Date Adjusted	Section/Page	Comment	Reviewer
20141015	Appendix	Added Final Contract Deliverables	Michael Wright
20150407	Signature Page	Update ICO Signature Block	Michael Wright
20150407	Appendix	Added Pollinator Information	Michael Wright
20140507 to 20150407	Main Doc. & Appendix	Comment Sticky Notes & Text Updates	Michael Wright
20150514	3.2.2	Deleted text and added proposed text submitted by NAVFAC ML EV2 Wetlands SME, Thad McDonald regarding floodplains.	Michael Wright
20150603	Signature Pages	Consolidated all Agency Official Signatures into a single set of Signatures. One additional page of signatures that includes the previous CO signature still remains, until an updated CO signature is obtained.	Michael Wright
20150603	Appendix E	Deleted place holder maps and Added updated 50ft Wetland and Riparian Buffer Map.	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
20150604	Appendix M	Replaced Capt Chope's 2013 CO Env Policy Letter with Capt Schager's 2015 letter.	Michael Wright
20150608	Appendix F Encl 2	Updated Marine Animal Stranding Reporting SOPs	Michael Wright
20150608	Appendix E	Deleted Placeholder and added updated Watershed/Hydrologic Unit Map.	Michael Wright
20150609	Signature Page	Inserted final consolidated signature page. Deleted old and individual signature pages from the front of the document.	Michael Wright
20150812	Appendix H, Enclosure 14	Replaced Draft NASO DNA Pond/ Stream Assessment with Final Version.	Michael Wright
20150812	Appendix H, Enclosure 13	Replaced Draft Commercial Forest Inventory with the Final Commercial Forest Inventory.	Michael Wright
20150812	Figure1-4	Deleted Map For INRMP Public Distribution Until NOSSA Approval is Obtained for Release.	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
20150812	Appendix J, Enclosure 2	Deleted Maps For INRMP Public Distribution Until NOSSA Approval is Obtained for Release.	Michael Wright
20150812	Appendix H, Enclosure 2	Inserted Map to Show Nearshore Area to be assessed/surveyed and the Accepted Contractor Proposal.	Michael Wright
20150825	Figure1-4	Replaced Map For INRMP Public Distribution after coordination with NOSSA per PWD Planning Office.	Michael Wright
20150825	Appendix J, Enclosure 2	Replaced Maps For INRMP Public Distribution after coordination with NOSSA per PWD Planning Office.	Michael Wright
20150825	Appendix M, Enclosures 1 & 2	POM16 & POM 18 Project Table and Project Justification and Cost Estimate Updates	Michael Wright
20150909	Appendix M, Enclosures 2	Added POM18 Manpower Justification Input submitted to NAVFAC MIDLANT CORE EV2.	Michael Wright
20150910	Appendix J, Enclosure 2	Updated Hunting Rules and Regulations	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
20150922	Appendix F Encl 1 & 2	Updated Sea Turtle SOPs to Include copies of Agreements and Permits.	Michael Wright
20151015	Appendix M , Enclosure 3	Added 08 Oct 2015 INRMP Metrics Agencies Meeting Attendance Roster.	Michael Wright
20151105	Appendix M, Enclosure 3	Added ICO 2015 INRMP Metrics Responses.	Michael Wright
20160606	Appendix M, Enclosure 3	Replaced older version with Final 2015 ICO INRMP Metrics Package. Deleted the NASO/NALFF INRMP information from the package.	Michael Wright
	Throughout	Update protected species info. NLEB found on installation via acoustic monitoring (update status info as well). RBEB found on installation via mist netting. State has listed add. bat species.	Michael Wright
	Appendix I, enclosure 2; Appendix H, enclosure 6	Update Avian Species List to include confirmed observation of Sandhill Cranes in 2016 during Shorebird Survey effort by NAVFAC LANT, Jennifer Wright.	Michael Wright
20160606	Appendix H, Enclosure 9; Appendix F Enclosure 6	Add the following documents to appendix: Natural Heritage Inventory/ Listed Species Survey; Bat Baseline; Sea Turtle Lighting Assessment; and Sea Turtle BA.	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
	Appendix I; Sections 2.5.1, 3.6, 4.3.5, etc.	Verify that Harp, Harbor and Gray Seals are identified in the INRMP as having been confirmed on the installation.	Michael Wright
	Appendix F, Enclosures 1 & 2	Update Marine Animal Stranding Procedures to reflect personnel/ notification changes.	Michael Wright
20160606	Appendix M, Enclosure 3	Delete early versions and replace with 2015 ICO Final INRMP Metrics Results Package, deleted NASO/NALFF INRMP information that was submitted with the package.	Michael Wright
20160606	Appendix M, Enclosure 3	Deplace 2015 IPAC information with 27 April 2016 information for NASO and NALFF.	Michael Wright
	Appendix I	Need to update Appendix species lists. These lists are not complete. Until updated people should search both the INRMP and it's associated appendices for specific species occurences.	Michael Wright
	Table 2-4	Need to cross-walk Table 2-4 with the FY15 INRMP Metrics List and Feb 2016 version of the Listed Species Survey (appendix h, enclosure 9) and edit Table 2-4 accordingly. Table needs to reflect Terrestrial and as appropriate Marine Species (delete the word Terrestrial from table title update INRMP text accordingly. RBEB, NLEB, Sea Turtles, Sturgeon, etc. need to be added to the table. State listed RBEB and Federal listed NLEB identified on the installation summer of 2015. American Eel determined not warranted for ESA listing. Monarch Butterfly has been petitioned for ESA listing and is currently under review by USFWS.	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
20160606	Appendix J, Enclosure 7; Still need to update main INRMP text.	Added the following information to appendix. Still need to update appropriate sections /references to Avian Protection Plan Guidance documents in the body of the INRMP. Projects should reference and implement applicable avian collision with powerline reduction/avoidance guidelines/procedures. These documents can be obtained from the following websites: < http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/guidance-documents.php >; http://www.aplic.org/ ; and < http://www.dodpif.org/plans/app.php >. Also need to add to appendix and reference in INRMP the REDUCING BIRD COLLISIONS WITH BUILDINGS AND BUILDING GLASS BEST PRACTICES document from USFWS.	Michael Wright
20160606	Appendix B, Enclosure 3; Still need to update main INRMP text.	Need to add LCAC Land Training Course and Beach Operations Training Course Map to INRMP and reference accordingly in INRMP text.	Michael Wright
	Appendix C	Recommend Changing Appendix to: Commanding Officer Designations and Authorizations: Encl 1 Designation Letters; Encl 2 CO EV Policy; Encl 3 CO Auth to Carry Firearms; etc.	Michael Wright
	Figure 1-4	Figure 1-4. Needs to be updated. Does not depict the PJD wetlands for the NSWDG compound (currently only depicts NWI data for this area. Adjust so SIAs and wetlands can both be viewed. Need to add existing mitigation sites to this map. See appendix E for current wetland maps.	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
	Section 3.12	<p>Section 3.12. Update as appropriate. In the State of Virginia as of 24 March 2016 <http://www.vdacs.virginia.gov/plant-industry-services-plant-pest-survey-and-detection.shtml> there are 6 ongoing pest survey programs for the following species: Asian Longhorned Beetle; European Grapevine Moth; Giant Hogweed; Gypsy Moth; Khapra Beetle; and Sudden Oak Death (Phytophthora ramorum). Other tracked Pests of Concern in VA: Asian Ambrosia Beetle; Giant African Land Snails; Imported Fire Ants; Pine Shoot Beetle; and Sirex Woodwasp. <http://caps.ceris.purdue.edu/pest-lists>. Invasives in VA: <http://www.dcr.virginia.gov/natural-heritage/vaisc/species/> Not Established but Top goal for prevention in VA: Zebra Mussel; Sirex Wood Wasp; Rusty Crayfish; Sudden Oak Death; Emerald Ash Borer; Chinese Mitten Crab. Established in VA and Goal For Control: Northern snakehead fish; rapa whelk; tree of heaven; japanese stilt grass; imported fire ant; and phragmites. Chesapeake Bay Program Invasive Species Priorities for Mngt.: mute swan, nutria, purple loosestrife, Phragmites, water chestnut, and zebra mussel.</p>	Michael Wright
	Section 2.6.2.1.1	<p>Need to update NLEB status information (April 2015 = Federally Threatened under the ESA). Species was confirmed present on the installation via acoustic monitoring in 2015. Need to add information on: Rafinesque's big-eard bat, state endangerd; Little brown bat, state endangered; and Tricolored bat, state endangered. Confirmed on the installation in 2015.</p>	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
	Section 1.7.1	Section 1.7.1. Research origin of statement, "In the northern area of NASO DNA, nearly all of the primary and secondary dunes have been reduced..." Cross reference with Dune Delineation evaluation. Sentence likely needs to be deleted from the INRMP. May be a legacy statement from pre-restoration actions on the North-end dunes. Statement was likely true in the 1990's, but per the 2013-2014 Dune Delineation Report located in the INRMP Appendix, the dunes have recovered and there is sufficient dunal vegetation on the majority of the dunes. VMRC verified the dune delineation and indicated that the NASO DNA's dunes are excellent examples of successful restoration actions resulting in Naturalized Dunes.	Michael Wright
	Section 2.6.2.2	Need to update Piping plover observation information.	Michael Wright
	Section 2.6.2.2.1	VDGIF had not completed State wide surveys since 2010. In FY15 a project was awarded to complete a mapping effort of suitable nesting habitat, nest location surveys, and eagle fledgling tracking. Surveys and tracking, will commence Winter of 2015. Flights completed, 03 Apr 2016 and 05 May 2017, no eagle nests documented on installation; however, nests were document adjacent to the installation within a 2,640ft buffer of the installation boundary.	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
	Section 2.6.2.2.2	Updated confirmation observations: 21 Aug 2014 by Paul Block, NAVFAC LANT NRS as part of the installation's funded annual shorebird survey efforts; 29 Jun 2016, by Michael Wright, INRM, during morning nesting sea turtle patrols (potential nest, unable to confirm via 30 Jun survey effort, though evidence the next day indicated it may have been predated by coyotes).	Michael Wright
	Section 2.6.2.4.1	Oct 2015 determined to be not warranted for listing under ESA. (Fish-American eel). Not finding is in Litigation.	Michael Wright
	Section 2.6.2.5	Info. needs to be updated with previously discussed species and more details provided associated with all species. In particular monarch butterfly, candidate species for listing under ESA, needs to be added and the Appendix information associated with pollinator species needs to be referenced.	Michael Wright
	Section 3.11.3 and Appendix H, Enclosure 17	Program is currently understaffed. An assessment of need was funded in FY15 to be completed in FY16/17. This assessment should be utilized to direct staffing levels and/or cooperative agreement requirements. This assessment should be added to the INRMP appendix and should be referenced here and in other appropriate INRMP locations.	Michael Wright
	Section 3.11.3, paragraph 2	Delete, the term Game Warden. This term is obsolete conservation officer is now the universal term since these individuals enforce more than Game Species laws. (Apply this throughout document.)	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
	<p>Section 3.10.4, pg 3-30 paragraphs 2-3 of 5</p>	<p>Need to update with current information. There are no known eagle nests on the property, as of 05 March 2017 surveying efforts; however, there are known eagle's nests on adjacent landowner property. The installation falls within one or more of the USFWS defined buffers in accordance with BAGEPA of an active nest. Eagles are occasionally observed on the property. Eagles begin establishing nesting territories in the fall, and have active nests over the winter and early spring months. Surveys may be required to ensure there are no violations of established eagle buffer distances (activity should be prepared to fund any required surveys). Coordination with the installation Natural Resources Manager will need to be maintained to ensure no new nests or roosts are established prior to the project construction time-line. Consultations with USFWS and VDGIF may be required. USFWS & VDGIF Distance Buffers associated with active nests (in parenthesis are examples of types of activities extending from the nest out the associated distance requiring regulatory agency consultation and possibly permits: *330ft (motorized watercraft and ATV use, non-motorized recreation/human entry); *660ft (construction, land alterations, etc.); *1,000ft (helicopter and fixed-wing aircraft); *2,640ft (blasting operations, fireworks, and other loud, intermittent noises). Navy awarded a Cooperative Ecosystems Studies Unit Agreement with W&M CCB to survey for eagle nests and track offspring associated with any known nests (survey completed 03 Apr 2016).</p>	<p>Michael Wright</p>

Date Adjusted	Section/Page	Comment	Reviewer
	Various	<p>Need to add Information on Natural Resources Emergency Nuisance and Emergency Wildlife Notification Processes.</p> <p>Need to update with information regarding dead animal notifications and who responds and when they respond.</p> <p>Dead Animals are potential zoonotic disease vectors just as much as living animals. Animals found dead in human populated areas of the installation should be disposed of via cremation (especially when origin of death or animal condition of health cannot be determined or is uncertain).</p>	Michael Wright
	Section 3.10.5.1	<p>Need to add to section on Inactive Nests: Anyone seeking to remove an inactive nest on the installation, prior to removal, must coordinate with the installation NRM. All nest removals must be appropriately documented in order to identify problem locations over time and to update existing Navy databases.</p>	Michael Wright
		<p>Need to add to appropriate sections of INRMP text: If the activity proposes to conduct night operations or install lighting in association with this project, the activity should NOT install lighting that could disorient birds migrating at night. Activity should follow Unified Facilities Criteria (UFC), Interior and exterior lighting systems and controls and ensure: Lighting structures be installed that minimize ambient light (light should be directed/shielded downwards, not up or out), the following website provides examples of acceptable and unacceptable lighting fixtures <http://darksky.org/lighting/lighting-basics/>; and light-bulbs to be installed should utilize a color temperature of no more than 3000 Kelvins (NO blue-rich white lights), utilizing “warm-white” or filtered LEDs can meet this requirement. This may mean more poles have to be installed than what would be required for higher kelvine bulbs to meet any lighting requirements. Following these measures can gain the installation/project Bird Safe LEAD lighting credits. The Activity should take every precaution to avoid potential negative impacts to Migratory Birds. This project is located along the Atlantic Flyway.</p>	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
		<p>Need to add to appropriate sections: The Activity should take every precaution to avoid potential negative impacts to Migratory Birds. This project is located along the Atlantic Flyway. In addition there are known Threatened and Endangered Species that migrate through this area. Landscape alterations (i.e., Tree removal, mowing, land clearing, etc.) actions should occur during months with minimal impacts to migrating and nesting birds. United States Fish & Wildlife Service's (USFWS) recommended time frame for vegetation clearing activities = Nov-Feb. If birds of conservation concern are identified as utilizing this area additional consultations and permit requirements with USFWS may be required. For habitat disturbing activities that must be conducted during the active breeding season, the contractor must perform a pre-job clearance survey by a qualified wildlife biologist (credentials must be provided to the Contract Manager and Installation Natural Resources Manager) to identify any active nests and implement avoidance measures for those particular nests. If any nests are found during these surveys, the contractor must contact the installation natural resources program manager (NRM). The NRM will provide further guidance and coordinate obtaining permits and the associated removal of the nest's, once approved.</p> <p>Project must conduct a survey of migratory birds if conducting vegetation clearing activities in the months of Mar, Apr, May, Jun, Jul, Aug, Sep or Oct. The survey boundary and nest locations must be surveyed with a Global Positioning System (GPS) and placed into an appropriate Geographic Information Systems (GIS) geodatabase. The GIS data must be compliant with the current Navy Data Model Standard Environmental Module (to obtain details, coordinate with the NAVFAC ML EV GIS Coordinator). Any data (date, surveyor name, species, species behavior, nest activity, etc.) not included in the geodatabase, must be placed in tables that can be joined to the associated GIS data. The geodatabase, associated tables, and photos must be provided to the installation NRM and NAVFAC MIDLANT Environmental GIS Coordinator.</p> <p>As of 27 April 2016 the USFWS IPAC system documented 36 species of Breeding Birds of Conservation Concern (BCC) that could occur on the project site. Any take of a migratory bird (including possession of parts of a bird), an active nest, or eggs is a violation of the Migratory Bird Treaty Act, unless appropriate permits and authorizations are obtained. Installation has suitable eagle nesting & roosting habitat.</p> <p>Note: Once a project site has been confirmed to not have any birds nesting on-site, the contractor/activity should conduct daily site checks to harass birds off of the project site and remove any items that look like the start of a nest being built (sticks, moss, other piled debris, etc.). For protected species of birds, once a nest has been established and is active (containing eggs or hatchlings) work must cease until the birds fledge the nest or until appropriate permits and authorizations are granted to remove the nest.</p>	<p>Michael Wright</p>

