary form (i.e., station was visited/not visited over the sampling interval) and detectability of individuals is less than 1.0 (i.e., non-detection of a species at a site does not imply that the species is absent unless the probability of detection is 100 percent). A large number of stations (usually in excess of 100) is required and stations need to be checked at least five times to use their Poisson distribution model. Data can be used to estimate site occupancy, model factors influencing patterns of occupancy and abundance in space, and estimate abundance under certain circumstances.

6.2 NUTRIA

6.2.1 Methods

The desktop evaluation and local expert review and recommendations provided an efficient and effective method of identifying potential nutria habitat at NASO DNA. The potential habitat areas indicate where nutria are likely to occur, provide a basis for estimating population density potential, and may be used to direct future survey efforts. The strategic plan for nutria eradication in the Chesapeake Bay region is based on focusing efforts in designated nutria habitats (U.S. Fish and Wildlife Service 2012). Documentation of the potential habitat with GIS will facilitate future survey efforts.

Field surveys in the designated habitat areas proved to be successful in detecting nutria presence. The presence of nutria and their potential for harm are the basis for their eradication. One of the objectives for maintaining support in the Chesapeake Bay strategic plan for nutria eradication is to ensure that agency and partnering organizations are committed to the goal of nutria eradication (U.S. Fish and Wildlife Service 2012). Documentation of the locations with GIS where nutria

tracks and potential den sites occur will facilitate early detection and rapid response for eradication (Chesapeake Bay Nutria Working Group 2003).

6.2.2 Results

Analysis of aerial imagery, review by USDA local experts, and field survey identified at least 43 ac of potential nutria habitat at NASO DNA. There are other small areas that were considered quality habitat, but they are isolated which would prevent constant use by nutria. Most of these areas would connect to other quality habitat areas after a wet season, but would not be present for a long time. If the installation had a larger population, it is possible that nutria would be found in the isolated areas because individuals would be crowded out of the high quality habitat areas.

Observations of nutria and a run indicated that nutria occur in the designated habitat areas. However, the few observations indicate that the population density is probably at a low level.

Nutria was observed more than once at the southernmost reach of Lake Christine. They were followed to the forested area between Rifle Range Road and South Birdneck Road, where they were able to escape, possibly into a den at the edge of the narrow tributary. No denning activities or bank damage were obvious along the tributary into Lake Christine. Observations were recorded in the GIS geodatabase.

The central area of NASO DNA has potential for nutria infestation, due to the large wetland complexes and large bodies of water, including Lake Redwing. The golf course at the western end of Lake Redwing provides good habitat and food source for nutria, along with connectivity to other wetland complexes in the area. Successional wetland areas that lack open water (either lentic or lotic) and contain a significant woody components were not considered useful habitat for nutria.

As with most rodents, the nutria is a prolific breeder. Females are ready to breed again within a day or two following birth of a litter. In areas with plentiful food and low predation, adult females may produce three or more litters per year with an average of 15 young per female per year. Density estimates in Maryland were estimated to range between 1 and 6 nutria per ac. Nutria density has been estimated as high as 56 per ac (Baroch et al. 2002).

Based on the Maryland estimates given above and 88 ac classified as potential nutria habitat, the few nutria that occur at NASO DNA could increase to a population density of 88 to 528 individuals. However, it is not expected that the nutria population would increase to the higher estimate because NASO DNA has limited quality habitat, especially freshwater floating marsh habitat that nutria prefer (Baroch et al. 2002). The data indicate that low numbers of nutria may be present; future surveys in the designated habitat areas could be used to determine changes in the occurrence of nutria and level of potential habitat NASO DNA.

6.3 CONCLUSIONS

The primary purpose of this study was to provide baseline information on nuisance wildlife at NASO DNA, as well as to establish the methods and protocols for future study. In summary, we believe the project successfully implemented a baseline nuisance wildlife survey and met the project's stated goal and objectives (Section 1.1). Notable outcomes from the study include the following:

1. Two coyotes were caught on camera.

2. The coyote camera survey resulted in a detection index of 0.035.
3. NASO DNA has approximately 88 ac (25 ha) of nutria habitat.
4. Nutria were observed, as well as tracks and scat.
5. GPS and GIS documentation of methods and results will facilitate future replicated efforts.

APPENDIX A
VDGIF Survey Permit

COMMONWEALTH of VIRGINIA

Douglas W. Domenech
Secretary of Natural Resources

Department of Game and Inland Fisheries

Robert W. Duncan
Executive Director

January 1, 2013

RE: New Permit and Reporting Requirements – Scientific Collection and Threatened & Endangered Species Permits

Dear Permit Holder:

Enclosed is your new permit and the standard conditions effective with the date of issue of your permit. Thank you for acquiring the proper permits to carry out your research and educational activities. We appreciate your cooperation. Please be sure **you AND all subpermittees** read your permit, especially any collections limitations and restrictions which are in addition to the standard conditions. Also read the standard conditions document and any other accompanying documentation thoroughly before commencing **any** field work. Remember that the permit, standard conditions, and other documentation (or a copy of them) **MUST** be with you at all times when you are in the field.

ALL requests for changes **MUST** be made using the Supplemental Amendment Form available for download at www.dgif.virginia.gov/forms and sent via email to collectionpermits@dgif.virginia.gov with as much lead time as possible. All changes must be approved by the permitting team (with the exception of requested deletions from the permit). If you are adding subpermittees, please remember that you **MUST** provide a resume for each person you wish to have added. **The standard conditions which accompany EVERY permit cannot be changed.**

As you know, we are continually trying to improve the permit process and better manage the wildlife resources of Virginia. This year, we are continuing to emphasize the need to coordinate with the Department prior to commencing any of your field work. **Please notify the Department via email at collectionpermits@dgif.virginia.gov, a minimum of 7 days prior to commencing field work and provide the following information: date(s) of field work, location(s) of field work, and species and numbers to be collected. You should also follow any additional contact instructions listed on your permit.**

Version 2013

To facilitate the compilation of data provided by you in your annual collection or salvage reports, you **MUST** submit your data on the customized Excel database program for use on Windows 2000 and later systems. **This Excel reporting application available for download from www.dgif.virginia.gov/permits/guide.asp.**

Enclosure (1) provides information regarding permit renewal, reporting and fee schedules.

Thank you again your cooperation! Your data is very important to VDGIF. This data will be entered into the Virginia Fish and Wildlife Information Service (VAFWIS) system of databases, which is available online to visitors and by subscription at <http://vafwis.org/fwis/>.

Please do not hesitate to contact myself or Shirl Dressler if you have questions or need assistance: (804) 367-6913 or collectionpermits@dgif.virginia.gov

Sincerely,

James E. Husband
Fish and Wildlife Information Service
Bureau of Wildlife Resources, Bureau Services

Enclosure

PERMIT RENEWAL, REPORTING, AND FEE SCHEDULE

The table below summarizes the permit period, renewal date, report date, and permit fee. I encourage you to send your renewal application and documentation by November 1 each year to ensure timely review and issuance by the Department permit team. Information and forms for permit renewal may be obtained from www.dgif.virginia.gov/forms.

Permit Type	Permit Period	Permit Duration	Permit Report Due Date	Permit Fee
Scientific Collection	Jan. 1-Dec. 31, or date approved through Dec. 31	2 years, or part thereof of first year, always expiring on Dec. 31	Annually by January 31	\$40, due with application
Wildlife Salvage	Jan. 1-Dec. 31, or date approved through Dec. 31	3 years, or part thereof of first year, always expiring on Dec. 31	Annually by January 31	\$60, due with application
Endangered & Threatened Species	Jan. 1-Dec. 31, or date approved through Dec. 31	1 year, or part thereof, always expiring on Dec. 31	Annually by January 31	\$20, due with application

REMINDER: Your report is due by January 31. You MUST use the Excel application available at www.dgif.virginia.gov/permits/guide.asp.

Scientific Collection Permit -- Standard Conditions

- **This permit, or a copy, must be carried by the above named individuals during collection activities.**
- **The permittee is required to submit to this Department a report of all specimens collected under this permit by the report due date. Report form may be found at <http://www.dgif.virginia.gov/permits/guide.asp>. FAILURE TO RETURN THIS REPORT WILL RESULT IN NON-ISSUANCE OF FUTURE PERMITS. If no activity occurs under this permit, an email should be sent to collectionpermits@dgif.virginia.gov containing the following statement: No activity occurred under Permit #insert permitID during insert year (i.e. 2006). Permit reports are due by January 31.**
- Permittee MUST notify VDGIF within the seven (7) day period prior to EACH sampling event. Notification must be made via email to: collectionpermits@dgif.virginia.gov.)
- This permit does not support any activities outside of those associated with the application and proposal submitted to and approved by DGIF.
- No species currently listed by the U.S. Fish and Wildlife Service or the Virginia Department of Game and Inland Fisheries as threatened or endangered may be intentionally collected under this permit. If incidental *death or injury* of threatened or endangered species does occur, the permittee is required to notify this Department at collectionpermits@dgif.virginia.gov within twenty-four (24) hours of occurrence. The following information must be reported: collector, date, species, location (county, quad, waterbody, and latitude and longitude to nearest second), and number collected.
- If incidental *observation or collection and live release* of threatened or endangered species occurs, the permittee is required to notify this Department at collectionpermits@dgif.virginia.gov within seven (7) days, providing the same information as the above condition.
- If incidental *mortality or injury of specimens intended to be taken live* occurs, the permittee is required to notify this Department at collectionpermits@dgif.virginia.gov within 48 hours, providing the same information as the above conditions. In addition, the permittee must provide the cause of mortality or injury and steps that are being taken to address the problem.
- No species may be retained unless specifically authorized by this permit.
- Game birds/game mammals/game fish protected by State and/or Federal laws must be taken during authorized hunting and trapping seasons and under applicable daily and seasonal bag/number limits by properly licensed persons unless otherwise specifically authorized. A valid Virginia fishing license is required for each person collecting samples by hook-and-line.
- All traps must be marked with the name and address of the trapper or an identification number issued by the Department (Code of Virginia §29.1-521.7). Steel foothold traps, Conibear-style body gripping traps, and snares must be marked with a nonferrous metal tag bearing this information (Virginia Administrative Code 4 VAC 15-40-170).
- All traps must be checked at least once a day and all captured animals removed, except completely submerged body-gripping traps which must be checked at least once every 72 hours (Code of Virginia §29.1-521.9).
- The permittee is required to report any incidences of wildlife deaths or diseases observed during the course of collection activities. Reports should be made to: collectionpermits@dgif.virginia.gov within seven (7) days.
- This permit satisfies only the Department's requirement for collection permits and is issued with the understanding that no collections will be made on federal, state, or private property without the prior approval and necessary permits from the landowners involved. The permittee is responsible for obtaining any additional permits required for collection.
- Sampling gear, boats, or trailers which have been used in states harboring zebra mussels must be cleaned and prepared following accepted guidelines for removal of zebra mussels, prior to being used in Virginia.
- For safety reasons, it is recommended that all permittees display at least 100 square inches of solid blaze orange material at shoulder level within body reach and visible from 360 degrees, especially during hunting season.

APPENDIX C
Scent Station Camera Information

Instructions for M-80BLX GameSpy Digital Camera

THANK YOU for your purchase of the M-80BLX GameSpy Digital Camera. Please read this booklet before using the unit. If you should have any questions about this product or any other Moultrie product, please contact us using the information on the back of this booklet. Please register your camera at www.moultriefeeders.com to activate your warranty.

I GAMESPY OVERVIEW

FRONT VIEW

SIDE VIEW

I GAMESPY OVERVIEW (cont.)

ON / OFF / AIM SWITCH

Used for turning On, turning Off, or Aiming the camera. When in AIM position the red LED light on the front of the camera will illuminate. To help find the center field of view for the camera, stand out in front of the camera and move left or right as you observe the AIM LED - as you walk away from direct center the LED light will be less bright. As you walk towards center the LED will appear brighter.

MODE BUTTON

The Mode Button selects Camera Setup or Main Screen. When camera mode is selected, the UP and DOWN buttons navigate through the menu options. The Mode Button is also used to wake-up the camera and turn on the display when the camera is in a power saving mode.

ENTER, UP/DOWN and LEFT/RIGHT BUTTONS

The ENTER button selects the item to be changed. The UP/DOWN and LEFT/RIGHT buttons are used to step through the menu options. Pressing the ENTER button again, selects the option indicated on the display. The ENTER button is also used to manually take a picture.

BATTERY COMPARTMENT

The Camera is powered by four(4) or eight(8) AA size alkaline or lithium batteries. Slide the Unlock switch to the right and grab the small handle under the switch to slide-out the battery compartment tray.

NOTE: It is recommended to use lithium batteries for best performance.

SD CARD SLOT

Accepts up to a 32GB SD Card for photo and video storage. Note: An SD Card must be installed for the camera to operate (sold separately).

USB PORT

Download still pictures and video onto your computer by connecting provided cable.

POWERPANEL PORT

Accepts the Moultrie PowerPanel accessory (sold separately) only. Refer to www.moultriefeeders.com for more information.

TV OUT JACK

View still pictures and videos on your TV by connecting a 2.5mm video cable (sold separately).

II QUICK START INSTRUCTIONS

- 1 Slide the UNLOCK switch on the bottom of Camera and use the knob to pull the slide-out Battery Tray. Install four(4) or eight(8) AA size alkaline or lithium batteries with polarities as indicated in the Battery Tray. Re-install the Battery Tray.
- 2 Thread the provided Mounting Strap through the Eyelets on the back of the camera and secure to a tree or pole approximately 36" from the ground as shown.
- 3 Turn Camera on by sliding ON/OFF/AIM switch to the ON position.
- 4 Press the MODE button one time to get to the Camera Setup Menu. Set Time and Date by pressing ENTER, using UP/DOWN to adjust selected field, LEFT/RIGHT to move to the next field and ENTER when done.
- 5 Press MODE button until MENU SELECTION screen is displayed. Use the UP/DOWN buttons until the MAIN SCREEN option is highlighted yellow. Press ENTER.
- 6 Your Camera will now automatically take pictures whenever an animal is detected in range -based on the default settings below.

III DEFAULT SETTINGS

Capture Mode	TRAIL CAM (Still)
Photo Quality	HIGH
Photo Delay after each photo is taken	1 MIN
Motion Freeze	OFF
Multi Shot Count	OFF
Digital Zoom	NO ZOOM
Video Resolution	HIGH
Video Length	5 SEC
Video Audio	ON
Camera Name	MYCAMERA
Temperature	Fahrenheit
Info Strip printed on photos	ON
Plot Frequency	15 SECONDS
Plot Duration	3 HOUR
Default Setting	NO
Delete All?	NO

IV CAPTURE MODES

The GameSpy offers four capture modes as described below. The default capture mode is Trail Cam.

1 TRAIL CAM MODE

Still photos are taken when an animal is detected. The number of photos taken when an animal is detected is configurable in Settings. Photos are stored in the in the DCIM/100_MDGC folder on the SD card.

2 PLOT CAM MODE

The camera takes photos at a specified interval during the day and combines them together to create a Plot Video (*.MLT file) which can be viewed on the supplied Moultrie Plot Stalker software. The camera takes a Plot Video twice a day; once in the morning and once in the evening. The morning Plot Video begins 15 min before sunrise. The evening Plot Video ends 15 min after sunset. See chart below as a reference. The length of each Plot Video is determined by the Plot Duration setting in the camera menu. The camera will detect the correct sunrise and sunset times automatically and adjust itself accordingly. The Plot Videos are stored in :/PLOT folder on the SD card.

IMPORTANT: It will take the camera 24hrs to properly adjust to the correct sunrise and sunset times. As a default the camera will start the morning Plot Video at 5:45am and end the evening video at 6:15pm. To reset the sunrise and sunset times back to the default times, use the Default Settings option in the menu.

NOTE: The camera can still be triggered to take a photo under certain settings while in plot mode. Please see the "Plot Frequency" settings in the camera setup section.

3 HYBRID CAM MODE

Camera operates in Plot Cam mode during the day and Trail Cam Mode during the night. Thirty minutes after dusk the camera will enter the Trail Cam mode and take night photos when the PIR sensor is triggered.

4 VIDEO MODE

Camera records a video when an animal is detected by the motion sensor. During daylight hours the camera will record a video 5, 15 or 30 seconds in length. During night the camera will record a video with a maximum length of 10 seconds. The video length is configurable in SETTINGS.

V CAMERA SETUP

Setup Menu - The UP/DOWN buttons are used to navigate through the available setting choices. UP/DOWN moves to the next menu item, and ENTER selects the item to be changed. Additional menu choices are available by hitting the UP/DOWN button when either the first/last option is highlighted.

SETUP DATE/TIME
MM/DD/YY HH:MMAM

Date/Time - Set Date /Time - on the SETUP DATE/TIME screen, use the UP/DOWN buttons to modify the month. Press LEFT/RIGHT buttons to move to the next field. Press the ENTER button again to save your selections. The Time and Date is retained between battery changes. Time is not automatically adjusted for daylight savings.

CAPTURE MODE
TRAIL CAM

Capture Mode - (default Trail Cam) Press the UP/DOWN buttons to highlight the desired mode. Press the ENTER button to save the mode and return to the Camera Setup Menu. There are four capture mode settings -TRAIL CAM, PLOT CAM, HYBRID CAM or VIDEO. Refer to the CAPTURE MODE section of this manual for details.

PHOTO QUALITY
HIGH

Photo Quality - (default High) -The higher the quality of the photo/image the more memory it consumes. However, higher quality images have higher resolution which results in clearer images -especially when zooming in. There are four photo/image quality settings -ENHANCED, HIGH, MEDIUM, and LOW. Press the UP/DOWN buttons to highlight the desired setting. Press the ENTER button to save the setting and return to the Camera Setup Menu. Refer to SPECIFICATIONS section of this document for details on number of images stored based on Photo Quality.

V CAMERA SETUP (cont.)

PHOTO DELAY
1 MIN

Photo Delay - (default 1 minute) -The photo delay determines the number of minutes between pictures when an animal is detected and remains in range. To change the delay time, press the UP/DOWN buttons to highlight the desired setting. Press the ENTER button to save the setting and return to the Camera Setup Menu. Additional menu choices are available by hitting the UP/DOWN button when the first/last option is highlighted. Photo Delays can be set to 5, 15 and 30 seconds, 1, 5, 10, 30 and 60 minutes.

MOTION FREEZE
OFF

Motion Freeze - (default OFF) - This feature maximizes the image clarity during night photos. When this feature is on the camera will use a maximum exposure time of 1/20sec for the night photos. Other adjustments are made to increase the brightness and clarity of the photo. When this feature is turned off the camera will use a maximum exposure time of 1/8sec for the night photos.

MULTI SHOT
OFF

Multi-Shot - (default OFF) - When the Game Spy Camera is configured for TRAIL in the capture mode screen, the camera can take 2 shot standard or 3 Shot standard, 2 Shot Fast, 3 Shot Fast, and 4 Shot Fast each time an animal is detected. There is an approximate 3-4 second delay between pictures when the 2 shot standard or 3 Shot standard setting is selected. When the 2 Shot Fast, 3 Shot Fast, and 4 Shot setting is selected, the camera will take the selected amount of photos within 1-2 seconds. To choose the desired setting press the ENTER button to enter the Multi Shot settings. Press UP or DOWN to select the desired number of photos. Then press ENTER again to return to the camera setup menu.

V CAMERA SETUP (cont.)

VIDEO RESOLUTION
HIGH

Video Resolution - (default High) -Video resolution can be set to LOW or HIGH. The higher the quality of the video, the more memory it consumes. However, higher quality videos have higher resolution.

Low: 352 x 192 @ 24fps High: 720 x 400 @ 24fps
Press the UP/DOWN buttons to highlight the desired setting. Press the ENTER button to save the setting and return to the Camera Setup Menu.

VIDEO LENGTH
5 SEC

Video Length- (default 5 seconds) -When the Game Spy Camera is configured for VIDEO in the Capture Mode screen, the camera will record video for a designated amount of time each time an animal is detected. To change the amount of time recorded, press the UP/DOWN buttons to highlight the desired setting. Press the ENTER button to save the setting and return to the Camera Setup Menu. The maximum video length for a nighttime IR video is 10 seconds.

VIDEO AUDIO
ON

Video Audio - (default On) - This option allows the user to turn the audio during video recording ON or OFF. When selected and the Game Spy Camera is configured for VIDEO in the Capture Mode screen; the camera will record audio along with the video each time an animal is detected. Press the LEFT/RIGHT buttons to highlight the desired setting. Press the ENTER button to save the setting and return to the Camera Setup Menu.

CAMERA NAME
MYCAMERA

Camera Name - (default MYCAMERA) The Camera Name is imprinted on the photos and provides a point of reference when multiple cameras are used. To change the Camera Name, use the LEFT/RIGHT buttons to highlight the character to be modified. Press the UP/DOWN button to select the desired character (A to Z, 0 to 9, dash or space). Press LEFT/RIGHT to move to the next character. Press the ENTER button to save the new camera name and return to the Camera Setup Menu.

V CAMERA SETUP (cont.)

IR TEST
OFF

IR Test- (default Off) When IR Test is ON and the PIR sensor detects motion, the red LED on the front of the camera will come on for 2 sec and then shut off.

TEMPERATURE
FAHRENHEIT

Temperature - (default Fahrenheit) - The temperature is imprinted on each photo and can be in degrees Fahrenheit or Celsius. To change the temperature units, press the UP/DOWN buttons to highlight the desired setting. Press the ENTER button to save the setting and return to the Camera Setup Menu.

INFO STRIP
ON

Info Strip - (default On) -When the Info Strip is turned ON, the information strip, as described in the Advanced Setup section of this manual, is imprinted on the photos. The Temperature, Moon phase, Date, Time, Camera Name, & Moultrie logo are imprinted on the bottom of each picture. When the Info Strip is turned OFF, the photo contains no information strip. To change the Info Strip setting, press the LEFT/RIGHT buttons to highlight the desired setting. Press the ENTER button to save the setting and return to the Camera Setup Menu.

PLOT FREQUENCY
15 SECONDS

Plot Frequency - (default 15 seconds) - Used to set the time frequency between each photo in plot mode. To change the plot frequency, press the UP/DOWN buttons to highlight the desired setting. Press the ENTER button to save the setting and return to the Camera Setup Menu. Plot frequency can be set to 5, 10, 15, 30, 60 seconds or 2 or 5 minutes.

NOTE: Increasing the Plot Frequency will decrease the battery life of the camera. It is recommended to use lithium batteries for taking plot videos.

NOTE: When the Plot Frequency is set to 60 seconds, 2 minutes or 5 minutes, the cameras motion sensor can still be activated in between photos. When this occurs, a photo will be taken and added to the plot video.

V CAMERA SETUP (cont.)

PLOT DURATION
3 HOURS

Plot Duration - (default 3 hours) - Plot Duration is used to limit the time periods that the camera will be active. To change the plot duration, press the UP/DOWN buttons to highlight the desired setting. Press the ENTER button to save the setting and return to the Camera Setup Menu.

Plot duration can be set to All Day, 1, 2, 3, or 4 hours.

- All Day - Plot cam takes photos all day
- 1 Hour - Plot cam takes photos for 1 hour twice a day.
- 2 Hour - Plot cam takes photos for 2 hours twice a day.
- 3 Hour - Plot cam takes photos for 3 hours twice a day.
- 4 Hour - Plot cam takes photos for 4 hours twice a day.

NOTE: Increasing the Plot Duration will decrease the battery life of the camera. It is recommended to use lithium batteries for taking plot videos.

BATTERY LIFE
67 DAYS

Battery Life- This feature provides an **estimated** battery life of the camera. The battery life is expressed as "**### Days**". Pressing the MODE button will return to the Camera Setup menu.

NOTE: The number of days shown is based on using 8 AA alkaline batteries with 5 day and 5 night photos per day. Actual battery life will vary depending on type of battery, weather conditions and camera usage. It is recommended to use lithium batteries for best performance.

DEFAULT SETTINGS
NO

Default Settings - (default No) -To restore all the settings back to the factory default, press the LEFT/RIGHT buttons to highlight the YES setting. Press the ENTER button to restore the default settings and return to the Camera Setup Menu.

DELETE ALL?
NO

Delete All Photos - (default No) - To remove all content on the SD card, press the LEFT/RIGHT buttons to highlight the YES setting. Press the ENTER button to erase photos and return to the Camera Setup Menu.

VI ADVANCED INFORMATION

1 VIEWING PICTURES ON COMPUTER VIA USB

1. Plug provided USB cable into the USB port on your Windows 7/Vista/XP computer.
2. Plug other end of USB cable into the camera's USB port.
3. To access JPG pictures and AVI movie files, navigate to "My Computer" and double click the "Moultrie CAM" drive. Picture files will be stored in the DCIM/100_MDGC directory; video files are located in the DCIM directory.
4. To exit USB mode, follow Windows' instructions for properly disconnecting a removable drive and then unplug.

2 VIEWING PICTURES - TV OUT

1. To enter TV Out Mode, turn on the camera and place in the SETUP mode.
2. Plug RCA jack from TV Adapter Cable (sold separately) into a VIDEO IN port on a TV or VCR.
3. Plug other end of TV Adapter Cable into the TV Out Jack. Pictures are now presented on the TV.
4. To view pictures use the RIGHT or LEFT button to sequence to the next/previous captured picture or video clip. The camera's menu display shows the picture number being viewed.
5. To delete current picture or video, press the DOWN button.
6. To exit TV mode, unplug the TV Adapter Cable from the TV Out Jack and TV or VCR.

FCC Statements

FC Moultrie Products, LLC

NOTE: Changes or Modifications not expressly approved by the party responsible could void the user's authority to operate this device.

The device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

NOTE: THE MANUFACTURER IS NOT RESPONSIBLE FOR ANY RADIO OR TV INTERFERENCE CAUSED BY UNAUTHORIZED MODIFICATIONS TO THIS EQUIPMENT. SUCH MODIFICATIONS COULD VOID THE USER AUTHORITY TO OPERATE THE EQUIPMENT.

NOTE: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation.

If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Optional SD Memory Card	32 GB Max
Optical Field of View	55 degrees
Batteries	Alkaline AA-cells
Approximate Detection Range	45 +/-5 feet

A PLOTSTALKER SOFTWARE INTRO

INTRODUCTION

In time-lapse photography a series of still photos are taken at regular time intervals. The PlotStalker Software allows you to load the time lapse file that was captured from your Moultrie Game Camera and scroll backward and forward through your photos, single step, search for activity in a designated area, and save the files.

SYSTEM REQUIREMENTS

- Computer: Intel® Pentium® 4 or AMD Athlon® 64 processor or above; 1GB RAM minimum; 100 MB hard disk space minimum.
- Operating System: Microsoft® Windows® 32 bit - XP with Service Pack 2 or later; Windows Vista® Home Premium, Business, Ultimate, or Enterprise with Service Pack 1; or Windows 7

SOFTWARE INSTALLATION

- Insert the PlotStalker CD into your computer and follow on-screen instructions.

LOADING PLOT FILES

- 1 Using standard Microsoft utilities (ex. File Explorer – My Computer), copy the PlotFiles (extension is .MLT) from the PLOT directory on the SD card to the hard disk drive in your computer. Note the location stored on the hard disk drive.
- 2 Open the PlotStalker software application from the Windows Start Button menu. Once in the PlotStalker software, click on the File Button
- 3 Browse to the location in which you have saved the Plot file(s) (.MLT) in step 1 above, select the file of interest and click Open.

BEGIN/END

Goes to the first or last photo in the Plot File.

FRAME BY FRAME SEARCH

Individually step forward or backward through each photo.

REWIND/PAUSE/PLAY

Play photos in sequence, pause, or play the photos in reverse order. These functions simulate a video and are useful for manually searching changes in the photos. When a sequence is being played, press fast-forward or fast-rewind multiple times to increase speed. (1x-5x)

B PLOTSTALKER ACTIVITY SEARCH

ACTIVITY SEARCH

The Search Feature will scan through your photos and automatically look for changes in regions that you identify in Setup.

In search mode, the PlotStalker software scans through the .mlt photo file, stops on a photo when changes are found in your identified region, and then highlights the changes in blue. You can click anywhere in the video viewing area to remove the blue highlights.

ACTIVITY SEARCH SETUP

Click the Settings button to activate the Region and Sensitivity settings for the Activity Search

DEFINE SEARCH REGION

Provides the ability to search for changes in the photo in a specific region rather than the entire photo.

- 1 Click on the Set Motion Search Area Button.
- 2 Use the mouse to select and drag the red outline around the area you want to search for movement. This allows you to focus on a very precise area if required.
- 3 Click OK button on the Settings Popup window to confirm your settings and exit the menu.

SENSITIVITY

- 1 Set to High, Medium or Low - This sets the level of pixel change the program will detect. Note; a pixel change will occur with a color, intensity, lighting or movement so this setting is critical to obtain the desired results.

DEFAULT SETTINGS

- 1 Click on Default button to return to the default values for Search Area and Sensitivity settings

C PLOTSTALKER SAVE FILE

SAVING FILES OVERVIEW

Use the Save File features of the PlotStalker software to create a single photo, reduce the overall size of the .mlt file, exclude unwanted photos in the front, or create a video that can be viewed using a standard media player.

EXPORTING AN IMAGE/PHOTO

- 1 On the main screen, choose a starting image/photo (frame) by using the scroll bar on the bottom of the display or the frame-by-frame search feature.
- 2 Press the SAVE button
- 3 Select the Current Image (*.jpg) radio button
- 4 Press Change... to enter the directory and filename to save the image
- 5 Press Export to save the file

EXPORTING MLT FILE

- 1 Select the appropriate 50, 100, or 200 images video clip radio button. This will create a MLT format file from the starting frame plus the next 50, 100, or 200 frames.
- 2 Select the Change button to select the desired location to save the export file.
- 3 Enter the directory and filename to save the file
- 4 Select the Export button to save the file. These files are viewable with Plot Stalker Software.

EXPORTING WMV FILE

- 1 Select the appropriate 50, 100, or 200 images video clip radio button. This will create a .wmv format file of the starting frame plus the next 50, 100, or 200 frames.
 - 2 Select the Change button to select the desired location to save the export file.
 - 3 Enter the directory and filename to save the file
 - 4 Select the Export button to save the file. The program will convert the images to video based on the chosen settings. The .wmv file can be viewed using a standard media player.
- Great for uploading to the internet or emailing.

Our Service Department will gladly answer any questions you have. Call 800-653-3334, Monday - Friday, 8:00 AM to 5:00 PM CST.

Many Problems, March 10, 2013

By [Badcam](#) [D](#) ([read all my reviews](#))

Advantages: there are nonewhen it doesn't work

Disadvantages: Performance, Quality, Durability

"I purchased two of the Moultrie M80's a year ago. Both of them stopped taking pictures within days of one another. After two calls to Moultrie(I was on hold for ever) I got a hold of someone that fixed the problem. They do not take good pictures in the dark if something moves. The pictures are very blurry.Now one of them have stopped taking picture again and will not even turn on. I emailed Moultrie,but as of 3/9/2013 knowone has made any attempt to contact me about the problem. I will never buy another Moultrie product."

Pretty good Camera, December 3, 2012

By [Plogan11](#) from Northeast texas [D](#) ([read all my reviews](#))

Reviewer Images

(click to see full-size image)

Advantages: Ease of use, Performs well

"This is my first game camera so I dont have too much to compare it too. What I have noticed is that it dose not always take pictures. I have sat in my stand several mornings watching the doe play around my feeder. They show up like clockwork every morning. When I check the card I find that there will only be a couple of pics if any at all, so I wonder what im missing out on when I'm not there. The day pictures are impressive, but the night pictures are usually dark and often times very blurry. I do like the black flash feature and the deer never noticed the camera. There is also the night/day transition period where all the pictures look like there is a fresh blanket of snow on everything. Overall its not a bad camera for a first purchase."

Kaatz Bros Karac Coyote Gland Lure
16 OZ

Price: \$45.00

ADD TO CART

Category: Kaatz Bros Lures

Description: The most valuable asset to the coyote trapper--an aged, quality gland lure. Karac is formulated to significantly improve coyote trapping success will into the late winter and the breeding season. While coyote trapping, the Kaatz Bros. often benefit from the assistance of a trapline dog in locating natural territorial markers. After the dog adds a shot of urine to a prominent bush or rock, we'll drop in a set and add a smear of Karac. The results continue to be staggering! Karac can be used to freshen up stale droppings as well, for a highly effective, subtle flat set!

1.0 INTRODUCTION

The U.S. Department of the Navy (Navy), Naval Facilities Engineering Command (NAVFAC) Mid-Atlantic prepared this nuisance wildlife management plan for Naval Air Station Oceana Dam Neck Annex (NASO DNA) (Figure 1). The term nuisance wildlife includes species that adversely affect the well-being of domestic animals, other wildlife, property, or human health and safety. The Virginia Administrative Code (Title 4VAC15-20-160) lists the house mouse (*Mus musculus*), Norway rat (*Rattus norvegicus*), black rat (*Rattus rattus*), coyote (*Canis latrans*), feral hog (*Sus scrofa*), nutria (*Myocastor coypus*), woodchuck (*Marmota monax*), European starling (*Sturnus vulgaris*), English sparrow (*Passer domesticus*), and pigeon (*Columba livia*) as nuisance species. All of these species are known to or have the potential to occur on NASO DNA. This plan is designed to address nuisance wildlife on NASO DNA and is designated as Version 1 to indicate that it is a living document to be updated as required to address changing conditions and new information as it becomes available.

Although all of these species occur or have the potential to occur at NASO DNA, coordination with installation personnel and local experts identified the coyote and nutria as the primary nuisance wildlife species of interest/concern at the time of this plan. Of the listed nuisance wildlife species, the occurrence of coyote and nutria was considered to have the greatest potential for adverse effects on NASO DNA. As a result of this determination, field surveys were initiated to gain baseline information on the occurrence of these two species and their potential habitats. The results of those surveys (Navy 2014) are used herein to develop the guidance and recommendation for monitoring and control.

1.1 PURPOSE

The purpose of this management plan is to prevent nuisance wildlife from adversely affecting the military mission and operations on NASO DNA. This plan identifies and focuses management efforts and provides management guidelines for control of nuisance wildlife. This plan is recommended for implementation under the overarching guidance of NASO DNA's Integrated Natural Resources Management Plan (INRMP) (Navy 2013).

1.2 GOALS AND OBJECTIVES

To effectively implement this management plan and evaluate its success, measurable goals and objectives must be identified. The goals include (1) informing installation personnel of the nuisance wildlife conditions and (2) minimizing nuisance wildlife concerns on NASO DNA. The objectives include (1) disseminating information on the occurrence and abundance of nuisance wildlife and (2) implementing management actions to prevent nuisance wildlife from becoming a threat to NASO DNA military mission and operations. Measures of success include the dissemination of fact sheets on nuisance wildlife and the number of nuisance complaints received. Implementation of this plan requires the cooperation of the installation commander and key persons within the chain of command affecting natural resources management.

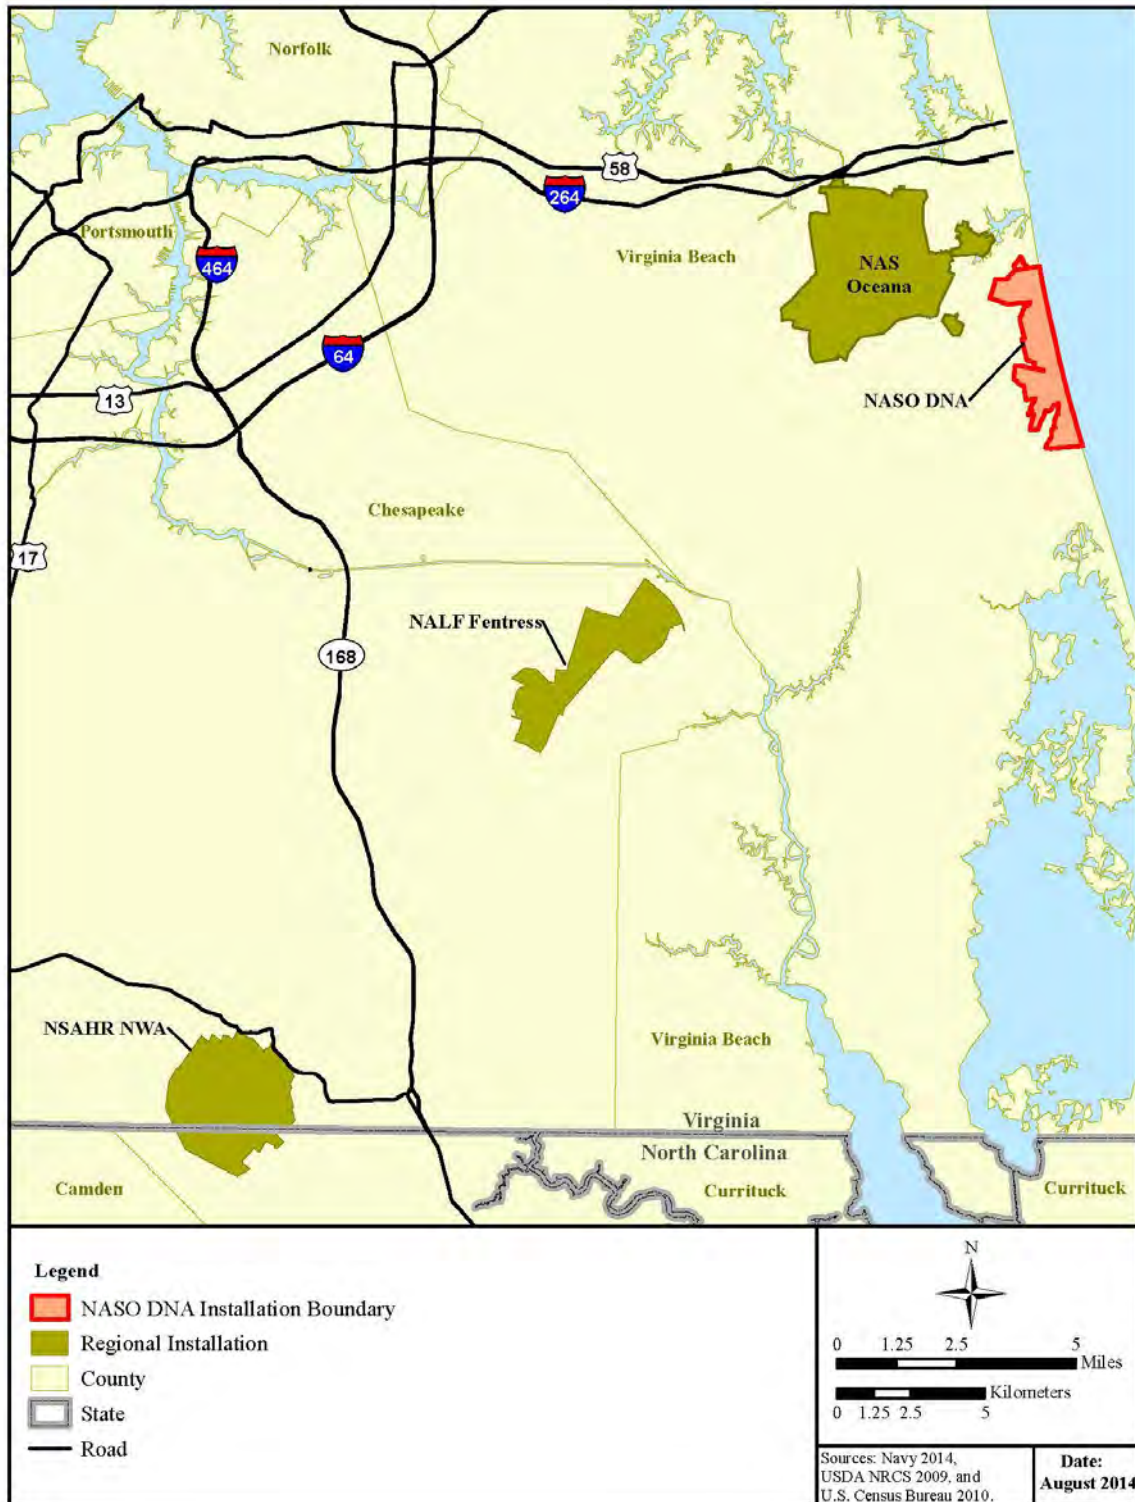

Figure 1. General Location of NASO DNA.

1.3 NATURAL RESOURCES OVERVIEW

Natural resources management on NASO DNA is part of a region-wide Navy natural resources program that is overseen by the mid-Atlantic regional natural resources program manager. The Natural Resources Manager (NRM), stationed at Naval Air Station (NAS) Oceana, supervises natural resources management activities on NASO DNA. Program administration includes 13 management issues and concerns.

- Coastal Zone Protection
- Wetlands and Water Quality Protection
- Environmental Restoration Program
- Oil and Hazardous Substances
- Threatened and Endangered Species Protection
- Marine Resources Protection
- Habitat Conservation and Restoration
- Shade Tree and Urban Forest Management
- Forest Management
- Fish and Wildlife Management
- Outdoor Recreation and Environmental Awareness
- Integrated Pest Management
- Cultural Resources Management.

Three management units are recognized for planning of natural resources management activities. The management units include urban/developed areas, natural areas, and beaches and dunes. Nuisance wildlife issues from coyote and nutria could occur in each of the management units but would be of greatest concern in the urban/developed areas and natural areas.

2.0 ROLES AND RESPONSIBILITIES

Navy program requirements for ensuring military readiness and sustainability while complying with natural resource protection laws, and conserving and managing natural resources includes coordination of roles and responsibilities. Specific assignment of responsibilities, centralized supervision, professionally trained personnel, and stakeholder coordination are necessary for managing natural resources, including nuisance wildlife, on Navy lands as specified in the Operational Navy Instruction Manual (OPNAVINST 5090.1D, M-5090.1), *Environmental Readiness Program*. Coordination with state and other federal agencies enhances the Navy's ability to achieve stewardship of natural resources in support of readiness and sustainability.

2.1 STATE

The Virginia Department of Game and Inland Fisheries (VDGIF) is responsible for non-migratory game and non-game wildlife management in the Commonwealth of Virginia. Department biologists can assist planning and compliance with state regulations pertaining to the management of wildlife, including nuisance species. VDGIF provides additional information on coyote control at <http://www.dgif.virginia.gov/wildlife/problems/coyotes/>, including the no kill permit requirement, continuous open season, no Sunday hunting or killing permitted, and requirement to contact the Commonwealth Attorney's office for local information regarding legal methods of animal removal (some cities or counties have stricter regulations than state law). The Invasive Species Working Group of Virginia was established in 2009 by the General Assembly (Code of Virginia § 2.2-220.2) to develop a state invasive species management plan and list of invasive species that pose the greatest threat to the Commonwealth (Virginia Invasive Species Working Group 2012). The nutria is included in the list of invasive species that are actively managed or monitored in Virginia.

2.2 FEDERAL

The U.S. Department of Agriculture, Animal and Plant Health Inspection Service, Wildlife Services Division (USDA-APHIS-WS) is the federal program authorized by law to reduce damage caused by wildlife in accordance with the Animal Damage Control Act of 1931, as amended (7 U.S. Code [U.S.C.] 426-426c) and the Rural Development, Agriculture, and Related Agencies Appropriations Act of 1988 (7 U.S.C. 426c). USDA-APHIS-WS provides technical assistance for control of nuisance wildlife. Their mission is to provide federal leadership and expertise to resolve wildlife conflicts and allow people and wildlife to coexist. Additional information is provided at www.aphis.usda.gov/wildlife_damage. Executive Order (EO) 13112, *Invasive Species*, directs USDA-APHIS-WS to provide national leadership and oversight in managing invasive species, including nuisance wildlife, in cooperation with other federal agencies. All USDA-APHIS-WS wildlife damage management is conducted in compliance with state and federal relevant laws, regulations, policies, orders, and procedures.

2.3 DEPARTMENT OF DEFENSE

Management of nuisance wildlife concerns is specified in the NASO DNA INRMP (Navy 2013). EO 11987, *Exotic Organisms*, and EO 13112 address the control of invasive, non-native species on federal facilities. Procedures and responsibilities for management and control of nuisance

wildlife are prescribed in COMNAVREG MIDLANT INST 11015.3 (*Natural Resources Management for Fish and Wildlife, Feral Animals, Invasive Species, and Certain Pests*) (Appendix A). These documents direct installations to prevent introductions, conduct surveys on the distribution and abundance of non-native species, and to provide management for their control.

NAVFAC MIDLANT is responsible for management and control of, and providing services pertaining to, fish and wildlife, feral animals, invasive species, and pests. Pest management services are provided through the Environmental Services Department, which responds to routine service calls for removal of non-migratory birds and control of feral animals. Requests for services involving animals not under the purview of the Environmental Services Department are referred to NRMs.

Natural Resource Specialists, under the direction of the Regional Natural Resources Program Manager, are responsible for implementation of practices and procedures to manage fish and wildlife and control certain feral, nuisance, and invasive species. Under the direction of NRMs, Conservation Officers are responsible for enforcing fish and wildlife and other natural resources laws and regulations. They may conduct field inspections and employ approved control methods for certain species, perform wildlife forensic investigations, and respond to wildlife damage complaints.

Authority and responsibility for nuisance wildlife ultimately resides with the NAVFAC MIDLANT Core Environmental (EV) director. The NAVFAC MIDLANT CORE EV director may delegate this authority to the NAVFAC MIDLANT Core and/or the NAVFAC MIDLANT Installation NRM. The NAVFAC MIDLANT CORE EV director or an appointed delegate maintains the permits necessary for controlling species protected by federal or state law.

3.0 INSTALLATION DESCRIPTION

NASO DNA (Figure 2) was established by the Navy in 1941 in City of Virginia Beach, Virginia. The installation size was increased over several years and encompasses approximately 1,900 acres (ac, 769 hectares [ha]). The installation is adjacent to the Atlantic Ocean and bounded by mostly developed land to the north, south, and west. Surrounding land uses include industrial, commercial, residential, recreational, and agricultural. NASO DNA is part of NAS Oceana and its mission includes education and training to operational and systems commands, and to perform other functions and tasks as directed by higher authority. This installation description is taken from the INRMP (2013), which provides more detailed information on the physical and biological resources that are abbreviated below.

3.1 PHYSICAL RESOURCES

NASO DNA is located in Virginia's outer Atlantic Coastal Plain. The climate is moderated by the Atlantic Ocean; January is typically the coldest month (average 32.6° Fahrenheit [F], 0.3° Celsius [C]) and July is typically the warmest month (average 87.4° F, 30.8° C). The area receives an average of 45.7 inches of rain per year. The normal growing season (daily minimum temperatures higher than 32° F, 0.0° C) is approximately 250 days from 22 March to 21 November.

The outer Atlantic Coastal Plain physiographic province is characterized as flat with low relief and elevations of 0–60 feet (0–18 meters) above mean sea level. The largest portion of the installation lies in a low basin behind primary and secondary dunes adjacent to the Atlantic Ocean. Approximately half of the soils on NASO DNA are hydric and have severe constraints for development.

Most of NASO DNA is in the Southern Watersheds Area and drains into the Back Bay Watershed unit. A very small portion in the northern section of the installation is in the Rudee Inlet/Owl's Creek Watershed which drains into Rudee Inlet. Most of the installation is in the 100-year floodplain.

3.2 BIOLOGICAL RESOURCES

Wetlands occur on 922 ac (373 ha), mostly in the southern portion of NASO DNA. All of the major wetland systems except riverine wetlands were identified on NASO DNA. The primary wetland type consists of large tracts of palustrine forested wetlands.

NASO DNA is in the Virginian Barrier Islands and Coastal Marshes ecoregion, which is part of the Middle Atlantic Coastal Plain ecoregion that extends northeast from Georgia to New Jersey. The ecoregion is characterized by beaches, dunes, low terraces, beach ridges, and barrier islands that are fringed by lagoons, bays, tidal salt marshes, mudflats, tidal channels, and ocean.

The vegetative community types on NASO DNA include upland/developed, hardwood, beaches and dunes, pine, hardwood/pine, marsh, and early successional (old field). The undeveloped landscape on NASO DNA supports a diverse fauna of mammals, reptiles and amphibians, fish, and birds. One state- and federally-listed terrestrial wildlife species, piping plover (*Charadrius melodus*), is known to occur on NASO DNA.

Figure 2. NASO DNA Land Management Areas.

4.0 NUISANCE WILDLIFE

The house mouse, Norway rat, black rat, European starling, English sparrow, and pigeon are known to or likely occur at NASO DNA. The bird and small mammal species at the time of this plan, do not pose a significant threat to the health and safety of personnel or the military mission.

The VDGIF has created a feral hog committee to address the growing feral hog problem in Virginia (<http://www.dgif.virginia.gov/wildlife/feral-hogs/>). At the time of this plan, no feral hogs are reported as occurring on NASO DNA; however, recent VDGIF reports indicate that feral hogs are in the vicinity. The woodchuck is present everywhere in Virginia except the eastern shore and the extreme southeastern corner of the state. Although the feral hog has the potential to someday expand its range to NASO DNA and the woodchuck does occur at NASO DNA, at the time of this plan the feral hog and woodchuck do not present significant threats to the health and safety of personnel or the military mission.

Of the 10 species listed as nuisance wildlife in Virginia, the coyote and nutria were considered to have the greatest potential to adversely affect mission activities on NASO DNA. Early detection and rapid response management of coyote and nutria is required to avoid harm to the well-being of domestic animals, other wildlife, property, or human health and safety. Accordingly, the other listed species are not considered further in this management plan. As new information becomes available on the distribution and abundance of nuisance wildlife and their potential impact on NASO DNA, an updated version of this management plan will be prepared. Brief background information for the coyote and nutria are presented within the following sections.

Prevention or control of wildlife damage, which often includes removal of the animals responsible for the damage, is an essential and responsible part of wildlife management (The Wildlife Society 1990).

4.1 COYOTE

Historically, coyotes were most commonly found on the Great Plains of North America. Their range now includes all of the continental United States (USDA 2011). The coyote was first observed in Virginia in the early 1950s (VFWIS 2013a). The coyote's great adaptability to almost any circumstances has led to its widespread occurrence. Factsheets (USDA 2011) with additional information are provided in Appendix B.

Coyotes are about the size and weight of a medium-sized dog. Coyotes in the eastern United States are typically larger than coyotes elsewhere. The average weight of females is 35 pounds (15 kilograms [kg]) and average weight of males is 40 pounds (18 kg) (VDGIF n.d.).

Male and female coyotes form a pair bond and defend a home range that may range from 1,000 acres (404 ha) to 25,000 acres (10,117 ha). There is currently no published data on home-range sizes in the mid-Atlantic region (Mastro 2011). Litters range from 3 to 12 pups and may be born between late March and May. Coyotes have a high reproductive rate; both mates and offspring from a previous litter contribute to feeding the pups (VDGIF n.d.).

The coyote is a habitat generalist and thrives in a wide variety of habitats. Being primarily nocturnal and secretive during the daytime hours, some dense cover nearby is often associated

with coyote habitats. Small mammals and deer make up the majority of their diet, although vegetation and fruits are often listed as food items.

The coyote occurs throughout the Commonwealth of Virginia. Coyote populations in forested landscapes are generally less abundant than in their preferred habitats of semi-forested or open farm and pasture lands. Hunter surveys by the VDGIF have been the only estimates of coyote abundance and indicate that the coyote population is more abundant in counties west of the Blue Ridge Mountains (VDGIF n.d.).

Coyotes can carry rabies, which is contagious to humans. Typical signs of rabies include drooling, convulsions, circling, disorientation, partial paralysis, unprovoked aggression, and uncharacteristic tameness. If a person is bitten by a coyote, the animal should be captured without damaging the head and kept for analysis. The NRM should be immediately contacted for coordination with USDA-APHIS–WS to analyze the animal for rabies.

The coyote is filling an ecological niche that was void since the extirpation of wolves from Virginia around the beginning of the 20th century. In addition to preying on small (e.g., rodents and birds) to large (e.g., turkeys and deer) prey species, coyotes tend to kill or exclude red fox from their territories and thus potentially limit red fox population abundance (VDGIF n.d.). Coyotes are opportunistic feeders and will also take advantage of carrion, livestock, and pets (VFWIS 2013a).

Coyotes can be a nuisance to residents and present hazards to operating on NASO DNA. Animals that lose their natural fear of humans are more likely to pose a danger to humans and adversely impact the military mission. If food is deliberately or inadvertently provided by people, coyotes quickly learn not to fear humans. They will take advantage of easy food sources and their boldness to occupy residential areas could endanger human health and safety. Encouraging coyote avoidance behavior of humans by zero tolerance of coyotes around residences and facilities reduces the threat of coyotes in an area.

4.2 NUTRIA

The nutria is a large semi-aquatic mammal native to South America that has been introduced to numerous countries around the world, primarily for fur farming. Nutria are often confused with beavers or muskrats; however, nutria are much smaller than the beaver and much larger than the muskrat. Nutria have a thin, rounded, and pointed tail; beavers have a broad, horizontally flattened tail and muskrats have a vertically flattened tail. Nutria's hind legs are much longer than the front legs, giving the species a hunched appearance when on land. Nutria's prominent incisors are yellow to dark orange (LeBlanc 1994). Factsheets (USDA 2010) with additional information are provided in Appendix B.

Nutria are large rodents and average 12 pounds (5.4 kg). Males can grow to 20 pounds (9 kg) and females grow to 18 pounds (8 kg). Mature adults measure 2 feet (0.6 meters) in length (LeBlanc 1994). Nutria are almost entirely herbivorous and eat animal material incidentally when they feed on plants. Nutria consume a large variety of aquatic, semi-aquatic, and terrestrial plants including agricultural crops, lawn grasses, and ornamental plants.

Nutria have a very high reproductive potential; they are polygamous, breed throughout the year, and can produce up to three litters per year. Litter size varies between 2 and 11 and the gestation period is only four months. The young are precocial, leaving the nest or burrow and feeding on

solids within one day of birth. Sexual maturity is reached at approximately six months (VFWIS 2013b).

The nutria in Virginia originated from releases in Dorchester County, Maryland in 1943 to establish an experimental fur station at the Blackwater National Wildlife Refuge (Maryland Sea Grant 2013). By 1998, the nutria population in the refuge had increased to 50,000. Initiated in 2002, the Chesapeake Bay Nutria Eradication Project has reduced nutria populations to near zero on 150,000 wetland acres (USFWS 2012).

The first record of nutria in Virginia was in 1956. Coordinated nutria monitoring efforts in Virginia began in 2012 and populations are believed to be limited to the southeast corner of the state. Recent data by VDGIF indicate that nutria numbers and distribution appear to be increasing and the threat to Virginia wetlands may be increasing (VDGIF 2012).

Nutria are capable of carrying diseases, pathogens, and infections. Nutria are susceptible to rabies, equine encephalomyelitis, paratyphoid, salmonellosis, papillomatosis, leptospirosis, toxoplasmosis, richettsia, coccidiosis, and sarcoporidiosis. Nutria also host a wide variety of internal and external parasites (Sheffels and Sytsma 2007). Pathogens and parasites can be transmitted to humans, livestock, and pets (LeBlanc 1994).

Damage to vegetation and crops; banks of ditches, lakes, and other water bodies; and vegetation destruction in marshes and other wetlands caused by nutria are a direct result of feeding and burrowing. Nutria have caused widespread ecosystem changes by decimating native plants that hold marsh soils together and support the survival of native wildlife species. Burrowing is the most commonly reported damage caused by nutria. Burrows can weaken roadbeds, ditches, stream banks, dams, and dikes, which could collapse when the soil is saturated or when subjected to the weight of heavy equipment (USDA 2010). The subsequent damage from nutria burrowing activity has the potential to adversely impact water management and drainage efforts.

Adverse impacts on biodiversity by nutria foraging have been documented to directly and indirectly harm native flora and fauna (Sheffels and Sytsma 2007). Where at-risk species occur and there is concern for potential listing and designation of critical habitat, nutria presence could only worsen the concern because of their foraging and burrowing activities. The potential for adverse impacts on biodiversity and contributing to species listings ultimately threatens the military mission.

5.0 NUISANCE WILDLIFE AT NASO DNA

As stated earlier, all of the state identified nuisance wildlife occur or have the potential to occur on NASO DNA. However, coyote and nutria were determined to present the greatest threat to the military mission due to their potential impacts on biodiversity, natural ecosystems, water control structures, as well as potential threats to human health and safety. To better understand the distribution and abundance of these two species, field surveys were initiated to provide support to this management plan.

Field surveys for coyote and nutria were conducted between January 16 and February 15, 2013. Prior to the 2013 surveys, there were no formal surveys, inventories, or assessments conducted for nuisance wildlife species on NASO DNA. The nuisance wildlife surveys are summarized in *NASO DNA Nuisance Wildlife Survey: Coyote and Nutria* (Navy 2014). If additional nuisance species are determined to be of interest to the installation, similar studies and reports can be planned and generated to provide support for revisions of this management plan. The coyote and nutria survey results summaries and understanding of these species and threats on NASO DNA is provided in the following sections.

5.1 COYOTE

5.1.1 Survey, Abundance, and Distribution

Eleven remote camera scent stations were installed on NASO DNA to trap (photograph) coyotes to document occurrence and obtain baseline information for future comparisons. Placement of the scent station locations was based on aerial imagery assessments and field evaluations. Stations were placed at locations across the installations and focused on a variety of habitats, as coyote were expected to occur almost anywhere on the installation. Large wetland and inundated areas were avoided. Bait and lure (attractants) were used at each station and cameras were deployed for six camera days (24-hour periods). Two of the 11 cameras recorded at least a single coyote visit during the survey period. Two coyotes were caught on camera and the detection index of 0.035 coyotes per camera night was recorded.

This camera station survey documented presence of the coyote at NASO DNA and provided preliminary and scientific based information on abundance. Similar future studies could allow more inferences on abundance or changes in abundance. In general, the coyote is likely to inhabit almost all areas of the installation and is even likely to venture into developed areas. The coyote is probably no more abundant at NASO DNA than on adjacent lands.

5.1.2 Threats

The coyote is not known currently to present significant threats to the mission or human health and safety at NASO DNA. There are no reports of human/coyote conflicts for this installation; however, the coyote has the potential to be a threat of zoonotic disease transfer to humans and other wildlife, especially if it becomes overabundant. Coyotes are attracted to open areas of airfields and runways where small mammals are often found in greater abundance or carrion may occur as a result of air strikes and vehicle collisions. Conversely, coyotes are top predators and likely provide some level of control of deer, wild turkey, and waterfowl populations that also present air strike hazards. Coyotes will also use open air fields to mark territories and as travel

lanes between habitats. Coyotes may den within dry culverts or within constructed embankments within or nearby airfields and golf courses. BirdStrike.org reports that over 1,030 civil aircraft collisions with deer and 400 collisions with coyotes were reported in the United States, 1990-2012.

KEEP THE WILD IN WILDLIFE
ENCOURAGE COYOTE AVOIDANCE BEHAVIOR OF HUMANS (VDGIF)

Coyotes are wary creatures and are usually not aggressive toward humans except when humans attempt to feed or interact with them. Approaching any wildlife may provoke an attack if the animal feels threatened. Before confronting a coyote near a residence or any other human living space, be sure there is a safe position for escape in the event there is an unlikely attack and then scare off the animal by practicable means. Although there are very few recorded instances of coyotes attacking humans in the United States, coyotes that have contracted rabies may attack humans without warning. The possibility of an attack should always be considered for any close encounter with a coyote.

Coyotes typically hunt small mammals (i.e., mice, voles, and rabbits), but they will also make a meal of a pet cat if given the opportunity. Coyotes are medium-sized carnivores that are very territorial in nature, and generally will not tolerate other dogs in their territories, especially when coyotes are caring for their young between March and August. The territorial nature of coyotes poses a real risk to small, free-roaming dogs and cats. Dogs (especially small dogs) should be restrained on a leash when walking them outdoors. Pets are also vulnerable to attacks by coyotes when tethered outside; therefore, outdoor pets should be kept in a coyote-proof enclosure (7-foot high fence with outward slanting overhang) to prevent coyotes from attacking and killing a pet animal.

5.1.3 Current Management

Under the Code of Virginia (Title 4 VAC 15-20-160) the coyote is a nuisance species and may be killed at any time and in any manner allowed by law. According to VDGIF regulations, no hunting license is required to shoot nuisance wildlife. Under Virginia law, nuisance wildlife species can be killed at any time and in any manner that is legal under state and local laws. The Navy obtains a Kill Permit from VDGIF to be able to take coyote on NASO DNA any day of the year due to human health and safety concerns. However, for recreational trapping a trapping license is required to take coyote by legal trapping methods. It is not legal to live-trap nuisance wildlife and move them to another location. Hunting and trapping are permitted on NASO DNA; these recreational activities could contribute to control efforts for coyotes. An average of 425 hunting permits is sold each year for NAS Oceana, NAS Oceana Dam Neck Annex, Naval Auxiliary Landing Field Fentress, and Naval Support Activity Hampton Roads Northwest Annex.

5.2 NUTRIA

5.2.1 Survey, Abundance, and Distribution

Surveys were conducted to identify the available habitats for nutria on NASO DNA. Biologists reviewed aerial photography and other remote sensing data, coordinated with local experts from the USDA, and searched the available habitats for nutria and nutria field sign to assess

occupancy. A 50-foot (15-meter) buffer was added to streams and a 25-foot (7.6-meter) buffer was added to ditches to create polygons of potential habitat. Areas not considered to be viable habitat by the USDA experts were removed from the draft potential habitat map.

Approximately 286 ac (115 ha) of potential habitat were field surveyed to verify its designation as habitat and investigate nutria occupancy. All potential habitats were searched by biologists walking throughout the areas for nutria, tracks, scat, slides, and eat-out areas. Following the field surveys and further coordination with the USDA experts, 88 ac (25 ha) of potential nutria habitat was identified on NASO DNA. Nutria were observed on the installation, tracks were observed at several locations, and potential den sites were found along ditch banks. The data indicate that low numbers of nutria could be present. Future surveys in the designated habitat areas could be used to determine changes in the occurrence of nutria and level of potential habitat on NASO DNA.

5.2.2 Threats

The nutria is not currently known to present significant threats to the mission or human health and safety because of the low-level population that likely exist on NASO DNA. Although the data indicate the presence of low numbers, nutria could soon become a nuisance on NASO DNA and require management for control because of their high reproductive potential. They are associated with the destruction of stormwater control ditches that keep the installation from flooding. The damage to the ditches poses a mission loss because flooded areas have to be closed during flood events.

Nutria pose a general threat to the environment because of their foraging and burrowing habitats in wetlands, drainage ways, and croplands. Nutria can cause widespread ecosystem changes because of their destructive habits and in some areas the loss of soils and vegetation has caused permanent damage to ecosystems (USFWS 2012). The loss of vegetation increases erosion and reduces critical habitat for many species, including sensitive plant species, shorebirds, and waterfowl (Chesapeake Bay Nutria Working Group 2003).

Nutria can be infected with the bacterial disease tularemia, which can be transmitted to humans. Nutria droppings may contaminate water with giardia and cause infections when contaminated water is ingested. These infections cause flu-like symptoms in humans. Anyone handling a nutria should wear rubber gloves, and wash their hands well when finished.

5.2.3 Current Management

As a nuisance species (Title 4VAC15-20-160), nutria can be trapped year round for eradication. A trapping license is required for recreational trapping. As previously mentioned, it is not legal to live-trap nuisance wildlife and move them to another location. Nutria can also be taken by use of a firearm or other weapon at any time (except on Sunday). The NASO DNA INRMP lists the nutria as a nuisance species for management due to their non-native and invasive status. Shooting is recommended in the INRMP as the most effective method of control. Hunting and trapping are permitted on NASO DNA and these recreational activities could contribute to control efforts for nutria.

6.0 NUISANCE WILDLIFE MANAGEMENT

6.1 COYOTE

Prior to this plan, there was no plan for coyote management other than the general guidelines provided with the INRMP for nuisance wildlife control. The cited survey conducted in 2013 and this plan's attention to this species are due to its known presence and potential to quickly become problematic for the installation if disease or overabundance creates conflict with natural fauna or the military mission. As a result of the current condition, this plan focuses on treatment of individual incidents and provides guidance for the continuation of monitoring and additional studies to expand the coyote knowledge base.

6.1.1 Incidents/Encounters

All coyote encounters that are determined to be a threat or were reported as potential threat to installation personnel, visitors, or pets will be reported to the installation NRM. The report will include the location, the number of coyotes, and a description of the encounter or threat. The report should express the desire of the person (s) to have the situation resolved. Repeated incidents or problematic individual or groups of coyotes posing a non-immediate threat will each be evaluated by the NRM. The manager will develop a plan of action that may include passive actions (e.g., keep pets inside, habitat management) or more direct actions such as the removal of the coyote or group. If removal is warranted, the section below outlines the method for conducting such removal. Immediate threats to humans and pets will be handled by installation law enforcement officers at their discretion and reported to the NRM. Simple sightings of coyotes are not reportable incidents or encounters; a sighting must be accompanied by some sense of abnormal behavior or threat to safety.

6.1.2 Natural Fauna Conflicts

The impact of coyote on natural fauna, and therefore ecosystem health and biodiversity is unknown for NASO DNA. However, the coyote is native to the area and should be considered a natural predator and efforts to reduce or control the population should only be implemented if warranted. In a review of the effects of coyote control on their prey, Henke (1995) concluded that coyotes are often removed from an area because of their predatory nature, regardless of the effect such removal may have on the ecosystem. Questions to consider before concluding coyote removal is warranted include (1) will coyote control produce the desired effects, (2) would the increase in desired fauna expected as a result of coyote control be within the habitat carrying capacity, and (3) would coyote mortality be replaced with other mortality factors acting in a compensatory manner.

Coyotes are described as a keystone species (i.e., their presence effects other species around them). Coyotes tend to kill or exclude foxes from their territories and may subsequently limit fox population abundance. Studies have concluded that foxes are not eliminated but just become less common where coyotes occur. The coyote may indirectly benefit ground-nesting birds, by reducing ground-nest predators. In this way, coyotes help to maintain balance in the food web below and around them. Future study could focus on overabundance impacts on sensitive or

game species and/or consideration of its temporary control of sensitive or game species restoration opportunities (e.g., dismal swamp southeastern shrew, bobwhite quail).

6.1.3 Removal/Control

If the NRM determines that a removal action should be undertaken for population control, the manager will contact the USDA-APHIS–WS with the request. This will open the consultation phase and the NRM and WS will determine the best course of action to handle the removal attempt. There are several removal methods available including toxicants, trapping, and shooting (see Appendix B fact sheets for additional information). The selected method(s) will need to be adapted to the situation and left to the WS professionals or installation safety officers to implement. The NRM takes action for the removal of the occasional nuisance or sick animal call.

All coyotes that are taken, that area suspected of rabies will be tested for rabies. The NRM after review of the incident/encounter reports will determine if the rabies test is warranted and provide the direction to test to WS personnel. Any animal that is suspected to be sick or behaving abnormally (without obvious issues, such as a broken leg) should be tested. In addition, any coyotes taken or found dead that exhibit disease will be reported to the NRM. The NRM will provide direction on the need for a necropsy to WS personnel.

6.1.4 Habitat

Habitat management against the coyote is not practicable because the opportunistic nature of its foraging habits facilitates its occurrence in all habitat types. Eliminating brushy areas, dense thickets, and similar areas around residences, airfields, and facilities that coyotes may use as cover or foraging sites could be the focus of habitat management. However, these habitats also provide food and cover for many native species, so these efforts to reduce habitat should only be considered as responsive action rather than a proactive action. The NRM should coordinate with Public Works Department personnel responsible for grounds maintenance to eliminate habitats if it is determined to be the desired management action.

6.1.5 Survey

The 2013 nuisance wildlife survey for coyote provided an index of coyote abundance and should be replicated to determine changes in the occurrence of coyotes (Navy 2014). The cameras should be deployed in the station locations that were used in 2013 for consistency and trend analysis. In addition, consistent tracking of data on coyotes and incident/encounters reported under implementation of this plan should provide additional insights on coyote abundance and better quantify the nuisance level.

6.2 NUTRIA

Other than the general guidelines provided in the INRMP for nuisance wildlife control, this plan provides the only guidance for nutria management on NASO DNA. This plan provides guidance for the continuation of monitoring and additional studies to expand the nutria knowledge base.

6.2.1 Removal/Control

The NRM should be notified upon first observance of a nutria(s) on the installation. Removal of all nutria is warranted because of their invasiveness and damage potential. Natural resources personnel will document the recommendations for removal. If the NRM determines that a removal action should be undertaken, the NRM will contact the USDA-APHIS-WS with the request. This will open the consultation phase and NRM and WS will determine the best course of action to handle the removal attempt. There are several removal methods available including toxicants, trapping, and shooting (see Appendix B fact sheets for additional information). The selected method(s) will need to be adapted to the situation and implemented by the WS professionals.

6.2.2 Habitat

Nutria use a wide variety of habitats including farm ponds and other freshwater impoundments, drainage canals, rivers and bayous, freshwater and brackish marshes, swamps, and combinations of various wetland types. Freshwater marshes are the preferred habitat. Nutria do not use well-drained land that is free of dense, weedy vegetation. Eliminating brush, weeds, and thickets adjacent to ditches, drainages, and waterways to reduce food and cover will discourage nutria use. Drainages that retain water may be used by nutrias as travel routes; eliminating standing water and ensuring positive drainage will reduce their attractiveness. Nutria prefer to burrow on steep slopes to allow tunneling upward for establishing the den site above the water level. Den entrances may be located at or below the water level. They can be discouraged by keeping side slopes to a 3:1 or less ratio, and by controlling vegetation growth (i.e., routine mowing). Contouring bank slopes at less than 45° will discourage borrowing.

6.2.3 Survey

The 2013 nuisance wildlife survey for nutria confirmed the presence of nutria and should be replicated to determine changes in the occurrence of nutria. The potential habitats identified in 2013 should be surveyed using the same procedures for consistency and trend analysis. In addition to replicating the survey conducted in the winter of 2013, field surveys should be conducted in spring, summer, and fall to gather information on reproduction (observations of young of the year).

6.3 PROJECT IMPLEMENTATION

General guidelines to help reduce the potential for nuisance wildlife problems on NASO DNA are listed below.

1. Do not feed coyotes.
2. Secure garbage receptacles to avoid providing a potential food supply.
3. Conduct scheduled inspections of facilities to minimize nuisance wildlife entry.
4. Do not leave unconsumed pet food outdoors.
5. Remove or clean-up bird feeders if nuisance wildlife are attracted to the area.
6. Clear brushy areas around residences and facilities to reduce hiding and foraging cover.
7. Periodically inspect the major drainage ditches for nutria sign.
8. Contact the NRM to evaluate all nuisance wildlife concerns.

Environmental program priorities for control of nuisance wildlife are defined using environmental readiness levels (ERL) as specified in OPNAVINST 5090.1D, M-5090.1 and recurring or non-recurring natural resources management requirements as specified in the Department of Defense Instruction 4715.03, *Natural Resources Conservation Program*. Recognition of the potential for nuisance wildlife to threaten human health and safety or the military mission and determination that management action is necessary meet the ERL 4 funding priority and also contribute to investments in environmental leadership and general proactive environmental stewardship. The designation of enhancement actions beyond compliance for non-recurring natural resources management requirements is consistent with implementation of management actions to prevent nuisance wildlife from becoming a threat to NASO DNA military mission and operations. Table 1 provides the project implementation schedule for nuisance wildlife control on NASO DNA.

Table 1. Project Implementation Schedule.

Project No.	Project Description	Schedule
1	Distribute the USDA-APHIS–WS factsheets (Appendix B) on coyote and nutria to raise environmental awareness of nuisance wildlife on NASO DNA.	Recurring bi-annually, 2 times/year (Earth Day event and beginning of hunting season)
2	Conduct reconnaissance inspections of housing and facilities areas to look for incorrectly secured garbage receptacles that could become a food source for nuisance wildlife. Report corrective actions required to the Regional Environmental Program Manager.	Recurring bi-monthly, 6 times/year
3	Conduct reconnaissance inspections of housing and facilities areas to look for required actions to clear brush that could provide hiding and foraging cover for nuisance wildlife. Report corrective actions required to the Regional Environmental Program Manager.	Recurring bi-monthly, 6 times/year
4	Conduct reconnaissance inspections of roadsides and trails to look for evidence of coyote tracks and dens for early detection and rapid response. Report corrective actions required to the Regional Environmental Program Manager. Coyotes may dig their own den or enlarge another animals den to the size that would accommodate a medium-sized dog.	Recurring bi-monthly, 6 times/year
5	Conduct reconnaissance inspections of major drainage ditches to look for evidence of nutria burrowing activity	Recurring bi-monthly,

Project No.	Project Description	Schedule
	and denning as a means of early detection and rapid response. Report corrective actions required to the Regional Environmental Program Manager.	6 times/year
6	Replicate the 2013 nuisance wildlife surveys and expand the survey period seasonally to assess occurrences and determine the need for control of coyotes and nutrias. Report corrective actions required to the Regional Environmental Program Manager.	Recurring bi-annually, every other year

7.0 EDUCATION, TRAINING, AND PUBLIC OUTREACH

Public perception is an important consideration in management for nuisance wildlife problems. Misinformation leads to implementation of inappropriate management actions and unintended outcomes. Dissemination of current and factual information on the extent of nuisance wildlife problems is key to successful implementation of nuisance wildlife management. The following considerations for stakeholder coordination and public involvement provide the NRM opportunities to promote education, training, and public outreach for nuisance wildlife management on NASO DNA.

7.1 STAKEHOLDER COORDINATION

In 2011, the Mid-Atlantic Panel on Aquatic Invasive Species and the Virginia Tech Conservation Management Institute funded a collaborative project in Virginia to examine the expanding nutria population and to initiate the process of developing and implementing an eradication strategy. A steering committee of representatives from state and federal agencies has been formed to coordinate detection and response actions, maintain databases and records of nutria sightings, and prioritize future collaborations. The Virginia point of contact is Ray Fernald, 804-367-8364, Ray.Fernald@dgif.virginia.gov. Additional information on the Mid-Atlantic Panel on Aquatic Invasive Species is available at <http://www.midatlanticpanel.org/>.

Cooperation and coordination with external stakeholders is an integral part of the Navy's natural resources program. The NRM should coordinate annually with VDGIF and USDA-APHIS–WS for current information regarding nuisance wildlife management. The Virginia Wildlife Services point of contact is David Allaben, 804-739-7739, david.j.allaben@aphis.usda.gov. Additional information on nuisance wildlife assistance is available at http://www.aphis.usda.gov/wildlife_damage/state_office/virginia_info.shtml. In addition, the NRM should coordinate with the VDGIF and USDA-APHIS–WS stakeholders prior to any determination to conduct nuisance wildlife management actions on NASO DNA.

7.2 eMAMMAL

eMammal (<http://emammal.wordpress.com/author/emammal/>) is a project where citizen scientists work in collaboration with researchers at the Smithsonian Institution and North Carolina State University to document mammals throughout the mid-Atlantic region. Citizen volunteers place “camera traps”, infrared activated cameras, across the landscape in parks and other natural areas to collect photos of mammals. These photos help researchers answer questions about mammal distribution and abundance and use this information for conservation. The Smithsonian Institution presents projects that have used camera traps for conservation at <http://siwild.si.edu/about.cfm>. The NRM could use eMammal to promote volunteerism in natural resources and as an additional means of increasing environmental awareness of nuisance wildlife concerns on NASO DNA.

1. Purpose. To prescribe procedures and assign responsibility for management and control of fish and wildlife, feral animals, invasive species, and certain pests within Commander, Navy Region, Mid-Atlantic (COMNAVREG MIDLANT) Area of Responsibility (AOR). This includes the areas of Naval Weapons Station (WPNSTA), Yorktown (including Cheatham Annex); Naval Air Station (NAS), Oceana (including Naval Auxiliary Landing Field [NALF] Fentress, Camp Pendleton, and Dam Neck Annex); Naval Station (NAVSTA), Norfolk (including St. Julien's Creek Annex and St. Helena Annex); Naval Support Activity (NAVSUPACT), Norfolk (including Northwest Annex); Naval Amphibious Base (NAVPHIBASE), Little Creek; Fleet and Industrial Supply Center (FISC), Norfolk (Craney Island Fuel Depot and Yorktown Fuel Terminal); and Norfolk Naval Shipyard (NAVSHIPYD Norfolk), Portsmouth, VA (only New Gosport Annex, Scott Center Annex, and South Gate Annex).

2. Policy

a. Per references (a) through (c), the Navy is authorized to take measures to control invasive species.

b. References (d) through (g), the Lacey, Migratory Bird Treaty, Eagle Protection, and Marine Mammal Protection Acts, respectively, protect designated wildlife and control activity involving protected wildlife parts. Violations of these statutes may result in criminal prosecution. Regulations contained in references (h) and (i) implement reference (e) and list species protected by Federal law. Reference (j) describes government responsibility for preventing injury and diseases from animals.

12 MAR 2003

3. Definitions

a. Per reference (a), an "invasive species" is a species that is non-native (or alien to the ecosystem under consideration), and whose introduction causes, or is likely to cause harm to economic, environmental, or human health.

b. Per reference (e), "take" means to pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to pursue, hunt, shoot, wound, kill, trap, capture, or collect.

c. Per reference (c), "pest" refers to any organism (except for microorganisms that cause human or animal diseases) that adversely affects the well-being of humans or animals, attacks real property, supplies, equipment or vegetation, or is otherwise undesirable.

d. Per reference (j), "feral" refers to wild animals and unowned dogs, cats, or other domestic animals.

4. Responsibilities

a. Regional Engineer. The Commanding Officer, Navy Public Works Center/Regional Engineer (PWC/RE), Norfolk, as the Regional Environmental Program Manager, is responsible for management and control of, and for providing services pertaining to, fish and wildlife, feral animals, invasive species, and pests. On behalf of COMNAVREG MIDLANT, the Regional Engineer obtains natural resources permits required by Federal law to carry out this program. Regional Engineer authority, in natural resources matters, may be sub-delegated to a properly trained Regional Natural Resources Program Manager, under the supervision of the Regional Environmental Group Head.

(1) Environmental Services Desk. The PWC/RE Environmental Group provides pest management services through the Environmental Services Department. In addition, the Environmental Services Department responds to routine service calls for removal of non-migratory birds and control of feral animals. These services may be requested through the Environmental Services Desk at (757) 444-7528 during working hours and (757) 444-3477 after hours. Requests for services involving animals, such as sea turtles, marine mammals, game animals and migratory birds or raptors, not under the purview of the Environmental Services Department, will be referred by Service Desk personnel to Natural Resources Managers.

(2) Natural Resources Specialists. Under the direction of the Regional Natural Resources Program Manager, installation Natural Resource Specialists use integrated management practices and procedures to manage fish and wildlife and control certain feral, nuisance and invasive species. Per reference (k), Natural Resources personnel also develop and execute depredation and

1 2 MAR 2003

dispersal procedures for Bird Animal/Aircraft Strike Hazard (BASH) purposes, and personally supervise these activities when lethal methods are required. Natural Resources Managers, and all other PWC/RE personnel involved in lethal control activities, must be properly trained and duly certified for all weapons employed in accordance with applicable regulations. These personnel are located in Storefront Compliance Departments of the Regional Environmental Group. Natural Resources personnel will also identify bird and/or other animal remains associated with aircraft mishaps in accordance with reference (k).

(3) Conservation Officers. Under the direction of Natural Resources Managers, Conservation Officers enforce fish and wildlife and other natural resources laws and regulations. They may conduct field inspections and employ approved control methods for certain species. Control measures include, but are not limited to, live trapping, relocation, and lethal methods. Conservation Officers also perform wildlife forensic investigations and respond to wildlife damage complaints.

(4) Regional Natural Resources Managers. Regional natural resources managers shall:

(a) Provide direction to natural resources managers and game wardens regarding the management of fish and wildlife and the control of feral animals, invasive species, and pests.

(b) Ensure appropriate approval and procedures are in place to properly issue, store, carry, and use firearms.

(c) Ensure the natural resource manager and game warden weapons qualifications cards are certified and remain current.

(d) Coordinate with local and regional security for required range time, qualifications, and DoD training as needed.

b. NAVSHIPYD Norfolk. Pest control services for NAVSHIPYD Norfolk are currently provided through government contract; these services may be requested through LANTNAVFACENCOM at (757) 396-5121, extension 200.

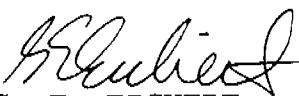

c. Security Officers. Security Officers respond to emergency wildlife complaints and requests for services. Security Officers are an after-hours emergency contact point for Natural Resources Managers, Conservation Officers, and pest management personnel. Within existing resources and according to established training priorities, Security Officers also assist Natural Resources personnel in obtaining required weapons qualifications.

12 MAR 2003

d. Airfield Facilities Division Officer. All bird/animal strikes should be investigated and reported in accordance with reference (k). Animal remains will be collected by the Airfield Facilities Division Officer and placed in appropriate BASH freezers located in Building 102 at NAS Oceana and LP-167 at Chambers Field, NAVSTA Norfolk.

e. Aviation Squadrons. All bird strikes must be reported in accordance with reference (k). Airfield Facilities or Natural Resources should be immediately contacted following any strike to ensure bird/animal remains are collected and identified.

5. Review. The Regional Natural Resources Program Manager is responsible for review and update of this instruction.

Coyotes in Towns and Suburbs

Wildlife Services (WS), a program of the U.S. Department of Agriculture's (USDA) Animal and Plant Health Inspection Service (APHIS), provides Federal leadership and expertise to resolve wildlife conflicts that threaten the Nation's agricultural and natural resources, human health and safety, and property.

As coyotes have become more common in urban and suburban settings, WS has received increased calls in every State to address coyote-related damage. Often the damage is linked to human activity that attracts the animals. WS can assist with problems using an integrated approach.

Historically, coyotes were most commonly found on the Great Plains of North America. Their range now extends from Central America to the Arctic. Except for Hawaii, coyotes live in all of the United States, Canada, and Mexico. More coyotes exist today than when the U.S. Constitution was signed.

Almost no animal in America is more adaptable to changing conditions than the coyote. Coyotes can live just about anywhere. They are found in deserts, swamps, tundra, grasslands, brush, and dense forests, from below sea level to high mountains. They have also learned to live in suburbs and cities like Denver, Los Angeles, New York, and Phoenix.

One of the keys to the coyote's success is its diet. A true scavenger, the coyote will eat just about anything. Identified as a killer of sheep, poultry, and deer, the coyote will also eat snakes and foxes, doughnuts and sandwiches, rodents and rabbits, fruits and vegetables, birds, frogs, grass and grasshoppers, pet cats and cat food, pet dogs and dog food, carrion, and just plain garbage.

Coyotes are active mainly during the night, but they can also move about during the day. Most sightings of coyotes occur during the hours close to sunrise and sunset.

Adult coyotes weigh between 20 and 45 pounds. Females are generally smaller than males, and western coyotes are generally smaller than eastern coyotes.

Coyotes look like small collie dogs. They have erect pointed ears, slender muzzle, and a bushy tail. Most coyotes are brownish gray in color with a light gray to cream-colored belly. However, a coyote's color varies and may be somewhat darker or lighter depending upon the geographic region and the time of year. Most coyotes have dark or black hairs over their back and tail.

Coyotes quickly learn not to fear humans and develop a dependency on easy food sources.

A high reproductive rate and the rapid growth of its offspring also aid in the coyote's success. Coyotes breed in February and March, and pups are born about 60 days later. During this time, territorial male coyotes do not tolerate other canines in their territory; many conflicts between coyotes and domestic dogs result from this territorial behavior. An average coyote litter contains four or five pups, born in dens. In urban environments, dens can be in storm drains, under storage sheds, in holes dug in vacant lots, parks, or golf courses, or any other dark, dry place.

Coyote pups are cared for, fed, and protected by both parents. The pups mature quickly and can eat meat and move about well by the time they are a month old. By 6 months, pups have permanent teeth and are taught to hunt for food. During this time of pup rearing, the amount of food that coyotes hunt and eat increase significantly. As a result, conflicts between coyotes and humans are common. It is not unusual to observe a family of coyotes traveling through urbanized areas such as parks or golf courses. If food is deliberately or inadvertently provided by people, the pups quickly learn not to fear humans and develop a dependency on easy food sources.

The pups are fully independent at about 9 months, and they disperse. During the next year, these young adults may be seen as nuisances in urban/suburban areas while they seek safe living areas away from established coyote territories. A few pups may stay with the parents, forming family groups as population densities increase or where food is abundant, such as in urbanized areas. Coyotes adapting to an urban environment can become bolder because they are less likely to be harmed and more likely to associate people with an easy and dependable food source.

Urban Area Coyote

Coyotes have learned that small dogs and cats are easy prey. Newspapers across the country have carried stories of coyotes harassing leashed dogs on

walks with their owners in and near parks and golf courses within city limits. Calls to WS for help or information about urban coyotes often pertain to the animals attacking pets, eating garbage, or simply coming too close to houses or people on foot.

Remember, all wild animals are unpredictable and caution is the watchword when they are around. Don't ever put food out to lure them closer. Nearly all wild animal bites occur when people attempt to feed wildlife or treat them like domestic animals.

Here are some steps you can take to reduce the chance of human-coyote conflicts:

- Do not feed coyotes!
- Eliminate sources of water, particularly in dry climates.
- Bird feeders should be positioned so that coyotes cannot get feed. Coyotes are attracted by bread, table scraps, and even seed. They may also be attracted by the birds and rodents that come to feeders.
- Do not discard edible garbage where coyotes can get to it.
- Secure garbage containers and eliminate garbage odors.
- Feed pets indoors whenever possible. Pick up any leftovers if feeding outdoors. Store pet and livestock feed where it is inaccessible to wildlife.
- Trim and clean, near ground level, any shrubbery that provides hiding cover for coyotes or prey.
- Fencing your yard could deter coyotes. The fence should be at least 6 feet high with the bottom extending at least 6 inches below ground level for best results.
- Don't leave small children unattended outside if coyotes have been frequenting the area.
- Don't allow pets to run free. Keep them safely confined and provide secure nighttime housing for them. Walk your dog on a leash and accompany your pet outside, especially at night. Provide secure shelters for poultry, rabbits, and other vulnerable animals.

- Discourage coyotes from frequenting your area. If you start seeing coyotes around your home or property, chase them away by shouting, making loud noises, or throwing rocks.

These steps may decrease the frequency of coyote sightings in your area if practiced continuously. However, coyotes are adaptable to change and are quick to learn new ways of survival. Occasional sightings most likely will continue. By making life for coyotes in your neighborhood more difficult, you will increase the likelihood that they will go somewhere else.

Suburban/Semi-rural

“Hobby farms” and “ranchettes” are more common today than ever before. Many Americans are enjoying a return to the rural lifestyle, living on a few acres and keeping poultry, horses, and other livestock. Many of these new “farmers” and “ranchers” are shocked to discover that coyotes kill and eat pets, poultry, and stock.

WS suggests (and offers technical assistance for) the following nonlethal methods to reduce coyote damage:

- Use net-wire or electric fencing to keep coyotes away from livestock.
- Shorten the length of calving or lambing seasons.
- Confine livestock in a coyote-proof corral at night when coyotes are most likely to attack livestock.
- Use lights above corrals.
- Remove dead livestock so coyotes won't be attracted to scavenge.
- Remove habitats that provide homes to natural prey of coyotes, like rabbits, from lambing and calving areas.
- Use strobe lights and sirens to scare coyotes away.
- Use guard animals, such as dogs, donkeys, and llamas, to protect livestock.

Additional Information

For more information about this and other WS programs contact your WS State office at 1-866-4- USDA-WS (1-866-487-3297) or visit www.aphis.usda/wildlife_damage. WS is not the sole source for wildlife damage management services; these services may be available from private sector providers.

October 2010

Nutria, an Invasive Rodent

Wildlife Services (WS), a program within the U.S. Department of Agriculture's (USDA) Animal and Plant Health Inspection Service (APHIS), provides Federal leadership and expertise to resolve wildlife conflicts that threaten the Nation's agricultural and natural resources, human health and safety, and property.

The increased population and range of invasive species can harm native ecosystems, impact agricultural resources, and increase disease transmission. Under an Executive Order that directs Federal agencies to address invasive species damage, the WS program works to control and prevent damage caused by nutria.

The nutria (*Myocastor coypus*), a large, semi-aquatic rodent native to South America, originally was brought to the United States in 1889 for its fur. When the nutria fur market collapsed in the 1940s, thousands of nutria were released into the wild by ranchers who could no longer afford to feed and house them. Entrepreneurs began selling the herbivores to control noxious weeds. Wildlife agencies further expanded the range of the nutria by introducing the species into new areas of the United States. While the nutria did devour weeds and overabundant vegetation, they also destroyed native aquatic vegetation, crops, and wetland areas.

Recognized in the United States as an invasive wildlife species, nutria have been found in 22 States, and are currently established in 16 States. The nutria's relatively high reproductive rate combined with a lack of population controls have resulted in a proliferation of the species. In many regions they cause severe damage. Nutria are most abundant in the Gulf Coast States, but they also cause problems in other southeastern States and along the Atlantic coast. In addition to damaging vegetation and crops, nutria destroy the banks of ditches, lakes, and other water bodies. Of greatest significance, however, is the permanent damage nutria can cause to marshes and other wetlands.

In these areas, nutria feed on native plants that hold wetland soil together. The destruction of this vegetation intensifies the loss of coastal marshes that has been stimulated by rising sea levels.

Identification

Nutria are approximately 2-feet long, with a large head, short legs and a stout body that appears hump-backed on land. They are dark brown in color, although occasional light-colored and albino animals are observed. Because nutria spend much of their time in the water,

A small bay area along Maryland's Chesapeake Bay shows recovery in the 2 years after invasive nutria were removed by Wildlife Services biologists and specialists.

they are highly adapted for a semi-aquatic existence.

Their hind feet are partially webbed for swimming, and their eyes, ears, and nostrils are set high on their heads, so they can stay above the waterline when swimming. Nutria are excellent swimmers, and valves in their nostrils and mouths seal out water when submerged to swim or feed. When pursued, they can swim long distances underwater, seeing well enough to evade capture. Female nutria have teats located high on their backs so that their young can suckle when floating in the water. From a distance, nutria often are mistaken for beavers and muskrats. All three species are dark brown in color and semi-aquatic with large front teeth that are yellow to orange in color. However, at 15- to 20-pounds for a large adult, nutria are about one-third the size of an adult beaver (45 pounds) and 5 to 8 times larger than an adult muskrat (2–4 pounds).

Additionally, the tails and whiskers of the three species are distinctly different. Beavers have large broad flat tails that they often smack loudly on the water to signal alarm. Muskrats have long narrowly flattened tails that can be seen whipping snake-like behind when swimming the water. Nutria have a heavy, rat-like tail thinly covered in bristly hairs that trails smoothly behind when swimming. In northern climates, nutria often suffer frostbite to their tails and may retain only a stub tail following a cold winter. Another distinguishing characteristic of nutria

are the long (3–5 inch) noticeable white whiskers that protrude from either side of their nose and can be easily seen from a distance. Beaver and musk-

Sometimes mistaken for beaver or muskrat, some characteristics can assist in identifying nutria. These include large front teeth that are yellow to orange in color; a heavy, rat-like tail thinly covered in bristly hairs; and noticeable white whiskers that protrude from either side of their nose and can be easily seen from a distance (USFWS photo).

rat have subtle black whiskers that can only be viewed from very close.

Nutria adapt to a wide variety of habitats but are usually closely associated with water. In the United States, the largest nutria populations are located in freshwater marshes in coastal areas along Gulf Coast States. These regions have an abundance of small trees, shrubs, and vegetation with underwater roots and surface leaves. In these areas, nutria live in farm ponds and other fresh water impoundments, drainage canals, rivers, bayous, freshwater and brackish marshes, and swamps. In cities, they can be found under buildings, in overgrown lots, on golf courses, and in storm drains.

Beaver create lodges from mud and sticks and muskrat create mounded huts from mud and vegetation. Nutria do not create their own shelters from the elements. Nutria sometimes live in burrows; in

Included in the nutria's preferred diet are the roots, rhizomes and tubers of cattails, cordgrass, and bulrush.

marshes they often create flat, nest-like platforms of dead vegetation for feeding, loafing, grooming, and birthing. Sometimes, nutria will burrow into muskrat houses and displace their residents.

Damage

Nutria damage is evident to varying degrees in every area they are found. Burrowing causes the most noticeable damage. Nutria are notorious in Louisiana and Texas for undermining and breaching water-retention levees in flooded fields used to produce rice and crawfish. Nutria burrows also can damage flood-control levees that protect low-lying areas; weaken the foundations of reservoir dams, buildings, and roadbeds; and erode the banks of streams, lakes, and ditches.

Nutria damage, however, is not limited to burrowing. Depredation on crops is well documented.

In the United States, sugarcane and rice are the primary crops damaged by the nutria. Grazing on rice plants can significantly reduce yields, with severe localized loss. Other crops damaged by the nutria include corn, milo, sugar and table beets, alfalfa, wheat, barley, oats, peanuts, various melons, and a variety of vegetables. This depredation can lead to significant losses, especially for small farmers.

The negative impact this invasive species has on native vegetation and associated wetlands is critically important. In Louisiana, some nutria feed on seedling bald cypress with such intensity that the trees cannot survive. Similarly, nutria can severely damage coastal marshes by decimating native plants that hold marsh soils together and support the survival of native wildlife species. The impact of nutria on disappearing marshlands along the Gulf Coast and the Chesapeake Bay in Maryland has been well documented. Nutria have caused widespread ecosystem changes. In some cases, nutria damage to marsh vegetation and soils is so severe that these resources are permanently lost. The

destruction of these marshlands also increases the vulnerability of adjacent upland sites to erosion and flooding during storms.

Nutria also can impact public health and safety. The rodents can serve as hosts for several pathogens, including tuberculosis and septicemia, which can infect people, pets, and livestock. In addition, nutria can carry parasites, such as blood flukes, tapeworms, and liver flukes and a nematode known to cause a rash called “nutria itch.” Many of these organisms—found in nutria feces and urine—can contaminate drinking water supplies and swimming

Highly adapted for a semi-aquatic existence, from a distance, nutria often are mistaken for beavers and muskrats while swimming.

areas.

How Wildlife Services Manages the Damage

WS is authorized by Congress to resolve damage caused by wildlife. A 1997 Executive Order also directs USDA to provide national leadership and oversight in managing invasive species, such as the nutria, in cooperation with other Federal agencies.

When requested, WS provides nutria assistance; WS program specialists work closely with Federal, State, and local governments to develop comprehensive management plans that include

Their eating, digging, rooting, and swimming causes massive erosion, converting healthy marsh and habitat for native species into open water habitat.

provisions for protecting native vegetation, marsh soil, and other natural resources against nutria damage.

Preventive measures should be used whenever possible, especially in areas where nutria damage is common. Habitat management can help reduce rodent numbers by manipulating vegetation and water sources attractive to nutria. Small areas, such as gardens, can be enclosed by partially buried fences. Wire tubes can be used to protect bald cypress and other tree seedlings from nutria damage and bulkheads can be used to deter burrowing into banks. These methods can be expensive to implement and are not always effective or practical.

When damage cannot be resolved by nonlethal measures, WS has the expertise to remove nutria populations in problem areas. Relocation is not a viable option; nutria are an invasive species that threaten both native wildlife species and vegetation. Relocating nutria to a new area just relocates the problem, and can lead to the establishment of new nutria colonies and new damage concerns.

Additional Information

Coexisting with Coyotes

U.S. Fish and Wildlife

If you live in North Carolina, you've probably seen a coyote, or know someone who has.

The animal's unique ability to adapt to a wide range of habitats, including suburban environments, along with rapid human population growth across the state, has led to an increase in sightings. While in most cases coyotes are harmless, people can take steps to prevent conflicts with the animals.

Coyote Quick Facts

Where did coyotes come from?

Coyotes were once found only in the mid-western portion of North America. But as Europeans settled across the country, the subsequent landscape changes, coupled with elimination of wolves, allowed the coyote to expand its range toward the eastern United States. By the 1980s coyotes started to appear in western North Carolina as a result of natural range expansion from our neighboring states. Coyotes are now established in all 100 counties of North Carolina and live in many towns.

National Park Service

What do coyotes look like?

Often described as a "mangy-looking dog," coyotes weigh about 20-45 pounds (similar to a mid-sized dog) with, typically, reddish to dark gray thick fur. They have long slender snouts, a bushy tail and pointed ears.

Do they make noise?

Yes, coyotes howl. While some find it unnerving, this howl serves many purposes, none of which are malicious. If you hear a family of coyotes howling, it is easy to think that the area is overflowing with coyotes. In reality, there are usually only 2-6 coyotes, including the pups.

Will coyotes attack me or my child?

Attacks on people, including children, are extremely rare. Normal coyote behavior is to be curious, but wary, when close to humans. Like other wildlife, they will become bold and habituated if people feed them, either purposely or inadvertently, such as with garbage or outdoor pet food. They rarely contract rabies.

Will coyotes attack my pet?

Possibly. Coyotes view outdoor cats and small unleashed dogs as prey, while larger dogs are viewed as threats to their territory and/or their pups. Coyotes are most likely to confront larger dogs during the mating and pup birthing period, January through June.

What should I do if I see a coyote?

Simply seeing a coyote is not cause for concern. If you see a coyote frequently, you and your neighbors should take steps to prevent conflicts with it and other wildlife.

Preventing Conflicts with Coyotes

To prevent problems with coyotes:

- **Secure garbage** in containers with tight-fitting lids, and take them out in the morning or pick up, not the night before. Coyotes and other wildlife will scavenge trash.
- **Don't feed or try to pet** coyotes. Feeding a coyote rewards it for coming in close proximity to people. Once a coyote becomes habituated, it loses its natural wariness of people and may become bold and aggressive.
- **Protect your pets by keeping them inside**, leashed, or inside a fenced area.
- **Install coyote-proof fencing** around your home to protect unsupervised pets.
- **Feed pets indoors** or remove food when your pet is finished eating outside. Coyotes and other wildlife are attracted to pet food left outdoors.
- **Keep bird-feeder areas clean.** Use bird feeders that keep seed off the ground. Coyotes are attracted to small animals congregating on the ground. If coyotes are frequently seen, remove all feeders.
- **Close off crawl spaces** under sheds and porches. Coyotes and other wildlife may use these spaces for resting and raising young.
- **Cut back brushy edges** in your yard, which provide cover for coyotes.
- Don't be intimidated by a coyote. Maintain its wariness by throwing a small object, such as a tennis ball, at it, making a loud noise or spraying it with a hose. Let it know it is unwelcome near your home.
- **Clear fallen fruit** from around fruit trees.
- **Educate your neighbors.** Your efforts to prevent coyote conflicts will be less effective if some neighbors are still providing foods.
- **Allow hunters or trappers** access to your property, so the local coyote population can be managed. Coyotes avoid areas in which threats are perceived.

National Park Service

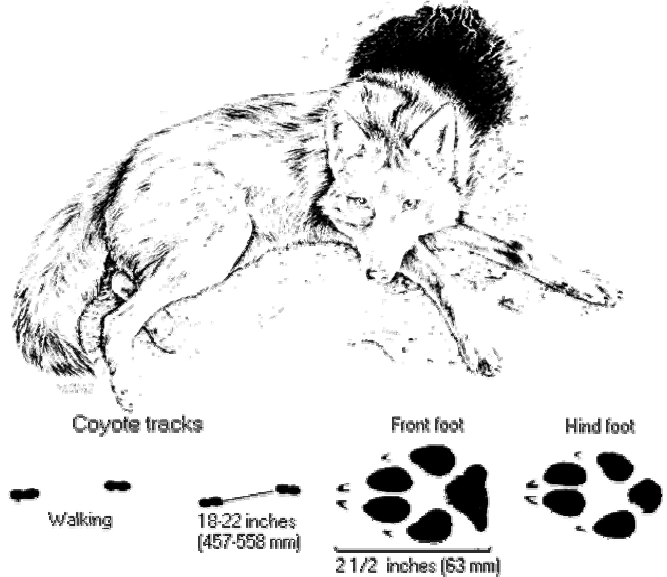

If you already have a problem with a coyote:

- **Implement the non-lethal steps** described above.
- **Contact a Wildlife Damage Control Agent**, a private individual who charges for his/her services. A list is available at www.ncwildlife.org under "Coexisting with Wildlife."
- **Contact a licensed trapper** during the regulated trapping season. See the list at www.ncwildlife.org under "Coexisting with Wildlife."
- **Coyotes can be hunted** year-round using firearms and archery equipment. However, check to see if local ordinances restrict the discharge of firearms. A landowner can shoot a coyote in the act of causing damage.

LIVING WITH THE COYOTE IN VIRGINIA

The coyote population in Virginia continues to become more abundant and is distributed throughout the Commonwealth. To avoid conflicts with coyotes, it is important to understand coyote behavior and to consider the following advice:

❖ **KEEP THE WILD IN WILDLIFE – ENCOURAGE COYOTE AVOIDANCE BEHAVIOR OF HUMANS**

REMOVE ACCESS TO UNNATURAL FOOD SOURCES: Unnatural man-made food sources alter coyote behavior and may result in coyotes becoming tolerant of and dependent on humans. In addition, feeding or unintentionally providing a food source (such as pet food on your porch or in your back yard) over a long period of time may result in coyotes becoming less wary of your presence or actions. **Such behavior may result in coyotes becoming bold and even aggressive towards humans.** If you feed pets in your yard or on your porch, feed only enough food that can be completely consumed by your pet in a short amount of time. Secure garbage cans and lids in order to prevent coyotes from overturning the can for an easy meal.

DEFEND YOUR LIVING SPACE: Tolerating coyotes around your residence may result in coyotes becoming less wary of your presence or actions. **Such behavior may result in coyotes becoming bold and even aggressive around humans.** It is the responsibility of everyone living in a residential community to dissuade coyotes from occupying or using space in areas frequented by humans. When coyotes attempt to extend their living space to include space around your residence, find a safe position that affords you an opportunity to escape an unlikely attack, and yell, throw non-edible objects in the direction of the coyote, or otherwise convey to any “trespassing” animal that it is not welcome in your “space”.

❖ **AVOID COYOTE PREDATORY AND TERRITORIAL BEHAVIOR**

PEOPLE: Approaching any wildlife may provoke an encounter if the animal feels cornered or restricted in movement. This is particularly true of animals that have become accustomed to the presence of humans and their activities as a consequence of being fed, or because of access to a readily available food source such as pet food or refuse in a garbage can or compost pile. **Be aware that coyotes in other eastern states have attacked and severely injured small toddlers when left unattended for even a short period of time. Although the likelihood of such an attack is very remote, never leave small children unattended in areas frequented by coyotes.**

Consider removing habitat that provides protective cover for coyotes and their prey such as small rodents. Modifying such habitat around residential areas will dissuade coyotes from using the space as a part of a territory or home range and will reduce the likelihood of conflicts.

PETS: The territorial nature of predatory coyotes poses a real risk to small, free-roaming dogs and cats. Keep small dogs restrained on a leash when walking them outdoors and avoid walking in areas where coyotes are raising their pups from March – August. **Be aware that there have been a few recorded instances of coyotes attacking small dogs on a leash.**

Small dogs and cats are also vulnerable to attacks by coyotes when tethered outside of your house or even on your porch. Small dogs and cats should be kept in an enclosure when kept outdoors in order to prevent coyotes from attacking and killing a pet animal. **Even though a fence may dissuade coyotes from attacking your pet, be aware that coyotes can jump over fences less than 7-feet high and can climb over taller fencing that does not have an outward slanting overhang.**

LIVESTOCK: Contact the Virginia Department of Agriculture and Consumer Services - USDA Wildlife Services Virginia Cooperative Coyote Damage Control Program at 540-381-7387 to obtain information and assistance on preventing and alleviating coyote damage to livestock or other agricultural products.

COYOTE INFORMATION

HISTORY OF THE COYOTE IN VIRGINIA: The coyote is not a native species of Virginia, and was first observed in the very western regions of the Commonwealth in the early 1950s.

DESCRIPTION: Coyotes are about the size and weight of a medium-sized dog. They generally have longer and thicker hair or fur than a dog. Their long black tipped tail is usually bushy and is pointed downward rather than outward or upward. The fur of the coyote in Virginia can vary from blond, light reddish-brown or tan, grayish black, or black with a small white blaze in the center of the chest. The coyote ears are pointed and erect, and the snout is relatively long and slender. The coyote in the eastern United States is typically larger than coyotes in the western United States. Female coyotes weigh on average 30 – 40 pounds, and male coyotes weigh on average 35 – 45 pounds. Coyotes can weigh as much as 60 pounds.

DISTRIBUTION AND ABUNDANCE: The coyote is distributed throughout the Commonwealth and prefers semi-forested or open farm and pasture lands. Coyote populations in more forested landscapes are generally less abundant and typically exhibit different foraging and social behaviors depending on forest prey species size and abundance. Surveys of hunter harvest of coyotes as well as surveys of hunter observations of coyotes while hunting big game indicate that the coyote population is more abundant in counties west of the Blue Ridge Mountains.

HABITS: Coyotes are elusive and normally avoid humans. They can be active at anytime of day or night, but are more typically observed at dawn and dusk. The coyote communicates by barking, yelping, and howling. Male and female coyotes form a pair bond and establish and defend a territory where they raise 3-12 pups that are born anytime between late March and May. The pups are fed by both the male and female, and sometimes by one or two offspring from a previous litter. The pups may disperse and leave the parents territory anytime after August. However, the parents may tolerate the pups occupying their territory as late February if prey resources are plentiful and large in size (e.g. deer). They remain active and do not hibernate in dens regardless of winter severity. Coyotes will develop a “search image” for a prey type that is more easily scavenged or killed. A coyote’s “search image” includes visual, auditory, and olfactory senses. When the abundance of a specific prey decreases to the point that a coyote is opportunistically finding and consuming more of a different prey resource than it is actually hunting for, the search image of the coyote will change to reflect the more abundant or most easily accessible food resource available in its home range. The habitat and space that the coyote hunts in may also change depending on the type of habitat that the predator is more likely to fill its belly. In situations where wild game is stocked to reestablish populations for hunting, or situations where livestock are raised and maintained throughout the year, coyotes may artificially retain a search image for the artificially abundant game or livestock that also tend to be more vulnerable to predation.

FOOD: The coyote is an opportunistic forager that will consume anything of nutritional value. They do not specialize in hunting and killing only one type of prey, and they will not turn down an easy meal if they happen to stumble onto other prey that they were not hunting for. Consequently, coyotes will prey and scavenge on anything including vegetable matter and fruits, insects, and the meat of wildlife killed or scavenged. Although coyotes generally prey on small rodents, rabbits, birds, snakes and frogs, they will kill larger animals such as big game and livestock during periods when the larger prey are more vulnerable to predation (e.g., turkey on nests; deer fawns in the spring and summer; lambs, kid goats, and newborn calves). The coyote will not pass up a free meal to feed its belly with artificial food resources. They will scavenge exposed garbage or other refuse, and may even kill and consume house cats.

LEGAL STATUS: The coyote is legally classified as a nuisance species and may be killed at anytime, except coyotes may not be killed with a gun, firearm, or other weapon on Sunday.

ECOLOGY: The coyote, a medium sized canid predator, occupies an ecological niche that has been void since the extirpation of wolves from Virginia around the beginning of the 20th century. In addition to inflicting mortality on small as well as large prey species such as beaver, turkey and deer, coyotes tend to kill or exclude red fox from their territories in red fox habitat and may subsequently limit red fox population abundance. The coyote may also indirectly benefit ground-nesting bird species, such as Bobwhite quail, by killing or excluding ground-nest predators such as raccoon, opossum and skunks.

MANAGEMENT: Coyote populations, not unlike all wildlife populations, will continue to grow until their numbers are limited by food availability or space. Unlike most wildlife populations, the reproductive potential of coyotes is such that harvesting coyotes for recreation or fur pelts or other economic incentive will not generally have any impact on limiting or even reducing the abundance of the coyote population. In general, increasing coyote mortality through hunting and trapping will tend to only change the age distribution of the population rather than change pre-whelping population density.

When populations of game species decline, hunters and some game resource managers may sensibly conclude that coyote predation on game is reducing or limiting game populations. Under certain conditions coyote predation has been shown to limit the abundance of big game populations. However, under normal conditions – that is when there is an abundance of game habitat available and the game population has not been decimated by disease or by another catastrophic mortality factor – **predation will rarely limit the population abundance of a game species.** In fact, it is more often the case that overall prey abundance and diversity will dictate the total number of coyotes that can thrive in a given area. If you feel coyotes are reducing big game populations in your area, please obtain a copy of “Coyote Management Strategies to Enhance Big Game Survival” for information on determining if it is necessary and feasible to manage coyote predation in your area.

INTERACTION WITH PETS: Coyotes are medium sized carnivores that are very territorial in nature, and generally will not tolerate other coyotes or dogs trespassing in their territories. This behavior is even more pronounced when coyotes are caring for their young anytime between March and August. For this reason, **coyotes have been known to show aggression and attack or even kill free-roaming small domestic dogs and cats that live within a coyote family’s territory.** Attacks have also been known to occur in the yard or on the porch of houses.

INTERACTION WITH HUMANS: There are very few recorded instances of coyotes attacking humans in the United States. Coyotes that have contracted rabies, as is the case with any domestic animal or wildlife that contracts rabies, may attack humans without warning. However, **there are very few recorded instances of non-rabid coyotes actually attacking humans unprovoked.** In most cases where coyotes act aggressively towards humans, a coyote is responding to the presence of a dog with the human and the aggression occurs within a few hundred yards of a den with pups. In those instances where coyotes have actually attacked humans, coyote populations were very abundant and coyotes were residing and foraging for food in residential areas. In most cases, the attacks occurred on small children, and may have been due to hunger or due to the territorial nature of the coyote to exclude small “animals” from its territory.

Aquatic Invasive Species

in the Chesapeake Bay

A M A R Y L A N D S E A G R A N T B R I E F

Nutria

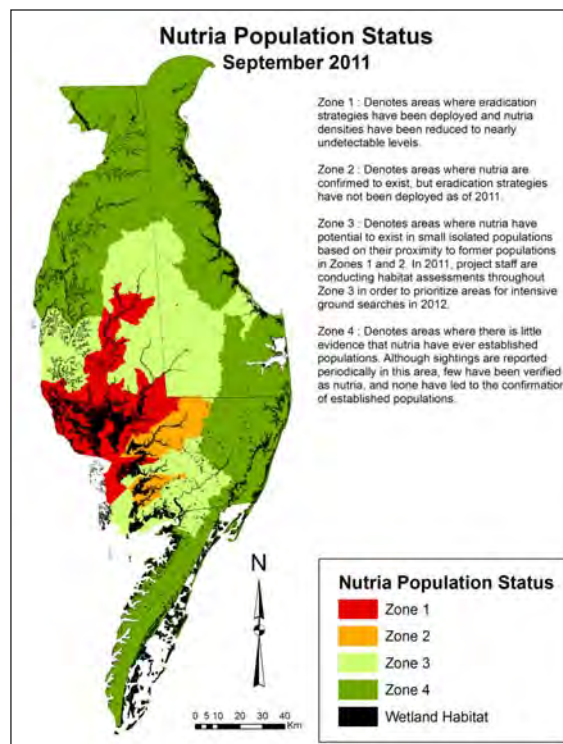

What Are Nutria?

Nutria (*Myocastor coypus*) are prolific aquatic rodents native to South America. They were introduced into the United States during the late 1800s and early 1900s to establish a fur farm industry. However, nutria farming was not successful, and nutria were intentionally released into the wild or translocated to the Southeast to serve as “weed cutters” to control undesirable vegetation.

The species was first introduced into Maryland’s Lower Eastern Shore in 1943 in order to establish an experimental fur station at the Blackwater National Wildlife Refuge. The nutria population in the wildlife refuge increased to approximately 50,000 by the early 1990s.

Why Are They Harmful to the Chesapeake Bay?

Feeding behaviors by nutria are extremely damaging to marsh ecosystems. Nutria can eat 25 percent of their body

weight in a single day. They consume plants by excavating the roots, creating circles of mudflats called “eat outs.” As a result, these areas become highly susceptible to erosion, and the wetlands are quickly converted to open water, removing valuable habitat for native species. Nutria also create deep swimming channels through marshes, fragmenting the area and preventing marsh-dependent species from using all of the available habitat. Over 7,000 acres of marshland in Blackwater National Wildlife Refuge have been destroyed since the introduction of nutria — almost half the refuge’s total acreage.

What Is Being Done to Control Them?

Management efforts to control or eradicate nutria in Maryland began in the late 1980s. They led to the development in 2000 of a three-year pilot program. It brought together state, federal, and private organizations to investigate

and apply the most successful methods. These include sending out teams to track and trap the animals.

In 2002 the Chesapeake Bay Program (CBP), in partnership with Maryland Sea Grant, sponsored a workshop aimed at developing Baywide management strategies for problematic invasive species, including nutria. In 2003 President George W. Bush signed a law that provided \$20 million over five years for nutria eradication in Maryland. The CBP — the partnership of federal and state agencies that oversees Bay restoration efforts — concluded that the nutria populations needed to be eliminated throughout the Chesapeake Bay region, not just in Maryland. The CBP created a Chesapeake Bay Nutria Working Group in 2003 to develop a Baywide management plan, which set a target date of 2009 to eradicate the animals.

What is Their Status?

Management efforts have resulted in substantial progress in controlling the nutria population in the

Chesapeake region. As of 2004, nutria have been completely eradicated from Blackwater National Wildlife Refuge. Intensive surveys conducted throughout the Delmarva Peninsula from 2010 to 2012 indicate that the remaining nutria populations are confined to Maryland's Lower Shore in Wicomico and Somerset Counties, primarily in the Wicomico and Manokin rivers. Eradication efforts continue, and resource managers hope to remove the remaining populations within a few years.

NUTRIA

Fig. 1. Nutria (*Myocastor coypus*)

Damage Prevention and Control Methods

Exclusion

Protect small areas with partially buried fences.

Wire tubes can be used to protect baldcypress or other seedlings but are expensive and difficult to use.

Use sheet metal shields to prevent gnawing on wooden and styrofoam structures and trees near aquatic habitat.

Install bulkheads to deter burrowing into banks.

Cultural Methods and Habitat Modification

Improve drainage to destroy travel lanes.

Manage vegetation to eliminate food and cover.

Contour stream banks to control burrowing.

Plant baldcypress seedlings in the fall to minimize losses.

Restrict farming, building construction, and other "high risk" activities to upland sites away from water to prevent damage.

Manipulate water levels to stress nutria populations.

Frightening

Ineffective.

Repellents

None are registered. None are effective.

Toxicants

Zinc phosphide on carrot or sweet potato baits.

Fumigants

None are registered. None are effective.

Trapping

Commercial harvest by trappers.

Double longspring traps, Nos. 11 and 2, as preferred by trappers and wildlife damage control specialists.

Body-gripping traps, for example, Conibear® Nos. 160-2 and 220-2, and locking snares are most effective when set in trails, den entrances, or culverts.

Live traps should be used when leghold and body-gripping traps cannot be set.

Long-handled dip nets can be used to catch unwary nutria.

Shooting

Effective when environmental conditions force nutria into the open. Night hunting is illegal in many states.

Other Methods

Available control techniques may not be applicable to all damage situations. In these cases, safe and effective methods must be tailored to specific problems.

Animal Damage Control

Great Plains Agricultural Council
Wildlife Committee

Identification

The nutria (*Myocastor coypus*, Fig. 1) is a large, dark-colored, semiaquatic rodent that is native to southern South America. At first glance, a casual observer may misidentify a nutria as either a beaver (*Castor canadensis*) or a muskrat (*Ondatra zibethicus*), especially when it is swimming. This superficial resemblance ends when a more detailed study of the animal is made. Other names used for the nutria include coypu, nutria-rat, South American beaver, Argentine beaver, and swamp beaver.

Nutria are members of the family Myocastoridae. They have short legs and a robust, highly arched body that is approximately 24 inches (61 cm) long. Their round tail is from 13 to 16 inches (33 to 41 cm) long and scantily haired. Males are slightly larger than females; the average weight for each is about 12 pounds (5.4 kg). Males and females may grow to 20 pounds (9.1 kg) and 18 pounds (8.2 kg), respectively.

The dense grayish underfur is overlaid by long, glossy guard hairs that vary in color from dark brown to yellowish brown. The forepaws have four well-developed and clawed toes and one vestigial toe. Four of the five clawed toes on the hind foot are interconnected by webbing; the fifth outer toe is free. The hind legs are much larger than the forelegs. When moving on land, a nutria may drag its chest and appear to hunch its back. Like beavers, nutria have large incisors that are yellow-orange to orange-red on their outer surfaces.

In addition to having webbed hind feet, nutria have several other adaptations to a semiaquatic life. The eyes, ears, and nostrils of nutria are set high on their heads. Additionally, the nostrils and mouth have valves that seal out water while swimming, diving, or feeding underwater. The mammae or teats of the female are located high on the sides, which allows the young to suckle while in the water. When pursued, nutria can swim long distances under water and see well enough to evade capture.

Fig. 2. Range of the nutria introduced in North America.

Range

The original range of nutria was south of the equator in temperate South America. This species has been introduced into other areas, primarily for fur farming, and feral populations can now be found in North America, Europe, the Soviet Union, the Middle East, Africa, and Japan. *M. c. bonariensis* was the primary subspecies of nutria introduced into the United States.

Fur ranchers, hoping to exploit new markets, imported nutria into California, Washington, Oregon, Michigan, New Mexico, Louisiana, Ohio, and Utah between 1899 and 1940. Many of the nutria from these ranches were freed into the wild when the businesses failed in the late 1940s. State and federal agencies and individuals translocated nutria into Alabama, Arkansas, Georgia, Kentucky, Maryland, Mississippi, Oklahoma, Louisiana, and Texas, with the intent that nutria would control undesirable vegetation and enhance trapping opportunities. Nutria were also sold as “weed cutters” to an ignorant public throughout the Southeast. A hurricane in the late 1940s aided dispersal by scattering nutria over wide areas of coastal southwest Louisiana and southeast Texas.

Accidental and intentional releases have led to the establishment of widespread and localized populations of nutria in various wetlands throughout the United States. Feral animals have been reported in at least 40 states and

three Canadian provinces in North America since their introduction. About one-third of these states still have viable populations that are stable or increasing in number. Some of the populations are economically important to the fur industry. Adverse climatic conditions, particularly extreme cold, are probably the main factors limiting range expansion of nutria in North America. Nutria populations in the United States are most dense along the Gulf Coast of Louisiana and Texas (Fig. 2).

Habitat

Nutria adapt to a wide variety of environmental conditions and persist in areas previously claimed to be unsuitable. In the United States, farm ponds and other freshwater impoundments, drainage canals with spoil banks, rivers and bayous, freshwater and brackish marshes, swamps, and combinations of various wetland types can provide a home to nutria. Nutria habitat, in general, is the semiaquatic environment that occurs at the boundary between land and permanent water. This zone usually has an abundance of emergent aquatic vegetation, small trees, and/or shrubs and may be interspersed with small clumps and hillocks of high ground. In the United States, all significant nutria populations are in coastal areas, and freshwater marshes are the preferred habitat.

Food Habits

Nutria are almost entirely herbivorous and eat animal material (mostly insects) incidentally, when they feed on plants. Freshwater mussels and crustaceans are occasionally eaten in some parts of their range. Nutria are opportunistic feeders and eat approximately 25% of their body weight daily. They prefer several small meals to one large meal.

The succulent, basal portions of plants are preferred as food, but nutria also eat entire plants or several different parts of a plant. Roots, rhizomes, and tubers are especially important during winter. Important food plants in the

United States include cordgrasses (*Spartina* spp.), bulrushes (*Scirpus* spp.), spikerushes (*Eleocharis* spp.), chaffflower (*Alternanthera* spp.), pickleweeds (*Pontederia* spp.), cattails (*Typha* spp.), arrowheads (*Sagittaria* spp.), and flatsedges (*Cyperus* spp.). During winter, the bark of trees such as black willow (*Salix nigra*) and baldcypress (*Taxodium distichum*) may be eaten. Nutria also eat crops and lawn grasses found adjacent to aquatic habitat.

Because of their dexterous forepaws, nutria can excavate soil and handle very small food items. Food is eaten in the water; on feeding platforms constructed from cut vegetation; at floating stations supported by logs, decaying mats of vegetation, or other debris; in shallow water; or on land. In some areas, the tops of muskrat houses and beaver lodges may also be used as feeding platforms.

General Biology, Reproduction, and Behavior

General Biology

In the wild, most nutria probably live less than 3 years; captive animals, however, may live 15 to 20 years. Predation, disease and parasitism, water level fluctuations, habitat quality, highway traffic, and weather extremes affect mortality. Annual mortality of nutria is between 60% and 80%.

Predators of nutria include humans (through regulated harvest), alligators (*Alligator mississippiensis*), garfish (*Lepisosteus* spp.), bald eagles (*Haliaeetus leucocephalus*), and other birds of prey, turtles, snakes such as the cottonmouth (*Agkistrodon piscivorus*), and several carnivorous mammals.

Nutria densities vary greatly. In Louisiana, autumn densities of about 18 animals per acre (44/ha) have been found in floating freshwater marshes. In Oregon, summer densities in freshwater marshes may be 56 animals per acre (138/ha). Sex ratios range from 0.6 to 1.6 males per female.

In summer, nutria live on the ground in dense vegetation, but at other times of the year they use burrows. Burrows may be those abandoned by other animals such as armadillos (*Dasypus novemcinctus*), beavers, and muskrats, or they may be dug by nutria. Underground burrows are used by individuals or multigenerational family groups.

Burrow entrances are usually located in the vegetated banks of natural and human-made waterways, especially those having a slope greater than 45°. Burrows range from a simple, short tunnel with one entrance to complex systems with several tunnels and entrances at different levels. Tunnels are usually 4 to 6 feet (1.2 to 1.8 m) long; however, lengths of up to 150 feet (46 m) have been recorded. Compartments within the tunnel system are used for resting, feeding, escape from predators and the weather, and other activities. These vary in size, from small ledges that are only 1 foot (0.3 m) across to large family chambers that measure 3 feet (0.9 m) across. The floors of these chambers are above the water line and may be covered with plant debris discarded during feeding and shaped into crude nests.

In addition to using land nests and burrows, nutria often build flattened circular platforms of vegetation in shallow water. Constructed of coarse emergent vegetation, these platforms are used for feeding, loafing, grooming, birthing, and escape, and are often misidentified as muskrat houses. Initially, platforms may be relatively low and inconspicuous; however, as vegetation accumulates, some may attain a height of 3 feet (0.9 m).

Reproduction

Nutria breed in all seasons throughout most of their range, and sexually active individuals are present every month of the year. Reproductive peaks occur in late winter, early summer, and mid-autumn, and may be regulated by prevailing weather conditions.

Under optimal conditions, nutria reach sexual maturity at 4 months of age. Female nutria are polyestrous, and nonpregnant females cycle into estrus

(“heat”) every 2 to 4 weeks. Estrous is maintained for 1 to 4 days in most females. Sexually mature males can breed at any time because sperm is produced throughout the year.

The gestation period for nutria ranges from 130 to 132 days. A postpartum estrus occurs within 48 hours after birth and most females probably breed again during that time.

Litters average 4 to 5 young, with a range of 1 to 13. Litter sizes are generally smaller during winter, in suboptimal habitats, and for young females. Females often abort or assimilate embryos in response to adverse environmental conditions.

Young are precocial and are born fully furred and active. They weigh approximately 8 ounces (227 g) at birth and can swim and eat vegetation shortly thereafter. Young normally suckle for 7 to 8 weeks until they are weaned.

Behavior

Nutria tend to be crepuscular and nocturnal, with the start and end of activity periods coinciding with sunset and sunrise, respectively. Peak activity occurs near midnight. When food is abundant, nutria rest and groom during the day and feed at night. When food is limited, daytime feeding increases, especially in wetlands free from frequent disturbance.

Nutria generally occupy a small area throughout their lives. In Louisiana, the home range of nutria is about 32 acres (13 ha). Daily cruising distances for most nutria are less than 600 feet (183 m), although some individuals may travel much farther. Nutria move most in winter, due to an increased demand for food. Adults usually move farther than young. Seasonal migrations of nutria may also occur. Nutria living in some agricultural areas move in from marshes and swamps when crops are planted and leave after the crops are harvested.

Nutria have relatively poor eyesight and sense danger primarily by hearing. They occasionally test the air for scent. Although they appear to be

clumsy on land, they can move with surprising speed when disturbed. When frightened, nutria head for the nearest water, dive in with a splash, and either swim underwater to protective cover or stay submerged near the bottom for several minutes. When cornered or captured, nutria are aggressive and can inflict serious injury to pets and humans by biting and scratching.

Damage and Damage Identification

Kinds of Damage

Nutria damage has been observed throughout their range. Most damage is from feeding or burrowing. In the United States, most damage occurs along the Gulf Coast of Louisiana and Texas. The numerous natural and human-made waterways that traverse this area are used extensively for travel by nutria.

Burrowing is the most commonly reported damage caused by nutria. Nutria are notorious in Louisiana and Texas for undermining and breaking through water-retaining levees in flooded fields used to produce rice and crawfish. Additionally, nutria burrows sometimes weaken flood control levees that protect low-lying areas. In some cases, tunneling in these levees is so extensive that water will flow unobstructed from one side to the other, necessitating their complete reconstruction.

Nutria sometimes burrow into the styrofoam flotation under boat docks and wharves, causing these structures to lean and sink. They may burrow under buildings, which may lead to uneven settling or failure of the foundations. Burrows can weaken roadbeds, stream banks, dams, and dikes, which may collapse when the soil is saturated by rain or high water or when subjected to the weight of heavy objects on the surface (such as vehicles, farm machinery, or grazing livestock). Rain and wave action can wash out and enlarge collapsed burrows and compound the damage.

Nutria depredation on crops is well documented. In the United States, sugarcane and rice are the primary crops damaged by nutria. Grazing on rice plants can significantly reduce yields, and damage can be locally severe. Sugarcane stalks are often gnawed or cut during the growing season. Often only the basal internodes of cut plants are eaten. Other crops that have been damaged include corn, milo (grain sorghum), sugar and table beets, alfalfa, wheat, barley, oats, peanuts, various melons, and a variety of vegetables from home gardens and truck farms.

Nutria girdle fruit, nut, and shade trees and ornamental shrubs. They also dig up lawns and golf courses when feeding on the tender roots and shoots of sod grasses. Gnawing damage to wooden structures is common. Nutria also gnaw on styrofoam floats used to mark the location of traps in commercial crawfish ponds.

At high densities and under certain adverse environmental conditions, foraging nutria can significantly impact natural plant communities. In Louisiana, nutria often feed on seedling baldcypress and can cause the complete failure of planted or naturally-regenerated stands. Overutilization of emergent marsh plants can damage stands of desirable vegetation used by other wildlife species and aggravate coastal erosion problems by destroying vegetation that holds marsh soils together. Nutria are fond of grassy arrowhead (*Sagittaria platyphylla*) tubers and may destroy stands propagated as food for waterfowl in artificial impoundments.

Nutria can be infected with several pathogens and parasites that can be transmitted to humans, livestock, and pets. The role of nutria, however, in the spread of diseases such as equine encephalomyelitis, leptospirosis, hemorrhagic septicemia (Pasteurellosis), paratyphoid, and salmonellosis is not well documented. They may also host a number of parasites, including the nematodes and blood flukes that cause "swimmer's-itch" or "nutria-itch" (*Strongyloides myopotami* and

Schistosoma mansoni), the protozoan responsible for giardiasis (*Giardia lamblia*), tapeworms (*Taenia* spp.), and common liver flukes (*Fasciola hepatica*). The threat of disease may be an important consideration in some situations, such as when livestock drink from water contaminated by nutria feces and urine.

Damage Identification

The ranges of nutria, beavers, and muskrats overlap in many areas and damage caused by each may be similar in appearance. Therefore, careful examination of sign left at the damage site is necessary to identify the responsible species.

On-site observations of animals and their burrows are the best indicators of the presence of nutria. Crawl outs, slides, trails, and the exposed entrances to burrows often have tracks that can be used to identify the species. The hind foot, which is about 5 inches (13 cm) long, has four webbed toes and a free outer toe. A drag mark left by the tail may be evident between the footprints (Fig. 3).

Droppings may be found floating in the water, along trails, or at feeding sites. These are dark green to almost black in color, cylindrical, and approximately 2 inches (5 cm) long and 1/2 inch (1.3 cm) in diameter. Additionally, each dropping usually has deep, parallel grooves along its entire length (Fig. 4).

Trees girdled by nutria often have no tooth marks, and bark may be peeled from the trunk. The crowns of seedling trees are usually clipped (similar to rabbit [*Sylvilagus* spp.] damage) and discarded along with other woody portions of the plant.

In rice fields, damage caused by nutria, muskrats, and Norway rats (*Rattus norvegicus*) can be confused. Nutria and muskrats damage rice plants by clipping stems at the water line in flooded fields; Norway rats reportedly clip stems above the surface of the water (E. A. Wilson, personal communication).

Fig. 3. Nutria tracks. Note unwebbed outer toe on the hind foot and the tail drag mark between the tracks. The adult hind foot is approximately 5 inches (12.7 cm) long.

Fig. 4. Nutria dropping in relation to a 2-inch (5.1-cm) camera lens cover. Note longitudinal grooves along the length of the dropping.

Legal Status

Nutria are protected as furbearers in some states or localities because they are economically important. Permits may be necessary to control animals that are damaging property. In other areas, nutria have no legal protection and can be taken at any time by any legal means. Consequently, citizens experiencing problems with nutria should be familiar with local wildlife laws and regulations. Complex problems should be handled by professional wildlife damage control specialists who have the necessary permits and expertise to do the job correctly. Your state wildlife agency can provide the names of qualified wildlife damage control specialists and information on pertinent laws and regulations.

Damage Prevention and Control Methods

Preventive measures should be used whenever possible, especially in areas where damage is prevalent. When control is warranted, all available techniques should be considered before a control plan is implemented. The objective of control is to use only those techniques that will stop or alleviate anticipated or ongoing damage or reduce it to tolerable levels. In most cases, successful control will depend on integrating a number of different techniques and methods.

Timing and location of control activities are important factors governing the success or failure of any control project. Control in sugarcane, for example, is best applied during the growing season, after damage has started. At this time, nutria in affected areas are relatively stationary and concentrated in drainages adjacent to fields. Conversely, efforts to protect rice field levees or the shorelines of southern lakes and ponds should be initiated during the winter when animals are mobile and concentrated in major ditches and other large bodies of water.

Nutria are best controlled where they are causing damage or where they are most active. Baiting is sometimes used to concentrate nutria in specific locations where they can be controlled more easily. After the main concentrations of nutria are removed, control efforts should be directed at removing wary individuals.

Exclusion

Fences, walls, and other structures can reduce nutria damage, but high costs usually limit their use. As a general rule, barriers are too expensive to be used to control damage to agricultural crops. Low fences (about 4 feet [1.2 m]) with an apron buried at least 6 inches (15 cm) have been used effectively to exclude nutria from home gardens and lawns. Sheet metal shields can be used to prevent gnawing damage to wooden and styrofoam structures and trees. Barriers constructed of sheet metal can be expensive to erect and unsightly.

Protect baldcypress and other seedlings with hardware cloth tubes around individual plants or wire mesh fencing around the perimeter of a stand. Extensive use of these is neither practical nor cost-effective. Plastic seedling protectors are not effective in controlling damage to baldcypress seedlings because nutria can chew through them.

Sheet piling, bulkheads, and riprap can effectively protect stream banks from burrowing nutria. Installation requires heavy equipment and is expensive. Use is usually restricted to industrial or commercial applications.

Cultural Methods and Habitat Modification

Land that is well-drained and free of dense, weedy vegetation is generally unattractive to nutria. Use of other good farming practices, such as precision land leveling and weed management, can minimize nutria damage in agricultural areas.

Draining and Grading. Any drainage that holds water can be used by nutria as a travel route or home site. Consequently, eliminate standing

water in drainages to reduce their attractiveness to nutria. This may be extremely difficult or impossible to accomplish in low-lying areas near coastal marshes and permanent bodies of water. Higher sites, such as those used for growing sugarcane and other crops, are better suited for this type of management.

On poorly drained soils, contour small ditches to eliminate low spots and sills and enhance rapid drainage. Use precision leveling on well-drained soils to eliminate small ditches that are occasionally used by nutria.

Grading and bulldozing can destroy active burrows in the banks of steep-sided ditches and waterways. In addition, contour bank slopes at less than 45° to discourage new burrowing. Sculpting rice field levees to make them gently sloping is similarly effective. Continued deep plowing of land undermined by nutria can destroy shallow burrow systems and discourage new burrowing activity.

Vegetation Control. Eliminate brush, trees, thickets, and weeds from fence lines and turn rows that are adjacent to ditches, drainages, waterways, and other wetlands to discourage nutria. Burn or remove cleared vegetation from the site. Brush piles left on the ground or in low spots can become ideal summer homes for nutria.

Water Level Manipulation. Many low-lying areas along the Gulf Coast are protected by flood control levees and pumps that can be used to manipulate water levels. By dropping water levels during the summer, stressful drought conditions that cause nutria to concentrate in the remaining aquatic habitat can be simulated, thus increasing competition for food and space, exposure to predators, and emigration to other suitable habitat. Raising water levels in winter will force nutria out of their burrows and expose them to the additional stresses of cold weather. Water level manipulation is expensive to implement and has not yet been proven to be effective. Nevertheless, this method should be considered when a comprehensive nutria control program is being developed.

Other Cultural Methods. Alternate field and garden sites should be considered in areas where nutria damage has occurred on a regular basis. New fields, gardens, and slab-on-grade buildings should be located as far as possible from drainages, waterways, and other water bodies where nutria live.

Late-planted baldcypress seedlings are less susceptible to damage by nutria than those planted in the spring. For this reason, plant unprotected seedlings in the early fall when alternative natural foods are readily available.

Frightening

Nutria are wary creatures and will try to escape when threatened. Loud noises, high pressure water sprays, and other types of harassment have been used to scare nutria from lawns and golf courses. The success of this type of control is usually short-lived and problem animals soon return. Consequently, frightening as a control technique is neither practical nor effective.

Repellents

No chemical repellents for nutria are currently registered. Other rodent repellents (such as Thiram) may repel nutria, but their effectiveness has not been determined. Use of these without the proper state and federal pesticide registrations is illegal.

Toxicants

Zinc Phosphide. Zinc phosphide is the only toxicant that is registered for controlling nutria. Zinc phosphide is a Restricted Use Pesticide that can only be purchased and applied by certified pesticide applicators or individuals under their direct supervision. It is a grayish-black powder with a heavy garlic-like smell and is widely used for controlling a variety of rodents. When used properly, zinc phosphide poses little hazard to nontarget species, humans, pets, or livestock.

Zinc phosphide is highly toxic to wildlife and humans, so all precautions and instructions on the product label

should be carefully reviewed, understood, and followed precisely. Use an approved respirator and wear elbow-length rubber gloves when handling this chemical to prevent accidental poisoning. Mix and store baits treated with zinc phosphide only in well-ventilated areas to reduce exposing humans to chemical fumes and dust. When possible, mix zinc phosphide at the baiting site to avoid having to store and transport treated baits. Never transport mixed bait or open zinc phosphide containers in the cab of any vehicle. Store unused zinc phosphide in a dry place in its original watertight container because moisture causes it to deteriorate. Immediately wash off any zinc phosphide that gets on the skin.

Past studies have shown that zinc phosphide can kill over 95% of the nutria present along waterways when applied to fresh baits at a 0.75% (7,500 ppm) rate. Today, the use of zinc phosphide at this concentration is illegal. Federal and state registrations, however, allow lower rates to be used. For example, the label held by USDA-APHIS-ADC (EPA Reg. No. 56228-9) allows for a maximum 0.67% (6,700 ppm) treatment rate. At this rate, approximately 94 pounds (42.7 kg) of

bait can be treated with 1 pound (0.4 kg) of 63.2% zinc phosphide concentrate.

Where to Bait. The best places to bait nutria are in waterways, ponds, and ditches where permanent standing water and recent nutria sign are found. Baiting in these areas increases efficiency and reduces the likelihood that nontarget animals will be affected. Small chunks of unpeeled carrots, sweet potatoes, watermelon rind, and apples can be used as bait.

The best baiting stations for large waterways are floating rafts spaced 1/4 to 1/2 mile (0.4 to 0.8 km) apart throughout the damaged area. In ponds, use one raft per 3 acres (1.2 ha). Rafts measuring 4 feet (1.2 m) square or 4 x 8 feet (1.2 x 2.4 m) are easily made from sheets of 3/8- to 3/4-inch (1.0- to 1.9- cm) exterior plywood and 3-inch (7.6-cm) styrofoam flotation. Install a thin wooden strip around the perimeter of the raft's surface to keep bait from rolling into the water. The raft should float 1 to 4 inches (2.5 to 10.2 cm) above the surface and should be anchored to the bottom with a heavy weight or tied to the shore (Fig. 5).

In small ditches or areas where nutria densities are low, use 6-inch (15.2-cm) square floating bait boards made of wood and styrofoam, in lieu of rafts (Fig. 5). These can be maintained in place with a long slender anchoring pole made of bamboo, reed, or other suitable material that is placed through a hole in the center of the platform. This allows the board to move up and down as water levels change. Attach baits to small nails driven into the surface of the platform. Bait boards should be spaced 50 to 100 feet (15.2 to 30.5 m) apart in areas where nutria are active.

Other natural sites surrounded by water can also be baited for nutria. Small islands, exposed tree stumps, floating logs, and feeding platforms are excellent baiting sites. Avoid placing baits on muskrat houses and beaver lodges. Baits can be attached to trees, stumps, or other structures with small nails and should be kept out of the water.

Baiting on the ground should only be used when water sites are unsuitable or lacking. Ground baiting is justified and effective when eliminating the last few nutria in a local population. Use care when ground baiting because baits may be accessible to nontarget animals and humans. Place ground baits near sites of nutria activity, such as trails and entrances to burrows.

Prebaiting. Prebaiting is a crucial step when using zinc phosphide because it leads to nutria feeding at specific sites on specific types of food (such as the baits; carrots or sweet potatoes are preferred). Nutria tend to be communal feeders, and if one nutria finds a new feeding spot, other nutria in the area will also begin feeding there.

To prebait, lightly coat small (approximately 2-inch [5.1-cm] long) chunks of untreated bait with corn oil. Place the bait at each baiting station in late afternoon, and leave it overnight. Use no more than 10 pounds (4.5 kg) of bait per raft, 4 pieces of bait per baiting board, or 2 to 5 pieces at other sites at one time. Prebaiting should continue at least 2 successive nights after nutria begin feeding at a baiting site. Large

Fig. 5. Examples of a 4-foot (1.2-m) square raft (left) and a 6-inch (15.2-cm) square baiting board, which are used to concentrate nutria for shooting, trapping, or poisoning. These baiting platforms are constructed of plywood and styrofoam and baited with sweet potatoes.

(more than 1 week) gaps in the prebaiting sequence necessitate that the process be started over.

Observations of prebaited sites will help you decide how the control program should proceed. If nontarget animals are feeding at these sites (as determined by sign or actual observations of animals), then prebaiting should start over at another location. Prepare and apply zinc phosphide-treated baits when nutria become regular users of prebaited baiting stations and nontarget animals are not a problem.

Applying Zinc Phosphide. Prepare zinc phosphide baits as needed to prevent deterioration. Treated baits are prepared in 10-pound (4.5-kg) batches (enough to treat one raft) by using the following ingredients: 10 pounds (4.5 kg) of bait (carrots or sweet potatoes are preferred), prepared as for prebaiting; 1 fluid ounce or 2 tablespoons (30 ml) of corn oil; and 1.7 ounces or 7.5 tablespoons (48.2 g) of 63.2% zinc phosphide concentrate.

To prepare treated baits, add corn oil to the bait in a 5 gallon (18.9 l) plastic or metal container. Stir the mixture until the bait is lightly coated with corn oil. Sprinkle zinc phosphide over the mixture and stir until the bait is uniformly coated. Treated baits have a shiny black appearance and should be dried for about 1 hour in a well-ventilated area until the color changes to a dull gray. Properly dried baits are weather-resistant and remain toxic until they deteriorate. Although treated baits can survive light rain, they should not be used when heavy rains are expected or on open water that is subject to heavy wave action.

The amount of untreated bait eaten the last night of prebaiting determines how much treated bait should be used on the first night. When all or most of the untreated prebait is gone from baiting stations by morning, the same amount of treated bait is used on the stations the following night (e.g., up to 10 pounds [4.5 kg] per raft, 4 pieces per baiting board, and 2 to 5 pieces at other sites). When smaller quantities are eaten, reduce the amount of

treated bait that is used per station proportionately. When only a few pieces of prebait on a raft are eaten, the raft should be removed and replaced with several scattered baiting boards.

The quantity of treated bait eaten each treatment night is the quantity that should be put out the following afternoon. Continue baiting until no more bait is being taken. Most nutria can be controlled after 4 nights of baiting. When densities are high, control may require more time.

Post-Control Procedures. Usually only 25% of the poisoned nutria die where they can be found. Many nutria die in dens, dense vegetation, and other inaccessible areas. Carcasses of nutria killed with zinc phosphide should be collected as soon as possible and disposed of by deep burial or burning to prevent exposure of domestic and wild scavengers to undigested stomach material containing zinc phosphide. Dispose of any leftover treated bait in accordance with label directions.

Cessation of damage is the best indicator that zinc phosphide is controlling problem animals. You can quantify the reduction in nutria activity by putting out untreated bait at baiting stations after the last application of zinc phosphide. The amount eaten at this time is compared to the amount of bait eaten on the last night of prebaiting.

Fumigants

Several fumigants are registered for controlling burrowing rodents but none are registered for use against nutria. Some, such as aluminum phosphide, may have potential as nutria control agents, but their efficacy has not been scientifically demonstrated. Carbon monoxide gas pumped into dens has reportedly been used to kill nutria, but this method is neither practical nor legal because it is not registered for this purpose.

Trapping

Commercial Harvest. Damage to crops, levees, wetlands, and other resources is minimal in areas where

nutria are harvested by commercial trappers. The commercial harvest of nutria on private and public lands should be encouraged as part of an overall program to manage nutria-caused damage. Landowners may be able to obtain additional information on nutria management, trapping, and a list of licensed trappers in their area from their state wildlife agency.

Leghold traps. Leghold traps are the most commonly used traps for catching nutria. Double longspring traps, No. 11 or 2, are preferred by most trappers; however, the No. 1 1/2 coilspring, No. 3 double longspring, or the soft-catch fox trap can also be used effectively. Legholds are more efficient and versatile than body-grip traps and are highly recommended for nutria control work. Leghold traps should be used with care to prevent injury to children and pets.

Several ways of setting leghold traps are effective. Set traps just under the water where a trail enters a ditch, canal, or other body of water. Make trail sets by placing a trap offset from the trail's center line so that nutria are caught by the foot. Traps can be lightly covered with leaves or other debris to hide them, but nutria are easily captured in unconcealed traps.

Bait can be used to lure nutria to leghold sets. Nutria use their teeth to pick up large pieces of food; therefore, bait should be placed beside, rather than inside, the trap jaws. Leghold traps are also effective when set on floating rafts that have been prebaited for a short period of time.

Use drowning sets when deep water is available. Otherwise, stake leghold traps to the ground, or anchor them to solid objects in the water or on land (such as floating logs, stumps, or trees and shrubs). Nutria caught in non-drowning leghold sets should be humanely dispatched with a shot or hard blow to the head. Nontarget animals should be released.

Live Traps. Nutria are easily captured in single- or double-door live traps that measure 9 x 9 x 32 inches (22.8 x 22.8 x 81.3 cm) or larger. Use

Fig. 6. Hand-caught nutria must be handled carefully to avoid being bitten or clawed.

Place set snares in trails and other travel routes, feeding lanes, trails, and bank slides. Snares do not kill the animals they catch, so anchor the snare securely. Check snares frequently because they are often knocked down by nutria and other animals. Snared nutria should be dispatched with a shot or blow to the head. Release any nontarget animals that are captured.

Shooting

Shooting can be used as the primary method of nutria control or to supplement other control techniques. Shooting is most effective when done at night with a spotlight, however, night shooting is illegal in many states and should not be done until proper permits have been obtained. Once shooting has been approved by the proper authorities, nutria can be shot from the banks of waterways and other bodies of water or from boats. In some cases, 80% of the nutria in an area can be removed by shooting with a shotgun or small caliber rifle, such as the .22 rimfire. Care should be taken when shooting over open water to prevent bullets from ricocheting.

Shooting at Bait Stations. Baits can attract large numbers of nutria to floating rafts, baiting boards, and other areas where they can be shot. Shooting from dusk to about 10:00 p.m. for 3 consecutive nights is effective once a regular feeding pattern has been established. Feeding sites should be lit continuously by a spotlight and easily visible to the shooter from a vehicle or other stationary blind. At night, nutria can be located by their red-shining eyes and the V-shaped wake left by swimming animals. As many as 4 to 5 nutria per hour may be taken by this method. Shooters should wait 2 to 3 weeks before shooting nutria at the same site again.

Boat Shooting. Shooting can also be done in the late afternoon or early evening from a small boat paddled slowly along waterways and large ditches or along the shores of small lakes and ponds. Nutria are especially vulnerable to this method when water levels are extremely high or vegetative

these when leghold and body-grip traps cannot be set or when animals are to be translocated. Bait live traps with sweet potatoes and carrots and place them along active trails or wherever nutria or their sign are seen. A short line of baits leading to the entrance of a live trap will increase capture success. Live traps placed on floating rafts will effectively catch nutria but prebaiting is necessary. A large raft can hold up to 8 traps. Unwanted nutria should be destroyed with a shot or blow to the head. Nontarget animals should be released.

Floating, drop-door live traps catch nutria but are bulky and cumbersome to use. The same is true for expensive suitcase-type beaver traps. Unwary nutria can be captured using a long-handled dip net. This method should only be used by trained damage control professionals who should take special precautions to prevent being bitten or clawed (Fig. 6). Live nutria can be immobilized with an injection of ketamine hydrochloride. Funnel traps are not effective for controlling nutria.

Body-gripping Traps. The Conibear® trap, No. 220-2, is the most commonly used body-gripping trap for controlling nutria. Nos. 160-2 and 330-2 Conibear® traps can also be used. Place sets in trails, at den entrances, in culverts, and in narrow waterways. Large body-grip traps can be dangerous and should be handled with extreme caution. These traps should not be set in areas frequented by children, pets, or desirable wildlife species.

Other Traps. Use locking snares to catch nutria when other traps cannot be set. Snares are relatively easy to set, safer than leghold and body-grip traps, and almost invisible to the casual observer. Snares constructed with 3/32-inch (0.2-cm) diameter, flexible (7 x 7-winding) stainless steel or galvanized aircraft cable are suitable for catching nutria. Ready-made snares and components (for example, cable, one-way cable locks, swivels, and cable stops) for making homemade snares can be purchased from trapping suppliers.

cover is scarce. At times, animals can be stimulated to vocalize or decoyed to a boat or blind by making a "maw" call, which imitates the nutria's nocturnal feeding and assembly call. This call can be learned from someone who knows it or by listening to nutria vocalizations at night. Nutria become wary quickly, so limit shooting to no more than 3 nights, followed by 2 to 3 weeks of no activity.

Bank Shooting. Nutria can be shot by slowly stalking along the banks of ditches and levees; this can be an effective control method where nutria have not been previously harassed. Unlike night shooting from a boat or blind, bank shooting is most effective at twilight, both in the evening and morning. Several nutria can usually be shot the first night, however, success decreases with each successive night of shooting. Daytime shooting from the bank of a waterway is effective in some situations.

Economics of Damage and Control

Nutria can have either positive or negative values. They are economically important furbearers when their pelts provide income to commercial trappers. Conversely, they are considered pests when they damage property.

From 1977 to 1984, an average of 1.3 million nutria pelts were harvested annually in the United States. Based on prices paid to Louisiana trappers during this period, these pelts were worth about \$7.3 million.

The estimated value of sugarcane and rice damaged by nutria each year has ranged from several thousand dollars to over a million dollars. If losses of other resources are added to this amount, the estimated average loss would probably exceed \$1 million annually.

Management plans developed for nutria should be comprehensive and should consider the needs of all stakeholders. Regulated commercial trapping should be an integral part of any management scheme because it can provide continuous, long-term income to trappers; maintain acceptable nutria densities; and reduce damage to tolerable levels.

The value of the protected resource must be compared with the cost of control when determining whether nutria control is economically feasible. Most people will not control nutria if costs exceed the value of the resource being protected or if control will adversely impact income derived from trapping. Of course, there are exceptions, especially when the resource has a high sentimental or aesthetic value to the owner or user.

Acknowledgments

This chapter is a revision of an earlier chapter written by Evans (1983). Kinler et al. (1987) and Willner (1982) were the primary sources consulted for biological information on nutria.

1.0 INTRODUCTION

Tetra Tech, Inc. (Tetra Tech) was contracted by the United States (U.S.) Department of the Navy (Navy), Naval Facilities Engineering Command Atlantic (NAVFAC Atlantic) to conduct Listed Species Surveys at Naval Air Station Oceana Dam Neck Annex (NASO DNA) (Project). NASO DNA is located along the Atlantic Coast on the border between southeastern Virginia and northeastern North Carolina (Figure 1). These activities are a continuation of previous natural heritage studies completed at the NASO DNA in 1990 (VDCR-DNH 1990), 1992 (Buhlman et al. 1992), 2001 (Van Alstine et al. 2001), and 2010 (Evans and Belden 2010).

The approximately 1,900 acres (ac) (769 hectares [ha]) that compose NASO DNA provide habitats and open space for a wide variety of floral and faunal species. The federal regulation referred to as the Sikes Act Improvement Act (Sikes Act) (16 United States Code [USC] §670 a-f) requires the Secretary of the Department of Defense (DOD) to prepare and implement an Integrated Natural Resources Management Plan (INRMP) for any installations with significant natural resources. The purpose of an INRMP is to guide conservation and long-term management of natural resources through implementation of ecosystem-based conservation and management programs that provide for integrated conservation, restoration, and enhancement of natural resources consistent with each installation's mission. In accordance with the Sikes Act, one of several elements that every INRMP shall provide for is the enforcement of applicable natural resource laws and regulations.

The primary regulatory protection for threatened and endangered species on federal lands is the Endangered Species Act (ESA) of 1973 (16 Code of Federal Regulations [CFR] §1531 to §1544). The federal ESA is intended to serve as a mechanism for conservation of ecosystems upon which threatened and endangered species depend, as well as to provide programs for species conservation that reduces their potential for becoming extinct. The ESA is administered by the United States Fish and Wildlife Service (USFWS) for terrestrial and freshwater wildlife, and the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NMFS) for marine species. Section 7 of the ESA requires all federal agencies, in consultation with USFWS and/or NMFS, to use their authority to further the purpose of the ESA and to ensure that their actions are not likely to jeopardize the continued existence of listed species as a result of destruction or adverse modification of their habitat.

Furthermore, the Virginia Endangered Species Act (Section 29.1-564 through 570, Code of Virginia) gives the Virginia Department of Game and Inland Fisheries (VDGIF) regulatory authority over federally- or state-listed fish and wildlife species (excluding Class Insecta) in Virginia. The Office of Plant Protection within the Virginia Department of Agriculture and Consumer Services (VDACS) has regulatory responsibility for the listing and protection of the state's insects and plants under the Virginia Endangered Plant and Insect Act (Section 3.1-1020 through 1030, Code of Virginia). The Virginia Department of Conservation and Recreation, Department of Natural Heritage (DCR-DNH) is a primary source of recommendations to each regulatory agency for species in need of listing as endangered or threatened. Therefore coordination with federal (USFWS) and state (VDGIF, VDACS, and DCR-DNH) agencies is necessary when actions have the potential to affect listed species (Navy 2014).

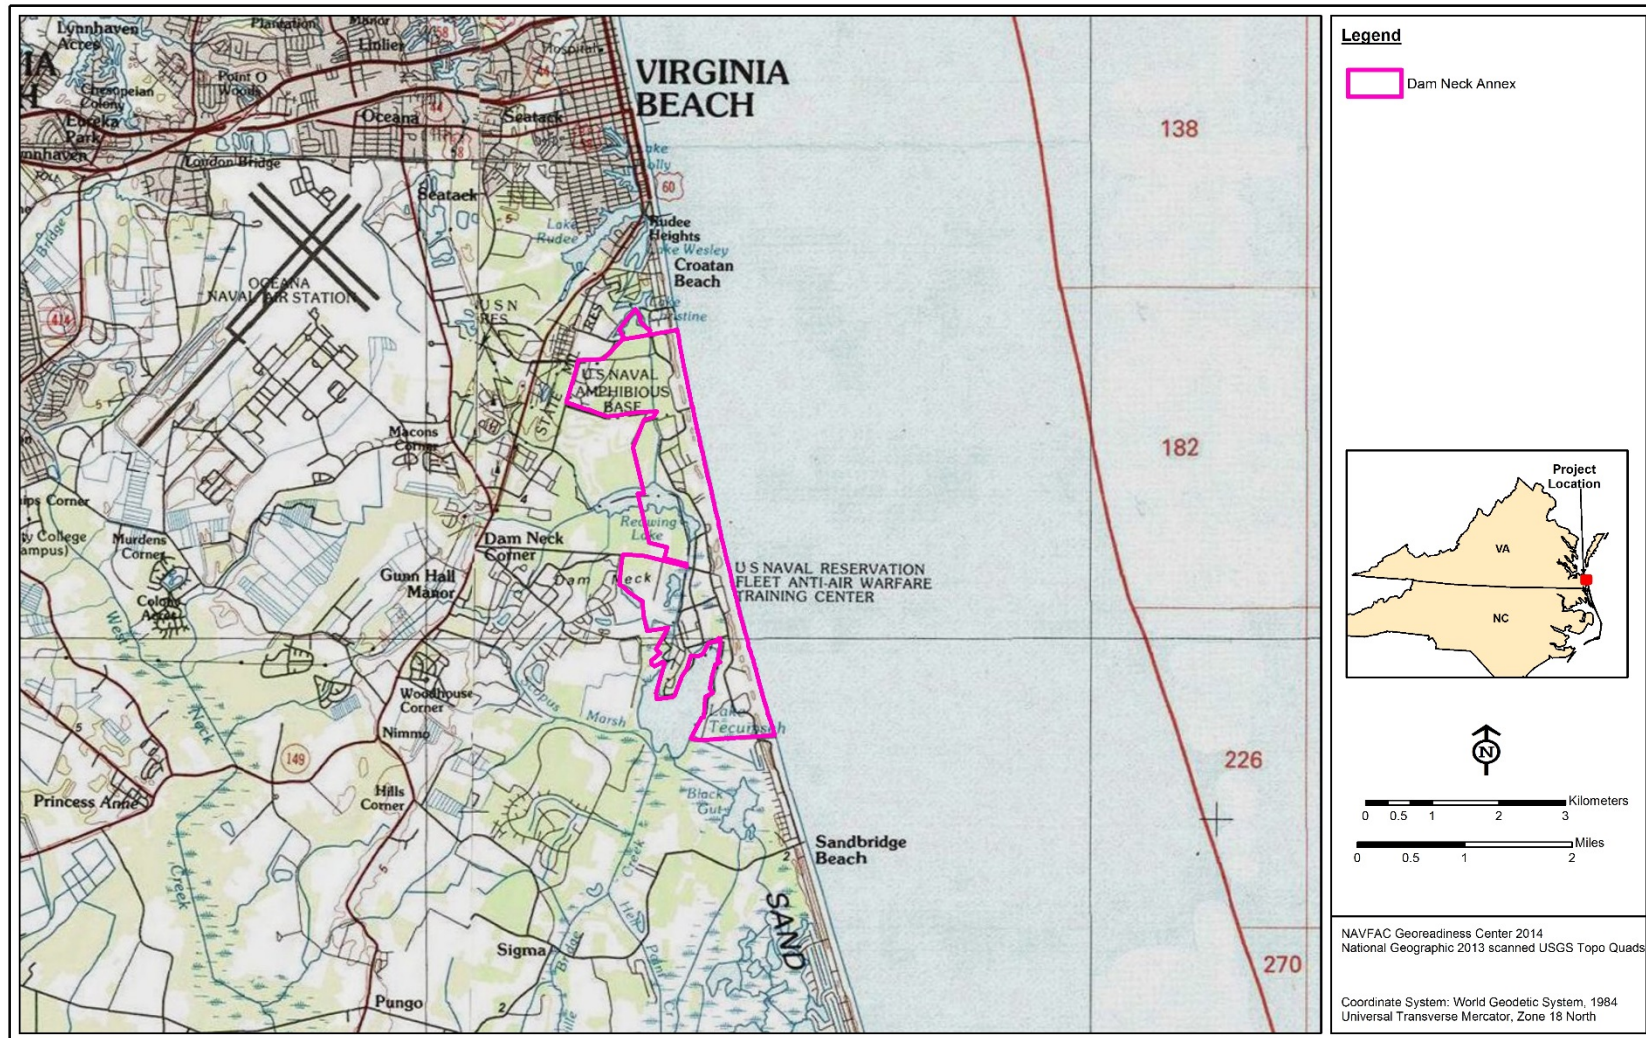

Figure 1. Site Location for NASO DNA, Virginia Beach, Virginia.

To avoid or minimize impacts to threatened and endangered species and species of concern, DOD natural resources managers must be aware of current conditions and status of species. In fact, 32 CFR 190 (Natural Resources Management Program) requires that INRMPs include current inventories and conditions of natural resources. Therefore, periodic surveys of installation resources, including threatened and endangered species, are necessary to maintain compliance with federal regulations. Furthermore, coordinated, proactive management and conservation actions that protect imperiled species not yet listed at the federal level (e.g., state-listed and special concern species) on DOD installations may help prevent them from being listed under the ESA.

1.1 GOALS AND OBJECTIVES

The goal of threatened and endangered species management at NASO DNA is to protect known listed species in compliance with state and federal endangered species laws (Navy 2014). The most recent surveys targeting listed species were conducted 5 years ago in the northern portion of the survey area and more than 10 years ago in the larger, southern section of the installation.

The goal of this Project to complete surveys to determine the presence of state- or federally-listed threatened or endangered species, or species of concern that may occur at NASO DNA. Specific Project objectives are as follows:

1. Establish a list of target species to be the focus of the field surveys using available information,
2. Establish appropriate methods for conducting baseline presence/absence surveys of target species and significant plant community types,
3. Implement survey methods to assess the presence of target species and significant plant communities, and
4. Summarize and report survey data.

1.2 REPORT ORGANIZATION

This report provides an overview of the Project and study area and synthesizes results of the species and plant community surveys.

- **Section 1.0 Introduction** – Describes Project overview, discusses background and regulatory basis, and describes Project goals and objectives.
- **Section 2.0 Description of Study Area: NASO DNA** – Describes the setting and land use, climate, physiography, topography, and soils of the study area.
- **Section 3.0 Selection of Project Target Species** – Provides background information on the steps that were followed in developing a list of species that would be the focus of the Project.
- **Section 4.0 Survey Methods** – Describes survey procedures used to determine presence of target species including desktop and field analyses.
- **Section 5.0 Results and Discussion** – Summarizes results of species and community surveys and discusses findings in relation to the habitats present at NASO DNA.

- **Section 6.0 Special Interest Area Background and Recommendations** – Provides an overview of the Special Interest Areas (SIAs) found on the installation and describes recommended protection areas.
- **Section 7.0 Conclusion** – Provides an overall summary and discusses how Project objectives were met.
- **Section 8.0 References** – Provides a complete list of references used during field survey efforts and in preparation of this report.

2.0 DESCRIPTION OF STUDY AREA: NASO DNA

2.1 INSTALLATION SETTING AND LAND USE

NASO DNA is located in the southeastern portion of the City of Virginia Beach, Virginia (see Figure 1) and encompasses approximately 1,900 acres (ac) (769 hectares [ha]). The installation is bounded by the community of Sandbridge to the south; the Atlantic Ocean to the east; Hampton Roads Sanitation Division, City of Virginia Beach Properties, and private properties to the west; and Virginia Army National Guard - Camp Pendleton to the north. Area surrounding the installation includes industrial, commercial, residential, recreational, and agricultural land uses. However, most of the agricultural lands are rapidly being converted to residential and recreational developments.

2.2 PHYSICAL ENVIRONMENT

NASO DNA is located in Virginia's outer Atlantic Coastal Plain physiographic province. This physiographic province is characterized as flat with low relief and elevations of 0–60 feet (ft) (0–18 meters [m]) above mean sea level (msl). Elevations at NASO DNA range from sea level along the beaches to approximately 20 ft (6 m) above msl on the tallest dunes (ESRI 2012). The largest portion of the installation lies in a low basin behind the primary and secondary dunes and has an elevation of less than 5 ft (2 m) above msl.

The United States Department of Agriculture Natural Resources Conservation Service (USDA NRCS) prepared a soil survey report for Virginia Beach in 1985 (Navy 2014). The survey indicates that approximately half of NASO DNA is composed of Newhan-Duckston-Corolla association of the beaches and dunes and the very poorly drained, flood-prone Backbay-Nawney association in the marshes and swamps. The hydric soils at NASO DNA are Acredale silt loam, Backbay mucky peat, Chapanoke silt loam, Duckston fine sand, Nawney silt loam, Nimmo loam, and Tomotley loam (USDA NRCS 2009b). Fifty-nine percent of the soils are hydric. Other soil types mapped at NASO DNA are Udorthents and Urban Land. Udorthents are soils that have been disturbed by excavation and grading and have had top soils removed. They generally occur in areas of low intensity development. Urban Land occurs in developed areas where more than 80 percent of the land is covered by impermeable surface such as concrete, asphalt, or buildings. Five percent of the soils at NASO DNA are mapped as Udorthents and 11 percent are Urban Land.

NASO DNA is located in an area where temperature extremes are moderated by the Atlantic Ocean. The average yearly temperature is 60.0° Fahrenheit (F) (16.0° Celsius [C]). January is the coldest month with an average low of 32.6°F (0.3°C), and July is the warmest month with an average high of 87.4°F (30.8°C). The average growing season (daily minimum temperatures higher than 32.0°F (0.0°C) for a light frost) lasts approximately 250 days from 22 March to 21 November. The average annual precipitation is 45.7 inches (in) (116 centimeters [cm]) and is generally somewhat concentrated in the late summer. The prevailing wind is from the southwest in summer and northeast in winter at an average speed of 10 miles (mi) (16 kilometers [km]) per hour. During the hurricane season (June through September), torrential rainfall may accompany these storms with winds greater than 75 mi (121 km) per hour. The average relative humidity is 62 percent.