Date Adjusted	Section/Page	Comment	Reviewer
	Appendix D, Enclosure 5; Appendix J, Enclosures 1 and 2; various	Installation Instructions (Hunt/Fish/Firewood) = Update/Create and update INRMP Accordingly.	Michael Wright
20171025	Appendix F, Enclosure 6 Still need to update INRMP text	Insert Sea Turtle BO received 21 Oct 2016 & Update INRMP accordingly	Michael Wright
20171025	Appendix H, Enclosure 17	Brief ICO on the Conservation Law-enforcement Program Needs Assessment Results and Update INRMP accordingly, after ICO briefing.	Michael Wright
20171025	Appendix M, Enclosure 3	Insert FY16 INRMP Metrics Results & Associated Briefing/Presentation Materials. Delete FY2015 metrics information.	Michael Wright
	Appendix H, Enclosure 9	Insert Feb 2016 Listed Species Survey into INRMP appendices.	Michael Wright
	Appendix H, Enclosure 4	Insert VIMS Dune Delineation Confirmation in the INRMP appendices with the Dune Delineation Report/Survey.	Michael Wright
	various locations	Update INRMP to reflect 2016 Piping Plover, Rosete Tern, and Sandhill Crane observations.	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
	Throughout	Update Special Status Species Content & lists in the INRMP. Several new State listed species have been added since 2014. An updated comprehensive Species of Concern Inventory is planned to be awarded in 2019 with targeted species of concern surveys in 2019/20.	Michael Wright
20171025	Appendix C, Enclosure 2	Delete Capt. Schager's EV Policy Letter and replace with Capt. Meadows' letter.	Michael Wright
	Appendix I, Enclosure 3	Update with current VNHP & VDGIF documents on rare flora, fauna, and communities.	Michael Wright
	Appendix H, Enclosure 18	Add Enclosure for the Installation's Shorebirds Survey Report.	Michael Wright
	Appendix H, Enclosure 19	Add Enclosure for the Installation's Anuran Acoustic Recorder Survey Report.	Michael Wright
20170809	Appendix K, Enclosure 9	Delete Invasive Species Brochure and replace with 2017 updated brochure.	Michael Wright
	Appendix K, Enclosure 3	Update Appendix K, Enclosure 3 to Read "Feral Animal Control" and insert VDGIF Feral Hog Flyer	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
	Appendix E, Enclosure 1	Replace 2011/2016 USACE PJD Wetlands documents/maps with the 2016 documents.	Michael Wright
	Appendix D	Need to add enclosures for installation directory, encroachment action plan, and restrictive easements.	Michael Wright
	Appendix H	Need to add the Environmental Restoration Plan Site Mngt. Plan	Michael Wright
	Appendix D, Enclosure 4	Add updated Landscaping Guidance and associated Native Species lists.	Michael Wright
	Appendix D, Enclosures 1 & 2	Insert 2016 & 2017 Tree City USA/ Arboday Information.	Michael Wright
	Appendix J	Add an Enclosure for Permits: USFWS Sturgeon Permit; VDGIF Kill Permit; VDGIF T&E Species Permit.	Michael Wright
	Appendix H	Add EMS Internal Audit Plan.	Michael Wright
	Throughout as appropriate	Asiatic sand-sedge has been confirmed to occur on the installation as documented in appendix H/encl 9 and appendix K/encl 9. At least 6 small patches have been documented. The largest patch appearing along the installation border with SMR-Camp Pendleton. NASO DNA & SMR-CP NR teams have partnered to try and eradicate this species. Update INRMP with 2016 Fall NPLD event information and resulting follow-on actions/partnerships.	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
	Appendix K, and throughout text as appropriate	Add non-lead ammunition brochure to Appendix K. Update INRMP text to reflect impacts of lead on wildlife and humans and update hunting program to reflect 2017 introduction of voluntary non-lead ammunition program.	Michael Wright
20171025	Appendix H, Enclosure 16	Remove 2013 Integrated Pest Mngt. Plan (IPMP) and Insert 2016 IPMP	Michael Wright
	Throughout	Recommend revising INRMP's Goals and Objectives to be more clear and quantifiable. Each INRMP project is relevant to at least one of the overarching goals; however, the objectives need to be better stated to ensure it is clear what INRMP projects accomplish those objectives and vice versa.	Michael Wright
	Throughout	Rewrite the INRMP to better mirror Navy and DoD Guidance documents for how INRMPs should be structured and the information that should be included in each of those sections. Consider combining NASO/NALFF and NASO DNA INRMPs into one INRMP.	Michael Wright
	Appendix A, Enclosure 1	NEPA documentation for INRMP Implementation is dated. The overarching Goals of the INRMP are the same; however, there have been significant updates and data collection since the original NEPA EA was completed. Updated EA needs to be structured to follow current DOD/Navy EA structure guidance.	Michael Wright

Date Adjusted	Section/Page	Comment	Reviewer
	Throughout	Update text and appendices to reflect information from the following documents: May 2019, Sea Turtle SOP; Dec 2017, 2018 and 2019 Sea Turtle Program Annual Reports; and Sep 2019, NLEB Survey Report. Ensure all surveys and reports received between 2014 and 2020 are incorporated into the INRMP accordingly.	Michael Wright

PLAN UPDATES

This Integrated Natural Resources Management Plan (INRMP) addresses existing future requirements and identifies projects to be implemented. INRMPs should contain the most up-to-date natural resources information, and updates and revisions may be necessary to maintain a proactive management plan. Natural resources managers are encouraged to use geographic information systems (GIS) to supplement their INRMP and to incorporate the guidance and recommendations contained in “Conserving Biodiversity on Military Lands: A Guide for Natural Resources Managers” (Benton et al. 2008 and Chief of Naval Operations Operating Instruction [OPNAVINST] 5090.1C Change Transmittal 1 [Ch-1]).

In accordance with the Integrated Natural Resources Management Program (32 CFR Appendix to Part 190), the Sikes Act Improvement Act of 1997, and the United States (U.S.) Department of the Navy (Navy) Environmental Readiness Program Manual (OPNAVINST 5090.1C Ch-1, Chapter 24), installations are required to perform an informal annual review to ensure INRMP information is current, and to evaluate the effectiveness of their INRMP.

The annual INRMP review must be completed in cooperation with the appropriate U.S Fish and Wildlife Service (USFWS), the National Oceanic and Atmospheric Administration (NOAA) National Marine Fisheries Service (NMFS) and state fish and wildlife agency field-level offices. Measure of the success of the INRMP and identification of any issues associated with implementation of the INRMP will result from collaboration with cooperating partners (Navy 2006a). A Memorandum of Understanding (MOU) was signed in 2013 between the U.S. Department of Defense (DoD), USFWS, and state fish and wildlife agencies acting through the Association of Fish and Wildlife Agencies and established under the authority of the Sikes Act. The purpose of this MOU, referred to as the Sikes Tripartite MOU, is to further the cooperative relationship between these federal and state agencies in preparing, reviewing, revising, updating, and implementing INRMPs for military installations. In accordance with DoD Manual 4715.03, the DoD is required to invite USFWS, appropriate state fish and wildlife agencies, and NOAA NMFS (when relevant) to participate in the INRMP review process at installations that contain natural resources under their respective jurisdictions.

The annual review also provides an opportunity to incorporate changes in accepted environmental conservation practices and scientific advances associated with evaluation and implementation of natural resources management. If necessary, the annual review will include an update to the INRMP that includes an updated project list, documentation of significant changes to natural ecosystems, and updates to information contained in the INRMP appendices. Forms to document annual reviews are included in this document, and should be used to document changes to the INRMP that will improve natural resources management. Each entry in the update form should reference the plan section and page number that is being updated to facilitate quick cross-referencing.

Installations are not required to revise their INRMP within a specified time interval; however, a formal review is required every five years in coordination with USFWS, NOAA NMFS (as applicable), and state partners (Navy 2006a). If USFWS and state partners agree, the completed annual review forms may be used in lieu of a formal review. Minor revisions to the INRMP should be completed annually to reduce the need for a more costly and time consuming revision

following the formal five-year review. Annual reviews should be fully documented each year to provide each installation the option to utilize the annual review documentation to fulfill the formal review requirement whenever possible. If results of the formal review determine that the existing INRMP is effective, the INRMP need not be revised. Any revisions to the authorities and guidance documents driving plan update requirements would be implemented as appropriate during the annual or formal review periods.

Annual and formal reviews of this INRMP will occur every five years in coordination with the USFWS, the NOAA NMFS, and the Virginia Department of Game and Inland Fisheries (VDGIF). The formal review shall verify that all environmental compliance projects have been budgeted for and implemented on schedule; that all required natural resources positions are filled with trained staff or are in the process of being filled; projects and activities identified for the coming year are included in the INRMP; all required coordination has been conducted; and that all significant changes to the installation's mission requirements or its natural resources have been identified. The Navy class and hierarchy system for INRMP projects, which identifies which projects qualify as environmental compliance projects, are described in Sections 5.4.1 (Programming and Budget Classification) and 5.4.2 (Project Classification).

INRMP modifications that are necessary are usually covered by the original Environmental Assessment (EA) prepared for the INRMP; however, INRMP modifications should be reviewed to compare the original action documented in the existing INRMP to the proposed modifications to determine if modifications to the INRMP are significant. If INRMP modifications are deemed to be not significant, updated actions will be covered by the original National Environmental Policy Act (NEPA) documentation. Proposed INRMP updates that are deemed significant will require additional NEPA documentation, usually at the EA level.

Activities that may constitute an INRMP revision include, but are not limited to: a change in mission requirements or intensity of land use; a significant change in natural resources baseline conditions; a determination that the old INRMP has proven to be inadequate, was not able to be implemented, or show that projects are ineffective in meeting natural resources management goals as evidenced from monitoring results; natural resources management goals have changed, or the planning horizon of the previous INRMP has expired; or, base realignment and closure actions have been put into effect. Any of these activities should be brought to the attention of the USFWS, NOAA NMFS, and VDGIF during the formal review process.

EXECUTIVE SUMMARY

The United States (U.S.) Department of Defense (DoD) manages approximately 30 million acres (approximately 12 million hectares) of land in the U.S (DoD No date [n.d.]). Each military installation that has suitable habitat for conserving and managing natural ecosystems is required to prepare, maintain, and implement an Integrated Natural Resources Management Plan (INRMP). This INRMP was prepared for the Naval Air Station Oceana, Dam Neck Annex (NASO DNA or Installation), which includes the former Virginia Army National Guard Camp Pendleton and Naval Amphibious Base Little Creek South Virginia Beach Annex (formerly known as Camp Pendleton) portions of the Installation, located at the northern end of the NASO DNA parcel. This INRMP has been prepared in accordance with the following authorities, which were current at the time the INRMP was updated. Revisions to the following authorities and guidance documents would replace the older version, and any necessary changes to the INRMP would be documented during the annual review, or incorporated into the INRMP at the time it is updated:

- DoD Manual 4715.03, INRMP Implementation Manual, 25 November 2013;
- Chief of Naval Operations Operating Instruction 5090.1C Ch-1, Environmental Readiness Program Manual, 18 July 2011;
- Navy Procedural Manual Naval Facilities (NAVFAC) P-73, Vol. II, Natural Resources Management Procedural Manual; 01 May 1987:
- U.S. Code (USC) §670 a-f, the Sikes Act Improvement Act, 18 November 1997;
- Federal Endangered Species Act of 1973 (16 USC §1531-1544, 87 Stat. 884), as amended; and
- 32 Code of Federal Regulations (CFR) Part 190, DoD Natural Resources Management Program, 01 July 2009.

Organization of Document

The INRMP is organized into the following sections:

Section 1 – Introduction. This section provides a discussion of the purpose of the INRMP and the policies that drive it; the goals of the INRMP; details regarding the location and regional setting of the Installation; a brief overview of the history and mission of NASO DNA; and an overview of natural resources management on the Installation including existing natural resources partnerships, data management including geographic information system, and environmental planning.

Section 2 – Existing Conditions. This section describes the existing physical and natural conditions at NASO DNA. Included are climate; physiography and soils; hydrology; ecological communities; flora; fauna; and rare, threatened, and endangered species.

Section 3 – Natural Resources Management Issues. A number of management issues that are relevant to NASO DNA are discussed in this section to help identify responsibilities, opportunities, and potential conflicts in natural resources management.

Section 4 – NASO DNA Natural Resources Management Units. This section provides discussion of natural resources management issues and recommendations for the NASO DNA management units with varying land use constraints and mission requirements. Continuing and new natural resources management actions are identified for each unit.

Section 5 – INRMP Implementation. This section identifies the requirements for INRMP implementation. In particular, this section describes achieving no net loss, NEPA compliance, project development and classification, funding sources, commitments, and use of cooperative agreements.

Section 6 – References. References and internet resources that were used in the development of this document are listed in this section.

Appendix A – National Environmental Policy Act and Coastal Consistency Documentation and Information. Appendix A includes information on National Environmental Policy Act and Coastal Consistency and related documentation prepared or received for NASO DNA, related to the INRMP.

Appendix B – Agency Correspondence. Appendix B includes agency correspondence received in regards to the NASO DNA INRMP, including comments received on the INRMP and mutual agreement letters.

Appendix C – Designation Letter. Appendix C includes a copy of the designation letter which allows the Commanding Officer to delegate authority to an Environmental Director to implement natural resources management activities through the Installation’s Natural Resources Specialist.

Appendix D – Urban Forestry, Grounds Maintenance, and Landscaping Management. Appendix D includes resources for urban forestry, grounds maintenance, and landscaping management at NASO DNA, including Tree City USA application, draft proclamation, pruning and planting guidelines, and native plants for landscaping.