3.0 SELECTION OF PROJECT TARGET SPECIES

3.1 DEVELOPING A LIST OF TARGET SPECIES

A preliminary list of target species was created by completing a query of the DCR-DNH database. Search outputs for the City of Virginia Beach, Virginia resulted in a list of sensitive species for the installation. To be included in the preliminary list for the Project, each species had to meet one of two criteria:

1. Federally-listed as endangered, threatened, candidate, or species of concern; or
2. State-listed as endangered, threatened, proposed, or candidate.

The initial screening process excluded several species from the database outputs that were designated with only global or state natural heritage rankings (e.g., S1, S2, G2, G3) and no listing designation. The preliminary species list was further refined by conducting a cursory desktop analysis to determine the presence of potential habitat for each species at the installation. Based on this analysis and habitat requisites of each species, it was determined that several species listed for the City of Virginia Beach would not likely be found at NASO DNA. Finally, the installation's INRMP was reviewed for additional species with the potential to occur at NASO DNA (Navy 2014). The final list of target species with a reasonable likelihood of occurring at NASO DNA is provided in Table 1.

Although all five species of sea turtles have the potential to occur at NASO DNA, this group of reptiles was not included in the project surveys due to ongoing surveys and other work that address them. Two species, loggerhead (*Caretta caretta*) and Kemp's Ridley (*Lepidochelys kempii*) are known to nest in on NASO DNA and another species, the green sea turtle (*Chelonia mydas*) is known to nest in the vicinity of NASO DNA (Navy 2014). Loggerhead sea turtles nested on the installation in 1992 and 2002. Furthermore, a loggerhead sea turtle false crawl was documented on NASO DNA in 2014 and in 2015 a loggerhead sea turtle nested on VA Army National Guard property border NASO DNA. A Kemp's Ridley sea turtle nested on NASO DNA in 2012.

In addition, all five species including leatherback (*Dermochelys coriacea*) and hawksbill (*Eretmochelys imbricata*), have the potential to strand on the beaches of NASO DNA. The Navy coordinates with USFWS, Backbay National Wildlife Refuge (BBNWR), and Virginia Aquarium on sea turtle management and stranding response and conducts annual nesting and stranding surveys. Additional information on this group of turtles can be found in the installation's INRMP (Navy 2014).

3.2 FEDERAL AND STATE LISTING STATUS

Federal status is determined by USFWS and NMFS. This status is used for all animals listed as endangered or threatened by the U.S. government and receiving protection under the federal ESA. The list also notes those species that are currently candidates under consideration for listing. A list of Virginia Species of Concern can be found on the USFWS Virginia Ecological Services website (USFWS 2011). State status in Virginia is determined by VDGIF (all animals

except insects) and VDACS (insects and plants) primarily through recommendation from DCR-DNH.

Table 1. Preliminary List of Target Species for Natural Heritage Surveys, NASO DNA, Virginia Beach, Virginia.

Common Name	Scientific Name	Federal Status/ Rank ¹	State Status/ Rank ¹	Habitat	Potential Habitat Present?
HERPETOFAUNA					
Barking treefrog	<i>Hyla gratiosa</i>	n/a	T	Graminoid dominated temporary pools with open-canopies and surrounding forest (non-breeding).	YES
Canebrake rattlesnake	<i>Crotalus horridus</i>	n/a	E	In the coastal plain, canebrakes are found in bottomland hardwood and mixed hardwood-conifer communities, cane fields and higher areas of swamps.	YES
Chicken turtle	<i>Deirochelys reticularia</i>	n/a	E	Primarily associated with ephemeral water bodies. Prefer a soft substrate and copious vegetation.	YES
Eastern glass lizard	<i>Ophisaurus ventralis</i>	n/a	T	Has been found only in Back Bay NWR, False Cape State Park and west of False Cape near Munden. Inhabits grassy areas with sandy soils, wet meadows, forested wetlands, hammocks, and pine woods	YES
Loggerhead sea turtle ²	<i>Caretta caretta</i>	LE	LT	Coastal waters with a muddy or rocky bottom, coral reefs, salt marshes, brackish lagoons, and river mouths.	YES
Hawksbill sea turtle ²	<i>Eretmochelys imbricata</i>	E	n/a	Marine. Young live in floating masses of plants like Sargassum.	YES
Leatherback sea turtle ²	<i>Dermochelys coriacea</i>	E	n/a	Forages along coast and only come on land to nest on tropical beaches.	YES
Kemp's Ridley sea turtle ²	<i>Lepidochelys kempii</i>	E	n/a	Marine. Shallow coastal regions like bays and lagoons, with muddy or sandy	YES
Green sea turtle ²	<i>Chelonia mydas</i>	T	n/a	Nearshore coastal habitats; associated with sea grass beds. Only on shore when females are nesting.	YES
MAMMALS					
Northern long-eared bat	<i>Myotis septentrionalis</i>	T	T	Strong association with large blocks of older forests, forages along wooded hillsides and ridgelines.	YES
Rafinesque's big-eared bat	<i>Corynorhinus rafinesquii macrotis</i>	n/a	E	Heavily forested areas with minimal anthropogenic activity often near perennial water sources.	YES

Common Name	Scientific Name	Federal Status/ Rank ¹	State Status/ Rank ¹	Habitat	Potential Habitat Present?
Dismal Swamp southeastern shrew	<i>Sorex longirostris fisheri</i>	n/a	T	Successional stages from grassy openings to closed forests, generally in moist to wet areas in or bordering swamps, marshes, or rivers; with a heavy ground cover.	YES
BIRDS					
Piping plover	<i>Charadrius melodus</i>	T	T	Coastal beaches above high tide, sand flats at end of sandpits and barrier islands, fore dunes, blowout behind primary dunes, and wash over areas around dunes.	YES
Roseate tern	<i>Sterna dougallii</i>	E	E	Breeds on rocky offshore islands, barrier breaches, and salt marsh islands. Winters along coasts or offshore.	YES
Red knot	<i>Calidris canutus rufa</i>	T	T	Winter habitats are large, sandy, tidal flats and coastlines near inlet of undeveloped bays and coves. Breeds in tundra.	YES
INSECTS					
Brimley's assassin bug	<i>Pnirontis brimleyi</i>	SC	S1S3	Limited habitat information available.	YES
PLANTS					
Seabeach amaranth	<i>Amaranthus pumilus</i>	T	T	Annual; grows on sandy beaches along the Mid-Atlantic coast of the U.S.	
Blue witch grass	<i>Dichantherium caeruleum</i>	SC	S1	Interdunal swales, tidal marshes, wet flatwoods, bogs, and boggy clearings. Sandy, peaty areas with low nutrient quantity.	YES
Virginia least trillium	<i>Trillium pusillum var. virginianum</i>	SC	S2	Non-riverine flatwoods and swamps	YES
Florida Thoroughwort	<i>Eupatorium anomalum</i>	SC	S1	Wet and low ground, typically intertidal zones.	YES
Long Beach seedbox	<i>Ludwigia brevipes</i>	SC	S2	Shallow water and low, wet places including pondshores, lakeshores, pools, marshes, swamps, blackwater rivers, interdunal swales, borrow ponds, ditches and impoundments.	YES

¹ T = Threatened, E = Endangered, and SC = Species of Concern, S1 = Critically Imperiled (in Virginia), S2 = Imperiled (in Virginia), S3 = Vulnerable (in Virginia)

² Species was removed from consideration for this project due to ongoing or imminent studies focusing on the species.

Endangered: A species (taxon) in danger of extinction throughout all or a significant portion of its range.

Threatened: A species (taxon) that is likely to become endangered within the foreseeable future throughout all or a significant portion of its range.

Federal Candidate: A species (taxon) under consideration for official listing for which there is sufficient information to support listing.

State Candidate: There is enough available information to propose the taxon for listing, but listing is “precluded by other pending proposals of higher priority.” The USFWS is “directed to make prompt use of the emergency listing if the wellbeing of any such species is at significant risk.”

Proposed Endangered: A species (taxon) is proposed for listing as endangered.

Proposed Threatened: A species (taxon) is proposed for listing as threatened.

Federal Species of Concern: A species that has not been petitioned or been given endangered, threatened, or candidate status but has been identified as important to monitor. Such species receive no legal protection and use of the term does not necessarily imply that a species will eventually be proposed for listing.

3.3 STATE HERITAGE RANKINGS

State ranks are assigned by a consensus of the network of natural heritage programs, scientific experts, and The Nature Conservancy to designate a rarity rank based on the range-wide status of a species or variety. Although this system was developed by The Nature Conservancy for ranking taxon on a global scale, it is widely used by other agencies and organizations and is considered the best available scientific and objective assessment of a taxon’s rarity and level of threat to its existence. The ranks are assigned after considering a suite of factors, including number of occurrences, number of individuals, and severity of threats. State ranks consider only those factors within political boundaries of the Commonwealth of Virginia. Descriptions of ranks that pertain to the target species for this Project are provided below (Roble 2013, Townsend 2015).

S1, Critically Imperiled: At very high risk of extirpation from the state due to extreme rarity (often five or fewer populations), very steep declines, or other factors.

S2, Imperiled: At high risk of extirpation from the state due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors.

S3, Vulnerable: At moderate risk of extirpation from the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors.

S4, Apparently Secure: Uncommon but not rare; some cause for long-term concern due to declines or other factors.

S5, Secure: Common, widespread, and abundant.

4.0 METHODS

Various types of studies were conducted to assess the presence of the target species at the installation. Studies included visual surveys, auditory call surveys, and trapping. The following sections provide a description of specific survey methods used for each of the target species or groups of species. All state permits required to conduct these surveys were acquired and can be found in Appendix D.

4.1 AMPHIBIANS AND REPTILES

4.1.1 Barking Treefrog

Frog call surveys were conducted to assess the presence of barking treefrog (*Hyla gratiosa*) at NASO DNA. Survey protocol generally followed the North American Amphibian Monitoring Program as outlined in the Virginia Frog and Toad Survey Training Manual (VDGIF 2002). Prior to initiating the field effort, the field team completed a desktop review and identified a potential survey route comprising 10 call sites at NASO DNA. The 10 preliminary sites were verified in the field to assess suitability for inclusion in the survey route. Site 12 was later removed from field surveys, as it was inaccessible due to construction at the time of the surveys. Site 22 was added during field surveys due to observation of frog chorus and accessibility. The route of finalized sites was sampled two times in late spring/early summer during suitable weather conditions (Figure 2). A description of the survey sites is presented in Table 2. Suitable survey conditions were anytime between sunset and 12:00 am during or immediately after substantial precipitation events, with temperatures at or near 70 °F (21 °C) or higher. At each survey site the observer recorded all species heard during a 5 minute survey window.

Each species was assigned a calling index (1–3) based on the relative number of calling individuals. According to this index a 1 is recorded for the fewest individuals of a single species detected where individuals can be counted and there is space between calls. An index 2 is recorded when individuals can be distinguished but there is some overlapping of calls. An index of 3 represents a full chorus where calls are constant, continuous, and overlapping. The influence of background noise in terms of impairment of detecting species was recorded (type of noise and duration), as were any timeouts taken during the survey window to avoid major and excessive disturbances.

4.1.2 Canebrake Rattlesnake

Suitable habitats for canebrake rattlesnake surveys include relatively mature hardwood or mixed hardwood forest with somewhat open understory, abundant downed woody debris, periodic gaps in the forest canopy, and cane (*Arundinaria spp.*) thickets.

Surveys were completed for canebrake rattlesnakes (*Crotalus horridus*) within forested habitats of NASO DNA (Survey Areas A-E in Figure 3) using visual reconnaissance. Visual surveys entailed walking haphazardly through habitats determined to be suitable for the target species. Cover objects on the ground (e.g., logs, rocks) were turned over on an irregular basis and root masses and caverns under tipped up tree mounds were inspected.

Figure 2. Barking Treefrog Survey Locations, NASO DNA, Virginia Beach, Virginia.

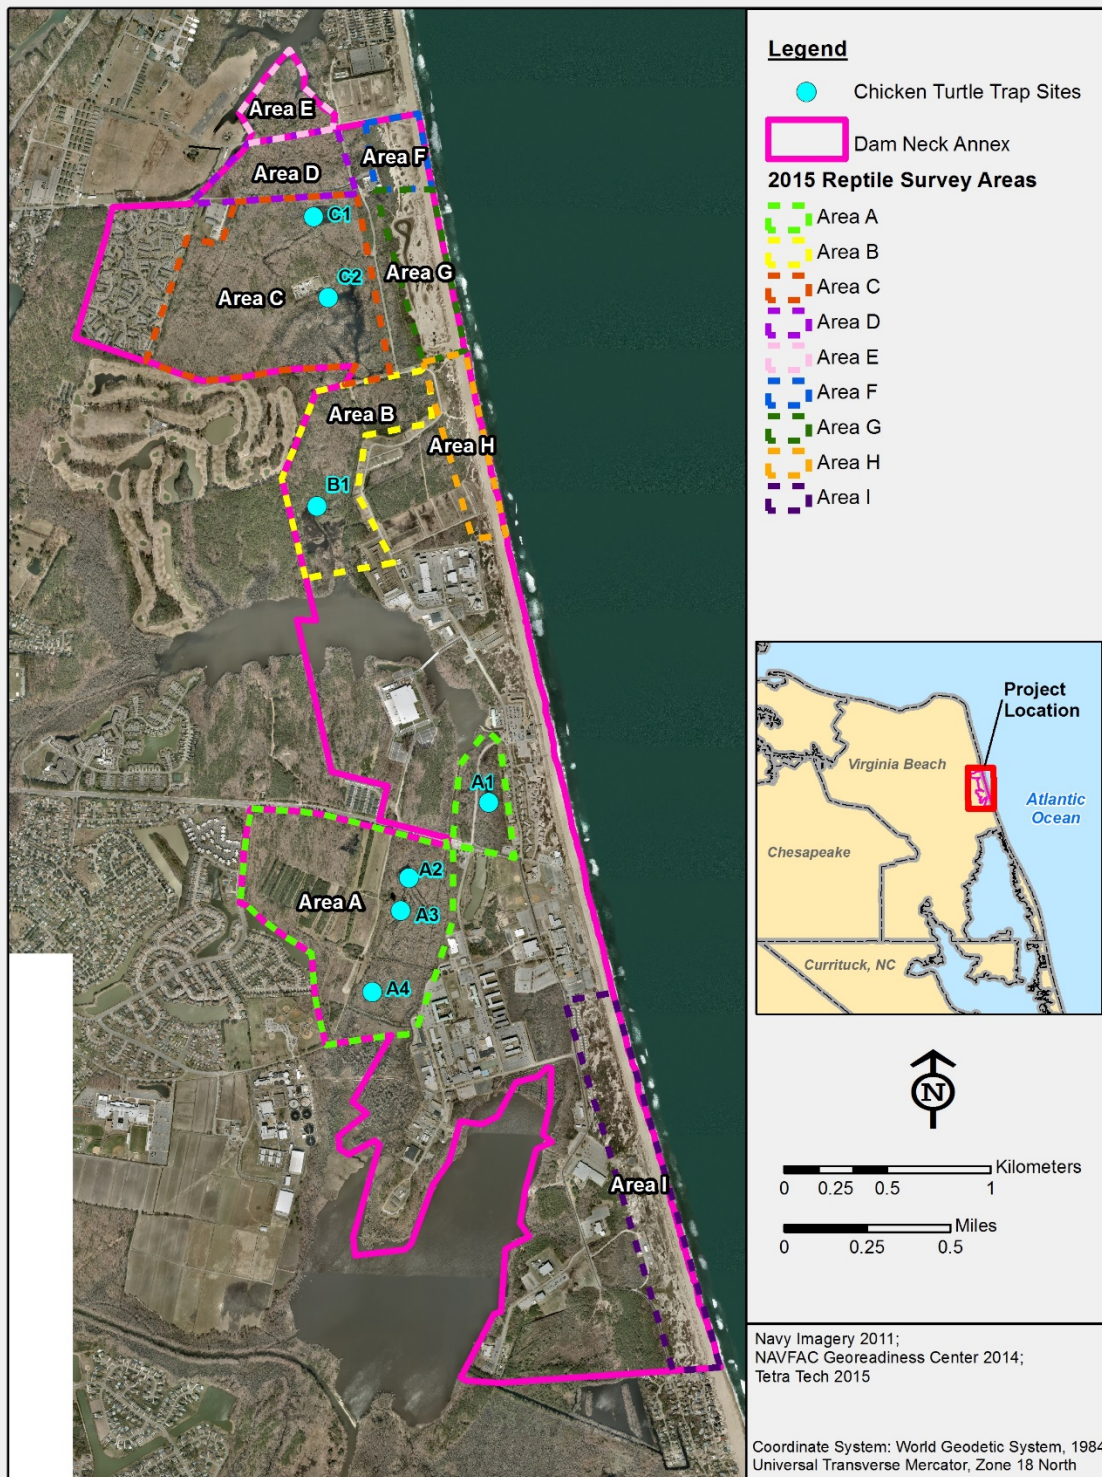

Figure 3. Reptile Survey Areas, NASO DNA, Virginia Beach, Virginia.

Table 2. Barking Treefrog Survey Sites, NASO DNA, Virginia Beach, Virginia.

Site	Description
01	Likely an old borrow pit. Open canopy w/ ~2ft deep water. Vegetation: buttonbush (<i>Cephalanthus occidentalis</i>), black willow (<i>Salix nigra</i>), and unknown emergent vegetation in the water. Lined with red maple (<i>Acer rubrum</i>), pines (<i>Pinus</i> spp.), & black cherry (<i>Prunus serotina</i>).
03	Large lake with water >2ft deep. West side has an herbaceous portion with floating mats of vegetation and emergent vegetation. Vegetation: rushes (<i>Juncus</i> spp.), wax myrtle (<i>Morella cerifera</i>), red maple saplings, and sweetgum (<i>Liquidambar styraciflua</i>). Mixed hardwoods surrounding lake.
05	Marsh separated from lake by a berm. Open canopy full of emergent vegetation. Vegetation: black willow, wax myrtle, rushes, & cattails (<i>Typha</i> spp.). Access most difficult, requires 6 minutes of walking through woods and a total of 10 minutes of walking to get to solid ground
06	High Value. Fully open canopy. Open water with a wide margin of emergent vegetation. Vegetation: black willow, red maple, rushes, cattail, & wool grass (<i>Scirpus cyperinus</i>).
07	Main ditch with 3-4 separate depressional pools. Main ditch is likely unsuitable, but a secondary ditch and pools are valid. Shallow water, ~0.5 ft surrounded by mowed turf grass. Various unknown emergent vegetation in pools.
08	Drainage ditch with several spots with standing water and emergent vegetation and scrub/shrub. Vegetation: black willow, wax myrtle, cattail, common reed (<i>Phragmites australis</i>), red maple, & water dock.
11	Inundated swale ending with small pond, surrounded by mowed turf grass. ~1 ft. deep and partially shaded by adjacent canopy, but none directly above and it has a southern exposure. Vegetation is various emergent.
12	Small depressional wetland, ~1 ft deep, adjacent to road with a mostly open canopy. Vegetation: small red maple, sweetgum, wax myrtle, rushes, sedges, cattail, & greenbrier (<i>smilax</i> sp.). Removed from study due to inaccessibility during field surveys.
13	Open marsh, ~1 ft deep water and thick emergent. Salt intrusion possible, but no solid evidence. Possible chorus frog heard. Vegetation: pine within and surrounding marsh, sedges, broom sedge (<i>Andropogon virginicus</i>), blue panic grass (<i>Panicum</i> sp.) & unknown other herbaceous.
14	Description limited by restricted access: observations made from road edge only. Open canopy wetland with ~15 ft tall pines and other typical hardwoods. Vegetation: black willow, wax myrtle, pine, cattail, red maple & unknown emergent.
22	A new site added on available frog choruses. Water depth ~6 inches and dominated by rushes.

4.1.3 Eastern Glass Lizard

Surveys were completed for eastern glass lizards (*Ophisaurus ventralis*) at NASO DNA using visual reconnaissance surveys. Visual surveys entailed walking haphazardly through habitats determined to be suitable for the target species. Cover objects on the ground (e.g., logs, rocks) were turned over on an irregular basis. Habitats that were targeted for eastern glass lizard surveys included old-field habitats, and other graminoid-dominated communities such as dunes and wet meadows (Survey Areas F-I in Figure 3). Maintained grassy areas were avoided.

4.1.4 Chicken Turtle

Prior to initiating field surveys, the Project herpetologist conducted a desktop analysis of available information to identify areas containing potentially suitable habitat for chicken turtle (*Deirochelys reticularia*). During this analysis, aerial photographs of NASO DNA were reviewed to determine preliminary locations within freshwater aquatic habitat that would be suitable for placing turtle traps.

Field surveys to assess the presence of chicken turtles were completed during one spring survey event. The first day of the survey event involved ground-verifying preliminary trap locations and adjusting final trap locations as needed based on conditions in the field (see Figure 3). After trap locations were finalized, eight 30-in hoop traps with nylon netting, with and without leads, were set in locations identified in freshwater ponds. Traps were set so that a portion remained above the water level so that captured turtles would not drown. In addition to traps with leads, a supplemental trap that lacked leads or wings was set during the survey effort. Traps were set without bait and checked within 24 hours of installation and for one to three consecutive days. Brief descriptions of the turtle trapping sites are provided in the following paragraphs.

Area A

Four ponds were sampled in Area A (Figure 3). One pond (A1) was situated at the southeastern border of NASO DNA. This was a large pond bordered by a road to the east, which had an open canopy and abundant emergent vegetation. As with all the forested areas on DNA dominant trees included red maple (*Acer rubrum*), white oak (*Quercus alba*), and mixed pines (*Pinus* spp.). One hoop trap without a lead was set in this pond for two trap nights. The remaining three ponds (A2, A3, and A4) were located in the most southern part of the installation in heavily forested areas with a high percentage of canopy cover. Hoop traps with leads were set in these three ponds for two trap nights. Pond A2 is a large pond with an island in the middle. One trap was set at the southern edge of A2. Pond A3 was a medium-sized pond separated into two parts with a narrow section connecting the two. One trap was set in A2 near the connecting section in the middle. Pond A4 was a smaller pond and one trap was set at the southern end.

Area B

One pond (B1) was sampled in Area B (Figure 3). This was a large, open canopy pond adjacent to a road with a deer stand at the edge. Dominant trees included red maple, white oak, and mixed pines. Two traps were set in this pond, one on the eastern border and one near the southern border. Two hoop traps with leads were set for three trap nights. Initially, one hoop trap without a lead was set towards the northeastern portion of the pond for one trap night and subsequently moved to another location.

Area C

Two ponds (C1 and C2) were sampled in Area C (Figure 3). Pond C1 was in an interior, forested area. This was an open canopy medium-sized pond with little emergent vegetation. Dominant trees included red maple, white oak, and mixed pines. One hoop trap with a lead was set towards the southeastern portion of the pond for three trap nights. Pond C2 was a large feature approximately 300 ft (91 m) west of a paved road in an interior forested area. Two hoop traps with leads were set for three trap nights.

4.2 MAMMALS

4.2.1 Dismal Swamp Southeastern Shrew

Field surveys were conducted to assess the presence of Dismal Swamp southeastern (DSS) shrew (*Sorex longirostris fisheri*) and led by Dr. Robert Rose of Kerr Environmental Services. Generally accepted methods, specifically the use of pitfall traps, were used for the DSS shrew study to assess presence of the species at the installation. Field study protocol for this species required the use of pitfall traps due to the fact that these shrews are rarely caught using live or snap traps.

Prior to initiating field surveys, biologists used habitat maps and aerial photos to identify eight preliminary locations as likely places for study. Several of these sites were eliminated from consideration due to access restrictions. An initial field reconnaissance was completed during which five of the eight potential sites were inspected for conditions that could potentially support the shrews: suitable soils, adequate leaf litter, and did not appear to be subject to prolonged flooding. The two best locations were selected for study and are described below (Figure 4).

Site 1

This site was flat and relatively free of disturbances, i.e., of depressions or mounds formed by earlier construction activity. It was a fairly open forested wetland located near Redwing Lake. Red maple trees were dominant (95%), with some trees and many seedlings of red bay (*Persea borbonia*), and wax myrtle (*Morella cerifera*) trees in the midstory. Vines included greenbriers (*Smilax rotundifolia* and *S. latifolia*), Japanese honeysuckle (*Lonicera japonica*), and trumpet creeper (*Campsis radicans*). Also present were sparse patches of blackberry (*Rubus allegheniensis*) and scattered grasses such as panic grasses (*Panicum* spp.). Other elements in the forest included sweet gum (*Liquidambar styraciflua*), black cherry (*Prunus serotina*), laurel oak (*Quercus latifolia*), and highbush blueberry (*Vaccinium corymbosum*). This 20-30 year old forest contained maples approximately 45 cm diameter above breast height (dbh), and soils were black loam and relatively dry. No water was reached when the 25-cm holes were dug for placement of the pitfall traps, indicating that the water table was well below the surface at that time of year.

Site 2

This site was flat and relatively free of earlier disturbances, except for one mound representing a loading platform from an earlier logging operation. It contained a relatively open forested wetland. The forest on this site was somewhat older (35-45 years) and among the oaks, laurel oak was both largest and most common. Also present were black gum (*Nyssa sylvatica*), some red maples, black cherry, and black oak (*Q. velutina*), one loblolly pine and numerous seedlings (*Pinus taeda*). The ground cover included Japanese honeysuckle, greenbriers, scattered blackberry and privet (*Ligustrum vulgare*) in the shrub stratum. A few grasses, most likely panic grasses, were also present. The loamy soils on this site were heavier (more clay) than those on Site 1 and were covered with a layer of leaf litter.

Pitfall traps were installed on a grid pattern at both sites. The methods included measuring and setting traps in 5 x 5 trap grids of pitfall traps set at 41 ft (12.5 m) intervals, resulting in an

effective trapping area of 0.61 ac (0.25 ha). Pitfall traps were installed using Iwan augers to drill the holes for the #10 cans.

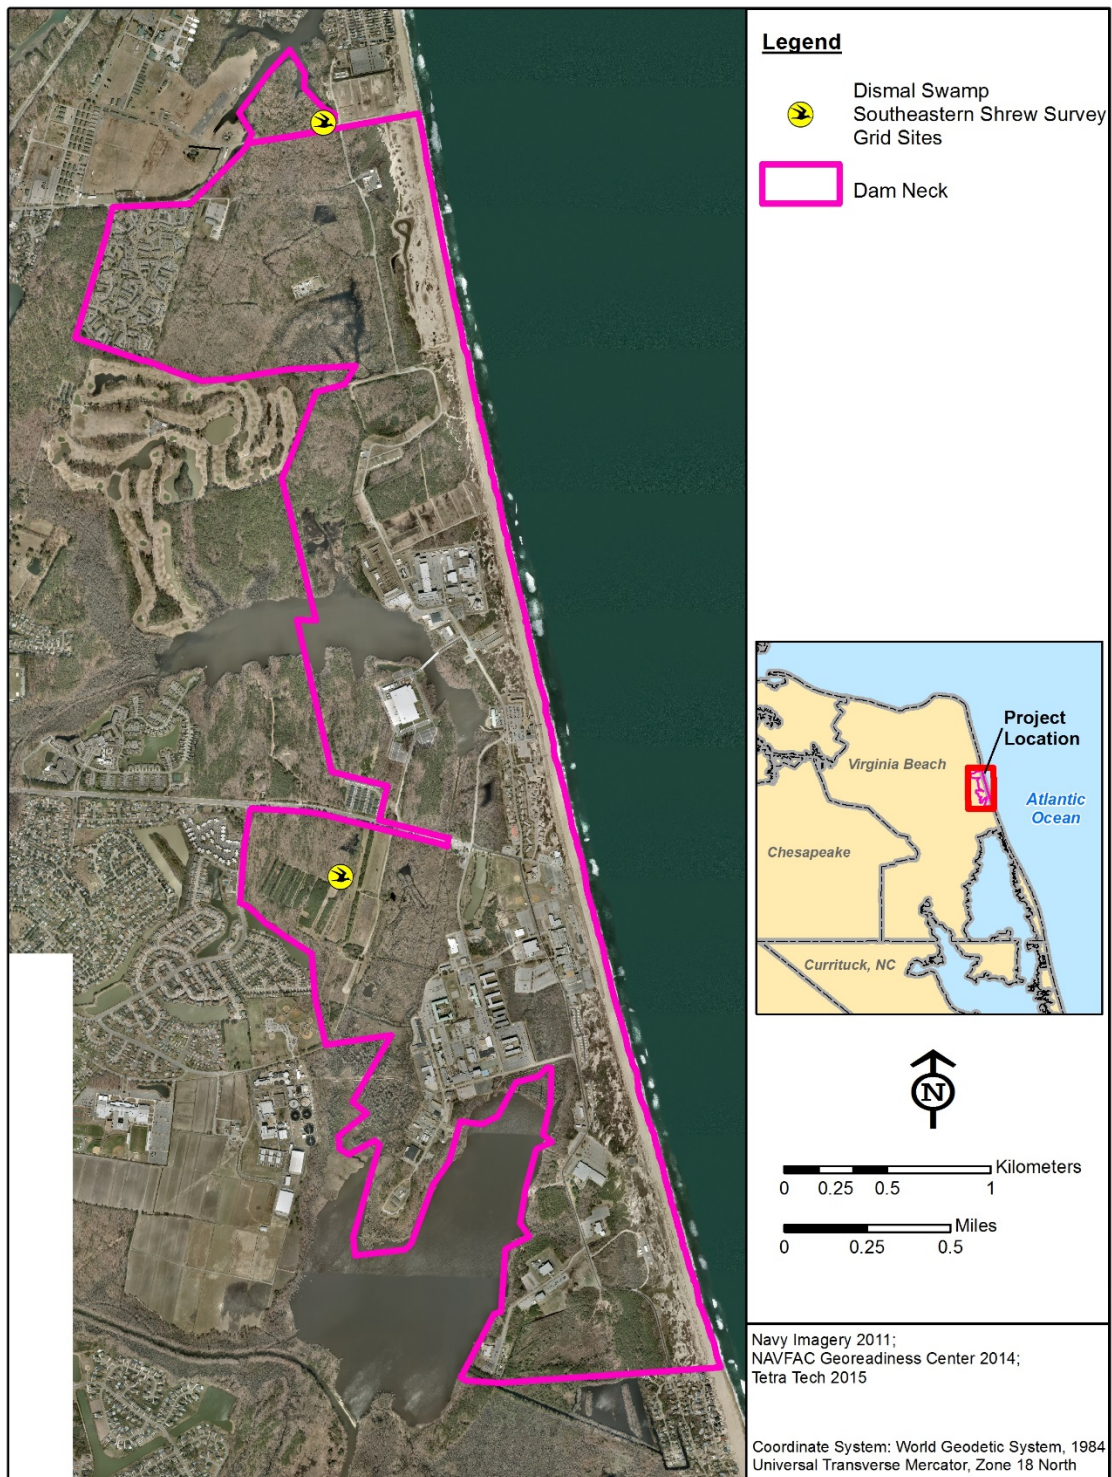

Figure 4. Dismal Swamp Southeastern Shrew Survey Locations, NASO DNA, Virginia Beach, Virginia

Traps were checked at regular intervals for the rest of the month and into early December. All small mammals that had fallen into the pitfall traps were to be removed and placed into plastic bags, labeled with date, grid number, and then frozen, to be examined and identified at a later time. Care was taken when the water was poured from each removed pitfall trap to make certain no small mammal at the bottom of the can was missed. On 12 December, the traps were checked one last time and then removed, as were the surveyors' flags and all ribbon flagging from the grids.

4.2.2 Bat Mistnet Survey

Field surveys were conducted to assess the presence of Rafinesque's big-eared bat (*Corynorhinus rafinesquii*) and the northern long-eared bat (*Myotis septentrionalis*) at NASO DNA. These efforts included site reconnaissance to identify the most suitable survey sites and five calendar nights of mist net surveys. Mist netting activities were led by Biodiversity Research Institute (BRI), assisted by a Tetra Tech biologist. A Threatened/Endangered Species Permit (#051933) was acquired from VDGIF to perform the mist net surveys (Appendix D).

A typical mist net site is at least two net sets active for one night. Three (3) mist net sites were planned for the survey, or a minimum of six (6) nets. The final survey included a total of three sites each with three nets for a total of nine nets (Figure 5). Precipitation on the night of 6 August required that nets A and B were closed for approximately 15 minutes. Net C was under enough tree cover to prevent rainfall from being heavy enough to warrant closing the nets. A full five hours of survey was completed at all nets.

Before initiating mist netting, Tetra Tech biologists selected preliminary sampling locations based on prior knowledge of the installation acquired during other environmental surveys. Areas considered suitable for mist net sites were wooded corridors (e.g., roads, trails, road ruts, creeks). All locations were finalized in the field with BRI on the first survey day. Three net sets were established at each site and each net was placed with neighboring environmental features in mind to maximize capture success (e.g., near or over pools or ponded ruts, away from adjacent open canopy, under overarching canopy). Mist net poles were placed in wooded edges and with the nets directly under canopy. Whenever feasible, nets were set over or adjacent to water sources, as they provide both foraging and drinking locations for bats, thus increasing capture potential.

Net sets were placed across expected travel corridors and road ruts holding water from approximately ground level to the tree canopy; ground level was near 1 ft (0.3 m) but varied due to canopy and features underneath nets (e.g., road ruts and vegetation). A mist net is made up of four vertically stacked sections (shelves) and totals 8.5 ft (2.6 m) in height. Each net set was constructed with at least two nets stacked on top of each other ("double high") so that the total capture area when deployed was up to 17.1 ft (5.2 m) high. A double high mist net setup often overlaps one of the "shelves" to remove any gaps in the junction of the nets. The overlap can vary, but the overall height of a double high net is between 15 ft (4.55 m) and 17.1 feet (5.2 m). Some nets were "triple high" with the same procedure as above. The overall height for a triple high varied between 21 feet (6.4 m) and 25 feet (7.6 m).

Mist nets were supported by up to three approximately 10-ft (3.1-m) aluminum poles stacked on top of each other (i.e., one 20-ft [6.1-m] pole at each end of the net), standard rope gny lines, and

Figure 5. Bat Mist Net Survey Locations, NASO DNA, Virginia Beach, Virginia.

aluminum stakes. It should be noted that the equipment used on this project was custom and some variability was present. Surveyors selected the length of net that could span the corridor completely in order to minimize the bats' evasive maneuvers. Typically, each net set was placed more than 100 ft (30.5 m) from its paired net set, except in the case of prohibitive environmental constraints or where the arrangement improved bat capture success. All net sets in a site were within the same general habitat, but in some cases they were placed over different microhabitats such as road ruts, corridors, or streams. The following paragraphs include a brief description of the habitats at each net site.

Surveys began at approximately sunset each night and continued for a minimum of 5 hours. Weather conditions that would be considered a significant detriment to sampling results include sizeable duration of precipitation (i.e., more than a drizzle), extreme cold (less than 50 °F [10 °C]), steady high winds (i.e., mist nets are blowing around frequently), and moonlight illuminating the nets (USFWS 2007). Therefore, in accordance with survey protocol, if one or more of these conditions were observed, surveys were suspended until the following night. General information recorded hourly included ambient temperatures, sky condition, and wind condition.

Nets were checked on 10-minute intervals and the following information was recorded for each bat captured: time, species, sex, age, reproductive status, forearm length, weight, height of capture, and identification of capture net. Individuals were placed in paper bags to await data collection if more than one bat was captured at once or if a surveyor was working alone. Bats were weighed by being placed in a paper sandwich bag and on a hanging scale. Any individuals of the target species were to be banded before release. Band numbers were recorded on the data sheets.

White-nose syndrome (WNS) is a highly transmissible disease that has been responsible for the deaths of more than 5.7 million bats in the eastern U.S. since its discovery at Howe's Caverns west of Albany, New York in the winter of 2006 (USFWS 2012). The USFWS, state agencies, and bat researchers have worked together to identify appropriate methods for decontaminating all equipment and/or persons that come in contact with bats. These methods are outlined in the National White-nose Syndrome Decontamination Protocol – Version 06.25.2012 (USFWS 2012a) and were used at all net sites established for this Project.

Several methods were used to prevent the transmission of WNS between bats. Surveyors used a new pair of rubber gloves for each bat that was handled. Disinfectant wipes were used in the event of contact with bare skin or work gloves. Paper bags used to hold bats prior to data collection were disposed of after each bat was released. All hard, non-porous equipment (e.g., rulers, scales) was wiped down with disinfectant wipes between bats. All previously-used equipment was disinfected before arriving at the Project site. Stakes and poles also were decontaminated using disinfectant wipes or by spraying with an approved cleaner.

Mist Net Site 1

All three net sets at Site 1 were set across a hunting road corridor in a young, but mature, relatively even-aged conifer forest near a large emergent wetland on the south edge of the installation boundary. Some pocosin habitats were intermixed with the forest. The canopy of the

forest surrounding this site was relatively dense and dominated by pine. Common reed was dominant in the area where the large adjacent wetland has some interstitial flow across the hunting road. One double high and two triple high sets were placed at this site. Two nets were placed over a large ponded ruts on the hunting road.

Mist Net Site 2

All three net sets at Site 2 were set across a relatively wide and maintained road in the Development Group area of NASO DNA. The nets were close to a large emergent wetland with significant presence of open water. The entire surrounding habitat was a young pine and sweetgum mixed forest, with varying density of understory. One double high and two triple high net sets were placed at this site, all across the road.

Mist Net Site 3

All three nets in Site 3 were set in maintained trail clearings in a large planted area. The planted areas were a young successional forest with a very thick understory. The surrounding habitat for the planted area was a mature deciduous forest with a thick understory. One double high net and two triple high nets were set at this location.

4.3 BIRDS: PIPING PLOVER, RED KNOT, AND ROSEATE TERN

Three two-day avian point count surveys were completed and led by Tetra Tech biologist Joseph Campo. The purpose of the surveys was to determine presence/absence of bird species at NASO DNA with a specific focus on the three target species associated with shore habitat. Inland forest habitat was sampled as well at the request of the installation natural resources manager in order to assess presence of state-ranked bird species targeted during previous surveys including king and Virginia rails (*Rallus elegans* and *R. limicola*). Two point count transects (R1 and R2) were established based on appropriateness of habitat and ease of travel within the NASO DNA property: R1 along the beach/dune areas for focusing on presence of shorebird survey species and R2 to the west in undeveloped and forest interior areas of the facility. Each transect consisted of 10 points each for a total of 20 fixed point count stations (Figure 6). Survey transects were a combination of driving route(s) with roadside observation points and walking routes. Point count station sites were situated in representative habitat types within the installation including forests, wetlands, open water, beaches and dunes. Transects were sampled two times on separate days during the spring, summer, and fall season.

Point counts were spaced accordingly by habitat type to minimize double counting individual birds and to maintain independence from other observation points. At each point count station (observation point) birds seen or heard were counted during a 10-minute sampling period. Incidental observations of birds during transit between point count stations also were recorded. All point count stations were recorded by a Global Positioning System (GPS) unit and plotted on maps. A list of species observed during field efforts is provided in Appendix A.

4.4 INSECTS: BRIMLEY'S ASSASSIN BUG

Brimley's Assassin Bug (*Pnirontis brimleyi*): Although it is considered the most distinctive species of *Pnirontis* in North America, little is known about the distribution and habitat requirements of Brimley's assassin bug (Asquith 1992).

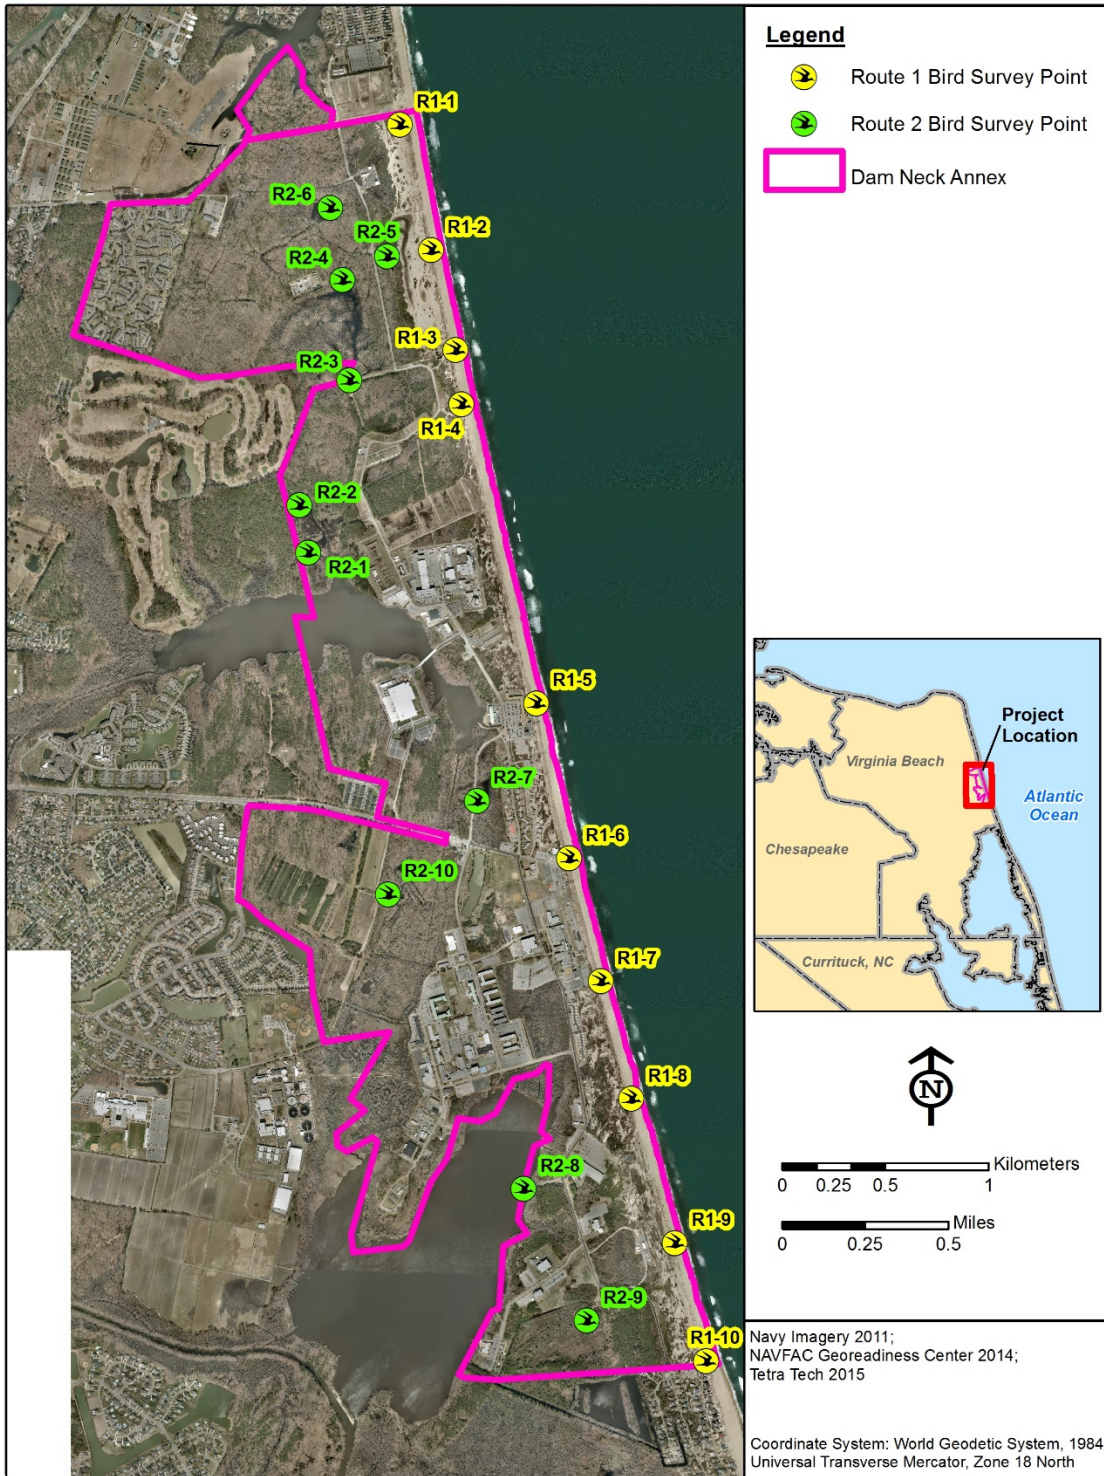

Figure 6. Avian Point Count Stations, NASO DNA, Virginia Beach, Virginia.

Tetra Tech conducted background research to determine the extent of knowledge for this species. This analysis included contacting subject matter experts to determine known habitat use in Virginia and neighboring states. There is no existing data available on the preferred habitat of this species, though a historical record of a single occurrence on NASO DNA exists (Hoffman 2006).

4.5 PLANTS AND SIGNIFICANT NATURAL COMMUNITIES

Surveys for target plant species were led by Tetra Tech biologist Joseph Campo, assisted by a Tetra Tech plant biologist. Potential habitat for target species was reviewed with a geographic information system (GIS) desktop survey to assess suitable forested, wetland, stream, and dune/beach habitats.

Plant surveys were conducted during two separate site visits in late summer and early spring in order to survey within the ideal window for each target species. Each survey event consisted of meander searches covering as much suitable habitat as could be accessed within the given timeframe. Surveys were conducted over a 3-day period each for September 2014 and April 2015. (Figure 7). GPS coordinates were recorded at regular intervals to depict the meander routes on each survey day. In addition to documenting occurrence of target species, incidental observations of any rare species encountered were documented. A plant was considered a species of concern if it occurred in the Natural Heritage Resources of Virginia: Rare Plants List (Townsend 2015).

The initial fall survey targeted intertidal dune swales that might be suitable for long beach seedbox (*Ludwigia brevipes*), Florida thoroughwort (*Eupatorium anomalum*), seabeach amaranth (*Amaranthus pumilus*), and blue witch grass (*Dicanthelium caeruleum*). This primarily included intertidal dune swales along the east shore line but also incorporated limited sampling of forested wetlands and mesic woods within the ‘South Parcel’ (western-most parcel on south side of Dam Neck Road) and Camp Pendleton Annex. The large expanse of dunes and beaches on the eastern section of the installation was targeted as potential habitat for other species of interest, as were the woods and forests on the interior western/northern portions of the installation. An additional three day survey was completed in the spring, targeting inland mesic woods and wetland habitats suitable for Virginia least trillium (*Trillium pusillum*) and long beach seedbox. Survey routes, points of interest, and potential habitats to revisit were recorded using a hand-held Trimble GeoXH sub-meter hand-held GPS unit. Notes on habitat and current conditions were documented for all sites visited.

Significant natural communities with a state ranking S1, S2, or S3 were identified and mapped via desktop analysis. Results of a concurrent project for the installation to identify and map the natural communities at NASO DNA using the National Vegetation Classification System (USNVC 2015) were used to determine the presence of significant natural communities according to the *Natural Communities of Virginia: Ecological Groups and Community Types* (Fleming and Patterson 2013).

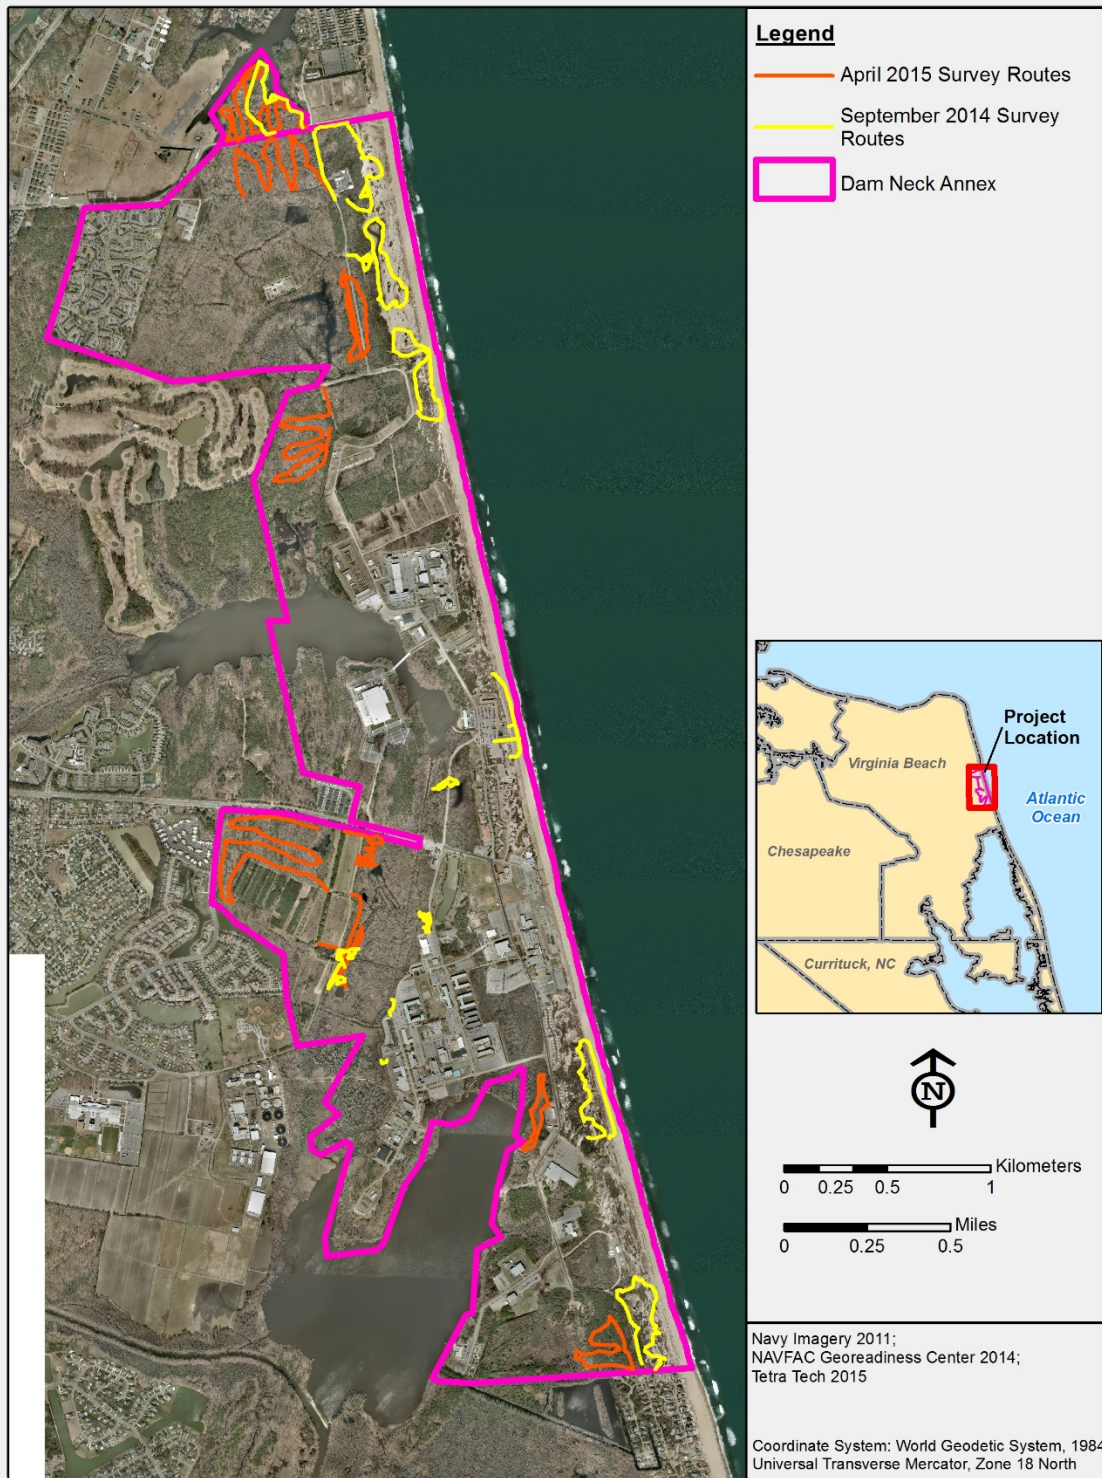

Figure 7. Plant Survey Routes, NASO DNA, Virginia Beach, Virginia.

5.0 RESULTS AND DISCUSSION

The following sections summarize results and observations for the presence/absence species surveys. A list of bird, mammal, amphibian, reptile, and plant species observed during field surveys is provided in Appendix A. Photographic documentation is provided in Appendix B and field data forms are provided in Appendix C. Permits that were acquired to conduct surveys are provided in Appendix D, and survey location coordinates are listed in Appendix E. It should be noted the limited photographic documentation was collected due to a high level of security in many areas of the installation.

5.1 AMPHIBIANS AND REPTILES

Amphibian surveys were completed during two survey events on 15 May and 15 June 2015. Reptile surveys were completed during a single field effort conducted between 5 May and 8 May, 2015. No target species were detected at NASO DNA. The following sections provide the results of amphibian and reptile surveys at the installation.

5.1.1 Barking Treefrog

Ten call sites at NASO DNA were assessed for the presence of barking treefrogs during two survey events on 15 May and 15 June 2015. Because Site 12 was found to be inaccessible due to road construction on Regulus Avenue, a new site (22) was added opportunistically during field surveys based on audible chorus and ease of access.

Both frog call surveys were conducted immediately after or during significant rain events with temperatures ranging from 65° to 81 °F (18° to 27 °C). No barking treefrogs were detected during the surveys. Table 3 includes species observed by site and relative abundance for each survey run.

The greatest number of species (6) were detected at Sites 5, 7, and 22 followed by Sites 1, 3, 6, 11, and 13 with five species. The fewest number of species (0) was detected at Site 8. Two or more hylid (treefrog) species were detected in 9 of 10 locations surveyed (Table 3).

Barking treefrogs typically are associated with sandy areas. The wetlands surveyed for barking treefrogs at Sites 7, 8, 11, 13, and 14 were all mapped as Duckston Fine Sand. The remaining sites were mapped as silt loam, loam, or mucky peat.

Some habitat preferences of the pine woods treefrog are similar to that of the barking treefrog. Pine woods treefrogs are associated with sandy sites and primarily breed in shallow forest pools and freshwater wetlands including Carolina bays, marshes and shallow swamps that lack predatory fish. Therefore, the presence (or absence) of pine woods treefrogs may be an indicator of the suitability of a particular site for barking treefrogs. This smaller treefrog was detected at only one of the sandy sites that occur at NASO DNA, Site 13.

The wetlands that occur at NASO DNA are marginal for barking treefrog habitat. Whereas the majority of known barking treefrog breeding sites in Virginia are ephemeral pools that have abundant emergent vegetation, open canopy, sandy soils and are surrounded by mature forest habitat, wetlands at NASO DNA are missing one or more of these key features. Furthermore, the

historically disturbed and fragmented condition of forests at NASO DNA and highly developed surrounding land use make it all the more unlikely that this species occurs there.

Table 3. Frog Call Survey¹ Results for NASO DNA, Virginia Beach, Virginia.

Site ID	Green Treefrog		Squirrel Treefrog		Pine Woods Treefrog		Northern Green Frog		American Bull Frog		Southern Leopard Frog		Southern Toad		Eastern Narrow-Mouthed Toad		Pickerel Frog

22		3	3	3							1		2	1					

¹Frog Call Index: 1 = individuals can be counted, there is space between calls; 2 = calls of individuals can be distinguished but there is some overlapping of calls; 3 = full chorus, calls are constant, continuous and overlapping.

5.1.2 Canebrake Rattlesnake

Undeveloped areas of the installations were assessed for suitability of canebrake habitat during the May 2015 field effort. However, no canebrake rattlesnakes were observed at NASO DNA. The lack of high quality canebrake habitat observed at this installation is attributed to the immature stands of hardwood forested parcels and historically disturbed conditions. The cryptic nature of canebrake rattlesnakes makes them extremely difficult to detect; however, no suitable habitat was observed at NASO DNA. The likelihood of occurrence is very low as this species prefers old hardwood forests with cane thickets.

5.1.3 Eastern Glass Lizard

Undeveloped areas of NASO DNA that were identified as most suitable eastern glass lizard habitat were surveyed during a single field effort: 5–8 May 2015. Two areas of unmaintained grassy habitat in the secondary (back) dune systems were determined to be the most suitable habitat at the installation for eastern glass lizard. The first of these non-maintained search areas is located in the northeast corner of NASO DNA and is bounded by Jefferson Street/Rifle Range Road to the north, buildings to the south, and the Atlantic Ocean to the east (Survey Area F in Figure 3). The second habitat is located south of the area described above and is loosely bounded to the west by Regulus Avenue, with the Atlantic Ocean to the east (Survey Area H in Figure 3).

No eastern glass lizards were observed during meandering surveys. Furthermore, a minimal amount of moderate eastern glass lizard habitat was observed at NASO DNA. The majority of grass-dominated areas at the installation were either fore dunes or in the interface between grassy areas and the forest edge where shallow water accumulates. Most grasses behind the fore dunes were in clumps, while the preferred habitat for this species is matted grasses. A small amount of appropriate habitat exists in the interface between the grassy areas behind the dunes and the edge of the forest in the northeastern-most corner of NASO DNA (Survey Area F in Figure 3). No appropriate habitat was found in Survey Areas G or I. During the field effort to assess potential eastern glass lizard habitat, field biologists discovered that few cover objects were present within the most suitable glass lizard survey area.

Despite the presence of moderately suitable eastern glass lizard habitat, current and historic disturbed conditions that exist throughout much of NASO DNA, as well as highly developed land use surrounding it, make it unlikely that eastern glass lizards occur there. Although there is a specimen in the Florida State Museum found in 1951 by an unknown collector that lists the collection site as “nr Norfolk” (Mitchell 1994), there are no confirmed records that indicate this lizard’s range ever extended this far north or west in Virginia. Furthermore, the closest known populations to NASO DNA—and only known locations in the state—are at BBNWR and False Cape State Park approximately 10 miles to the south. The area between NASO DNA and the known locations is highly developed, and the absence of vegetated corridors make it unlikely that individuals would be able to populate what limited suitable habitat occurs at NASO DNA.

5.1.4 Chicken Turtle

During the first trapping effort eight hoop net traps (six with leads or wings) were deployed on 5-6 May and removed on 6-8 May 2015. Each trap was set for 1-3 nights depending on location. A total of 73 turtles comprising five species were collected across all sites (Table 4). No chicken turtles were observed during this trapping effort.

Table 4. Turtle Trapping Results for NASO DNA, Virginia Beach, Virginia.

Site	No. of Traps	Total Trap Nights	Snapping Turtle	Painted Turtle	Stinkpot Turtle	Red-bellied Cooter	Yellow-bellied Slider	Total	Trap Rate ³
A1	1	2	2	0	0	3	2	7	3.5
A2	1	2	0	1	0	0	0	1	0.5

C2 ²	1	2	0	2	3	0	0	5	2.5
Total			5	26	23	4	15	73	

¹Note that one trap was moved from its original location at B1 (one trap night) to A1 (two trap nights).

²Note that one trap was moved from its original location at C2 (two trap nights) to A2 (one trap night).

³Number per trap night.

Painted turtles were the most abundant species detected with 26 individuals captured, followed by stinkpot turtles with 23 individuals captured. Fifteen yellow-bellied sliders were captured, while very few common snapping turtles (5) and red-bellied cooters (4) were captured.

The greatest number of species and number of individuals was captured at Pond C1. This pond had the greatest trap rate with 7.0 captures per trap night.

Of all trap sites at NASO DNA, none was associated with preferred chicken turtle habitat. This species requires ephemeral ponds, not the permanent ponds that occur at NASO DNA. They generally do not use altered landscapes, and the terrestrial habitat has been altered throughout NASO DNA.

5.2 MAMMALS

DSS surveys were completed between 21 November and 12 December 2014. Bat surveys were completed between 6 August and 8 August 2014. No target species were detected at NASO DNA. Incidental observations of non-target species are included in Appendix A and photographic documentation is provided in Appendix B. The following sections provide the results of mammal surveys at the installation.

5.2.1 Dismal Swamp Southeastern Shrew

A site reconnaissance to locate potential DSS shrew habitat was completed at NASO DNA in early November 2014. No old fields or other areas of early successional habitat, the prime habitat for southeastern shrews, were seen on the maps and in fact Dam Neck has no such habitats. Five potential sites were inspected during the reconnaissance and three were identified potentially supporting populations of Dismal Swamp southeastern shrews: each had suitable soils, adequate leaf litter, and did not appear to be subject to prolonged flooding. Two of these sites were selected as the best locations for study.

Trapping efforts were initiated on 21 November and continued through 12 December 2014. A total of 21 days of trapping were completed at NASO DNA. No specimens of small mammal were collected over the 21 days of trapping at the two forested sites at Dam Neck. Thus, the presence of the target species of this project was not confirmed.

Such results are not unexpected when a small number of grids is used in forested sites. Forests support fewer species overall than early successional habitats such as grassy old fields or those with much herbaceous vegetation and few shrubs or trees. Forests also support fewer individuals of the species that do occupy forests. Further, the catch rates for pitfall traps are low, often in the range of 1 or so specimen per 100 trap-nights; a trap-night is defined as one trap in place for one night. Because forests have low densities of small mammals, on the order of 10 per hectare, and pitfall traps have a low catch rate, the yield in forests often is a fraction of a specimen per 100 trap-nights.

If management plans at NASO DNA have the goal to increase biological diversity, then cutting blocks of forest at 4-7 year intervals and allowing natural regeneration of native plants would substantially enhance the diversity of plant communities and these plots in turn would promote the numbers and species of wildlife of all kinds, including small mammals.

5.2.2 Bat Mistnet Survey

Scouting efforts to identify suitable mist net sites were conducted on 6 August 2014, and mist netting began on 6 August and continued through 8 August 2014. A total of 21 bats representing three species were caught during these surveys (Table 5). Species captured included the eastern red bat (*Lasiurus borealis*), southeastern myotis (*Myotis austroriparius*), and evening bat (*Nyctecius humeralis*). There is a significant lack of diversity in the bat species identified during the survey. This could be due to any number of rationale, including the previously discussed WNS die-off, geographic location, or even moon phase.

Records for southeastern myotis occur in surrounding counties, but this species has not been documented in large numbers in southeastern Virginia. Eastern red bats are common throughout Virginia, and evening bats are common in the state’s lower elevations.

While not detected during this effort, another mist net survey completed at NASO DNA in 2015 identified the presence of Rafinesque’s big-eared bat (*Corynorhinus rafinesquii macrotis*) south of Site 3 location (Natural Resource Manager, NASO DNA, 14 January 2016). Details of this record the State endangered species will be available pending completion of that effort’s report in 2016.

Although all the habitats on site are generally high quality, with many standing dead trees and foraging areas, NASO DNA is located directly on the coast and generally has high levels of wind. Bats are generally not strong fliers, and the wind may drive individuals into the sheltered forests – or, there may be a relatively low number of bats present in the area overall.

Table 5. Mist Net Survey Results at NASO DNA, Virginia Beach, Virginia.

Site ID	Date ¹	Rafinesque’s Big-eared Bat	Eastern Red Bat	Southeastern Myotis	Evening Bat	Total Captures
1	8/6/14	-	6	-	-	6
2	8/7/14	-	13	-	1	14
3	8/8/14	-	-	1	-	1
Total		0	19	1	1	21

¹ Sampling periods proceeded past midnight and survey date refers to the date sampling began (e.g., a bat captured at 1 a.m. on 8/02/2014 in real time will be discussed as a bat caught at 1 a.m. on 8/01/2014 because sampling began around 8 p.m. on 8/01/2014).

5.3 BIRDS: PIPING PLOVER, RED KNOT, AND ROSEATE TERN

Three two-day survey events were conducted; 5-6 August 2014, 15-16 September 2014, and on 12 and 14 May 2015. Although no target species were observed during these efforts, two state threatened avian species listed by the VDGIF (VDGIF 2015a) were observed. A state threatened peregrine falcon (*Falco peregrinus*) was observed near point R1-9 during the May 2015 survey,

and state threatened gull-billed tern (*Gelochelidon nilotica*) was observed near point R1-6 during the August 2015 survey.

According to the VDGIF (VDGIF 2015b), the Virginia peregrine falcon population is heavily managed and not yet self-sustaining. Management recommendations include the repair, replacement and creation of new towers and nesting structures on the coast, parasite control and other actions as necessary to ensure the continued nesting success of Virginia's falcons and to maintain a stable coastal population. The peregrine falcon was not observed on NASO DNA during an avian species list study prepared in 2014 (Navy 2014a). The peregrine falcon observation was incidental for birds passing through the Virginia Beach area.

The gull-billed tern was not observed on NASO DNA during an avian species list study prepared by Tetra Tech in 2014, though it is listed on the checklist of birds likely to occur on the facility (Navy 2014a).

No piping plovers (*Charadrius melodus*) were observed during these surveys, or during surveys in conducted in 2010 or 2001; however, the Landing Craft Air Cushion (LCAC) Area of NASO DNA may contain suitable (though not-ideal) beach habitat. Piping plovers were observed in 2013 and 2014 during Navy staff and contractor surveying efforts at NASO DNA. In 2013 there was a pair of plovers in breeding plumage; however, after careful observation no nesting locations were identified. One plover was observed in 2014 that had been banded with its original banding location being Big Island. Again, additional survey efforts were conducted in 2014 that resulted in no nests being identified. It is recommended that yearly checks be conducted for piping plover during nesting season between late April and early August (Navy 2014a, Evans and Belden 2010, Alstine et al 2001).

Roseate tern (*Sterna dougallii dougallii*) was not observed on the facility during these surveys, or previous surveys in 2014 (Navy 2014a). Roseate terns nest on small barrier islands, in hollows or under dense vegetation, debris or rocks hidden from predators. They arrive in breeding areas on the Northeast coast at the end of April, and migrate south in August and September (USFWS 2011a). While potential habitat is present on the facility, it is not ideal, and this species is not likely to utilize the facility.

Red knot (*Calidris canutus rufa*) was not observed on the facility during these surveys. Red knots winter and migrate in large flocks, and require stopover habitats rich with food sources such as spawning invertebrates and juvenile shellfish (USFWS 2013). While potential habitat exists on the facility, it is not ideal, and red knot are not likely to utilize this facility.

The king rail and Virginia rail are considered imperiled (S2) in Virginia and were the focus of the R2 transect surveys. Point count locations were placed in likely habitats for recording the presence of rails on NASO DNA; however, no rails were observed or heard during the three survey seasons.

Other notable observations included immature bald eagles (*Haliaeetus leucocephalus*) fighting on the beach with an osprey (*Pandion haliaetus*). Bald eagles are protected under the Bald Eagle

Protection Act. The Act prohibits taking or possession of bald eagles or any parts including feathers, eggs, and nests.

There are 275 avian species listed as occurring or likely to occur on the facility (Navy 2014a). During the 2014-2015 surveys, 48 species were observed, 47 of which were documented on the previous NASO DNA bird list (Navy 2014a), and are listed in Appendix A.

5.4 INSECTS: BRIMLEY'S ASSASSIN BUG

Very little information is available concerning the distribution and biology of this secretive species, and only a handful of specimens have been collected or reported in the literature since this species was first described in 1926 (Blatchley 1926, Asquith 1992). According to available records, single specimens were collected in Raleigh, North Carolina in 1926; Vernon, Missouri in 1980; Baldwin, Alabama in 1994; Gainesville, Florida in 1966; Virginia Beach, Virginia in 1990; and Columbus, Texas in 1930 (Discover Life Global Mapper 2012, Asquith 1992).

During background research on the species, it was discovered that a single specimen of Brimley's assassin bug was collected in a pitfall trap placed in a grassy interdunal swale at NASO DNA by Dr. Kurt Buhlmann in September 1990 (personal communication, 15 October 2015). The unidentified specimen, along with many others collected during the 1990 field survey, was submitted to the Virginia Museum of Natural History in Martinsville, Virginia. These specimens were not prioritized and it wasn't until later (between 1992 and 2006) that Dr. Richard Hoffman at the Virginia Museum of Natural History identified one of them as Brimley's assassin bug. This finding extended the known range of this species 160 miles northeast of Raleigh, North Carolina (Hoffman 2006). This insect is listed as a species of special concern in the Mid-Atlantic Coastal Plain Focal Area (USFWS 2012b), and is globally ranked G2, and state ranked S1S3 (VDCR-DNH 2013).

The findings show that the Brimley's assassin bug was documented on the facility. Although this finding should be considered an historical record, it is recommended that this species be added to the NASO DNA INRMP, and that future surveys for this species be conducted on NASO DNA. While the 1990 surveys that resulted in capture of the assassin bug were focused on the southern section of NASO DNA, future surveys should target all grassy, interdunal areas of NASO DNA. According to the NASO DNA natural heritage report from 2010, crews surveyed for the Brimley's assassin bug at the northern end of NASO DNA via sweeping vegetation, which involves inspecting flowers with the aid of forceps or a respirator. However, no specimens of Brimley's assassin bug were collected (Evans and Belden 2010). As such, future survey methods should include a combination of sweeping and pitfall trap methods.

5.5 PLANTS AND SIGNIFICANT COMMUNITIES

Two, three-day meander surveys were conducted at different times of the growing season to facilitate identification of the target species: 17, 23, 24 September 2014, and 20-22 April 2015. (Figure 7). Survey areas and periods were selected to target species that would be flowering or

identifiable during the appropriate times, though as much prime habitat as possible was covered during each survey. One targeted plant, Florida thoroughwort¹, was found, and two non-target species, beach pinweed (*Lechea maritima*) and tall horned beaksedge (*Rhynchospora macrostachya*) were observed (Figure 8a and 8b). Beach pinweed and horned beaksedge are considered vulnerable and tracked by DCR-DNH (Towsend 2015). Incidental observations of non-target species are included in Appendix A.

5.5.1 Target Plant Species: Virginia Least Trillium, Blue Witch Grass, Long Beach Seedbox, and Florida Thoroughwort

Seabeach amaranth is a federally threatened plant species that has the potential to occur at NASO DNA, based on the presence of suitable habitat; however, no federally listed plants were identified at NASO DNA. Seabeach amaranth is an annual plant that grows on sandy beaches along the Mid-Atlantic coast of the U.S. (USFWS 2003). Between 2001 and 2005 populations identified from Maryland and Virginia steadily declined due to habitat destruction, poor timing of beach nourishment projects, beach raking, and outdoor recreational vehicle use (USFWS 2007a). In 2001, nine plants were found on the portion of Assateague Island that lies in Virginia, which is approximately 90 miles northeast of NASO DNA.

No occurrences of Virginia least trillium were found during the spring surveys in 2015. The meander surveys in mid-April targeted trillium during its peak season. Given the regional distribution occurring in Virginia Beach, along with the habitat preference of hummocks and bottomland hardwood forests dominated by red maple and tulip poplar, the South Parcel and Camp Pendleton Annex locations were considered suitable habitat. The Digital Atlas of Virginia Flora indicates that the Virginia least trillium occurs in Virginia Beach. However, surveys revealed no observations of Virginia least trillium.

No occurrences of blue witch grass or long beach seedbox were observed in the September 2014 surveys. The meander surveys included the preferred habitats of interdunal swales, wet flatwoods, ditches, and borrow ponds on NSAO DNA. A 2010 Virginia Natural Heritage Program study (Evans and Belden 2010) reported the presence of long beach seedbox (S2); the small colony (0.01 ha) was being encroached by common reed. The 2010 location of long beach seedbox was searched in September 2014 and found to be covered in common reed, which eliminated other species. The installation contracted a common reed removal effort that started in the fall of 2014 in this area (and elsewhere on the installation).

Florida thoroughwort was found on NASO DNA during the fall survey of 2014 (Figure 8a and 8b). The target species is considered a federal Species of Concern. While it is not listed on Virginia's 2015 list of rare plants (Towsend 2015), NatureServe lists it as critically imperiled (S1) in Virginia, known to inhabit wet depressional dunes and savannahs (NatureServe 2015). Location of the targeted species included low lying wet depressions and margins between access

¹ Digital Atlas of the Virginia Flora, <http://vaplantatlas.org/index.php?do=plant&plant=2066>

roads and adjacent dunes, on the transition from scrub shrub to dune and intertidal swale habitats.

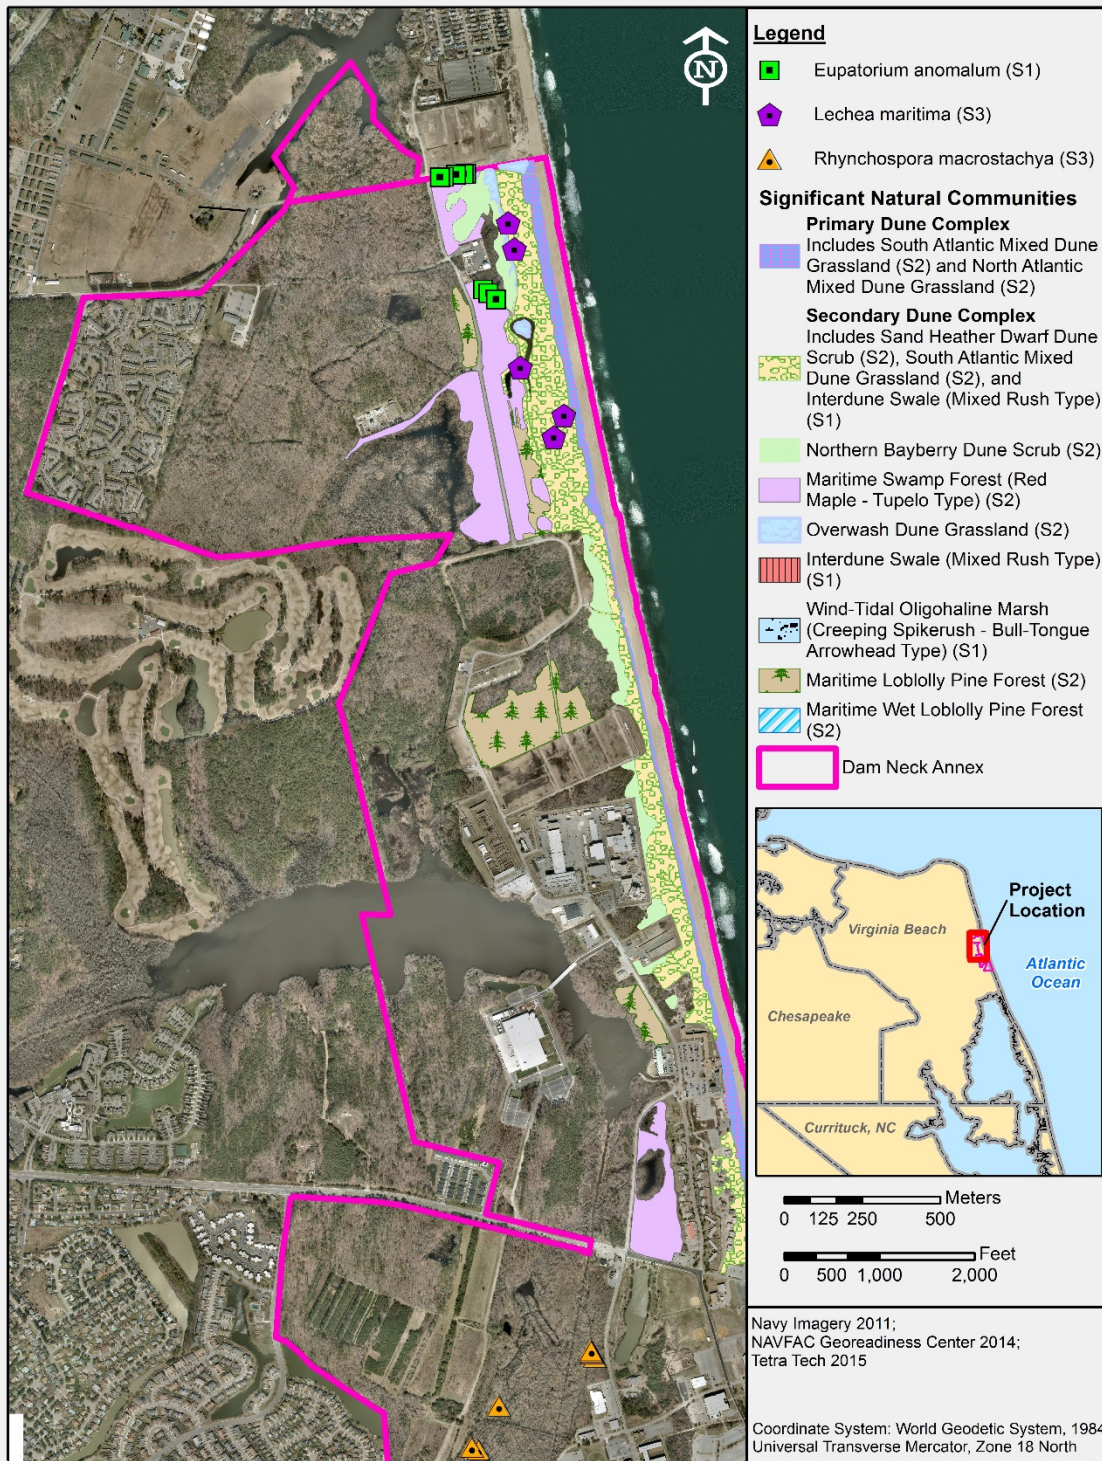

Figure 8a. Plant Survey Results - North, NASO DNA, Virginia Beach, Virginia.

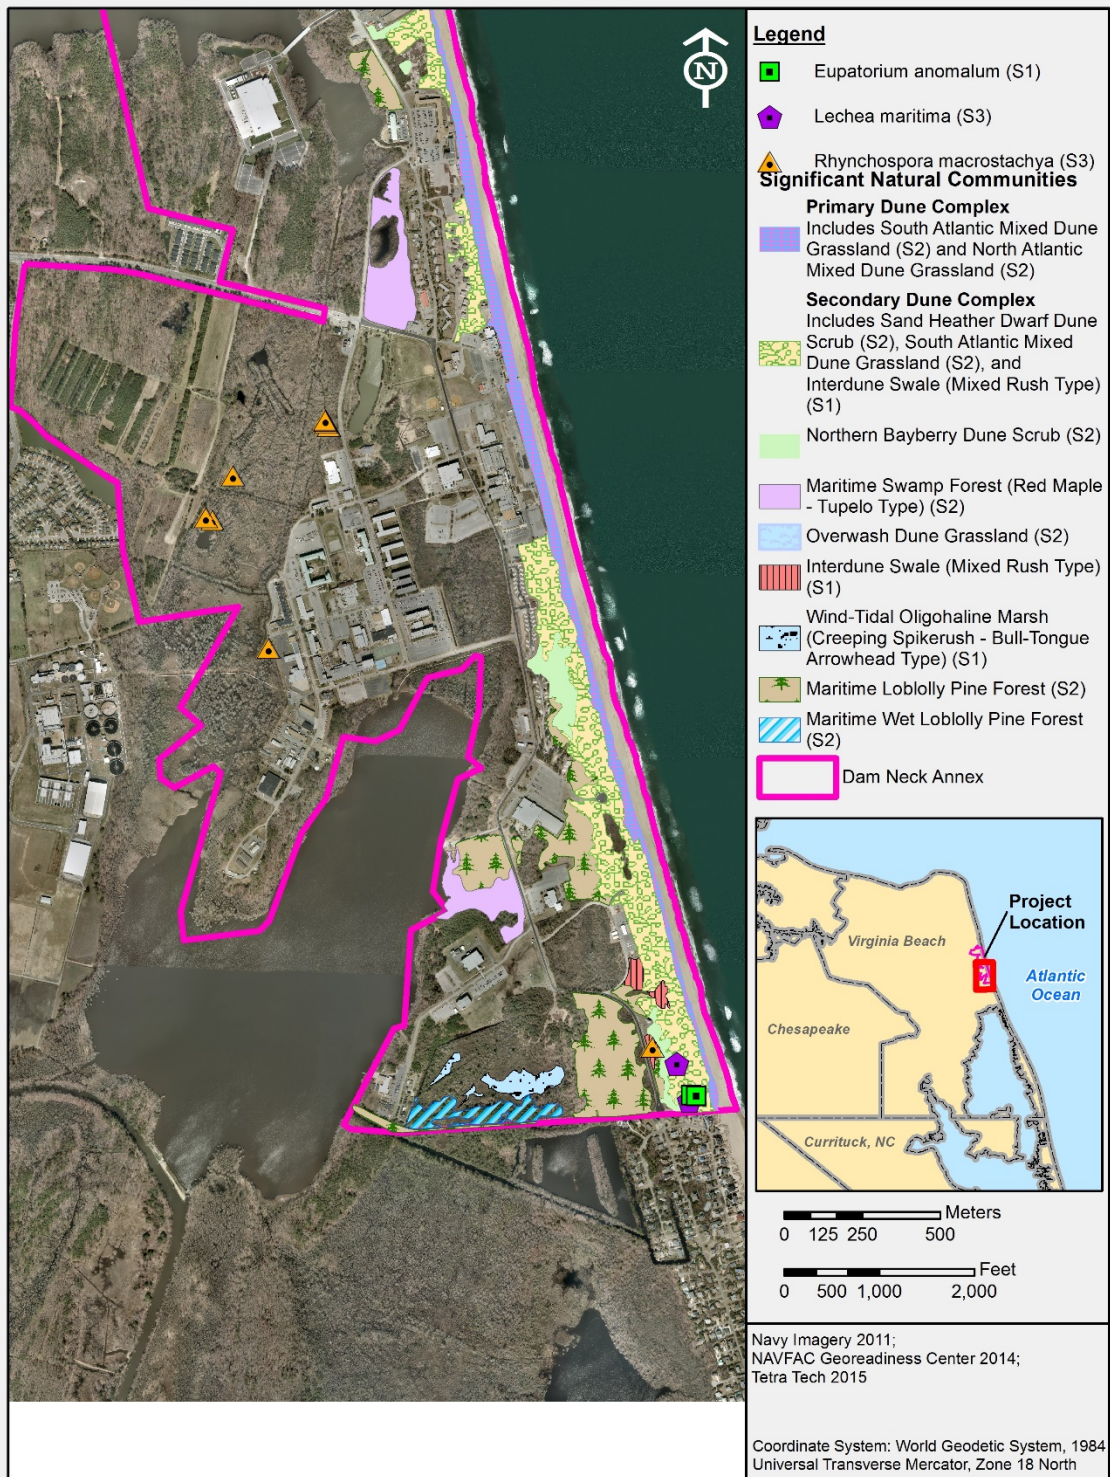

Figure 8b. Plant Survey Results - South, NASO DNA, Virginia Beach, Virginia.

5.5.2 Non-Target Plant Species: Beech Pinweed and Tall Horned Beaksedge

Scattered plants of beach pinweed were observed in the secondary sand dunes, Beach-heather Dune Shrubland community, where large patches of sparsely vegetated or unvegetated sand are common at NASO DNA. This community is locally common on coastal dunes from New Jersey to northern North Carolina. Associated plants included *Hudsonia tomentosa*, *Morella pensylvanica*, *Morella cerifera*, *Schizachyrium littorale*, *Ammophila breviligulata*, and *Panicum amarum*.

Individual plants and small clumps of tall horned beaksedge were observed (Figure 8a and 8b) in the Bald Cypress Swamp community type at NASO DNA. One community was mapped on the eastern portion of NASO DNA, an emergent wetland between an access road and a scrub shrub dune. Tall horned beaksedge is on the Watch List Species List (S3) for the Virginia Natural Heritage Program (Townsend 2015). The seasonally to semipermanently flooded swamp forests occur throughout the Coastal Plain from Delaware south to Florida. Associated plants included *Persicaria arifolia*, *Juncus canadensis*, *Scirpus cyperinus*, *Taxodium distichum*, and *Acer rubrum*. A 2010 Virginia Natural Heritage Program study (Evans and Belden 2010) reported the presence of tall horned beakrush (S3).

5.5.3 Significant Natural Communities

There are 12 significant communities (S1-S3 ranks) at NASO DNA (Table 6). The communities are represented in six ecological systems. Brief descriptions of each community from *Nature Serve Explorer* (NatureServe 2015) are presented below.

The Northern Bayberry Dune Scrub community occupies the intermediate areas between the very unstable oceanward portions of the dunes and the more protected backdunes, where it forms partially open to dense shrub thickets. The Sand Heather Dwarf Dune Scrub community is a maritime beach heather community of mid-Atlantic sand dunes and is locally common on coastal dunes from New Jersey to northern North Carolina. The South Atlantic Mixed Dune Grassland consists primarily of grasslands and related shrublands of Atlantic Coastal Plain barrier islands and related coastal areas from Virginia south to northern and central Florida.

The North Atlantic Mixed Dune Grassland community is a maritime dune grassland from southern New Jersey (Cape May) south to the Chesapeake Bay, Virginia, as well as on the northern North Carolina coast. The Maritime Swamp Forest community is a forested basin swamp of dune swales on barrier islands and other mid-Atlantic coastal areas. The Overwash Dune Grassland community is an upland dune grassland or overwash area of Atlantic barrier islands on dunes or back sides of beaches forming from wave-deposited sand during spring tides or storms. The Interdune Swale community occurs in small, shallow, saturated depressions of the Eastern Shore of Maryland and Virginia. The North Atlantic Upper Beach/Overwash Flat community is a sparsely vegetated upper beach community occurring on unstable sands and often gravels and cobbles just above mean high tide on maritime beaches and foredunes along the middle and northern Atlantic Coast. The Wind-Tidal Oligohaline Marsh community of Maryland, Virginia, and North Carolina occurs on the interior of extensive marshes, well away from tidal channels or guts and is inundated primarily by wind tides and, less commonly, lunar tides.

The Maritime Loblolly Pine Forest community occurs on the Outer Coastal Plain and on barrier islands in sheltered backdunes protected from salt spray and overwash. The Maritime Wet Loblolly Pine Forest community occurs in backdune depressions with high water tables and fringing estuaries from Delaware to North Carolina. The Coastal Plain/Piedmont Floodplain Swamp community of the Mid-Atlantic Coastal Plain of the Chesapeake Bay and Piedmont regions occurs on poorly drained to very poorly drained soils on flats and along watercourses that are seasonally to semipermanently flooded.

Table 6. Significant Natural Communities at NASO DNA, Virginia Beach, Virginia.

Ecological System	Common Name	State Rank
Northern Atlantic Coastal Plain Dune and Swale	Northern Bayberry Dune Scrub	S2
Northern Atlantic Coastal Plain Dune and Swale	Sand Heather Dwarf Dune Scrub	S2
Southern Atlantic Coastal Plain Dune and Maritime Grassland	South Atlantic Mixed Dune Grassland	S2
Northern Atlantic Coastal Plain Dune and Swale	North Atlantic Mixed Dune Grassland	S2
Central Atlantic Coastal Plain Maritime Forest	Maritime Swamp Forest (Red Maple - Tupelo Type)	S2
Northern Atlantic Coastal Plain Dune and Swale	Overwash Dune Grassland	S2
Northern Atlantic Coastal Plain Dune and Swale	Interdune Swale (Mixed Rush Type)	S1
Central Atlantic Coastal Plain Sandy Beach	North Atlantic Upper Beach/Overwash Flat	S3
Atlantic Coastal Plain Embayed Region Tidal Freshwater Marsh	Wind-Tidal Oligohaline Marsh (Creeping Spikerush - Bull-Tongue Arrowhead Type)	S1
Northern Atlantic Coastal Plain Maritime Forest	Maritime Loblolly Pine Forest	S2
Central Atlantic Coastal Plain Maritime Forest	Maritime Wet Loblolly Pine Forest	S2
Northern Atlantic Coastal Plain Basin Swamp and Wet Hardwood Forest	Coastal Plain/Piedmont Floodplain Swamp (Green Ash - Red Maple Type)	S3/S4

6.0 SPECIAL INTEREST AREA BACKGROUND AND RECOMMENDATIONS

Because of the intense level of development in the region, NASO DNA and the other coastal military installations with large areas of undeveloped land are extremely important to the region's ecology. These installations, along with First Landing State Park (formerly Seashore State Park) to the north and BBNWR and False Cape State Park to the south, support the few remaining tracts of undeveloped dune ecosystems along the southeastern Virginia coast. NASO DNA contains approximately 4.0 continuous mi (6.4 km) of primary and secondary coastal dune habitat.

Previous natural heritage surveys resulted in the establishment of six ecologically significant areas at NASO DNA (VDCR-DNH 1990 and Buhlmann et. al. 1992). This section provides a brief overview of these ecologically significant areas—collectively referred to as SIAs—and provides descriptions of proposed modifications to their current boundaries as well as recommendations for additional protection areas. Base on a review of historic information and data gathered during this study, a modification to one existing SIA and the addition of two SIAs are recommended (Figure 9).

6.1.1 Existing Special Interest Areas

In 1990 at the request of the Navy, DCR-DNH conducted rare, threatened and endangered species surveys at Camp Pendleton (VDCR-DNH 1990). In the resultant report, DCR-DNH biologists identified and described two ecologically significant areas at NASO DNA referred to as Dune and Swale SIA and Lovetts Marsh SIA. The report for a similar survey of the rest of NASO DNA in 1992 provided recommendations to extend both the Dune and Swale SIA and Lovetts Marsh SIA south and described four additional SIAs, Helicopter Pad Wetlands, Southeast Redwing Lake Wetlands, Interdunal Swale, Dune and Freshwater Marsh, and Middle Beach Dunes (Buhlmann et. al. 1992) (Figure 9). Subsequent natural heritage survey reports maintained root names of these protection areas but alternated referring to them as resource protection areas or conservation sites.

DCR-DNH tracks conservation sites via their Land Conservation database and makes the data available through a subscription service to licensed public and private partners of the Virginia Natural Heritage Program (VDCR 2013). DCR-DNH describes conservation sites as follows:

“Conservation sites are a tool for representing key areas of the landscape worthy of protection and stewardship action because of the natural heritage resources and habitat they support. Terrestrial conservation sites are boundaries that contain one or more rare plant, animal or natural community. Sites are designed to include the element and, where possible, its associated habitat and buffer or other adjacent land needed for the element's conservation.”

The following sections describe each of the existing SIAs at NASO DNA. Descriptions of each area are taken from the most recent installation INRMP (Navy 2014). Additional information including management recommendations for each SIA can be found in the INRMP as well.

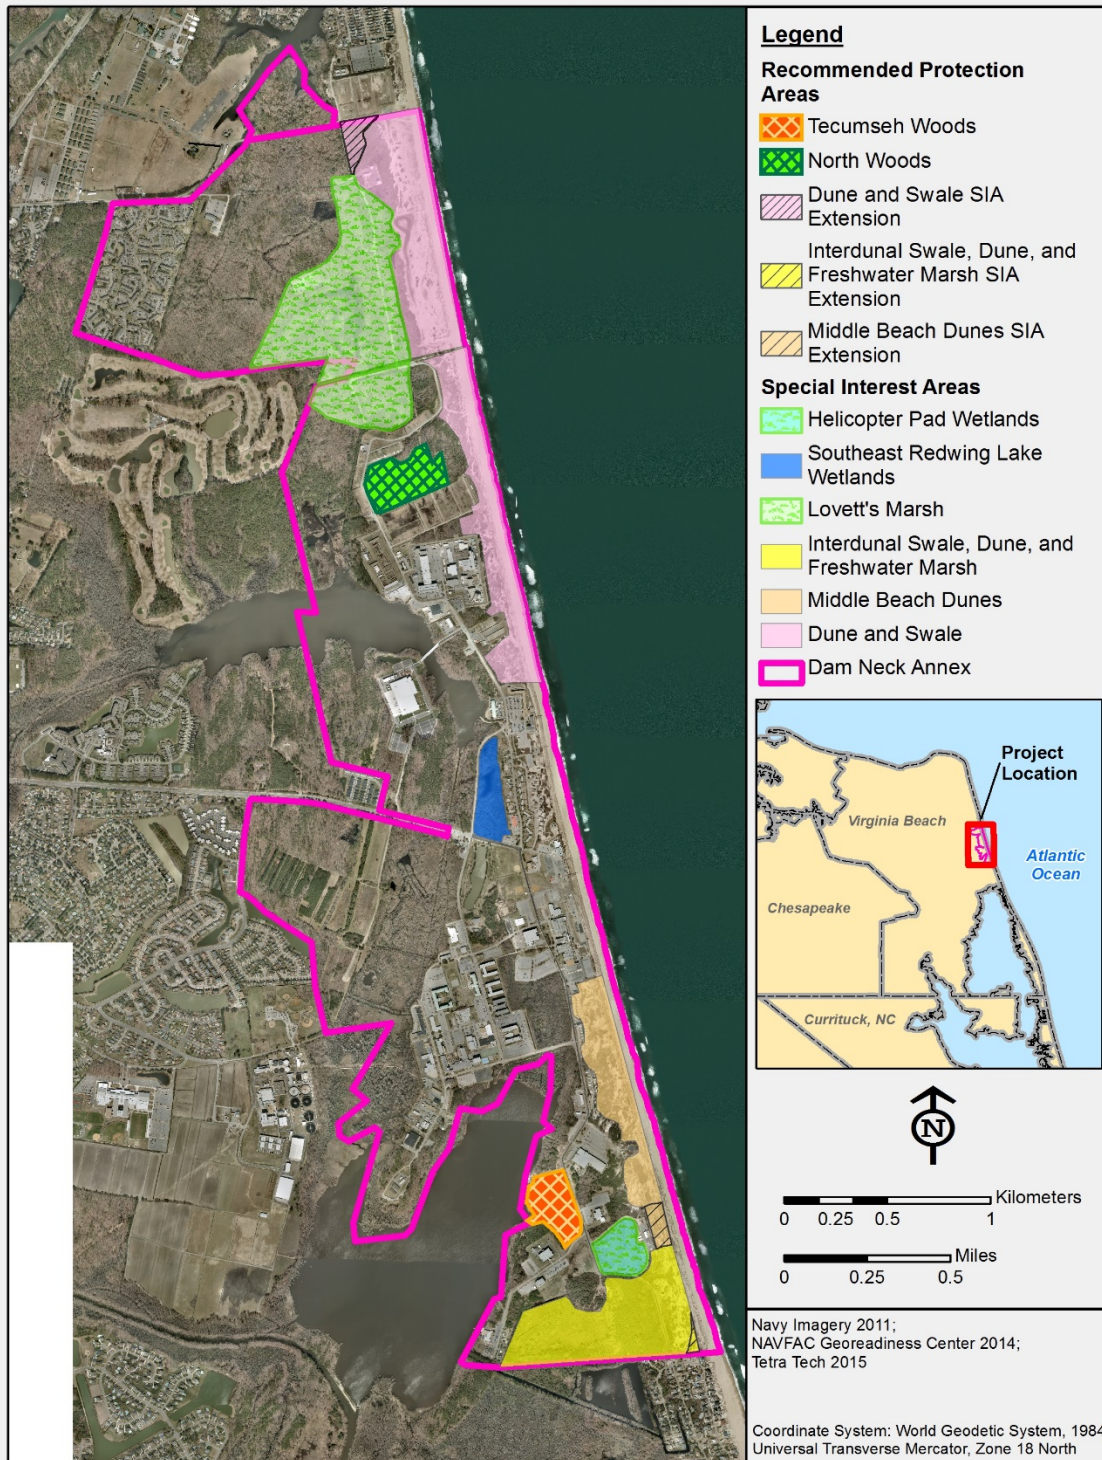

Figure 9. Special Interest Areas and Recommended Protection Areas at NASO DNA, Virginia Beach, Virginia.

Dune and Swale Special Interest Area

The Dune and Swale SIA at NASO DNA contains the Installation's most significant maritime forest community, a small interdunal swale, and includes a number of sensitive plant species, including bluejack oak, American halfchaff sedge, Long Beach primrose-willow, fasciculate beaksedge, and early white-top fleabane. Bluejack oak, Long Beach primrose-willow, and early white-top fleabane are both imperiled (S2) and fasciculate beaksedge and American halfchaff sedge are critically imperiled (S1) in Virginia (Townsend 2015). The current extent encompasses approximately 135 ac (54 ha), and consists of an approximately 1.75-mi (1.2-km) long, approximately 0.2-mi (0.3 km) wide section of beach, dunes, and interdune. An interdune pond, which is a significant natural community, occurs immediately south of the Marine Air Control Squadron 24 radar station. The pond, although apparently altered by dredging and impoundment by a road, supports an interesting assemblage of native vascular plant species.

During the 2014-2015 plant surveys, several occurrences of Florida thoroughwort were documented just outside the SIA boundary at the northern end of the SIA (Figure 8a). Similarly, a portion of an imperiled natural community, Maritime Swamp Forest (Red Maple – Tupelo Type) (S2) extends north to this location as well. Therefore, it is recommended that the boundary of the Dune Swale SIA is extended west to Regulus Avenue at its north end in order to encompass this population of Florida thoroughwort and the section of Maritime Swamp Forest (Figure 9).

Lovetts Marsh Special Interest Area

The Lovetts Marsh SIA is approximately 124 ac (50 ha) and contains what remains of an isolated emergent marsh documented on 1891 topographic maps as the only site of its kind from Cape Henry to the North Carolina border. The VDCR-DNH report (Van Alstine et al. 2001) states that open areas of marsh were evident on aerial photographs as late as 1965, and that later ditching and development lowered the water table, increased the drainage rate, and resulted in the succession from open marsh to forested wetland. State-rare plants fasciculate beaksedge and saltmarsh umbrella-sedge as well as a significant interdune pond community also have been reported to occur within the boundaries of this SIA (Van Alstine et al. 2001). The boundary of the SIA includes the significant community, rare plants, and the surrounding buffer area needed to protect the hydrology of the site.

Southeast Redwing Lake Wetlands Special Interest Area

The Southeast Redwing Lake Wetlands SIA provides habitat for the greater siren, a former state watch list species and a Tier IV (Moderate Conservation Need) species identified in the Virginia State Wildlife Action Plan (SWAP).

Middle Beach Dunes Special Interest Area

The Middle Beach Dunes SIA encompasses an extensive area of vegetated primary and secondary dunes and areas of interdunal swale wetlands. The dune system in this protected area is relatively undisturbed and supports a large area of maritime dune woodland, which is considered a significant natural community by the VDCR-DNH.

Helicopter Pad Wetlands Special Interest Area

The Helicopter Pad Wetlands SIA was designed to protect a wetland community that contains American spongeplant and greater siren habitat. The greater siren is currently a Tier IV (Moderate Conservation Need) species in the Virginia SWAP, and is a former state watch list species. The American spongeplant is no longer tracked by the VDCR-DNH; however, it is in the Navy's best interest to continue to protect the habitats of these fairly rare species in order to maintain their current population levels and prevent them from becoming state or federally protected.

Interdunal Swale, Dune, and Freshwater Marsh Special Interest Area

The Interdunal Swale, Dune, and Freshwater Marsh SIA in the southern portion of NASO DNA contains the most significant example of interdunal swale wetlands at the installation. Although this swale is bisected by Regulus Avenue and has been partially filled, it is a unique habitat type that supports two state-rare plant species: the early white-top fleabane, imperiled (S2), and fasciculate beaksedge, critically imperiled (S1). The swale wetland and its unique vegetation extend to the west side of Regulus Avenue to an area that was planted with loblolly pines during the 1970s.

6.1.2 Proposed Special Interest Areas

Analysis of the locations of rare species and significant natural communities indicates that a majority of these sensitive resources occur within the boundary of an existing SIA. However, approximately five small to medium-sized tracts of forest that are classified as Loblolly Maritime Pine Forest do not (Figure 8a and 8b). Maritime Pine Forest communities are considered Imperiled (S2) and for this reason, the two most extensive occurrences of this natural community at NASO DNA are recommended for protection (Figure 9). These areas are referred to as Tecumseh Woods and North Woods SIAs.

Furthermore, the boundary of three existing SIAs were extended to include relatively small but contiguous areas of similar habitat. It appears that small areas were arbitrarily excluded from the original SIA boundaries during the mapping process. These areas are identified as Dune and Swale SIA Extension, Interdunal Swale, Dune, and Freshwater Marsh SIA Extension, and Middle Beach Dunes SIA Extension in Figure 9.

7.0 CONCLUSION

The purpose of this study was to conduct field surveys to determine the presence of state or federally listed threatened or endangered species, or species of concern that may occur at NASO DNA and Camp Pendleton and to review existing ecological significant area designations and identify the need for modifications. This Project is a continuation of other natural heritage surveys conducted approximately 5 and 15 years prior and is part of the Navy's program for the conservation of endangered and threatened species on its properties.

The overall project objectives were met through the successful implementation of field surveys to document the presence of state and federally listed threatened or endangered species, or rare species with the potential for occurring at the installations. In summary, two state listed threatened species, one targeted species, and two rare species were documented across the installation. These include two state listed threatened birds (peregrine falcon and gull billed turn), one targeted state listed critically imperiled plant (Florida thoroughwort), and two rare plant species (beach pinweed and tall horned beaksedge). In addition, 12 significant ecological communities were identified at NASO DNA and their locations mapped. Finally, a review of the installation's ecologically significant areas was completed and recommendations provided that include modifications to an existing SIA as well as the addition of two new SIAs at NASO DNA.

The results and recommendations presented herein provide a better understanding of the sensitive species that inhabit these installations, knowledge that is critical for guiding habitat management decisions, and guidance towards improving natural resource inventories. This information will be used to contribute to management plans designed to provide a sustainable, integrated management strategies for sensitive species support of the Navy's mission of ensuring healthy lands for long-term use of installations for military training and readiness activities.

APPENDIX A

Project Species List

Fauna and Flora Observed at NASO DNA (2014-2015), Virginia.

Common Name	Scientific Name
Amphibians and Reptiles	
<i>Salamanders</i>	
Slimy salamander	<i>Plethodon chlorobryonis</i>
<i>Frogs and Toads</i>	
American bull frog	<i>Lithobates catesbeianus</i>
Easter narrow-mouthed toad	<i>Gastrophryne carolinensis</i>
Green treefrog	<i>Hyla cinerea</i>
Northern green frog	<i>Lithobates clamitans</i>
Pickerel frog	<i>Lithobates palustris</i>
Pine woods treefrog	<i>Hyla femoralis</i>
Southern leopard frog	<i>Lithobates sphenoccephalus</i>
Southern toad	<i>Anaxyrus terrestris</i>
Squirrel treefrog	<i>Hyla squirella</i>
<i>Lizards</i>	
Southeastern Five-lined skink	<i>Plestiodon inexpectatus</i>
<i>Snakes</i>	
Black racer	<i>Coluber constrictor</i>
Eastern kingsnake	<i>Lampropeltis getula</i>
Eastern worm snake	<i>Carphophis amoenus</i>
Red-bellied watersnake	<i>Nerodia erythrogaster</i>
<i>Turtles</i>	
Eastern box turtle	<i>Terrapene carolina carolina</i>
Eastern mud turtle	<i>Kinosternon subrubrum</i>
Eastern painted turtle	<i>Chrysemys picta</i>
Musk turtle	<i>Sternotherus odoratus</i>
Red-bellied cooter	<i>Pseudemys rubriventris</i>
Snapping turtle	<i>Chelydra serpentina</i>
Yellow-bellied slider	<i>Trachemys scripta scripta</i>
Mammals	
Eastern red bat	<i>Lasiurus borealis</i>
Evening bat	<i>Nyctecius humeralis</i>
Southeastern myotis	<i>Myotis austroriparius</i>
Birds	
Bald eagle	<i>Haliaeetus leucocephalus</i>
Black backed gull	<i>Larus fuscus</i>
Black skimmer	<i>Rynchops niger</i>
Brown pelican	<i>Pelecanus occidentalis</i>
Brown thrasher	<i>Toxostoma rufum</i>
Canada goose	<i>Branta canadensis</i>
Cardinal	<i>Cardinalis cardinalis</i>

Common Name	Scientific Name
Carolina chickadee	<i>Poecile carolinensis</i>
Chimney swift	<i>Chaetura pelagica</i>
Common crow	<i>Corvus brachyrhynchos</i>
Common grackle	<i>Quiscalus quiscula</i>
Common tern	<i>Sterna hirundo</i>
Double crested cormorant	<i>Phalacrocorax auritus</i>
Downey woodpecker	<i>Picoides pubescens</i>
Forester's tern	<i>Sterna forsteri</i>
Glossy ibis	<i>Plegadis falcinellus</i>
Great blue heron	<i>Ardea herodias</i>
Great egret	<i>Ardea alba</i>
Green heron	<i>Butorides virescens</i>
Gull-billed tern	<i>Gelochelidon nilotica</i>
Hairy woodpecker	<i>Leuconotopicus villosus</i>
Herring gull	<i>Larus smithsonianus</i>
Laughing gull	<i>Leucophaeus atricilla</i>
Least sandpiper	<i>Calidris minutilla</i>
Least tern	<i>Sternula antillarum</i>
Long billed dowitcher	<i>Limnodromus scolopaceus</i>
Mallard	<i>Anas platyrhynchos</i>
Osprey	<i>Pandion haliaetus</i>
Peregrine falcon	<i>Falco peregrinus</i>
Pie billed grebe	<i>Podilymbus podiceps</i>
Pileated woodpecker	<i>Hylatomus pileatus</i>
Pileated woodpecker	<i>Hylatomus pileatus</i>
Purple martin	<i>Progne subis</i>
Red bellied woodpecker	<i>Melanerpes carolinus</i>
Red breasted murganser	<i>Mergus serrator</i>
Ring billed gull	<i>Larus delawarensis</i>
Robin	<i>Turdus migratorius</i>
Rock dove	<i>Columba livia</i>
Royal tern	<i>Thalasseus maximus</i>
Ruby throated hummingbird	<i>Archilochus colubris</i>
Ruddy turnstone	<i>Arenaria interpres</i>
Sanderling	<i>Calidris alba</i>
Semi palmated plover	<i>Charadrius semipalmatus</i>
Semi palmated sandpiper	<i>Calidris pusilla</i>
Spotted sandpiper	<i>Actitis macularius</i>
Virginia rail	<i>Rallus limicola</i>
Whimbrel	<i>Numenius phaeopus</i>
Willet	<i>Tringa semipalmata</i>
Yellow shafted flicker	<i>Colaptes auratus auratus</i>

Common Name	Scientific Name
Plants	
Red maple	<i>Acer rubrum</i>
Green dragon	<i>Arisaema dracontium</i>
Jack-in-the-pulpit	<i>Arisaema triphyllum</i>
Giant cane	<i>Arundinaria gigantea</i>
Asiatic sand sedge	<i>Carex kobomugi</i>
Centella	<i>Centella asiatica</i>
Florida thoroughwort	<i>Eupatorium anomalum</i>
Manyflower marshpennywort	<i>Hydrocotyle umbellata</i>
Canada rush	<i>Juncus canadensis</i>
Beach pinweed	<i>Lechea maritima</i>
Sweetgum	<i>Liquidambar styraciflua</i>
Southern twayblade	<i>Listera australis</i>
Marsh seedbox	<i>Ludwigia palustris</i>
creeping primrose-willow	<i>Ludwigia repens</i>
Asian dayflower	<i>Murdannia keisak</i>
Blackgum	<i>Nyssa sylvatica</i>
Halberd-leaf tearthumb	<i>Persicaria arifolia</i>
Longleaf pine	<i>Pinus palustris</i>
Pond pine	<i>Pinus serotina</i>
Loblolly pine	<i>Pinus taeda</i>
Common reed	<i>Phragmites australis</i>
Mayapple	<i>Podophyllum peltatum</i>
Tall horned beaksedge	<i>Rhynchospora macrostachya</i>
Woolgrass	<i>Scirpus cyperinus</i>
Bald cypress	<i>Taxodium distichum</i>
Poison ivy	<i>Toxicodendron radicans</i>
Highbush blueberry	<i>Vaccinium corymbosum</i>

APPENDIX C

Field Data

Barking Treefrog survey for May 12, 2015 at CDSA Dam Neck

Kory Steele

Notes for each site are included on the second page.

Site #	01	03	05	06	07	08	11	12	13	14	22
Wind Scale	1	0	2	1	0	2	1		2	1	2
Sky Code	1	1	1	0	1	1	1		1	1	1
Air Temperature (F)	80	79	81	76	78	77	77		77	77	76
Time	8:55	9:14	8:33	10:45	9:34	9:43	9:53		10:11	10:01	10:21
Species	Calling Index	Calling Index	Calling Index	Calling Index	Calling Index	Calling Index	Calling Index	Calling Index	Calling Index	Calling Index	Calling Index
<i>Anaxyrus terrestris</i> Southern Toad		3								3	2
<i>Gastrophryne carolinensis</i> Eastern Narrow-mouthed Toad			1								
<i>Hyla cinerea</i> Green Treefrog	2	3	3	2	2					2	
<i>Hyla femoralis</i> Pinewoods Treefrog									1		
<i>Hyla squirella</i> Squirrel Treefrog					2		2		1		3
<i>Lithobates catesbeianus</i> American Bullfrog		1	1								
<i>Lithobates clamitans</i> Green Frog	1			1							
<i>Lithobates sphenoccephalus</i> Southern Leopard Frog	1		2	1					1		1
<i>Lithobates palustris</i> Pickerel Frog				1			1		2		
No species heard calling						0		NA			
Noise Interference:	Road Traffic				Building HVAC						

Comments:

01) None

03) None

05) More frogs were calling from the adjacent pond than the wetland. Frogs were calling from approximately 100 feet away in the wetland.

06) A strong Southern Toad chorus heard across Terrier Ave to the west. Nesting Yellowbelly Slider and roadkilled cottonmouth found near the monitoring point (floating dock).

07) None

08) No frogs calling. Water depth ~6 inches, plenty of graminoid growth. Southern Leopard frog observed in wetland.

11) None

12) Regulus Ave was closed to traffic. Site was not accessible.

13) A strong Green Treefrog chorus heard to the southwest.

14) Calls were relatively distant, most frogs were >100ft away from the road.

22) New site added opportunistically based audible chorus from 400 ft away and easy access.

General: May 12, 2015 was an unusually hot day, and this altered the species composition of the frog choruses. The conditions were in line with acceptable weather for breeding frogs, including the Barking Treefrog. This is support by species composition mostly consisted of typically summer breeders.

Weather

Prior to the survey: 0.47 inches of precipitation fell in the morning. A strong storm was forecasted, as of 5:30pm on the day of the survey, to hit the installation around 7 pm. However, no precipitation occurred during the survey. The high temperature for the day was 95.2F, low temperature around 69.6F. Lightening was persistent over the ocean.

Barking Treefrog survey for June 2, 2015 at CDSA Dam Neck

Kory Steele

Notes for each site are included on the second page.

Site #	01	03	05	06	07	08	11	12	13	14	22
Wind Scale	1	2	3	1	3	2	2		3	2	2

<i>Hyla cinerea</i> Green Treefrog		2	2	3	2					2	3
<i>Hyla femoralis</i> Pinewoods Treefrog									1		
<i>Hyla squirella</i> Squirrel Treefrog					2		3				3
<i>Lithobates catesbeianus</i> American Bullfrog	1		1								
<i>Lithobates clamitans melanota</i> Northern Green Frog	1	1									
No species heard calling						0		0			
Noise Interference:										Surf from nearby ocean	

Comments:

01) None

03) None

05) More frogs were calling from the adjacent pond than the wetland. Frogs are calling from approximately 100 feet away in the wetland.

06) None

07) Minnows and a medium sized snapping turtle were observed in the water. Toad calling could possibly be an American toad and not a Southern toad. Confirmation is pending.

08) No frogs calling. Water depth ~6 inches, plenty of graminoid growth.

11) None

12) Regulus Ave was closed to traffic. Site was not accessible.

13) None

14) Calls were relatively distant, most frogs were >100ft away from the road.

22) None

Weather

Prior to the survey, 2.6 inches of precipitation fell in the afternoon of the survey. A cold front associated with the storm dropped the temperatures by 20F. The temperature at any site was heavily influenced by a lack of trees and wind from the ocean. Despite cooler temperatures, choruses were strong and with typical summer breeders. Site 07 had the coldest temperature but had choruses consistent with the May 12, 2015 survey when it was 10F warmer. Temperatures during the survey were above the minimum required temperature for the date in the Virginia Frog and Toad Survey Training Manual (page 14).

APPENDIX D

Permits for Species Surveys

Virginia Department of Game and Inland Fisheries

4010 West Broad Street, P.O. Box 11104, Richmond, VA 23230-1104
(804) 367-1000 (V/TDD)

Under Authority of § 29.1-412, § 29.1-417, & § 29.1-568 of the Code of Virginia & DGIF Policy E-1-90

Threatened/Endangered Species Permit

Permit Type: New

Fee Paid: \$40.00

VADGIF Permit No. 053961

Permittee: **Rebecca Kipp**
Address: **Tetra Tech, Inc.**
234 Mall Boulevard, Suite 260
King of Prussia, PA 19406

Office: (302) 354-0529
City/County:

Contract Species Surveys

Authorized Collection Methods: By Hand/Nets-Traps (Fyke/Hoop/D-Frame)/Visual Encounter (turning over rocks/logs)
Authorized Waterbodies: All within Naval Facility NASO Dam Neck Annex
Authorized Marking Techniques: N/A

Authorized Counties / Cities:
Virginia Beach

Permittee MUST notify VDGIF within the 7 day period prior to each sampling event. Notification must be made via email to: collectionpermits@dgif.virginia.gov

Report Due: 31 January 2016

ALL PERMIT REPORTS MUST CONTAIN COORDINATES; PERMITTEE CAN USE THE VIRGINIA FISH AND WILDLIFE INFORMATION SERVICE (VAFWIS) TO OBTAIN COORDINATES BY VISITING:
[HTTP://VAFWIS.ORG/FWIS](http://VAFWIS.ORG/FWIS)

STANDARD CONDITIONS ATTACHED APPLY TO THIS PERMIT.

Authorized Species:

Description

Canebrake Rattlesnake
Eastern Chicken Turtle
Eastern Glass Lizard

ID Number

Scientific Name

Crotalus horridus
Deirochelys reticularia reticularia
Ophisaurus ventralis

Authorized Sub-Permittees:

Dr. Joseph Mitchell, Mitchell Ecological Research LLC

Approved by:

Title: James E. Husband - Permits Manager

Applicants may appeal permit decisions within 60 days of issuance. The appeal must be in writing to the Director, Department of Game and Inland Fisheries.

Date: 4/15/2015

20

Permit Effective

4/15/2015

through

12/31/2015

15

Virginia Department of Game and Inland Fisheries

4010 West Broad Street, P.O. Box 11104, Richmond, VA 23230-1104
(804) 367-1000 (V/TDD)

Under Authority of § 29.1-412, § 29.1-417, & § 29.1-418 of the Code of Virginia

Scientific Collection Permit

Permit Type: New

Fee Paid: \$40.00

VADGIF Permit No. 052628

Permittee: **Dr. Robert K Rose**
Address: **Old Dominion University - Dept. of Biology**
Hampton Boulevard
Norfolk, VA 23529-0266

Office: (757) 343-4409
City/County:

Populations Studies using Capture/Mark and Re-Capture Methods/Biomonitoring/Contract Species

Authorized Collection Methods: Live-Traps (Box/Pitfall/Funnel/Bell/Pot)/Kill Traps (Pitfall/Snap Traps)
Authorized Waterbodies: N/A
Authorized Marking Techniques: Ear Tags

Authorized Counties / Cities:
Northampton
Chesapeake
Suffolk
Virginia Beach

PERMIT AMENDMENT 10/23/2014: This amendment adds the following:

Authorized Species: Southeastern Shrew
Authorized Method: Kill Traps (Pitfall/Snap Traps)
Authorized Subpermittees: Brent Ashley/Emily Marino

Permittee MUST notify VDGIF a minimum of 7 days prior to each sampling event.
Notification must be made via email to: collectionpermits@dgif.virginia.gov

Report Due: 31 January 2015, 31 January 2016

ALL PERMIT REPORTS MUST CONTAIN COORDINATES; PERMITTEE CAN USE THE VIRGINIA FISH AND WILDLIFE INFORMATION SERVICE (VAFWIS) TO OBTAIN COORDINATES BY VISITING:
[HTTPS://FWISWEB1.DGIF.VIRGINIA.GOV/FWIS/INDEX.HTML](https://fwisweb1.dgif.virginia.gov/fwis/index.html)

STANDARD CONDITIONS ATTACHED APPLY TO THIS PERMIT.

Authorized Species:

Description
Small Mammals
Southeastern Shrew
Annual Report Due End of Each Year

ID Number

Scientific Name

Sorex longirostris longirostris

Authorized Sub-Permittees:

Jana M Eggleston, Old Dominion University
Kathryn Rogers, Old Dominion University
Brent Ashley, Kerr Environmental
Emily Marino, Kerr Environmental

Virginia Department of Game and Inland Fisheries

4010 West Broad Street, P.O. Box 11104, Richmond, VA 23230-1104

Under Authority of § 29.1-412, § 29.1-417, & § 29.1-418 of the Code of Virginia

Scientific Collection Permit

Permit Type: New Fee Paid: \$40.00 VADGIF Permit No. **051933**

Permittee: **Dave Yates**
Address: **Biodiversity Research Institute**
19 Flaggy Meadow Road
Gorham, ME 04038

Office: (207) 839-7600
City/County: Out of State

Contract Species Surveys

Authorized Collection Methods: Harp Traps for Bats/Terrestrial Mist Nets
(Bats/Birds)
Authorized Waterbodies: N/A
Authorized Marking Techniques: N/A

Authorized Counties / Cities:
York
Norfolk

Permittee MUST notify VDGIF a minimum of 7 days prior to each sampling event.
Notification must be made via email to: collectionpermits@dgif.virginia.gov

Report Due: 31 January 2015, 31 January 2016

ALL PERMIT REPORTS MUST CONTAIN COORDINATES; PERMITTEE
CAN USE THE VIRGINIA FISH AND WILDLIFE INFORMATION SERVICE
(VAFWIS) TO OBTAIN COORDINATES BY VISITING:
[HTTPS://FWISWEB1.DGIF.VIRGINIA.GOV/FWIS/INDEX.HTML](https://fwisweb1.dgif.virginia.gov/fwis/index.html)

STANDARD CONDITIONS ATTACHED APPLY TO THIS PERMIT.

Authorized Species:

Description

ID Number

Scientific Name

Bats

Annual Report Due End of Each Year

Authorized Sub-Permittees:

Tim Divoll, Biodiversity Research Institute

Dustin Meattey, Biodiversity Research Institute

Carl Anderson, Biodiversity Research Institute

Lauren Gilpatrick, Biodiversity Research Institute

Approved by:

Applicants may appeal permit decisions within 60 days of
issuance. The appeal must be in writing to the Director,
Department of Game and Inland Fisheries.

1.0 INTRODUCTION

Tetra Tech, Inc. was contracted to collect baseline information on all bat species at Naval Air Station Oceana Dam Neck Annex (NASO Dam Neck Annex; Installation), Virginia Beach, Virginia (Figure 2-1). The survey concentrated on areas of interest (i.e., future developments and expansions at the Installation) as identified by the Navy. The objectives of this project were to determine species composition, foraging distribution, and relative abundance of resident and migratory bat species. This survey included mist-net field capture and acoustic monitoring.

Optimal baseline surveys combine acoustic surveys along with mist-netting because species are variably detectable by each method (O'Farrell and Gannon 1999). Mist-netting allows a snapshot of what species, and in what abundance, are utilizing the areas of interest. Some species are rarely caught in mist-nets due to the height at which they forage, but are easily detected acoustically; in contrast, some species have very quiet calls that are difficult to detect acoustically (Barclay 1986). Acoustic monitoring can provide overall bat activity levels and temporal changes in activity. Information collected can be used by natural resource managers to make informed land-use decisions on the Installation.

2.0 SPECIES BACKGROUND

Eleven bat species expected to be present at the Installation based on habitat and range are listed in Table 2-1. Significant decreases in populations of myotis and tri-colored bats, have occurred over the last five years as a result of White-Nose Syndrome (WNS), a fungal pathogen responsible for over 5.5 million bat deaths since its emergence in the United States (USFWS 2015a). WNS was first discovered in eastern New York in February 2006 and has now been documented in 26 states and five Canadian provinces (Heffernan 2016). Other threats to myotis species include loss and fragmentation of forested habitat, alteration to traditional hibernacula, and anthropogenic sources of mortality including wind energy facilities (USFWS 2014).

Although big brown bats are hibernators and have been found with WNS, their survival rate with WNS is much higher (Frank *et al.* 2014). There may be two reasons for this with the first being that big brown bats select areas within caves that are colder and with less humidity, which inhibits the fungus' growth (Hayman *et al.* 2016). Second, their size allows for a greater amount of body fat during hibernation, which potentially mitigates the effects of WNS (Hayman *et al.* 2016).

Rafinesque's big-eared bats and southeastern bats have been found with the fungus, but have no diagnostic symptoms of WNS, and may have some resistance to the disease. Both species are known to occur only in the southeastern corner of Virginia and are listed as state endangered. The subspecies of Rafinesque's big-eared bats previously observed at the Installation is listed in Virginia's Wildlife Action Plan (WAP) as Tier I, critical conservation need, and southeastern bats are Tier IV, moderate conservation need (VDGIF 2005).

Long-distance migrators (Table 2-1) are bats who generally travel over 1000km south during the fall to southern states or even Mexico to find areas that support insects year round or are warm enough to sustain hibernation in tree foliage or cavity. They return to the Installation in the spring where females raise their young. Because they do not enter hibernation they are not susceptible to WNS, however, they are the species most often struck by wind turbines along their migration routes in the fall (Cryan 2003). Seminole bats are unique in that they do not hibernate or undergo long-distance migrations. They can remain in torpor, a state of decreased physiological activity, during cold winter periods and then wake up to forage during warmer winter periods. Evening bats gain enough fat reserves to either migrate shorter distances to warmer climates or over-winter.

Northern long-eared bats (NLEBs) are a species of special interest at the Installation. On April 2, 2015, the USFWS announced that the NLEB was listed as threatened with an interim section 4(d) rule. The intent of the 4(d) rule was to provide the USFWS flexibility in implementing the Endangered Species Act (ESA) by modifying regulations necessary to provide for the conservation of a threatened species while not overburdening private landowners, state agencies, and others with blanket regulations that do not further the conservation of the species. A final 4(d) rule for NLEB was released on January 14, 2016 (USFWS 2016a) and became effective February 16, 2016. USFWS determined that WNS is the primary threat to NLEB and regulating other sources of mortality or harm, such as habitat loss, will not effectively conserve this species.

The final 4(d) rule prohibits all *purposeful take*¹ within the range of NLEB except removal of NLEB from human structures, defense of human health (disease monitoring), or removal of hazardous trees for the protection of human life and property. All take incidental to otherwise lawful activities is allowed outside of the WNS zone. The WNS zone includes all counties affected by WNS and an additional 241 kilometer (150-mile) buffer around these counties which includes the Installation (USFWS 2016b). For areas within the WNS zone, *incidental take*² is prohibited only if it occurs within a hibernaculum³, if tree removal activities occur within a 0.4 kilometer (quarter-mile) of a known, occupied hibernaculum at any time of year or within 46 meters (150 feet) of a known, occupied maternity roost tree from June 1 through July 31 (USFWS 2016a). If a federal project may result in prohibited tree removal described above (or if a project is authorized, funded, or permitted by a federal agency), the final 4(d) rule provides a programmatic biological opinion and optional framework for streamlining section 7 consultations. However, the USFWS may advise federal agencies when project level consultation for NLEB is required (USFWS 2016a).

¹ "Purposeful take is when the reason for the activity or action is to conduct some form of take. For instance, conducting a research project that includes collecting and putting bands on bats is a form of purposeful take. Intentionally killing or harming bats is also purposeful take and is prohibited" (USFWS 2016c).

² "Incidental take is defined by the Endangered Species Act as take that is incidental to, and not the purpose of the carrying out of an otherwise lawful activity. For example, harvesting trees can kill bats that are roosting in the trees, but the purpose of the activity is not to kill bats" (USFWS 2016c).

³ NLEB hibernaculum include caves and abandoned mines with constant, cooler temperatures and high humidity in which they spend the winter in a state of metabolic depression (USFWS 2016c).

Figure 2-1. Regional Setting and Mist Netting Locations of NASO Dam Neck Annex, Virginia.

Table 2-1. Species Expected to Occur at NSAHR Northwest Annex, Virginia and North Carolina.

Life Strategy	Species Common Name	Scientific Name	Range in Virginia	Federal/ State Status	WNS Affects
Long-distance Migrants/ Tree roosting bats	Eastern red bat	<i>Lasiurus borealis</i>	Entire State		Fungus positive
	Hoary bat	<i>L. cinereus</i>	Entire State		
	Silver-haired bat	<i>Lasionycteris noctivagans</i>	Entire State		Fungus positive
Winter torpor/ short migration	Evening bat	<i>Nycticeius humeralis</i>	Eastern half		
	Seminole bat	<i>Lasiurus seminolus</i>	Two counties ⁴		
Cave Hibernators	Southeastern bat	<i>Myotis austroriparius</i>	Four counties ⁵	State Endangered WAP Tier IV	Fungus positive
	Little brown bat	<i>M. lucifugus</i>	Most of the state		WNS symptoms
	Northern long-eared bat (NLEB)		Entire State	Federally Threatened	WNS symptoms
	Tri-colored bat	<i>Perimyotis subflavus</i>	Entire State		WNS symptoms
	Rafinesque's eastern big-eared bat	<i>Corynorhinus rafinesquii macrotus</i>	Southeastern corner	State Endangered WAP Tier I	Fungus positive
	Big brown bat	<i>Eptesicus fuscus</i>	Entire State		WNS symptoms

⁵ Chesapeake, Suffolk, Isle of Wight, and Newport News counties

3.0 METHODS

3.1 CAPTURE

Mist-net surveys were completed over two nights from 27 July 2015 to 28 July 2015, for a total of 8 net nights. The required federal (TE63633A-3) and state collection permits (VADGIF 051933) were obtained by a subcontractor, Biodiversity Research Institute (BRI), for completion of these tasks (Appendix B). During the two-night survey window, bats were captured at two locations (Figure 2-1) within the areas of interest. Mist-net survey sites were typically surrounded by mature trees that potentially provide good roosting habitat and a clear path to foraging areas for bats leaving their roosts. Two two-person teams, each operating two to three nets, conducted the mist-netting survey and one USFWS-approved biologist monitored all survey activities.

A combination of triple-high (three nets stacked upon another, 7.8 meters height) and double-high (two nets stacked upon another, 5.2 meters height) were set up each night (Figure 3-1). Depending on the site, nets varied in length from 6 to 9 meters and were positioned to maximize coverage of flight paths, including suitable travel corridors, foraging areas, and/or drinking areas. These areas act as natural corridors and funnel bats toward the nets. Nets were set at dusk and monitored until at least 00:15 hours, for a minimum of 5 hours. If bats continued to be captured, nets were left up until as late as 01:30 hours.

Bats were live-caught in mist-nets and released unharmed near the point of capture. Nets were checked at an interval of every 10 minutes and processing was completed within 30 minutes from the time the bat was removed from the net. Biological and morphometric data was recorded for each individual captured (e.g., time of capture, capture net, species, sex, age class, reproductive condition, mass, and forearm length). A juvenile bat is generally considered less than 1 year old and determined through the observation of a long smooth joint demonstrating incomplete epiphyseal ossification (fusion) of the metacarpal-phalangeal joint that are not present in the ossified knobby adult joints. Bats become reproductively active around 1 year old. Each bat was also banded on the forearm with a unique number for later identification (Figure 3-2). Time, weather, global positioning system location of each net site and hourly weather conditions also were recorded. To reduce human error, data was recorded in Chiro, an iPad application, for ease of tracking and compiling data. Mist-net information and capture data is provided in Appendix C.

Caution was taken during mist-net activities to minimize the potential for transmission of WNS by following the most recent decontamination protocols of the USFWS (2008). For example, bats were held in paper bags until processed, and holding bags were disposed of after each use. Bats were evaluated for potential WNS infection following the *Wing-Damage Index Used for Characterizing Wing Condition of Bats Affected by White-nose Syndrome* by Reichard (no date).

3.2 ACOUSTIC SURVEYS

3.2.1 Bat Detectors

Tetra Tech used Wildlife Acoustic Song Meter SM2 Monitoring Systems (bat detectors, Appendix D) for the duration of the acoustic monitoring survey, 475 detector nights from spring to fall in 2015, 11 March to 17 November, 2015. Each bat detector station consisted of a 25–50 watt solar panel, a 12-volt DC battery encased in a waterproof housing, and the acoustic detector. The SMX-U1 microphone was attached to the recording unit by a high-quality, low-loss microphone cable.

Each bat detector was manually checked by trained technicians approximately monthly during the survey period.

Two ground-based bat detectors (VADM-1 and VADM-2) with microphones 1.5 meters from the ground were deployed. Sampling locations were based on representative habitats within the Installation. Preference was given to areas with potential for high bat activity and areas available for access (Figure 3-3). Each detector was powered by a battery that is charged during the day with solar panels, thus the locations were limited by solar availability. VADM-1 (Site 1) was located in a small periodically mowed clearing along a jogging trail south of Regulus Ave. The clearing contained an early successional community dominated by a variety of herbaceous vegetation, including invasive species such as Chinese lespedeza (*Lespedeza cuneata*) and common reed (*Phragmites australis*). Immediately surrounding the clearing was a dense scrub-shrub community dominated by loblolly pine (*Pinus taeda*), wax myrtle (*Morella cerifera*), and greenbrier (*Smilax* sp.), with palustrine forested wetlands to the south. VADM-2 (Site 2) was located on a regularly mowed strip of lawn along a perimeter fence on the southeast edge of the Marine Corps Reserve Facility on South Birdneck Rd. A pond and palustrine forested wetland community dominated by red maple (*Acer rubrum*) and sweetgum (*Liquidambar styraciflua*) was located directly east, outside of the fence.

To ensure that the greatest period of bat activity was surveyed, bat detectors were programmed to begin recording at sunset and stop recording approximately at sunrise each day. The Installation was continuously surveyed from 11 March to 17 November 2015, to sample the spring and fall migration and maternity periods for the majority of North American bat species, including federally protected species. All bat detectors remained in their designated locations throughout the study period.

Tetra Tech implemented quality assurance and quality control measures during all stages of data collection, analysis, and report preparation. Bat detector data were downloaded at least once every month. The incoming echolocation calls were recorded onto high-capacity SD data storage cards. The data from the SD data storage cards were then backed up to an external hard drive and sent to a Tetra Tech biologist for analysis. Field biologists submitted data within 7 business days, and data were immediately reviewed to confirm the operational status of the bat detectors.

3.2.2 Bat Call Analysis

There are three parts to bat call data analysis that, when synthesized, produce the most accurate final tally of bat species activity. First, Tetra Tech used Kaleidoscope Pro v 3.1.4b (Wildlife Acoustics Inc. (WA) software to filter and analyze all recordings. All recorded data files were filtered to identify data files containing potential bat calls⁶ or passes. The software analysis, therefore, included only files of suitable quality and duration, defined as individual call pulses exhibiting the full spectrum of frequency modulation produced by a bat (i.e. sonogram consisting of sharp, distinct lines) between 8 and 120 kHz with at least two call pulses. The Kaleidoscope

⁶ Each recorded event including a bat vocalization consists of individual “call pulses” that comprise a “bat call sequence” or “bat passes”.

classifier was set to include species occurring in or near Virginia Beach, Virginia, and at the “-1 More Sensitive” setting, per USFWS recommendations (USFWS 2015b). This generates a summary of the number of bat calls of each species and a maximum likelihood estimate (MLE) report. Seminole bats are acoustically indistinguishable from eastern red bats and not offered as a classifier within Kaleidoscope Pro. Townsends big-eared bat and Rafinesque’s big-eared bat are also almost identical acoustically so although Rafinesque’s is not a Kaleidoscope Pro classifier, Townsend’s is an appropriate proxy and offered as a classifier.

The second step is to examine the MLE report that is generated by the Kaleidoscope Pro software. Many species have significant overlap in call frequency and shape and for each species there is a known error rate for misclassifications of each species by the software. Therefore, the MLE report provides statistical probability values (p -values) to help determine if a species is likely present ($p = \leq 0.05$) or absent at each location given the known error rate of classification. A subset of calls from species with high MLE values (indicated absence) are then manually vetted in an attempt to confirm presence or absence.

SonoBat 4.0.6 NE (SonoBat, Inc.), with its superior spectrogram platform, was chosen for manual review so classifications could be cross-validated with an additional software program. All calls classified as NLEB were manually reviewed by Tetra Tech in full spectrum format to confirm the automated classifications due to NLEB’s status as a federally threatened species. Calls classified as “High Frequency” (frequency center above 40 kHz) or “Low Frequency” (frequency center below 40 kHz) during manual review lacked detail to be identified at the species level (e.g., too far from the microphone or noise interference). To positively confirm an NLEB call there must be 3–5 call pulses that exceed 120 kHz that are not broken in the middle or oversaturated. Those calls that were determined through manual vetting as probable NLEB calls, but did not meet the stringent standards stated above, were labelled as “Possible NLEB.” Manual review can confirm species that were not considered to have probable presence, indicated by a high MLE, due to error rate of software automatic classification. Representative samples of each of the remaining species were checked for software accuracy by manual vetting until 10 calls for each detector were positively identified.

Manual vetting showed that half of the hoary bat calls manually vetted ($n=20$) were noise files. Low frequency electronic or insect noise can trigger the detector and be classified as a hoary bat call. The approach phase and feeding buzzes of eastern red bats are often misclassified as myotis sp. by software programs due to their steeper slope and toes at the end of the calls that mimic myotis sp call pulses. Manual vetting showed high percentages of incorrect classifications of eastern red bat calls as southeastern bats, little brown bats, and NLEB. The high activity rates of little brown bats may be misleading, and are most likely eastern red bats, especially because of the high activity rates of eastern red bats in the area.

4.0 RESULTS

4.1 MIST-NET CAPTURE

Eight bats were captured over 8 net nights between 27 July and 28 July in 2015 (Table 4-1). Eastern red bats represented 75 percent of the bats captured. Of the remaining 25 percent, 13 percent were big brown bats and 13 percent were Rafinesque’s big-eared bat. Four bats escaped the net before metrics were able to be taken, leaving the remaining four bats for processing. Two of the bats processed were non-reproductive males. The other two were females: one was non reproductive and one was a post-lactating eastern red bat. In addition, two of the processed bats were adults and two were juvenile eastern red bats.

4.2 ACOUSTIC SURVEY RESULTS

During the 2015 survey, 475 detector-nights were sampled over the course of 251 calendar nights between 11 March and 16 November 2015 (Table 4-2). A total of 94,261 bat calls were detected, resulting in an overall activity rate of 198 bat calls/detector night (Table 4-2). VADM-1 was fully functional during the operation period, VADM-2 had an extremely high call volume and filled up the cards before they were switched out leading to four small data gaps.

Table 4-2. Acoustic Effort and Summary at NASO Dam Neck Annex, Virginia - 2015.

4.2.1 Species Presence and Activity Rates

Nine species and three groups were detected acoustically (Table 4-3). Eastern red bats/Seminole bats were the most commonly recorded (76 percent of the total calls recorded), followed by evening bats (13 percent), tri-colored bats (5 percent), and little brown bats (4 percent). Species with less than 1 percent of the total calls included NLEB, possible NLEB, big brown bats, hoary bats, silver haired bats, southeastern bat, high frequency, and low frequency (Table 4-3). High and low frequency groups contain calls that are not clear enough to distinguish a specific species and can only be designated as high or low frequency type calls. Eastern red bats and Seminole bats were placed in the same group because their echolocation calls are indistinguishable from each other. MLE values show probable presence at the Installation of eastern red bats/ Seminole bats and tri-colored bats, but manual review confirms presence of all species listed above.

Activity rates were calculated for each detector and for each species by detector (Table 4-4). Activity rates are calculated by dividing the total number of calls by detector nights, which normalizes the data among differing survey efforts or detector functionality. Normalizing the data allows comparison across detectors, species, and other Installations. Average activity rates among all detectors was 198 bat calls/detector night, with the highest rate occurring at VADM-2, 394 calls per night compared to only 24 at VADM-1 (Table 4-4). Compared to other Navy bases in Virginia, the Installation had lower activity rates than average (Table 4-5). In addition, there were lower activity rates of big brown bats, silver-haired bats, and tri-colored bats than would be expected compared to the following Navy bases: Joint Expeditionary Base Fort Story, Naval Support Activity Hampton Roads Northwest Annex, and Naval Weapons Station Yorktown/ Naval Supply Center Cheatham Annex (Table 4-5).

4.2.2 Timing of Activity

Bat activity was first detected on 11 March (first day of recording) and calls were recorded until the detectors were removed on 16 November 2015. First and last acoustic detection is available for each species in Table 4-6. Bat activity peaked in mid-August, over 1,500 call per night weekly average for all detectors combined (Figure 4-1). Two smaller spikes occurred in late May and late July with weekly averages of almost 1,000 calls per night and over 1,400 calls per night respectively. Periods of low activity following 9 May, 28 May, 13 July, and 28 July were due to detector data gaps and not actual low bat activity.

Eastern red/Seminole bats accounted for the majority of migratory bat activity and were most active during May, July, and late October, with two large spikes in late July and early August (Figure 4-2). Evening bats mirrored this activity pattern, but at lower activity rates. Hoary bats and silver-haired bats were at too low of activity rates to observe patterns.

Tri-colored bats were the most active hibernating species with activity in April and July, there was low activity during May and June (Figure 4-3). Southeastern bats were largely absent until late July and were active through the end of the survey period. Big brown bats had steady, but low activity from April through November, with the peak of activity reaching over 20 calls per night

on 11 June. Little brown bats appeared to have steady activity through the spring and summer and then again before hibernation. Manual vetting, however, showed that the majority of these calls are most likely misclassified eastern red bats and southeastern myotis calls.

Table 4-6. First and Last Acoustic Detection per Species

Species	First Detection Acoustically	Last Detection Acoustically
Big brown bat	3/16/2015	11/12/2015
Eastern red bat	3/11/2015	11/16/2015
Hoary bat	3/18/2015	11/15/2015
Silver-haired bat	3/16/2015	11/13/2015

5.0 DISCUSSION

The baseline survey at NASO Dam Neck Annex acoustically documented activity of at least nine different species of bat including big brown bat, eastern red/Seminole bat, hoary bat, silver-haired bat, little brown bat, evening bat, southeastern bat, NLEB, and tri-colored bat. Due to the inability to distinguish between eastern red bat and Seminole bat calls, it is not possible to determine presence of both of these species acoustically. Eastern red bats, however, are very common and Seminole bats only occur occasionally in Virginia. Mist-net surveys further confirmed the presence of big-brown bats and eastern red bat, as well as the presence of Rafinesque's big-eared bat that has a quiet call that is not often observed in acoustic surveys. In a previous survey in 2014, mist-netting also captured evening bats and southeastern bats, which confirms their presence at the Installation (Tetra Tech unpublished data). Species composition at NASO Dam Neck was similar to other Virginia Navy Bases, however, there were lower activity rates than average for big brown bats, silver-haired bats, and tri-colored bats (Table 4-5). The overall activity rate at NASO Dam Neck was also lower than the average activity rate of other Virginia Navy bases (Table 4-5).

The majority of bats recorded at the Installation were eastern red/Seminole bat and evening bat, which is typical for white-nose affected areas. WNS is a fungal pathogen caused by the fungus *Pseudogymnoascus destructans*. It is responsible for unprecedented mortality of hibernating bats and has killed an estimated 5.5 -5.7 million bats since its 2006 discovery in eastern New York (USFWS 2012, USFWS 2015a, Veilleux 2008). WNS has hit hibernating species like myotis species and tri-colored bats the hardest, which could explain why myotis are found in small numbers at the Installation. Tri-colored bats were detected at relatively high rates compared to myotis species, however, a study in New York showed no statistical differences between acoustic detection of tri-colored bats before and after WNS (Ford *et al.* 2011). In contrast, caves surveyed in Virginia found a decline of almost 90 percent of tri-colored bats (388 individuals in 2009 to 42 in 2012) (VADGIF 2012).

Federally listed NLEB are present, but at very low rates likely due to the lack of contiguous mature forest at the Installation. However, the forested North Landing River corridor (5 miles away) leads to the Great Dismal Swamp National Wildlife Refuge (25 miles away) providing 112,000 acres of important forest habitat. Precipitous declines have been documented for NLEB over the last three years. Sampled populations of NLEB in New York, Massachusetts, and Vermont declined 93 percent overall between the first year of exposure to WNS in 2006 and 2009 (Langwig *et al.* 2009). Thus, it is expected that NLEB represents less than 1 percent of all bat call sequences in this survey.

Southeastern bats are also found in low activity rates, however, the Installation is beyond the northern boundary of their commonly published range (Harvey 2011, Kays and Wilson 2009). They have been detected and captured at multiple Navy bases in Virginia, so they may be expanding their ranges to fill the niche that myotis species declining from WNS have left vacant or may have been detected due to increased survey effort in the area.

Little brown bats have had one of the highest mortality rates from WNS and are estimated to have a population decrease of 91 percent in the east (Turner *et al.* 2011). Little brown bats have deceptively high activity rates and are likely much lower due to eastern red bat calls mimicking little brown bat calls. Historically, however, little brown bats were one of the most common bats in this area.

Big brown bats are less affected by WNS (Frank *et al.* 2014) and red bats, hoary bats, and silver-haired bats are migrators rather than hibernators, which allow them to avoid hibernacula that harbor this fungus. Big brown bats select areas of caves for hibernation that are colder with less humidity, which inhibits the fungus' growth (Hayman *et al.* 2016). Their body size also allows for a greater amount of body fat during hibernation which mitigates the effects of WNS (Hayman *et al.* 2016). Therefore, it is unexpected to see the low activity rates of big brown bats at the Installation as they are usually extremely common across the landscape in Virginia (Table 4-5). Hoary bats and silver-haired bats similarly had low activity rates that are uncharacteristic for Virginia. Both detectors were placed in open habitats that would attract both hoary bats and silver-haired bats for foraging.

In addition to high activity rates, both post-lactating and juvenile individuals of eastern red bats were captured, suggesting breeding populations in the area. Even during the maternity season, however, they remain solitary and do not form colonies. Eastern red bats tend to forage in the same areas each night and circle for long periods of time, so often the same bat will trigger the detector multiple times leading to high activity rates that do not necessarily equate to abundance.

5.1 DETECTOR HABITAT DIFFERENCES

Although all local bats are aerial insectivores, each species specializes in or prefers certain habitats for foraging and roosting. Detectors were placed in differing, but highly suitable habitats to get a picture of the bat community at the Installation. Overall the detectors recorded large variations in activity between habitats and for each separate species.

There were large differences in activity between the two detector sites at the Installation (374 call per night activity rate difference). VADM-1 had the lowest activity rates and was located near a jogging trail within a mowed clearing whereas VADM-2 was also in a mowed field, but near a pond. The pond could be the closest large water source for bats inhabiting many different habitats. Bats, particularly reproductive females, spend the day in roosts with high temperatures causing them to lose water during the hot summer months (Johnson and Gates 2008). Species require drinking water to replenish evaporated water in addition to water provided in their insect prey (Hayes 2003). Proximity to water is often associated with better foraging habitat and therefore more frequent bat use (Carter *et al.* 2003, Grindal *et al.* 1999). Therefore, a large water source may have drawn in many different species and at high activity rates.

Southeastern bats were the only species detected more often in VADM-1 than VADM-2. This species is usually associated with foraging over water and catching insects just above the water's surface (Harvey 2011, Kays and Wilson 2009). Therefore this result is unexpected because we would expect them to be near the pond and detected more often at VADM-2.

5.2 NIGHTLY ACTIVITY

There were weekly average spikes in call rates during each life history event throughout the seasons surveyed. The first spike occurred during late May when bats typically return to the area from their hibernacula and winter ranges, or migrate through the area heading for more northern summer ranges. The bats remained active during the maternity periods of June and July. When maternity colonies are present, females often forage near their roosts so they can return to nurse their young throughout the night, leading to high localized activity (Swift 1980). This was followed by a spike in late July and the peak in early August when bat pups become volant (able to fly) and increase the number of bats out foraging. In late August and September maternity colonies disperse leading to a decrease in activity. Finally, activity spiked in late October when bats gather to enter hibernaculum and migrate south for the winter.

The spikes in activity among species often occurred on the same nights. When spikes of different species coincide it indicates periods of high insect abundance or good weather, such as high temperatures, low wind, and no precipitation. An example of this is late in October when eastern red/ Seminole bats, evening bats, tri-colored bats, and little brown bats all had activity spikes. Eastern red bats and evening bats may be migrating during favorable weather conditions. Little brown bats and tri-colored bats may be foraging to build up fat reserves before hibernation or swarming before traveling to a nearby hibernaculum. Swarming behavior brings male and female bats together, who largely roost separately through the summer, to choose mates, breed, and locate suitable hibernacula (Fenton 1969). Eastern red/ Seminole bats, however, had two large spikes in activity, over 2,000 calls per night, after the volancy period that did not coincide with other species. In conjunction with the juveniles caught it suggests large breeding populations near the Installation that became volant and were out foraging.

DEPARTMENT OF THE INTERIOR
U.S. FISH AND WILDLIFE SERVICE

FEDERAL FISH AND WILDLIFE PERMIT

1. PERMITTEE

BIODIVERSITY RESEARCH INSTITUTE
652 MAIN STREET
GORHAM, ME 04038
U.S.A.

2. AUTHORITY-STATUTES
16 USC 1539(a)

REGULATIONS
50 CFR 17.22

50 CFR 13

3. NUMBER
TE63633A-2 AMENDMENT

4. RENEWABLE
 YES
 NO

5. MAY COPY
 YES
 NO

6. EFFECTIVE
07/12/2013

7. EXPIRES
07/31/2015

8. NAME AND TITLE OF PRINCIPAL OFFICER *(If #1 is a business)*
DAVID C EVERS
EXECUTIVE DIRECTOR

9. TYPE OF PERMIT
NATIVE ENDANGERED SP. RECOVERY - E WILDLIFE

10. LOCATION WHERE AUTHORIZED ACTIVITY MAY BE CONDUCTED
OHIO, GEORGIA, ALABAMA, LOUISIANA, MISSISSIPPI, KENTUCKY, TENNESSEE, NEW YORK AND NEW JERSEY

11. CONDITIONS AND AUTHORIZATIONS:

A. GENERAL CONDITIONS SET OUT IN SUBPART D OF 50 CFR 13, AND SPECIFIC CONDITIONS CONTAINED IN FEDERAL REGULATIONS CITED IN BLOCK #2 ABOVE, ARE HEREBY MADE A PART OF THIS PERMIT. ALL ACTIVITIES AUTHORIZED HEREIN MUST BE CARRIED OUT IN ACCORD WITH AND FOR THE PURPOSES DESCRIBED IN THE APPLICATION SUBMITTED. CONTINUED VALIDITY, OR RENEWAL, OF THIS PERMIT IS SUBJECT TO COMPLETE AND TIMELY COMPLIANCE WITH ALL APPLICABLE CONDITIONS, INCLUDING THE FILING OF ALL REQUIRED INFORMATION AND REPORTS.

B. THE VALIDITY OF THIS PERMIT IS ALSO CONDITIONED UPON STRICT OBSERVANCE OF ALL APPLICABLE FOREIGN, STATE, LOCAL, TRIBAL, OR OTHER FEDERAL LAW.

C. VALID FOR USE BY PERMITTEE NAMED ABOVE

C. CONTINUED: THE FOLLOWING INDIVIDUALS ARE AUTHORIZED TO CONDUCT ACTIVITIES AS AUTHORIZED BY THIS PERMIT: TIMOTHY DIVOLL, DAVID YATES, DUSTIN MEATTEY, CARL ANDERSON AND FOR INDIANA BATS ONLY: JONATHAN FIELY.

TRAINED ASSISTANTS NOT NAMED ON THIS PERMIT MAY WORK ON PERMITTED BAT ACTIVITIES UNDER THE DIRECT AND ON-SITE SUPERVISION OF THE INDIVIDUALS NAMED ABOVE. HOWEVER, TRAINED ASSISTANTS MAY NOT WORK INDEPENDENTLY AT A SITE. TRAINED ASSISTANTS ARE INDIVIDUALS WHO ARE CONSIDERED QUALIFIED BY THE PERMITTED BIOLOGIST(S) TO SELECT SAMPLING SITES, DEPLOY SAMPLING EQUIPMENT AND NETS, AND HANDLE BATS IN THE FIELD AS STATED IN CONDITION F, BELOW.

D. THE FOLLOWING CONDITIONS APPLY WHEN WORKING IN THE FOLLOWING STATES; TENNESSEE, GEORGIA, ALABAMA, LOUISIANA, MISSISSIPPI AND KENTUCKY :

PERMITTEE IS AUTHORIZED TO TAKE (ACOUSTICAL MONITORING, ENTER HIBERNACULA OR MATERNITY ROOST CAVES, SALVAGE DEAD BATS, CAPTURE WITH MIST NETS OR HARP TRAPS, HANDLE, IDENTIFY, COLLECT HAIR SAMPLES, BAND, TRANSMITTER, LIGHT-TAG, WING-PUNCH, AND SELECTIVELY EUTHANIZE FOR WHITE NOSE SYNDROME TESTING) INDIANA BATS (MYOTIS SODALIS) AND GRAY BATS (MYOTIS GRISESCENS) WHILE CONDUCTING PRESENCE/ABSENCE SURVEYS, STUDIES TO DOCUMENT HABITAT USE, AND POPULATION

ADDITIONAL CONDITIONS AND AUTHORIZATIONS ALSO APPLY

12. REPORTING REQUIREMENTS

REPORTS WILL BE PROVIDED TO THE U.S. FISH AND WILDLIFE SERVICE OFFICES APPEARING IN CONDITIONS L, M AND N OF THIS PERMIT. REPORTING CONTENT, FORMAT, SUFFICIENCY AND FREQUENCY ARE OUTLINED IN CONDITION K OF THIS PERMIT.

ISSUED BY

TITLE *Acting*
CHIEF, DIVISION OF ENDANGERED SPECIES

DATE

07/12/2013

MONITORING, AS CONDITIONED BELOW.

1. FOR ALL ACTIVITIES CONSIDERED WITHIN THIS PERMIT, THE **DISINFECTION PROTOCOL FOR BAT FIELD STUDIES** SHALL BE FOLLOWED. YOU ARE REQUIRED TO USE THE MOST RECENT PROTOCOLS AVAILABLE. YOU SHALL CONTACT THE SERVICE'S OFFICE LISTED IN M., BELOW FOR A COPY OF THE PROTOCOL EACH YEAR AND TO DETERMINE IF ANY SITE SPECIFIC MODIFICATIONS ARE REQUIRED.
2. UPON DETERMINATION THAT ENDANGERED BATS ARE PRESENT, THE PERMITEE SHALL NOTIFY THE SERVICE FIELD OFFICE IN THE STATE IN WHICH THE SITE IS LOCATED AND THE CORRESPONDING REGIONAL OFFICE.
3. DEAD BATS MAY BE SALVAGED AND IDENTIFIED (INCLUDING PHOTOGRAPHIC DOCUMENTATION), AND SENT TO THE APPROPRIATE LAB FACILITIES FOR THE PURPOSES OF EVALUATING IMPACTS FROM THE CAUSE OF DEATH (WHITE-NOSE SYNDROME, WIND ENERGY OPERATIONS, ETC.). ANY DISCOVERY OF FEDERALLY LISTED SPECIMENS SHALL BE REPORTED, WITHIN 48 HOURS OF DISCOVERY, TO THE USFWS FIELD SUPERVISOR IN THE STATE IN WHICH THE SALVAGE OCCURS. YOUR REPORT MUST BE IN WRITING AND MUST INCLUDE INFORMATION ON THE SPECIES, SEX, LOCATION, DATE, TIME, AND ANY OBSERVATIONS ON THE CONDITION OF THE SPECIMEN. SPECIMENS MUST BE CHILLED AND SURRENDERED TO THE OFFICE IN CONDITION M., BELOW, UNLESS OTHERWISE INSTRUCTED BY THAT OFFICE.
4. BATS MAY BE CAPTURED WITH MIST NETS AND HARP TRAPS. THE MONITORING INTERVAL FOR MIST NETS MAY NOT EXCEED 10 MINUTES. BATS MAY BE CAPTURED WITH HARP TRAPS ONLY WITH WRITTEN CONCURRENCE FROM THE FIELD SUPERVISOR IN THE STATE IN WHICH TRAPPING IS PROPOSED. HARP TRAPS MUST BE CONTINUALLY MONITORED. CAPTURED BATS MAY NOT BE HELD FOR MORE THAN 30 MINUTES, UNLESS INJURED. FOR ESA COMPLIANCE PROJECTS INVOLVING SURVEY WORK FOR THE INDIANA BAT IN KENTUCKY, INDIVIDUALS REFERENCED IN CONDITION C. ABOVE MUST FOLLOW THE INDIANA BAT SURVEY GUIDANCE ISSUED BY THE U.S. FISH AND WILDLIFE SERVICE, KENTUCKY FIELD OFFICE AND KENTUCKY DEPARTMENT OF FISH AND WILDLIFE RESOURCES (ATTACHED). FOR INDIANA BAT SURVEY WORK CONDUCTED IN KENTUCKY, THIS GUIDANCE SUPERCEDES OTHER CONDITIONS LISTED IN THIS PERMIT; THE GUIDANCE MUST BE CURRENT FOR THE YEAR IN WHICH THE SURVEY IS CONDUCTED/REQUIRED.
5. PERMITEES MAY CARRY OUT NON-INTRUSIVE MEASUREMENTS ON CAPTURED BATS.
6. UNIQUELY NUMBERED, MODERN, LIPPED, CORRECTLY SIZED ALUMINUM BAT BANDS SHALL BE USED. SPLIT-RING, PLASTIC BANDS SHALL BE AVOIDED.
7. PRIOR TO CONDUCTING ACTIVITIES WRITTEN APPROVAL SHALL BE RECEIVED FROM THE PERMIT COORDINATOR AND/OR APPROPRIATE FIELD OFFICE LISTED IN CONDITION M AND N., BELOW.
8. COPIES OF ALL REQUEST AND APPROVAL LETTERS, WITH THE PERMIT NUMBER INCLUDED, SHALL BE FORWARDED TO THE PERMITS COORDINATOR LISTED IN CONDITION L, M AND N., BELOW.
9. RADIO TRANSMITTERS (TOTAL PACKAGE WEIGHT NOT TO EXCEED 7.5 PERCENT (5 PERCENT RECOMMENDED) OF BODY WEIGHT OR 0.45 GRAM, WHICHEVER IS LESS) MAY BE ATTACHED TO BATS DURING THE SPRING, SUMMER, AND FALL ROOSTING PERIODS BY NONTOXIC SKIN BOND ADHESIVE. BATS CARRYING TRANSMITTERS SHOULD BE MONITORED DAILY FOR AT LEAST FIVE DAYS, OR UNTIL THE TRANSMITTER FALLS OFF, WHICHEVER OCCURS FIRST. RADIO TRANSMITTERS SHALL NOT BE PLACED ON NEWLY VOLANT JUVENILES WITHOUT PRIOR APPROVAL OF THE APPROPRIATE FIELD OFFICE.
10. SURVEYS OF GRAY BAT MATERNITY ROOSTS AND THEIR OTHER KNOWN SUMMER ROOST SITES SHALL BE CONDUCTED BY OBSERVING THE BATS WITH NIGHT VISION EQUIPMENT AND INFRARED LIGHT SOURCE AS THEY EMERGE FROM THEIR CAVES AND MINE ROOSTS. AT SITES THAT ARE NOT CURRENTLY KNOWN TO SUPPORT THESE SPECIES THE ACCEPTED METHOD TO DETERMINE IF THEY ARE PRESENT IS TO CAREFULLY AND SLOWLY ENTER THE POTENTIAL ROOST SITE AND VISUALLY CHECK FOR EVIDENCE OF THE PRESENCE OF BATS, SUCH AS SIGNIFICANT QUANTITIES OF GUANO, A STRONG SMELL OF GUANO OR THE AUDIBLE SOUNDS PRODUCED BY BATS ROOSTING AT THE SITE. ONCE ANY OF THE INDICATORS ARE OBSERVED, SURVEY TEAM MEMBERS SHALL EXIT THE ROOST SITE AND MAKE FURTHER OBSERVATIONS FROM OUTSIDE THE ENTRANCE TO THE ROOST. ALL FURTHER OBSERVATIONS (WITH AQUOSTICS AND/OR NIGHT VISION EQUIPMENT AND A SUPPLEMENTAL INFRARED LIGHT SOURCE) SHALL BE MADE FROM THE CAVE OR MINE ENTRANCE DURING THE EVENING EMERGENCE. FOR CAVE ENTRY ACTIVITIES, WRITTEN

APPROVAL IS REQUIRED FROM THE U.S. FISH AND WILDLIFE SERVICE FIELD SUPERVISOR FOR THE STATE IN WHICH THE ACTIVITIES ARE PROPOSED.

11. AT SOME SITES, ESPECIALLY ABANDONED MINES, IT IS NOT ADVISABLE TO ENTER A POTENTIAL ROOST BECAUSE OF THE PHYSICAL HAZARDS PRESENT IN THE SITE. ACOUSTICAL MONITORING, MIST NETS, OR HARP TRAPS MAY BE USED OUTSIDE THE ENTRANCE OF THESE SITES TO DETERMINE THE IDENTITY, SEX AND REPRODUCTIVE CONDITION OF BATS USING THE SITE. NETS AND HARP TRAPS SHALL BE CHECKED REGULARLY AND THE MONITORING INTERVAL FOR MIST NETS MAY NOT EXCEED 10 MINUTES. CAPTURED BATS SHALL NOT BE HELD FOR MORE THAN 30 MINUTES, UNLESS INJURED. DATA SHALL BE RECORDED FOR ALL BATS REMOVED FROM THE NET AND/OR TRAP. THESE DATA SHALL INCLUDE SPECIES, SEX, REPRODUCTIVE CONDITION, AND PHYSICAL MEASUREMENTS SUCH AS FOREARM LENGTH, FOOT LENGTH, PRESENCE/ABSENCE OF A KEEL ON THE CALCAR, ETC. BATS MAY BE PHOTOGRAPHED BEFORE RELEASE TO DOCUMENT THEIR PRESENCE AT THE ROOST SITE.
12. IF IT IS DETERMINED TO BE NECESSARY TO DOCUMENT REPRODUCTIVE LEVELS WITHIN A GRAY BAT MATERNITY ROOST THE ROOST MAY BE ENTERED AFTER THE EVENING EMERGENCE OF ADULTS HAS BEEN COMPLETED. ENTRY SHALL BE LIMITED TO SMALLEST NUMBER OF PEOPLE THAT CAN SAFELY ACCOMPLISH THE SURVEY AND ALL SURVEY TEAM MEMBERS WILL EXIT THE ROOST SITE PRIOR TO THE RETURN OF ADULTS TO THE ROOST. THIS ACTIVITY REQUIRES WRITTEN APPROVAL FROM THE U.S. FISH AND WILDLIFE SERVICE FIELD SUPERVISOR FOR THE STATE IN WHICH ACTIVITIES ARE PROPOSED.
13. SURVEYS CONDUCTED DURING THE WINTER HIBERNATION SEASON SHALL FOLLOW THE GUIDELINES ESTABLISHED IN THE RECOVERY PLANS FOR THESE SPECIES. BATS MAY BE HANDLED DURING WINTER SURVEYS IN ORDER TO COLLECT BAND INFORMATION AND CONFIRM THE IDENTIFICATION OF LISTED SPECIES. DETAILED PHOTOGRAPHS MAY BE TAKEN TO DOCUMENT THE PRESENCE OF LISTED SPECIES. ONLY ONE TRIP TO THE HIBERNATION AREA OF EACH CAVE OR ABANDONED MINE IS AUTHORIZED DURING THE HIBERNATION SEASON. INDIANA BAT AND GRAY BAT HIBERNATION SITES SHALL ONLY BE SURVEYED ONCE EVERY TWO YEARS. THIS ACTIVITY REQUIRES WRITTEN APPROVAL FROM THE U.S. FISH AND WILDLIFE SERVICE FIELD SUPERVISOR FOR THE STATE IN WHICH ACTIVITIES ARE PROPOSED.
14. WHEN CONDUCTING INDIANA BAT SURVEYS, THE CURRENT MINIMUM SURVEY GUIDANCE CONTAINED IN THE 2007 DRAFT INDIANA BAT RECOVERY PLAN SHALL BE FOLLOWED; HOWEVER, THE PERMITTEE MUST ADHERE TO ANY ADDITIONAL, SPECIFIC GUIDANCE DEVELOPED FOR THE STATE IN WHICH THEIR PROJECT IS LOCATED. DEVIATION FROM THESE GUIDELINES IS NOT AUTHORIZED VIA THIS PERMIT AUTHORIZATION. HOWEVER, IT IS ENCOURAGED THAT ECHOLOCATION DETECTION EQUIPMENT BE USED TO SUPPLEMENT THE INFORMATION GAINED DURING MIST NET SURVEYS. AT THIS TIME ECHOLOCATION DETECTION CAN NOT BE USED TO POSITIVELY IDENTIFY ALL SPECIES OF BATS THAT MAY BE ENCOUNTERED DURING SUMMER SURVEYS AND THEREFORE IT CAN NOT BE USED TO POSITIVELY ESTABLISH PRESENCE WITHIN THE SURVEY AREA. NO TRAPPING ACTIVITIES SHALL OCCUR WITHIN 20 METERS OF AN INDIANA BAT MATERNITY ROOST SITE, UNLESS PERMITTEE RECEIVES WRITTEN APPROVAL FROM THE U.S. FISH AND WILDLIFE SERVICE FIELD SUPERVISOR FOR THE STATE IN WHICH ACTIVITIES ARE PROPOSED.
15. FECAL MATERIAL MAY BE COLLECTED AFTER A BAT IS CAPTURED BY PLACING IT IN A CLOTH BAG FOR A SHORT TIME (NOT TO EXCEED 30 MINUTES) BEFORE IT IS CAREFULLY EXAMINED AND KEY PHYSICAL CHARACTERS DOCUMENTED. FECAL MATERIAL CAN THEN BE REMOVED FROM THE BAG OR COLLECTED OFF THE FUR OF THE BAT.
16. LIGHT TAGS MAY BE ATTACHED TO THE DORSAL FUR OF A BAT WITH A NONTOXIC ADHESIVE THAT WILL QUICKLY DEGRADE AND LOOSE ITS ADHESIVE QUALITIES. THE SMALLEST AND LIGHTEST CYALUME CAPSULES THAT WILL MEET THE PROJECT OBJECTIVES SHALL BE USED.
17. WING PUNCHES MAY BE TAKEN IN SPRING/SUMMER BY PUNCHING A HOLE IN THE WING MEMBRANE, AVOIDING BONES AND MAJOR BLOOD VESSELS. A SEPARATE BIOPSY TOOL MUST BE USED FOR EACH INDIVIDUAL LISTED BAT.
18. UNDER THE FOLLOWING SPECIFIC CONDITIONS RELATED TO WHITE-NOSE SYNDROME, LISTED BATS MAY BE EUTHANIZED: (A) THE SITE OF COLLECTION HAS NOT BEEN PREVIOUSLY DEMONSTRATED TO CONTAIN WNS-INFECTION OR WNS-INFECTED BATS (LISTED AND/OR NON-LISTED), (B) NO OTHER NON-LISTED BATS ARE PRESENT THAT ALSO SHOW SYMPTOMS OF WNS, AND (C) NO OTHER METHOD OF WNS SAMPLE COLLECTION IS POSSIBLE. IN ADDITION, ONLY ONE LISTED BAT OF ANY SPECIES WILL BE COLLECTED AT A SINGLE ROOST SITE AND ONLY IF CRITERIA (A), (B), AND (C) ARE MET AND THOSE CIRCUMSTANCES

DOCUMENTED BY THE PERMITTEE IN WRITING TO THE SERVICE.