Appendix E – NASO DNA Preliminary Jurisdictional Determinations. Appendix E contains the NASO DNA Preliminary Jurisdictional Determinations (2011 and 2012).

Appendix F – Marine Mammal, Sea Turtle, and Essential Fish Habitat Management. Appendix F includes resources for marine mammal, sea turtle, and essential fish habitat management at NASO DNA, including standard operating procedures for sea turtles at NASO DNA, marine resources stranding database, Virginia Aquarium Stranding Response, Section 7 consultation materials, a biological opinion issued on the Back Bay National Wildlife Refuge Sea Turtle Management Program (2011) and updated to include NASO DNA (2012), and a summary of essential fish habitat and general habitat parameters for federally managed fish species. The essential fish habitat information is provided for species that have the potential to occur in the vicinity of the NASO DNA nearshore environment and not all fish species listed are known to occur at NASO DNA.

Appendix G – Encroachment and Adjacent Land Use. Appendix G contains figures related to encroachment and adjacent land use at NASO DNA.

Appendix H – Surveys and Plans. Appendix H includes copies of recently completed surveys and plans, as well as placeholders for plans scheduled to be completed at NASO DNA during the INRMP plan period.

Appendix I – Flora and Fauna. Appendix I includes the flora and fauna species lists for NASO DNA, and a list of fish and wildlife species identified as Species of Greatest Conservation Need for the Mid-Atlantic Coastal Plain in the Virginia State Wildlife Action Plan (SWAP).

Appendix J – Wildlife Management. Appendix J includes resources for wildlife management at NASO DNA, including fishing and hunting instructions, guidance on feral cats and dogs, and a prescribed burn and smoke management plan.

Appendix K – Educational Outreach. Appendix K contains educational outreach materials for NASO DNA.

Appendix L – Cross-Reference of Integrated Natural Resources Management Plan Guidance for Navy Installations to DoD INRMP Template. Appendix L provides a cross-walk comparison of the NASO DNA INRMP sections with the DoD INRMP template requirements.

Appendix M – Naval Air Station Oceana Dam Neck Annex Environmental Program Requirements Project Updates/Budget Execution Plans. Appendix M includes the Natural Resources Project information for the INRMP, including annual INRMP updates and metrics.

Appendix N – Naval Air Station Oceana Dam Neck Annex Large Size (11” x 17”) INRMP Figures. Appendix N includes a complete set of 11” x 17”-sized INRMP figures.

Map Figures

The Commander, Navy Region Mid-Atlantic’s GeoReadiness Center is the single, authoritative source and distribution point for all geospatial information within the area of responsibility of the Navy Mid-Atlantic Region and is managed by the Mid-Atlantic Facility Engineering Command GIS Division. The GeoReadiness Center houses the most current geospatial information (including aerial photography) for the entire Navy Mid-Atlantic Region and provides access to the comprehensive data set and analysis tools to Regional and DoD decision makers/managers, sponsored contractors, and other sponsored individuals via a secure government Internet site. GIS data for NASO DNA, including those environmental layers used for the development of this INRMP, can be accessed through this portal. Environmental planners, project managers, engineers, and sponsored contractors are encouraged to use the portal to access GIS data for analysis, development of maps and project planning. In addition, the portal provides guidance documentation for the collection of new geospatial data.

The map figures presented in the INRMP are based on Navy and publicly available data, and most include base imagery with true color 1-foot (0.3 meters) resolution satellite imagery from Esri World Imagery (Sources: Esri, DigitalGlobe, GeoEye, i-cubed, USDA, USGS, AEX, Getmapping, Aerogrid, IGN, IGP, swisstopo, and the GIS User Community), publically available at http://goto.arcgisonline.com/maps/World_Imagery. All GIS data created or modified for use in this INRMP will be submitted to the Navy Technical Representative and Installation Natural Resources Manager upon completion of this project.

The INRMP text contains standard size figures, with a complete set of larger-sized (11” x 17”) INRMP figures included in Appendix N.

Management Actions and Major Initiatives

The management actions identified for NASO DNA natural resources management program are intended to help the Commanding Officer manage natural resources effectively to ensure that Installation lands remain available and in good condition to support the military mission and to ensure compliance with relevant environmental regulations. These actions incorporate the principles of ecosystem management and are consistent with Navy policy on sustainable, multiple use of natural resources on Navy property. Projects and management actions that have been identified for implementation during the plan period are detailed in Appendix M. The following are some of the plan’s major initiatives:

- review plans and proposed actions to ensure consistency with the Virginia Coastal Zone Management Program and to help obtain a consistency determination when required;
- review plans for projects that have the potential to impact wetlands against NASO DNA wetland delineation maps, and assist the proponent of an action in applying for and obtaining all required state and federal wetlands permits;
- ensure the NEPA planning and documentation process is implemented for proposed development or land use changes on NASO DNA lands;
- manage the NASO DNA hunting and fishing programs to maximize outdoor recreational opportunities and maintain the Installation’s deer and fish populations within carrying capacity;
- implement habitat management practices that promote ecosystem diversity and functionality;
- protect the Installation’s state and federally protected species and their associated natural habitats including areas identified as special interest areas by the state;
- implement sea turtle monitoring protocols, as described in the Standard Operating Procedures for sea turtles at NASO DNA (2013), along the Atlantic coast from mid-May through mid-August, when turtles are most likely to nest in the area;
- implement dune protection measures including installing fencing and posting informational signs to prevent excess vehicle access roads that dissect the fragile dunes ecosystem; and
- encourage implementation of integrated pest management practices throughout the Installation.

1.0 INTRODUCTION

1.1 PURPOSE AND AUTHORITY

In accordance with 32 Code of Federal Regulations (CFR) Part 190, Department of Defense (DoD) Manual 4715.03, Chief of Naval Operations Operating Instruction (OPNAVINST) 5090.1C Change Transmittal (Ch-1) Chapter 24, Naval Facilities Engineering Command (NAVFAC) Real Estate Operations and Natural Resources Management Procedural Manual 73 (NAVFAC P-73), and the Sikes Act Improvement Act (SAIA or Sikes Act) of 1997 (16 United States Code [USC] §670a-f), the United States (U.S.) Department of the Navy (Navy) must implement and maintain a balanced and integrated program for the management of natural resources. To facilitate the Navy's Natural Resources Program (NRP), the Secretary of the Navy is further directed to prepare and implement an Integrated Natural Resources Management Plan (INRMP) for each military installation that has suitable natural resources. The INRMP must ensure that natural resources management practices comply with all pertinent laws and regulations and, in accordance with Navy policy, must incorporate ecosystem management as the basis for planning and management. In addition, the Sikes Act requires the INRMP be prepared in cooperation with the Secretary of the Department of Interior, acting through the Director of the U.S. Fish and Wildlife Service (USFWS); the Secretary of the Department of Commerce, acting through the Director of the National Oceanic and Atmospheric Administration (NOAA), National Marine Fisheries Service (NMFS); and the head of the Virginia Department of Game and Inland Fisheries (VDGIF). The INRMP must reflect the mutual agreement of these parties concerning conservation, protection, and management of fish and wildlife resources. Such mutual agreement and cooperation will support the principles of ecosystem management by improving the management of ecosystems that cross federal, state, and private boundaries. Under the SAIA, all new INRMPs also must be submitted for public review and comment before final acceptance. To fulfill this requirement, National Environmental Policy Act (NEPA) documentation has been prepared for the INRMP and is presented in Appendix A. Federal and state agency correspondence is included in Appendix B, and updated mutual agreement letters will be inserted into Appendix B upon receipt. The information included in this INRMP update does not represent a significant change, and does not require additional environmental review beyond what was covered by the Environmental Assessment (EA) prepared in 2006 for the INRMP.

Appropriations for implementation of the Sikes Act were recently reauthorized until 30 September 2019 as part of the House of Representatives Bill H.R. 910 that was passed in June 2013. While no significant changes were associated with this reauthorization, the bill did identify the need for DoD installations to improve their commitment to implementation of the Disabled Sportsmen's Access Act of 1998. This Act strives to improve access and provide adaptive equipment for disabled active and former military personnel for hunting, fishing, and/or other outdoor recreational activities on military installations (see Section 3.11.1).

1.2 SCOPE

An INRMP's scope comprises all lands, ranges, nearshore areas, and leased areas 1) owned by the U.S. and administered by the Navy; 2) used by the Navy via license, permit, or lease for

which the Navy has been assigned management responsibility; or 3) withdrawn from the public domain for use by the Navy for which the Navy has been assigned management responsibility (Navy 2006a).

This INRMP outlines conservation efforts and establishes procedures to ensure compliance with related environmental laws and regulations during INRMP implementation over the five-year duration of the plan. Development of this INRMP included input from state and federal stakeholders in addition to cross coordination with other appropriate Navy programs. As required under the SAIA, this INRMP reflects mutual agreement of agencies concerned with the conservation, protection, and management of fish and wildlife resources, including the USFWS and the VDGIF. This INRMP provides the direction for natural resources management at Naval Air Station (NAS) Oceana, Dam Neck Annex (NASO DNA or Installation); however, it does not replace or affect any federal laws, or state responsibility and authority for protecting fish and wildlife resources.

NASO DNA does not have any leased properties managed for natural resources, for example agricultural outleases, and as such, this INRMP does not cover management of leased areas.

This INRMP covers a five-year period, but as ecosystems are dynamic and Installation requirements are subject to frequent modification, natural resources management must be flexible. To accommodate these changes, this INRMP will be reviewed and updated annually by Installation personnel and revised and reapproved after five years in coordination with USFWS, NOAA NMFS, and VDGIF. Natural Resources (NR) personnel will have responsibility for maintaining the currency of this document.

1.3 OBJECTIVES

This INRMP is a long-term planning document that guides implementation of the Installation NRP. The INRMP supports Installation missions, while protecting and enhancing natural resources and providing a variety of outdoor recreational opportunities for Installation personnel. This INRMP integrates all aspects of natural resources management, including the various components of the Environmental Compliance, Environmental Restoration Program, and Cultural Resources programs, as well as the management of sensitive species, wetlands, watershed and floodplain protection, wildlife, grounds maintenance, pest management, and outdoor recreation, with the current military mission. In accordance with the SAIA and OPNAVINST 5090.1C Ch-1, this plan must provide for:

- fish and wildlife management, land management, forest management, and fish- and wildlife-oriented recreation;
- fish and wildlife habitat protection and enhancement;
- wetland protection, enhancement, and restoration;
- integration of, and consistency among, the various activities conducted under the plan;
- establishment of specific natural resources management objectives and time frames for proposed actions;

Introduction

- sustained use by the public of natural resources to the extent such use is consistent with the needs of fish and wildlife management and subject to installation safety and security requirements;
- enforcement of natural resources laws and regulations; and
- no net loss in the capability of military lands to support the military mission of the installations.

1.4 RESPONSIBILITIES

The Sikes Act requires qualified professionals to implement environmental management programs. Implementation of the INRMP at NASO DNA is the responsibility of all NR personnel at the Installation, including the NASO DNA Commanding Officer (CO), who is responsible for managing all aspects of the Installation's natural resources; the NASO DNA Environmental Director; the NAVFAC Mid-Atlantic Regional Natural Resources Manager (NRM); the Installation Natural Resources Specialist (NRS) and NRM; and other Installation personnel. The CO has delegated the authority to an Environmental Director within the Environmental Office to implement natural resources management activities through the Regional NRM (See Appendix C for Designation Letter). The NRM responsible for natural resource management at the Installation is based at NAS Oceana, and also is responsible for natural resources management at NAS Oceana, Naval Auxiliary Landing Field (NALF) Fentress, and Naval Support Activity Hampton Roads Northwest Annex. Other Installation personnel, such as security, grounds maintenance, Morale, Welfare and Recreation (MWR) Department, housing, and safety have functions overlapping the NRP, but report to the Environmental Director on natural resources-related issues. The Regional NRM also oversees natural resources management for other installations in the Mid-Atlantic Region, including NAS Oceana and NALF Fentress, Naval Support Activity Hampton Roads Northwest Annex, Naval Weapons Station Yorktown, and Joint Expeditionary Base (JEB) Little Creek – Fort Story.

The Installation CO's Environmental Policy (Navy 2011a) has made certain commitments that include, but are not limited to:

- compliance with federal, state and local environmental laws, regulations and policies,
- integration of environmental stewardship into operational decisions;
- pollution prevention at its source whenever possible; and
- continual improvement of the Installation's environmental performance.

Stakeholders of NASO DNA natural resources include federal and state natural resources agencies, local governments and landowners, civic and conservation groups, and the Navy. For this INRMP, a stakeholder is an individual, group, or agency that has the responsibility or mandate to preserve and manage Installation natural resources, that has a right or privilege to make use of the natural resources, or that may be affected directly or indirectly by natural resources management actions conducted at the Installation.

1.4.1 Installation Stakeholders

The organization chart below (Figure 1-1) illustrates the Navy chain of command for NASO DNA. OPNAVINST 5090.1C Ch-1, Section 1.4 provides a detailed description of environmental responsibilities associated with different positions within the Navy. To implement the INRMP while ensuring successful accomplishment of the military mission, the Commander, Navy Region Mid-Atlantic (CNRMA), acts as a trustee for NASO DNA. At the Installation level, the NASO DNA CO and the Installation NRM are directly involved in implementation of this INRMP, while ensuring successful implementation of the military mission. The NASO DNA CO is responsible for ensuring that NASO DNA personnel comply with the laws and requirements relevant to the conservation and management of natural resources. The Installation NRM is responsible for the daily implementation and coordination of the INRMP, as well as ensuring this INRMP is reviewed annually and updated as necessary to reflect current natural resources conditions, and formally reviewed and updated every five years as required by the SAIA. In addition to these responsibilities, the Installation NRM also manages a Microsoft Access database that contains survey, permit/regulatory consultation, and project review information; and is responsible for storing and maintaining equipment need to conduct management of natural resources at the Installation and to support this INRMP. The Regional NRM provides additional assistance to the Installation NRM for implementation of the INRMP.