WHEN MORE THAN ONE LISTED BAT SPECIES IS PRESENT WITHIN A SITE AND SHOWING SYMPTOMS OF WNS, THE FOLLOWING ORDER SHOULD BE USED IN SELECTING WHICH INDIVIDUAL TO SELECTIVELY EUTHANIZE FOR WNS TESTING: GRAY BAT BEFORE INDIANA BAT.

19. THE ATTACHED LETTER OF INSTRUCTION, BAT CAVE ADVISORY, AND DISINFECTION PROTOCOL - AND ANY SUBSEQUENT VERSIONS OF THESE ATTACHMENTS SHALL BE FOLLOWED.

D. THE FOLLOWING CONDITIONS APPLY WHEN WORKING IN OHIO, NEW JERSEY AND NEW YORK:

PERMITTEE IS AUTHORIZED TO TAKE (CAPTURE, HANDLE, RADIO-TAG, AND RELEASE) THE INDIANA BAT (*MYOTIS SODALIS*) AND GRAY BAT (*M. GRISESCENS*) FOR SCIENTIFIC RESEARCH AIMED AT RECOVERY OF THE SPECIES: PRESENCE/ABSENCE SURVEYS, STUDIES TO DOCUMENT HABITAT USE, POPULATION MONITORING, AND TO EVALUATE POTENTIAL IMPACTS. THIS PERMIT DOES NOT AUTHORIZE THE COLLECTION OF VOUCHER SPECIMENS.

1. PERMITTEE SHALL NOTIFY THE USFWS FIELD SUPERVISOR FOR THE STATE IN WHICH ACTIVITIES ARE PROPOSED TO OCCUR AT LEAST 15 DAYS PRIOR TO CONDUCTING ANY ACTIVITIES. CONTACT INFORMATION IS CONDITION N., BELOW. YOUR REQUEST MUST BE IN WRITING AND MUST INDICATE:

LOCATION OF PROPOSED ACTIVITIES, INCLUDING PROJECT SITE, COUNTY, AND STATE.

A DESCRIPTION OF THE ACTIVITIES (I.E., SURVEYS, RADIO-TELEMETRY STUDIES, ETC.).

DATES WHEN THE PROJECT IS PROPOSED TO TAKE PLACE.

EVIDENCE THAT PERMITTEE HAS RECEIVED ANY REQUIRED CONTRACTS TO COMPLETE THE ACTIVITIES.

YOU MAY PROCEED WITH ACTIVITIES ONLY UPON RECEIPT OF WRITTEN CONCURRENCE FROM THE APPLICABLE USFWS FIELD SUPERVISOR. *YOUR CONCURRENCE LETTER MUST BE CARRIED WITH THIS PERMIT TO AUTHORIZE SITE-SPECIFIC ACTIVITIES.*

2. PERMITTEE SHALL ADHERE TO THE FOLLOWING CONDITIONS INVOLVING CAPTURE AND HANDLING OF BATS:

A. BATS MAY BE CAPTURED WITH MIST NETS FOLLOWING THE PROTOCOL "INDIANA BAT MIST-NETTING GUIDELINES" (USFWS 2007 DRAFT INDIANA BAT RECOVERY PLAN). THE MONITORING INTERVAL FOR MIST NETS MAY NOT EXCEED 15 MINUTES. CAPTURED BATS MAY BE HELD FOR A MAXIMUM OF 30 MINUTES, UNLESS INJURED. IN EXTENUATING CIRCUMSTANCES, BATS SHALL BE HELD FOR NO LONGER THAN 45 MINUTES.

B. BATS MAY BE CAPTURED WITH HARP TRAPS WITH WRITTEN CONCURRENCE FROM THE FIELD SUPERVISOR IN THE STATE IN WHICH TRAPPING IS PROPOSED. HARP TRAPS MUST BE CONTINUALLY MONITORED. CAPTURED BATS MAY BE HELD FOR A MAXIMUM OF 30 MINUTES, UNLESS INJURED. IN EXTENUATING CIRCUMSTANCES, BATS SHALL BE HELD FOR NO LONGER THAN 45 MINUTES.

C. PERMITTEES MAY CARRY OUT NON-INTRUSIVE MEASUREMENTS ON CAPTURED BATS. LIPPED METAL BANDS HAVING A UNIQUE IDENTIFIER MAY BE APPLIED TO THE FOREARM OF CAPTURED BATS PRIOR TO RELEASE. NO MORE THAN ONE BAND PER BAT MAY BE USED.

D. RADIO TRANSMITTERS MAY BE APPLIED DURING SUMMER ROOSTING PERIOD VIA NONTOXIC SKIN BOND ADHESIVE SUCH AS COLOSTOMY GLUE. THE TOTAL WEIGHT OF THE TRANSMITTER MAY NOT EXCEED 5% OF THE BAT'S BODY WEIGHT AND THE TOTAL WEIGHT OF THE PACKAGE (TRANSMITTER AND ADHESIVE) MAY NOT EXCEED 6% OF THE BAT'S BODY WEIGHT. THE LIGHTEST PACKAGE (BOTH TRANSMITTER AND ADHESIVE) CAPABLE OF ACCOMPLISHING THE REQUIRED TASK SHOULD BE USED, ESPECIALLY WITH PREGNANT FEMALES AND NEWLY VOLANT JUVENILES. BATS CARRYING TRANSMITTERS MUST BE MONITORED DAILY FOR AT LEAST THREE DAYS, OR UNTIL THE TRANSMITTER FALLS OFF, WHICHEVER OCCURS FIRST.

- E. NO TRAPPING ACTIVITIES SHALL OCCUR WITHIN 20 METERS OF A KNOWN INDIANA BAT MATERNITY ROOST SITE, EITHER NATURAL OR ARTIFICIAL ROOSTS, UNLESS PERMITTEE RECEIVES PRIOR WRITTEN APPROVAL FROM THE U.S. FISH AND WILDLIFE SERVICE FIELD SUPERVISOR FOR THE STATE IN WHICH THE ACTIVITIES ARE PROPOSED TO OCCUR.
- F. PERMITTEE MAY COLLECT DORSAL HAIR SAMPLES, WING BIOPSY TISSUE SAMPLES, FUNGAL LIFT TAPE AND SWAB SAMPLES FROM CAPTURED BATS FOR SCIENTIFIC STUDY. HAIR SAMPLES SHALL BE OBTAINED VIA CLIPPING FUR FROM BETWEEN SCAPULA FROM FEMALES AND JUVENILE MALES. THE CLIPPED AREA IS THE SAME AREA FREQUENTLY CLIPPED FOR RADIO TRANSMITTER ATTACHMENT. WING TISSUE SAMPLES MAY BE TAKEN USING A NEW, STERILE BIOPSY PUNCH (2MM) FOR EACH ENDANGERED BAT SAMPLED. NO MORE THAN TWO SAMPLES, ONE FROM EACH WING, MAY BE OBTAINED PER INDIVIDUAL. ALL BOARDS AND EQUIPMENT USED TO OBTAIN SAMPLES MUST BE DISINFECTED ACCORDING TO THE PROTOCOL CITED IN CONDITION H.8.
- G. CYALUME LIGHT TAGS MAY BE AFFIXED TO THE BACK OF UNMARKED BATS DURING SUMMER ROOSTING PERIOD VIA NON-TOXIC SKIN BOND ADHESIVE TO AID IN IDENTIFICATION OF INDIVIDUALS FOR ECHOLOCATION RECORDINGS. LIGHT TAGS SHALL **NOT** BE AFFIXED TO BATS CARRYING RADIO TRANSMITTERS. LIGHT TAG CANNOT EXCEED 2 CM IN LENGTH OR 0.15 G IN WEIGHT. ANY TAG THAT HAS THE POTENTIAL TO EXPOSE BATS TO THE CYALUME COMPOUND IS PROHIBITED. THE LIGHT TAG MUST BE RESISTANT TO TOOTH PUNCTURE AND SEALED TO PREVENT BAT FROM INGESTING CYALUME COMPOUND.
- H. EQUIPMENT USED TO CAPTURE AND HANDLE BATS SHALL BE CLEANED AND DECONTAMINATED ACCORDING TO THE MOST RECENT USFWS APPROVED DECONTAMINATION PROTOCOL AVAILABLE ON THE USFWS WEBSITE AT: [HTTP://WWW.FWS.GOV/WHITENOOSYNDROME/RESEARCH.HTML](http://www.fws.gov/whitenoosesyndrome/research.html).
- I. CAVES, MINES, OR OTHER SUITABLE HIBERNATION SITES MAY BE QUIETLY SEARCHED IN A MANNER THAT MINIMIZES DISTURBANCE BY UTILIZING THE MINIMUM NUMBER OF PEOPLE AND TIME REQUIRED TO COMPLETE THE SURVEY. SURVEYS SHOULD NOT BE REPEATED MORE OFTEN THAN ONCE EVERY OTHER YEAR IN ANY GIVEN HIBERNACULUM THAT IS OCCUPIED BY INDIANA BATS. WHERE HIBERNACULA AREA AND SAFETY CONDITIONS ALLOW, INDIVIDUALS ENTERING CAVES ARE RECOMMENDED TO UTILIZE NIGHT VISION GOGGLES OR RED-FILTERED LIGHT AND TO REMAIN IN THE CAVE NO MORE THAN 90 MINUTES TO COMPLETE THE WORK.

3. UPON DETERMINATION THAT ENDANGERED BATS ARE PRESENT AT PREVIOUSLY UNDOCUMENTED SITES, PERMITTEE SHALL NOTIFY THE FOLLOWING OFFICES WITHIN 48 HOURS: THE U.S. FISH AND WILDLIFE SERVICE REGION 3 OFFICE (CONDITION L.), AND THE U.S. FISH AND WILDLIFE SERVICE FIELD OFFICE WITHIN THE GEOGRAPHIC LOCATION OF STUDY AREAS (CONDITION M.).
4. ACCIDENTAL MORTALITY MAY NOT EXCEED TWO SPECIMENS. IN THE EVENT THAT THIS NUMBER IS MET, ALL ACTIVITIES MUST CEASE. ANY BAT MORTALITY OR SERIOUS INJURY MUST BE REPORTED WITHIN 5 CALENDAR DAYS TO THE APPLICABLE OFFICE LISTED IN CONDITION M. AND TO THE NEAREST U.S. FISH AND WILDLIFE SERVICE LAW ENFORCEMENT OFFICE ([HTTP://WWW.FWS.GOV/OFFICES/DIRECTORY](http://www.fws.gov/offices/directory)). DEAD OR MORIBUND BATS MAY BE RETAINED FOR FURTHER STUDY ONLY WITH THE WRITTEN PERMISSION OF THE U.S. FISH AND WILDLIFE SERVICE. ANY BATS THAT ARE NOT AUTHORIZED FOR RETENTION ARE TO BE CHILLED AND PROMPTLY TRANSFERRED TO THE U.S. FISH AND WILDLIFE SERVICE FOR POTENTIAL NECROPSY AND/OR CONTAMINANTS ANALYSIS (CONDITION L.6.).

E. NO BAT INJURY OR MORTALITY IS ANTICIPATED AS A RESULT OF THE IMPLEMENTATION OF THE AUTHORIZED ACTIVITIES, EXCEPT AS EXPLICITLY STATED IN CONDITION D22 ABOVE. IF ANY INJURY OR MORTALITY DOES OCCUR, THE PERMITTEE SHALL IMMEDIATELY NOTIFY THE APPROPRIATE U.S. FISH AND WILDLIFE SERVICE OFFICES NOTED IN CONDITION M., BELOW. NOTIFICATION SHALL ALSO BE MADE WITHIN 24 HOURS TO THE REGIONAL PERMITS BIOLOGIST, AT THE ADDRESS AND TELEPHONE NUMBER NOTED IN CONDITION L., BELOW. BASED ON DISCUSSIONS WITH THESE OFFICES, A DECISION WILL BE MADE AS TO WHETHER ANY OF THE AUTHORIZED ACTIVITIES CAN CONTINUE. DECISIONS WILL ALSO BE MADE CONCERNING THE DISPOSITION OF ANY DEAD OR INJURED BATS. THE PERMITTEE SHALL PROVIDE A WRITTEN STATEMENT TO THE U.S. FISH AND WILDLIFE SERVICE OFFICES NOTED IN CONDITIONS L. AND M., BELOW, WHICH DOCUMENTS THE CAUSE OF THE INJURY/MORTALITY, AND IDENTIFIES THE REMEDIAL MEASURES EMPLOYED BY THE PERMITTEE TO ELIMINATE FUTURE MORTALITY/INJURY EVENTS. THE FINAL DECISION ON REMEDIAL MEASURES RESTS WITH THE U.S. FISH AND WILDLIFE SERVICE.

F. THIS PERMIT IS NON-TRANSFERABLE, BUT OTHER QUALIFIED PERSONNEL MAY ASSIST IN THE AUTHORIZED

ACTIVITIES, SUBJECT TO THE REQUIREMENTS OF §13.25. WHEN ANY SUCH ASSISTANCE IS TO BE PROVIDED, THOSE DESIGNATIONS ARE TO BE MADE BY LETTER FROM THE PERMITTEE TO EACH AGENT. THE LETTER(S) MUST IDENTIFY THE SCOPE AND DURATION OF THE ASSISTANCE TO THE PERMITTEE. COPIES OF SUCH LETTERS WILL BE PROVIDED IMMEDIATELY TO THE U.S. FISH AND WILDLIFE SERVICE'S REPORTING ADDRESSES LISTED IN CONDITIONS L, M, AND N., BELOW, AS APPROPRIATE. THE PERMITTEE MUST BE PRESENT ON SITE AT ALL TIMES WHILE ACTIVITIES AUTHORIZED UNDER THIS PERMIT ARE BEING CARRIED OUT.

G. PERMITTEE MUST CARRY A COPY OF THIS PERMIT AT ALL TIMES WHEN CONDUCTING THE AUTHORIZED ACTIVITIES. SHIPMENTS OF COLLECTED BIOLOGICAL MATERIALS SHOULD ALSO BE ACCOMPANIED BY A COPY OF THIS PERMIT. NOTE THAT THIS PERMIT IS LIMITED TO THE ABOVE ACTIVITIES AND IDENTIFIED SPECIES.

H. ISSUANCE OF THIS PERMIT DOES NOT CONSTITUTE PERMISSION TO CONDUCT THESE ACTIVITIES ON NATIONAL WILDLIFE REFUGES OR ANY OTHER PUBLIC OR PRIVATE LANDS; SUCH PERMISSION MUST BE OBTAINED SEPARATELY FROM THE APPROPRIATE LANDOWNER OR LAND MANAGER BEFORE BEGINNING THESE AUTHORIZED ACTIVITIES. THIS PERMIT, NEITHER DIRECTLY OR BY IMPLICATION, GRANTS THE RIGHT OF TRESPASS.

I. ACCEPTANCE OF THIS PERMIT SERVES AS EVIDENCE THAT THE PERMITTEE AND ITS AUTHORIZED AGENTS UNDERSTAND AND AGREE TO ABIDE BY THE TERMS OF THIS PERMIT AND ALL SECTIONS OF TITLE 50 CODE OF FEDERAL REGULATIONS, PARTS 13 AND 17, PERTINENT TO ISSUED PERMITS. SECTION 11 OF THE ENDANGERED SPECIES ACT OF 1973, AS AMENDED, PROVIDES FOR CIVIL AND CRIMINAL PENALTIES FOR FAILURE TO COMPLY WITH PERMIT CONDITIONS.

J. UPON LOCATING A DEAD, INJURED, OR SICK BAT, OR ANY OTHER THREATENED OR ENDANGERED SPECIES, UNDER CIRCUMSTANCES NOT ADDRESSED IN THIS AUTHORIZATION, INITIAL NOTIFICATION MUST BE MADE IMMEDIATELY TO THE U.S. FISH AND WILDLIFE SERVICE FIELD OFFICE IDENTIFIED IN CONDITION N., BELOW. NOTIFICATION SHOULD ALSO BE MADE BY THE NEXT WORK DAY TO THE U.S. FISH AND WILDLIFE SERVICE OFFICE IDENTIFIED IN CONDITION L., BELOW. CARE SHOULD BE TAKEN IN HANDLING SICK, INJURED, OR DEAD SPECIMENS TO ENSURE EFFECTIVE TREATMENT OR TO PRESERVE BIOLOGICAL MATERIALS FOR LATER ANALYSIS. IN CONJUNCTION WITH THE CARE OF SICK OR INJURED ENDANGERED OR THREATENED SPECIES, AND THE PRESERVATION OF BIOLOGICAL MATERIALS FROM A DEAD ANIMAL, THE FINDER SHOULD TAKE RESPONSIBLE STEPS TO ENSURE THAT THE SITE IS NOT UNNECESSARILY DISTURBED.

K. AN ANNUAL REPORT SUMMARIZING AUTHORIZED ACTIVITIES MUST BE SUBMITTED BY DECEMBER 31 OF EACH YEAR THIS PERMIT IS VALID. EACH REPORT SHOULD INCLUDE, AT A MINIMUM, THE FOLLOWING INFORMATION:

1. TOTAL NUMBER OF SURVEYS CONDUCTED AND LOCATIONS OF THE TRAPPING AND SURVEY SITES. LOCATIONS SHALL BE NOTED USING FIGURES, MAPS, AND BY REFERENCING THE NAD83 COORDINATE SYSTEM (E.G., DEGREES, MINUTES, SECONDS).
2. A DESCRIPTION OF SAMPLING METHODS, INCLUDING A DESCRIPTION OF AREA SAMPLED AND NOTES ON BIOTIC AND ABIOTIC FEATURES THAT MIGHT INFLUENCE SAMPLE COMPOSITION.
3. A SPECIES LIST FROM EACH COLLECTION SITE, INCLUDING SPECIES ABUNDANCE AND RICHNESS, CONDITION, AGE, AND SEX OF CAPTURED BATS.
4. THE RESULTS OF THE SURVEYS AND RESEARCH, WITH DISCUSSIONS AND INTERPRETATIONS OF THE DATA IN CONTEXT TO RECOVERY OF THE SPECIES.
5. INFORMATION ON INJURIES AND/OR MORTALITIES AND DISPOSITION OF SPECIMENS.
6. LOCATION AND CHARACTERISTICS OF ROOST TREES AND BAT COLONIES.
7. COPIES OF ALL PUBLISHED PAPERS AND REPORTS.

L. FOR PURPOSES OF MONITORING COMPLIANCE AND ADMINISTRATION OF THE TERMS AND CONDITIONS OF THIS PERMIT, THE CONTACT OFFICE OF THE U.S. FISH AND WILDLIFE SERVICE IS:

Scientific Collection Permit

Permit Type: **New**

Fee Paid:

\$40.00

VADGIF Permit No.

051933

Permittee: **Dave Yates**

Address: **Biodiversity Research Institute**

19 Flaggy Meadow Road

Gorham, ME 04038

Office: (207) 839-7600
City/County: **Out of State**

Contract Species Surveys

Authorized Collection Methods: Harp Traps for Bats/Terrestrial Mist Nets (Bats/Birds)

Authorized Waterbodies: N/A

Authorized Marking Techniques: N/A

Authorized Counties / Cities:

York

Norfolk

PERMIT AMENDMENT 5/18/2015: This amendment adds the following:

Authorized Subpermittees: Amanda Bailey/Morgan Ingalls/Caroliine

Byrnes/Chelsea Vosburgh

Authorized Locations: Naval Properties:

Yorktown/Northwest/Norfolk/Oceana/Fentress/Fort Story/Dam Neck/Fort

Eustis/Langley

Permittee MUST notify VDGIF a minimum of 7 days prior to each sampling event. Notification must be made via email to: collectionpermits@dgif.virginia.gov

Report Due: 31 January 2015, 31 January 2016

ALL PERMIT REPORTS MUST CONTAIN COORDINATES; PERMITTEE CAN USE THE VIRGINIA FISH AND WILDLIFE INFORMATION SERVICE (VAFWIS) TO OBTAIN COORDINATES BY VISITING: [HTTPS://FWISWEB1.DGIF.VIRGINIA.GOV/FWIS/INDEX.HTML](https://fwisweb1.dgif.virginia.gov/fwis/index.html)

STANDARD CONDITIONS ATTACHED APPLY TO THIS PERMIT.

Authorized Species:

Description

ID Number

Scientific Name

Bats

Annual Report Due End of Each Year

Authorized Sub-Permittees:

See Attached Sheet

Approved by:

Applicants may appeal permit decisions within 60 days of issuance. The appeal must be in writing to the Director, Department of Game and Inland Fisheries.

Permit Effective **7/28/2014** through **12/31/2015**

15

Virginia Department of Game and Inland Fisheries
4010 West Broad Street, P.O. Box 11104, Richmond, VA 23230-1104
(804) 367-1000 (V/TDD)

Under Authority of § 29.1-412, § 29.1-417, & § 29.1-418 of the Code of Virginia

Scientific Collection Permit

Permit Type: **New**

FeePaid:

\$40.00

VADGIF Permit No.

051933

Authorized Sub-Permittees:

Tim Divoll, Biodiversity Research Institute

Dustin Meattey, Biodiversity Research Institute

Carl Anderson, Biodiversity Research Institute

Lauren Gilpatrick, Biodiversity Research Institute

Amanda Bailey, Biodiversity Research Institute

Morgan Ingalls, Biodiversity Research Institute

Caroline Byrne, Biodiversity Research Institute

Chelsea Vosburgh, Biodiversity Research Institute

DAVID YATES

719 Moosehead Lake Rd
Greenville, ME 04441
(207) 491-4707

EDUCATION:

Bachelor of Science, Wildlife Biology and Management
Unity College, Unity, ME
Graduated May 1999

M.Sc., Conservation Biology
Antioch University New England
Graduated May 2006

SKILLS:

- Proficient in animal tagging and release methods
- Ability to identify bats of N. and C. America in and QIBS by USFWS and PA State
- HERO training
- Collected and prepared blood samples for contaminant analyses.
- Current DEA drug license
- Analyzed water quality of ponds, rivers and streams
- Experience using tranquilizers/sedatives
- B3 and HUET certificates for low level flights
- HAZWOPR training
- Trained in CPR and First Aid

EXPERIENCE:

- Biodiversity Research Institute – Research Biologist/Mammal Director, Gorham, ME*** January 1998 -present
- Certified Indiana Bat Identifier for the state of PA and USFWS
 - Project Manager for Acadia National Park bat survey and tracking study
 - Project manager and conducted bat surveys for US Navy in VA and NJ
 - Lead Biologist Indiana bat surveys for Gas fracking and pipelines in PA
 - Project Manager/Lead Biologist for Maine IF&W Eco-region Surveys for bats for 5 years
 - Project Manager/Lead Biologists for bat mercury studies at superfund sites from VA to Maine involving U.S.F.&W.S.
 - Project Manager/Lead Biologist at 4 U.S. Fish and Wildlife NRDAR sites for bats and furbearers
 - Project Manager bat surveys at multiple National Wildlife Refuges in the northeast
 - Telemetry Coordinator Gulf Oil Spill Project for USFWS NRDAR bird injury assessment
 - Developed Scope of Work for USFWS NRDAR Gulf Oil Spill bird injury assessment
 - Coordinated aerial and ground tracking of more than 400 birds using multiple airplanes and satellite technology
 - Project Manager/Lead Biologist for FPL Maine Hydro. Beaver, muskrat, otter, and mink telemetry study
 - Project Manager/Lead Biologist for live trapping mink and otter study in Maine for state DEP (Master's thesis)
 - Project Manager/Lead Biologist for live trapping mink and otter study in Massachusetts for EPA and other superfund studies
 - Project Manager for Maine IF&W Ecoregion for three areas in Maine, birds and small mammals
 - Project Manager for common loon monitoring in northern and western Maine
 - Project Manager/Lead Biologist for National Park Service survey of small and large mammals of Appalachian Trail in Maine
 - Winter large carnivore tracking surveys for NPS and private landowner
 - Administered schedule III drugs for mink and otter study (Ketamine & Metomidine)
 - DEA Schedule II-III license
 - Researched recent trends of mercury and lead contaminants in the North American piscivorous bird's mammals.
 - Captured, banded and gathered mercury and lead level data in piscivorous birds.
 - Entered banding data into database for Biodiversity Research Institute data analysis.
 - Compiled banding data into official banding schedules for U.S. Fish & Wildlife Services.
 - Supervised banding of Common Loons, Eagles, Kingfishers and various other species.
 - Surveyed reservoirs and lakes for Common Loons, Kingfishers and other piscivorous birds.
 - Presented Mammal, Bat and Common Loon slide show to various organizations for educational purposes
 - Wrote reports for Loon productivity on Reservoirs for state and private agencies.
 - Proposed, designed and organized a mink and otter study for Maine Department of Environmental Protection.

Introduction

About This Document

This document describes the use of the SM2BAT+ daughter card for the Song Meter SM2+ acoustic monitoring and data logging platform.

Refer to the *Song Meter SM2+ User Manual* for detailed information on using the Song Meter SM2+ platform. This document is intended as a supplement and assumes you are already familiar with the Song Meter's operation.

You will also want to download and install the latest Wac2Wav postprocessing software and Song Meter Configuration Utility software from the downloads section of our website at www.wildlifeacoustics.com.

Overview

The SM2BAT+ daughter card is installed on the back of the SM2+ motherboard and provides a high-speed 16-bit digital sampling capability. The SM2BAT+ is able to sample at 192kHz on one or both channels, 384kHz on either channel, and can also record in native zero crossing.

The audio input to the SM2BAT+ comes from the output of the two-stage preamplifier on the SM2+. Refer to the section on *Amplifier Configuration Jumpers* in the *Song Meter SM2+ User Manual* for more information about configuring the analog high-pass filters and gain settings. Note that the SM2BAT+ audio signal is **not** routed through the third-stage amplifier configured by the left and right gain parameters in the settings menu. Therefore, the gain is configurable only with the SM2+ switches to +0, +12, +24, +36, +48, or +60dB, and the third stage gain settings will have no effect. For monitoring bats with the SMX-US ultrasonic microphone, the +36dB or +48dB setting is recommended.

The SM2+ automatically detects the presence of the SM2BAT+ daughter card. If present, the 192,000 and 384,000 Hz sample rate choices are added to the list of possible sample rate settings. In addition, the *SET* advanced scheduling command can also configure the 192,000 and 384,000 Hz sample rate as part of an advanced schedule.

When 384,000 Hz sample rate is selected, the SM2BAT+ card is used to sample the audio stream from either the left or right channel. When the 192,000 Hz sample rate is selected, the SM2BAT+ card is used to sample

the audio stream from the left and/or right channels. Otherwise, the SM2+ uses its on-board codec to sample at audio rates up to 96,000Hz.

The SM2BAT+ daughter card can also be configured for zero crossing on the left channel. See “Zero Crossing” on page 13 for more information.

SMX-US Microphone

The SMX-US is an ultrasonic microphone designed for terrestrial monitoring applications, specifically for recording the echolocation calls of bats.

Notes on Weatherproofing

The transducer inside the SMX-US microphone **can be permanently damaged** if it is exposed to water in the event that the weatherproofing fails.

To protect the transducer, there are trade-offs between ultrasonic sensitivity and weatherproofing.

The SMX-US features several layers of protection. First, a porous membrane transparent to ultrasound prevents unpressurized liquid water from entering the microphone. However, the membrane is rated to only 0.07 lbs/in² or 5g/cm². This is easily exceeded by wind-blown rain. The foam windscreen provides a critical second layer of protection to absorb the impact of wind-blown rain so that only unpressurized water reaches the membrane effectively protecting the transducer. When dry, the foam windscreen is almost transparent to ultrasound with a loss of only 2dB. However, the loss increases with frequency when wet, and will effectively block ultrasound if it then freezes.

The membrane is also fragile. The foam windscreen adds a layer of protection against insects, rodents and birds who will tend to nibble on the windscreen instead of the membrane.

We strongly recommend operating the SMX-US with the windscreen, and replacing the windscreen if it becomes fully or partially eaten.

We also recommend positioning the microphones so that they point parallel to the ground, or even slightly downward. In this configuration, even if the windscreen is absent and water penetrates the membrane, the water should not collect in sensitive areas inside the microphone and there is a good chance that the transducer will survive. If you suspect that water may have

SMX-US Microphone

entered the microphone, you should avoid handling it until it has completely dried out. Otherwise water could change position and come in contact with the transducer resulting in damage.

If you are deploying the SM2+ in field conditions expected to remain wet or frozen, you may want to operate the SMX-US microphone without its foam windscreen and instead implement your own weather protection to protect the membrane from wind-blown rain. Again, we recommend that you aim the microphone horizontally or downward (not upward) to reduce the risk of damage should weatherproofing fail.

Directionality and Frequency Response

The SMX-US is an omnidirectional microphone and is therefore ideally suited to unattended monitoring in which the precise direction of bat activity may not be known in advance. The following graph illustrates the typical pick-up pattern:

SMX-US Directionality

The SMX-US is sensitive to frequencies over 150kHz. The graph shows the typical frequency response and noise floor of the SMX-US microphone. Some additional attenuation can be expected if the microphone windscreen is wet, especially in higher frequencies:

SMX-US Microphone

Cables

The SMX-US is a powered microphone with low impedance and can drive cables up to 100 meters without a preamplifier and without any noticeable loss at frequencies up to 120kHz.

The SMX-US microphone can be either connected directly to the SM2+ enclosure without any cable or extended on one or more lengths of our standard one meter, ten meter and fifty meter cables up to the maximum. For best results, the SMX-US microphone should be mounted on a cable and placed away from the Song Meter enclosure or other hard objects in order to reduce echos.

Power Consumption and Card Usage

Power

The following table illustrates the typical power consumption for different configurations and settings. Note that actual consumption may vary depending on flash cards, variation in electronic components, and other variables:

Triggered Recordings		
Configuration	Wait for Trigger	Recording
192Kx1 WAV	75	95
192Kx1 WAC	115	125
192Kx2 WAV 384Kx1 WAV	100	130
192Kx2 WAC 384Kx1 WAC	175	190
ZC	35	35

Untriggered Recordings	
Configuration	Recording
192Kx1 WAV	90
192Kx1 WAC	120
192Kx2 WAV	120
192Kx2 WAC	155
384Kx1 WAV	95
384Kx1 WAC	160
ZC	35

High quality Alkaline D cells can deliver about 12,000mAh capacity at 20° C. With triggers in WAV mode, this translates to about 130 hours record time with 192kHz mono and 100 hours record time with 192kHz stereo or 384kHz mono. In zero cross mode, it is possible to record for well over 300 hours. Longer deployments are possible with larger external batteries using the Song Meter SM2PWR power adapter sold separately.

When the SM2BAT+ daughter card is not being used, for example when the Song Meter SM2+ is configured for sampling rates at or below 96kHz, it will still consume an additional 10mA when recording compared to an SM2+ without the SM2BAT+ card installed.

When the Song Meter is sleeping between scheduled recording events, the SM2BAT+ is also powered down and total current consumption is typically less than one milliamp.

Flash Cards

In a typical night with bat activity (and no rain or gusty wind), you will need about 0.5GB per night for a stereo recording. But even with gusty wind causing false triggers, you will probably only need about 2GB per night. In WAV mode, since the files are filtered for false positives, you can expect to use even less. Therefore, a single 32GB card should easily last for 2-8

weeks. In zero cross mode, you can expect a 32GB card to last for months if not years.

For longer deployments, you can use a larger external power source. With 4x32GB flash cards, you should have enough storage to last 50-250 nights depending on conditions.

While most SDHC Class 4 and Class 6 flash cards work well with SM2BAT+, there are some that may result in choppy recordings. The cards we sell are guaranteed to work

Settings

Gain and Filter Switch Settings

You should configure the preamplifier switches with the analog high-pass filter set to 1kHz and the gain set for +48dB or +36dB. Refer to the *Song Meter SM2+ User Manual* for details. The dynamic range can be increased by using +36dB gain to avoid clipping stronger signals without significant impact to quieter signals. +48dB gain will deliver a stronger signal with a slight improvement to high-frequency signal-to-noise ratio over +36dB gain.

The SMX-US microphone does not need the 2.5V 2.2K bias, but will work with or without the bias switched “on”. Note that the bias is required for the SMX-II acoustic microphones.

Menu Settings

Audio Settings

The audio settings should be set as follows:

```

Sample rate: 192000      (for 192kHz rate)
                or      384000      (for 384kHz rate)
Channels:    MONO-L      (for left channel)
                or      MONO-R      (for right channel)
                or      STEREO      (for both channels)
Compression: WAC0      (lossless compression)
                or      None      (individual WAV files)
                or      ZC      (zero crossing mode)

```

Settings

The SM2BAT+ card can both record at 192kHz in stereo, or in mono on either the left or right channel.

WAC compression will create one file for each scheduled recording and contains compressed samples for each detected trigger event. Triggers on left and right channels (in the case of 192kHz stereo recordings) are triggered and compressed individually. With +36dB gain, all 16 bits are needed to resolve fainter signals, and so lossy compression is not recommended (so you should use WAC0). At +48dB gain, WAC1 will offer some improvement in compression without significant adverse effects. Higher levels of compression with the SMX-US microphone are not recommended.

If no compression is used, an individual time-stamped WAV file will be created for each triggered event during the scheduled recording period.

Advance Audio Settings

The advanced settings should be set as follows:

Dig HPF Left	fs/12 (16kHz for 192kHz)
	or fs/24 (16kHz for 384kHz)
Dig LPF Left	Off (low-pass disabled)
Trg Lvl Left	18SNR (adaptive +18dB)
Trg Win Left	2.0s

There are two trigger operational modes for WAC and WAV mode. Both trigger modes operation is specified with the above settings but their function differs.

In WAC mode, digital filters are implemented as specified by a fraction of the sample rate in the HPF (high pass filter) and LPF (low pass filter setting). For example, the digital high-pass filter shown above is set to either 1/12th of the sample rate for 192kHz / 12 = 16kHz or 1/24th of the sample rate for 384kHz / 24 = 16kHz. This will filter out frequencies below 16kHz. Higher or lower settings are available to suit your needs. For example, if you have low frequency bats echolocating near or below 16kHz, you may consider using fs/16 for 192kHz and fs/32 for 384kHz for a 12kHz high pass filter.

In WAC mode, Song Meter will measure the rolling-average power spectrum in the frequency band (above 16kHz in the above example) for periods of the trigger window setting 2.0 seconds in the above

example), and if an onset of signal is detected that exceeds this threshold by 18dB, a trigger event is started. Recording will continue until no trigger is detected for a 2.0 second period of time. Longer or shorter trigger windows are available. Longer windows will increase card usage, but will allow further detection if a bat is passing and becomes too faint to re-trigger. You can increase detection rate on fainter signals by reducing the threshold, but this may also increase the false trigger rate, especially in wind and rain.

In triggered WAV mode, individual WAV files are created for each trigger. In this mode, the digital HPF and LPF settings do not actually filter out information from the recordings, but are instead used to define the frequency band of interest for the SM2BAT+ to apply more sophisticated triggering algorithms. At the end of the trigger event, additional algorithms are used to determine if the recording likely contains bat activity or just unwanted noise e.g. wind and rain. If the latter, the SM2BAT+ deletes the WAV file keeping only those recordings most likely to contain useful information. This allows considerable savings in card storage. The resulting WAV files can be opened directly in the analysis software of your choice.

More information on filters and triggers can be found in the *Song Meter SM2+ User Manual*

Scheduling Recordings

Simple One-Channel Configuration

The configurations described below are available as example configurations in the Song Meter Configuration Utility distribution. They are titled “SM2BAT-192-MONO.SET” and “SM2BAT-384-MONO.SET”. For the SM2BAT+ to be able to determine your location's sunrise and sunset times, it is necessary to input your latitude, longitude and timezone. These are found under location settings. You may also want to set a device-specific prefix.

The SM2BAT+ Terrestrial Ultrasonic Packages come with one SMX-US ultrasonic microphone. The easiest set-up is to connect the microphone directly to the left microphone connector on the SM2BAT+ enclosure and mount on a tree or post at the field site. You can also extend the microphone on a cable up to 100 meters away from the enclosure.

Scheduling Recordings

You can configure the Song Meter to record only from sunset to sunrise each day in half hour segments as follows:

First, configure your latitude, longitude, and UTC offset in the “Location” settings.

Next, enter the following advanced schedule:

```
01 AT SSET-00:00:00
02 DO

03 RECORD 00:30:00 (recommended for 384kHz)
or 03 RECORD 01:00:00 (recommended for 192kHz)

04 GOTO LINE 03 00X
05 UNTSRIS+00:00:00
06 GOTO LINE 01 00X
```

The schedule above will wait for sunset, then record back-to-back one-hour or half-hour segments until sunrise (the last segment will end early at sunrise), and repeat daily. You can modify this example to suit your own needs.

Note that the maximum uncompressed file length is 2GB which works out to 46.6 minutes at 384kHz mono and 192kHz stereo or 93.2 minutes at 192kHz mono. If you use one hour periods instead of half-hour periods for 384kHz mono or 192kHz stereo, recordings would be split into alternating 46.6 and 13.4 minute recordings which may be confusing.

Two-Channel Ultrasonic Recording

The SM2BAT+ can sample at 192kHz on both channels in stereo. Recordings with two channels from one or both microphones on cables can allow monitoring two locations simultaneously. For example you could monitor at ground level and at 50m in the rotor swept zone of a wind farm simultaneously with just one SM2BAT+.

The configuration described below is available as an example configuration in the Song Meter Configuration Utility distribution, “SM2BA+-192-STEREO.SET”. For the SM2BAT+ to be able to determine your location's sunrise and sunset times, it is necessary to input your latitude, longitude and timezone. These are found under location settings. You may also want to set a device-specific prefix.

For stereo ultrasonic recordings, you can configure Song Meter to use both channels and install a second SMX-US microphone.

Refer to the one-channel recording settings above. The Settings->Audio->Channels should be set to “STEREO” to enable both channels, and you will want to set the digital high-pass filter and triggers for the right channel as well.

Stereo recordings with compression and triggering consume about 30% more power and will use twice as much flash storage as single-channel recordings.

The triggers act independently so each channel is compressed efficiently.

Mixed Ultrasonic and Acoustic Recording

The SM2BAT+ card permits two channels to simultaneously record conventional audio on one channel and ultrasonic activity on the other at 192kHz sample rate by using an SMX-II acoustic microphone on one channel and an SMX-US ultrasonic microphone on the other.

Alternatively, the SM2BAT permits the recording of conventional audio on one channel on one schedule and ultrasonic activity at 384kHz sample rate on the other channel on a different schedule, but not simultaneously.

Stereo Mixed Recordings

One way to make a mixed recording is to sample both channels at 192kHz at the same time to make a stereo recording. But you can then use the digital low-pass filters to set a cut-off frequency on the acoustic side to filter out the ultrasonic sounds and improve compression ratios. For example, setting a digital low-pass filter to $f_s/24$ will filter out sounds above 8kHz. An example of this is available in the Song Meter Configuration Utility distribution “SM2BAT-192-MIXED-STEREO.SET”

Scheduled Mixed Recordings

Another way to make mixed recordings is to use the Song Meter advanced schedule “*SET*” command to make ultrasonic recordings at some times and conventional recordings at other times. An example of this configuration is available in the Song Meter Configuration Utility distribution “SM2BAT-192-MIXED-SCHED.SET”

Scheduling Recordings

For example, the following schedule would make ultrasonic recordings on the left channel at 192kHz at night, and then a 24kHz recording on the right channel to record the dawn chorus for an hour after sunrise.

```
01 SET192000xMONO-L
02 AT SSET-00:00:00
03 DO
04 RECORD 01:00:00
05 GOTO LINE 04 00X
06 UNTSRIS+00:00:00
07 SET 24000xMONO-R
08 RECORD 01:00:00
09 GOTO LINE 01 00X
```

A similar example for 384kHz can be found in “SM2BAT+-384-MIXED-SCHED.SET”:

```
01 SET384000xMONO-L
02 AT SSET-00:00:00
03 DO
04 RECORD 00:30:00
05 GOTO LINE 04 00X
06 UNTSRIS+00:00:00
07 SET 24000xMONO-R
08 RECORD 01:00:00
09 GOTO LINE 01 00X
```

Zero Crossing

Native Zero Crossing mode is supported in the SM2BAT+ daughter card on the left channel and can be selected by setting Settings->Audio->Compression to “ZC”. In this mode, the sample rate and advanced audio settings have no effect except for the left trigger window (“Trg Win Left”) as described below.

Zero Crossing is not the same as full-spectrum recording. In full spectrum recording, the SM2+ samples audio signals at a specified sample rate measuring the relative amplitude of the signal at each point using 16 bits per sample such that each sample is represented as an integer number between -32,768 and +32,767 inclusive. In contrast, zero crossing mode measures the time between transitions of the signal between positive and negative values relative to some sensitivity threshold. Zero crossing has advantages

including significantly lower power consumption and flash card storage requirements. However, zero crossing representations of bat calls lack information about the changing amplitude and harmonic structure of the underlying signal. It is possible to convert from full spectrum to zero crossing by removing information from the signal, but it is not possible to convert from zero crossing back to full spectrum.

If Zero Crossing is selected, the Song Meter goes into a low power state and creates Titley Scientific AnaBat™ sequence files compatible with AnaLookW™ or other zero crossing software¹. This is “native” zero crossing, meaning that the files are not digitally created. They are created using zero-crossing hardware on the SM2BAT+ daughter card.

The SM2BAT+ assesses each zero cross trigger to verify that it is a bat pass and not a false positive. This performs a similar function to CFCread, but no post processing is necessary, the files are ready to be opened directly in AnaLookW or other zero cross software.

The Zero Crossing implementation reduces data requirements further by dividing the zero crossings by a division ratio. The SM2BAT+ uses a division ratio of 8.

During the scheduled recording period, SM2BAT+ will create zero crossing sequence files for each trigger. The trigger starts when a zero crossing event is detected, and ends when no zero crossing event is detected for the period specified by Settings->Audio->Advanced->Trig Win Left. The trigger may also end when the sequence file grows to its maximum capacity.

Note that it is also possible to convert full spectrum ultrasonic recordings created in the WAC file format from any SM2BAT+ card to AnaLookW compatible files as described in “Post Processing” on page 15.

Zero Crossing requires a sensitivity threshold that is not actually “zero”, but a level slightly greater than zero, and measures signal transitions that cross this threshold. The threshold is required because a signal devoid of bat calls will still contain transitions around zero as a result of ambient and electronic noise. If the threshold is too low, many zero crossings will be detected in a quiet signal resulting in significant noise. If the threshold is too high, the echolocation calls of bats may be distorted or undetectable.

1. AnaBat, AnaLookW and CFCread are trademarks of Titley Scientific. There is no relationship between Titley Scientific and Wildlife Acoustics.

Scheduling Recordings

The SM2BAT+ automatically adjusts the sensitivity threshold at the start of each recording period after waking up from sleep mode. The display will show “ZC Sensitivity Auto Leveling” for several seconds while the level is adjusted.

Post Processing

A .WAC file is created for each scheduled recording segment. In the advanced program above, for example, a .WAC file would be created every hour from sunset to sunrise.

The *Song Scope* software can open .WAC files natively. To quickly locate and review potential bat echolocation calls in a long triggered recording, you can set up *Song Scope* band-pass and detector parameters and use the batch scan feature.

The *WAC2WAV* utility (available at no charge on our web site) can convert the .WAC files into standard .WAV files for analysis by other programs. Usually it is best when processing triggered ultrasonic recordings to use the “Split Triggers” feature. This will take a mono or stereo .WAC file containing possibly many individual triggered events (e.g. bat passes), and break them out into many individual .WAV files for analysis.

The max duration and min spacing parameters let you selectively restrict the duration of each created .wav file and to optionally ignore detections to satisfy the desired spacing in order to fit whatever monitoring protocol you may be used to. For example, if you are used to using Time Expansion detectors that only record for 5 seconds and then pause for 50 seconds while the time expansion buffer is recorded, you could select a max duration of 5 seconds and a min spacing of 50 seconds to simulate this behavior. By default, all detections are included in their entirety.

The compensation filter may be selected to digitally alter the signal to flatten the frequency response of the SMX-US microphone. This may be helpful for analysis by automated classification software that relies on the frequency response to match known bat recordings.

The “Skip Noise” feature can be used to further analyze each candidate trigger to determine if it contains actual bat echolocation calls (or other biological activity) rather than just noise. The algorithm looks for the presence of narrowband energy in the specified frequency band with at least the minimum specified duration. Files that do not meet this criterion are

still split out as .WAV files, but the filename is prepended with the prefix “NOISE_” so they can be set aside.

Finally, if you prefer zero crossing analysis over full spectrum recordings, you can select “Output ZCA” to create zero crossing files instead of .WAV files. In this way, the SM2+ is like having a full spectrum recorder and a zero crossing recorder in one device. The division ratio can be specified as well as the sensitivity. The sensitivity is specified in dB relative to a full-scale signal, or can be set to zero for auto-leveling

Enclosure 10. Sustainability Report, Dune Surveys & Plantings

NATIONAL AQUARIUM®

Sustainability Report, Dune Surveys & Plantings

Naval Air Station Oceana – Dam Neck Annex

**Naval Facilities Engineering Command Mid-Atlantic
(NAVFAC MIDLANT), PWD Oceana Environmental
Program Division**

November 2010

I. Introduction

Sand dunes protect many coastal areas from high winds, salt spray, storms, and flooding and erosion due to wave energy. Along the mid-Atlantic seaboard, wave and wind action cause these dunes to shift over time. Many native dune plant species are adapted to grow with these moving sands and provide some stabilization. In many areas, human development over the past century has upset the balance of this natural system and the coastal dune system has degraded over the years. Mankind is only now beginning to find ways to work with nature so that the dunes are preserved and development is better planned to reduce adverse impacts to this habitat.

A healthy dune system is important for ecological and physical reasons. Sand dune vegetation is uniquely adapted to thrive in stressful conditions such as extreme heat, salt spray, drought, limited nutrients, and shifting sands. This vegetation provides habitat, including nesting sites to birds, small mammals, reptiles, amphibians, and insects.

Dunes also provide a physical barrier to the harsh conditions of the sea and act as a reservoir for beach nourishment. Coastal communities are beginning to see the value of these systems and are actively working to restore dune systems in their area.

Eroding sand dunes at Dam Neck Annex (February, 2010)

Naval Air Station Oceana (NASO) – Dam Neck Annex maintains nearly 1930 acres of land, including four miles of beachfront property. The base's coastal habitat communities contain primary sand dune structures, and marshes. Many of the dunes at the base are degraded, barren of plant life, and require stabilization. In their present condition, they are eroding along the trailing edge, resulting in lost habitat and hindered base operations. It is a long-term objective to stabilize these dunes by planting native grasses and installing dune fencing so that a protective barrier can be maintained while ensuring that the mission of the naval base is not compromised. Working with community volunteers to plant these grasses, provides an opportunity to educate local citizens about the importance of dune communities as coastal habitat and provide them with a hands-on opportunity for restoration activities.

II. Objectives

This project supports the Naval Facilities Engineering Command Mid-Atlantic (NAVFAC MIDLANT), PWD Oceana Environmental Program Division (NAVFAC ML-PWD Oceana EV) managers with the implementation of shoreline and dune stabilization and conservation/habitat restoration along the coastal region of NASO Dam Neck Annex. Federal regulations require sound management in support of mission. The beach dunes are in danger of severely eroding due to wave and wind action associated with storm conditions. The NAVFAC ML-PWD Oceana EV has partnered with the National Aquarium to assist with eroding dune areas along the Dam Neck beaches. In order to sustain the most valuable resource and training area, protective measures and stabilization is required. The installation of sand fencing builds up sand from wind

action and provides a medium for vegetation to bind sand and strengthen the integrity of the dune system. A plan of future restoration sites is required to provide guidance for future phases of restoration. Beach stability has been compromised with such storms as Hurricane Isabel (2003) and Hurricane Ida (2009). Buffer and training sites have been degraded as well as sensitive ecological habitat areas. The goal of this project is to stabilize sand dunes covering Naval Air Station Oceana – Dam Neck Annex. Stabilizing these dunes will reduce their movement, protecting base operations from creeping sand and providing a natural barrier to ocean swells. Project objectives include:

- Provide the lead on dune restoration activities along the four mile stretch of Dam Neck beaches. Base and community volunteers will be utilized to plant the vegetation; however, the Aquarium will plan, coordinate, purchase materials, and implement the project.
- Provide technical assistance in support of a development of a master plan map documenting erosive conditions and future dune restoration sites as well as vegetative restoration projects. This road map will be provided as a guide for future conservation opportunities as well as document site vulnerabilities.

III. Methods

Since 2006 the Aquarium has worked with Navy operations to restore and maintain the Dam Neck beaches sections at a time. These 2-3 day planting events were prioritized by areas of the beach where attention was needed most and could be easily accessed by Aquarium staff and community volunteers.

Four grasses and one flowering species were planted to compliment what currently thrives on the existing dunes as well as adding diversity to the habitat. Availability of native grass species from local nurseries also contributed to the decision of species selection. These five species, American beach grass (*Ammophila breviligulata*), bitter panicum (*Panicum amarum*), switchgrass (*Panicum virgatum*), salt meadow hay (*Spartina patens*), and goldenrod (*Solidago nemoralis*) are perennial plants that play an important part of mid-Atlantic coastal dune habitats and are uniquely equipped to survive in this type of environment (Appendix B). Over the course of the restoration events the grasses were planted in either pairs of bareroot “culms” or rooted “plugs” spaced approximately 18” apart and at least 6” deep. Hand-held applicators were used to spread a slow-release 10-10-10 fertilizer over the areas.

Dune fencing was installed at each site stretching along the main beach to further stabilize the dunes (Appendix A). These fences serve as a wind break, helping sand accrete around them. Parallel lines of fencing were placed along the bottom (or toe) of the dunes. Dune **instillation** at Dam Neck planting events prior to 2006 had additional fencing installed at 100’ intervals perpendicular to the toe and top fences. Galvanized wiring was used to secure the 3’ tall slatted wood fences to 8’ long posts half-buried in the sand.

IV. Results

During the period of March, 2006 - November 2010 over 220,000 plants were planted on the Dam Neck dunes with the help of 362 volunteers. Continuous dune fencing was installed over the last 5+ years by Navy personnel, Aquarium staff and volunteers. Due to a lack in records from personnel turnover it is uncertain exactly how much linear footage of fencing was installed. As of the November 2010 survey, fencing stretches along the main beach of Dam Neck Annex (Figure 1). Volunteers who assisted in the work included individuals from: Navy personnel, college and high school classes, the Virginia Aquarium and Marine Science Center, youth groups, and local members of the community.

Our goal of stabilized dune habitat can be readily demonstrable using various monitoring protocols. We expect to demonstrate at least 80 percent plant survival one year after planting, along with subsequent plant spreading and coalescence, such that plant cover approaches that typically found in dune habitats in the mid-Atlantic region.

Planting events showing less than 80 percent survival after one year were observed at Dam Neck Annex when a planting was followed by a major storm event or long period of drought.

In November 2009, Hurricane Ida hit the Virginia Beach coast.

NAVFAC ML-PWD Oceana EV staff reported Dam Neck's coast eroding an area approximately 20-40+ ft deep along 5000+ linear feet

stretch of the coastal dune line (Figure 1). Though significant dune damage, half of the restoration grasses planted in October, 2009 remained and no breaching occurred protecting base operations from salt intrusion and flooding. Base personnel immediately replaced lost fencing and the Aquarium returned to replant areas of lost grasses. In addition, areas unsuccessful due to drought are replanted by Navy personnel, Aquarium staff and volunteers the following planting season after the drought.

The shifting sand dunes on Dam Neck Annex are dynamic complex systems. Dam Neck Annex is observed to have an active coastline with high energy waves and major storm events annually. Due to a highly active coast, dunes are observed to frequently shift along the Dam Neck coast. Because these sites are owned by the Department of Defense, they will remain in a natural state and not be threatened by coastal development. The restored dunes are monitored visually throughout the year by a long-standing partnership with NAVFAC ML-PWD Oceana EV staff and the help of the Aquarium. With additional funding the Aquarium will progress to advanced monitoring techniques using areal photography and random species sampling of the project site. After a series of successful planting events (seven since 2006), the Aquarium is confident with the knowledge and skill to implement the long term stability plan maintaining the shifting dunes at Dam Neck Annex protecting base operations.

V. Future Work

A master plan of the four mile coast of NASO Dam Neck Annex was created as a road map for future optimal planting sites and dune fence installation (Figure 1). This road map is an evaluation of the dunes that will be revisited annually as more restoration occurs, the dunes shift, and general maintenance of the area is performed.

On the master plan below the four mile stretch of Dam Neck is identified by three sections to better understand the current condition. These three sections consist of beaches known as the Main Beach, Range Beach, and MACS24 making up the ~21120 linear foot shoreline (Figure 1).

- Section one is the area furthest south marked in green. The site was both fenced and planted over two restoration events in April and November of 2010 by the National Aquarium and volunteers. This area will be visually monitored by NAVFAC ML-PWD Oceana EV staff at the beginning of each planting season, after any major storm events and after long periods of drought to determine plant survival and condition of dune fencing. Further restoration in this area will occur to replace lost vegetation and damaged fencing as needed.
- Section two is an area the Aquarium restored with several planting events from 2006-2008. In November 2009 Hurricane Ida damaged this area creating loss in plants, sand and fencing (Figure 1). New fencing was installed by the NAVFAC ML-PWD Oceana EV staff between December 2009-January 2010 in an effort to replace lost fencing and accrete sand. This section was also part of the Christmas tree project. Over 500 Christmas trees were placed behind the newly installed fence to expedite sand accumulation. As of November 2010 base personnel have plans to bring in sand replenishing these areas hit hardest during the storm. These areas will be revisited after sand replenishment to determine if they are suitable for planting. Ideally this section is most favorable for the next phase in dune stabilization at Dam Neck.
- Section three is a well established primary dune ecosystem. The dunes are very high in elevation and are thriving with vegetation (mostly Sea oats). Although this area was fenced in the past by Navy personnel, it has since been either lost or buried within the dune. It is expected this area will naturally accumulate some sand during the sand replenishment project. NAVFAC ML-PWD Oceana EV staff recommends installing a layer of fencing to widen the dune and prevent unapproved dune access. This area will be fenced by either Navy personnel or the Aquarium depending on when funding and supplies become available.

VI. Partners

Since the late 1990s, the National Aquarium in Baltimore has been building a multi-faceted citizen-based coastal habitat restoration program with many public and private sector partners aimed at achieving high-quality, science-based habitat restoration while increasing the connection of local residents to the beauty and value of the Chesapeake Bay and coastal habitats. Here we continued and expanded our larger community-based restoration program at NASO Dam Neck Annex with dune restoration events by engaging local community volunteers to help stabilize primary dune structures using native vegetation. Funding for these projects was provided by the Department of Defense and National Environmental Education and Training Foundation through the National Public Lands Day Program.

Naval Facilities Engineering Command Mid-Atlantic (NAVFAC MIDLANT), PWD Oceana Environmental Program Division will be the local contact for future projects. They have shown continued support with on-site logistics, preparation, and help in recruiting local volunteers. The Dam Neck Annex dune stabilization project helps the NAVFAC ML-PWD Oceana EV towards meeting the Navy's environmental mandates and helps meet many goals of the Chesapeake Bay Program. In-kind support from the base included on site lodging for Aquarium staff, use of equipment needed to install sand dune fencing and manual labor for the installation as well as volunteer labor for the planting events.

Community volunteers participated in a hands-on restoration experience of vital habitats close to their home. They learn about the importance of this coastal habitat while working to protect it. Public involvement in the process is critical because community-based restoration provides unique opportunities to engage the public to improve the status of the resource and generate positive publicity to raise awareness of the cause and effect relationships of coastal development. The Virginia Aquarium and Marine Science Center was an important partner in developing local support for the project.

VII. Conclusions

With future funding the Aquarium plans to continue the partnership with the NAVFAC ML-PWD Oceana EV strengthening their dunes at Dam Neck Annex. Final products for this project include further restoration of coastal dune habitat by installing sand dune fencing and planting native dune plants. The project continues to result in direct, substantial and measurable benefits to many living resources.

Dune habitats are an especially valuable and threatened resource along the mid-Atlantic coast. These areas have been particularly hard hit by erosion and human encroachment, resulting in widespread loss throughout the area. They provide remote and key habitat for many wildlife species, including ground nesting birds, songbirds, water fowl, small mammals, amphibians, reptiles and insects.

Public involvement in the process of coastal dune restoration is critical because community-based restoration of primary dunes provide unique opportunities to engage the public to improve the status of the resource and generate positive publicity to raise awareness of the cause and effect relationships of coastal development. The focus of educational messages associated with this project will range from imparting knowledge (classroom activities) to increasing action (direct involvement in the process) to increasing stewardship (best management practices in one's own backyard).

Dune Fence Installation Guide

Dam Neck Annex

Prepared by the

NATIONAL AQUARIUM®

September 2006

Importance of Dunes

Sand dunes protect many coastal areas from high winds, salt spray, storms, flooding and erosion due to wave energy. Along the mid-Atlantic seaboard, wave and wind action cause these dunes to shift over time. Many native dune plant species are adapted to grow with these moving sands and provide some stabilization. In many areas, human development over the past century has upset the balance of this natural system and the coastal dune system has degraded over the years. Mankind is only now beginning to find ways to work with nature so that the dunes are preserved and development is both better planned to reduce adverse impacts to this habitat.

A healthy dune system is important for ecological and physical reasons. Sand dune vegetation is uniquely adapted to thrive in stressful conditions such as extreme heat, salt spray, drought, limited nutrients, and shifting sands. This vegetation provides habitat, including nesting sites, to birds, small mammals, reptiles amphibians, and insects. Dunes also provide a physical barrier to the harsh conditions of the sea and act as a reservoir for beach nourishment. Coastal communities are beginning to see the value of these systems and are actively working to restore dune systems in their area.

Equipment

Dune fencing – 4' high by 50 ft rolls
Pressure treated 8' 2 x 4 posts
Galvanized wire
Gloves
Pliers
Auger and 4 foot long 4" Auger bit

Installation of Dune Fencing

Fencing provides a wind break, reducing the movement of dunes and helping sand accrete. Dune fencing consists of wire 4' pieces of wooden lathe bound together by wire into 50 foot long rolls. Installation requires deciding on fence line locations, digging post holes and placing posts in the ground along the fence line, and then attaching the

fence to the posts. Dune fencing functions by trapping sand blown by on-shore winds landward across the beach toward the dune line. As the fences become buried, they build up the dune by preventing windblown sand from migrating further in a shoreward direction. Dune fencing has the potential to increase dune height by as much as four feet per year and new fencing can be installed above buried fencing, further building dune height.

Main fence lines run parallel to the ocean. Most sections of the project site have at least one, and up to several existing fence lines in varying states of burial, depending on when they were installed. One new fence line will run approximately 20 ft below (seaward) of the existing bottom (toe) of the dune or 20 ft seaward of the seaward-most existing fence line. The new toe fence is to be installed along the entire length of the project site, except at pedestrian or vehicle crossover points. A second, parallel fence line is to be installed above the new toe fence along selected portions of the project site. Placement of this fence will vary depending on local conditions. In some areas, the second fence will be installed between existing, substantially buried, fence lines; and in other places behind all existing fence lines (e.g. Figure 1). Placement of the second fence line will be up to the installers' discretion, using the following guidance:

- Attempt to install the upper fence near the top or crest of the dune, to the seaward edge of the flattened top or plateau of the dune
- Install between existing fence lines if existing fences are substantially buried and there is a flattened space between them
- Install behind existing fences if the fences are still exposed and have substantial sand trapping potential or if there is a strong slope between existing fences and a more suitable plateau behind them

Using an auger, drill holes in the sand approximately 4' deep for the fence posts. If 4' is not tenable, dig as deep as possible. Holes should be placed at the ends of the length of fence (i.e. every 50 ft) and approximately 10 feet apart in between. Attempt to be place a post at the bottom of each "dip" or low point as you move along the dune, ensuring that the fence can be installed flush to the sand across each dip. It is more important that posts are installed taking local topography into consideration (i.e. at the bottom of dips) than it is that they be placed on strict 10 ft centers. Place the 2 x 4 in the hole, with the 4" face oriented toward the ocean, and infill with sand. Tamp the sand around the base of the posts. Sit the roll of fence next to the first post. Attach the end, with the bottom of the fence flush with sand, using galvanized wire near the top, bottom and in the middle of the fence. Unroll the fence to the next post and repeat until that section of fence is complete. Start the next roll of fence on the same post where the last one ended. Repeat in this manner until the fence runs the length of the dune. See Figure 2 for an illustration of a standard fence installation.

Work Plan

Sand dunes at Dam Neck run the length of the beach from Camp Pendleton to Sandbridge. The site has been divided into 6 sections (see Map), with divisions corresponding to natural breaks in the fencing design (e.g. Vehicle/pedestrian crossover

points, beginning or end points of existing fencing). The entire project will require the installation of approximately 5 miles of dune fencing along 3.1 miles of beach using about 2,600 2 x 4 posts. The following section describes a flow of work to divide the project into manageable, prioritized pieces.

Task 1: Install Toe Fence Entire Length of Section 2

Fencing			
Feet	Rolls	2x4s	Ties
2,300	46	230	690

Start installing toe (seaward-most) fence beginning just south of the vehicle cross over at the north end of Section 2 (75° 57' 19.29"W, 36° 46' 36.32" N). New toe fencing is to be installed approximately 20 ft seaward of existing seaward-most fence. Fence will run continuously south to the pedestrian cross over located between Sections 1 and 2.

Task 2: Install Toe Fence Entire Length of Section 1

Fencing			
Feet	Rolls	2x4s	Ties
3,800	76	380	1,140

Start installing toe (seaward-most) fence beginning just south of the pedestrian cross over separating Sections 2 and 1 (75° 57' 12.04"W, 36° 46' 15.21" N). New toe fencing to be installed approximately 20 ft seaward of existing seaward-most fence. Fence will run continuously south to the southern terminus of Section 1 (Sandbridge, southern end of the base). At the extreme end of the site, curve the fencing gradually west (landward) and run approximately 100 feet along sand path leading through the back dune area.

Task 3: Install Toe Fence Entire Length of Section 3

Fencing			
Feet	Rolls	2x4s	Ties
2,600	52	260	780

Start installing toe (seaward-most) fence beginning just north of the vehicle cross over separating Sections 2 and 3 (75° 57' 19.29"W, 36° 46' 36.32" N). New toe fencing is to be installed approximately 20 ft seaward of existing seaward-most fence. Begin new fence along sand path running up the dune; run fence southeast along path until about 20 feet east of existing toe fence; turn path sharply to the north and run new toe fence parallel to, and about 20 feet seaward of, existing toe fence. Fence will run continuously north to the northern end of Section 3 (75° 57' 27.20"W, 36° 47' 01.37" N), marked by wooden stairs and a pedestrian crossover. There are two additional pedestrian cross over in the section, both marked by stairs down the dune. Construct breaks in the fence to allow for pedestrian access at these locations. Note that there is

high-quality existing fencing in this section and no additional upper dune fencing will be needed.

Task 4: Install Toe Fence Entire Length of Section 4

Fencing			
Feet	Rolls	2x4s	Ties
2,000	40	200	600

Start installing toe (seaward-most) fence beginning just north of the pedestrian cross over separating Sections 3 and 4 (75° 57' 27.20"W, 36° 47' 01.37" N). New toe fencing is to be installed approximately 20 ft seaward of existing seaward-most fence. Fence will run continuously north to the northern end of Section 4 (75° 57' 31.93"W, 36° 47' 19.52" N), marked by wooden stairs and a pedestrian crossover. There are two additional pedestrian cross-overs in the section, both marked by stairs down the dune. Construct breaks in the fence to allow for pedestrian access at these locations. Note that there is high-quality existing fencing in this section and no additional upper dune fencing will be needed.

Task 5: Install Toe Fence Entire Length of Section 5

Fencing			
Feet	Rolls	2x4s	Ties
3,200	64	320	960

Start installing toe (seaward-most) fence beginning just north of the pedestrian cross over separating Sections 4 and 5 (75° 57' 31.93"W, 36° 47' 19.52" N). Conditions in Section 5 are variable. Existing high-quality toe fencing runs north, continuing from Section 4, until the vehicle crossover located approximately 1,200 feet into Section 5. New toe fencing is to be installed approximately 20 ft seaward of this existing toe fence until it ends. Fencing is absent, sporadic or in poor condition north of the end of the existing high-quality fence. There are some existing 4x4 posts without attached fencing in this area that can be used to install sand fence. The exact placement of fencing in this area will be up to the installer's discretion, with existing posts used to establish either toe or upper fence lines as possible and appropriate. For the purposes of this task, install only toe (seaward) fence, using existing posts if possible. Fence will run continuously north to the northern end of Section 5 (75° 57' 42.08"W, 36° 47' 50.30" N), which is approximately 275 ft north of the vehicle cross-over in front of a small (Guard?) structure. Construct breaks in the fence to allow for vehicle access at this location and the vehicle cross-over in the southern part of Section 5.

Task 6: Install Toe Fence Entire Length of Section 6

Fencing			
Feet	Rolls	2x4s	Ties
2,800	56	280	840

Conditions in Section 6 are similar to those in Section 5: sporadic or absent fencing throughout, with sporadic existing 4x4 posts without attached fencing. There is no continuous, high-quality fencing in Section 6 as there is in the southern part of Section 5. Start installing toe (seaward-most) fence southern end of Section 6 (75° 57' 42.08"W, 36° 47' 50.30" N), heading north. The exact placement of fencing in Section 6 will be up to the installer's discretion, with existing posts used to establish either toe or upper fence lines as possible and appropriate. For the purposes of this task, install only toe (seaward) fence, using existing posts if possible. Fence will run continuously north to the northern end of Section 6 (75° 57' 49.38"W, 36° 47' 16.76" N) There are two vehicle cross-overs in this Section – one just north of the beginning of the section and another about 960 feet south of the northern end of the section. Construct breaks in the fence to allow for vehicle access at these locations.

Task 7: Install Upper Fence Entire Length of Section 2

Fencing			
Feet	Rolls	2x4s	Ties
2,300	46	230	690

Start installing upper (landward-most) fence beginning just south of the vehicle cross over at the north end of Section 2 (75° 57' 19.29"W, 36° 46' 36.32" N). New upper fencing is to be installed near the top or crest of the dune, to the seaward edge of the flattened top or plateau of the dune. Fence will run continuously south to the pedestrian cross over located between Sections 1 and 2.

Task 8: Install Upper Fence Entire Length of Section 1

Fencing			
Feet	Rolls	2x4s	Ties
3,800	76	380	1,140

Start installing upper (landward-most) fence beginning just south of the pedestrian cross over separating Sections 2 and 1 (75° 57' 12.04"W, 36° 46' 15.21" N). Upper fencing is to be placed seaward of, or behind landward-most existing fence, as appropriate. Placement of the upper fence line will be up to the installers' discretion, using the following guidance:

- Attempt to install the upper fence near the top or crest of the dune, to the seaward edge of the flattened top or plateau of the dune
- Install between existing fence lines if existing fences are substantially buried and there is a flattened space between them
- Install behind existing fences if the fences are still exposed and have substantial sand trapping potential or if there is a strong slope between existing fences and a more suitable plateau behind them

Fence will run continuously south to the southern terminus of Section 1 (Sandbridge, southern end of the base).

Task 9: Install Upper Fence in Section 5, as Needed

Fencing			
Feet	Rolls	2x4s	Ties
2,000	40	200	600

Start installing toe (seaward-most) fence beginning just north of the end of the existing high-quality toe fencing runs that runs north to the vehicle crossover located approximately 1,200 feet into Section 5. New upper fencing is to be installed near the top or crest of the dune, to the seaward edge of the flattened top or plateau of the dune. There are some existing 4x4 posts without attached fencing in this area that can be used to install sand fence. The exact placement of fencing in this area will be up to the installer’s discretion, with existing posts used to establish either toe or upper fence lines as possible and appropriate. For the purposes of this task, install only upper fence, using existing suitable posts not used during earlier toe fence installation. Fence will run continuously north to the northern end of Section 5 (75° 57’ 42.08”W, 36° 47’ 50.30” N), which is approximately 275 ft north of the vehicle cross-over in front of a small (Guard?) structure. Construct breaks in the fence to allow for vehicle access at this location and the vehicle cross-over in the southern part of Section 5.

Task 10: Install Upper Fence Entire Length of Section 6

Fencing			
Feet	Rolls	2x4s	Ties
2,800	56	280	840

Conditions in Section 6 are similar to those in Section 5: sporadic or absent fencing throughout, with sporadic existing 4x4 posts without attached fencing. There is no continuous, high-quality fencing in Section 6 as there is in the southern part o Section 5. Start installing upper fence at southern end of Section 6 (75° 57’ 42.08”W, 36° 47’ 50.30” N), heading north. The exact placement of fencing in Section 6 will be up to the installer’s discretion, with existing posts used to establish either toe or upper fence lines as possible and appropriate. For the purposes of this task, install only upper fence, using existing suitable posts not used during earlier toe fence installation. Fence will run continuously north to the northern end of Section 6 (75° 57’ 49.38”W, 36° 47’ 16.76” N) There are two vehicle cross-overs in this Section – one just north of the beginning of the section and another about 960 feet south of the northern end of the section. Construct breaks in the fence to allow for vehicle access at these locations.

Task 10: Install Cross Fencing as Needed Using Remaining Materials

With any remaining material, install fencing perpendicular to, and connecting, the original toe and upper fencing. Cross fencing should be installed in areas where it

appears that prevailing winds parallel to the shore are limiting the effectiveness of the original fencing or where installation of cross fencing will enhance the trapping of long-shore transported sands. Cross fencing should be installed no closer than once every 100 feet.

Figure 2

Appendix B

Recommended Native Sand Dune Plant Species List for Dam Neck Annex

Species Name	Common Name
<i>Ammophila breviligulata</i>	American Beach Grass
<i>Cakile edentula</i>	American searocket
<i>Hibiscus moscheutos</i>	swamp rosemallow
<i>Panicum amarum</i>	coastal panic grass
<i>Panicum Virgatum</i>	switchgrass
<i>Spartina patens</i>	salt meadow hay
<i>Solidago nemoralis</i>	gray golden rod
<i>Solidago sempervirens</i>	seaside goldenrod
<i>Uniola paniculata</i>	sea oats

* Note, this is a limited list based on species present on Dam Neck Annex and availability from Pineland's Nursery (Columbus, NJ), American Native Plants (Perry Hall, MD), and Cullipher Farms (Norfolk, VA).

**Cooperative Agreement FINAL REPORT for Dune
Restoration at Naval Air Station Oceana – Dam Neck Annex**

VII. Conclusions5

I. Introduction

Sand dunes protect many coastal areas from high winds, salt spray, storms, flooding and erosion due to wave energy. Along the mid-Atlantic seaboard, wave and wind action cause these dunes to shift over time. Many native dune plant species are adapted to grow with these moving sands and provide some stabilization. In many areas, human

development over the past century has upset the balance of this natural system and the coastal dune system has degraded over the years. Mankind is only now beginning to find ways to work with nature so that the dunes are preserved and development is better planned to reduce adverse impacts to this habitat.

A healthy dune system is important for ecological and physical reasons. Sand dune vegetation is uniquely adapted to thrive in stressful conditions such as extreme heat, salt spray, drought, limited nutrients, and shifting sands. This vegetation provides habitat, including nesting sites, to birds, small mammals, reptiles, amphibians, and insects. Dunes also provide a physical barrier to the harsh conditions of the sea and act as a reservoir for beach nourishment. Coastal communities are beginning to see the value of these systems and are actively working to restore dune systems in their area.

Naval Air Station Oceana (NASO) – Dam Neck Annex maintains nearly 1,100 acres of land, including four miles of beachfront property. The base’s coastal habitat communities contain primary sand dune structures, and marshes. Many of the dunes at the base are degraded, barren of plant life, and require stabilization. In their present condition, they are eroding along the trailing edge resulting in lost habitat with the potential to hinder base operations. It is a long-term objective to stabilize these dunes by planting native grasses and installing dune fencing so a protective barrier can be maintained while ensuring the mission of the naval base is not compromised. Working with community volunteers to plant these grasses provides an opportunity to educate local citizens about

the importance of dune communities as coastal habitat and provide them with a hands-on opportunity for restoration activities.

II. Objectives

This project supports Commander, Navy Region Mid Atlantic Natural Resource (CNRMA) managers with the implementation of shoreline and dune stabilization and conservation/habitat restoration along the coastal region of NASO Dam Neck Annex. Federal regulations require sound management in support of mission. The beach dunes are in danger of erosion due to wave and wind action associated with storm conditions. In order to sustain the most valuable resource and training area, protective measures and stabilization is required. The installation of fencing supports sand deposit through wind action and provides a medium for vegetation to bind sand and strengthen the integrity of the dune system. Beach stability can often be compromised with major storm events, including hurricanes, threatening training sites as well as sensitive ecological habitat. The goal of this project is to stabilize sand dunes covering the Virginia coastline along NASO – Dam Neck Annex. Stabilizing these dunes will reduce their movement, protect base operations from creeping sand and provide a natural barrier to ocean swells.

Project objectives:

- Conduct two two-day community based outreach events in the spring (Mar-May) and fall (Sept-Nov). Activities included dune fence installation and vegetation planting.
- The National Aquarium (Aquarium) planned, coordinated volunteer registration, purchased materials, and acted as project lead.
- Planted a total of 55,000 native dune grasses.

III. Methods

Spring Planting Event

The Aquarium hosted a two-day restoration event May 11-12, 2012 with 76 volunteers dedicating 700 hours to the project. Restoration practices included planting native dune grasses along the leading and trailing edge of the dunes and the installation of dune fencing. Planting and fencing took place along the northernmost beachfront section of NASO – Dam Neck Annex.

Three grass species were planted, American beach grass (*Ammophila breviligulata*), Salt meadow hay (*Spartina patens*) and bitter panicum (*Panicum amarum*). These perennial grasses are an important part of mid-Atlantic coastal dune habitats and are uniquely equipped to survive in this type of environment. The salt meadow hay and bitter panicum were planted in pairs of bareroot “culms” spaced approximately 18” apart and at least 6” deep. Rooted American beach grass was similarly planted with one “plug” per wole. Using these methods, 15,000 American beach grass, 5,000 salt meadow hay, and 10,000 bitter

panicum were planted over 1.6 acres of dune. Hand-held applicators were used to spread a slow-release 10-10-10 fertilizer over the areas.

Dune fencing was also installed at the project site. Due to the nature of the site, augers provided to assist with post hole digging did not fare well. Volunteers found it more productive to hand dig 4' holes for the 8' 2x4 wooden posts. Although the plan was to fence the entire length of the planted area, this setback slightly slowed the process. At the end of the second day dune fencing stretched just over half the planting site and was later completed by base personnel.

Fall Planting Event

The Aquarium hosted a second two-day restoration event September 7-8, 2012 with 32 volunteers dedicating 160 hours to the project. Restoration practices included planting native dune grasses along the leading and trailing edge of the dunes. No fence installation occurred during the fall event. Planting took place starting at the Sea Mist campsite to the southernmost section of NASO – Dam Neck Annex.

During the fall event two grass species were planted, American beach grass (*Ammophila breviligulata*) and Switch grass (*Panicum amarum*). Each were planted one “plug” per hole spaced approximately 18” apart and at least 6” deep. Using these methods, 6,000 American beach grass, and 19,000 switch grass were planted over 1 acre of dune. Hand-held applicators were used to spread a slow-release 10-10-10 fertilizer over the areas.

For the fall event all plants were purchased through Pinelands Nursery (Columbus, NJ) and were not “bare root” (rather plugs of 50 per tray- 500 trays). Cullipher Farms, our bare root supplier in VA, informed the Aquarium in July, 2012 they would no longer be able to supply this type of grass. Although the CESU contract scoped 30K grasses for the September planting the Aquarium reduced the number of plants by 5,000 making it a total of 25k. This modification was made to reflect the change from bare root to plugs. Grass plugs are well established, larger, and typically a more expensive plant type. This adjustment allowed the Aquarium to stay on budget while acknowledging it is more time consuming to complete the planting.

IV. Results

Success is measured by the percent survival of the planted grasses over the years. After one growing season we typically expect to see an 80% survival of vegetation along with subsequent plant spreading and coalescence, such that plant cover approaches that typically found in dune habitats in the mid-Atlantic region. Because this site is owned by

the Department of Defense, dunes will remain in a natural state and not be threatened by coastal development.

Due to their close proximity, the Aquarium strongly depends on Naval Facilities Engineering Command MIDLANT (NAVFAC ML) natural resources staff to monitor the project site immediately following planting events up to the first year in the event of a major storm or hurricane. By maintaining communication with NAVFAC ML staff, the Aquarium receives post storm reports of any possible breaches or damage to dune fencing. In late October 2012, a category 1 hurricane “Sandy” approached the eastern coastline passing Virginia Beach Sunday, October 28. With peak

Dune fencing damage post Hurricane Sandy

winds of 80mph reported by NOAA’s National Weather Service, damage was incurred at the planting site. NAVFAC ML staff reported a total loss of dune fencing and up to a 50% loss of newly planted vegetation. Although a devastating storm, no breaches were reported along the four mile stretch of NASO-Dam Neck Annex, underscoring the importance of maintaining a healthy sand dune system in order to protect base resources.

V. Future Work

The Aquarium and partners will continue to build up the primary dunes at NASO – Dam Neck Annex over the next several years. As of March 2013 replacement dune fencing is being installed at the most vulnerable areas along the four mile stretch. The Aquarium has plans to revisit the site to plant additional native dune grasses in 2013 if funding is available.

VI. Partners

Since the late 1990s, the **National Aquarium** has been building a multi-faceted citizen-based coastal habitat restoration program with many public and private sector partners aimed at achieving high-quality, science-based habitat restoration while increasing the connection of local residents to the beauty and value of the Chesapeake Bay and coastal habitats. Here we continued and expanded our larger community-based restoration program with dune restoration events by engaging local community volunteers to help stabilize primary dune structures using native vegetation. Funding for this project was provided by the Cooperative Ecosystem Studies Unit.

Naval Facilities Engineering Command MIDLANT (NAVFAC ML) – NAS Oceana Public Works Department is the local contact for this project. They were responsible for on-site logistics and preparation while offering support to recruit local volunteers. This

project helps them towards meeting the Navy’s environmental mandates and helps meet many of the goals of the Chesapeake Bay Program. **Naval Air Station Oceana Dam Neck Annex** hosted the dune restoration projects. In-kind support from the bases included equipment needed to install sand dune fencing and manual labor for the installation as well as volunteer labor for the planting events.

Virginia Aquarium and Marine Science Center located nearby NASO Dam Neck Annex has supported the project by sharing the outreach opportunity at their institution with staff and volunteers. They have been involved throughout the planning process to offer support when needed.

Community volunteers participated in a hands-on restoration experience of vital habitats close to their home. They learned about the importance of this coastal habitat while working to protect it. Public involvement in the process was critical because community-based restoration provides unique opportunities to engage the public to improve the status of the resource and generate positive publicity to raise awareness of the cause and effect relationships of coastal development.

VII. Conclusions

Final products for this project include the restoration of 2.6 acres of coastal dune habitat by installing sand dune fencing and vegetating the site. This was accomplished with the help of 108 volunteers dedicating 540 hours planting 55,000 native sand dune grasses. Both grasses and fencing were quickly challenged during Hurricane Sandy and loss of

both incurred. While major storms such as Sandy not common, our coastlines are constantly assaulted by strong winds and other erosive forces. It is therefore very important to ensure a healthy sand dune system in these areas so that damage is minimized and nearby resources are not affected. A healthy dune system will provide the support needed to prevent a breach between the shoreline and freshwater marshes.