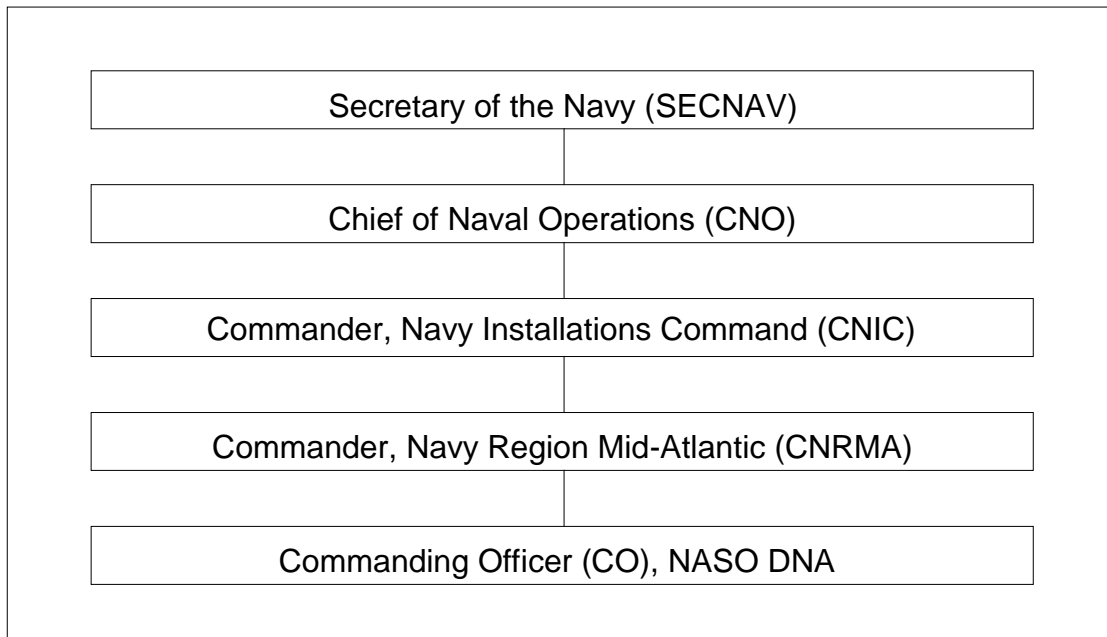

Figure 1-1. NASO DNA Command Organization.

Although these positions hold the primary responsibilities, all personnel at the Installation—public works/civil engineering personnel, legal staff, the public affairs representative, the local fire department, and the waterfront security officers—play important roles in supporting the plans and objectives identified in this INRMP, including ensuring environmental compliance within military operations. Other Installation stakeholders, including the Navy’s MWR Department, Environmental Engineers Office, Public Works Department (PWD), Navy contractors working at NASO DNA and the NASO DNA commands are responsible for sustaining natural resources for economic and recreational purposes, and/or for natural resources management and protection. Table 1-1 provides a list of stakeholders currently involved with natural resources management at NASO DNA.

Table 1-1. Stakeholders of NASO DNA Natural Resources.

Navy	
Naval Facilities Engineering Command, Atlantic	Naval Air Station Oceana Dam Neck Annex (NASO DNA) Commanding Officer
Naval Facilities Engineering Command, Mid-Atlantic	Command Navy Region Mid-Atlantic
NASO DNA Environmental Office	Major Shore Commands of NASO DNA
Morale, Welfare, and Recreation Department	Navy Recycling Program
Hampton Roads Sanitation District	Navy Personnel
Federal, State, and Local Agencies	
United States (U.S.) Fish and Wildlife Service	Virginia Department of Game and Inland Fisheries
U.S. Department of Agriculture (USDA), Natural Resources Conservation Service	USDA Wildlife Services
U.S. Geological Survey	U.S. Environmental Protection Agency
U.S. Army Corps of Engineers	City of Virginia Beach
National Oceanic and Atmospheric Administration, National Marine Fisheries Service	U.S. Forest Service
Virginia Department of Forestry	Virginia Department of Conservation and Recreation

Non-Governmental Organizations and Individuals	
Department of Defense Partners In Flight	Military Retirees
The Nature Conservancy of Virginia	Dependents of Navy Personnel
National Audubon Society	Virginia Institute of Marine Science
Back Bay Watershed Partnership	Lake Christine Watershed Partnership

1.4.2 External Stakeholders

State and federal agencies, such as USFWS, NOAA NMFS, VDGIF, U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS), U.S. Environmental Protection Agency (EPA), and U.S. Army Corps of Engineers (USACE) are the primary external stakeholders responsible for natural resources protection and preservation. The SAIA requires

that this INRMP be prepared in cooperation with, and reflect mutual agreement of, the USFWS, NOAA NMFS, and the VDGIF. This requirement affords them signatory authority as external stakeholders and approving officials of this INRMP. Cooperation and coordination with these agencies is an integral part of the Navy's NRP.

Other external stakeholders include non-governmental organizations (NGOs) and individuals who make use of those natural resources, such as civilian groups, including residents of the surrounding communities who have access to, or are affected by, the condition of NASO DNA natural resources, and private conservation organizations.

NASO DNA has established several partnerships with government agencies and NGOs. These are described in Section 1.12 (Partnerships and Outreach).

1.4.3 Technical Assistance

Technical assistance to implement this INRMP may be provided to the CO and NRM from the Navy or by outside agencies. Assistance from outside agencies is normally provided through individual agency requests and formal cooperative agreements, whereas assistance from within the Navy is normally less formal. During the five-year management period of this INRMP, additional cooperative agreements may be implemented. Technical assistance from organizations outside the Navy may include USFWS, VDGIF, USDA NRCS, USDA Forest Service, and The Nature Conservancy (TNC). Technical assistance from within the Navy may be provided by staff from the Installation Environmental Office, NAVFAC biologists, foresters, and soil conservationists, and additional staff, as needed and subject to funding, to be hired by the Installation to complete the continuous work to ensure successful implementation of this INRMP. Options for supplemental labor resources from outside the Navy for implementation of this INRMP include volunteers from local organizations and groups such as Boy Scouts of America, students from local public and private schools and universities, ecology clubs and conservation groups, retired and/or senior citizens. Options for supplemental labor resources also would be available from volunteer civilian and military personnel, and their dependents.

1.5 COMPLIANCE AND STEWARDSHIP

Compliance in terms of an INRMP refers to actions that must be taken in order to abide by the statutes and regulations applicable to natural resources. These are actions that an installation is legally mandated or obligated to take in order to meet current or recurring natural and cultural resources conservation management requirements, and for which it must obtain funding. Examples of compliance actions include developing, updating, and revising INRMPs; conducting biological surveys to inventory rare, threatened, and endangered species; and conducting wetland surveys for planning, monitoring, and/or permit applications. Compliance is essential, so these projects are of the utmost priority.

Stewardship is the responsibility to inventory, manage, conserve, protect, and enhance the natural resources entrusted to one's care in a way that respects the intrinsic value of those resources and the needs of present and future generations. Installations are required to recognize and balance environmental stewardship with mission readiness in retaining control and use of Navy land, sea, and air space for the purpose of maintaining the military mission. Conscious and

active concern for the inherent value of natural resources must be given in all Navy plans, actions, and programs (OPNAVINST 5090.1C Ch-1, Chapter 24). Stewardship projects and programs enhance an installation's natural resources, promote proactive conservation measures, and support investments that demonstrate Navy environmental leadership. Examples include education and public awareness projects, biological surveys or habitat protection for non-listed species, or management and execution of volunteer and partnership programs. Stewardship is an important component of the Navy's Environmental Readiness Program, and because stewardship projects can occur on an indefinite time-scale, these projects are prioritized after compliance projects.

1.6 LOCATION AND REGIONAL SETTING

NASO DNA is located in the southeastern portion of the City of Virginia Beach, Virginia (Figure 1-2) and encompasses approximately 1,900 acres (ac) (769 hectares [ha]). The Installation is bounded by the community of Sandbridge to the south; the Atlantic Ocean to the east; Hampton Roads Sanitation Division, City of Virginia Beach Properties, and private properties to the west; and Virginia Army National Guard - Camp Pendleton to the north. Several other military installations including JEB Little Creek – Fort Story and NAS Oceana are also located in Virginia Beach. NASO DNA is under the jurisdiction of CNRMA (Navy 2002a). Changes in Navy ownership of lands in the Hampton Roads area, such as from acquisitions, transfers, and establishment of easements, adjusts the total acreage under the jurisdiction of the CNRMA from year to year.

Land uses surrounding the Installation include industrial, commercial, residential, recreational, and agricultural though most of the agricultural lands are rapidly being converted to residential and recreational developments. Because of the intense level of development in the region, NASO DNA and the other coastal military installations are extremely important to the region's ecology. These installations, along with First Landing State Park (formerly Seashore State Park) to the north and Back Bay National Wildlife Refuge (BBNWR) and False Cape State Park to the south, support the few remaining tracts of undeveloped dune ecosystems along the southeastern Virginia coast. NASO DNA contains approximately 4.0 continuous miles (mi) (6.4 kilometers [km]) of primary and secondary coastal dune habitat. Recognizing and managing the beaches and dune system at NASO DNA as a contiguous ecosystem will help ensure the protection and appropriate management of this important natural resource.

1.7 HISTORICAL OVERVIEW AND MILITARY MISSION

NASO DNA was founded in November 1941 when the Navy established a training center, the Anti-Aircraft Range, Norfolk at Dam Neck to provide a live firing range to train fleet gunnery crews. This facility was located on undeveloped land south of Dam Neck Road. The Installation originally housed a firing line, one control tower, one magazine, one office, and one shop. On 04 April 1942, the activity was commissioned as the Anti-Aircraft Training and Test Center. During that year, land was acquired for rifle and pistol training ranges. Expansion continued through 1960, with construction of administrative and training facilities. During the 1980s, facilities for five new tenant commands were constructed at the south end of the Installation, and in 1988 133

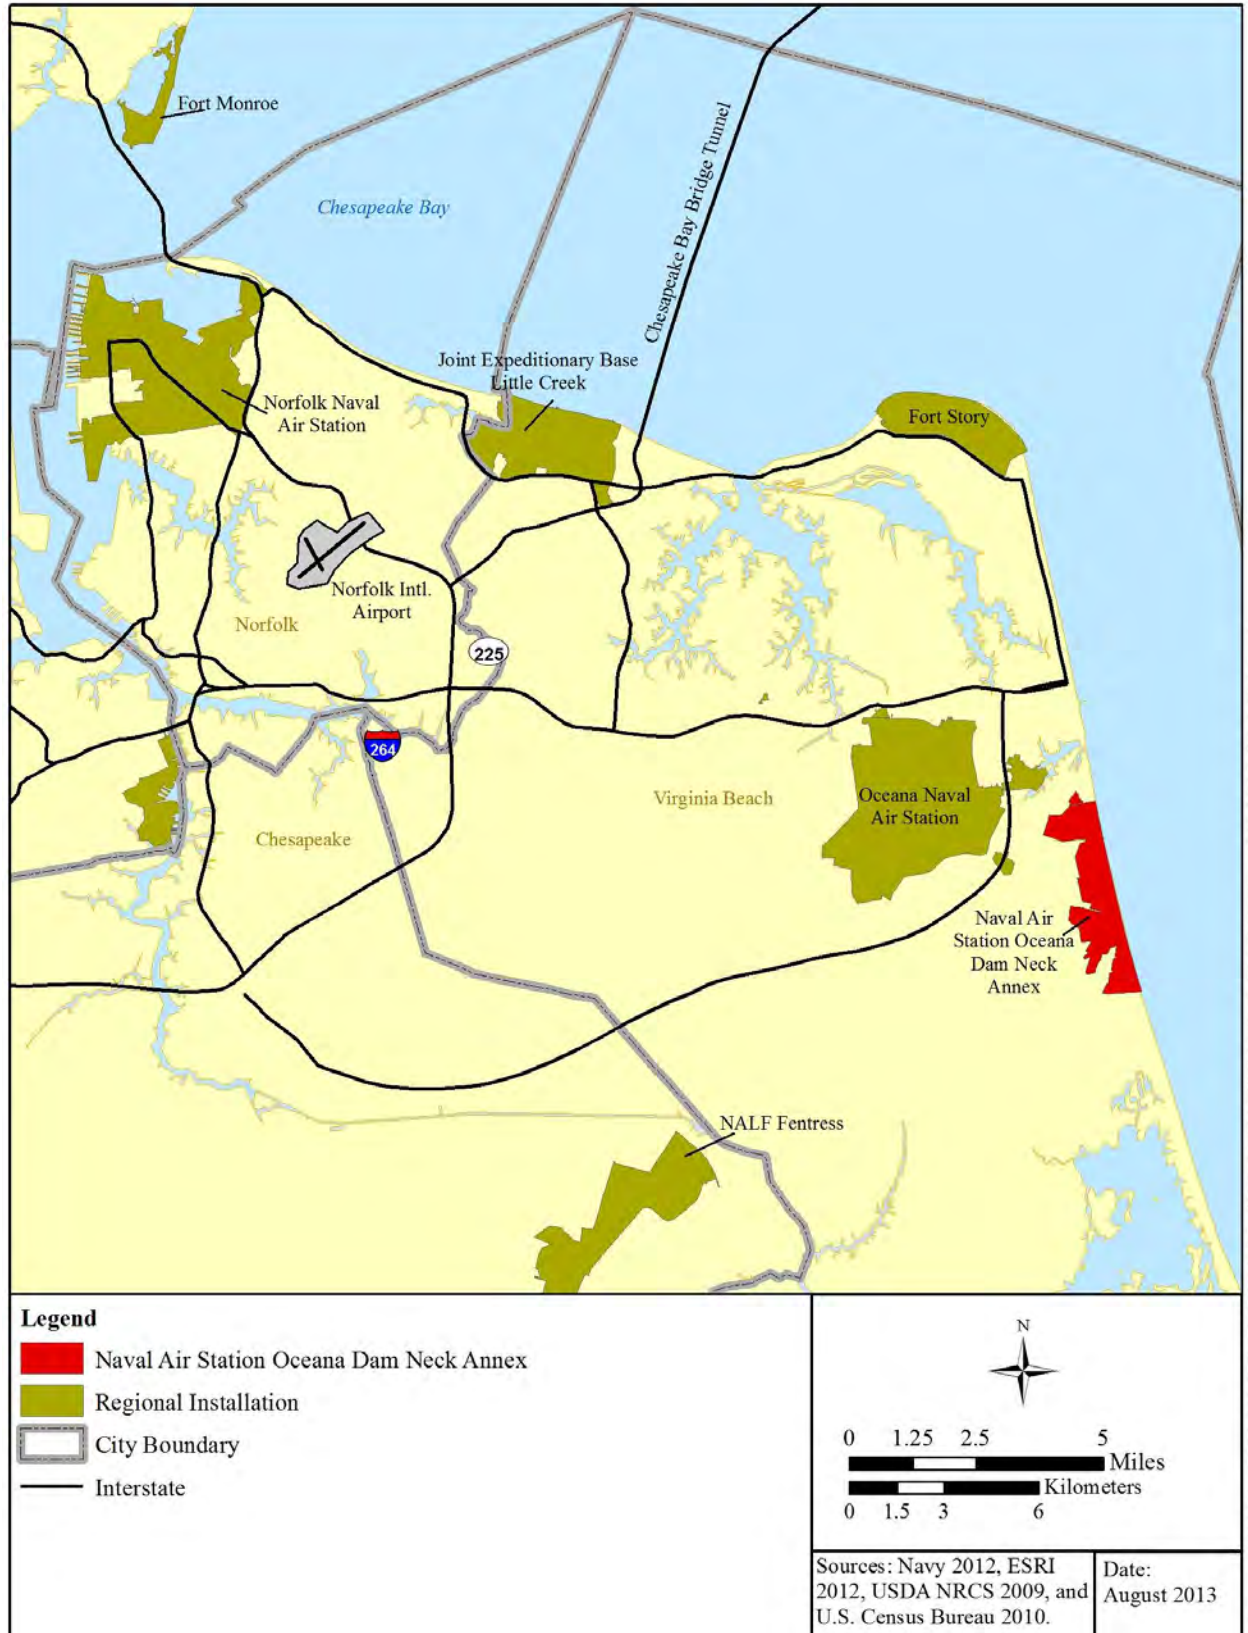

Figure 1-2. General Location of NASO DNA.

ac (54 ha) of additional land north of Dam Neck Road were acquired. This area was previously referred to as the north outparcel. In 1996 agricultural land south of Dam Neck Road was acquired to serve as a buffer zone against encroaching development and expansion space for military operations. This area, which was previously referred to as the south outparcel, added an additional 188 ac (76 ha) of land to NASO DNA.

The northernmost area of the Installation was originally acquired in 1947 by the federal government through leasehold condemnation from Virginia. Until federal acquisition, the property had been part of the adjacent Camp Pendleton State Military Reservation, which is still used by the Virginia Army National Guard. The major tenant command associated with this area of the Installation is the Marine Air Control Squadron 24 (MACS 24) compound and radar tower in the northeastern portion of the Installation, a reserve center along the northwestern border, a landing craft air cushion (LCAC) training area in the beach and dune areas, and an explosives test facility in the area north of Lovetts Marsh (Figure 1-3). The northern-most area of the Installation is used for training, testing and evaluation in special warfare, ordnance, overland assault, beach assault, and tactical air operations radar. In 2004, command of this area was transferred from Naval Amphibious Base Little Creek (now JEB Little Creek – Fort Story) to NAS Oceana. The previous terminology used to describe this parcel separately as the South Virginia Beach Annex (Camp Pendleton) is no longer utilized, as this area is managed as one contiguous installation along with the southern portion of the parcel (formerly known as Dam Neck Annex). The total Installation acreage changes periodically as parcel boundaries are changed, or parcels are added or removed. The current total Installation acreage, as provided by the Navy Real Estate Office, is 1,919 ac (777 ha). Total acreage based on Navy geographic information system (GIS) data for the Installation and used throughout this document for natural resources summary purposes, is 1,830 ac (741 ha).

Today, NASO DNA is part of NAS Oceana and is home to numerous major tenants: Commander Undersea Surveillance; Naval Education and Training Command, Center for Personal and Professional Development; Center for Surface Combat Systems Unit; NAS Oceana Dam Neck Annex Command Staff; Tactical Training Group, Atlantic; Distributed Training Center, Atlantic; Galley; Marine Air Control Squadron 24; Navy and Marine Corps Intelligence Training Center Marine Detachment; Maritime Civil Affairs and Security Training Command; Marine Corps Intelligence Schools; Medical/Dental Clinic; Maritime Intelligence Fusion Center, Atlantic; Navy Region Mid-Atlantic Fleet Readiness MWR & Child & Youth Programs; Naval Facilities Engineering Command Mid Atlantic PWD; Combat Direction Systems Activity; Navy Expeditionary Intelligence Command; Navy Exchange Service Command; Navy Federal Credit Union; Navy and Marine Corps Intelligence Training Center; Naval Ocean Processing Facility; Naval Surface Warfare Center Port Hueneme Division, Virginia Beach Detachment; Naval Special Warfare Development Group; Tactical Training Group, Atlantic; Training Support Center Hampton Roads; Naval Air Warfare Center, Aircraft Division, Atlantic Targets & Marine Operations; and Commander Navy Region Mid Atlantic Fire Station #8. The mission of the Installation is to provide quality education and training to sailors in specified combat systems operation and maintenance, specialized skills training, training systems support to operational and systems commands, and to perform other functions and tasks as directed by higher authority. Daily, over 5,600 instructors, students, and support personnel live or work at NASO DNA.

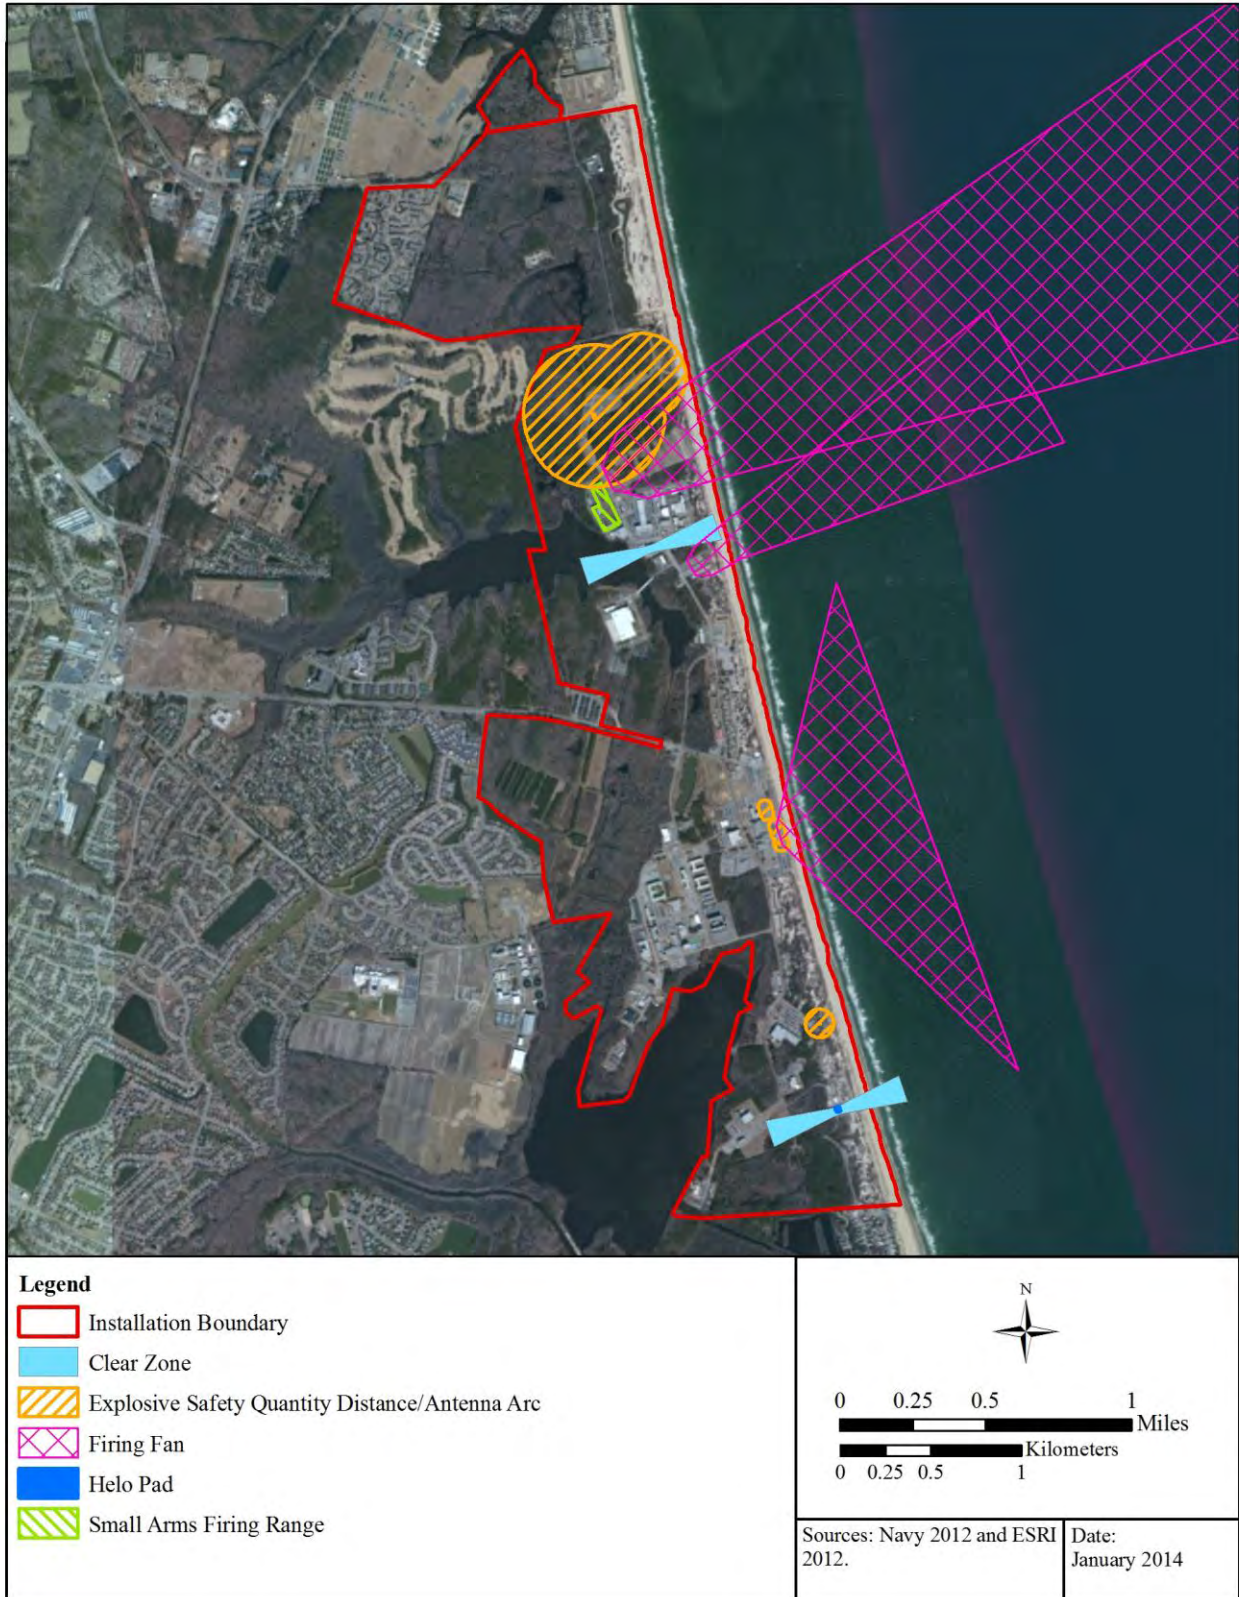

Figure 1-3. Training and Support Facilities of NASO DNA.

NASO DNA offers a number of training facilities that support the major command missions, with approximately 16,000 students trained annually in over 210 courses of instruction (MyBaseGuide 2012). Training, testing and evaluation facilities operated at NASO DNA include, but are not limited to, the following:

- **Small-Arms Firing Ranges:** The Installation's three small-arms ranges are located in the northern portion of the Installation and include a 50-yard (46-m) outdoor pistol range, a baffle range, and a 900-yard (823-m) rifle range
- **Weapons Gunline:** The weapons gunline is located in the center of the Installation on Viking Avenue. The gunline consists of concrete structures that support gun turrets and gun mounts for all weaponry currently in use. This facility is currently inactive.
- **Helicopter Pad:** NASO DNA has one helicopter pad.
- **Weapons Compound:** An 11-ac (5-ha) magazine compound stores munitions used at NASO DNA.
- **The Beach and Dune Training Areas:** Amphibious landing exercises using LCACs and other amphibious vehicles occur on the north end of the beach. The military mission of NASO DNA requires foot-traffic access to Installation dunes.

A number of these facilities have associated noise and safety buffers that constrain land use and resource management within the area. Training facilities located at NASO DNA and their associated air clear zones, firing range safety zones, and explosive safety quantity distance arcs are shown in Figure 1-3.

NASO DNA also supports military training requests from commands stationed at other installations. For example, LCAC and Explosive Ordinance Disposal detachment commands complete training at NASO DNA; however, the military personnel are stationed at JEB Little Creek – Fort Story or other installations. Additional land utilization requests from the military and public are reviewed for environmental and military mission conflicts at the time they are received.

1.7.1 Mission Impacts on the Environment

The Navy recognizes that military training and other operational activities have the potential to impact the environment and takes precautions to avoid or minimize degradation or harm to natural resources. Mission-related impacts are potentially greatest in the environmentally sensitive beach and dune areas, and wetland areas of NASO DNA.

Amphibious landing exercises involving LCACs and other amphibious vehicles are the primary training activity that impacts beach and dune areas at NASO DNA. The amphibious landing exercises, which occur up to four times per month, involve one to four amphibious vehicles maneuvering across the beach. Support personnel also dig foxholes to establish beachhead. Major impacts associated with training activities that occur in the beach and dune areas include accelerated beach and dune erosion and the loss of significant ecological communities. In the northern area of NASO DNA, nearly all of the primary and secondary dunes have been reduced

to remnant systems with little remaining dune vegetation. Military construction (MILCON) is another major source of disturbance on the beach and dune area at NASO DNA. Numerous buildings have been constructed in these fragile habitats, resulting in the loss of roughly one-third to one-half of the original dune system. Less disturbing activities include physical training, recreational activities, security patrols, and the maintenance of buried communication cables. A summary of beach operations that occur at NASO DNA is provided in Table 1-2. Beach and dune erosion resulting from these activities is an ongoing natural resources issue and has been addressed by various shoreline stabilization projects (Navy 1991 and Virginia Institute of Marine Science [VIMS] 2004). If impacts to this sensitive environment are not avoided or mitigated, beach and dune erosion will ultimately result in the loss of this unique training environment.

Wetlands are another sensitive resource that has the potential to be impacted by training and other mission-related activities. Construction and other disturbances that impact wetlands or alter hydrology are the primary causes of loss or degradation of wetlands at NASO DNA. Any action with the potential to impact wetlands is coordinated with USACE, Virginia Department of Environmental Quality (VDEQ), and when appropriate, the City of Virginia Beach Wetlands Board to obtain appropriate permits.

1.7.2 Integration of Military Mission and Sustainable Use

The Navy has taken a proactive approach towards integrating the military mission with concepts of sustainable land use by recognizing that efficient and effective land use planning supports military readiness and sustainability, while also protecting and enhancing the natural resources for multiple use, sustained yield, and biological integrity. Development and human use are inherently limited on military lands that are kept in their natural condition to support the military mission, often resulting in lands that have extremely high ecological value due to high biodiversity, an abundance of rare species, and presence of specialized habitats. As a result, DoD's land management responsibilities include acting as a steward for hundreds of our nation's rarest species and most characteristic habitats (Stein 2008) without compromising the preparedness of the Armed Forces. At the same time, using the land in a sustainable way that preserves the integrity of the ecosystem is vital to ensuring that military mission activities may continue to be conducted on these lands over the long term.

The Navy understands the role INRMPs play in identifying potential conflicts between an installation's mission and natural resources, and identifying actions necessary to maintain the availability of mission-essential properties and acreage. An INRMP balances the management of natural resources unique to the installation with military mission requirements and other land use activities affecting an installation's natural resources (DoD and USFWS 2002). The Installation is responsible for ensuring the accomplishment of the military mission in a way that sustains and enhances the natural resources on the installation. The NRM accomplishes this requirement by working in close cooperation with military operators to ensure mutual support and understanding.

The nature of military mission activities at NASO DNA does result in ground-disturbing impacts to natural resources, especially within the beach and dune areas located along the eastern boundary. Although the Installation is located in a developed, urban area, the Installation has

Introduction

Table 1-2. Beach Operations at NASO DNA.