Dune habitats are an especially valuable and threatened resource along the mid-Atlantic coast. These areas have been particularly hard hit by erosion and human encroachment, resulting in widespread loss throughout the area. They provide remote and key habitat for many wildlife species, including ground nesting birds, songbirds, water fowl, small mammals, amphibians, reptiles and insects.

Public involvement in the process of coastal dune restoration is critical because community-based restoration of primary dunes provide unique opportunities to engage the public to improve the status of the resource and generate positive publicity to raise awareness of the cause and effect relationships of coastal development. The focus of educational messages associated with this project will range from imparting knowledge to increasing action to increasing stewardship (best management practices in one's own backyard).

NATIONAL AQUARIUM®

Naval Air Station Oceana Dam Neck Annex – Monitoring needs.

I. Introduction

Sand dunes protect many coastal areas from high winds, salt spray, storms, flooding and erosion due to wave energy. Along the mid-Atlantic seaboard, wave and wind action cause these dunes to shift over time. Many native dune plant species are adapted to grow with these moving sands and provide some stabilization. In many areas, human development over the past century has upset the balance of this natural system and the coastal dune system has degraded over the years. Mankind is only now beginning to find ways to work with nature so that the dunes are preserved and development is better planned to reduce adverse impacts to this habitat.

A healthy dune system is important for ecological and physical reasons. Sand dune vegetation is uniquely adapted to thrive in stressful conditions such as extreme heat, salt spray, drought, limited nutrients, and shifting sands. This vegetation provides habitat, including nesting sites, to birds, small mammals, reptiles, amphibians, and insects. Dunes also provide a physical barrier to the harsh conditions of the sea and act as a reservoir for beach nourishment. Coastal communities are beginning to see the value of these systems and are actively working to restore dune systems in their area.

II. Site Description

Naval Air Station Oceana (NASO) – Dam Neck Annex maintains nearly 1,100 acres of land, including four miles of beachfront property. The base’s coastal habitat communities contain primary sand dune structures, and marshes. Many of the dunes at the base are degraded, barren of plant life, and require stabilization. In their present condition, they are eroding along the trailing edge resulting in lost habitat with the potential to hinder base operations. It is a long-term objective to stabilize these dunes by planting native grasses and installing dune fencing so a protective barrier can be maintained while ensuring the mission of the naval base is not compromised. Working with community volunteers to plant these grasses provides an opportunity to educate local citizens about the importance of dune communities as coastal habitat and provide them with a hands-on opportunity for restoration activities.

III. Monitoring Protocols

- a. **Photo Stations** (annually in fall)

The purpose of the photo station is to establish fixed locations from which photographs can periodically be taken. Comparing these photos as the site matures and shifts allows one to visually assess the progress of the sand dune.

i. Equipment

- Digital Camera
- Clipboard and paper or notebook
- Prints of earlier shots from each photo station
- Pens or pencils
- Map of photo station locations

ii. Protocol

It is very important each photo station shot is framed identically to previous shots from that station. Note landmarks in the previous shots, including the location of the horizon, tree lines, etc. and ensure these landmarks appear in the proper part of the frame when taking pictures from that station again. Retake any photos that do not appear to be properly framed. Attempt to schedule photos during fair weather.

Photo stations at NASO Dam Neck Annex should be taken immediately before and after a planting event followed by annual photos.

Sample photo station

b. **Wildlife, Bird and Habitat Survey** (measured quarterly)

Background: Sand dunes provide a unique habitat to wildlife including birds, small mammals and insects. They provide food and shelter for resident and migratory wildlife. Identifying the types and numbers of animals present at different times throughout the year can give a more complete picture of the habitat benefits this area provides.

It is very important to attempt to quantify the animals utilizing the land. This can be very difficult, as many animals will be scared off by human presence, or are active at night. Since it is not always possible to see and count the various species during a monitoring event, the next best thing is to monitor evidence of animal presence. This can come in many forms, including animal tracks, scat, or visible homes (dens, nests, etc.).

i. Supplies

- Binoculars
- Datasheets, clipboards and pencils
- Field guides for animal ID

ii. Protocols

Attempt to schedule monitoring session for early morning, when birds and other animals are most likely to be active. Use a data sheet to record all birds, mammals, reptiles, amphibians, and notable insects (such as dragonflies) that are observed.

In addition to animals actually observed, use the data sheet to note animal evidence. Attempt to identify scat and tracks to a species or family level using field guides. Monitoring should occur at minimum on a quarterly basis, but can be carried out more frequently if volunteers wish to do so.

c. Vegetation Survival (measured annually in the fall)

i. Supplies

- GPS
- clipboard and pencils

ii. Protocols

Attempt to estimate the percentage of plant survival post planting at the conclusion of the growing season (fall). Observations are also important after major storm events to determine any plant loss or dune breaching. Use GPS to estimate area calculation of lost section as well as marking waypoint of any breaches in the dunes.

Grasses should be monitored for both survival and seed production indicating plant propagation.

**COOPERATIVE AGREEMENT BETWEEN THE U.S. DEPARTMENT OF THE NAVY
AND
NATIONAL AQUARIUM, BALTIMORE MD
FOR DUNE GRASS PLANTINGS AT NAVAL AIR (NAS) OCEANA (DAM NECK
ANNEX)**

**COOPERATIVE AGREEMENT
NUMBER N62470-13-2-8023**

27 SEPTEMBER 2013

1. Introduction: This Cooperative Agreement is made by and between the U.S. Department of the Navy (DON), represented by the Naval Facilities Engineering Command, Atlantic, and National Aquarium in Baltimore, Inc. It is issued to:

National Aquarium in Baltimore
501 Pratt Street
Baltimore, MD 21202

2. Purpose: This project supports Commander, Navy Region Mid Atlantic Natural Resource managers with the implementation of shoreline and dune stabilization and conservation/habitat restoration along the coastal region of NASO Dam Neck Annex (DNA). National Aquarium Baltimore shall use cooperative agreement funds, in compliance with enclosure (1), Terms and Conditions, to carry out the project described by enclosure (2), Scope of Work (SOW).

3. Authorities: The authority for this Cooperative Agreement is 16 USC §670c-1 (Sikes Act; on-post project for the maintenance and improvement of natural resources or for the benefit of natural and historic research).

4. Period of Performance: The period of performance covered by this Cooperative Agreement is from the date of the last signatory to this Agreement until 30 March 2015.

5. Funding: The total funding obligated for this Cooperative Agreement is \$46,911.00.

6. Accounting and Appropriations Data:

AA 1731804 52FA 252 00052 0 068732 2D C002LD 324423CN400Q \$46,911.00
Funding Document Number: N3244213RC025LD

7. Awarding Office:

Commander
Naval Facilities Engineering Command, Atlantic
6506 Hampton Blvd
Norfolk, VA 23508-1278

8. Cooperative Agreement Administrative Office / Representative:

Stewart Blake Wittmann
Naval Facilities Engineering Command, Atlantic

D. Government Requirements/Materials Available for Use

To reimburse the Cooperator in the amount of \$46,911.00 for the direct costs of tasks and other allowable direct and indirect costs as described in the attached scope of work. Allowability of costs, whether direct or indirect, shall be determined in accordance with the DoDGARS, 32 C.F.R. Part 32, and OMB Circular A-122.

E. General Requirements

1. The Cooperator shall visit the designated areas as often as necessary and within the limits stated in the scope of work to accomplish the purpose of this agreement.
2. The Cooperator shall provide all vehicle transportation, meals, and lodging for him/herself and any personnel; and all equipment and analyses necessary to complete the work.

F. Specific Requirements

1. Conduct the work described in the attached scope of work ENCLOSURE (2) Scope of Work for Dune Grass Plantings at NAS Oceana (DAM NECK ANNEX)

2. The Cooperator shall be reimbursed for work as documentation of the work and cost is provided to the NTR. Except that no more than 80% of the total will be paid prior to the delivery of the services, described in section F.1 above, to NAVFAC Atlantic. The Cooperator shall provide sufficient details to support all payment invoices. Payments are on a reimbursable basis for work performed, but they shall not exceed the amount agreed to on page 1 of this Cooperative Agreement.

1. **Order of Precedence**

This Cooperative Agreement is subject to the laws and regulations of the United States. Any inconsistency or conflict in the terms and conditions specified in this Cooperative Agreement shall be resolved according to the following order of precedence:

- (a) The Federal statute authorizing this award, or any other Federal statutes directly affecting performance of this Cooperative Agreement.
- (b) Department of Defense Grant and Assistance Regulations (DoDGARs) 32 CFR Part 32, Administrative Requirements for Grants and Agreements with Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations.
- (c) These General Terms and Conditions.
- (d) Other terms and conditions contained within this Cooperative Agreement and any attached schedules.

2. **Statutes and Regulations**

This Cooperative Agreement is subject to the laws and regulations of the United States that apply to assistance instruments including Chapter 63 of U.S. Code Title 31. DoDGARs Part 32 is hereby incorporated into this Cooperative Agreement by reference. The following OMB circulars, as appropriate, are also incorporated by reference into this Cooperative Agreement:

- (a) A-133, "Audits of State, Local Governments, and Non-Profit Organizations"
- (b) A-122, "Cost Principles for Non-Profit Organizations"

3. Cost Principles and Audit

DoDGARS Part 32, Uniform Administrative Requirements for Grants and Cooperative Agreements with Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations and the OMB Circulars below apply specifically to the Cooperator. The Cooperative Agreement shall be consistent with these authorities:

- (a) A-133, "Audits of States, Local Governments, and Non-Profit Organizations"
- (b) A-122, "Cost Principles for Non-Profit Organizations"

Cooperator shall submit a copy of OMB Circular A-133 audit reports to the agency Inspector General (IG) and to DoD (IG).

4. Record Retention and Access Requirements

All financial and programmatic records, supporting documents, statistical records, and other records of cooperators or sub-cooperators which are:

- (i) Required to be maintained by the terms of this part, program regulations or the cooperative agreement, or
- (ii) Otherwise reasonably considered as pertinent to program regulations or the cooperative agreement.

5. Modification of Cooperative Agreement

The only method by which this Cooperative Agreement can be modified is by a formal, written and signed modification. Administrative modification(s) to the Cooperative Agreement may be accomplished unilaterally by the signature of designated Cooperative Agreement Administrative Representative or Awarding Officer. Changes to the express clauses or terms of the Cooperative Agreement affecting price, quality, quantity or delivery of the Cooperator's duties shall be the subject of a bilaterally executed modification. No other communications, whether oral or in writing, shall modify this Cooperative Agreement.

6. Prior Approvals and Changes

Any program changes to the approved project must comply with DoDGARS Subpart 32.25, Revision of Budget and Program Plans, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations.

7. Allowable Costs

Cooperative agreement funds may be applied only to those costs allowed under DoDGARS Subpart 32.27, Allowable Costs, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations and, for Institutions of Higher Education only, OMB Circular A-21.

8. Unexpended Balance

In the absence of any specific notice to the contrary, cooperators are authorized to carry forward unexpended balances of funds received to subsequent funding periods.

9. Overpayment and Earned Interest

Overpayment. Within ninety (90) days after the end date of the Cooperative Agreement, any overpayment of funds shall be remitted to the Administrative Grants Officer (AGO) at the Administrative Office on the Award/Modification document, by check made payable to the Naval Facilities Engineering Command. An overpayment represents the difference between allowable actual expenditures and total disbursements received by the Cooperator.

Cooperator is authorized reimbursements under the conditions set forth at 32 CFR 32.22 (e)-(j), for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations.

10. Future Funding

The total funding obligated for this Cooperative Agreement is \$46,911.00.

11. Subagreements

Cooperator shall comply with DoDGARS Subpart 32.5, Subawards, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations.

12. Officials Not to Benefit

No member of or delegate to Congress, or resident commissioner, shall be admitted to any share or part of this Cooperative Agreement, or to any benefit arising from it, in accordance with 41 U.S.C. 22.

13. Hatch Act

The cooperator agrees to comply with the Hatch Act (5 U.S.C. 1501-1508 and 7324 - 7328), as implemented by the Office of Personnel Management at 5 CFR part 151, which limits political activity of employees or officers of State or local governments whose employment is connected to an activity financed in whole or part with Federal funds.

14. Lobbying

By signing and submitting this proposal, the cooperator is providing the certification at Appendix A to 32 CFR Part 28 regarding lobbying.

15. Environmental Standards

By accepting funds under this Cooperative Agreement, the cooperator assures that it will:

(a) Comply with applicable provisions of the Clean Air Act (42 U.S.C. 7401, et seq.) and Clean Water Act (33 U.S.C. 1251, et seq.), as implemented by Executive Order 11738 [3 CFR, 1971-1975 comp., p. 799] and Environmental Protection Agency (EPA) rules at Subpart J of 40 CFR Part 32.

(b) Identify to the cooperator agency any impact that this agreement may have on:

(1) The quality of the human environment, and provide help the agency may need to comply with the National Environmental Policy Act (NEPA, at 42 U.S.C. 4321, et seq.) and to prepare Environmental Impact Statements or other required environmental documentation. In such cases, the cooperator agrees to take no action that will have an adverse environmental impact (e.g., physical disturbance of a site such as breaking of ground) until the agency provides written notification of compliance with the environmental impact analysis process.

(2) Coastal barriers, and provide help the agency may need to comply with the Coastal Barriers Resource Act (16 U.S.C. 3501, et seq.), concerning preservation of barrier resources.

(3) Any existing or proposed component of the National Wild and Scenic Rivers system, and provide help the agency may need to comply with the Wild and Scenic Rivers Act of 1968 (16 U.S.C. 1271, et seq.).

16. Nondiscrimination

By accepting funds under this Cooperative Agreement, the cooperator assures that it will comply with applicable provisions of the following national policies prohibiting discrimination:

(a) On the basis of race, color, or national origin, in Title VI of the Civil Rights Act of 1964 (42 U.S.C. 2000d, et seq.), as implemented by DoD regulations at 32 CFR Part 195

(b) On the basis of sex or blindness, in Title IX of the Education Amendments of 1972 (20 U.S.C. 1681, et seq.).

(c) On the basis of age, in the Age Discrimination Act of 1975 (42 U.S.C. 6101, et seq.) as implemented by Department of Health and Human Services regulations at 45 CFR Part 90.

(d) On the basis of handicap, in Section 504 of the Rehabilitation Act of 1973 (29 U.S.C. 794), as implemented by Department of Justice regulations at 28 CFR Part 41 and DoD regulations at 32 CFR Part 56.

17. Cargo Preference

The cooperator agrees that it will comply with the Cargo Preference Act of 1954 (46 U.S.C. 1241), as implemented by Department of Transportation regulations at 46 CFR 381.7, which require that at least 50 percent of equipment, materials or commodities procured or otherwise obtained with U.S. Government funds under this cooperative agreement, and which may be transported by ocean vessel, shall be transported on privately owned U.S.-flag commercial vessels, if available.

18. Preference for U. S. Flag Air Carriers

Travel supported by U.S. Government funds under this cooperative agreement shall use U.S.-flag air carriers (air carriers holding certificates under 49 U.S.C. 41102) for international air transportation of people and property to the extent that such service is available, in accordance with the International Air Transportation Fair Competitive Practices Act of 1974 (49 U.S.C. 40118) and the interpretative guidelines issued by the Comptroller General of the United States in the March 31, 1981, amendment to Comptroller General Decision B138942.

19. Profit or Fee

In accordance with 32 CFR 22.205(b), no fee or profit may be charged to this cooperative agreement.

20. Claims, Disputes, and Appeals

(a) Cooperator Claims.

Per 32 CFR 22.815, any claims arising out of this agreement must be:

- (1) Submitted in writing to the Grants Officer;
- (2) Specify the nature and basis for the relief requested, and;
- (3) Include all data and relevant facts in support of the claim.

(b) DOD Component Claims.

Claims by a DOD Component shall be the subject of a written decision by the Grants Officer.

(c) Alternative Dispute Resolution (ADR).

The Parties shall use ADR to the maximum extent practicable, and comply with 32 CFR 22.815 ADR policies and procedures.

(d) Grants Officer Decisions.

(1) Within 60 calendar days after receipt of a written claim, the Grants Officer shall:

(a) Prepare a written decision, which shall include: the reasons for the decision; the relevant facts on which the decision is based; and the identity and mailing address of the cognizant Appeal Authority, and; shall be included in the award file, or

(b) Notify the Cooperator of a date when the written decision will be rendered. The notice shall address why additional time is needed.

(2) The Grants Officer's decision is final, unless appealed. In the event of an appeal, the Parties shall endeavor to use ADR procedures to the maximum extent practicable.

(e) Formal Administrative Appeals.

All formal administrative appeals shall comply with the applicable provisions of 32 CFR 22.815(e), Claims, disputes, and appeals.

(1) Appeal Authority. The Assistant Commander for Acquisition is the Appeal Authority to decide formal, administrative appeals under this Grant.

(f) Non-exclusivity of remedies.

Nothing in this section is intended to limit a cooperator's right to any remedy under the law.

21. Controlled Unclassified Information

The parties understand that information and materials provided pursuant to or resulting from this cooperative agreement may be export controlled, sensitive, for official use only, or otherwise protected by law, executive order or regulation. The cooperator is responsible for compliance with all applicable laws and regulations. Nothing in this cooperative agreement shall be construed to permit any disclosure in violation of those restrictions.

22. Debarment and Suspension

Cooperators shall comply with the requirements of DoDGARs Part 25, Subpart C, "Government-Wide Suspension and Debarment (Nonprocurement)", 32 CFR Part 25, Subpart C. The cooperator shall also include a similar term or condition in any lower-tier covered transactions, as required by DoDGARs Part 25, Subpart B, 32 CFR Part 25 (2004).

23. Drug Free Workplace

By accepting funds under this Cooperative Agreement, the cooperator agrees to comply with the “Government –Wide Drug-Free Workplace (Grants)” requirements specified by DoDGARS Part 26, Subpart B (or Subpart C, if the cooperator is an individual) of 32 CFR Part 26 (2004), which implements Secs. 5151-5160 of the Drug-Free Workplace Act of 1988 (41 U.S.C. 701, et. seq.).

24. Standards for Financial Management Systems

By accepting funds under this cooperative agreement, the cooperator agrees to maintain a financial management system that complies with DoDGARS Subpart 32.21, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations.

25. Payment

Cooperator shall submit any request for payment in accordance with 32 CFR 32.22, Payment, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations. Cooperator is authorized reimbursements under the conditions set forth at 32 CFR 32.22(e)–(j), for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations as limited in this paragraph and in Terms and Conditions paragraphs F, Special Requirements, and I, Billing and Payment Procedures, set forth herein. Advance payments will not be made under this Cooperative Agreement.

26. Procurement

Cooperator’s system for acquiring goods and services under this Cooperative Agreement shall comply with 32 CFR 32.40-32.48, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations.

27. Property

Title shall vest in, and cooperator shall manage, property under this cooperative agreement in accordance with 32 CFR 32.2, and 32.30-32.37, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations].

28. Reports

Cooperator shall maintain and submit reports in accordance with 32 CFR 32.50-32.53, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations.

29. Termination and Enforcement

This award is subject to 32 CFR 32.61, Termination, and 32.62, Enforcement, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations.

30. After-Award Requirements

Closeouts, subsequent adjustments, continuing responsibilities, and collection of amounts due are subject to the requirements in 32 CFR 32.71 - 32.73, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations.

31. Cost Share or Match

Any cost share or cost match agreements shall comply with 32 CFR 32.23, for Institutions of Higher Education, Hospitals, and Other Non-Profit Organizations.

32. Resource Recovery and Conservation Act

Cooperator shall comply with the requirements contained in 32 CFR 32.49.

[End of Items]

H. Accident Prevention

1. The Cooperator shall ensure that the standard operating health and safety procedures and policies set forth by NAVFAC Atlantic and as stated in the proposal are adhered to in order to provide and maintain work environments and procedures which will—

- A) Safeguard the public and Government personnel, property, materials, supplies, and equipment exposed to Cooperator operations and activities;
- B) Avoid delays in project completion dates; and
- C) Control costs in the performance of this agreement.

2. Whenever the Contracting Officer becomes aware of any noncompliance with these requirements or any condition which poses a serious or imminent danger to the health or safety of the public or Government personnel, the Contracting Officer shall notify the Cooperator orally, with written confirmation, and request immediate initiation of corrective action. This notice, when delivered to the Cooperator or the Cooperator's representative at the work site, shall be deemed sufficient notice of the noncompliance and that corrective action is required. After receiving the notice, the Cooperator shall immediately take corrective action. If the Cooperator fails or refuses to promptly take corrective action, the Contracting Officer may issue an order stopping all or part of the work until satisfactory corrective action has been taken.

The Cooperator shall not be entitled to any equitable adjustment of the contract price or extension of the performance schedule on any stop work order issued under this clause.

3. The Cooperator shall insert this clause with appropriate changes in the designation of the parties, in subcontracts.

I. Billing and Payment Procedures

1. Partial payments equal to the amount of work accomplished may be made monthly during the field work portion; after submittal of a progress report.

2. The final payment of 20 percent of the Cooperative Agreement overall value shall be paid when the final report and all other submittals have been received.

3. Any requirement for the payment or obligation of funds, under the terms of this Cooperative Agreement, shall be subject to the availability of appropriated funds, and no provision herein shall be interpreted to require obligation or payment of funds in violation of the Anti-Deficiency

Act, 31 USC §1341 et seq. Nothing in this Cooperative Agreement shall be construed as implying that Congress will, at a later time, appropriate funds sufficient to meet deficiencies.

4. All work will be reviewed and approved by the Navy Cooperative Agreement Representative. The total cost of the project is \$46,911.00. Reimbursement for Cooperator expenses pursuant to this Agreement will be made by following the invoice procedures below.

252.232-7006 WIDE AREA WORKFLOW PAYMENT INSTRUCTIONS (JUN 2012)

(a) Definitions. As used in this clause--

Department of Defense Activity Address Code (DoDAAC) is a six position code that uniquely identifies a unit, activity, or organization.

Document type means the type of payment request or receiving report available for creation in Wide Area WorkFlow (WAWF).

Local processing office (LPO) is the office responsible for payment certification when payment certification is done external to the entitlement system.

(b) Electronic invoicing. The WAWF system is the method to electronically process vendor payment requests and receiving reports, as authorized by DFARS 252.232-7003, Electronic Submission of Payment Requests and Receiving Reports.

(c) WAWF access. To access WAWF, the Contractor shall--

(1) Have a designated electronic business point of contact in the Central Contractor Registration at <https://www.acquisition.gov>; and

(2) Be registered to use WAWF at <https://wawf.eb.mil/> following the step-by-step procedures for self-registration available at this Web site.

(d) WAWF training. The Contractor should follow the training instructions of the WAWF Web-Based Training Course and use the Practice Training Site before submitting payment requests through WAWF. Both can be accessed by selecting the "Web Based Training" link on the WAWF home page at <https://wawf.eb.mil/>.

(e) WAWF methods of document submission. Document submissions may be via Web entry, Electronic Data Interchange, or File Transfer Protocol.

(f) WAWF payment instructions. The Contractor must use the following information when submitting payment requests and receiving reports in WAWF for **N62470-13-2-8009**

(1) Document type. The Contractor shall use the following document type(s).

NAVY CONSTRUCTION/FACILITIES MANAGEMENT
INVOICE

(2) Inspection/acceptance location. The Contractor shall select the following inspection/acceptance location(s) in WAWF, as specified by the contracting officer.

Inspection – N62470
Acceptance – N62470

(3) Document routing. The Contractor shall use the information in the Routing Data Table below only to fill in applicable fields in WAWF when creating payment requests and receiving reports in the system.

Routing Data Table*

Field Name in WAWF	Data to be entered in WAWF
Pay Official DoDAAC	<u>N68732</u>
Issue By DoDAAC	<u>N62470</u>
Admin DoDAAC	<u>N/A</u>
Inspect By DoDAAC	<u>N62470</u>
Ship To Code	<u>N/A</u>
Ship From Code	<u>N/A</u>
Mark For Code	<u>N/A</u>
Service Approver (DoDAAC)	<u>N/A</u>
Service Acceptor (DoDAAC)	<u>N/A</u>
Accept at Other DoDAAC	<u>N/A</u>
LPO DoDAAC	<u>N62470</u>
DCAA Auditor DoDAAC	<u>N/A</u>
Other DoDAAC(s)	<u>N62470</u>

(4) Payment request and supporting documentation. The Contractor shall ensure a payment request includes appropriate contract line item and subline item descriptions of the work performed or supplies delivered, unit price/cost per unit, fee (if applicable), and all relevant back-up documentation, as defined in DFARS Appendix F, (e.g. timesheets) in support of each payment request.

(5) WAWF email notifications. The Contractor shall enter the email address identified below in the "Send Additional Email Notifications" field of WAWF once a document is submitted in the system.

NAFINVOICES@NAVY.MIL

(g) WAWF point of contact. (1) The Contractor may obtain clarification regarding invoicing in WAWF from the following contracting activity's WAWF point of contact.

Gina.johns@navy.mil or via telephone at 757-322-8309

(2) For technical WAWF help, contact the WAWF helpdesk at 866-618-5988.

(End of clause)

ENCLOSURE (2)

August 2013

SCOPE OF WORK:

Project Proposal for FY2013-FY2015 CESU **NASO Dam Neck Annex DUNE RESTORATION**

References: 15 CFR 930 Coastal Zone Management Act, Clean Water Act, and OPNAVINST 5090.1C

Project Number: EPR# 32442NR215

Background: This project supports Commander, Navy Region Mid Atlantic Natural Resource managers with the implementation of shoreline and dune stabilization and conservation/habitat restoration along the coastal region of NASO Dam Neck Annex (DNA). Period of Performance is 18 months from award date. End date is expected to be 30 March 2015.

Federal regulations require sound management in support of the mission. NASO DNA's mission is tied to the stability of beach and dune lands. The beach and dunes at this site are in danger of erosion due to wave and wind action associated with storm and general weather conditions. Beach stability has already been compromised due to such storms as Hurricane Isabel. This storm resulted in buffer, training sites, and sensitive ecological habitat areas being degraded. Currently, there are several severely eroded dune areas along the NASO DNA beaches. In order to sustain the most valuable resources and training area, protective measures and stabilization is required.

Several techniques are available to address stabilization concerns. One technique includes the installation of sand fencing. This fencing builds up sand from wind action and provides a medium for vegetation to bind sand and strengthen the integrity of the dune system. In November of 2010, as part of the FY09 CESU agreement with CESU PARTNER (National Aquarium in Baltimore), a fence installation and dune restoration plan was finalized for NASO DNA. We are in the implementation phase of the plan which requires fence installation and vegetation planting along the NASO DNA coastal dune line. Fence installation and vegetation planting will be completed by Navy, selected CESU partner and volunteer labor under CESU partner/NAVY supervision. Fencing activities are followed up with additional (CESU partner-led, community-based) restoration techniques such as planting appropriate vegetation cover for additional dune stabilization.

Deliverables/Responsibilities:

- Conduct a two day Spring (Mar-May) Fence Installation and Vegetation Planting Event...Due prior to: 15 May annually
 - Dune restoration at NASO DNA is an ongoing requirement due to the dynamic nature of the shoreline and dune environment. Navy will identify areas for dune restoration projects. CESU PARTNER will plan, coordinate, purchase materials, and implement the dune restoration projects, including managing its labor force. CESU Partner may utilize volunteers in dune restoration efforts. Volunteers, Natural Resources staff, project partners and community citizens will be utilized to plant vegetation. CESU PARTNER will coordinate and manage signing up all volunteers; any volunteers will be CESU PARTNER volunteers. Navy will coordinate granting base access for CESU PARTNER staff and volunteers.
 - Navy will provide lead in dune restoration project in classified areas CESU PARTNER will plan, coordinate, purchase materials, and implement dune restoration project in classified areas subject to applicable national security restrictions.
 - The CESU partner will be required to coordinate with Navy representatives concerning contracted beach replenishment projects and avoidance of potential threatened and endangered species.

- Conduct a two day Fall (Sept-Nov) Fence Installation and Vegetation Planting Event...Due prior to: 15 Nov annually
 - Dune restoration at NASO DNA is an ongoing requirement due to the dynamic nature of the shoreline and dune environment. Navy will identify areas for dune restoration projects. CESU PARTNER will plan, coordinate, purchase materials, and implement the dune restoration projects, including managing its labor force. CESU Partner may utilize volunteers in dune restoration efforts. Volunteers, Natural Resources staff, project partners and community citizens will be utilized to plant vegetation. CESU PARTNER will coordinate and manage signing up all volunteers any volunteers will be CESU PARTNER volunteers. Navy will coordinate granting base access for CESU PARTNER staff and volunteers.
 - Navy will provide lead in dune restoration project in classified area by base personnel. CESU PARTNER will plan, coordinate, purchase materials, and implement the project subject to applicable national security restrictions.
 - The CESU partner will be required to coordinate with Navy representatives concerning contracted beach replenishment projects and avoidance of potential threatened and endangered species.

- Produce and deliver a Final Project Summary Report

Routine correspondence to the NTRs may be addressed to:

Naval Facilities Engineering Command Atlantic

NATIONAL AQUARIUM[®]

Project Title: NASO DAM NECK ANNEX DUNE RESTORATION

Contract: N62470-13-2-8023

Organization Information: National Aquarium in Baltimore, Inc.
501 East Pratt Street
Baltimore, MD 21202
410-576-3800
www.aqua.org

Federal Tax Exempt Number: 52-1121163

Contact Person: Charmaine Dahlenburg
Project Manager

410 659-4274 (office)
410-576-2356 (fax)
cdahlenburg@aqua.org

Request: The National Aquarium requests \$46,911 to conduct a community-based environmental stewardship project that will engage 40 – 50 volunteers in planting 30,000 native dune grasses and installing sand fencing to restore eroded shoreline near Virginia Beach. Two restoration events (spring and fall) will educate volunteers about coastal dune ecology during a day of environmental stewardship.

Organizational Summary: The National Aquarium Institute (Aquarium) is one of the nation's foremost 501(c)(3) conservation education organizations. With venues in both Baltimore, MD and Washington, DC, our mission is to inspire conservation of the world's aquatic treasures. Since opening in 1981, the Aquarium has attracted more than 45 million visitors to our 5.8 acre campus in the heart of Baltimore, which features more than 16,000 animals representing more than 600 species. In 2005, we affiliated with the National Aquarium in Washington, DC to form the National Aquarium Institute. Today, our two venues attract approximately 1.6 million visitors annually.

Project Description: Since its inception, the Aquarium has recognized its significant role in educating people about the importance of protecting our environment. Each year, the Aquarium Conservation Team (ACT!) recruits more than 700 citizen volunteers and local students to engage them in restoring tidal habitats through planting events at six to seven project sites. In 2005, we began partnering with the Department of Navy (DoN) to restore native habitats including tidal salt marshes, underwater grass beds, and primary sand dunes at several locations in Virginia including Navy Air Station Oceana-Dam Neck Annex (DNA) in Virginia Beach. Much of the habitat at the DNA remains barren and eroding from wind and wave action associated with general weather conditions and heavy storms like Hurricane Isabel. In order to sustain the region's most valuable resources, protective measures and stabilization is required.

Dune habitats are an especially important and threatened resource along the Mid-Atlantic coast. They have always been a part of the natural history of Virginia Beach and are important to the ecology of the region. Coastal dunes provide critical habitat for many species of wildlife including ground nesting birds, songbirds, waterfowl, small mammals, amphibians, reptiles, and insects. Primary sand dunes act as a reservoir for beach nourishment and provide a physical barrier to the harsh conditions of the sea including high winds, storm activity, flooding, and erosion due to wave energy. Native dune plants are highly resilient and have adapted to thrive in stressful conditions such as extreme heat, drought, shifting sands, and limited nutrients.

The NASO Dam Neck Annex Dune Restoration project aims to protect these important habitats, by inviting local community volunteers to participate in restoration events. With this project, the National Aquarium will host two restoration events in spring and fall at Dam Neck, working with volunteers to address stabilization concerns. Volunteers will plant native grasses and install sand dune fencing, which builds up sand from wind action and provides a medium for vegetation to bind, strengthening the integrity of the dune system.

This project represents the continuation of an ongoing planting and stabilization. Since 2007, the National Aquarium organized sand dune restoration events at DNA in partnership with Virginia Aquarium & Marine Science Center and the U.S. Navy to restore a total of 15 acres of dunes. These events involved more than 400 local volunteers who planted over 250,000 native plants and installed sand fencing to protect the newly planted grasses. What differentiates the National Aquarium’s efforts is our commitment to developing community involvement at the grassroots level by providing hands-on projects that demonstrate conservation behaviors for local citizens.

Timeline:

February 2014	DNA Site Visit with DoN
Spring 2014	Two-day community based sand fence instillation and vegetation planting.
Fall 2014	Two-day community based sand fence instillation and vegetation planting.
February 2015	Final Report

Expected Deliverables and Outcomes:

The goal of the project is to stabilize dune structure along the 3 mile stretch of DNA by installing sand fencing and planting native grasses while providing an opportunity for community members to learn about the importance of coastal dunes. We plan to achieve this goal through the following activities:

1. Recruit 40 – 50 volunteers to participate in a restoration event at NASO Dam Neck Annex.
2. Purchase 30,000 native plants.
3. Conduct a pre-planting orientation for volunteers to educate them about coastal dune ecology and receive training in restoration techniques.
4. Plant 30,000 plants along the leading and trailing edges of the dunes.

5. Install sand fencing to strengthen the integrity of the dune system.
6. Conduct post event volunteer surveys to evaluate the impact of the program.

The first event is a two-day spring fence installation and planting event to be completed by May 15, 2014. The second is a two-day spring fence installation and planting event to be completed by November 15, 2014.

Key Staff: The National Aquarium's Chesapeake Bay Initiative (CBI) is a nationally recognized program that fosters partnerships with local communities and organizations to protect and restore habitats throughout the Bay. Each Year, CBI actively recruits volunteers and engages them in the technical process of restoring and monitoring tidal habitats at six to seven project sites. CBI directly supports increasing public awareness of conservation issues by providing citizens with the tools they need to become active environmental leaders in their communities.

The National Aquarium will take the lead in organizing a community-based restoration event in the spring and fall of 2014. Logistically, this will include registering volunteers, ordering plants and supplies, coordinating the planting event including planting instructions and providing volunteer education and comfort, and following up after the planting with volunteer thank you letters and surveys. Key individuals leading this effort include:

Laura Bankey currently holds the position of Director of Conservation at the National Aquarium, where she manages staff, volunteers, and interns in conjunction with the Aquarium's conservation objectives. Her Primary focus is on regional Chesapeake Bay issues and promoting individual, community, corporate and legislative actions that will improve Bay health. Areas of interest include community-based habitat restoration, sustainable seafood, climate change adaptation, marine debris, environmental education and gardening for wildlife. She holds undergraduate degrees in Chemistry and Biochemistry from the University of Dallas and a master's degree in Marine Science from the College of William and Mary's Virginia Institute of Marine Science.

Charmaine Dahlenburg, Conservation Project Manager II, holds a master's degree in Environmental Science and Policy from Johns Hopkins University. She manages conservation projects including budget preparation and grant writing, implementation of work plan at the project site, and tracking of all technical and financial project aspects. She also serves as the liaison between the Conservation Department, project partners, and volunteers to successfully carry out restoration projects including work with the Department of Defense at Naval Support Facility Indian Head and Naval Air Station Dam Neck Annex.

Laura Cattell Noll, Conservation Technician, holds a bachelor's degree from Eastern Mennonite University in Environmental Science. She coordinates many of the Aquarium's environmental education programs and serves as a liaison between the Conservation Department and local teachers participating in our *Wetland Nursery Program* and *Terrapins in the Classroom* program.

Stephanie Pully, Conservation Technician, holds a bachelor's degree in Environmental Science from the University of Maryland, Baltimore County. She serves as a liaison between project partners and volunteers while also acting as a volunteer coordinator for the Aquarium Conservation Team (ACT!), a core group of trained volunteers who lead community members in the field during restoration projects. She is also a certified Master Naturalist.

Budget: The total cost of the project is \$46,911. A detailed budget is attached with this proposal.

Project: NASO DAM NECK ANNEX DUNE RESTORATION

Project mission:

The National Aquarium and NASO Dam Neck Annex will be working together in 2014 on a Dune Restoration project in Virginia Beach, Virginia. The Aquarium Conservation Team will work to stabilize coastal dune habitat by planting native vegetation including American beachgrass, saltmeadow cordgrass, and switchgrass. Dune stabilization will help protect both sites and base operations in their trailing edge, as well as provide habitat to local wildlife and a food source for resident and migrating birds.

Liability:

All volunteers will have signed “The Hold-Harmless Form” approved by the NAIB’s Human Resources Department (attached).

Participant requirements:

The field site is an active military base and because of current security concerns, all participants must be American citizens.

The Aquarium is recommending that no one under 10 years of age participate. An adult must accompany those under 18. Participants are informed in advance that they will get dirty and that they should bring the following items: work gloves, water bottle, necessary medications, hat, sunscreen, comfortable shoes, identification, and warm clothes! No cameras allowed.

Potential safety hazards/considerations:

- sun exposure/dehydration and hypo/hyperthermia
- slippery conditions
- wildlife/plant-life/insects
- unforeseen emergencies/change in weather conditions
- uneven footing
- unexploded ordinances

Precautions:

- 1 comprehensive and 3 field pack first aid kits will either be positioned at designated locations or carried by field supervisors.
- Sunscreen will be supplied to minimize the effects of sun exposure. There will also be comfort stations for rest and/or assessment.
- Bug spray, poison ivy wipes, and Calamine lotion will be on hand. There are no larger animals (i.e. snakes or mammals) that are considered to be a potential threat. Gloves will be provided.
- Team leaders will have walk-about radios on hand for logistical needs as well as to report safety issues/injuries. There will be morning planning meetings* and evening

debriefings of the day's activities, at which time safety issues/concerns and solutions will be discussed.

- Holly Fowler, a Wilderness First Responder, will be the “onsite safety officer” of those that may be in need of medical attention. Laura Cattell Noll, a Maryland First Responder, is the alternate safety officer.

*Each morning a safety briefing will be given by an Aquarium staff member. The briefing will review the following points along with specific instructions as they relate to the points below:

- Thank you for being a part of the team this morning.
- Remind everyone to stay remain within the restoration area and not to roam
- If at anytime you, as a volunteer of the project, are unclear or uncomfortable about a procedure or undertaking please notify your supervisor immediately. We are grateful for your contribution as a volunteer and we want to make sure that this is an enjoyable, rewarding, and safe experience.
- With this being said, this will be hard work and you may be faced with challenging conditions. Remember: Team Work and Safety First!
 - Stay well hydrated and protect yourself from the sun.
 - We have (bug spray and water bottles) on hand for your use.
 - Supervisors will have field first aid kits.
 - Use the buddy system when working.
 - Listen carefully when instructions are being given.
 - When operating equipment of any kind look to see who is around you to avoid causing an injury.
 - If you witness a procedure that you feel is a potential hazard or could cause injury bring it up to a supervisor.
 - If an injury should occur we have a plan in place with local emergency agencies to evacuate you from the island and get you the appropriate medical attention
- Describe the mission of the day and take questions.

Contact information:

The following is a phone list for those involved a supervisory or contact role and their assigned task roles:

Dune Restoration Project Contact:

First Name	Last Name	Work Phone	Cell Phone
Laura	Bankey	410-659-4207	410-302-5655

SAND DUNE RESTORATION PLANTING

**NAVAL AIR STATION OCEANA-DAM NECK ANNEX
VIRGINIA BEACH, VA
SEPTEMBER 12-13, 2014**

HELP REBUILD SAND DUNES!

Sand dunes protect land by acting as natural barriers to prevent erosion and absorb wave energy. Without this protection, soft coastline would disappear rapidly.

The National Aquarium—in partnership with the Command Navy Region Mid-Atlantic, the Naval Facilities Engineering Command Mid-Atlantic and the Virginia Aquarium and Marine Science Center—will plant native dune grasses, restoring habitat for local wildlife while protecting the shoreline.

VOLUNTEERS ARE NEEDED!

Registration is required. Space is limited. Contact us today!

Please contact Stephanie Pully at (410) 576-1014 or conserve@aqua.org to receive a registration packet.

All participants must be a minimum age of 10 and a U.S. citizen. Participants under the age of 18 must be accompanied by an adult. This event is rain or shine, so please dress for the weather.

REGISTRATION FORM

SAND DUNE RESTORATION AT VIRGINIA BEACH

Please Note: All participants must be U.S. citizens. One form must be completed for each participant. Individual registration and release forms will need to be submitted for each volunteer. Personal information is required for base access.

Name (First, Middle, Last) _____

Social Security _____ Date of Birth _____

City _____ State _____ ZIP code _____

Phone _____ Email _____

Days of planned participation: Friday, September 12 Saturday, September 13

Please be sure to bring a valid picture ID with you during the event.

RELEASE AND WAIVER AGREEMENT

In consideration of being permitted to participate in the Sand Dune Restoration sponsored by the National Aquarium (the "Aquarium"),

I _____, acknowledge and agree that:
(print participant's name)

ASSUMPTION OF RISK; RELEASE. I am participating in the Program voluntarily. I understand that the Program includes activities beyond the Aquarium's control. I assume all risks of participating in the Program and I understand that such risks could be considerable. I, for myself and my heirs, personal representatives, assigns and next-of-kin, hereby voluntarily RELEASE AND FOREVER DISCHARGE the Aquarium, all of its affiliates, successors and assigns, and all of the directors, officers, employees, volunteers, agents and representatives of the Aquarium, the U.S. government and the other before-mentioned entities (the "Releasees"), from any and all claims, damages, costs (including reasonable attorneys' fees), and other liabilities ("Losses"), including without limitation, Losses arising from or related to any injury to me or my property, or any other person or their property, whether caused by the negligence of Releasees or otherwise.

Hold Harmless. I agree to indemnify and hold harmless each and every Releasee from and against any and all Losses (including without limitation, any damages inflicted by me upon any facilities or vehicles used in the Program) which any of them may sustain by reason of my participation in the Program.

Personal Health and Insurance. I certify that I am sufficiently physically fit to participate in the Program. I certify that I have and will maintain medical insurance covering any and all medical costs that may arise from my participation in the Program.

CANCELLATION/TERMINATION AND RULES. I agree that the Aquarium reserves the right to (i) alter the Program itinerary and arrangements for any reason whatsoever, and/or (ii) cancel or terminate the Program for any reason whatsoever. I agree to follow all rules of behavior deemed appropriate by the Aquarium Staff and to not exceed limits established by the Aquarium Staff. I agree that the Aquarium reserves the right to require me to withdraw from the Program at any time if I violate such rules or limits, or when such action is determined by the Aquarium to be in the best interests of the health, safety, and general welfare of the other Program participants. I understand that if I withdraw from the Program, I will be sent home at my own expense.

Applicable Law. I agree that this Release and Waiver Agreement (this "Agreement") shall be construed and governed by Maryland law without regard to any rules relating to conflicts of laws. I further agree that any lawsuit, claim or other legal proceeding related to the Program or this Agreement must be brought exclusively in the federal or state courts located in Baltimore, Maryland, and I hereby submit to personal jurisdiction in the State of Maryland and to venue in such courts.

Miscellaneous Terms. This Agreement contains the entire agreement between the Aquarium and I regarding any and all Losses arising from or related to my participation in the Program. I waive any right to a trial by a jury with regard to claims rising out of my participation in the Program. This release shall be construed as a whole according to its fair meaning, and not strictly for or against either of the parties. I agree that this Agreement is intended to be as broad and inclusive as permitted by applicable law and that if any portion of the Agreement is held invalid or unenforceable by a court of competent jurisdiction, the balance of the Agreement will continue in full legal force and effect.

ACKNOWLEDGEMENT. I certify that I (i) have read this Agreement in its entirety and understand all of its terms and conditions, (ii) have had the opportunity to consult with any advisors of my choice regarding this Agreement, and (iii) am entering into this Agreement by my own free will, without coercion from any source.

NATIONAL AQUARIUM[®]

Sand Dune Restoration NASO Dam Neck Annex

**Briefing Document for National Aquarium Staff/ACT!
May 16-17, 2014**

PROJECT SUMMARY

The National Aquarium Institute (Aquarium) is one of the nation's foremost 501(c)(3) conservation education organizations. Our mission is to inspire conservation of the world's aquatic treasures. Since its inception, the Aquarium has recognized its significant role in educating people about the importance of protecting our environment. Each year, the Aquarium Conservation Team (ACT!) recruits more than 700 citizen volunteers and local students to engage them in restoring habitats through planting events at six to seven project sites. In 2005, we began partnering with the Department of Navy (DoN) to restore native habitats including tidal salt marshes, underwater grass beds, and primary sand dunes at several locations in Virginia including Navy Air Station Oceana-Dam Neck Annex in Virginia Beach. Much of the habitat remains barren and eroding from wind and wave action associated with general weather conditions and heavy storms like Hurricane Isabel. In order to sustain the region's most valuable resources, protective measures and stabilization is required.

PROJECT DESCRIPTION

Coastal sand dunes are formed by the action of sea and wind. Material carried by the rivers is deposited with the help of the sea along the coastline forming sand dunes. They protect the land by acting as a natural barrier to salt water intrusion and sea wind erosion. The sand dune system absorbs the energy of the waves, and without this protection soft coastline would disappear rapidly. Even small disruptions in the dune system can cause salt-water infiltration into the ground water, threatening local farmlands. Although sand dunes may appear to be lifeless, in reality they are home to a multitude of species. Their importance has been acknowledged over the last years and they now are priority habitats for conservation.

PLANTING TECHNIQUE

We will be planting American beachgrass (*Ammophila breviligulata*), Bitter panicgrass (*Panicum amarum*), Groundsel brush (*Baccharis halimifolia*) and Beach plum (*Prunus maritima*). Planting technique will be demonstrated by Aquarium staff at the beginning of each day and all necessary tools will be provided. We will plant 7,000 American beachgrass 2" plugs, 7,950 Bitter panicgrass 2" plugs, 25 one gallon potted Groundsel brush and 25 one gallon potted Beach plum totaling 15,000 plants.

SAFETY

We developed a detailed safety plan for the project that includes all aspects of the program. All participants will be briefed daily on safety issues. A Project Leader will be in charge of all related safety issues and will coordinate the daily briefings and liability release forms. **Closed toed shoes must be worn at all times.**

ENTRANCE TO PLANTING SITE

Staff/Volunteers for the planting will be entering through ~~V.A. Army National Guard-Camp Pendleton property~~, reference the map below for directions. All volunteers/staff will be on an approved list at the gate if they supplied the required information *or* have a military ID/ Common Access Card.

THINGS TO BRING FOR FIELD WORK:

- Rain/foul weather Gear
- Hat
- Water Bottle
- necessary medications
- ID 

THE NATIONAL AQUARIUM WILL PROVIDE: Necessary tools, gloves, granola bars, water, and portable restrooms.

SCHEDULE:

Friday, May 16

Please arrive at the site by 9am for check-in (see map below). You will be shuttled from the parking area to the planting site (~~~1.5 miles away~~). Once you arrive at the planting site, you will be matched with an Aquarium Conservation Team member to guide you during planting. We anticipate ending by 3pm, however ending time may be earlier due to weather or the rate at which planting is completed.

Saturday, May 17

Please arrive at the site by 9am for check-in (see map below). You will be shuttled from the parking area to the planting site (~~~1.5 miles away~~). Once you arrive at the planting site, you will be matched with an Aquarium Conservation Team member to guide you during planting. We anticipate ending by 3pm, however ending time may be earlier due to weather or the rate at which planting is completed.

WEATHER

Unless weather conditions are extreme or dangerous, planting will continue as scheduled. **If we make the call to cancel a particular day's activities, you will be contacted with as much notice as possible. If you do not hear from us, then the planting will go on as planned.**

DIRECTIONS:

To Dam Neck Annex:

- Take I-295 Baltimore Washington Parkway South.
- Take exit 1B for I-95 S/I-495 S towards RICHMOND.
- Merge onto CAPITAL BELTWAY.
- Take I-95 S towards RICHMOND. 85 miles
- Take exit 84A for I-295 S, on the left towards ROCKY MT NC.
- Merge onto I-295 S.
- Take exit 28 for I-64/US-60 towards RICHMOND/NORFOLK.
- Merge onto I-64 E via EXIT 28A toward NORFOLK / VA BEACH.
- Follow I-64 East to Norfolk thru Hampton Roads Bridge tunnel (83.5 miles)
- Take exit 284A for 264 W toward Downtown/Norfolk/Portsmouth
- Keep left at the fork, follow signs for 264 E/ VA Beach and merge onto 264E (10.2 miles)
- Take exit 22 for Birdneck Road toward Oceanfront Alt Route.
- Turn right onto Birdneck Road
- Follow National Aquarium signs & flags to designated parking areas

cdahlenburg@aqua.org

Request: The National Aquarium requests \$94,308 to conduct a two-year community-based environmental stewardship project that will engage 80 – 100 volunteers in planting 60,000 native dune grasses and installing sand fencing to restore eroded shoreline near Virginia Beach. Four restoration events (spring and fall) spanned over two years will educate volunteers about coastal dune ecology during a day of environmental stewardship.

Organizational Summary: The National Aquarium Institute (Aquarium) is one of the nation's foremost 501(c)(3) conservation education organizations. Our mission is to inspire conservation of the world's aquatic treasures. Since opening in 1981, the Aquarium has attracted more than 45 million visitors to our 5.8 acre campus in the heart of Baltimore, which features more than 16,000 animals representing more than 600 species. In 2005. Today, the Aquarium attracts approximately 1.3 million visitors annually.

Project Description: Since its inception, the Aquarium has recognized its significant role in educating people about the importance of protecting our environment. Each year, the Aquarium Conservation Team (ACT!) recruits more than 700 citizen volunteers and local students to engage them in restoring tidal habitats through planting events at six to seven project sites. In 2005, we began partnering with the Department of Navy (DoN) to restore native habitats including tidal salt marshes, underwater grass beds, and primary sand dunes at several locations in Virginia including Navy Air Station Oceana-Dam Neck Annex (DNA) in Virginia Beach. Much of the habitat at the DNA remains barren and eroding from wind and wave action associated with general weather conditions

and heavy storms like Hurricane Isabel. In order to sustain the region's most valuable resources, protective measures and stabilization is required.

Dune habitats are an especially important and threatened resource along the Mid-Atlantic coast. They have always been a part of the natural history of Virginia Beach and are important to the ecology of the region. Coastal dunes provide critical habitat for many species of wildlife including ground nesting birds, songbirds, waterfowl, small mammals, amphibians, reptiles, and insects. Primary sand dunes act as a reservoir for beach nourishment and provide a physical barrier to the harsh conditions of the sea including high winds, storm activity, flooding, and erosion due to wave energy. Native dune plants are highly resilient and have adapted to thrive in stressful conditions such as extreme heat, drought, shifting sands, and limited nutrients.

The NASO Dam Neck Annex Dune Restoration project aims to protect these important habitats, by inviting local community volunteers to participate in restoration events. With this project, the National Aquarium will host two restoration events annually for two years in spring and fall at Dam Neck, working with volunteers to address stabilization concerns. Volunteers will plant native grasses and install sand dune fencing, which builds up sand from wind action and provides a medium for vegetation to bind, strengthening the integrity of the dune system.

This project represents the continuation of an ongoing planting and stabilization. Since 2007, the National Aquarium organized sand dune restoration events at DNA in partnership with Virginia Aquarium & Marine Science Center and the U.S. Navy to restore a total of 15 acres of dunes. These events involved more than 500 local volunteers who planted over 284,234 native plants and installed sand fencing to protect the newly planted grasses. What differentiates the National Aquarium’s efforts is our commitment to developing community involvement at the grassroots level by providing hands-on projects that demonstrate conservation behaviors for local citizens.

Timeline:

February 2015	DNA Site Visit with DoN
Spring 2015	Two-day community based sand fence instillation and vegetation planting.
Fall 2015	Two-day community based sand fence instillation and vegetation planting.
Spring 2016	Two-day community based sand fence instillation and vegetation planting.
Fall 2016	Two-day community based sand fence instillation and vegetation planting.
February 2017	Final Report

Expected Deliverables and Outcomes:

The goal of the project is to stabilize dune structure along the 3 mile stretch of DNA by installing sand fencing and planting native grasses while providing an opportunity for community members to learn about the importance of coastal dunes. We plan to achieve this goal through the following activities:

1. Recruit 80 – 100 volunteers to participate four restoration events at NASO Dam Neck Annex.
2. Purchase 60,000 native plants.

3. Conduct a pre-planting orientation for volunteers to educate them about coastal dune ecology and receive training in restoration techniques.
4. Plant 60,000 plants along the leading and trailing edges of the dunes.
5. Install sand fencing to strengthen the integrity of the dune system.
6. Conduct post event volunteer surveys to evaluate the impact of the program.

Outlined in the *Request for Statement of Interest, Cooperative Agreement*, task one will be a two-day spring fence installation and planting event to be completed by May 15, 2015. Task two, a two-day spring fence installation and planting event to be completed by November 15, 2015. Task three, a two-day spring fence installation and planting event to be completed by May 15, 2016 and task four, a two-day spring fence installation and planting event to be completed by November 15, 2016.

Key Staff: The National Aquarium's Chesapeake Bay Initiative (CBI) is a nationally recognized program that fosters partnerships with local communities and organizations to protect and restore habitats throughout the Bay. Each Year, CBI actively recruits volunteers and engages them in the technical process of restoring and monitoring tidal habitats at six to seven project sites. CBI directly supports increasingly public awareness of conservation issues by providing citizens with the tools they need to become active environmental leaders in their communities.

The National Aquarium will take the lead in organizing a community-based restoration events in the spring and fall of 2015 and 2016. Logistically, this will include registering volunteers, ordering plants and supplies, coordinating the planting event including planting instructions and providing volunteer education and comfort, and following up after the planting with volunteer thank you letters and surveys. Key individuals leading this effort include:

Laura Bankey currently holds the position of Director of Conservation at the National Aquarium, where she manages staff, volunteers, and interns in conjunction with the Aquarium's conservation objectives. Her Primary focus is on regional Chesapeake Bay issues and promoting individual, community, corporate and legislative actions that will improve Bay health. Areas of interest include community-based habitat restoration, sustainable seafood, climate change adaptation, marine debris, environmental education and gardening for wildlife. She holds undergraduate degrees in Chemistry and Biochemistry from the University of Dallas and a master's degree in Marine Science from the College of William and Mary's Virginia Institute of Marine Science.

Charmaine Dahlenburg, Conservation Project Manager II, holds a master's degree in Environmental Science and Policy from Johns Hopkins University. She manages conservation projects including budget preparation and grant writing, implementation of work plan at the project site, and tracking of all technical and financial project aspects. She also serves as the liaison between the Conservation Department, project partners, and volunteers to successfully carry out restoration projects including work with the Department of Defense at Naval Support Facility Indian Head and Naval Air Station Dam Neck Annex.

Curtis Bennett, Conservation Project Manager I, holds a master's degree in Wildlife Ecology from the University of Delaware. He manages many of the Aquarium's environmental education programs including budget preparation, grant writing, and implementation for the *Wetland Nursery Program* and *Terrapins in the Classroom* program.

Stephanie Pully, Conservation Technician, holds a bachelor's degree in Environmental Science from the University of Maryland, Baltimore County. She serves as a liaison between project partners and volunteers

while also acting as a volunteer coordinator for the Aquarium Conservation Team (ACT!), a core group of trained volunteers who lead community members in the field during restoration projects. She is also a certified Master Naturalist.

Stacy Trust, Conservation Technician, holds a bachelor's degree in Psychology from Bucknell University. She coordinates many of the Aquarium's environmental education programs and serves as a liaison between the Conservation Department and local teachers participating in our *Wetland Nursery Program* and *Terrapins in the Classroom* program. She is also a certified Master Naturalist.

Budget: The total cost of the project is \$94,308. A detailed budget is attached with this proposal.

1 INTRODUCTION

Stell Environmental Enterprises, Inc. (SEE) prepared this Erosion Control Plan (ECP) under Naval Facilities Engineering Command (NAVFAC) Contract No. N62470-12-R-7002, Delivery Order No. 002. A survey of all erosion features was conducted at each of the following four installations, located in the Virginia Beach, Virginia (VA) area:

- Naval Air Station Oceana (NASO),
- Naval Auxiliary Landing Field Fentress (NALFF),
- NASO Dam Neck Annex (NASO-DNA), and
- Naval Support Activity Hampton Roads Northwest Annex (NSA-NWA)

The results of the erosion survey, documented in this ECP, will allow the installations to maintain compliance with regulations, such as the Environmental Protection Agency's (EPA) Clean Water Act (CWA); prevent release of sediment to streams, ponds and wetlands; maintain productive land use; and ensure the safety of personnel using the lands. The locations of these installations are shown in Figure 1-1.

This is the first erosion control survey undertaken at these installations. Based on conversations with the client, there have been no Notices of Violation associated with erosion or sediment release to the surface waters on or off-site. This survey will be proactive in identifying those areas that may or could be releasing sediment that could affect downgradient water quality in surface water. This survey will also be used to establish a baseline showing the location and extent of erosion that currently exists at each installation.

1.1 PROJECT OBJECTIVES

The purpose of the erosion survey is to identify erosion areas and to document those areas (Sections 4 and 5), and then describe measures to address those areas (Sections 6 and 7). Specifically, the objectives for this project are to:

- Identify the areas of existing and potential erosion at each installation;
- Document the survey process and results of the erosion survey; and
- Address the erosion areas by recommending the appropriate control measure which may include: construction to repair the erosion or reduce the potential for future erosion, implementation of a best management practice, or monitoring.

1.2 PROJECT SCOPE

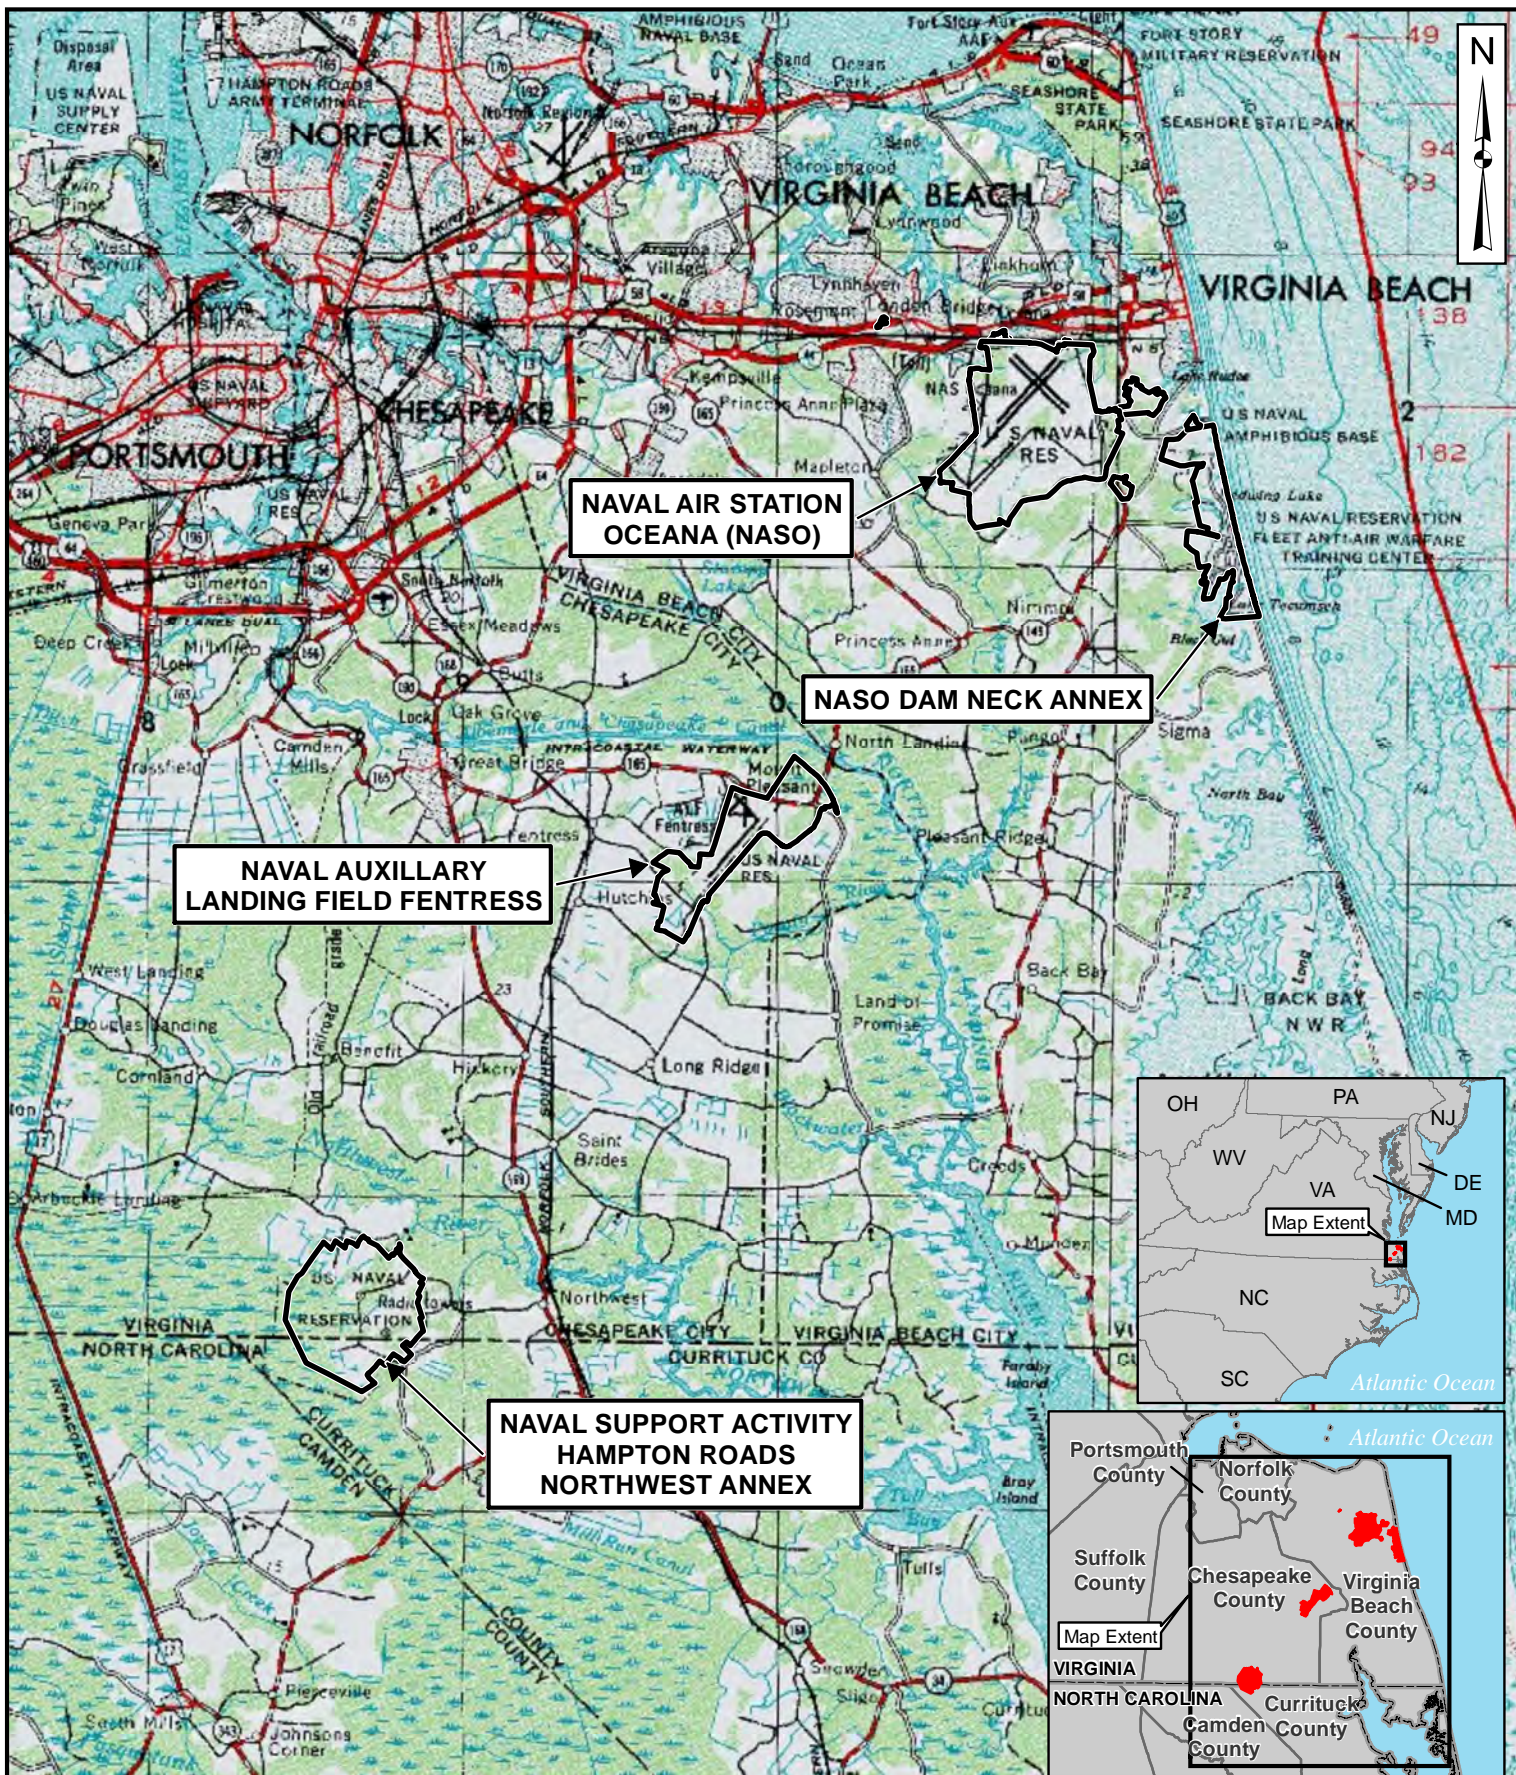

To meet the project objectives, the scope of this project includes the following activities:

- Provide a desk-top analysis of existing information, including Integrated Natural Resource Management Plans (INRMPs), Stormwater Pollution Prevention Plans (SWPPPs), and numerous aeriels, wetland maps, and geographic information system (GIS) information for each installation;
- Conduct a visual survey of accessible surface water features including streams, ditches, ponds, stormwater outfalls, unpaved roadways, agricultural areas, etc.;

- Document signs of erosion for the above areas by recording the type and cause of erosion, obtaining global positioning system (GPS) coordinates and photographs, and documenting soil types, and usage level; and
- Prepare the ECP to document observation results and provide recommendations to control or mitigate the erosion areas and the associated costs.

2 JUSTIFICATION AND DRIVERS

2.1 MISSION

The mission of NASO is to provide every element of supply, material, maintenance, personnel, and training facilities required to ensure F/A-18 Hornet fighter squadrons achieve the requisite level of readiness necessary to deploy on command aircraft carriers as fully combat fighter and attach squadrons. NALFF serves as a major carrier landing training facility for aircraft stationed at NASO and Chambers Field. The mission of NASO DNA is to provide quality education and training in specified combat systems operations and maintenance, provide specialized skills training, and to provide training systems support to operational and systems commands. The mission of NSA-NWA is to coordinate the provision of shore activity support to tenant commands, which include all branches of the armed forces and the Coast Guard. A large amount of suitable land area without erosion features, ruts, steep slopes, and depressions is required to support the training activities for these missions. By minimizing erosion, the current amount of suitable, level land area and roadways can be maintained for training purposes to support each facility's mission (INRMPs for NASO, NASO DNA, NALFF and NSA-NWA).

2.2 REGULATORY DRIVERS

Numerous federal and state government regulations, standards, and guidance drive or influence erosion control activities at NASO, NALFF, NASO DNA and NSA NWA. The following is an identification and summary of the primary regulations, standards, and guidance that pertain to the erosion control measures discussed in this document:

Navy Erosion and Sediment Control Instruction - The Commander, Navy Region (COMNAVREG), Mid-Atlantic (MIDLANT) has developed minimum standards and criteria for the effective control of soil erosion, sediment deposition, and non-agricultural runoff from land disturbing activities at installations under its purview. These standards and criteria apply to land disturbing activities greater than or equal to 10,000 square feet (SF) in size and have the following objectives:

- Establish the criteria, procedures, and responsibilities for preparing and complying with Erosion and Sediment Control Plans for land disturbing activities.
- Establish a procedure for inspecting land disturbing activities and their associated erosion and sediment controls.

Navy Post Construction Stormwater Runoff Management Instruction - The COMNAVREG MIDLANT has adopted stormwater best management practices for development or redevelopment activities of parcels greater than or equal to one acre in size. This instruction also applies to land development activities for parcels less than one acre in size if the activities are part of a larger common plan of development. This instruction seeks to maintain compliance with state and federal environmental regulations through the following objectives:

- Require that the after-development runoff from land development and redevelopment activities is maintained as nearly as practicable to the pre-development runoff characteristics in order to reduce flooding, siltation, stream bank erosion, and property damage.

- Establish minimum design criteria for the protection of properties and aquatic resources downstream from land development and redevelopment activities to prevent damage resulting from increases in volume, velocity, frequency, duration, and peak flow rate of stormwater runoff.
- Establish minimum design criteria for measures to minimize non-point source pollution from stormwater runoff that would otherwise degrade water quality.
- Establish provisions for the long-term maintenance of stormwater management control devices and other techniques specified to manage the quality and quantity of runoff.
- Establish administrative procedures for the submission, review, approval, and disapproval of stormwater plans and the inspection of approved projects.

VA Erosion and Sediment Control Regulation. The VA Erosion and Sediment Control Regulation (4 VA Code 50-60-48) was developed to address erosion and sediment control. The *Virginia Erosion and Sediment Control Handbook*, 1992, was prepared as a guidance to assist in implementing the above regulation and was used in preparing this document.

- This regulation is based upon relevant physical and developmental information relating to the watershed and drainage basins of the Commonwealth of VA, including, but not limited to, data relating to land use, soils, hydrology, geology, size of land area being disturbed, proximate water bodies and their characteristics, transportation, and public facilities and services.
- Erosion control measures will include such surveys of lands and waters as may be deemed appropriate by the VA Water Pollution Control Board or required by any applicable law to identify areas, including multijurisdictional and watershed areas, with critical erosion and sediment problems.
- The regulation contains conservation standards for various types of soil and land uses to include criteria, techniques, and methods for the control of erosion and sediment resulting from land-disturbing activities.

United States (U.S.) EPA CWA – Section 104 (2)(n1) of the CWA promotes and encourages continuing comprehensive studies of the effects of pollution, including sedimentation, in the estuaries and estuarine zones of the U.S. on fish and wildlife, fishing, recreation, water supply and water power, and other beneficial purposes. The CWA addresses water quality impacts through multiple sections within the Act including nonpoint pollution control, discharges to potable water systems, and stormwater management. Nonpoint pollution and stormwater discharges play a major role in transporting sediment resulting from erosion into our nation’s water resources; therefore, minimizing erosion will have a positive impact on water quality by limiting the sediment and pollutants that enter the potable, recreational, and navigable surface water on and downstream of the four installations.

Chesapeake Bay Preservation Act - The Chesapeake Bay Preservation Act, 1988, states that the Virginia Soil and Water Conservation Board will encourage and promote protection of existing high quality state waters and restoration of all other state waters to a condition or quality

that will permit all reasonable public uses and will support the propagation and growth of all aquatic life, including game fish, which might reasonably be expected to inhabit them. Minimizing erosion will have a positive impact by limiting the sediment and pollutants that enter state waters from portions of NASO.

2.3 NAVY POLICY

Navy policy on natural resources management, including surface water, is to manage natural resources to support and be consistent with the military mission while protecting and enhancing those resources for multiple use, sustainable yield, and biological integrity. Land use practices and decisions must be based on scientifically sound conservation procedures and techniques, and the use of scientific methods and an ecosystem management approach. (OPNAVINST 5090.1C 2007)

Employing ecosystem management will help maintain and improve the sustainability and biological diversity of terrestrial and aquatic ecosystems while supporting sustainable economies, human use, and the environment required for realistic military training operations. (Department of Defense Initiative 4715.3 1996).

The basic principles and guidelines of ecosystem management are to:

- Preserve the function and integrity of natural ecosystems;
- Integrate human social and economic interests with environmental considerations;
- Involve all interested parties (stakeholders) in identifying management goals; and
- Adapt to changing conditions and requirements.

2.4 STEWARDSHIP

Environmental stewardship is essential to the safe, healthful, and compliant execution of the Navy's mission and the protection and preservation of natural resources. The Navy promotes environmental stewardship through projects that enhance the installation's natural resources, promote proactive conservation measures, and support investments that demonstrate the Navy's environmental leadership and environmental stewardship (Department of the Navy, NASO 2011). To achieve these ideals, NAVFAC has established an Environmental Management System that will:

- Comply with applicable laws, regulations and policies;
- Integrate environmental stewardship into operational decisions;
- Implement, modify, and sustain practices that minimize and prevent creation of waste and pollutants at its source;
- Develop objectives and targets to minimize environmental risk, and monitor progress towards those goals;
- Educate the Navy's workforce and supported commands on their responsibilities to the environment;

- Foster communication throughout the installation on our environmental commitments and performance; and
- Sustain the Navy's partnerships with public agencies and community organizations to mutually monitor and improve the quality of the environment.

3 EROSION PROCESSES AND TYPES OF EROSION

Soil erosion is the process by which the land's surface is worn away by the action of wind, water, ice, and gravity. Natural or geologic erosion has been occurring at a relatively slow rate since the earth was formed and is a tremendous factor in the creation of the earth as we know it today. The picturesque mountains of the west, the rolling farmlands of the Piedmont, and the productive estuaries of the Coastal Zone are all products of the geologic erosion and sedimentation process in Virginia. Except for some cases of shoreline and stream channel erosion, natural erosion occurs at a slow rate and is an important factor in maintaining an environmental balance (VA DCR 1992).

Water-generated erosion is the most severe type of erosion and is the type of erosion that is the focus of this report. Water-generated erosion occurs as a result of the impact of rain droplets on unprotected soil surfaces and is due to frictional forces on soil particles as those rain droplets combine and move across the surface of the land. The force due to impact of raindrops is primarily vertical and tends to detach soil particles, while the force of flowing water is primarily horizontal and acts to move detached particles from one place to another. Water-generated erosion can be broken down into the following types, as defined in the Virginia Erosion and Sediment Control Handbook (VA DCR 1992).

Splash erosion is the initial effect of rain upon the soil. Raindrop impact dislodges soil particles and splashes them into the air. These detached particles are then vulnerable to movement via surface water flow, including sheet, rill, gully, or channel erosion.

Sheet erosion is caused by the shallow flow of water over the land's surface before it concentrates. Although seldom the detaching agent, sheet flow transports soil particles detached by raindrop impact. Sheet erosion has been identified as a major cause of soil loss on agricultural fields. Sheet flow rarely moves as a uniform sheet for more than a few feet on land surfaces before concentrating in the surface irregularities.

Rill erosion occurs as sheet flow begins to concentrate in the low spots of irregular surfaces. As flow changes from sheet flow to shallow concentrated flow, the velocity and turbulence of flow increase. The energy of this concentrated flow is able to detach and transport additional soil particles. When this occurs, the running water begins to cut small channels. Rills are small but well-defined channels that are up to a few inches deep. They are easily mitigated in agricultural areas by harrowing and other surface treatments.

Gully erosion occurs when rills combine and the increased volume and velocity of water form larger and deeper channels. The main difference between rill erosion and gully erosion is magnitude. Gullies are often too large to be repaired by tillage equipment and typically require heavy equipment and special repair techniques.

Stream and Channel erosion takes place when the volume and velocity within a stream channel are such that bed and/or bank materials are moved and not replaced. Streambed scour is the removal of underwater material by waves or currents, especially at the base or toe of a streambank or shoreline.

Figure 3-1: Types of Soil Erosion

(Source: CEP 1998)

4 METHODOLOGY USED FOR FIELD ASSESSMENT

4.1 DESKTOP ANALYSIS

Prior to the field assessment, a desk top analysis was conducted by SEE to review information provided by NAVFAC and to identify potential sites to be surveyed. Information provided by NAVFAC for the desk top analysis primarily consisted of the most recent INRMPs for each installation and relevant GIS files for each base. Using this information, SEE identified areas to be investigated during the field assessment. These areas consisted of primary stormwater drainage ditches, natural streams, channelized natural streams, and lake and pond shorelines. The primary resources utilized by SEE were Water Resource Maps from the INRMPs (GMI 2006 and 2008) and the Wetland Centerline GIS layers (GMI 2002), provided by NAVFAC in October and November 2012. Additional clarification regarding survey areas was provided by Michael Wright, Navy Natural Resources Specialist, during a site tour held on November 13, 2012, at the onset of site assessment activities. This site tour consisted of a daylong driving tour of NASO, NASO-DNA, NALFF, and NSA-NWA.

4.2 FIELD SURVEY

The field assessment was performed by SEE between the dates of November 13, 2012 and January 23, 2013. A total of five nonconsecutive weeks of field assessment was conducted to complete the field survey at all four facilities.

Field assessment activities consisted of the field location of survey areas, visual inspection of these areas, and documentation of any notable erosion features observed upon inspection. Investigation methods included walking inspections, driving inspections where practical, and investigation by means of canoe. When possible, the surveys were conducted by starting downstream and continuing upstream so that any discharge of sediment from erosion to the receiving stream would be identified early in the survey. The identification of erosion features was primarily based on the visual observation of typical erosion features such as sparse vegetation, occurrences of sheet erosion, erosion rills and gullies, slope failures, and scour. The general process employed by SEE was conducted as follows:

- Follow shoreline of watercourse or surface water until an erosion feature was identified.
- Take one or more photographs of the erosion feature showing the extent of erosion.
- Document each feature's location using a Trimble GeoXH 3000 GPS device. GPS measurements were recorded manually in decimal format and also stored on the unit. The GPS measurements collected represent the center of the erosion feature. The target accuracy was three meters or less.
- Complete a field inspection form.
- Repeat the process for the remainder of watercourse or surface water features.

Field documentation of erosion features included the following information:

- General description;
- GPS coordinates that were both manually and digitally recorded;
- Designated use of the surrounding area (e.g. agricultural, training, recreational, etc.);
- Apparent usage level of the surrounding area (e.g. heavy, moderate, light);
- Vegetative condition of the surrounding area (e.g. sparse grass, dense brush, etc.)
- Photographic documentation;
- Nature of erosion and sedimentation issues observed;
- Condition of drainage structure, if applicable;
- Apparent cause of the erosion; and
- Physical dimensions pertaining to the erosion feature.

Initially, SEE sought to perform a direct visual inspection of every area, regardless of impediments such as heavy brush and thickly forested areas. This approach, while very labor intensive and time consuming, proved worthwhile in that it allowed SEE to confirm that major erosion issues were not of primary concern in these densely vegetated areas where natural occurrences of erosion were present. Upon reporting this and with NAVFAC approval, SEE limited direct visual inspection to areas that were reasonably accessible by foot, vehicle, or canoe.

Areas identified in the field for which mitigation cost estimates were not provided generally consisted of occurrences of natural erosion along drainage ditches or channelized natural streams located within wooded areas where mitigation of the erosion would result in greater disturbance of surrounding areas if the present condition were to be addressed.

A summary of the surface water locations surveyed at each installation is provided in Table 4-1. These surface water locations and erosion features for NASO, NASO DNA, NALFF, and NSA NWA are shown in figures 5-1, 5-2, 5-3, and 5-4 respectively.

Table 4-1: Survey Summary by Installation

Installation	Total Length of Surface Water Surveyed	Surface Water Areas Surveyed	No. of Photographs (incl. in Appendix A)	No. of Erosion Features Identified
NASO	32 miles	Outfalls, Aeropines Golf Course Ponds and Mitigation Site, Runway Ditches, Agricultural Ditches, West Neck Creek, Weapons Compound Ditches, Oceana Pond, Owls Creek, Sand Pit Ponds, Base Perimeter Ditches, Roadside Ditches, Concrete Ponds, Skeet Range, VACAPES Area	173	20
NASO DNA	9 miles	MACS 24 Area, DEVGRU Area, Lake Christine, Redwing Lake, Lake Tecumseh, Sadler Pond, Lotus Pond, Lily Pond, Roadside Ditches, Main Ditch between Redwing Lake and Lake Tecumseh	11	3
NALFF	11 miles	Pocaty Creek, Runway Ditches, Agricultural Ditches, Chesapeake City Channel	18	3
NSA NWA	11 miles	Mill Stream, Lunker Lake, Brig Area, ROTHF Ditches, Agricultural Ditches, Roadside Ditches	12	6

5 ASSESSMENT RESULTS

The following sections present and discuss the results of the erosion survey by installation. Figures for each installation are provided at the end of this section. The primary causes of each erosion feature and the GPS coordinates are shown in Table 5-1.

5.1 NASO

A total of 20 erosion features, designated as NASO 01 through NASO 20, were identified during field assessment activities at NASO. The surface waters surveyed and locations of these 20 erosion features are shown in Figure 5-1 (end of section).