Activity	Beach Operations	Area	Time of Day	Frequency
Command Undersea Surveillance	Rebury communications cables spanning beach	South end of NASO DNA past fishing beach	N/A	Every few years; advanced notice given
Amphibious Landing Exercises *	Over the Beach landing exercises; amphibious vehicles (1-4) and supporting personnel maneuver across beach and dig foxholes in sand to establish beachhead	North end of DNA beach	Variable; 2-4 hour blocks	Up to four times a month
U.S. Army *	Over the Beach landing exercises	South end of NASO DNA beach near Loon Ct.	Variable	Four times per year
Marine Corps (MACS 24) *	Physical training on beach	North end of NASO DNA beach	Morning, daylight	Three to four times per week
Morale, Welfare, and Recreations (MWR) **	April-November; beach cleanup and trash pickup with two pickup trucks and beach-cleaning machine	Recreational beaches: Sea Breeze Beach and Shifting Sands Beach	April-November daily (0600-1000 hrs)	Once per day
	May-September; set up 6-10 lifeguard stands, two rental trailers, volleyball nets, and wooden barricades	Recreational beaches: Sea Breeze Beach and Shifting Sands Beach	Present on beach throughout summer season	May be relocated short distances daily
Recreational Activities	May-September; swimming, surfing, beachcombing, kayaking, fishing, volleyball, etc.	Recreational beaches: Sea Breeze, Surfing, Shifting Sands, and Fishing beaches	Beach open to recreation daily (1000-1800 hrs)	Eight hours per day
Security ***	Patrols along beach	Entire NASO DNA beach	Beach patrols begin at daybreak	Continuous throughout the day during the summer season

* Beach operations for military training units limited to small unit training (≤ 40 personnel). Specialized military training geared to low visibility with minimum equipment and personnel quantity to simulate tactical combat realism. No live fire or explosives are involved.

** Recreational public beaches limited to military personnel and their families. Number of visitors may peak at 50 individuals daily on weekdays and 200 individuals daily on weekends.

*** Security patrols usually limited to one truck and one all-terrain vehicle with two to three personnel.

strived to conserve special habitats identified within the beach and dune habitats, and in other areas with natural resources value, such as wetland areas, located throughout the Installation.

1.8 OVERVIEW OF THE NATURAL RESOURCES PROGRAM

1.8.1 History and Accomplishments

Originally the southern portion of NASO DNA (formerly the Dam Neck Annex) was managed separately from the northern portion of the Installation (formerly Camp Pendleton), with the northern portion included under the management of Naval Amphibious Base Little Creek (now JEB Little Creek – Fort Story). The natural resources management program for the former Dam Neck Annex area began in 1984, when MWR hired a park technician/game warden to implement the deer hunting program. This position was moved to the Base Civil Engineering Department in 1990. With this transfer came additional job responsibilities and the park technician became the NRS. The NRP at the former Camp Pendleton portion of NASO DNA began in 1992 when a NRM was hired and stationed at JEB Little Creek. An INRMP was previously developed for the former Dam Neck Annex area (Navy 1998a), with the former Camp Pendleton parcel covered by the INRMPs prepared for JEB Little Creek – Fort Story (Navy 1997).

In 2000, under Navy reorganization, the NRP at NASO DNA became part of the CNRMA NRP, which is overseen by a Regional Environmental Compliance Group Manager. Other resource specialists within the group who helped facilitate natural resources management were the Regional Media Managers, the NAVFAC Regional Forester, and Regional Outreach Specialist. In 2007, the NASO DNA NRP reorganized again and became a part of NAVFAC Mid-Atlantic. Currently, the regional forester and regional outreach specialist positions are vacant. The Installation is currently supported by the NAS Oceana NRS/NRM, the NAS Oceana Biological Science Technician, a regional/NAS Oceana Conservation Law Enforcement Officer (CLEO)/Biological Science Technician, and NAVFAC Mid-Atlantic and NAVFAC Atlantic NR staff as requested. The NAS Oceana NRM and Biological Science Technician service NAS Oceana, NASO DNA, NALF Fentress, and Naval Security Activity Hampton Roads Northwest Annex. The NRM also provides technical assistance to additional properties assigned to the NAS Oceana PWD for oversight (i.e., Navy Dare County Bombing Range in NC and several Naval/Marine Corps Support Operating Centers located in VA, NC, and WV). The CLEO services a total of 11 installations in SE VA/NE NC. The regional NR staff (NAVFAC Mid Atlantic) provide assistance upon request to Naval Facilities from ME to NC. As discussed in Section 1.4, the daily natural resources management at NASO DNA is the responsibility of the NAS Oceana NRM.

Program areas for which NR personnel have oversight include forestry, fish and wildlife management, threatened and endangered species protection, habitat conservation and restoration, and overseeing the hunting and fishing program. Another important function of NR personnel is ensuring compliance with federal, state, and regional environmental regulations. To this end, and in accordance with 32 CFR Part 190, DoD Natural Resources Management Program, all current and planned mission activities such as master planning, construction requests, site approval requests, and training exercise plans must be coordinated, in a timely manner, through

NR personnel. An overview of program highlights and accomplishments since the inception of the NRP at NASO DNA include the following:

- receipt of letters of appreciation from multiple sources since the 1980s, including, but not limited to Boy Scouts of America (Tidewater Council), National Aquarium (Baltimore, Maryland), Virginia Aquarium and Marine Science Center, Chesapeake Bay Foundation, Old Dominion University, and various DoD military commands;
- recognition by various programs of the Virginia Beach Clean Communities Commission in 1994 and 1997;
- receipt of Tree City USA certifications from the National Arbor Day Foundation annually since 1999 (Appendix D);
- receipt of the Chief of Naval Operations (CNO) Natural Resources Conservation Award in 1996, 1998, and 2009;
- receipt of the National Public Lands Day Financial Assistance Award (Dune Restoration) 6 out of 7 years from 2006-2012;
- annual participation in Earth Day and Clean the Bay Day celebrations, and annual celebration of the NASO DNA Arbor Day celebration (held on the second Monday in April each year);
- receipt of preliminary jurisdictional wetland determinations in 2011 and 2012, resulting in wetland delineation coverage of all of NASO DNA, with the exception of a small portion south of the fenceline that is known to contain wetlands. Wetland delineations completed to date have identified approximately 922 ac (373 ha) of wetland habitats (Appendix E);
- effective management of whitetail deer (*Odocoileus virginianus*) populations through a regulated hunting program;
- annual donations of venison to “Hunters for the Hungry” and fund-raisers to raise money for processing the deer meat;
- planting of beach grasses along 4.0 mi (6.4 km) of coastal sand dune habitat, and completion of a dune restoration site in association with the Disaster Preparation Team (formerly the First Lieutenant’s Division) and volunteers;
- participation in annual sea turtle nest recognition and marine mammal stranding training;
- received concurrence from USFWS with regards to sea turtle management at the Installation and coverage of the Installation by a Biological Opinion (BO) for the BBNWR Sea Turtle Management Program, Virginia Beach, Virginia (Appendix F);
- completion of rare, threatened, and endangered species inventories; and
- protection of the state champion longleaf pine (*Pinus palustris*), which resides at NASO DNA.

1.8.2 Ecosystem Management

Since the early 1990s, federal land managers have increasingly been adopting the concept of ecosystem management. DoD has had an official policy on ecosystem management since 1994 when the Deputy Under Secretary of Defense for Environmental Security issued a memorandum promoting ecosystem management on military installations. DoD Manual 4715.03 further states that natural resources under the stewardship and control of DoD should be managed using ecosystem-based management principles and guidelines that maintains and improves the sustainability and biological diversity of terrestrial and aquatic (including marine ecosystems, as applicable) ecosystems, while supporting sustainable economies, human use, and the environments required for realistic military training operations (DoD 2013). Adopting ecosystem-based management principles and guidelines has required a shift in focus from ensuring that resource utilization is sustainable, to ensuring that the natural ecosystems themselves are sustained. DoD ecosystem-based management principles and guidelines are incorporated by the following:

- maintaining and improving the sustainability and native biodiversity of ecosystems;
- considering ecological units and timeframes;
- supporting sustainable human activities;
- developing a vision of ecosystem health;
- developing priorities and reconciling conflicts;
- developing coordinated approaches to work toward ecosystem health;
- relying on the best science and data available;
- using goals and objectives to monitor and evaluate outcomes;
- using adaptive management; and
- implementing activities through existing installation plans and programs.

1.8.3 Adaptive Management

Ecosystem-based management is best accomplished by using adaptive management techniques. Adaptive management is an iterative cycle of planning, monitoring, evaluation, and adjusting management. Unknown factors and changing conditions require management goals and prescriptions to be adaptable. Periodic reviews of management goals and practices provide the opportunity to incorporate new science and information as well as assess the performance of management actions. Prescribed actions should be considered experimental and subject to change if the expected or desired results are not achieved.

At the installation level adaptive management includes development of flexible management practices to accommodate the evolving scientific understanding of ecosystems and adjusting management practices as necessary, based on, at a minimum, annual INRMP reviews. Installations also accommodate training and test mission changes and coordinate resultant

impacts on existing ecosystem management to preserve both training/testing and conservation processes and objectives. DoD components of adaptive management includes:

- identification and assessment of military mission operations and facility requirements;
- analysis and assessment of risks to natural resources;
- completion of needs assessment surveys;
- monitoring and preparation of the needs assessment results;
- updating natural resources inventories to ensure information is current;
- reanalysis and reassessment of risks to natural resources; and
- incorporation of adjustments into the overall NRP, as necessary (DoD 2013).

1.9 CONSTRAINTS AND OPPORTUNITIES

Due to the urban nature of the Installation, traditional natural resources management (such as forestry, wildlife management, and outdoor recreation) is limited throughout the majority of the Installation area. However, opportunities for habitat improvement, wetlands and water quality protection, and urban tree care exist. Natural resources constraints on training or other mission-related activities at NASO DNA exist throughout much of the Installation.

Natural resources management issues and requirements pose the following constraints to NASO DNA's military mission and to the further development of facility land (Figure 1-4):

- limitation on new construction in wetlands, floodplains, beaches, dunes, and riparian buffer areas;
- conservation and encouragement of protected flora and fauna species habitat; and
- restrictions on allowable uses of the beach and dune habitat, especially habitat conservation and restoration areas.

The major natural resources constraints at NASO DNA include surface waters, including lakes, streams, marshes, and wetlands; floodplain areas; and beach and dune areas. Other constraints to the military mission that are not directly related to natural resources management, but which must be considered, include environmental compliance requirements, restoration activities, cultural resources, and air clear zones, firing range safety zones, and explosive safety quantity distance arcs.

Outside of the military mission, and natural resources and other constraints, the remaining areas of NASO DNA represent opportunity areas where mission activities would not be restricted by mission or natural resources management issues. Opportunities for expansion of training and development are associated with the developed and open areas of the Installation shown on Figure 1-4. In addition to limited open areas at NASO DNA, there are some possible opportunities for the Navy to leverage undeveloped habitat outside of the NASO DNA boundaries in support of the military mission via encroachment partnering (see Section 1.11).

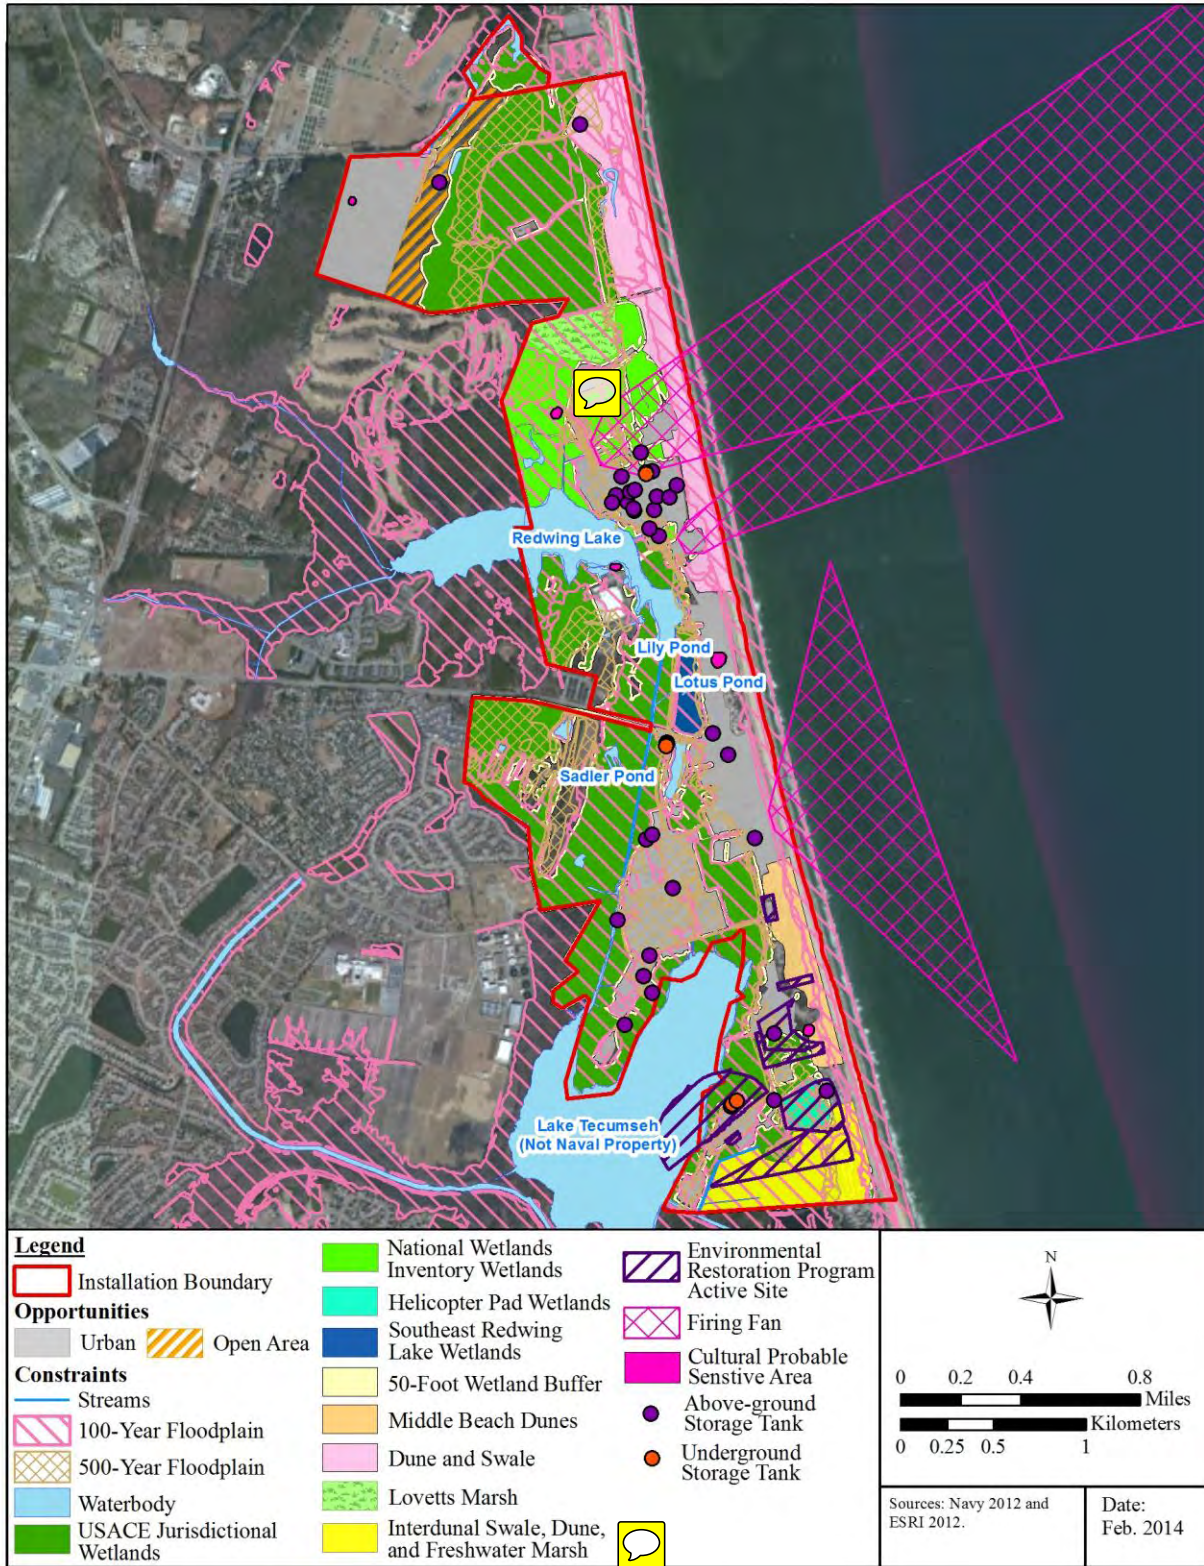

Figure 1-4. Constraints and Opportunities of NASO DNA.

1.10 INRMP INTEGRATION WITH OTHER INSTALLATION PLANS

The preparation and development of an INRMP must be coordinated with the development of other installation plans, planning processes, and National Environmental Policy Act (NEPA) documents as required by DoD guidance (Navy 2006a). Examples of these plans include installation range plans, training plans, integrated cultural resources management plans, pest management plans, and installation restoration plans.

Existing plans or programs that will be implemented in coordination with this INRMP include, but are not limited to:

- Fisheries and Aquatic Resources Management Plan for Redwing Lake, Fleet Combat Training Center – Dam Neck, Virginia Beach, Virginia (2000)
- Storm Water Pollution Prevention Plan (SWP3), Naval Air Station Oceana, Dam Neck Annex, Virginia Beach, Virginia (2012)
- NAS Oceana, NALF Fentress, and NASO DNA Prescribed Burn and Smoke Management Plan (2010)
- Spill Prevention, Control, and Countermeasures Plan and Oil Discharge Contingency Plan, Naval Air Station Oceana, Dam Neck Annex (2000)
- Regional Integrated Cultural Resources Management Plan for Naval Installations in Hampton Roads, Virginia (2012)
- Integrated Pest Management Plan (2013)
- Installation Appearance Plan (2008)
- Installation Encroachment Action Plan
- U.S. Navy Small Arms Range Study (2009)
- Virginia Capes/Northeast Range Complex Management Plan
- Small Arms Range & Explosive Range Development Plans (Draft)

Planning for training activities, other military mission requirements, MWR, natural resources, and other activities on the Installation are coordinated through each of the NAS Oceana NAVFAC PWD divisions and NAVFAC Mid-Atlantic regional personnel as appropriate. The PWD's Environmental Division provides a NRM to review such activities for natural resources concerns and recommendations. All other Environmental Medias have reach back support to NAVFAC Mid-Atlantic regional media managers to review activities for environmental concerns and recommendations between the Installation NRM and the Environmental Planning and Conservation Group. This ensures that the military mission is not compromised and that the Installation is meeting the mandated environmental regulatory requirements. Environmental resources must be considered during the planning and development of future training areas and facilities at NASO DNA, including construction of boat ramps, expansion of firing ranges, infrastructure stabilization/repair, new construction, increases in type and levels of training in existing training/testing/evaluation areas, etc. These reviews are typically conducted via three

different reviewing processes: the Environmental Checklist (Appendix A) review process submitted during the site approval process; the Work Permit review process submitted by a tenant command requesting to conduct in-house work; and the Site Work Induction Board review process where work requests have been submitted that require PWD assistance.

1.11 ENCROACHMENT AND ADJACENT LAND USE

The DoD has established an Encroachment Partnering program, which was authorized under 10 USC §2684a (Agreements to Limit Encroachments and other Constraints on Military Training, Testing and Operations). This program authorizes military services to enter into cost-sharing partnerships with states, their political subdivisions, and/or conservation minded NGOs to acquire lands from willing sellers. This serves to limit development or use of the acquired property, or preservation of habitat that supports military readiness requirements. Undeveloped habitat areas that border NASO DNA present ideal opportunities for the Navy to establish buffers to separate the Installation from encroaching development.

The DoD Readiness and Environmental Protection Initiative supports cost-sharing partnerships authorized by Congress (10 USC §2684a), between the military services, private conservation groups, and state and local governments to protect military test and training capabilities and conserve land (DoD Sustainable Ranges Initiative No date [n.d.]). This initiative enables the military to work with willing partners who help provide cost-sharing land conservation solutions to limit incompatible development and protect valuable open spaces and habitat around key test and training areas. The DoD Readiness and Environmental Protection Initiative provides funding for the military to work with state and local governments, NGOs, and willing landowners to help prevent encroachment. Successful projects have resulted in the expansion of easements and the preservation of land around DoD installations (DoD 2012a).

The City of Virginia Beach adopted a comprehensive plan in December 2009 that outlines how the physical development of the City of Virginia Beach should be directed for at least the next 20 years. As a primary employer in the City of Virginia Beach, the Navy has played an important role in the development of the city. It is critical that Navy representatives continue to participate in the joint decision making process to ensure continued compatible land use around the numerous naval stations in the Virginia Beach region (City of Virginia Beach 2009). Many of the counter-encroachment initiatives and programs which serve NAS Oceana and its satellite installations, including NALF Fentress and NASO DNA, have their genesis in the 2005 Hampton Roads Joint Land Use Study. The most significant of these are the legislative actions by the cities of Virginia Beach and Chesapeake, which incorporated the land use compatibility criteria contained in the Navy's Air Installations Compatible Use Zones (AICUZ) Instruction into the zoning ordinances for each city. The boundaries of the Virginia Beach AICUZ Overlay Zoning District and the Chesapeake Airfield Overlay District are delineated by the Hampton Roads Joint Land Use Study AICUZ Planning Map which was adopted by the cities at the conclusion of the Joint Land Use Study in 2005 (Appendix G) (Lauterbach 2013).

The Hampton Roads Joint Land Use Study also prompted aggressive action by the Navy and cities of Virginia Beach and Chesapeake under the aegis of the DoD Readiness and Environmental Protection Initiative. Referred to locally as the Encroachment Partnering Program, the effort is underpinned by a multi-year agreement for the purchase by the cities of

land located in the Interfacility Traffic Area (i.e., those portions of the cities beneath frequently-used flight tracks between NAS Oceana and NALF Fentress). Acquisitions also have occurred in an area of Virginia Beach designated as the Rural AICUZ Area (Appendix G). From monies received between fiscal year (FY) 2007 and FY 2011, 1,768 ac (715 ha) have been purchased, which have been encumbered with restrictive use easements. In all, the Navy has expended \$25.02 million in addressing encroachment issues in the area (Lauterbach 2013).

An Encroachment Action Plan for NASO DNA was completed in 2009. NASO DNA has no discrete buffer areas; however, a large portion of the Installation lies within the Virginia Beach AICUZ Overlay Zoning District, and thus is subject to development limitations contained in the ordinance. In addition, Section §15.2-2204 of the Code of Virginia requires that NAS Oceana's CO receive written notice at least 30 days before any public hearing for a proposed zoning change to, or development application for, land within 3,000 ft (914 m) of the NASO DNA property line. The NASO DNA Encroachment Action Plan is presently under revision.

A good example of an encroachment action topic is the Lake Tecumseh property, which is located immediately adjacent to NASO DNA and owned by Hampton Roads Sanitation Division. Preservation of the lake is in the best interest of the Navy from an ecosystem management perspective. The lake provides immediate access to recreational opportunities (including boating, fishing, and wildlife viewing) to military and civilians, thus supporting MWR opportunities. However, lake access also poses a security issue associated with the potential for unauthorized access to the Installation by recreationists. The USFWS, a partner agency with the Navy, has proposed acquiring Lake Tecumseh to incorporate it into the BBNWR.

1.12 PARTNERSHIPS AND OUTREACH

The diversity of natural resources found at NASO DNA creates the need for a variety of expertise and assistance in developing and implementing sound management practices. The development of partnerships with state and federal resources agencies, local colleges and universities, and local conservation groups makes such expertise available to NR personnel to accomplish set goals and objectives, and fosters good community relationships. The following is a list of groups and agencies that have formed significant partnerships with the Installation.

- VDGIF provides environmental analysis of projects or permit applications to determine likely impacts on fish and wildlife resources and habitats, and recommends appropriate measures to avoid such impacts. VDGIF provides guidance regarding the management and protection of state threatened and endangered wildlife, with the exception of listed insects. VDGIF is consulted during the INRMP update process and routinely makes valuable contributions to its development.
- The USFWS (terrestrial species and freshwater fish species) and NOAA NMFS (marine species) provides technical assistance with plans on fish and wildlife issues, identification of threatened and endangered species and critical habitat consultation under Section 7 of the Endangered Species Act (ESA) of 1973, fish and wildlife census surveys, and conservation law enforcement (CLE). The USFWS and NOAA NMFS are consulted during the INRMP update process and routinely makes valuable contributions to the development of this INRMP.

Introduction

- USFWS, Office of Fishery Assistance conducted fisheries surveys of Redwing Lake and Sadler Pond, and developed a Fisheries and Aquatic Resources Management Plan (2000).
- The Virginia Department of Conservation and Recreation, Natural Heritage Program (VDCR-DNH) has conducted threatened and endangered species surveys at NASO DNA that provide information on the occurrence of rare, threatened, and endangered species and rare natural communities and their management on the Installation.
- The Virginia Department of Forestry (VDOF) reviews and recommends recertification as a Tree City USA participant annually in support of the NASO DNA urban forest management program.
- VIMS has surveyed coastal erosion rates and is developing a shore change and dune impacts assessment for the beach and dune areas at NASO DNA.
- Virginia Aquarium Stranding Team staff and volunteers provides support in the event of strandings along the NASO DNA coast, and support the Installation's sea turtle nest watch program.
- The National Aquarium in Baltimore partners with the NRP through a Cooperative Ecosystems Studies Unit agreement to complete dune stabilization and restoration projects.
- The Disaster Preparation Team installs dune fencing and recycled Christmas trees on the dunes to protect vegetated dunes from degradation during training activities, and conducts litter cleanups in natural areas and trails.
- Various tenant commands have partnered with the NRP to host Clean the Bay Day, Clean the Base Day, Dune Restoration, and other events.
- The Chesapeake Bay Youth Conservation Corps has participated in beach and dune enhancement and restoration. Other various youth groups have assisted with dune restoration work.
- The Sportsman Quality Management Board works closely with NR personnel to assist with projects that promote ethical hunting.
- The Boy Scouts have built and installed nesting boxes, and have participated in dune restoration projects.
- Navy and non-Navy community citizens and groups from Virginia, Maryland, West Virginia, and North Carolina have volunteered to assist with dune restoration work.
- Military spouses groups and MWR have supported natural resources work on the Installation.
- NASO DNA is located in the South Atlantic Landscape Conservation Cooperative. The cooperative, established as part of the U.S. Department of the Interior's Climate Change Response Strategy, is designed to provide a partnership in which the private, state, tribal, and federal conservation community can work together to address increasing land use pressures and widespread resource threats and uncertainties amplified by a rapidly changing climate (South Atlantic Landscape Conservation Cooperative 2010).

- The Installation NRM is a representative for the Department of Defense Partners in Flight Program and provides assistance and partnering opportunities to all DoD installations within the State of Virginia and others outside of the state upon request primarily related to bird management.
- The Installation NRM was nominated in 2012 as the co-chair of the National Military Fish and Wildlife Associations' Bird/Wildlife Aircraft Strike Hazard (BASH) Working Group. This position promotes partnering and coordination amongst all groups associated with BASH concerns.

1.13 TRAINING OF NATURAL RESOURCES PERSONNEL

The SAIA states “Section 107 of the Sikes Act (16 USC 670e-2) requires sufficient numbers of professionally trained natural resources management personnel and natural resources law enforcement personnel to be available and assigned responsibility to perform tasks necessary to carry out Title I of the Sikes Act, including the preparation and implementation of integrated natural resource management plans.” The effectiveness of this INRMP is greatly enhanced by the professional development of natural resources management staff. Professional development of staff requires maintaining knowledge through training and participation in conferences and workshops.

The management of natural resources requires a specialized skill set on the part of personnel. In addition to holding science-based degrees, environmental personnel acquire skills by attending training through the Civil Engineer Corps Officers School, the Shipley Group, USFWS (National Conservation Training Center), USACE, Wetlands Training Institute, Inc., various university programs, Defense Environmental Network and Information Exchange, and other training centers or vendors as the need arises or training becomes available. Table 1-3 lists contact information for available training.

NR staff keeps current on natural resources issues by attending annual workshops or conferences held by various professional societies. Societies such as National Military Fish and Wildlife Association (NMFWA), The Wildlife Society, Society of American Foresters, and Society for Ecological Restoration all host annual meetings focused on the management of natural resources. Additionally, it is recommended that persons interested in natural resources management familiarize themselves with the natural resources that are accessible within the vicinity of the particular installation. Some options available are visits to nearby parks, reserves and other natural areas with an in-depth field guide to develop a practical sense for the area's natural history.

Table 1-3. Natural Resources Training Opportunities.

A list of core competencies has been developed by the NAVFAC Training Program Coordinator to ensure NR personnel are adequately trained in natural resources management practices. There are four phases of core competencies. Phase I training is required for new media managers, Phase II training is appropriate for existing media managers, Phase III training is required for personnel conducting compliance activities, including inspections at NASO DNA, and Phase IV training is required for general storefront compliance.

A list of required and recommended courses and training opportunities follows. A course identification number (CIN) is given for Navy environmental courses. Other information given includes locations or course providers.