5.1.1 NASO 01

Erosion feature NASO 01 consists of multiple erosion features located along an approximate 500 foot reach of an agricultural field drainage ditch west of West Neck Creek. These features are designated as NASO 01(a) through NASO 01(d) and are discussed in further detail below.

5.1.1.1 NASO 01(a)

Erosion feature NASO 01(a) is located approximately 0.27 miles upstream of Outfall 001 via an agricultural ditch west of West Neck Creek. No significant downstream impacts, including the transport of sediment, were observed as a result of this feature. The general location of this erosion feature is presented in Figure 5-1 and a photograph is provided as Photograph 5-1. The GPS coordinates for this feature are latitude 36.7892 and longitude -76.0438. All GPS coordinates represent the center of the erosion feature.

NASO 01(a) is characterized by occurrences of sheet erosion and erosion rills at the southeast corner of the intersection of the main agricultural drainage ditch and a tributary ditch to the south. The soil type present at this feature is silty loam. The erosion present at this feature can be attributed to the concentration of upgradient drainage over the sparsely vegetated area adjacent to the ditch.

Erosion at this feature extends southeast of the intersection of the main and tributary ditches and has an area of about 175 SF. The erosion rills are an average of 6 inches deep.

Photograph 5-23: NASO 20, Ditch Scour and Embankment Erosion at Outfall 005

5.2 NASO DNA

A total of three erosion features, designated as NASO DNA 01 through NASO DNA 03, were identified during field assessment activities at NASO DNA. The surface waters surveyed and the three erosion features identified are shown in Figure 5-2. These erosion features are discussed in detail in the following subsections.

5.2.1 NASO DNA 01

Erosion feature NASO DNA 01 is located at a bend along a small roadside drainage ditch. No significant downstream impacts, including the transport of sediment, were observed as a result of this feature. The general location of this erosion feature is presented in Figure 5-2 and a photograph is provided as Photograph 5-24. The GPS coordinates for this feature are latitude 36.8147 and longitude -75.9707.

NASO DNA 01 is characterized by the occurrence of minor streambank scour along a ninety degree bend in the drainage ditch and undermining of the adjacent security fence. The soil type present at this feature is silty loam. The erosion present at this feature can be attributed to the abrupt change in flow direction, which is likely only an issue under peak flow conditions.

Approximately 20 feet of erosive scour is present along the three feet deep streambank. The total eroded area is approximately 60 SF.

Photograph 5-24: NASO DNA 01, Streambank Scour along Roadside Ditch

5.2.2 NASO DNA 02

Erosion feature NASO DNA 02 is located along the southern shoreline of Lake Christine. No significant downstream impacts, including the transport of sediment, were observed as a result of this feature. The general location of this erosion feature is presented in Figure 5-2 and a photograph is provided as Photograph 5-25. The GPS coordinates for this feature are latitude 36.8145 and longitude -75.9769.

NASO DNA 02 is characterized by occurrences of limited embankment scour and failure along a relatively small section of the lake shoreline. The soil type present at this feature is silty loam. The erosion present at this feature can be attributed to wave action from the lake.

Approximately 500 feet of erosion is present along the shoreline, which varies in height from one to four feet above the water. Assuming an average height of 2.5 feet, the total eroded area of shoreline that is visible above the water is 1,250 SF.

Photograph 5-25: NASO DNA 02, Shoreline Erosion at Lake Christine

5.2.3 NASO DNA 03

Erosion feature NASO DNA 03 is located at the outlet of a drainage ditch culvert that passes beneath an unpaved roadway, approximately 0.60 miles upstream of Redwing Lake. No significant downstream impacts, including the transport of sediment, were observed as a result of this feature. The general location of this erosion feature is presented in Figure 5-2 and a photograph is provided as Photograph 5-26. The GPS coordinates for this feature are latitude 36.8035 and longitude -75.9698.

NASO DNA 03 is characterized by failure of the culvert embankment, resulting in potential blockage of the culvert outlet and roadway stability concerns. The soil type present at this feature is silty loam. The embankment failure is likely due to the concentration of upgradient drainage from the overlaying unpaved roadway at the point immediately above the culvert.

A section of the embankment above the culvert approximately 10 feet wide has collapsed. The embankment height is approximately three feet. The total eroded area is approximately 30 SF.

Table 5-1: Primary Causes of Erosion for Each Erosion Feature

Area of Erosion	Latitude	Longitude	Poor Agricultural Practices	Recent Land Development or Human Activity	Poor Drainage Structure Design	Severe Storm Event	Little or No Maintenance	Natural Erosion or Steep Slopes

6 DISCUSSION AND RECOMMENDATIONS

Based on the survey results discussed in Section 5.0 of this report, SEE has provided recommendations to address each erosion feature with an emphasis to stop any current erosion and downstream transport of sediment. The recommendations utilize proven methods and technologies that meet the following primary criteria: effectiveness in controlling erosion, implementability from an engineering standpoint, and cost effectiveness.

6.1 NASO

A total of 20 erosion features, designated as NASO 01 through NASO 20, were identified during field assessment activities at NASO and presented in Section 5.1 of this report. The following subsections discuss SEE's recommendations for addressing these erosion features. Estimated costs are also provided for each recommended approach with supporting documentation provided in Appendix C. Cost estimates are turnkey and include planning, supplies, equipment, and manpower for implementation, in addition to any required maintenance costs.

6.1.1 NASO 01

Erosion feature NASO 01 consists of multiple erosion features located along an approximate 500 foot span of an agricultural field drainage ditch that discharges into West Neck Creek. These features are designated as NASO 01(a) through NASO 01(d). For cost estimate purposes, these features are addressed as a single unit because of their close proximity to each other, similar erosion characteristics, and use of similar methods to address them.

A temporary silt fence should be placed upgradient of any land disturbing activities to prevent runoff from reaching disturbed areas. Where erosion rills and gullies are present, the recommended mitigation approach is to restore the areas to their original grade and reestablish vegetation to prevent erosion from recurring. Soil fill will be required to bring the areas up to grade. Grading work can be performed using a backhoe loader or similar equipment. Final grades should have a uniform surface with no irregularities to prevent drainage from concentrating and causing erosion to reoccur.

Where slope failure occurs along the streambank, the recommended mitigation approach is to restore the streambank to a stable condition. This can be accomplished by reducing the slope and revegetating the streambank. In the area where slope failure occurs, the streambank should be cut back to reduce the slope and minimize the potential for future failure. Where slope reduction is performed, the final grade of the newly sloped area should gradually taper into the existing undisturbed sections of the streambank to minimize abrupt irregularities that could lead to further erosion. In general, final slopes exceeding three horizontal to one vertical should be avoided when implementing these mitigation approaches.

The eight inch drain pipes associated with these erosion features should be addressed by removing the obstruction present at NASO 1(b) and by repairing or replacing the damaged section present at NASO 1(c). Maintenance of the planted vegetation and good agricultural practices will prevent the erosion from reoccurring.

6.1.20 NASO 20

The recommended approach to mitigating erosion feature NASO 20 is to apply riprap where erosion is present at the outfall and along the drainage ditches parallel to the roadway, and install a concrete headwall where erosion undercuts the culvert embankment.

A temporary silt fence should be placed upgradient of any land disturbing activities to prevent runoff from reaching disturbed areas. Riprap should be placed at the convergence of the roadside drainage ditches and the pipe culverts. The riprap should extend up to and slightly beyond where any erosion occurs within the ditches and on the culvert embankment. The riprap should also extend to where erosion occurs beneath the security fence. The activities associated with adding riprap in this area would be to strip existing vegetation where riprap will be placed, regrade the area to the extent necessary to provide uniform slopes, install a layer of geotextile filter fabric on the graded surface, and place riprap to a final grade matching the regraded surface. Final slopes should not exceed three horizontal to one vertical. A backhoe loader or similar equipment can be used to perform the grading and riprap placement.

Where erosion occurs above and between the concrete pipe culvert that extend beneath the road, a cast-in-place concrete headwall reinforced with structural steel should be installed to prevent undercutting of the embankment that supports the overlaying roadway. This will require some additional excavation of the culvert embankment, but should not require any disturbance of the road itself. The headwall can be prepared by constructing a form to encase the top and sides of the existing concrete pipe culvert.

The application of riprap should be in accordance with the specifications of VA ESC Handbook Chapter 3, Section 3.19. A layer of geotextile filter fabric should be installed and appropriately anchored where riprap is to be placed. The geotextile will help to stabilize the subgrade and protect against future scour. The geotextile will also prevent the migration of soils from the subgrade into the riprap and will minimize plant growth through the riprap.

This mitigation approach will require approximately two weeks to execute, excluding the planning and preparation time prior to field work. There are no maintenance activities associated with this approach.

The total estimated cost of mitigating erosion feature NASO 20 is \$33,700. This estimate includes planning and construction costs.

6.2 NASO DNA

A total of three erosion features, designated as NASO DNA 01 through NASO DNA 03, were identified during field assessment activities at NASO DNA and presented in Section 5.2 of this report. The following subsections discuss SEE's recommendations for addressing these erosion occurrences. Estimated costs are provided for each recommended approach. The documentation for all NASO DNA areas are in Appendix C.

6.2.1 NASO DNA 01

The recommended approach to mitigating erosion feature NASO DNA 01 is to apply riprap where erosion has occurred along the bend in the drainage ditch. The riprap should also extend to where erosion has occurred around the security fencepost.

A temporary silt fence should be placed upgradient of any land disturbing activities to prevent runoff from reaching disturbed areas. The activities associated with adding riprap in this area include stripping existing vegetation where riprap will be placed, regrading the area to the extent necessary to provide uniform slopes, installing a layer of geotextile filter fabric on the graded surface, and placing riprap to a final grade matching the regraded surface. Final slopes should not exceed three horizontal to one vertical. This work can be performed with a backhoe or similar equipment.

The application of riprap should be in accordance with the specifications of VA ESC Handbook Chapter 3, Section 3.19. A layer of geotextile filter fabric should be installed and appropriately anchored where riprap is to be placed. The geotextile will help to stabilize the subgrade and protect against future scour. The geotextile will also prevent the migration of soils from the subgrade into the riprap and will minimize plant growth through the riprap.

This mitigation approach will require approximately two days to execute, excluding the planning and preparation time prior to field work. There are no maintenance activities associated with this approach.

The total estimated cost of mitigating erosion feature NASO DNA 01 is \$9,200. This estimate includes planning and construction costs.

6.2.2 NASO DNA 02

Although some minor erosion is occurring along this section of shoreline at Lake Christine, no significant erosion or downstream impacts were observed in this area and there are no signs of collapse or sloughing along the embankment. It is recommended that this area be monitored annually by conducting a visual survey for erosion to determine if additional erosion control measures are required.

The total estimated cost of addressing erosion feature NASO DNA 02 is \$950 per year for monitoring.

6.2.3 NASO DNA 03

Difficulty was encountered in assessing the condition of the culvert at NASO DNA 03 due to the collapsed embankment material obscuring direct inspection, but it is assumed that some degree of blockage is present. The size and construction details associated with the existing culvert are unknown. In addition to blockage concerns, the stability and future use of the overlaying unpaved roadway is a concern, as erosion is likely to continue in this area.

The first step would be to clear the area adjacent to and within the culvert and dispose the material in an on-site (preferred) or off-site landfill. This will facilitate inspection of the culvert

so that an accurate assessment can be made. A temporary measure to mitigate erosion until further action can be determined is to place crushed stone along the section of road crossing over the culvert. The crushed stone should be underlain by geotextile filter fabric. The approach would require a backhoe loader or similar equipment.

This mitigation approach will require approximately two days to execute, excluding the planning and preparation time prior to field work. There are no maintenance activities associated with this approach.

The total estimated cost of removing overlying debris and installing the temporary measure for the roadway at NASO DNA 03 is \$6,900. This estimate includes planning and construction costs. Once debris is removed and the current status of the erosion feature can be evaluated, additional recommendations may be required to mitigate the erosion.

6.3 NALFF

A total of three erosion features, designated as NALFF 01 through NALFF 03, were identified during site assessment activities at NALFF and presented in Section 5.3 of this report. The following subsections discuss SEE's recommendations for addressing these erosion occurrences. Estimated costs are provided for each recommended approach. The documentation for all the NALFF costs is provided in Appendix C.

6.3.1 NALFF 01

Significant erosion exists at erosion feature NALFF 01. Erosion of this scale can be indicative of larger problems, such as inadequate channel or culvert capacity and changes in upstream conditions that affect high flow conditions. For larger scale erosion such as this, it is recommended that peak flow volumes be reevaluated prior to mitigation to ensure that proper design options are evaluated.

The recommended approach to mitigating erosion feature NALFF 01 is to utilize the existing eroded area as a catchment basin by regrading the impacted area and lining it with riprap. Removal of the debris from the culvert inlet will also be required as a part of mitigation. This approach would minimize mitigation costs by eliminating the need to import fill material that would be required to restore the area to its original condition. Also, restoring the area to its original condition with soil would increase the likelihood of the same erosion recurring.

The catchment basin upstream of the culvert will provide additional capacity to retain and temporarily store peak flow volumes, as well as provide energy dissipation that will reduce erosion potential downstream. The catchment basin would have the added benefit of acting as a small sedimentation pond by capturing any sediment or debris prior to entering the culvert and preventing sediment transport downstream.

Prior to initiating and land disturbing activities, a temporary silt fence will be placed around the eroded area and any areas disturbed by excavation. The activities associated with creating the catchment basin include cutting back the steeply sloped southwestern streambank and regrading the area to the extent necessary to provide uniform slopes. The excess material generated from cutting back the slopes could be used to restore the equally steep slopes along the northeastern

7 BEST MANAGEMENT PRACTICES

Best Management Practices (BMPs) are devices, systems, and procedures that reduce or eliminate pollutants and sediment from being released into the environment, particularly surface water features. BMPs generally fall into two categories: 1) physical devices or structures that involve construction, landscaping, and agricultural practices; and 2) systems and procedures that include stormwater management, training, regular monitoring, and natural resources management.

7.1 CONSTRUCTION

Uncontrolled stormwater runoff from construction sites can significantly impact rivers, lakes and estuaries. Sediment in water bodies from construction sites can transport pollutants that have a high affinity through adsorption on soil particles, reduce the amount of sunlight reaching aquatic plants, and smother aquatic habitats and fish spawning areas. Stormwater Management Control at construction sites is generally viewed as temporary erosion and sediment (E&S) control measures that provide benefit during the construction phase. Effective stormwater runoff control can be achieved through BMPs that consider future site usage, growth, inspection, and maintenance of the stormwater drainage controls implemented at the site. BMPs at construction sites can be implemented prior to construction activities, during construction activities, after following completion of construction activities as discussed below.

7.1.1 Pre-Construction BMPs

Construction activities that potential release sediment to streams are required to comply with federal National Pollutant Discharge Elimination System (NPDES) construction site stormwater regulations. These regulations include developing SWPPPs and preparing erosion and sediment control plans (ESCPs). The VA ESC Handbook requires an erosion and sediment control plan for all projects where the area of disturbed soil or vegetation exceeds 10,000 SF. In some cases, it may be good practice to prepare an ESCP for areas less than 10,000 SF. Such areas include: sites with steep slopes, areas that will be denuded for extended periods of time, and riparian areas. Due to the of the proposed repairs in this report to surface water, E&S controls are included for areas where land disturbance is proposed. Good construction management is as important as the physical BMPs. The following are management considerations that are recommended prior to construction:

- Include E&S controls as an agenda item during the pre-construction meeting;
- Sequence construction activities so that no area remains exposed for unnecessarily long periods of time;
- Consider the time of year: be prepared for thunderstorms, use straw mulch during poor germination periods;
- Limit land disturbance to only those that need to be disturbed and barricade vegetated areas that are not to be disturbed since construction workers tend to drive on and use more area than is required; and
- Designate one individual to be responsible for implementing E&S measures.

7.1.2 Construction Activities

Two general types of E&S controls that can be implemented during the construction phase of projects: structural and vegetative controls. A complete description of all available E&S controls is beyond the scope of this project but the structural controls recommended for NASO, NALFF, NASO DNA, and NSA NWA include: sediment barriers such as silt fencing; riprap; installing new culverts, retaining walls, excavation and filling; regrading to reduce slope; catchment basins, and in-stream sediment barriers such as check dams. The selection of the most appropriate controls is highly site-specific and needs to be evaluated for each erosion feature. The vegetative controls consist of seeding, over-seeding, sodding, soil stabilization blankets, and landscaping, which also need to be evaluated for each erosion feature. Most erosion control measures utilize a combination of structural and vegetative controls.

7.1.3 Post-Construction Activities:

Adequate BMP performance requires not only proper installation, but also regular maintenance and inspection. Maintenance needs are best determined by a self-inspection program since local agencies require advance notice to schedule an inspection. Stormwater control BMPs require regular inspections to ensure their effectiveness, and many permitting authorities require self-inspection for construction projects. Three types of BMP inspections can be performed: routine inspections, inspections performed before rain events, and inspections performed after rain events.

Routine inspections are an integral part of regular maintenance activities, such as debris removal, repair, and replacement necessary to ensure the integrity and effectiveness of BMPs. Construction site activities can damage BMPs. Earthmoving equipment, for example, can easily dislodge an entrenched silt fence. Routine inspection and maintenance minimizes the work required to prepare a site before a rain event.

After a rain event, prepare the site for the next rain event. Typically within 48 hours after a rain event, inspect, clean, and repair the site's BMPs. To prevent health and safety hazards, remove mud in traffic areas and remove mosquito-breeding standing water. Clean mud and debris from silt fences and other BMPs. Clogged BMP structures will not prevent sediment releases during subsequent rain events, so the contractor needs to clean, repair, or replace them as quickly as possible.

7.2 TRAINING

One of the most important factors in determining whether BMPs are properly installed and maintained is knowledge and experience of the contractor implementing and inspecting them. To ensure a high level of expertise, many naval facilities require formal certification for on-site contractors. These certified private contractors can then be used to lessen the community's inspection burden.

Any contractor who wishes to construct a BMP involving a land-disturbing activity in Virginia must complete the training and pass an exam as part of the *Responsible Land Disturber Certificate of Competence Program* (VDCR n.d.). This program was established through revisions to the VA ESC Law (VA Code of Regulations 1988). The VDCR administers this program which became effective in July 2001. The code states that any person responsible for

implementing the E&S plan must provide the name of an individual holding an RLD Certificate who will be in charge of and responsible for carrying out a regulated "land-disturbing activity."

7.3 LANDSCAPING

Proper landscaping practices help stabilize disturbed areas, minimize sediment transport from stormwater, and improve the overall aesthetics of a stormwater BMP. Landscaped areas can provide significant reductions in sediment transport from developed sites through biological uptake of nutrients, sediment trapping, filtering, and infiltration.

7.3.1 Landscaping Practices

The sites for this project are located primarily in riparian zones that experience both wet and dry soil conditions and periodic inundation. The vegetation in riparian zones serves the following purposes:

- reduce re-suspension of newly deposited sediments;
- prevent erosion; and
- provide habitat and food for wildlife,

The following are recommended landscaping practices at NASO, NALFF, NASO DNA, and NSA NWA to help prevent occurrence of future erosion:

- Do not mow vegetation within 5 feet of the surface water edge. Where there is a definite embankment, the 5 feet buffer starts from the top of the embankment and extends away from the channel.
- Do not mow vegetation too short. This will prevent it from drying or burning out, which can cause bare spots.
- Follow the instructions for adding fertilizer and other soil amendments in the applicable landscaping plan or design document so that the addition of phosphorous, nitrogen and other chemicals to the land surface are minimized.
- If fertilizer is needed, apply 10-20-10 fertilizer at a rate of 500 pounds per acre or 12 pounds per 1,000 SF.

7.3.2 Plants for Erosion Control

Plants selected for a stormwater BMP must tolerate stresses such as pollutants, variable soil types and soil moisture fluctuations, climate, and topography. When selecting plants, native plant species should always be used. Non-native plants require more care to adapt to the hydrology, climate, exposure, soil, or other conditions. Also, some non-native plants can become invasive, especially those used for stabilization, and may ultimately choke out the native plant population.

The placement of trees and larger shrubbery on an embankment is discouraged. The root system of large trees and shrubs can threaten the structural integrity of the embankment and possibly cause its failure. The side slopes of BMPs are usually compacted during the construction process to ensure stability and the density of these compacted soils is often such that plant roots cannot

penetrate to an adequate depth, leading to premature mortality or loss of vigor. In addition, planting trees will take from several years to a decade before any benefits are achieved.

Technical Bulletin No. 4 (VDCR 2003) identifies permanent seeding specifications for new plantings in Coastal Plain areas, such Virginia Beach, VA. For low-maintenance areas with a steep slope, the Bulletin recommends the following:

<u>SPECIES</u>	<u>APPLICATION RATES (lbs/acre)</u>
Tall Fescue	93–108
Bermudagrass	0-15
Red Top Grass or Creeping Red Fescue	2
Seasonal Nurse Crop	20
Sericea Lespedeza	20

The seed mixture recommended in section 6 conforms to the species and rates shown above. Other types of seed mixes may also be appropriate for coastal areas in Virginia. Although the seed mixture is important, it is also important that the plants be naturally occurring in coastal Virginia and that they be low maintenance and durable.

The success of any landscape plan depends on the selection of the proper specifications that are subsequently implemented by the contractor. The specifications should include procedures for installing the plants. They should also provide details for the steps to be taken before and after installation, such as any special instructions for the preparation for planting, fertilization, and watering requirements. Any seasonal requirements for installation should also be specified.

A maintenance schedule should be provided in the project plans and/or specifications. This is particularly important for BMPs that have a vegetative component that is integral to the pollutant removal efficiency. The schedule should include guidance regarding methods, frequency, and time of year for landscape maintenance and fertilization. Specific plant communities may require different levels of maintenance. Upland and floodplain terrace areas require very little maintenance, while aquatic or emergent vegetation may need periodic thinning or reinforcement plantings. After the first growing season it should be obvious if reinforcement plantings are needed. If they are, reinforcement plantings should be installed at the onset of the second growing season after construction (VDCR 2012).

7.4 AGRICULTURAL PRACTICES

The VDCR, U.S. Department of Agriculture, and other water conversation partners spend a large portion of their time and budgets installing, promoting and tracking agricultural BMPs. These include practices to control cropland runoff, animal waste dispersal, streambank erosion, improper use of fertilizers and pesticides, and other non-point source pollutant reduction actions. This is accomplished by constructing control devices such as riparian buffers, diversions, grass buffer strips, and chemical and fertilizer handling facilities. BMPs also include activities such as rotational grazing, planting of cover crops, practicing integrated pest management, nutrient management plan implementation, and other similar proven actions.

SEE recommends the following agricultural BMPs for NASO, NALFF and NSA NWA:

- Maintain a 5 foot buffer vegetation strip between planted crop areas and any stream embankment, ditch, channel, pond, or other surface water features. Do not mow the vegetation strip but allow the vegetation to reach maximum height.
- Construct feeder drainage ditches that are perpendicular to the direction of runoff rather than in the same direction as runoff.
- Maintain access roads in the agricultural fields so ruts do not develop associated with vehicle traffic.
- Follow the instructions for adding chemicals, fertilizer, and other soil amendments in the applicable landscaping plan or design document.

7.5 STORMWATER MANAGEMENT

One of the first considerations in selecting a stormwater BMP is the functional goal of the BMP. In general, stormwater BMPs can be categorized into water quality (sediment and pollution control) and water quantity (stream channel erosion and flooding) BMPs. The use of some BMPs is limited by site or watershed feasibility factors such as environmental impacts, drainage area or watershed size, and topographic constraints. The BMPs designed for water quality control provide varying levels of pollutant removal and are suited for specific development densities.

The decision making process of choosing a stormwater BMP must weigh the goals of the proposed activity against the limiting site feasibility factors of the proposed site or BMP location. The limiting site feasibility factors include:

- Topographic and geologic constraints;
- Contributing drainage area size;
- Environmental impacts; and
- Access for maintenance.

The possible stormwater management requirements that influence BMP selection include:

- Stormwater quality, stream channel erosion, flooding, and environmental mitigation;
- Multiple discharge points;
- Pollutant removal capability; and
- Performance-based versus technology-based water quality criteria.

7.6 NATURAL RESOURCE MANAGEMENT

Successful implementation of a watershed management plan will also depend on the ability to obtain the appropriate permits from state and federal agencies. An inventory of natural resource features in the watershed will promote a BMP development approach that minimizes or avoids impacts on environmental resources to the maximum extent practicable. Natural resource features to be considered prior to implementing BMPs depend on the characteristics of the watershed being studied and could include:

- Wetlands
- Floodplains
- Stream corridors and greenways
- Steep slopes
- Erodible soils
- Rare and endangered species
- Sensitive habitats
- Fish and wildlife resources
- Recreational areas
- Sources of water supply

Although all of the above resources apply to NASO, NALFF, NASO DNA, and NSA-NWA to some extent; the following natural resources should be carefully considered prior to implementing BMPs.

Wetlands. Protecting the natural functions of wetlands is a critical element of the site development process and watershed management planning. Wetlands provide unique habitats for both plants and wildlife, including many threatened and endangered species. Some BMPs, such as check dams, can retain more water in streams and could negatively impact down-stream wetlands by preventing water from reaching the normally saturated areas. For the repair projects recommended by this report, only the erosion areas associated with the Chesapeake City Channel at NALFF have a recommendation for the installation of check dams and there are no wetlands near that channel.

Floodplains and Stream Corridors. Floodplains and stream corridors include waterways and adjacent riparian lands that may be subject to flooding. Natural waterways provide habitat for fish, aquatic plants, and benthic (bottom dwelling) organisms. Vegetated riparian land adjacent to streams stabilize the stream bank; filter pollutants from storms and floods; and provide habitats for a variety of amphibians, aquatic birds, and mammals that depend on the proximity to water for their life functions. A riparian buffer should be preserved or created along the banks of streams, where possible.

Steep Slopes. Steep slopes, such as those on steam embankments, cause instability of the soil on the slopes. High runoff velocities from exposed steep slopes could result in destructive and unsightly erosion, denuded slopes that may be difficult to revegetate, and sediment deposition in sensitive areas both on and off the site. Stabilizing vegetation should be protected to the maximum extent practicable and disturbed areas should be immediately revegetated. Maintenance or revegetated areas, including removal of debris and mowing of non-slope areas is critical to the long-term growth and propagation of the planted vegetation. Some of the recommendations in this report directly address steep slopes by recommending reconstruction to a 3:1 (horizontal to vertical) slope.

Fish and Wildlife Resources. In accordance with Navy Instruction 5090.1C, installations must improve the quantity, function, sustainable productivity, and distribution of aquatic resources for increased recreational fishing opportunities by restoring degraded habitat, fostering conservation, and providing access to and awareness of opportunities for recreational fishing. Although hunting is a significant activity at NASO, hunting does not impact water quality by erosion.

There are no water bodies at NALF Fentress managed for recreational fishing. Oceana Pond at NASO is currently the only water body at NASO managed for recreational fishing. Freshwater fishing is permitted at Lake Tecumseh, Redwing Lake, and Sadler Pond at DNA. Fishing is also allowed in the ditches that drain DNA. Appropriate state licenses and a base permit for freshwater fishing are required for fishing at DNA.

Although three recreational fishing ponds were excavated during the 1960s at NSA NWA, there are no authorized fishing lakes at NSA NWA. Past fisheries assessments of Lunker Lake suggest that the pond is too small, steep-sided, and lacks shallow spawning grounds needed to support a self-sustaining, balanced fish population and that extensive reconstruction would be required to establish a fishing program (USFWS 1987).

Recreational Areas. An inventory of recreational areas and sources of water supply will also facilitate, and in some cases mandate, the goals of the watershed. This information will also be important in the selection of models that would be needed to identify sources of pollution, understand the hydrologic and hydraulic characteristics of the watershed, and evaluate alternatives to meet the watershed goals and manage water quality.

Types of outdoor recreation available at NSA NWA include hunting, fishing, picnicking, bird watching, hiking, jogging, and camping. The MWR at NSA NWA administers a number of these activities, whereas the fishing, hunting, and environmental awareness programs are administered as part of the regional natural resources program under the Regional Environmental Group. Fishing is the recreational activity most impacted by erosion due to sedimentation and should be a criterion in identifying the appropriate BMP for an area.

1 Introduction

The purpose of this work was to collect and analyze baseline forest inventory data associated with Naval Air Station Oceana-Dam Neck Annex (DNA) in Virginia Beach, Virginia. Data were collected at this site between March 1 and May 30, 2014. Although the forest resource at DNA had not been previously inventoried at the stand level, geographic information system (GIS) polygons for broad vegetation cover types were classified and used as the basis for delineating stands for forest management purposes. A detailed methodology of data collection and analytical methods is provided below. Higher level summary data are provided in the body of the report. Additionally, a more detailed summary and raw data are described in the body and provided in full throughout attached appendices.

2 Methods

2.1 Forest Inventory Methodology

Using the existing ortho-photography provided by the United States Navy (Navy) (photograph dates: DNA 03/2011), DNA stand boundaries were delineated from ortho-photographic interpretation and from field observations using ArcGIS. Data are summarized at multiple aggregated levels, including the entire facility (installation), cover type, and stand.

- In 2014, the field crew visited every stand delineated at DNA (**Appendix A, “DNA Forest Stands”** map). Refer to **Appendix B** (Table B-1) for notes on the ‘forest_stand_area’ feature class in the geodatabase (prior to updating) and Table B-2 for description of all fields in the ‘DNA_Stands’ feature class.
- After a review of existing forest classification maps and a preliminary cruise layout and design, a timber cruise was made by a two-person field crew¹ in each stand to acquire the forest information.
- Standard forest mensuration criteria and sampling techniques were used as the foundation for developing the 2014 Forest Inventory.
 - The plot layout was designed using a double-sampling method with more intensive sampling at every tenth plot.
 - A 20 basal area factor (BAF) prism was used when average tree diameter at breast height (DBH) was greater than 10 inches, and a 10 BAF prism when the average tree DBH was less than 10 inches.
 - Cruise points were equally distributed throughout each stand. At each variable radius prism plot, every tree was identified to species, measured for DBH, and product data collected (such as pulpwood, sawlog, and chip-n-saw).
 - At the intensively sampled plots, the field crew measured the height (total height and merchantable heights) of all trees determined to be within the plot using a laser hypsometer.
- Site index values were generated empirically based on tree height, tree DBH, and tree age for a representative dominant species (generally loblolly pine, but hardwood species were used as appropriate). See **Section 2.2** for analytical methods used to calculate height and volume estimates. **Appendix C** presents geographically appropriate site index curve figures for loblolly pine and sweetgum for management reference.
- Prior measurements were not available at this installation to use in estimating growth rates. Stand-level estimates of growth rates were made by using the inventory data collected in a peer-reviewed, regionally specific forest growth and yield model calibrated to local conditions. A detailed explanation of this process is provided in **Section 2.2**.
- Fuel moisture and fuel load assessments were conducted at the intensive sampling plots. **Section 2.3** provides detailed description of the method used. The additional tree and stand data that were collected on the

¹ Gary Roller and Travis Kay-Rugen from Spatial Informatics Group.

intensively sampled plots were used for developing statistical relationships between tree heights, DBH, and tree species for the purpose of estimating commercial volumes.

- **Appendix A ('DNA Forest Stands')** shows the final layout of sampling plots for DNA. The plots were established to allow at least 100 meters (m) between sampling locations. **Table 1** lists a summary of the inventoried sample plots.
 - The layout represents an approximate location of the variable radius plot center as the exact location may have been shifted to account for stand edges created by roads or other features such as water bodies.
 - The number of variable radius plots sampled was adjusted from the original estimate based on field reconnaissance.
 - Reasons for plot elimination included location no longer forested, location was too close to a stand boundary and was unable to be relocated.
 - Larger stands that were homogenous also had plot sample size reduced if the interim statistical analyses showed less than a 10 percent error around the mean for key variables such as basal area and mean DBH at the 90 percent confidence interval.
 - Field data were recorded electronically on a hand-held device. Copies of raw data are included in tabular form in **Appendix D**. Summaries of all the codes and abbreviations used in the tables and appendices are in **Appendix E**. Fuel plot photos (four at each intensively sampled plot) are included in **Appendix F** (no other photo data was collected in the field).

TABLE 1
Summary of Inventoried Forested Acres, Stands, and Variable Radius Sample Plots

Location	# of Stands	# of Variable Radius Sample Plots	Total Forest Acres (from GIS)
DNA	32 ²	261	710

2.2 Calculation of Height, Volume, and Summary Statistics for Variables of Interest

Merchantable Height

Merchantable height, rather than total bole length to particular top diameter, was used to estimate merchantable volume.

- **Sawlog-diameter trees (14-inch DBH class and greater):** The Richards model (Yaussey and Dale 1991) of the form was used:

$$\text{Merchantable Sawlog Height} = b_1 SI^{b_2} (1 - e^{(b_3(DBH-TD))}) + 17.5$$

Where

SI = Site Index

DBH = outside bark diameter at breast height

TD = top diameter

The model exhibited the best performance when fit separately to species of excurrent and decurrent growth habit and included factors such as the inventory's minimum merchantability standards for log length.

² While the DNA geodatabase provided had polygons roughly corresponding to various natural areas in the 'forest_stand_area' feature class, they were not accompanied by a prior comprehensive forest management plan. This, along with changes in forest area and type due to natural disturbances or human processes, explains any variation from prior estimates of forested area and number of stands. See Section 2.3.2, sub-section Feature Update and Projection Procedures, for a detailed explanation on the stand boundary delineation process.

- **Pulpwood and Chip-N-Saw Diameter Trees (6- to 12-inch DBH classes):** This class was best predicted by total height, using an equation of the form:

$$\text{Merchantable pulp/CNS height} = \frac{b_1 e^{(b_2 + b_3 \cdot THT)}}{1 + e^{(b_2 + b_3 \cdot THT)}}$$

Where

THT = Total height (Bolker 2008)

- **Sawtimber and Chip-N-Saw Trees:** Once total sawtimber height in feet from the ground was estimated, a 1-foot stump was deducted, and after accounting for a minimum of one 16-foot log, upper log merchandising was applied to mimic a logger's bucking decisions, maximizing log lengths in 2-foot increments (one-eighth of log) with 6-inch trim for each log.
- **Pulpwood:** The number of full 8-foot sticks in each tree was estimated from the calculated merchantable height, less a 1-foot stump. Volume in cords was calculated following the volume methods outlined below.

Board-Foot Volume

Once merchantable height and DBH was known, board-foot volume of sawlog and chip-n-saw trees could be calculated. The appropriate log rule was selected based on the species and product. A formulation of Mesavage and Girard's form class tables (Wiant and Castaneda 1977) was used to calculate board-foot volume, in the appropriate log rule, in form class 78. To be consistent with the prior inventory (conducted in 1997) on nearby installations, form class 78 was used to calculate hardwood sawlog board-foot volume, and form class 80 used to calculate softwood sawlog and chip-n-saw board-foot volume. The estimate of board-foot volume was adjusted upward by 3 percent for each deviation above form class 78 (Avery and Burkhardt 2002) as necessary for softwood species. This is an acceptable method when used for a relatively narrow range of form classes, as in this case (Brooks and Goerlich 2000).

Weight

To calculate the weight of wood in the merchantable portions of the trees, it was necessary to first tabulate cubic volume. Equations developed by Clark et al. (1991) were used to estimate the inside-bark volume in cubic feet (ft³) between a 1-foot stump and the tree's merchantable height, and were corroborated using the NVEL (Wang 2013). Using values provided by Miles and Smith (2009), the volume of bark was calculated and added to the volume of wood. This volume was used to calculate the number of cords, using a conversion rate of 80 ft³ of solid wood and bark to each cord. Miles and Smith (2009) also provided coefficients for calculating the green weight of wood and bark from cubic volume.

Inventory Data

Methods consistent with variable radius point double sampling where the measure plots are a subset of the count plots were used to summarize the inventory data.

- Horvitz-Thompson estimators were used to summarize non-volume and non-weight variables (such as basal area and trees per acre).
- Ratio of means (volume/weight to basal area) estimators were used to summarize volume and weight.
- Variance and sampling error for volume and weight variables was calculated using the variance of residuals method (Gregoire and Valentine 2008), and cross-checked using the covariance method.
- Small differences in volume and weight totals across categories were ignored, as non-additivity across subcategories is a feature of ratio estimators (Oderwald 1994).
- Quadratic mean diameter was estimated from stand, compartment, and forest type total basal area and trees per acre.

- Total height was estimated using non-linear regression of height on DBH from observations at the measure plots. Lorey's mean (basal-area weighted) height was calculated using the trees selected by variable radius sampling (Husch et al. 2003).
- Site index values were generated empirically based on tree height (as calculated above), tree DBH, and tree age for a representative dominant species (generally loblolly pine, but hardwood species were used as appropriate) and were calculated from coefficients presented in Carmean et al. (1989, p. 125). **Appendix C** presents geographically appropriate site index curve figures for loblolly pine and sweetgum for management reference.

Market Value

Market values were applied to sawtimber and chip-n-saw products using volume (board-foot) estimates and average stumpage prices in the appropriate log rule, for the appropriate region. Pulpwood prices were applied to weighted estimates of pulpwood products, again using average values for the appropriate region. All prices were obtained from the *Timber Mart-South 2nd Quarter, 2014* publication of Virginia stumpage prices, reported for Region 2. Pine sawtimber prices were applied to all species of softwood sawtimber, and pine chip-n-saw prices were applied to all species of softwood chip-n-saw timber. Oak sawtimber prices were applied to all species of oak sawtimber, and mixed hardwood sawtimber prices were applied to all other species of hardwood sawtimber. Pine pulpwood prices, by ton, were applied to the weight estimates of softwood pulpwood, and hardwood pulpwood prices were applied to estimates of hardwood pulpwood in a similar fashion.

Growth Rates

Unlike other nearby installations, prior inventory data were unavailable to use as a baseline for estimating forest growth. Thus, the Forest Vegetation Simulator Southern Variant (FVS-SN), a peer-reviewed model using regionally calibrated growth models that cover eastern Virginia, was used to estimate stand growth over 10 years. The model was calibrated to local conditions using plot-specific information, and model results were evaluated against the United States Forest Service's Forest Inventory and Analysis databases to ensure growth rates were within the range of local observations.

The inventory data was entered into the model and, after calibration as described above, "grown forward" for 10 years in the model. The model accounts for various factors such as site productivity, stand density, and species interaction. The change in quadratic mean stand diameter was compared at the time of inventory to the value modeled 10 years later using the formula:

$$Growth (\%) = \frac{V_2 - V_1}{n * V_1}$$

Where

V_2 = the measurement at the end of the period of interest

V_1 = the measurement at the beginning of the period

n = the number of years in the period of interest

The growth increment for the trees in these stands projected by the model was then used to estimate stand-level growth rates for each stand at DNA.

2.3 Fuel Moisture and Fuel Loading Assessment Methods

2.3.1 Fuel Loading Assessment

Surface fuel loading was quantified using a combination of field-based fuel transects and *Photograph Series Guides*.

Field Based Transects

Surface fuel loading was assessed on two random azimuth 11.3 m transects at the intensive sampling plots using the line-intercept method (van Wagner 1968; Brown 1974). For each transect, 1-hour (0–0.64 centimeter [cm]) and 10-hour (0.64–2.54 cm) fuels were sampled from 0 to 2 m, 100-hour (2.54–7.62 cm) fuels from 0–3 m, and

1,000-hour (greater than 7.62 cm) and larger fuels from 0 to 11.3 m on each transect. Duff and litter depth in cm were measured at 3 m and 10 m on each transect. Fuel depth (cm) was measured at two points along each transect (Stephens and Moghaddas 2005). From these measurements, surface and ground fuel loads were calculated using appropriate equations using the Brown's Planer Intercept Method (Brown 1974). Fuel loading data were summarized by forest cover type and stand in English units with 90 percent confidence intervals.

Plot Photograph Series

On each intensively sampled plot, the dominant fuel model (Scott and Burgan 2005) was classified using the appropriate *Photograph Series Guides* for the vegetation types present (Ottmar et al. 2000, 2003). The *Photograph Series Guides* allow the user to compare field conditions and field photographs with a systematic visual guide to determine the fuel type at a given plot. Plot photographs were used to help identify fuel types not represented within the *Photograph Series Guides*, if necessary. Four high-quality digital photographs were taken at each intensively sampled plot (one in each of the cardinal directions from plot center). The plot locations are identified with each photograph and are provided electronically in **Appendix F**.

Fuel Moisture Assessments

Fuel moistures were quantified using archived weather streams from local remote access weather stations (RAWS) using the Fire Family Plus Program (United States Department of Agriculture [USDA] 2009; Main et al. 1990). Three RAWS stations are within the vicinity of the inventory area (Mesowest 2014), which allowed for detailed fuel moisture calculations for several fuel classes from a broad data source. The three nearest RAWS with archived fuel moisture data are Back Bay, Virginia (Station Number 449905); Great Dismal Swamp NWR, Virginia (Station Number 449801); and Elizabeth City, North Carolina (Station Number 311503). Each of these RAWS is approximately 50 kilometers (km) or less from the project areas (**Table 2**). These stations were identified from a RAWS location maps (Desert Research Institute 2014) as well as other GIS data from Mesowest (2014). Typical data collected and used from RAWS stations include wind speed and direction, precipitation, air temperature, relative humidity, and fuel moisture. The full range of available data for each station was downloaded using the Kansas City Fire Access Software web portal (KCFAST 2014). Station metadata and weather data were imported into a database using Fire Family Plus version 4.0 (Main et al. 1990).

The climatology report feature of Fire Family Plus was used to create summary statistics and graphs for daily and monthly 1-hour, 10-hour, 100-hour, 1,000-hour, live woody, and herbaceous fuel moistures. Data from each station were then imported into a separate Microsoft Excel spreadsheet. The fire weather conditions specified as graphing thresholds in Fire Family Plus were 90th percentile (only 10 percent of values are lower) and 97.5th percentile (only 3 percent of values are lower). Outputs were saved as image files (.jpg) and presented in **Appendix G**. In addition to data summarized from each station listed above, a special interest group was created in Fire Family Plus that combines weather data from all three stations. The data for this unique fourth RAWS were summarized in the same way described above.

This historical fuel moisture data can be used in conjunction with real time RAWS data to assess period of potential high fire danger as well plan prescribed burn and other vegetation management activities.

- Real-time data streamed from RAWS stations can be viewed via the Real Time Observation and Monitor Network "ROMAN" (<http://raws.wrh.noaa.gov/roman/>).
- Detailed daily weather forecasts for the Virginia Beach area, including DNA, can be found here: (<http://forecast.weather.gov/>).
- The most up-to-date trends from the RAWS stations, including forecasts, 7-day, and monthly trends, and other data can be viewed at the links provided for each station in **Table 2**. Historical data can be downloaded here (<https://fam.nwcg.gov/fam-web/kcfast/html/wxhmenu.htm>) by entering the Station Identification Number provided in **Table 2**.

All of these data sources can be used in conjunction with long-term and recent weather trends to determine potential windows for implementation of various vegetation management activities.

2.3.2 Geodatabase Development and Management

Geodatabase File System

A template geodatabase and documentation were provided on December 16, 2014, by the GIS POC and were used as the basis for determining which database feature classes and tables could be updated. This report includes two ESRI ArcGIS file geodatabases as follows.

- **'Forest_Inventory_Stands_Compliant.gdb'**, adheres to the United States Navy SDSFIE 3.01 Data Model. As appropriate, previous geographic and tabular data from the prior cruises were updated, and data from the data collection and analysis components of this project were loaded into the feature classes below. The updated compliant data can be linked to the supplemental data described below using the 'Linking Attribute Keys', if desired. Detailed information on the attribute fields used to link field data with data in the geodatabase, and on the attribute tables in general and associated attribute fields that were updated are provided in **Appendix B**, Tables B-2 through B-7. The compliant feature classes within the NaturalResources feature dataset are as follows:
 - ForestStand – Navy-specified feature class containing stand polygons for DNA stands created for the 2014 inventory, and the specified fields (see Table B-2). Linking Attribute Key: forestStandIDPK.
 - NaturalResourceSurveyP - Navy-specified feature class containing approximate inventory point locations from the 2014 inventory for the DNA installation, and specified fields (Table B-3). Linking Attribute Key: naturalResourceSurveyIDPK.

Note that the "dataTableNames" fields were not populated because of the abundance of additional external noncompliant feature classes and tabular data as described below.

- **'Forest_Inventory_Stands.gdb'**, contains additional geographic and tabular data as was requested in the scope of work, but which did not have a specific placeholder within the Navy SDSFIE 3.01 data model (that is, feature class, table, or field). The tables and brief descriptions below outline this supplementary information and how to associate it with the existing compliant Navy feature classes, and supplemental data, using the 'Linking Attribute Keys', if desired. Additional detailed supplementary information are provided in **Appendix B**, Tables B-2 through B-7, as follows:
 - Table B-2. Crosswalk between fields in the compliant ForestStands feature class, populated with geometry and information that are relevant to the Navy-specified fields, and the SIG-supplied feature classes (DNA_Stands).
 - Table B-3. Crosswalk between fields in the compliant NaturalResourceSurveyP feature class, populated with geometry and information that are relevant to the Navy-specified fields, and the SIG-supplied feature classes (DNA_Inv_Plots).
 - Table B-4. Crosswalk between fields in the supplemental stands feature classes (DNA_Stands) that contain installation-specific geometry and data about stands from the inventory not explicitly contained in the Navy geographic data model for stands (ForestStands).
 - Table B-5. Crosswalk between fields in the supplemental plot feature classes (DNA_Inv_Plots) that contain installation-specific geometry and data about plots used in the inventory not explicitly contained in the Navy geographic data model (NaturalResourceSurveyP).
 - Table B-6. Description of supplemental tables and relationship classes provided in the noncompliant geodatabase and fields that can be used to link tabular data to geospatial data in the appropriate feature classes.
 - Table B-7. Table of additional metadata describing non-geospatial tables contained in noncompliant geodatabase.

- Feature classes in the NaturalResources feature dataset include:
 - DNA_Stands – Supplemental polygon feature classes for DNA and additional variables from the 2014 DNA forest inventory. See Table B-4 (and metadata associated with feature class) for detailed description. Linking Attribute Keys: forestStandIDPK, STAND_ID.
 - DNA_Inv_Plots – Supplemental point feature classes showing approximate locations of variable radius sample plots and fuel transect locations from the 2014 DNA forest inventory. See Table B-5 (and metadata associated with feature class) for detailed description. Linking Attribute Keys: naturalResourceSurveyIDPK, STAND_ID, PLOT_ID.
- File geodatabase tables include:
 - DNA_Point_Sample – Supplemental tables describing information about the points at which trees were sampled at DNA in the 2014 forest inventory. Linking Attribute Keys: STAND_ID, POINT_ID.
 - DNA_Tree_List – Supplemental tables containing the complete list of sampled trees and their characteristics to measure basal area and volume at DNA in the 2014 forest inventory. Linking Attribute Keys: STAND_ID, POINT_ID.
 - DNA_Site_Tree – Supplemental tables containing the complete list of sampled trees and their characteristics to measure site index at DNA in the 2014 forest inventory. Linking Attribute Keys: STAND_ID, POINT_ID.
 - DNA_Fuel_Load – Supplemental tables containing the mean fuel loading by forest type at DNA as sampled in the 2014 forest inventory. Linking Attribute Keys: Tree_Type.
 - DNA_Value_Per_Acre_By_Species – Supplemental table containing the mean dollar value per acre by species for stands at DNA as sampled during the 2014 forest inventory. Linking Attribute Keys: Std_ValID.
 - DNA_Table_Metadata – (see also Table B-7 and metadata associated with tables) Supplemental table containing detailed descriptions of the fields in each installation’s Point_Sample, Tree_List, Site_Tree, Value_Per_Acre_By_Species, and Fuel_Load tables.
- File geodatabase relationship class names include:
 - DNA_Stand_Plot – Supplemental relationship class linking the installation stand feature class and Inv_Plots tables.
 - DNA_Plot_Tree – Supplemental relationship class linking the installation Inv_Plots tables and the Tree_List tables.
 - DNA_Plot_SiteTree – Supplemental relationship class linking the installation Inv_Plots and Site_Tree tables.
 - DNA_Stand_Value – Supplemental relationship class linking the installation Stands feature classes and the Value_Per_Acre_By_Species tables.
 - DNA_Stand_Fuel_Load – Supplemental feature class linking the installation Stands feature classes and the Fuel_Load tables.

Note: For detailed descriptions of the table and relationship classes, see Table B-6.

Feature update and projection procedures

As part of the 2014 forest inventory development update, SIG personnel reviewed the available printed and digital data from DNA, and visited each stand delineated for the inventory. SIG personnel created the new boundaries of each stand. SIG personnel created the stand boundary geometry in the feature classes using field notes and available remotely sensed data (typically, 75 millimeter [mm] resolution color aerial photographs acquired in March 2011). Non-contiguous stands of similar characteristics, separated by short distances, may have

been assigned the same stand number. The existing geospatial data was provided by the GIS POC in a series of installation-specific geodatabases in WGS_1984_UTM_Zone_18N projection; the same projection required for geospatial data deliverables in the scope of work. The projection details are as follows:

Projection details for WGS_1984_UTM_Zone_18N

WKID: 32618 Authority: EPSG
 Projection: Transverse_Mercator
 False_Easting: 500000.0
 False_Northing: 0.0

 Spheroid: WGS_1984
 Semimajor Axis: 6378137.0
 Semiminor Axis: 6356752.314245179
 Inverse Flattening: 298.257223563

Point location and field data collection

The sampling scheme used a randomly established, systematic grid overlaid on the installation. To collect field data, a Microsoft Excel tool was used to generate Universal Transverse Mercator (UTM) coordinates corresponding with the corners of the grid cells. The coordinates were in UTM Zone 18N, the projection of the supplied geospatial data from the 1997 forest inventories at other Navy bases sampled for this project, and that required for the geospatial deliverables. The coordinates created by the tool are based on a cell size established to allocate the appropriate number of sample locations in the forested area of each installation to meet statistical accuracy goals. The point sample coordinates (that is, waypoint locations) were uploaded to a Garmin GPSMap 62st handheld global positioning system (GPS) unit set to use the WGS84 geographic coordinate system and UTM Zone 18N projection. That unit was used to navigate to each point in the field with an accuracy of 2 to 4 m as stated by the unit. For points that needed to be relocated because of field conditions (for example, stand boundary changed, too close to stand boundary, etc.), they were relocated a distance of up to one-half the original plot spacing in a manner to avoid edge effects and bias. The GPS was used to collect the location of the relocated plot, and no post-processing was done on the geospatial data associated with those relocated plots. Less than 10 percent of the final plots were plots that had to be relocated in this manner. Otherwise, the GPS was not used to collect geometry data that was represented in the geodatabase deliverables. The plot locations represented in the compliant and noncompliant geodatabases are thus those laid out in the original grid that were able to be located and sampled in the field, supplemented the small number of points that needed to be relocated whose location was collected by GPS.

3 DNA Inventory Summaries

3.1 Forest Resource Summary

The origin of many of the forest stands at DNA was through natural colonization of abandoned agricultural fields by pioneer species such as loblolly pine, natural succession of areas inundated with water for long periods, and to a lesser degree through direct planting. The 1997 inventory report from nearby Naval Air Station Oceana (Geo Marine 1998), noted that much of the forest resource there was already transitioning to hardwood from the early domination by loblolly pine. In the absence of forest management activity or natural disturbances, this transition is expected as species more tolerant of shade than loblolly pine become established in the understory and gradually increase in volume and importance in the stands. These species include oaks (*Quercus* spp.), sweetgum (*Liquidambar styraciflua*), and, to some degree, red maple (*Acer rubrum*). Table 3 shows the 2014 forest cover type distribution in terms of acreage and as a percent of total acreage. DNA stands have continued a transition to

a greater component of hardwood mixed with loblolly pine. In 2014, only 12 percent of the acreage has a pure loblolly pine composition and 74 percent of the acreage is hardwood dominated.

TABLE 3
DNA Forest Type Summary of Inventoried Forested Acres (Total Acreage, Percent of Total)

Forest Type	Acres	% of Total Area
Hardwood (H)	352	50%
Hardwood - Pine (HP)	173	24%
Pine (P)	87	12%
Pine - Hardwood (PH)	98	14%
Total	710	

Looking more closely at the composition of the species and commercial products (expressed by weight), the field crew found that loblolly pine makes up 32 percent of the total weight, with sweetgum, bald cypress, red oak, red maple, and other small diameter hardwoods (pulpwood) comprising the majority of the forest resource at DNA (**Table 4**). A similar relationship holds when the market value of the timber resource is considered (**Table 4**). Loblolly pine represents 52 percent of the total market value of the current timber resource of DNA.

TABLE 4
DNA Stocking class distribution by total weight (in tons) and total market value (\$)

Stock Class	Total Weight (t)	Total \$ Value
loblolly pine sawtimber	18,274	646,491
hardwood pulpwood	13,887	98,741
sweetgum sawtimber	9,099	175,558
bald cypress sawtimber	4,272	82,433
soft maple sawtimber	3,768	69,322
chip-n-saw	2,994	66,880
red oak sawtimber	1,390	35,366
laurel oak sawtimber	916	17,031
black gum sawtimber	635	9,427
softwood pulpwood	600	7,878
swamp chestnut		
oak sawtimber	208	5,289
tulip-poplar sawtimber	161	3,107
green ash sawtimber	67	1,237
unknown hardwood sawtimber	67	1,237
willow oak sawtimber	38	731

Recent evidence of silvicultural treatments was not observed on any of the stands (apart from several potential stands containing planted but sub-merchantable size trees). Generally, the stands have been allowed to develop without direct forest management interventions. As such, natural stand dynamics such as mortality through

disease, insect infestation, and competition have altered stand composition in recent years. When evaluated against typical forest stand stocking tables, the data presented below show that the absence of forest management has led to stands that are considered “overstocked” and are not being maximized for the commercial potential (including quality), particularly for the most valuable species such as loblolly pine and red oak sawtimber. The average stocking expressed in basal area is over 151 square feet per acre (ft²/ac) – which is considered fully stocked for both pine and hardwood types. Silviculture is generally employed to direct the trajectory of a stand to promote conditions that favor commercially desirable species and maximize growth rates and quality of residual trees. The development of a detailed management plan would be required to identify specific management objectives for each stand or groups of stands. The data presented here are designed to provide natural resource managers with detailed information to make management decisions regarding the timber resource.

Comprehensive data on the DNA forest inventory are provided below in a series of tables. Each table is described in detail with references to the location. For the most detailed tables, these are provided in **Appendices H through J**.

- **Summary Tables.** These tables provide a general overview of data summarizing the forestland at the installation, compartment, forest type, and stand level. Reported are average per acre and total values for variables of interest like tree count, volume, and value each by product class and species group; and at the stand level, summary variables illustrating the productivity, character, and condition of the woodland like age, area, and productivity.
 - **Table 5. Entire Forest Summary – DNA.** This table summarizes, at the installation level, basal area and number of trees; volume and weight by hardwood/softwood and product category (sawtimber, chip-n-saw, and pulpwood); and value, both per acre and for the entire installation. Total area is provided as well. Installation means and totals are based on stratification by forest type.
 - **Table 6. Forest Cover Type Summary – DNA.** This table summarizes, at the forest type level, basal area and number of trees; volume and weight by hardwood/softwood and product category (sawtimber, chip-n-saw, and pulpwood); and value, both per acre and for the entire installation.
- **Appendix H. DNA Stand Summary Table.** This table summarizes, at the stand level, basal area and number of trees; volume and weight by hardwood/softwood and product category (sawtimber, chip-n-saw, and pulpwood); and value, both per acre and for the entire installation. Additional variables describing the inherent productivity, character, and condition of the stand such as site index species, site index, growth, forest type, age, and size class are reported.
- **Appendix I. DNA Statistical Summary Table.** This table provides sampling error for overall quadratic mean diameter, and basal area, volume, and weight for hardwoods, softwoods, and product categories (sawtimber, chip-n-saw, and pulpwood). Sampling error is reported as the 90 percent confidence limit half-width expressed as a percent of the mean, for each compartment, forest type, and installation. Installation sampling error is stratified based on forest type.
- **Appendix J. DNA Stock Tables.** These tables provide information on how volume, weight, and value are distributed among various species, product classes, and tree diameter classes at the installation, compartment, forest type, and stand level.
 - **Table J-1. DNA Forest Installation Stock Tables.** These tables summarize at the installation level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2-inch DBH class, the mean number of trees per acre, mean basal area per acre (ft²/ac), mean volume per acre (cords for pulp, board-feet Doyle log rule for hardwood sawlog volume, or board-feet International 0.25-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood and bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. Installation means and totals are based on stratification by forest type, and thus vary from totals aggregated from compartment subtotals.

- **Table J-2. DNA Forest Compartment Stock Tables.** These tables summarize at the compartment level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2-inch DBH class, the mean number of trees per acre, mean basal area per acre (ft²/ac), mean volume per acre (cords for pulp, mean board-feet Doyle log rule for hardwood sawlog volume, or board-feet International 0.25-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood and bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. The total area of the compartment is also provided. No stratification is performed to arrive at means and totals at this hierarchical level.
- **Table J-3. DNA Forest Type Stock Tables.** These tables summarize at the forest type level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2-inch DBH class, the mean number of trees per acre, mean basal area per acre (ft²/ac), mean volume per acre (cords for pulp, board-feet Doyle log rule for hardwood sawlog volume, or board-feet International 0.25-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood and bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. The total area of the type contained in the installation is also provided.
- **Table J-4. DNA Forest Stand Stock Tables.** These tables summarize at the forest stand level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2-inch DBH class, the mean number of trees per acre, basal area per acre (ft²/ac), mean volume per acre (cords for pulp, board-feet Doyle log rule for hardwood sawlog volume, or board-feet International 0.25-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood and bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. The total area of the stand is also provided.

QMD is quadratic mean diameter, the diameter of the tree of average basal area

Average height is Lorey's mean height (BA-weighted height), the arithmetic average of the trees selected by variable radius point sampling. Site index (SI) values are all reported with base age of 50, and growth is calculated from Δ Mean Stand Diameter, a method more robust than counting rings on individual trees.

Size class is assigned based on majority basal area, and can take the values sawtimber, chip-n-saw, or pulpwood.

3.2 Forest Management Opportunities

Access to forest stands for management activities is quite good throughout DNA. Several areas held standing water throughout the spring inventory (March 2014), however, and access to these sites is uncertain. The site index is high throughout DNA, indicating good productivity and the potential for high growth rates. Stands with high site indices can be used to guide management priorities. **Appendix C** presents site index curves for loblolly pine appropriate to the coastal plain of Virginia (Carmean et al. 1989) that can be used to estimate maximum height growth expected based on the site indices presented in **Table 3**, **Table 4** and **Appendix H**. A number of silvicultural practices could be employed to reduce stocking density and improve the residual tree quality, particularly where high value hardwoods such as red oak are present. The maintenance of loblolly pine in future stands will require deliberate practices to regenerate this species through planting or natural regeneration in an even-aged system (such as clearcut or seed tree harvests). The fuel and moisture data presented below can also be used in decision-making regarding both the threat of high-severity wildfire and the use of prescribed fire to achieve management objectives.

3.2.1 Next Steps

1. Identify management objectives for DNA forest cover types based on forest inventory results and resource priorities.
2. Develop forest resource management plan based on specific management objectives for each forest type.
3. Evaluate role of prescribed fire as a management tool using fuel moisture and fuel loading data.
4. Implement forest resource management plan.

3.3 Fuel Moisture and Fuel Loading Summaries

3.3.1 Fuel Moisture

For each RAWS station (**Table 2**), figures presented in **Appendix G** (Figures G-1 through G-18) are shown on an annual basis, including the average, maximum, and minimum trends: 1-hour, 10-hour, 100-hour, woody, and herbaceous fuel moistures. The data across these different fuel classes over the three RAWS stations and combined data from these stations give a complete profile of fuel moisture characteristics for each facility in the Inventory Area. Data are classified to the stand level at DNA in the corresponding geodatabase created based on these data.

3.3.2 Assessment of Surface Fuel Loading

For total fuel loadings (**Table 7A** and **Table 7B**), the hardwood and hardwood-pine type generally had the lowest surface fuel loading and the pine types had the highest. Within individual fuel classes, the combined 1-, 10-, and 100-hour fuel class, which typically carries the flaming front in wildland and prescribed fires (Marshall et al. 2008), averaged 1.5 tons per acre, with the exception of the hardwood-pine type, where it was 0.8 ton per acre. The 1,000-hour rotten and sound material fuels were found at low levels across all vegetation types. The 1,000-hour sound material fuel peaked at 1.9 tons per acre in the pine-hardwood type and rotten material at 1.3 tons per acre in the pine types. Total average fuel depths were similar across all vegetation types. The average 1-, 10-, and 100-hour fuel loadings at DNA were comparable or lower than fuel loadings previously reported for loblolly (*Pinus taeda*) and shortleaf (*Pinus echinata*) pine stands that had undergone prescribed burns, which were effective at reducing fuel loads and related fire hazard (Waldrop et al. 2004; Mohr et al. 2004). While a detailed fire modeling assessment could be conducted in *FlamMap* (Finney 2006) to determine the geo-spatial distribution of the current fire hazard and risk, from the fuel loading data, it appears that current surface fuel loadings are generally low.

Table 7A
Summary of Fuel Depth, 1-, 10-, and 100-hour¹ Fuel Loadings with 90 Percent Confidence Interval by Vegetation Type - DNA

Vegetation Type	Number of Transects	Fuel Depth (Inches)	Fuel Depth-90% CI (+/-) (Inches)	1 Hour Fuel Load (Tons Per Acre)	1 Hour Fuel Load-90% CI (+/-) (Tons Per Acre)	10 Hour Fuel Load (Tons Per Acre)	10 Hour Fuel Load-90% CI (+/-) (Tons Per Acre)	100 Hour Fuel Load (Tons Per Acre)	100 Hour Fuel Load-90% CI (+/-) (Tons Per Acre)

¹Dead fuel moisture responds to ambient environmental conditions and is critical in determining fire potential. Dead fuel moistures are classed by timelag. A fuel's timelag is proportional to its diameter and is loosely defined as the time it takes a fuel particle to reach 2/3 of its way to equilibrium with its local environment, i.e. lose 66% of its current moisture content. There are four timelag classes:

1-hour: Less than 0.25 inch diameter, fine fuels that respond quickly to weather changes.

10-hour: 0.25-1 inch diameter

100-hour: 1-3 inch diameter

1,000-hour: 3-8 inch diameter.

3.4 Fuel Load Models

For each forest cover type (hardwood, hardwood-pine, pine, and pine-hardwood), a representative photo and dominant fuel load model(s) as derived from field photos for all plots in that vegetation type are shown in **Figures 1** through **4**.

FIGURE 1
Representative Hardwood Stand (H) and Dominant Fuel Models - DNA

Fuel Model Name	Fuel Model Number	Fuel Model Abbreviation	Description
Low Load Broadleaf Litter	182	TL2	The primary carrier of fire in TL2 is broadleaf litter. Spread rate is very low; flame length very low.
Moderate Load Broadleaf Litter	186	TL6	The primary carrier of fire in TL6 is moderate load broadleaf litter, less compact than TL2. Spread rate is moderate; flame length low.

Appendix A

Installation Maps

DNA Forest Stands

Forest stand types are from field work conducted from 4/2014 – 5/2014 (plot centers shown); and stand boundaries are based on field review of 1997 forest inventory stand maps and GIS review of orthophotography dated 3/2011. No compartments were identified in prior inventory/GIS data. Non-contiguous stands of similar characteristics, separated by short distances, may have the same stand number.

Stand identification codes as follows:
Compartment # - Stand # / Type Code - Size Class Code

June 9, 2015 Rev. 2
Spatial Informatics Group

□ Installation area

Forest inventory (2014) points

Plot Type

- ▲ Basal area
- Basal area/Height/Fuels

DNA Stands: Forest type

- H**ardwood: < 25% pine BA
- H**ardwood/**P**ine/: ≥25-< 50% pine BA
- P**ine/**H**ardwood/: ≥50-< 75% pine BA
- P**ine: ≥75% pine BA

Size class code	Code meaning	Stand average basal area criteria
4	sawtimber	majority of basal area in sawtimber size (dbh ≥13") trees
3	chip-n-saw	majority of basal area in chip-n-saw size (softwoods only: dbh ≥9-<13") trees
2	pulpwood	majority of basal area in pulpwood size (softwoods: dbh ≥6-<9"; hardwoods: dbh ≥6-<13") trees
1 (WL)	seedling/sapling (wildlife)	majority of basal area in trees <6" dbh

DNA Fuel Loading

Forest stand types are from field work conducted from 4/2014 – 5/2014 (plot centers shown); and stand boundaries are based on field review of 1997 forest inventory stand maps and GIS review of orthophotography dated 3/2011.

Fuel loading based on mean values for forest type. No compartments were identified in prior inventory/GIS data. Non-contiguous stands of similar characteristics, separated by short distances, may have the same stand number.

Stand identification codes as follows:

Compartment # - Stand # / Type Code - Size Class Code

- 10.8 tons/acre

Size class code	Code meaning	Stand average basal area criteria
4	sawtimber	majority of basal area in sawtimber size (dbh ≥13") trees
3	chip-n-saw	majority of basal area in chip-n-saw size (softwoods only: dbh ≥9-<13") trees
2	pulpwood	majority of basal area in pulpwood size (softwoods: dbh ≥6-<9"; hardwoods: dbh ≥6-<13") trees
1 (WL)	seedling/sapling (wildlife)	majority of basal area in trees <6" dbh

Appendix B

Geospatial Data

Table B-1. Comparison of prior polygons and new stand boundaries delineated by SIG personnel at DNA installation.

OID in geodatabase provided	Notes	New stand number
NOTE: Unlike NASO, NALFF, and NWA, DNA had no prior stands delineated as part of a comprehensive forest management plan. Prior stands were not assigned numbers; stand polygons in the GIS had only sequential ID numbers. Thus, those prior polygons' simple sequential ID number is being used as the reference in this table to allow for comparisons as were made for other installations.		
295	Most of polygon incorporated into new stand 8; small areas are now non-forest along western and northern edges.	8
296	Most of polygon incorporated into new stand 8 and a very small part into stand 9; some now mapped as non-forest.	8, 9
297	Most of polygon incorporated into new stand 9; some areas along western and northern edges now mapped as non-forest.	9
298	Most of polygon incorporated into new stand 7; some areas along western and northern edges now mapped as non-forest.	7
299	Most of polygon incorporated into new stand 7; some area along western edge now mapped as non-forest.	7
300	Northern part of polygon incorporated into stand 7, and southern parts incorporated into stand 10; some parts of the western and eastern sections are now mapped as non-forest.	7, 10
301	Most of polygon incorporated into stand 10; portions along western and southern edge now mapped as non-forest.	10
302	Polygon eliminated - non-forest	
362	Polygon eliminated - non-forest	
363	Central portion of polygon incorporated into stand 12; large sections of north and south now mapped as non-forest.	12
364	Most of polygon incorporated into stand 11; small area in the south now mapped as non-forest.	11
365	Most of polygon incorporated into stand 11; western edge now mapped as non-forest.	11
366	Most of polygon incorporated into stand 11; eastern part now mapped as non-forest.	11
367	Central portion of polygon incorporated into stand 13; western part mapped as stand 11. Northeastern and southern parts now mapped as non-forest.	11, 13
368	Small area of northern portion now part of stand 11. Small area of eastern portion incorporated into stand 14. Small areas of southern portion now mapped as stand 15. Most of central part of polygon now mapped as non-forest.	11, 14, 15
369	Almost all of polygon incorporated into stand 11. Very small portion along western edge now mapped as non-forest.	11
370	Most of polygon incorporated into stand 16. Small portions in the northerly part now mapped as non-forest.	16
371	Most of polygon incorporated into stand 17. Small areas along the western edge now mapped as non-forest.	17
372	Most of polygon incorporated into stand 16. Some area along the southern and southwestern edges now mapped as non-forest.	16
373	Polygon eliminated - non-forest	
374	Polygon eliminated - non-forest	
375	Most of polygon incorporated into stand 22. Boundaries revised significantly and central portion now mapped as non-forest.	22
376	Northern part of polygon incorporated into stand 19; eastern part incorporated into stand 21; and southern part now mapped as stand 20. Boundaries revised to reflect current edge of woodland.	19, 20, 21
377	Northern part of polygon incorporated into stand 18; much of southern and northwestern edges now mapped as non-forest.	18
378	Northern and southern parts of polygon incorporated into stand 18. Northern and central parts now mapped as non-forest.	18
379	Most of polygon incorporated into stand 18. Areas along northern and southern edges now mapped as non-forest.	18
380	Western and southern parts of this polygon now incorporated into stand 18. Majority of northeastern and central parts now mapped as non-forest.	18
381	Most of southern part of polygon incorporated into stand 31. Northwestern section now mapped as non-forest.	31
382	Polygon eliminated - non-forest	
383	Northwestern part of polygon incorporated into stand 30; eastern part incorporated into stand 32; and southwestern part into stand 31. Small areas along the northwestern, western, and southern edges now mapped as non-forest.	30, 31, 32
384	Polygon incorporated into stand 30.	30
385	Nearly all of polygon eliminated and mapped as non-forest except small area in northwestern section incorporated into stand 31.	31
386	Northern and central parts of polygon incorporated into stand 29. Southern and central sections, as well as areas along the northern edges, now mapped as non-forest.	29
387	Small portions of the northern and central parts of this polygon incorporated into stand 29; vast majority now mapped as non-forest.	29
388	Most of northern, central, and southern parts of polygon incorporated into stand 27. Large section in the northeast, and areas along the central and southern edges now mapped as non-forest.	27
389	Most of central and eastern part of polygon incorporated into stand 28. Areas along western edges now mapped as non-forest.	28
390	Polygon eliminated - non-forest	
391	Northeastern section of polygon incorporated into stand 25; southern part incorporated into stand 26; and northwestern part incorporated into stand 24. areas along the eastern, southern, and western edges now mapped as non-forest.	24, 25, 26
392	Most of polygon incorporated into stand 20; small areas along northern and northwestern edges now mapped as non-forest.	20

Table B-1 (continued). Comparison of prior stand boundaries and new stand boundaries delineated by SIG personnel at DNA installation.

OID in geodatabase provided	Notes	New stand number
393	Eastern and western parts of polygon incorporated into stand 23; southeastern edge incorporated into stand 24. Most of central part of polygon, and areas along the northeasterly and westerly edges now mapped as non-forest.	23, 24
394	Polygon eliminated - non-forest	
395, 727	These are duplicate polygons. Northeastern and southern portions incorporated into stand 9; areas along northerly edge now mapped as non-forest.	9
676	Vast majority of polygon now mapped as non-forest, except for small area in the central section of the westerly edge incorporated into stand 8.	8
677	Vast majority of polygon now mapped as non-forest, except for very small area along the southwesterly edge incorporated into stand 6.	6
678	Most of polygon incorporated into stand 6; small areas along the northern and westerly edges now mapped as non-forest.	6
679	Most of polygon incorporated into stand 7 except for small area along the northwestern edge now mapped as non-forest.	7
680	Most of polygon incorporated into stand 9 except for small areas along the western and southerly edge now mapped as non-forest.	9
709	Polygon eliminated - non-forest	
710	Northern section and parts of the edges in the central part of the polygon now mapped as stand 14. Central part of polygon now mapped as stand 15. Area in the southwestern part of polygon incorporated into stand 13. Areas along edges and in the northwestern part of polygon now mapped as non-forest.	13, 14, 15
711	Most of polygon incorporated into stand 11. Small areas along the edges in the southwestern part of the polygon are now mapped as non-forest.	11
712	Most of polygon now mapped as non-forest, except for small portions in the northern section and along the easterly edges now incorporated into stand 11.	11
713	Polygon eliminated - non-forest	
714	Northeasterly part of polygon incorporated into stand 17. Areas along the northern edges, and the western part of the polygon, are now mapped as non-forest.	17
715	Most of the eastern, southern, and western parts of the polygon incorporated into stand 14. Areas in the center of the polygon incorporated into stand 15. Areas along the eastern and southern edges now mapped as non-forest.	14, 15
716	Polygon eliminated - non-forest	
717	Northwestern part of polygon incorporated into stand 19. Small areas along the southern edges incorporated into stand 20. Most of the central part of the polygon, and a small area along the western edge now mapped as non-forest.	19, 20
718	Most of polygon incorporated into stand 18. Areas along the western, southern, and northern edges now mapped as non-forest.	18
719	Most of polygon incorporated into stand 18. Areas along the northern and westerly edge now mapped as non-forest.	18
720	Most of polygon incorporated into stand 31. Small area along the western edge now mapped as non-forest.	31
721	Most of polygon now mapped as non-forest. Small area along the northeastern edge now mapped as stand 30.	30
722	Most of polygon now mapped as stand 28. Areas along the northwestern, western, and southern edges now mapped as non-forest.	28
723	Most of polygon now mapped as non-forest. Small area along the north-central part of the western edge now mapped as stand 28. Small area along the south-central part of the western edge now mapped as stand 32.	32
724	Most of polygon incorporated into stand 28. Small areas along the northern, western, and southern edges now mapped as non-forest.	28
725	Most of the northern and central parts of polygon mapped as stand 25. Small areas along the southern and southwestern edge now mapped as stand 26. Small area in northwestern part of polygon incorporated into stand 24. Areas along the northern, northeastern, central, and northwestern edges now mapped as non-forest.	24, 25, 26
726	Most of polygon incorporated into stand 30. Areas in the central part of polygon and along the southern edges now mapped as non-forest.	30
	New stand mapped in northerly part of installation; does not overlap any part of any polygon in the previous feature class.	1
	New stand mapped in northerly part of installation; does not overlap any part of any polygon in the previous feature class.	2
	New stand mapped in northerly part of installation; does not overlap any part of any polygon in the previous feature class.	3

Table B-1 (continued). Comparison of prior stand boundaries and new stand boundaries delineated by SIG personnel at DNA installation.

OID in geodatabase provided	Notes	New stand number
	New stand mapped in northerly part of installation; does not overlap any part of any polygon in the previous feature class.	4
	New stand mapped in northerly part of installation; does not overlap any part of any polygon in the previous feature class.	5

General notes:

Unlike NASO, NALFF, and NWA, DNA had no prior stands delineated as part of a comprehensive forest management plan. Prior stands were not assigned numbers; stand polygons in the GIS had only sequential ID numbers. Thus, those prior polygons' simple sequential ID number is being used as the reference in this table to allow for comparisons as were made for other installations.

Polygon eliminated indicates that the area inside the polygon is not included in any stand delineated by the new inventory.

Area incorporated indicates some of the area inside the polygon from the old geodatabase is included in a stand delineated by the new inventory.

Area mapped as non-forest indicates that some of the area inside the polygon from the old geodatabase was not delineated as a forest stand at the time of the new inventory.

Table B-2. Crosswalk between fields in the Navy ForestStand feature class, populated with geometry and information that is relevant to the Navy-specified fields, and the SIG-supplied feature class (DNA_Stands).

Navy feature class field name	Description	Field from SIG feature classes from where information was drawn
OBJECTID	Internal feature number	—
Shape	Feature geometry	—
forestStandIDPK	Unique identifier for stand populated from prior shapefile's STAND_ID field; missing values for new stands populated using similar pattern. Non-contiguous stands of similar characteristics, separated by short distances, may have been assigned the same stand number.	STAND_ID forestStandIDPK
sdsID	Null	—
sdsFeatureName	forest stand	—
sdsFeatureDescription	Alphanumeric code describing the stand populated from prior shapefile's FEAT_DESC field. Describes the stand's compartment, stand ID number, forest type, and size class. Non-contiguous stands of similar characteristics, separated by short distances, may have been assigned the same stand number.	FEAT_DESC
sdsMetadataID	Null	—
installationID	Used to link the record to the applicable installation record. A version of this is contained within the prior data's INSTLN_ID field	INSTLN_ID (partial)
commerciallyProductive	True	—
forestCategory	Left null, the domain specified in the Navy data model required far more detailed information that was specified to be collected. A more generalized forest type can be obtained from SIG's TREE_TYPE field in the Stand feature classes.	TREE_TYPE (partial)
standID	A unique-to-installation code identifying the stand. Populated using values from prior shapefile where available. Information contained in the STAND_ID, FEAT_DESC, and STAND_NUM fields in the SIG-supplied stand feature classes. Non-contiguous stands of similar characteristics, separated by short distances, may have been assigned the same stand number.	STAND_ID (embedded) FEAT_DESC (embedded) STAND_NUM
silviculturePractice	Null	—
dataFK	Null	—
dataTable	Null	(Note: too many to populate)
forestCompartmentIDFK	A value uniquely identifying the compartment (geographic division using natural or man-made features) in which the forest stand is located. Populated from values directly obtained (when stand existed in prior shapefile) or inferred (for new stands) from prior shapefile.	FEAT_DESC (embedded) STAND_NUM (embedded) COMP_NO
conservationIDFK	Null	—
editor	Name of person who last edited the data	—
dateEdited	Date that the feature was edited from its original or previous value	—
collectionSource	Describes how the data was collected and mapped	—
locAccy	Describes the location accuracy of the data	—
metaNotes	Text supplied by SIG staff indicating when the data was most recently edited and on what the edits were based	—
GLOBALID	N/A	—
SHAPE_Length	Length of feature in internal units	—
SHAPE_Area	Area of feature in internal units	—

Table B-3. Crosswalk between fields in the Navy NaturalResourceSurveyP feature class, populated with geometry and information that is relevant to the Navy-specified fields, and the SIG-supplied feature class (DNA_Inv_Plots).

Navy feature class field name	Description	Field from SIG feature classes from where information was drawn
OBJECTID	Internal feature number	—
Shape	Feature geometry	—
naturalResourceSurveyIDPK	Unique identifier for inventory point populated using the stand's unique identifier (Navy's forestStandIDPK field, the prior/current STAND_ID field), concatenated with the plot's unique (to installation) identification number using a colon	naturalResourceSurveyIDPK
sdsID	Null	—
sdsFeatureName	forest inventory point	—
sdsFeatureDescription	Narrative describing the feature	—
sdsMetadataID	Null	—
installationID	Used to link the record to the applicable Installation record	—
dataFK	Null	—
dataTableName	Null	(Note: too many to populate)
surveyDate	Date the point was sampled	DATE_
suveyOrSampleMethod	A description of the survey or sample method used	Based on inventory design in scope of work
suveyOrSamplePurpose	A discriminator that indicates the purpose of survey or sample	Based on inventory design in scope of work
suveyYear	The year of the survey	DATE_
conservationIDFK	Null	—
editor	Name of person who last edited the data	—
dateEdited	Date that the feature was edited from its original or previous value	—
collectionSource	Describes how the data was collected and mapped	—
locAccy	Describes the location accuracy of the data	—
metaNotes	Text supplied by SIG staff indicating when the data was most recently edited and on what the edits were based	—

Table B-4. Crosswalk between fields in the supplemental stands feature classes (DNA_Stands) that contain installation-specific geometry and data about stands from the inventory not explicitly contained in Navy geographic data model for stands (ForestStand).

SIG feature class field	Description	Field from Navy feature class (ForestStand) containing similar information
OBJECTID_1	Internal feature number	—
Shape	Feature geometry	—
OBJECTID	Identifier for the stand created by software during post-processing	—
STAND_ID	Identification number for the stand; also used as the forestStandIDPK code, and when concatenated with plot numbers using a colon, is used as the naturalResourceSurveyIDPK. Non-contiguous stands of similar characteristics, separated by short distances, may have been assigned the same stand number.	forestStandIDPK
MAP_ID	Was a field contained in the prior stand dataset	—
META_ID	Was a field contained in the prior stand dataset; populated from prior data if stand was pre-existing; values of date of last edit used for new stands	—
AREA_SIZE	Was a field contained in the prior stand dataset	—
PERIM	Was a field contained in the prior stand dataset	—
FEAT_DESC	Alphanumeric code describing the stand populated from prior shapefile's FEAT_DESC field. Describes the stand's compartment, stand ID number, forest type, and size class Used as the Navy's sdsFeatureDescription value. Non-contiguous stands of similar characteristics, separated by short distances, may have been assigned the same stand number.	sdsFeatureDescription standID (partial) forestStandIDPK (partial)
USER_FLAG	Was a field contained in the prior stand dataset	—
INSTLN_ID	Was a field contained in the prior stand dataset. Used to help determine a value for the Navy's installationID field.	—
FACIL_ID	Was a field contained in the prior stand dataset	—
FOR_ACRES	Was a field contained in the prior stand dataset	—
TREE_SIZE	Code indicated the tree size class with the predominance of basal area in the stand; 4=sawlog; 3=chip-n-saw; 2=pulpwood	—
TREE_TYPE	Code indicating the forest type; P=>75% softwood BA; PH= 50-75% softwood BA; HP=25-50% softwood BA; H= <25% softwood BA. This is a very generalized forest type as compared to what the Navy would use to populate its forestCategory field.	forestCategory (partial)
BA_AC	Average basal area (square feet) of trees 6" dbh and up per acre	—
TPA	Average trees per acre	—
TOT_VALUE	Total value (USD\$) of sawlogs, chip-n-saw, and pulpwood in the stand	—
PINE_BA	Softwood basal area per acre	—
COMP_NO	Compartment number	forestCompartmentIDFK sdsFeatureDescription (partial)
FEAT_ID	Was a field contained in the prior stand dataset	—
FEAT_NAME	Was a field contained in the prior stand dataset	—
NARRATIVE	Was a field contained in the prior stand dataset	—
SERVICE_D	Was a field contained in the prior stand dataset	—
SCHEMA_SRC	Was a field contained in the prior stand dataset	—
AREA_AC	Area (acres) of the stand polygon as updated by SIG staff based on 2014 forest inventory	—
SI_SP	Site index species	—
SI50	Site index (base age 50)	—
GROWTH	Growth (%)	—
AGE	Age	—
SIZECL	Size class by predominance of basal area	—
HWBA	Hardwood basal area per acre	—
QMD	Quadratic mean diameter	—
AVGHT	Average stand height (Lorey's)	—

Table B-4 (cont'd). Crosswalk between fields in the supplemental stands feature classes (DNA_Stands) that contain installation-specific geometry and data about stands from the inventory not explicitly contained in Navy geographic data model for stands (ForestStand).

SIG feature class field	Description	Field from Navy feature class (ForestStand) containing similar information
SAWBA	Average basal area (square feet) per acre of sawtimber size trees as determined by 2014 forest inventory	—
SAHWBBA	Average basal area (square feet) per acre of hardwood sawtimber size trees as determined by 2014 forest inventory	—
SAWSWBA	Average basal area (square feet) per acre of softwood sawtimber size trees as determined by 2014 forest inventory	—
SAWBFAC	Average board-feet per acre in sawtimber size trees as determined by 2014 forest inventory	—
SAHWBFAC	Average board-feet per acre in hardwood sawtimber size trees as determined by 2014 forest inventory	—
SAWSBFAC	Average board-feet per acre in softwood sawtimber size trees as determined by 2014 forest inventory	—
SAWTNAC	Average tons per acre in merchantable sawtimber size trees as determined by 2014 forest inventory	—
SAHWTNAC	Average tons per acre in merchantable hardwood sawtimber size trees as determined by 2014 forest inventory	—
SAWSWTNAC	Average tons per acre in merchantable softwood sawtimber size trees as determined by 2014 forest inventory	—
SAWVALAC	Average value per acre in merchantable sawtimber size trees as determined by 2014 forest inventory	—
CNSBA	Average basal area (square feet) per acre of chip-n-saw size trees as determined by 2014 forest inventory	—
CNSBFAC	Average board-feet per acre in chip-n-saw size trees as determined by 2014 forest inventory	—
CNSTNAC	Average tons per acre in merchantable chip-n-saw size trees as determined by 2014 forest inventory	—
CNSVALAC	Average value per acre in merchantable chip-n-saw size trees as determined by 2014 forest inventory	—
PLPBA	Average basal area (square feet) per acre of pulpwood size trees as determined by 2014 forest inventory	—
PLPHWBA	Average basal area (square feet) per acre of hardwood pulpwood size trees as determined by 2014 forest inventory	—
PLPSWBA	Average basal area (square feet) per acre of softwood pulpwood size trees as determined by 2014 forest inventory	—
PLPCDAC	Average cords per acre of pulpwood size trees as determined by 2014 forest inventory	—
PLPHWCDAC	Average cords per acre of hardwood pulpwood size trees as determined by 2014 forest inventory	—
PLPSWCDAC	Average cords per acre of softwood pulpwood size trees as determined by 2014 forest inventory	—
PLPTNAC	Average tons per acre in merchantable pulpwood size trees as determined by 2014 forest inventory	—
PLPHWTNAC	Average tons per acre in merchantable hardwood pulpwood size trees as determined by 2014 forest inventory	—
PLPSWTNAC	Average tons per acre in merchantable softwood pulpwood size trees as determined by 2014 forest inventory	—
PLPVALAC	Average value per acre in merchantable pulpwood size trees as determined by 2014 forest inventory	—
VALAC	Average value per acre of trees of all product classes	—
TOTTREES	Total number of trees	—
SAWBFTOT	Total sawtimber volume (board-feet) in stand area	—
SAHWBFTOT	Total hardwood sawtimber volume (board-feet) in stand area	—
SAWSBFTOT	Total softwood sawtimber volume (board-feet) in stand area	—

Table B-4 (cont'd). Crosswalk between fields in the supplemental stands feature classes (DNA_Stands) that contain installation-specific geometry and data about stands from the inventory not explicitly contained in Navy geographic data model for stands (ForestStand).

SIG feature class field	Description	Field from Navy feature class (ForestStand) containing similar information
SAWTNTOT	Total weight (tons) of wood and bark in merchantable sawlog portions of trees in stand area	—
SAHWNTOT	Total weight (tons) of wood and bark in merchantable sawlog portions of hardwood trees in stand area	—
SAWSWNTOT	Total weight (tons) of wood and bark in merchantable sawlog portions of softwood trees in stand area	—
SAWVALTOT	Total value of sawtimber	—
CNSBFTOT	Total volume (board-feet) in chip-n-saw trees in stand area	—
CNSTNTOT	Total weight (tons) in chip-n-saw trees in stand area	—
CNSVALTOT	Total value of chip-n-saw timber	—
PLPCDTOT	Total volume (cords) in pulpwood trees in stand area	—
PLPHWCDTOT	Total volume (cords) in hardwood pulpwood trees in stand area	—
PLPSWCDTOT	Total volume (cords) in softwood pulpwood trees in stand area	—
PLPTNTOT	Total weight (tons) in pulpwood trees in stand area	—
PLPHWNTOT	Total weight (tons) in hardwood pulpwood trees in stand area	—
PLPSWNTOT	Total weight (tons) in softwood pulpwood trees in stand area	—
PLPVALTOT	Total value of pulpwood	—
STAND_NUM	Numeric stand number (exclusive of other codes) for joining. Non-contiguous stands of similar characteristics, separated by short distances, may have been assigned the same stand number.	standID forestStandIDPK (partial) sdsFeatureDescription (partial)
forestStan	Same as Stand_ID; Identification number for the stand; also used as the forestStandIDPK code, and when concatenated with plot numbers using a colon, is used as the naturalResourceSurveyIDPK. Non-contiguous stands of similar characteristics, separated by short distances, may have been assigned the same stand number.	forestStandIDPK (partial)
Shape_Length	Length of feature in internal units	—
Shape_Area	Area of feature in internal units squared	—
Std_ValID	Same as Stand_Num; Numeric stand number (exclusive of other codes) for joining. Non-contiguous stands of similar characteristics, separated by short distances, may have been assigned the same stand number.	
ACRU_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for soft maple (<i>Acer rubrum</i>)	Note - only present if species was sampled at the installation
FRCA_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for Carolina ash (<i>Fraxinus caroliniana</i>)	Note - only present if species was sampled at the installation
FRPE_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for green ash (<i>Fraxinus pennsylvanica</i>)	Note - only present if species was sampled at the installation
ILOP_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for American holly (<i>Ilex opaca</i>)	Note - only present if species was sampled at the installation
LIST_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for sweetgum (<i>Liquidambar styraciflua</i>)	Note - only present if species was sampled at the installation
LITU_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for tulip-poplar (<i>Liriodendron tulipifera</i>)	Note - only present if species was sampled at the installation
NYAQ_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for water tupelo (<i>Nyssa aquatica</i>)	Note - only present if species was sampled at the installation
NYSY_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for blackgum (<i>Nyssa sylvatica</i>)	Note - only present if species was sampled at the installation

Table B-4 (cont'd). Crosswalk between fields in the supplemental stands feature classes (DNA_Stands) that contain installation-specific geometry and data about stands from the inventory not explicitly contained in Navy geographic data model for stands (ForestStand).

SIG feature class field	Description	Field from Navy feature class (ForestStand) containing similar information
PIPA_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for longleaf pine (<i>Pinus palustris</i>)	Note - only present if species was sampled at the installation
PITA_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for loblolly pine (<i>Pinus taeda</i>)	Note - only present if species was sampled at the installation
QUAL_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for white oak (<i>Quercus alba</i>)	Note - only present if species was sampled at the installation
QULA_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for laurel oak (<i>Quercus laurifolia</i>)	Note - only present if species was sampled at the installation
QUMI_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for swamp chestnut oak (<i>Quercus michauxii</i>)	Note - only present if species was sampled at the installation
QUNI_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for water oak (<i>Quercus nigra</i>)	Note - only present if species was sampled at the installation
QUPH_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for willow oak (<i>Quercus phellos</i>)	Note - only present if species was sampled at the installation
QURU_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for red oak (<i>Quercus rubra</i>)	Note - only present if species was sampled at the installation
TADI_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for bald cypress (<i>Taxodium distichum</i>)	Note - only present if species was sampled at the installation
ULAM_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for American elm (<i>Ulmus americana</i>)	Note - only present if species was sampled at the installation
UNHW_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for unidentified hardwoods	Note - only present if species was sampled at the installation

Table B-5. Crosswalk between fields in the supplemental plots feature class (DNA_Inv_Plots) that contain installation-specific geometry and data describing inventory points from the inventory not explicitly contained in Navy geographic data model for inventory points (NaturalResourceSurveyPoints).

SIG feature class field name	Description	Field from Navy feature class (NaturalResourceSurveyP) containing similar information
OBJECTID	Internal feature number	
Shape	Feature geometry	
UTM_X	X-coordinate (meters) of the point in the UTM Zone in which the point is located	
UTM_Y	Y-coordinate (meters) of the point in the UTM Zone in which the point is located	
PointID	Unique (to installation) identification number of the inventory point	
OBJECTID_1	Identifier for the stand created by software during post-processing	
STAND_ID	Unique (to installation) stand identification number of the stand in which the inventory point is located	
POINT_ID	Duplicate point identification field for joining and relationships. Can be used to join tabular date of sampled trees.	
STPT_ID	Concatenation of stand and point identification numbers. Can be used to join tabular date of sampled trees.	
BAF	Basal area factor (BAF) used to select trees for sampling at the point	
DATE_	Date on which the point was sampled	surveyDate
CREW	Initials of the inventory crew that conducted the sampling	
naturalResourceSurveyIDPK	Unique identification number for the plot, consisting of a concatenation of the Stand ID/forestStandIDPK (a unique stand identifier) and the plot number	naturalResourceSurveyIDPK

Table B-6. Information about supplemental stand-alone/non-geographic data tables and relationship classes included in the geodatabase.

Data tables for non-geographic information

Name	Description
DNA_Point_Sample	Table describing information about the points at which trees were sampled at DNA.
DNA_Tree_List	Table containing the complete list of sampled trees and their characteristics, to measure basal area and volume, at DNA, in the 2014 forest inventory.
DNA_Site_Tree	Table containing the complete list of sampled trees and their characteristics, to measure site index, at DNA, in the 2014 forest inventory.
DNA_Fuel_Load	Table containing summary of mean fuel loadings by forest type from data collected during the 2014 forest inventory at DNA.
DNA_Value_Per_Acre_By_Species	Table containing a summary of the value per acre, across all product groups, of each species at DNA, from data collected during the 2014 forest inventory using mean stumpage values from the Timber Mart-South 2014 Q2 report.
DNA_Table_Metadata	Table containing detailed descriptions of the fields in the DNA_Point_Sample, DNA_Tree_List, and DNA_Site_Tree tables.

Table B-6 (continued). Information about supplemental stand-alone/non-geographic data tables and relationship classes included in the geodatabase.

Relationship classes

NAME	Description
DNA_Stand_Plots	Establishes the one-to-many relationship between the DNA_Stands feature class and DNA_Inv_Plots table using the STAND_NUM and STAND_ID field, respectively, so that information about plots sampled within stands can be ascertained rapidly.
DNA_Plot_Tree	Establishes the one-to-many relationship between the DNA_Inv_Plots feature class and DNA_Tree_List table using the PointID and POINT_ID field, respectively, so that information about trees sampled for basal area and/or height at each plot can be ascertained rapidly.
DNA_Plot_SiteTree	Establishes the one-to-many relationship between the DNA_Inv_Plots feature class and DNA_Site_Tree table using the PointID and POINT_ID field, respectively, so that information about trees sampled for site index at selected plots can be ascertained rapidly.
DNA_Stand_Value	Establishes the one-to-many relationship between the DNA_Stands feature class and DNA_Value_Per_Acre_By_Species_For_Stands table using the StandVal_ID field in each table, so that information about each stand's value can be quickly ascertained.
DNA_Stand_Fuel_Load	Establishes the one-to-many relationship between the DNA_Stands feature class and the DNA_Fuel_Load table using the TREE_TYPE and Tree_Type fields, respectively, so that information about fuel loading in the various stands can be ascertained rapidly.

Table B-7. Table of additional metadata describing non-geospatial tables contained in non-compliant geodatabase.

Table name	Attribute/field	Description
DNA_Point_Sample	STAND_ID	Numeric stand ID code, unique to installation, consistent w/prior inventory; new stands have new numbers.
DNA_Point_Sample	POINT_ID	Sequential sample point identifier for location where data are collected; unique to installation.
DNA_Point_Sample	STPT_ID	Concatenation of stand and point ID codes for joining.
DNA_Point_Sample	BAF	Basal area factor used to sample the trees at the plot.
DNA_Point_Sample	DATE	Date plot was inventoried.
DNA_Point_Sample	CREW	Initials of the inventory crew.
DNA_Tree_List	STAND_ID	Numeric stand ID code, unique to installation, consistent w/prior inventory; new stands have new numbers.
DNA_Tree_List	POINT_ID	Sequential sample point identifier for location where data are collected.
DNA_Tree_List	STPT_ID	Concatenation of stand and point ID codes for joining.
DNA_Tree_List	TREE_NUM	Tree ID code; unique to installation; sequential.
DNA_Tree_List	TREE_SPP	Four letter species code (first two letters of genus and first two letters of species).
DNA_Tree_List	TREE_DBH	Tree diameter outside bark (inches) at breast height (typically 4.5' above ground).
DNA_Tree_List	TREE_VGR	Acceptable Growing Stock (AGS), Unacceptable Growing Stock (UGS), Cull (dead).
DNA_Tree_List	TREE_PRDG	Pulpwood, Chip-n-Saw, Sawtimber.
DNA_Tree_List	4IN_TOPHT	The height (feet) at which the tree is 4 in. dob; measured for trees classified as pulpwood by the inventory scheme.
DNA_Tree_List	6IN_TOPHT	The height (feet) at which the tree is 6 in. dob; measured for trees classified as chip-n-saw by the inventory scheme.
DNA_Tree_List	8IN_TOPHT	The height (feet) at which the tree is 8 in. dob; measured for trees classified as sawtimber by the inventory scheme.
DNA_Tree_List	TOT_HT	Total tree height (feet).
DNA_Tree_List	DATE	Date of measurements.
DNA_Site_Tree	STAND_ID	Numeric stand ID code, unique to installation, consistent w/prior inventory; new stands have new numbers.
DNA_Site_Tree	POINT_ID	Sequential sample point identifier for location where data are collected.
DNA_Site_Tree	STPT_ID	Concatenation of stand and point ID codes for joining.
DNA_Site_Tree	TREE_NUM	Unique tree ID code (same as above if tree was sampled for BA or height; new sequence beginning at 100000 if not).
DNA_Site_Tree	TREE_SPP	Four letter species code (first two letters of genus and first two letters of species).
DNA_Site_Tree	TREE_DBH	Tree diameter outside bark (inches) at breast height (typically 4.5' above ground). If null or zero, tree was not sampled for BA/height; only for age and total height for site index calculations.
DNA_Site_Tree	TREE_VGR	Acceptable Growing Stock (AGS), Unacceptable Growing Stock (UGS), Cull (dead).
DNA_Site_Tree	TREE_PRDG	Three-letter code indicating the product classification of the tree assigned by the inventory scheme; pulpwood (PLP), chip-n-Saw (CNS), sawtimber (SAW).
DNA_Site_Tree	4IN_TOPHT	The height (feet) at which the tree is 4 in. dob; measured for trees classified as pulpwood by the inventory scheme.
DNA_Site_Tree	6IN_TOPHT	The height (feet) at which the tree is 6 in. dob; measured for trees classified as chip-n-saw by the inventory scheme.
DNA_Site_Tree	8IN_TOPHT	The height (feet) at which the tree is 8 in. dob; measured for trees classified as sawtimber by the inventory scheme.
DNA_Site_Tree	TOT_HT	Total tree height (feet).
DNA_Site_Tree	TREE_AGE	Age of tree as measured by increment core sampled using standard procedures.
DNA_Fuel_Load	Tree_Type	1 or 2 letter code representing Vegetation_Type.
DNA_Fuel_Load	Vegetation_Type	Code indicating the forest type; P=>75% softwood BA; PH= 50-75% softwood BA; HP=25-50% softwood BA; H=<25% softwood BA. This is a very generalized forest type as compared to what the Navy would use to populate its forestCategory field.
DNA_Fuel_Load	F1_Hr_Tons_Acre	Down woody debris measured in Tons per acre that is up to 1/4 inch in diameter.
DNA_Fuel_Load	F10_Hr_Tons_Acre	Down woody debris measured in Tons per acre that is 1/4 inch to 1 inch in diameter.
DNA_Fuel_Load	F100_Hr_Tons_Acre	Down woody debris measured in Tons per acre that is 1 inch to 3 inches in diameter.
DNA_Fuel_Load	F1000_Hr_Sound_Tons_Acre	Down woody debris measured in Tons per acre that is over 3 inches in diameter and Sound.
DNA_Fuel_Load	F1000_Hr_Rotten_Tons_Acre	Down woody debris measured in Tons per acre that is over 3 inches in diameter and Rotten.
DNA_Fuel_Load	F1_10_100_Hr_Tons_Acre	Down woody debris measured in Tons per acre of 1hr, 10hr and 100hr fuel.

Table B-7 (cont'd). Table of additional metadata describing non-geospatial tables contained in non-compliant geodatabase.

Table name	Attribute/field	Description
DNA_Fuel_Load	Litter_Tons_Acre	Litter is the surface layer of the forest floor and consists of freshly fallen leaves, needles, twigs, bark, and fruits measured in Tons per acre.
DNA_Fuel_Load	Duff_Tons_Acre	Duff is the fermentation and humus layers of the forest floor measured in Tons per acre.
DNA_Fuel_Load	All_Fuel_Tons_Acre	All Down woody debris, litter and duff measured in Tons per acre.
DNA_Value_Per_Acre_By_Species_For_Stands	Std_ValID	Numeric stand ID code, unique to installation, consistent w/prior inventory; new stands have new numbers.
DNA_Value_Per_Acre_By_Species_For_Stands	ACRU_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for soft maple (<i>Acer rubrum</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	FRCA_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for Carolina ash (<i>Fraxinus caroliniana</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	FRPE_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for green ash (<i>Fraxinus pennsylvanica</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	ILOP_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for American holly (<i>Ilex opaca</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	LIST_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for sweetgum (<i>Liquidambar styraciflua</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	LITU_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for tulip-poplar (<i>Liriodendron tulipifera</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	NYAQ_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for water tupelo (<i>Nyssa aquatica</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	NYSY_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for blackgum (<i>Nyssa sylvatica</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	PIPA_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for longleaf pine (<i>Pinus palustris</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	PITA_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for loblolly pine (<i>Pinus taeda</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	QUAL_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for white oak (<i>Quercus alba</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	QULA_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for laurel oak (<i>Quercus laurifolia</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	QUMI_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for swamp chestnut oak (<i>Quercus michauxii</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	QUNI_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for water oak (<i>Quercus nigra</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	QUPH_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for willow oak (<i>Quercus phellos</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	QURU_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for red oak (<i>Quercus rubra</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	TADI_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for bald cypress (<i>Taxodium distichum</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	ULAM_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for American elm (<i>Ulmus americana</i>) (only present if species sampled at installation).
DNA_Value_Per_Acre_By_Species_For_Stands	UNHW_ValAc	Mean value (\$) per acre for indicated stand across all product classes (sawtimber, chip-n-saw, and pulpwood) for unidentified hardwoods (only present if species sampled at installation).

Appendix D
Raw Inventory Data Tables

Appendix D-1: DNA Less-intensive plot data tables: These tables represent the count, species, dbh, vigor, and grade data collected at plots in the point, double sampling for timber attributes protocol employed. Data from all plots is included, but only the count/species/dbh/vigor data is presented. Each record (row) corresponds to a single sampled tree stem. Data collected includes:

Stand #	The stand number in which the plot was located. Existing stand numbers used where available; sequential numbers beginning higher than existing stands assigned to new stands.
Type	Forest type-size class code for stand from prior inventory. At DNA, there was no prior comprehensive forest inventory, so this field was left blank. If data were available, it would have been taken into the field by the field crew to assist in refining and updating stand boundaries. Type code, concatenated with a dash to the size class code, yields the combined forest type-size class code. See Table E-1 for definition of type codes and Table E-2 for definition of size class code.
Plot #	Unique (to installation) plot identification number.
Species	Species code used to uniquely identify the species of tree. See Table E-3 for definition of codes.
DBH	Diameter at breast height (dbh) measured to the nearest tenth of an inch.
Vigor cls	The vigor class of the tree. See Table E-4 for definition of codes.
Grade	The diameter-based product grade of the tree. See Table E-5 for definition of codes.
Date	Date the tree was sampled (MM/DD/YY).
Notes	Miscellaneous notes about the tree represented by record (row) in the table. The most common note, "10BAF", indicates that the plot (and thus tree) was sampled using 10BAF, instead of the default 20BAF, as requested in the scope of work.

Appendix D-2: DNA More-intensive plot data tables: These tables represent the merchantable height and site index data collected at a subset of plots in the point, double sampling for timber attributes protocol employed. Each record (row) corresponds to a single sampled tree stem. Data collected includes:

Stand #	The stand number in which the plot was located. Existing stand numbers used where available; sequential numbers beginning higher than existing stands assigned to new stands.
Type	Forest type-size class code for stand from prior inventory. At DNA, there was no prior comprehensive forest inventory, so this field was left blank. If data were available, it would have been taken into the field by the field crew to assist in refining and updating stand boundaries. Type code, concatenated with a dash to the size class code, yields the combined forest type-size class code. See Table E-1 for definition of type codes and Table E-2 for definition of size class code.
Plot #	Unique (to installation) plot identification number.
Species	Species code to uniquely identify the species of tree. See Table E-3 for definition of codes.
DBH	Diameter at breast height (dbh) measured to the nearest tenth of an inch.
Vigor cls	The vigor class of the tree. See Table E-4 for definition of codes. Typically not populated in this table, as the trees sampled in this table are also represented in the less-intensive tables to avoid double-counting basal area in the point, double sampling scheme employed.
Grade	The diameter-based product grade of the tree. See Table E-5 for definition of codes. Typically not populated in this table, as the trees sampled in this table are also represented in the less-intensive tables to avoid double-counting basal area in the point, double sampling scheme employed.
Ht. 4in.	Height from the ground to a point on the main stem where the diameter outside bark (dob) is 4", or the point just below where the tree breaks into branches each smaller than 4" dob. Populated only if the tree was a pulpwood class tree.
Ht. 6in.	Height from the ground to a point on the main stem where the diameter outside bark (dob) is 6", or the point just below where the tree breaks into branches each smaller than 6" dob. Populated only if the tree was a chip-n-saw class tree.
Ht. 8in.	Height from the ground to a point on the main stem where the diameter outside bark (dob) is 8", or the point just below where the tree breaks into branches each smaller than 8" dob. Populated only if the tree was a sawtimber class tree.
Total Ht.	Total height of the tree from ground to tip. Populated only if tree sampled for total height.
Site tree age	Age of the tree as determined from an increment core. Populated only if the tree was sampled for age to calculate site index.
Notes	Miscellaneous notes about the tree represented by record (row) in the table. The most common note, "10BAF", indicates that the plot (and thus tree) was sampled using 10BAF, instead of the default 20BAF, as requested in the scope of work.

Appendix D-3: DNA Fuels transect activity fuels data tables: These tables represent the data summarizing activity fuels (duff, litter, 1-, 10-, and 100-hour fuels) collected from the fuel transects, performed at the same subset of plots as the more-intensive timber inventory data in the point, double sampling for timber attributes protocol employed. The class values (1-, 10-, and 100-hours) represent the length of time it takes for fuels in each class to lose 66% of their moisture. Each record (row) corresponds to a single transect; two transects were sampled at each more-intensive plot. Data collected includes:

Stand #	The stand number in which the transect was located. Existing stand numbers used where available; sequential numbers beginning higher than existing stands assigned to new stands. This field was not be populated since there were effectively no stands delineated by a prior inventory. Plot can be cross-referenced against new stands using Appendix D.
Type	Forest type-size class code for stand from prior inventory. At DNA, there was no prior comprehensive forest inventory, so this field was left blank. If data were available, it would have been taken into the field by the field crew to assist in refining and updating stand boundaries. Type code, concatenated with a dash to the size class code, yields the combined forest type-size class code. See Table E-1 for definition of type codes and Table E-2 for definition of size class code.
Plot #	Unique (to installation) plot identification number.
Tx ID	Fuels transect ID, corresponding to the azimuth of the transect.
1-H	Number of 1-hour fuels (0-0.64 cm diameter) encountered from 0-2m along transect.
10-H	Number of 10-hour fuels (0.64-2.54 cm diameter) encountered from 0-3m along transect.
100-H	Number of 100-hour fuels (2.54-7.62 cm diameter) encountered from 0-11.3m along transect.
3m D	Duff depth (cm) at 3m distance from beginning of transect.
3m L	Litter depth (cm) at 3m distance from beginning of transect.
3m F	Fuel depth (cm) at 3m distance from beginning of transect.
10m D	Duff depth (cm) at 10m distance from beginning of transect.
10m L	Litter depth (cm) at 10m distance from beginning of transect.
10m F	Fuel depth (cm) at 10m distance from beginning of transect.

Appendix D-3 (continued): DNA Fuels transect 1000-hour fuels data tables: These tables represent the data collected from the fuel transects, performed at the same subset of plots as the more-intensive timber inventory data in the point, double sampling for timber attributes protocol employed. Each record (row) corresponds to a single piece of 1000-hour fuel (>7.62 cm diameter). Two transects were sampled at each more-intensive plot. No row is present for a plot or transect if no fuels were encountered. Data collected includes:

Plot #	Unique (to installation) plot identification number.
Tx ID	Fuels transect ID, corresponding to the azimuth of the transect
Species	Species, identified to hardwood (HW) or softwood (SW) of the 1000-fuel encountered.
Rotten	If the fuel encountered is rotten/falling apart/in advanced decomposition, then its diameter is indicated in this column. Null values indicate no fuels in this category were encountered along transect.
Sound	If the fuel encountered is solid/holds form/etc., then its diameter is indicated in this column. Null values indicate no fuels in this category were encountered along transect.

Appendix D-4: Cross-walk for DNA old stand number & type, new stand number & type, and type of plot from the 2014 inventory: These tables contain a cross-walk showing, for each plot in the 2014 forest inventory at DNA, the stand data (full designation, number, and type) from the prior forest inventory and the 2014 forest inventory. Sorted by new stand number. Data displayed includes:

Plot ID	Unique (to installation) plot identification number.
Plot Type	Type of plot. "BA" indicates a less-intensive plot where basal area (BA) was measured, and each tree in the plot was measured for species, vigor class, dbh, and grade. "HEIGHT" indicates a more-intensive plot, where total height, merchantable height, and age may have been measured based on the grade (pulp, chip-n-saw, or sawtimber) of the tree. "FUELS" indicates that fuels transects were also established at the plot.
Old Stand Code	Stand code (Compartment - Stand Number/Type - Size Class) of the stand from the prior inventory in which the plot was located. Note that no prior forest inventory was present for this installation but polygons were present in the "forest_stand_area" feature class in the DNA installation; so no codes could be displayed here, thus "—" is the sole value displayed for this column.
New Stand Code	Stand code (Compartment - Stand Number/Type - Size Class) of the stand from the 2014 inventory in which the plot was located. See Table E-1 for definition of type codes and Table E-2 for definition of size class code.
Old Stand Number	Stand OID of the stand from the prior data in which the plot was located. "—" indicates the plot was located in an area not delineated as a stand or with no associated information from the prior inventory. Note that no prior forest inventory was present for this installation but polygons were present in the "forest_stand_area" feature class in the DNA installation; so for sake of comparison the OID from that data is displayed here.
New Stand Number	Stand number/ID of the stand from the 2014 inventory in which the plot was located. Sorted by new stand number.
Old Stand Type	Stand type of the stand from the prior GIS data in which the plot was located. "—" indicates the plot was located in an area not delineated as a stand or with no associated information from the prior inventory. Note that no prior forest inventory was present for this installation but polygons were present in the "forest_stand_area" feature class in the DNA installation; so for sake of comparison the type from that data is displayed here. Note that it may not conform to the standards in Table E-1 defining type codes.
New Stand Type	Stand type of the stand from the 2014 inventory in which the plot was located. See Table E-1 for definition of type codes.

This list is not meant to be all inclusive. These and additional variables may be reported in additional places in the body of the report, appendices, and/or GIS data. Summary of accuracy at the compartment, forest type and installation levels reported in

Table E-1: List and definition of forest type codes used in the summary and data tables; based on prior report.

Forest type code	Code meaning	Stand average basal area criteria
H	hardwood	< 25% softwood basal area
HP	hardwood - pine	≥25% – <50% softwood basal area
PH	pine - hardwood	≥50% – <75% softwood basal area
P	pine	≥75% softwood basal area
Wildlife	—	Pre-merchantable stand

Type code concatenated with size class code, using dash, to arrive at a combined forest type-size class code.

Table E-2: List and definition of size class codes used in the summary and data tables; based on prior report.

Size class code	Code meaning	Stand average basal area criteria
4	sawtimber	majority of basal area in sawtimber size (dbh \geq 13") trees
3	chip-n-saw	majority of basal area in chip-n-saw size (softwoods only: dbh \geq 9 – <13") trees
2	pulpwood	majority of basal area in pulpwood size (softwoods: dbh \geq 6 – <9"; hardwoods: dbh \geq 6 – <13") trees
1 (WL)	seedling/sapling (wildlife)	majority of basal area in trees <6" dbh

Type code concatenated with size class code, using dash, to arrive at a combined forest type-size class code.

Table E-3: List and definition of species codes used in the summary and data tables.

Species code	Common name	Scientific name
ACRU	soft maple	Acer rubrum
FRCA	Carolina ash	Fraxinus caroliniana
FRPE	green ash	Fraxinus pennsylvanica
ILOP	American holly	Ilex opaca
LIST	sweetgum	Liquidambar styraciflua
LITU	tulip-poplar	Liriodendron tulipifera
NYAQ	water tupelo	Nyssa aquatica
NYSY	blackgum	Nyssa sylvatica
PIPA	longleaf pine	Pinus palustris
PITA	loblolly pine	Pinus taeda
QUAL	white oak	Quercus alba
QULA	laurel oak	Quercus laurifolia
QUMI	swamp chestnut oak	Quercus michauxii
QUNI	water oak	Quercus nigra
QUPH	willow oak	Quercus phellos
QURU	red oak	Quercus rubra
TADI	bald cypress	Taxodium distichum
ULAM	American elm	Ulmus americana
UNHW	unidentified hardwood	N/A

Table E-4: List and definition of vigor class codes used in the summary and data tables.

Vigor class code	Code meaning	Product class/grade criteria
AGS	<u>A</u> ceptable <u>G</u> rowing <u>S</u> tock	Tree is of desirable species and quality, and worth retaining through at least one additional thinning/cutting cycle.
UGS	<u>U</u> nacceptable <u>G</u> rowing <u>S</u> tock	Tree is of undesirable species or quality, and is not worth retaining through at least one additional thinning/cutting cycle.

Table E-5: List and definition of grade codes used in the summary and data tables.

Grade code	Code meaning	Product class/grade criteria
ST	sawlog	Tree is sawtimber size (dbh \geq 13")
CS	chip-n-saw	Tree is chip-n-saw size (softwoods only: dbh \geq 9 – <13")
PW	pulpwood	Tree is pulpwood size (softwoods: dbh \geq 6 – <9"; hardwoods: dbh \geq 6 – <13")

Appendix H
DNA Forest Stand Summary

Appendix H: DNA Forest Stand Summary Table These tables summarize, at the stand level, basal area, and number of trees, volume, and weight by hardwood/softwood and product category (sawtimber, chip-n-saw, and pulpwood), and value, both per acre and for the entire installation. Additional variables describing the inherent productivity, character, and condition of the stand such as site index species, site index, growth, forest type, age, and size class are reported.

DNA Forest Stand Summary Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
Softwood sawtimber and chip-n-saw: Board-feet, International 1/4 inch log rule (form class 80)
Hardwood and softwood pulpwood: Cords; 80 ft³ of wood and bark in one cord

Weight units are:

Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons.

QMD is quadratic mean diameter, the diameter of the tree of average basal area

Average height is Lorey's mean height (BA-weighted height), the arithmetic average of the trees selected by variable radius point sampling.
Site index values are all reported with base age of 50, and growth is calculated from ΔMean Stand Diameter, a method more robust than counting rings on individual trees.
Type-inventory is assigned on the basis of the majority of basal area; Pine: >=75% softwood BA; Pine-Hardwood: >=50 - <75% softwood BA;
Hardwood-Pine: >=25 - <50% softwood BA; Hardwood: <25% softwood BA.
Size class is assigned on the basis of majority basal area, and can take the values sawtimber, chip-n-saw, or pulpwood.

Stand number	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

DNA Forest Stand Summary Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
Softwood sawtimber and chip-n-saw: Board-feet, International 1/4 inch log rule (form class 80)
Hardwood and softwood pulpwood: Cords; 80 ft³ of wood and bark in one cord

Weight units are:

Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons.

QMD is quadratic mean diameter, the diameter of the tree of average basal area

Average height is Lorey's mean height (BA-weighted height), the arithmetic average of the trees selected by variable radius point sampling.
Site index values are all reported with base age of 50, and growth is calculated from ΔMean Stand Diameter, a method more robust than counting rings on individual trees.

Type-inventory is assigned on the basis of the majority of basal area; Pine: >=75% softwood BA; Pine-Hardwood: >=50 - <75% softwood BA;

Hardwood-Pine: >=25 - <50% softwood BA; Hardwood: <25% softwood BA.

Size class is assigned on the basis of majority basal area, and can take the values sawtimber, chip-n-saw, or pulpwood.

Appendix I
DNA Statistical Summary Table

Appendix I: DNA Timber Inventory Statistical Summary Table: This table provides sampling error for overall quadratic mean diameter, and basal area, volume, and weight for hardwoods, softwoods, and product categories (sawtimber, chip-n-saw, and pulpwood). Sampling error is reported as the 90% confidence limit half-width expressed as a percent of the mean, for each compartment, forest type, and installation. Installation sampling error is stratified based on forest type.

90% confidence limit half-width as percent of the mean for major timber category totals for 2014 forest inventory at DNA. A value of zero indicates no trees of the category were sampled in the stratum.

Appendix J
DNA Stock Tables

Appendix J-1: DNA Forest Installation Stock Tables: These tables summarize at the installation level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2" dbh class, the mean number of trees per acre, mean basal area per acre (ft²/ac), mean volume per acre (cords for pulp, board-feet Doyle log rule for hardwood sawlog volume, or board-feet Int'l ¼-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood & bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. Installation means and totals are based on stratification by forest type and so vary from totals aggregated from compartment sub-totals. Total installation area is 710.14 acres. Null (blank) entries in the table indicate no trees were sampled of that particular combination of dbh and stock class.

DNA Forest Installation Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Int'l 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords; 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

DNA Forest Installation Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Int'l 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords; 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

Appendix J-2: DNA Forest Compartment Stock Tables: These tables summarize at the compartment level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2" dbh class, the mean number of trees per acre, mean basal area per acre (ft²/ac), mean volume per acre (cords for pulp, mean board-feet Doyle log rule for hardwood sawlog volume, or board-feet Int'l ¼-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood & bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. The total area of the compartment is also provided. No stratification is performed to arrive at means and totals at this hierarchical level. Null (blank) entries in the table indicate no trees were sampled of that particular combination of dbh and stock class. Compartment designations were retained from the prior inventory, if present (which it was not for DNA), and compartment designations were not updated as part of the 2014 inventory. As such, there is a single compartment at DNA.

DNA Forest Compartment Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Int'l 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

Appendix J-3: DNA Forest Type Stock Tables: These tables summarize at the forest type level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2" dbh class, the mean number of trees per acre, mean basal area per acre (ft²/ac), mean volume per acre (cords for pulp, board-feet Doyle log rule for hardwood sawlog volume, or board-feet Int'l ¼-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood & bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. The total area of the type contained in the installation is also provided. Null (blank) entries in the table indicate no trees were sampled of that particular combination of dbh and stock class.

DNA Forest Type Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Int'l 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

DNA Forest Type Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Int'l 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

Appendix J-4: DNA Forest Stand Stock Tables: These tables summarize at the forest stand level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2" dbh class, the mean number of trees per acre, basal area per acre (ft²/ac), mean volume per acre (cords for pulp, board-feet Doyle log rule for hardwood sawlog volume, or board-feet Int'l ¼-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood & bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. The total area of the stand is also provided. Null (blank) entries in the table indicate no trees were sampled of that particular combination of dbh and stock class.

DNA Forest Stand Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Intl 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

DNA Forest Stand Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Intl 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

DNA Forest Stand Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Intl 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

DNA Forest Stand Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Intl 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

DNA Forest Stand Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Intl 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

DNA Forest Stand Stock Tables
Based on field reconnaissance 4/14 - 5/14

Volume units are:

- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Intl 1/4 inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft³ of wood and bark in one cord

Weight units are:

- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

EXECUTIVE SUMMARY

This Project assessed the current condition of selected streams and ponds at Naval Air Station Oceana (NASO) Dam Neck Annex (DNA). The pond assessments included seasonal boat electrofishing surveys, water quality, shoreline habitat, and fish habitat improvements. The stream assessments included seasonal backpack electrofishing surveys, evaluating the existing suitability of habitat (e.g., fish passage) and the potential for enhancements to habitat accessibility.

These data will be used to supplement the existing data and used in current and future environmental planning and management at DNA. Additionally, these data were analyzed to develop improvement recommendations to habitat as well as fish populations, which are presented in this report. Survey biologists used a modified version of the U.S. Environmental Protection Agency's (EPA) Rapid Bioassessment Protocol (RBP) for fish to collect a representative sample of the fish assemblage from the appropriate habitat composition in DNA ponds and streams (Barbour et al. 1999). Field crews used the Habitat Assessment Field Data Sheets for Low Gradient Streams, as provided in Barbour et al. (1999). The RBP protocols are included as Appendix D to this report. A "score" was assigned to each of these categories for each surveyed reach so that relative comparisons can be made between reaches and streams. Qualitative habitat surveys were also used to assess pond habitat quality. Additionally, a barrier survey using a combination of assessment protocols was used to identify potential impediments to fish migration within DNA streams. Water quality was recorded *in situ* at every stream and pond during sampling, using a hand held multi-parameter meter. Additionally, water grab samples were obtained with a horizontal water sampler in ponds and submitted for laboratory analyses.

In accordance with EPA RBP standards, DNA streams all fell within marginal categories for habitat quality. Fish surveys at DNA streams yielded fish assemblages typical of degraded, channelized coastal plain streams. DNA streams yielded 130 individual fishes represented by 15 species. Notably, migratory species were present in DNA water bodies (gizzard shad and American eel). No migration barriers were encountered in any of the surveyed streams at the DNA Installation. Fish data show that DNA streams offer little to no recreational value and periodic monitoring is necessary. DNA ponds offered suitable habitat to support healthy fish communities and a recreational fishery. DNA P3 and P5 both support healthy fish assemblages and DNA P5 can support a healthy recreational fishery. Pond fish survey results yielded 3,198 individual fish represented by 24 species.

1 INTRODUCTION

1.1 OBJECTIVES

The purpose of this survey was to assess the current condition of selected streams and ponds at Naval Air Station Oceana (NASO) Dam Neck Annex (DNA). The stream assessment included seasonal backpack electrofishing surveys, habitat and water quality measurements, and the characterization of physical barriers to migratory fishes, especially American eel (*Anguilla rostrata*) and alosines, including alewife (*Alosa pseudoharengus*), blueback herring (*A. aestivalis*), American shad (*A. sapidissima*), and hickory shad (*A. mediocris*). The pond assessment included seasonal electrofishing surveys, shoreline habitat, and water quality measurements .

The results of this survey and assessment will be used to supplement the existing data that will be incorporated into future environmental planning documents, such as the Integrated Natural Resource Management Plans (INRMP) or Environmental Assessments (EA) at DNA.

1.2 SITE DESCRIPTION

DNA is located in the southeastern portion of the City of Virginia Beach, Virginia (Figure 1) and encompasses approximately 1,900 acres (ac) (769 hectares [ha]). The Installation is bound by the community of Sandbridge to the south; the Atlantic Ocean to the east; Hampton Roads Sanitation Division, City of Virginia Beach Properties, and private properties to the west; and Virginia Army National Guard - Camp Pendleton to the north. Land uses surrounding the Installation include industrial, commercial, residential, recreational, and agricultural, though most of the agricultural lands are rapidly being converted to residential and recreational developments. Because of the intense level of development in the region, DNA and the other coastal military installations are extremely important to the region's ecology (Navy 2014).

Surface waters at DNA are limited to mostly drainage ditches, channelized streams, and several small ponds. Surface water that occurs on DNA includes a small portion (0.5 ac [0.2 ha]) of Lake Christine, which lies almost entirely within the State Military Reservation to the north of the Installation; approximately 51 ac (21 ha) of Redwing Lake (DNA-P3); Fish surveys were conducted on Lake Christine during 2013 and 2008, which documented 15 species of fish present (see Table 5), all of which had already been previously documented at other DNA ponds, including Lake Tecumseh (Williamsburg Environmental Group 2013, Fritz and Wolf 2008).

Sadler Pond (DNA-P5), located within the central support area; and several small ponds such as Lotus Pond and Lilly Pond, and areas of open water, which are associated with the extensive marsh system. DNA-P5 (4.5 ac [1.8 ha]) was excavated in 1969 as part of the Installation picnic area to provide recreational fishing at DNA. DNA-P3 has historically been extremely shallow, and both turbid and eutrophic (Swihart 1982). Redwing Lake and adjacent Lake Tecumseh are connected through an open drainage channel and are connected to Back Bay, which is part of the U.S. Fish and Wildlife Service (USFWS) National Wildlife Refuge System, through open canal. Lake Tecumseh (also known as Brinson Lake Inlet) forms the southern boundary of DNA but is not on Navy property. In 2011, the Hampton Roads Sanitation Division (who owns Lake Tecumseh) in cooperation with the USFWS, installed a weir on Lake Tecumseh to help control sedimentation from the lake into Back Bay.

Figure 1: Dam Neck Annex (DNA) Site Overview of Proposed Stream and Pond Survey Locations

This page intentionally left blank.

1.3 FISHERIES MANAGEMENT

Previous fish surveys at DNA have documented several species of fish that have been introduced into Redwing Lake and Sadler Pond for recreational fishing including largemouth bass (*Micropterus salmoides*), pumpkinseed (*Lepomis gibbosus*), common carp (*Cyprinus carpio*), and bluegill (*Lepomis macrochirus*). Other species collected during previous fisheries surveys are listed in Table 1.

Saltwater fishing is permitted along the shoreline and freshwater fishing is permitted at DNA-P5, as well as in drainage canals throughout the Installation. Fishing along the shores of Lake Tecumseh also is authorized; however, the Navy Natural Resources Program (NRP) does not manage the Lake Tecumseh fisheries because the lake is owned by the Hampton Roads Sanitation District.

DNA-P3 and DNA-P5 have been managed as recreational fisheries to varying degrees at DNA for many years, and past support for fisheries management has been provided by the Virginia Department of Game and Inland Fisheries VDGIF and USFWS fisheries biologists beginning in 1961 (Corning 1968) and has continued through recent years. Fish and water quality surveys found that fisheries potential was marginal at Redwing Lake because of its shallow water (less than 4.0 ft. [1.2 m] maximum depth), low productivity, and high turbidity (Corning 1968, Galvez and Swihart 2000, and Swihart 1982). Turbidity is the most limiting factor because it interferes with successful reproduction in nest-building species, such as bass and sunfishes, and prevents the establishment of a self-sustaining sport fish population. The lake's high turbidity is attributed to wave action and a high population of common carp, which churn bottom sediments when feeding (Drenner et al. 1997). Because the sediments in the lake largely results from off-Installation activities, management actions taken at DNA are not expected to be effective in correcting the situation.

Fishing at DNA-P3 was formerly authorized; however, this lake has been closed to fishing due to military mission/security reasons. The Southeast Redwing Lake Wetlands Special Interest Area (SIA) ponds are currently not authorized for inclusion in the recreational fishing program as this area is being managed as a conservation site. Although DNA-P3 has minimal potential for quality recreational fishing, it provides habitat for a variety of fishes, birds, and other wildlife and provides valuable habitat at DNA and in the region.

DNA-P5 was excavated in 1969 as an alternative site for recreational fishing at DNA. The pond, however, was constructed in a soil formation composed of colloidal clay material. Clay particles are negatively charged, which causes them to repel each other and remain suspended in the water column, creating a turbidity problem at this pond as well.

† First number represents total abundance from the 2013 survey. Number in parentheses represents catch-per-hour, as reported for the 2008 survey

* Average across surveys. Length and weight not consistently reported.

No rare, threatened, or endangered fish species have been identified at the Installation, however two individual sturgeon have been reported as stranded (washed ashore dead) on DNA beaches (Wright, personal communication 2015). Both the Atlantic sturgeon (*Acipenser oxyrinchus oxyrinchus*) and shortnose sturgeon (*Acipenser brevirostrum*), federally listed fish species, have ranges that overlap DNA based on geographic range. However, these species are rarely expected to occur in any of the available freshwater habitats within DNA. American eel (*Anguilla rostrata*) has been identified on the DNA Installation. The American eel was petitioned for listing under the ESA in 2010. In 2011, the U.S. Fish and Wildlife Service (USFWS) issued a finding that listing of the species may be warranted, and initiated a status review (76 FR 60431-60444), which has not yet been completed. Blueback herring also have the potential to occur on DNA and were petitioned for listing under ESA previously. However, a 2013 status review by the National Marine Fisheries Service (NMFS) of blueback herring (*Alosa aestivalis*) found that a listing under the ESA was not warranted (78 FR 48943-48994), this determination continues to be controversial and could be revisited by regulators and stakeholders.

2 ASSESSMENT METHODS

The purpose of this study was to perform fish community assessments on targeted streams and ponds located at DNA. An additional goal was to qualitatively characterize habitat and identify barriers to fish movement that may affect anadromous and catadromous species by performing a walk-over survey of the streams. In total, two streams and three ponds were surveyed on a seasonal basis (spring, early summer, late summer, and fall); habitat and barrier surveys were conducted once. The resulting data and analyses presented here will help characterize existing fish populations and habitat within these installations; this characterization will aid in ensuring compliance with applicable federal, state, and local statutes and regulations, and with Department of Defense (DOD) policies, instructions, and guidance.

2.1 WATERBODY SELECTION

Geographic Information System (GIS) layers were used to identify all freshwater stream reaches and ponds within the DNA boundaries, as shown in Figure 2. Identified water bodies were cross-referenced with the U.S. Geological Survey (USGS) stream layer and the surface water course centerlines layer to focus only on freshwater streams (no marine or estuarine areas). A list of streams and ponds were selected during a site visit on 19 September 2013, based on data needs, accessibility, and scoping requirements. The streams and ponds listed in Table 2 represent those selected for evaluation during this survey.

Table 2: Streams Surveyed at Naval Air Station Oceana, Dam Neck Annex

Waterbody type	Site ID	Name	Location and description
Streams	DNA-S1	Unnamed	Connecting slough between Redwing and Tecumseh
	DNA-S2	Unnamed	Stream at south Dam Neck fence
Ponds	DNA-P2	Unnamed	Wetland east of Terrier Ave., with floating dock
	DNA-P3	Redwing Lake	Behind Navy Lodge, within Naval Special Warfare Development Group (DEVGRU) area
	DNA-P5	Sadler Pond	Park near main gate (corner of Dam Neck/Terrier)

For consistency throughout this report, the streams (S1, S2) and ponds (Unnamed Pond [P2], Redwing Lake [P3], Sadler Pond [P5]) surveyed will be referred to by their assigned numbers, as shown in Table 2.

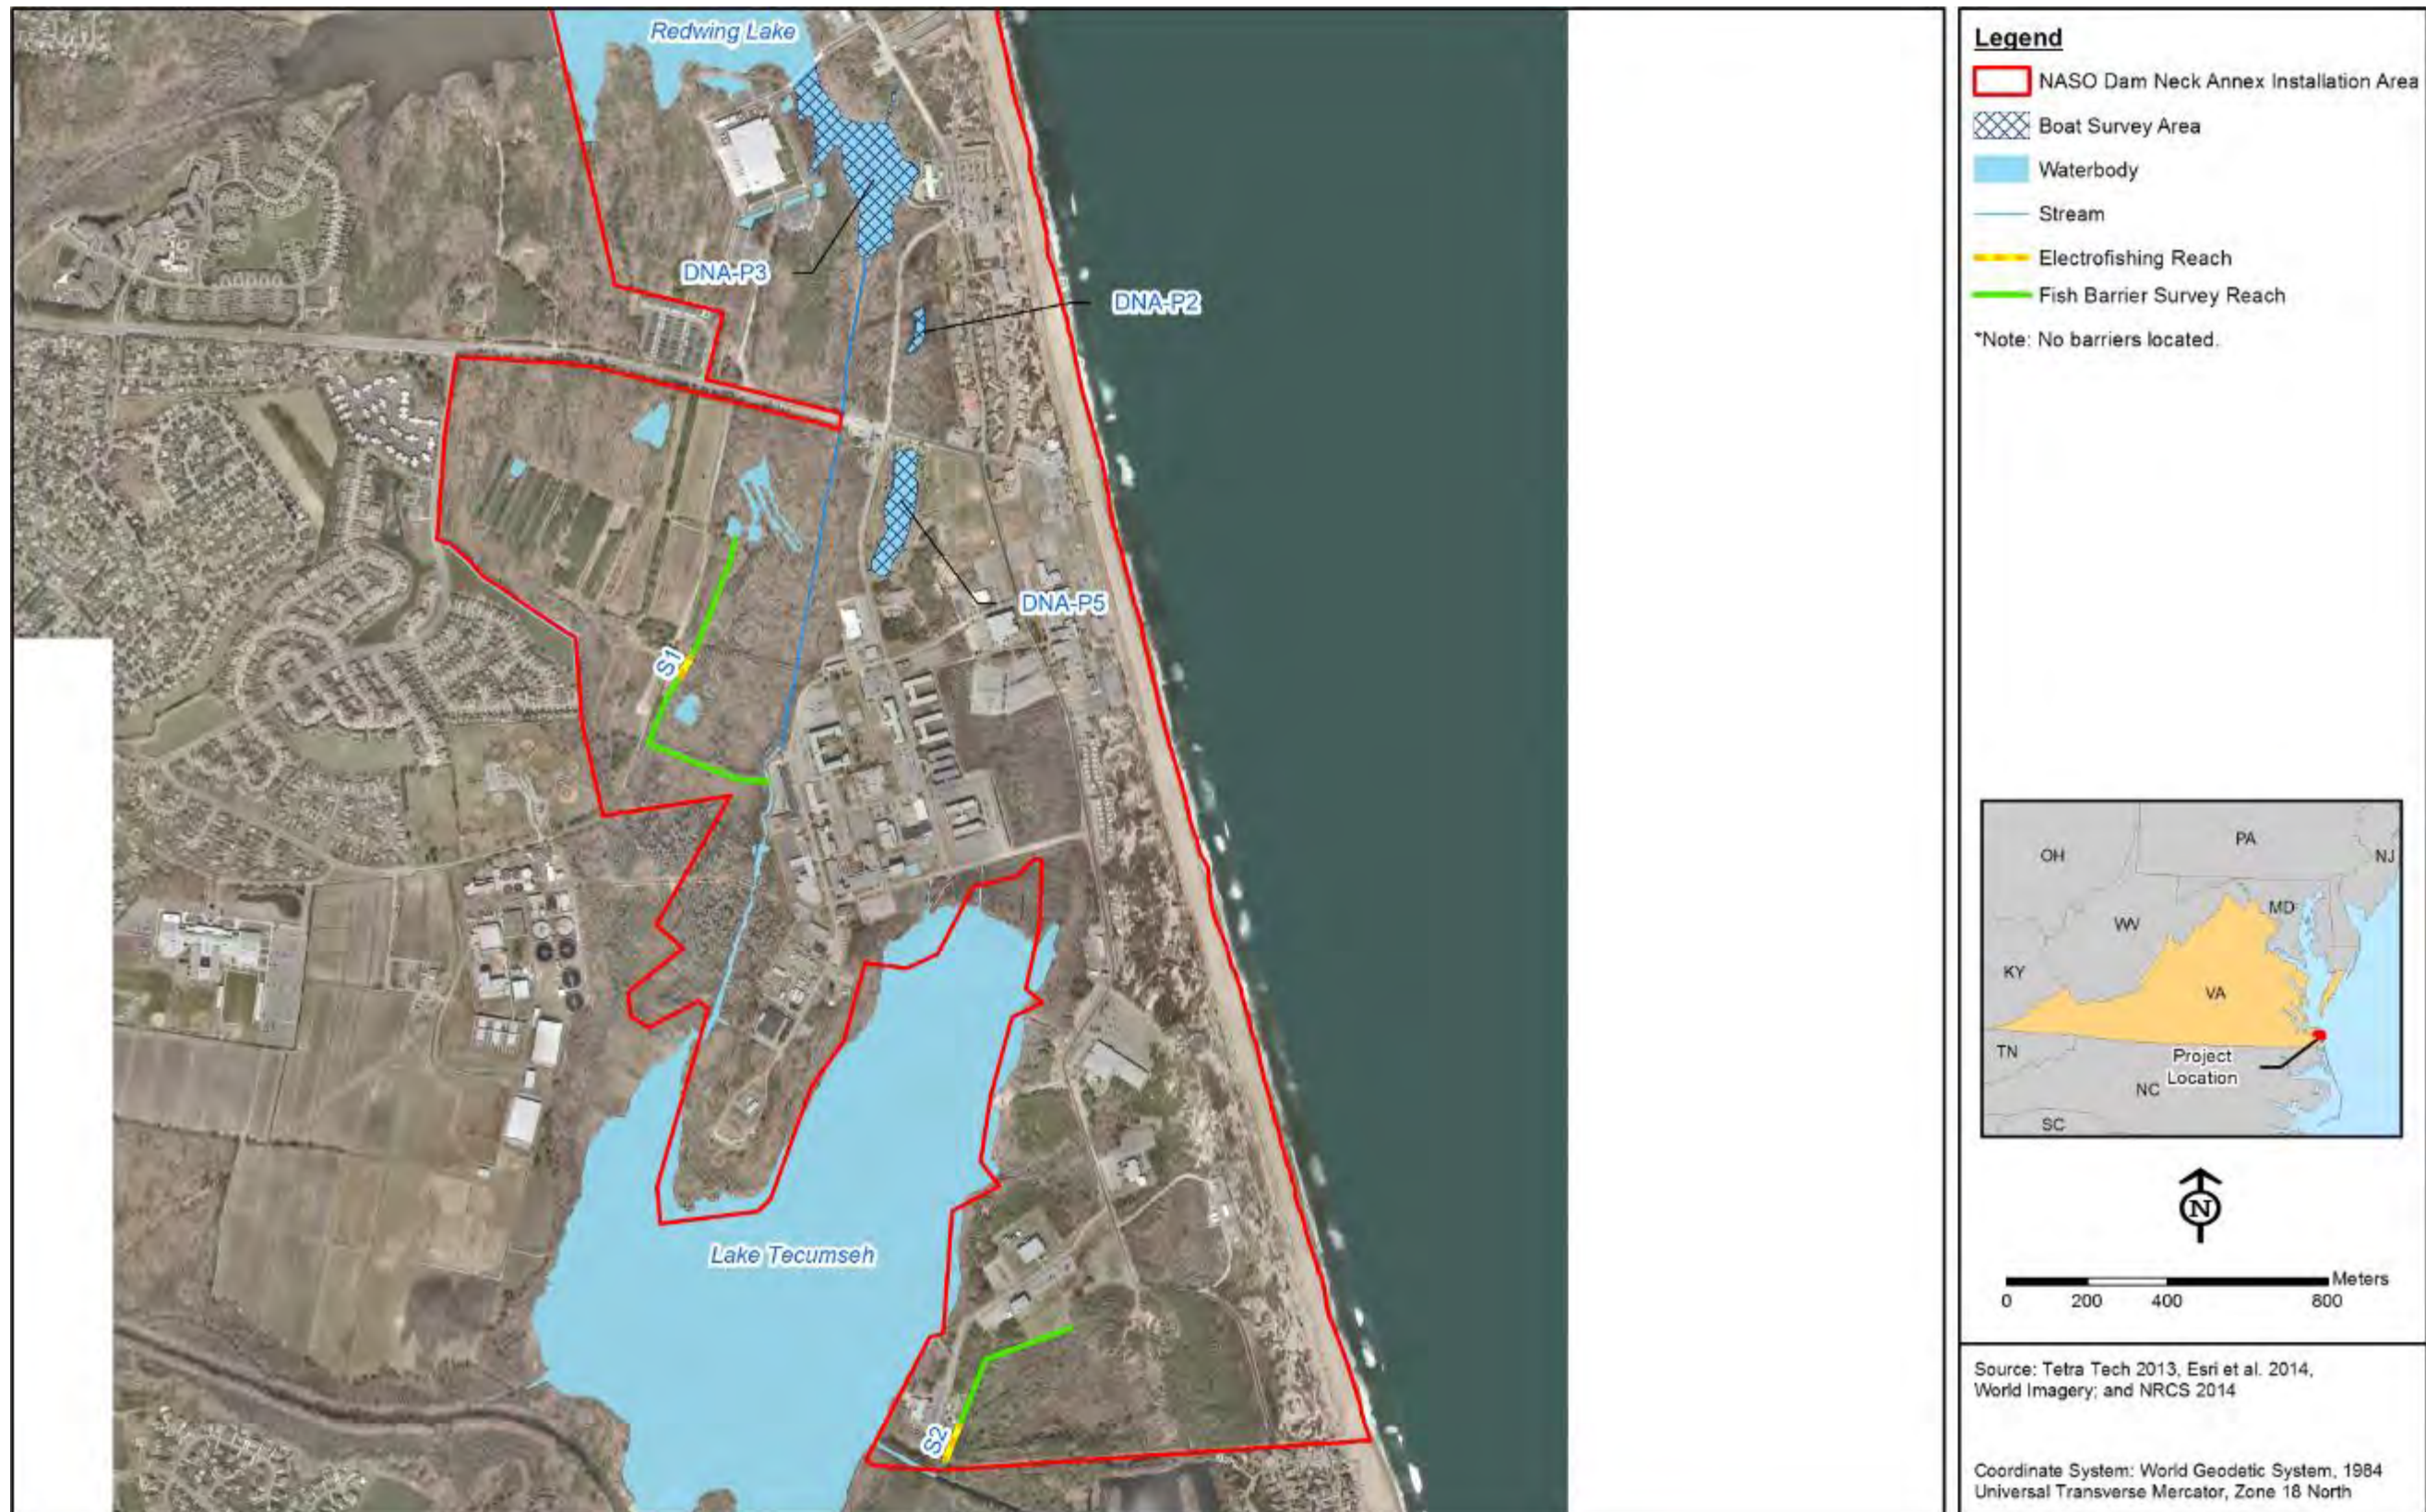

Figure 2: Selected Streams and Ponds Surveyed at Naval Air Station Oceana – Dam Neck Annex

This page intentionally left blank.

2.2 STREAMS

The stream survey methods consisted of a biological (fish) and physical habitat assessment, as modified from the U.S. Environmental Protection Agency’s (EPA) Rapid Bioassessment Protocols (RBP) developed by Barbour et al. (1999). Seasonal fish surveys at all stream locations used backpack electrofishing methods in accordance with the modified RBP. The one-time habitat assessment used visual-based observations to quantify the conditions of the habitat. Water quality was collected seasonally.

2.2.1 HABITAT SURVEY

Most of the stream habitat assessment parameters are based on physical characteristics; therefore, the habitat characterization was conducted as a “one-time” characterization for each stream reach. Other parameters, such as water quality (*in-situ* and grab samples), flow, channel depth, wetted channel width, etc. are dynamic and were recorded during more than one visit.

The RBP habitat survey was performed once on each stream reach that was also sampled for the fish assessment by a small field team during a walk-over survey. Tetra Tech biologists attempted to walk the wadeable portions of each stream, ensuring that the 150-m survey reaches would capture a representative sample of stream features (e.g., riffles, runs, pools). Where applicable, natural fish barriers or habitat breaks were used to delineate the start or end of a reach.

For this study, Tetra Tech used the Habitat Assessment Field Data Sheets for Low Gradient Streams, as provided in Barbour et al. (1999) (see Appendix B for data sheets). The data sheets assigned a “score” was assigned to each of these categories for each surveyed reach so that relative comparisons can be made between reaches and streams (Table 3). Further detail on scoring and criteria used can be found in Barbour et al. 1999.

By assigning a score and condition category to the ten visual-based habitat assessment parameters, described in Table 3, a stream can be assessed and given a total score related to its condition. Scores ranging from 0 to 20 were assigned to each of the ten visual-based habitat assessment parameters, with 0 being a “poor” score and 20 being an “optimal” score. After scoring all parameters, a final score was determined for each reach. The final score can range from 0 to 200 with a score of 0 to 59 representing a “poor” condition; 60 to 112 representing a “marginal” condition; 113 to 165 representing a “suboptimal” condition; and 166 to 200 representing an “optimal” condition. This rapid, qualitative physical habitat assessment was conducted at each DNA stream reach that was also assessed for fish populations. Water quality sampling methods were similar between streams and ponds, and are therefore described in Section 2.3.2.

Table 3 : Rapid Bioassessment Protocol (RBP) Parameters

RBP habitat parameter	Components analyzed in this survey
Physical characterization (one-time)	<ul style="list-style-type: none"> • Riparian and watershed land use • Stream origin and type • Riparian/canopy vegetation features • Instream parameters – channel width, depth, relative flow, high water mark, and substrate • Proportion of riffles, runs, and pools • Degree of channelization • Potential fish barriers (not part of RBP, but included in this survey)
Water quality (each visit)	<ul style="list-style-type: none"> • <i>In situ</i> measurements, such as water temperature, dissolved oxygen, and conductivity will be collected for each stream reach. • Grab samples will be collected to measure a total of three parameters (listed below) for each stream reach: <ul style="list-style-type: none"> ○ Total Nitrogen (TN) ○ Total Phosphorus (TPhos) & ortho-Phosphate (SRP) – Method 365.1 ○ Total Suspended Solids (TSS) – Method SM 2340D
Habitat features (one-time)	<ul style="list-style-type: none"> • Large woody debris/debris dams • Aquatic vegetation • Available cover
Visual-based habitat assessment (low gradient streams) (one-time)	<ul style="list-style-type: none"> • Epifaunal substrate/available cover • Pool substrate characterization • Pool variability • Sediment deposition • Channel flow status • Channel alteration • Channel sinuosity • Bank stability • Bank vegetative protection • Riparian vegetative zone width

2.2.2 BARRIER SURVEY

A combination of assessment protocols was used to identify potential barriers to fish migration within DNA streams. Fish barrier surveys are typically implemented to assess the potential for habitat use by migratory fishes that may encounter obstacles in their migration, such as culverts, debris dams, beaver dams, or other physical blockages to migration. Additional data forms were included to facilitate the fish barrier survey as a supplement to the modified RBP survey. The fish barrier survey and accompanying data forms were adapted from a similar survey on the Rappahannock River (McInnich and Garman 2004, 1999), which were also applied to a stream habitat survey at NSA Northwest Annex (Tetra Tech and Stell 2014). Additional input for culvert and bridge data were incorporated in the form, adapted from the Vermont Agency of Natural Resources (2009). Copies of field data forms are included in Appendix C. During the modified RBP survey, each of the potential barriers to fish migration were inventoried for as much of a stream as possible, beyond the reaches assessed for habitat and fish. The entire stream was

walked by two field scientists starting at the downstream end of each stream (at the installation boundary, or confluence with another stream) and walking upstream until reaching an apparent habitat break or other boundary. Tetra Tech staff walked the entire wadeable length of each stream to the furthest extent practical to record and characterize potential barriers to fish migration. Each bridge or culvert crossing and other potential barrier (e.g., beaver dam or large debris dam) was inventoried during the survey and physical measurements of the barrier were obtained in accordance with the data sheet. Photographs were also taken for each potential barrier and included in the photograph log (Appendix A).

2.2.3 FISH SURVEY

Fish surveys were conducted at two stream sites within DNA. Both sites were sampled in June, August, and September. The fish sampling methods were modified from the EPA's RBP for fish (Barbour et al. 1999). Field biologists used the 150 meter (m) fixed-distance sampling reach to collect a representative sample of the fish assemblage from the appropriate habitat composition (e.g., riffles, runs, pools) (further details described in EPA 2007). Where applicable, natural fish barriers or habitat breaks were used to delineate the start or end of a reach.

The downstream start point at each surveyed reach was marked with a temporary pin flag and recorded as a GPS point. A tape measure was used to delineate the 150-m reach of the stream. The upstream end of the reach was also marked with a temporary pin flag and a GPS point. Water quality measurements, including temperature, specific conductance, dissolved oxygen, and percent oxygen saturation, were obtained at the downstream start point of each surveyed reach.

A Smith-Root LR-24 backpack electrofishing unit was used for all stream sites. The LR-24 was calibrated through the "auto-setup" function; then settings such as voltage, frequency, and duty-cycle were fine-tuned according to water parameters to maximize the effectiveness of the electrofishing unit and safety of the fish and operator. A single-pass protocol was used. Backpack electrofishing protocols were consistent with those used by the U.S. Fish and Wildlife Service (USFWS 2010) and the American Fisheries Society (AFS 2008). The survey began at the downstream end of each reach at physical fish barriers to prevent fish escape, as recommended by the RBP protocol. The fish survey continued upstream in a bank-to-bank sweeping technique, covering all wadeable habitats within the reach. Effort was measured in duration (seconds) of active electrofishing, or "trigger" time. Variation between reaches is typical due to stream width, depth, and habitat types.

At the end of the reach, fish were identified and counted. A subsample of up to 30 specimens of each species were measured and weighed (total length [TL] to the nearest millimeter [mm], mass in grams [g]), prior to being released back into the stream. All individuals were observed for any deformities, erosion, lesions, or tumors (DELT anomalies). All individuals were identified to lowest practicable taxonomic level in the field based on external characteristics using taxonomic keys, including "The Freshwater Fishes of Virginia" (Jenkins and Burkhead 1994). Page et al. (2013) was used to ensure accurate common and scientific fish names.

2.3 PONDS

Similar to streams, most of the pond habitat assessment parameters are based on physical characteristics; therefore the habitat characterization was conducted as a "one-time" characterization for each pond. Other parameters, such as water quality (*in-situ* and grab samples) and vegetation are dynamic and were recorded during each visit.

The methods used for pond surveys for this study consisted of a biological (fish) assessment, as well as a physical habitat assessment, within a similar framework as outlined above for streams.

2.3.1 HABITAT SURVEY

The pond habitat assessment at DNA included a site-walk (or by boat) around the perimeter of each accessible pond to collect qualitative habitat data. The pond habitat survey was limited to DNA-P2 and DNA-P3. Security restrictions at DNA-P5 precluded its inclusion in the habitat portion of the survey. Data sheets modified from the EPA National Lakes Assessment Program (EPA 2012) were used to support the qualitative assessment of the ponds, by characterizing the shoreline/littoral zone, macrophytes, and water quality (see Appendix C). Table 4 lists the parameters included in the pond habitat assessment. These data were used to develop an overall assessment of fisheries habitat for the selected DNA ponds. These data were used to develop an overall assessment of fisheries habitat for the selected NASO ponds.

Table 4 : Pond Habitat Survey Parameters

Pond habitat parameter	Components analyzed in this survey
Physical characterization (one-time)	<ul style="list-style-type: none"> • Shoreline and watershed land use • Pond origin and type • Inlet/outlet stream(s) • Shoreline vegetation features • Hydrology – depth, high water mark, modifications, and substrate • Shoreline stability/erosion
Water quality (seasonal)	<ul style="list-style-type: none"> • <i>In situ</i> measurements, such as water temperature, dissolved oxygen, and conductivity will be collected at the middle, or deepest point, of each pond. • Grab samples will be collected to measure a total of three parameters (listed below) for each stream reach: <ul style="list-style-type: none"> ○ Total Nitrogen (TN) ○ Total Phosphorus (TPhos) & ortho-Phosphate (SRP) – Method 365.1 ○ Total Suspended Solids (TSS) – Method SM 2340D
Habitat features (one-time)	<ul style="list-style-type: none"> • Aquatic vegetation • Available cover

2.3.2 WATER QUALITY

Water quality was recorded *in situ* at every stream and pond during each sampling event, using a hand held multi-parameter meter (YSI 556). Parameters measured included water temperature (degrees Celsius [°C]), dissolved oxygen (milligrams per liter [mg/L] and percent [%] saturation), pH, and conductivity (milliSiemens per centimeter [mS/cm]).

Additionally, water grab samples were obtained with a horizontal water sampler in ponds and submitted for laboratory analyses at Test America Laboratories Inc. in Savannah, GA. Laboratory analysis measured total nitrogen (TN), total phosphorus (TPhos), ortho-phosphate (SRP), and total suspended solids (TSS). TN was measured using EPA Method 351.2, as well as a calculated method. TPhos was analyzed in

accordance with EPA Method 365.4. SRP analysis used EPA Method 365.1. TSS was measured using SM 2540D.

2.3.3 FISH SURVEY

Fish surveys at all pond locations used boat electrofishing. Both DNA-P3, and DNA-P5 were most effectively sampled by electrofishing boat, which occurred April/May, June, August, and October.

A 12-ft. jon-boat equipped with a Smith-Root 1.5 KVA pulse box electrofisher was used to sample fish inhabiting these ponds. In general, boat electrofishing protocols were consistent with those used by the USFWS (USFWS 2010) and the American Fisheries Society (AFS 2008). Boat electrofishing occurred in and along littoral habitats, targeting structure and beds of submerged aquatic vegetation. Stunned fish were captured and stored in a livewell until they were processed at the end of the survey.

At the end of each survey (for each method), fish were identified and counted. A subsample of up to 25 specimens of each species were measured (TL to the nearest mm), prior to being released back into the pond. All individuals were observed for any deformities, erosion, lesions, or tumors (DELT anomalies). All individuals were identified to lowest practicable taxonomic level in the field using the same resources as described for streams in Section 2.2.3.

2.4 DATA ANALYSIS

Field data were transferred from field data sheets to a Microsoft Excel spreadsheet. Metrics calculated from the data included catch per unit effort (CPUE) and a species diversity index. CPUE allows for a standardization of the fishing effort across streams, which enables comparisons where effort was not consistent. CPUE was calculated by dividing the total number of fishes collected at each stream by the total electrofishing time (in seconds) of each stream. Species richness, commonly denoted as R , is simply the number of different species present in the dataset. A diversity index allows for comparisons of species diversity among multiple locations (streams in this case). The Simpson index (λ) measures the degree of concentration and is calculated by:

$$\lambda = \sum_{i=1}^R p_i^2$$

Where p_i is the proportional abundance of each species within each sampling reach (number of individuals of species i , divided by the total number of individuals [n] in each sampling reach) and R is species richness. Values of λ range from 0 to 1, with lower values representing higher diversity. Another diversity parameter that is often used is the Shannon-Wiener diversity index (H'), which is calculated by using the proportional abundance of each species observed in the sample, as follows:

$$H' = - \sum_{i=1}^R p_i \ln p_i$$

In this equation, p_i is again the proportional abundance of each species and R is species richness. The resulting H' values are the Shannon-Wiener diversity index values for each sampling reach, with higher values corresponding to greater diversity.

3 RESULTS

In general, fish surveys encountered a wide range of species, with 15 taxa captured in the DNA streams and 24 taxa in the DNA ponds. DNA stream surveys captured 130 individual fishes with the most abundant species being eastern mudminnow, bluespotted sunfish, and eastern mosquitofish, respectively. The average time spent electrofishing the DNA streams was 1,473 seconds. DNA ponds yielded a much higher total abundance and species diversity than DNA streams with over 3,000 individual fishes captured during the pond electrofishing efforts. The most abundant species were bluegill, gizzard shad, and pumpkinseed, respectively. The average time spent electrofishing the DNA ponds was 3,740 seconds. All fishes collected from the DNA stream and pond sampling efforts are shown in Table 5.

Table 5: All Fishes Collected from the 2014 DNA Sampling and Lake Christine Sampling

Common Name	Species	DNA		Virginia Army National Guard Camp Pendleton

3.1 STREAMS

3.1.1 HABITAT

Habitat surveys were conducted for both surveyed DNA streams (DNA-S1 and DNA-S2) on 03 June 2014. The reach locations are shown in Figure 2. All of the reaches were 150 m in length. Table 6 highlights some of the physical characteristics of the stream; full results of the habitat survey and RBP assessment are provided in Appendix C.

Overall, the DNA streams were perennial, originating in either storm water drainage or coastal plain swamp. They were most often highly channelized and surrounded by forest and military lands, with trees providing partial to full shade. The DNA streams lacked habitat diversity, and all stream sections were categorized as continuous runs, with very little flow. The substrate was generally fine grained, with nothing larger than sand-sized particles.

The results of the physical habitat surveys of DNA streams showed that they are highly disturbed and do not offer optimal habitat for aquatic organisms (Table 7). Both of the surveyed stream reaches fell within the “marginal” category. Most streams lacked suitable habitat diversity, riffle habitat, and sinuosity throughout the surveyed streams. Channel sinuosity was lacking because of the channelization of each stream section. Generally, DNA streams scored well on bank stability, falling within the “optimal” and “suboptimal” categories. Fish barriers were not encountered in the surveyed streams, therefore no barrier data is presented in this section.

DNA-S1. This reach averaged 5.0 m wide, and ranged from 0.5 to 0.8 m deep and was highly channelized. The intermittent drainage channel was located in a forested area bordered by agricultural fields. The riparian vegetation was comprised of primarily trees and shrubs, dominated by sweet gum (*Liquidambar styraciflua*), wax myrtle (*Morella cerifera*), and bald cypress (*Taxodium distichum*). Aquatic vegetation was primarily rooted submergent and free-floating species, dominated by duckweed (Subfamily Lemnoideae) and hydrilla (*Hydrilla verticillata*). Stream reach DNA-S1 had a very low velocity of 0.02 ft./s and was characterized as a continuous pool, but lacking a hydraulic control. There was minimal erosion with stable banks and channelized throughout. The stream substrate was primarily composed of silt, with a high incidence of detritus and muck-mud. Typical S1 habitat is shown in Appendix A (photo #-20140929_105939)

The DNA-S1 barrier survey began at the confluence with the S1 stream with the connecting channel between DNA P3 and Lake Tecumseh, and continuing upstream into the south outparcel. There were no partial or full barriers to fish passage observed within the surveyed reach.

DNA-S2. This reach averaged 5.0 m wide, and had a depth of 0.7 to 0.9 m. The perennial stream was surrounded by forested area to the east and a fenced-in military training area to the west. The riparian zone was primarily trees and shrubs. Manicured lawn bordered the fence along the western bank and transitioned into mixed pine/hardwoods and shrubs beyond the fence. Aquatic vegetation was primarily rooted submergent and free-floating species, dominated by duckweed and hydrilla. The DNA-S2 reach also had a low velocity of 0.11 ft./s and was characterized as a continuous pool, but lacking a hydraulic control. There was minimal erosion with stable banks and channelized throughout. This reach of stream was also primarily composed of silt, with a high proportion of detritus and muck-mud. Typical S2 habitat is shown in Appendix A (photo #-20140929_142214)

The DNA-S2 barrier survey covered from the southern perimeter fence, continuing upstream to the confluence with the wetland area, south of South Bullpup St. There were no partial or full barriers to fish passage observed within the surveyed reach.

Table 6 : Physical Habitat Assessment Data for Each Stream Reach Surveyed at Dam Neck Annex

Reach	DNA-S1	DNA-S2
Date (2014)	3-Jun	3-Jun
Weather	Clear/sunny	Clear/sunny
Previous 24 hours	Clear sunny. Heavy rain within past 7 days, 27°C air temp	Clear sunny. Heavy rain within past 7 days, 21°C air temp
Watershed features	Forested, field/pasture, and military use surrounding stream	Mixed forest with military use outside of riparian zone
Reach Length	150 m	150 m
Stream width	5.0 m	5.0 m

3.1.2 FISH

A total of 130 fishes representing 15 species were collected from the two DNA streams during the June, August, and September 2014 collection periods. Streams were not electrofished during April because of high water conditions. All individuals were positively identified to the species level in the field. Total fish sampling effort was 4,903 s within the DNA-S1 reach and 3,933 s within the DNA-S2 reach (Table 8).

Table 8 : Backpack Electrofishing Effort at Naval Air Station Oceana, Dam Neck Annex, by Sampling Period and Stream

Stream ID	Sampling duration (seconds)		
	June	August	September
DNA-S1	2,370	1,528	1,005
DNA-S2	1,365	1,428	1,140

Eastern mudminnow (*Umbra pygmaea*) was the most abundant species, representing 33.8% of the total catch, followed by Bluespotted sunfish (*Enneacanthus gloriosus*) at 22.3%, and eastern mosquitofish (*Gambusia holbrooki*) at 16.9% (Table 9). No deformities, lesions, or abnormalities were observed in any of the specimens collected. Two fish species were found in both surveyed stream reaches; eastern mudminnow, and Bluespotted sunfish. The overall length distributions for most species were comparable among all surveyed streams.

Table 9: Number, Relative Abundance, Frequency of Occurrence, and Length of Fishes Collected from Dam Neck Annex Streams

Common name	Scientific name	Number of individuals	Total relative abundance (%)	Range of total length (mm)	Range of mass (g)
Eastern Mudminnow	<i>Umbra pygmaea</i>	44	33.8%	27–82	0.1–5.1
Bluespotted Sunfish	<i>Enneacanthus gloriosus</i>	29	22.3%	28–74	0.2–8.0
Eastern Mosquitofish	<i>Gambusia holbrooki</i>	22	16.9%	25–42	0.1–1.0
Flier	<i>Centrarchus macropterus</i>	8	6.2%	72–164	7.4–93.0
Banded Sunfish	<i>Enneacanthus obesus</i>	6	4.6%	36–62	1.0–3.7
Yellow Perch	<i>Perca flavescens</i>	5	3.8%	178–229	65.6–134.5
Redfin Pickerel	<i>Esox americanus</i>	4	3.1%	77–141	3.1–17.3
Bluegill	<i>Lepomis macrochirus</i>	3	2.3%	52–70	2.3–5.9
Green Sunfish	<i>Lepomis cyanellus</i>	3	2.3%	23–36	0.5–2.4
Black Crappie	<i>Pomoxis nigromaculatus</i>	1	0.8%	103	11.7
Bowfin	<i>Amia calva</i>	1	0.8%	519	641.9
Common Carp	<i>Cyprinus carpio</i>	1	0.8%	238	199.4
Eastern Silvery Minnow	<i>Hybognathus regius</i>	1	0.8%	70	2.7
Largemouth Bass	<i>Micropterus salmoides</i>	1	0.8%	98	100
Mud Sunfish	<i>Acantharchus pomotis</i>	1	0.8%	192	152.2
TOTAL		130	100%	--	--

DNA-S1. A total of 67 fish, represented by three species, were collected from DNA-S1 on 03 June 2014. Fish sampling was conducted for an electrofishing duration of 2,370 seconds. Eastern mudminnow was the most abundant species, representing 56.7% of the total catch, followed by bluespotted sunfish at 31.3%, and flier at 11.9% (Table 10). During the second sampling event, a total of 3 fish, represented by two species, were collected from DNA-S1 on 11 August 2014. Bluegill was the most abundant species, representing 66.7% of the total catch, followed by bluespotted sunfish at 33.3%, with 1,528 seconds of electrofishing. A total of 4 fish, represented by three species, were collected from DNA-S1 on 29 September 2014 with 1,005 seconds of electrofishing. Eastern mudminnow was the most abundant species, representing 50.0% of the total catch, followed by black crappie and largemouth bass, each at 25.0%.

DNA-S2. A total of 28 fish, represented by seven species, were collected from DNA-S2 on 03 June 2014. Fish sampling was conducted for an electrofishing duration of 1,365 seconds. Eastern mosquitofish was the most abundant species, representing 35.7% of the total catch, followed by bluespotted sunfish at 25.0%, and yellow perch at 17.9% (Table 11). During the second sampling event, a total of 8 fish, represented by four species, were collected from DNA-S2 on 11 August 2014. Green sunfish was the most abundant species, representing 37.5% of the total catch, followed by eastern mosquitofish and eastern mudminnow both at 25.0%, with 1,428 seconds of electrofishing. A total of 20 fish, represented by five species, were collected from DNA-S2 on 29 September 2014 with 1,140 seconds of electrofishing. Eastern mosquitofish was the most abundant species, representing 50.0 % of the total catch, followed by banded sunfish at 30.0% and redfin pickerel at 10.0%.