PHASE I – New Media Managers

A. Civil Engineering Corps Officer's School Courses

1. Basic Environmental Law, CIN: A 4A-0058
2. Environmental Protection, CIN: A-4A-0036
3. Introduction to Cultural Resource Management Laws, CIN: A-4A-0070
4. Natural Resources Compliance, CIN: A-4A-0087
5. Ecological Risk Assessment, CIN: A-4A-0081
6. Advanced Environmental Management, CIN: A-4A-0063
7. Pesticide Applicator Training (Core) B-322 1070

B. Navy Occupational Safety and Health Courses

1. Spill Management Team Training, CIN: A-493-0088/5637

C. Other Government Offerings

1. Joint Permit Application (USACE)
2. Range Master Certification (annual)
3. CNO/NAVFAC NRMs Meeting (December, annual)

D. Public Offerings

1. Virginia

- a. Prescribed Burn Management Certification (VDOF)
- b. Land Management Certification for Soil & Erosion Control (VDCR-DNH)
- c. Marine Mammal Stranding Training (Virginia Aquarium and Marine Science Museum)
- d. Chesapeake Bay Act/Coastal Consistency Determinations (VDEQ)

2. NMFWA

- a. NMFWA Conference (March, annual)
- b. Invasive Species Control
- c. Fish and Wildlife Law Enforcement (annual)
- d. BASH
- e. Bats
- f. Climate Change
- g. CLE
- h. Fish and Wildlife Recreation
- i. Herpetology
- j. Invasive Species
- k. Pollinators

E. Other Public Offerings

1. Wetlands Regulations (Wetland Training Institute)
2. 404 Permitting (USACE)
3. NEPA (Duke University)
4. BASH Conference (annual)
5. GIS (Louisiana State University School of Forestry, continual)
6. DoD Pesticide Applicator Certification (2 weeks in Jacksonville, Florida)
7. NAVFAC sponsored courses

PHASE II – Existing Media Manager

A. Civil Engineering Corps Officer's School Courses

1. Ecological Risk Assessment, CIN: A-4A-0081
2. Natural Resources Compliance, CIN:A-4A-0087 (every 3 years)
3. Health & Environmental Risk Communication, CIN: A-4A-0072
4. Historic Preservation Law and Section 106 Compliance, CIN: A-4A-0073
5. Pesticide Re-Certification B 322 1074 (every 2 years)

B. Public Offerings/Courses

1. Wetlands Regulations (Wetland Training Institute)
2. Wetlands Delineation & Practicum (Wetland Training Institute)
3. The Wildlife Society Conference and Workshop (September/October)
4. 404 Permitting (USACE)
5. Joint Permit Application (USACE)
6. BASH Conference (annual)
7. Coastal Zone Management Act (CZMA)/Chesapeake Bay Act/Coastal Consistency Determinations

8. GIS (Louisiana State University School of Forestry, continual)
9. Invasive Species (NMFVA, continual)
10. NMFVA Conference (March, annual)
11. CNO/NAVFAC NRMs Meeting (December, annual)
12. Fish and Wildlife Law Enforcement Refresher (NMFVA, continual)
13. Coastal Ecology/Shoreline Stabilization (VIMS, continual)
14. Forestry Wetlands Permitting
15. Wetlands Construction/Mitigation
16. Society of American Foresters Conference (continual)
17. Southeast Deer Workshop (continual)
18. VDGIF Workshops – various wildlife, game management, and habitat management workshops
19. Gap Analysis (U.S. Geological Survey [USGS])
20. NAVFAC sponsored courses Partners in Flight Meetings and Workshops
21. DoD, National and Regional Partners for Amphibian and Reptile Conservation Meetings and Workshops

PHASE III – Storefront Compliance Technicians

- A. Civil Engineering Corps Officer’s School Courses
- B. Navy Occupational Safety and Health Courses
- C. Other Offerings
 1. In House Media Manager Training Checklist
 2. General Wetlands/Permit Awareness
 3. Marine Mammal Stranding Training (Virginia Aquarium and Marine Science Museum, 2 hours)
 4. National Military Fish and Wildlife Association Conference (annual)
 5. BASH Conference (annual)

PHASE IV – Storefront Compliance Requirements

- A. Environmental Awareness
 1. Provided by media managers (video)
 2. Excerpts from OPNAVINST 5090.1C Ch-1 Chapter 24 (e.g., wetlands, permits)

1.14 GEOGRAPHIC INFORMATION SYSTEMS

GIS is an integral part of natural resources and environmental protection and planning. The CNRMA’s GeoReadiness Center is the single, authoritative source and distribution point for all geospatial information within the area of responsibility of the Navy Mid-Atlantic Region and is managed by the NAVFAC Mid-Atlantic Asset Management Business Line. The GeoReadiness Center houses the most current geospatial information (including aerial photography) for the entire Navy Mid-Atlantic Region and provides access to the comprehensive data set and analysis tools to Regional and DoD decision makers/managers, sponsored contractors, and other sponsored individuals via a secure government Internet site. GIS data for NASO DNA, including

the environmental layers used for the development of this INRMP, can be accessed through the portal at:

https://portal.navfac.navy.mil/portal/page/portal/am/mid-atlantic/am_ml_au/gis.

Baseline data layers used to develop the figures for this INRMP include, but are not limited to:

- Installation boundary and site details
- Installation training facilities
- Topography
- Soils
- Aquatic resources
- Flood zones
- Ecological communities
- Rare, threatened, and endangered species and their habitats
- Regional environmentally sensitive resources
- Bird and bat box locations
- Special interest areas (SIAs)
- Prescribed burn units
- Hunting compartments
- Invasive and nonnative plant locations
- Natural resources management units

Environmental planners, project managers, engineers, and sponsored contractors are encouraged to use the portal to access GIS data for analysis, development of maps and project planning. In addition, the portal provides guidance documentation for the collection of new geospatial data.

1.15 ENVIRONMENTAL PLANNING

The proponent of any action at NASO DNA that has the potential to impact natural resources or may require federal or state permits must coordinate the proposed actions with the NAVFAC Planning Department. The NAVFAC Planning Department is responsible for initiating the Environmental Checklist (Appendix A) through the Environmental Core NEPA Group. Additional review of proposed actions also will be conducted by the Installation NRM for potential environmental impacts.

Advanced planning and coordination are required to ensure compliance with a number of environmental regulations including:

- NEPA, 42 USC §4231 et seq.;
- SAIA, 16 USC §670a-670o;

- Clean Air Act, 42 USC §7401 et seq.;
- Clean Water Act (CWA), 33 USC §1251-1387;
- CZMA, 16 USC §1451 et seq.;
- Migratory Bird Treaty Act (MBTA), 16 USC §703-712; and
- ESA, 16 USC §1531 et seq.

A summary of laws relevant to natural resources management on Navy lands is located in OPNAVINST 5090.1C Ch-1 at the Defense Environmental Network and Information Exchange website:

<http://www.denix.osd.mil/nr/LegislationandPolicy/LawsandStatutes/Index.cfm>

According to OPNAVINST 5090.1C Ch-1, Navy installations are responsible for applying for federal, state, and local permits where appropriate. Regardless of the permit holder, permits for environmental and natural resources actions at Navy installations must be coordinated with the appropriate Regional Environmental Coordinator prior to the permit being signed. Permit conditions shall be coordinated with all affected tenant commands. Examples of permits that may be held by NASO DNA include, but are not limited to, the following:

- CWA permits, including actions related to water quality, wetlands, and waters of the U.S. under the jurisdiction of USACE;
- VDEQ and City of Virginia Beach wetland and water protection permits;
- Virginia Marine Resources Commission (VMRC) permits;
- Virginia Pollutant Discharge Elimination System (VPDES) National Pollutant Discharge Elimination System stormwater permits;
- Floodplain development permits;
- Consumptive use permits for groundwater use;
- Navy NRP permits for hunting, trapping, and archery ranges; fishing; firewood cutting and collection; agricultural land use and timber harvest lease agreements; training area use permits and permissions; and natural resources research lease agreements;
- USFWS wildlife depredation and migratory bird permits for control of nuisance wildlife and birds related to BASH management;
- USFWS special purpose salvage and possession permits;
- Marine Mammal Protection Act (MMPA) permits;
- VDGIF scientific collection, salvage, and kill permits;
- VDGIF deer population reduction program permits; and
- Resource Conservation and Recovery Act (RCRA) hazardous waste permits.

These permits are discussed in greater detail as relevant in subsequent sections of this INRMP.

This page intentionally left blank.

2.0 EXISTING CONDITIONS

2.1 CLIMATE

An understanding of general climate patterns is important to natural resources management because of the affects that weather has on the planning and success of natural resources activities such as tree planting and pesticide application. NASO DNA is located in an area where temperature extremes are moderated by the Atlantic Ocean. The average yearly temperature is 60.0° Fahrenheit (F) (16.0° Celsius [C]). January is the coldest month with an average low of 32.6°F (0.3°C), and July is the warmest month with an average high of 87.4°F (30.8°C). The average growing season (daily minimum temperatures higher than 32.0°F (0.0°C) for a light frost) lasts approximately 250 days from 22 March to 21 November. The average annual precipitation is 45.7 inches (in) (116 centimeters [cm]) and is generally somewhat concentrated in the late summer. The prevailing wind is from the southwest in summer and northeast in winter at an average speed of 10 mi (16 km) per hour. During the hurricane season (June through September), torrential rainfall may accompany these storms with winds greater than 75 mi (121 km) per hour. The average relative humidity is 62 percent (%). The climate summary in Table 2-1 includes data recorded by the Southeast Regional Climate Center at Norfolk International Airport from 1946 to April 2012.

Table 2-1. Weather Data Recorded at Norfolk International Airport (1946–2012).

	January	February	March	April	May	June	July	August	September	October	November	December	Annual
Average Max Temp (°F)	48.9	51.0	58.3	68.2	75.9	83.6	87.4	85.6	80.0	70.3	61.4	52.4	68.6
Average Min Temp (°F)	32.6	33.5	40.2	48.5	57.6	66.2	70.9	70.1	64.8	53.6	43.8	35.7	51.5

2.1.1 Climate Change

DoD Manual 4715.03 requires the Navy to consider climate change in the development of INRMPS to help mitigate impacts on military installations. Information that must be considered when updating climate change information in INRMPS include:

- historical regional trends and projections of future climate or sea level rise relevant to the region;
- information developed for other purposes (e.g. facilities risk assessments) that NR personnel can use to assess climate change impacts or adaptation strategies;
- discussion of sustainability in the context of climate change in the management strategies section, which should support, at a minimum, the development and updating of vulnerability assessments (identified in the INRMP and INRMP project table to ensure allocation of funding);
- information from regional collaborations to develop vulnerability assessments and adaptation strategies; and
- collaboration with DoD mission leads for comprehensive incorporation of training and test vulnerabilities related to climate change (DoD 2013).

In 2009, the U.S. Global Climate Research Program released its *Second National Climate Assessment*, which was written under the authority of the Federal Advisory Committee Act. The report identified several trends and project impacts related to climate change throughout the U.S. as well as within specific regions of the country. The annual average temperature in the southeastern U.S. has risen 2.0°F (1.1°C) since 1970 with the greatest seasonal change occurring in the winter months. There has been a 30% increase in precipitation during the fall over most the region and summer precipitation has decreased over almost the entire region. Additionally, the power of Atlantic hurricanes has increased since 1970, associated with an increase in sea surface temperature. Continued warming is projected, with a lower emission scenario projecting a 4.5°F (2.5°C) increase in average annual temperatures. Sea-level rise also is projected to increase, as will the associated threats of coastal flooding, shoreline retreat and higher intensity hurricanes (U.S. Global Change Research Program 2009).

Impacts due to climate change include more heat-related illness, declines in forest growth and agricultural crop production, declines in cattle production, increased buckling of pavements and railways, and reduced oxygen levels in streams and lakes causing fish kills and declines in aquatic species diversity. The report indicates that sea-level rise and increases in hurricane intensity will be among the most serious consequences of climate change, especially for low-lying areas along the Atlantic coast (U.S. Global Change Research Program 2009).

2.2 PHYSIOGRAPHY AND SOILS

NASO DNA is located in Virginia's outer Atlantic Coastal Plain physiographic province. This physiographic province is characterized as flat with low relief and elevations of 0–60 ft (0–18 m) above mean sea level (msl). Elevations at NASO DNA range from sea level along the beaches to approximately 20 ft (6 m) above msl on the tallest dunes (Figure 2-1). The largest portion of the Installation lies in a low basin behind the primary and secondary dunes and has an elevation of less than 5 ft (2 m) above msl.

*A list of hydric soils for Virginia is available on the USDA NRCS website:
<http://soils.usda.gov/use/hydric>.*

Figure 2-1. Elevation Contours of NASO DNA.

The USDA NRCS (formerly the Soil Conservation Service) prepared a soil survey report for Virginia Beach in 1985. The survey indicates that approximately half of the soils on NASO DNA have properties that severely constrain development. These restrictive soils include the Newhan-Duckston-Corolla association of the beaches and dunes and the very poorly drained, flood-prone Backbay-Nawney association in the marshes and swamps. The hydric soils at NASO DNA are Acredale silt loam, Backbay mucky peat, Chapanoke silt loam, Duckston fine sand, Nawney silt loam, Nimmo loam, and Tomotley loam (USDA NRCS 2009b). Hydric soils are soils that form under conditions of saturation, flooding, or ponding that last long enough during the growing season to develop anaerobic conditions in the upper part and may indicate the presence of a wetland. Fifty-nine (59%) of the soils at NASO DNA are hydric. Other soil types mapped at NASO DNA are Udorthents and Urban Land. Udorthents are soils that have been disturbed by excavation and grading and have had top soils removed. They generally occur in areas of low intensity development. Urban Land occurs in developed areas where more than 80% of the land is covered by impermeable surface such as concrete, asphalt, or buildings. Five (5) % of the soils at NASO DNA are mapped as Udorthents and 11 % are Urban Land.

The Munden and Tetotum soils are considered prime farmland. The Acredale, Augusta, Chapanoke, Dragston, Nimmo, and Tomotley soils are considered prime farmland if drained (USDA NRCS 2011). These soils, with the exception of previously built areas, are regulated under the Farmland Protection Policy Act (7 USC §4201 et seq.), which restricts actions of the federal government that would cause the irreversible conversion of prime and unique farmland to nonagricultural uses. Only a very small portion of the area at NASO DNA (2%) is prime farmland; however, 30% of the area at NASO DNA is considered prime farmland if drained (USDA NRCS 2011). Table 2-2 provides a brief description of some of the major soil characteristics associated with the Installation, and Figure 2-2 shows their location.

2.3 HYDROLOGY

2.3.1 Surface Water

Surface water that occurs on NASO DNA includes a small portion (0.5 ac [0.2 ha]) of Lake Christine, which lies almost entirely within the State Military Reservation to the north of the Installation; approximately 51 ac (21 ha) of Redwing Lake; Sadler Pond, located within the central support area; and several small ponds such as Lotus Pond and Lilly Pond, and areas of open water, which are associated with the extensive marsh system. Areas of Lovetts Marsh and a wetland mitigation site in the northern portion of the Installation may be seasonally flooded and have minimal areas of surface water. Sadler Pond (4.5 ac [1.8 ha]) was excavated in 1969 as part of the Installation picnic area to provide recreational fishing at NASO DNA. Redwing Lake is extremely shallow, and is turbid and eutrophic (Swihart 1982). Redwing Lake and adjacent Lake Tecumseh are connected through an open drainage channel and are connected to Back Bay, which is part of the USFWS National Wildlife Refuge System, through open canal. Lake Tecumseh (also known as Brinson Lake Inlet) forms the southern boundary of NASO DNA but is not a part of Navy property. In 2011, the Hampton Roads Sanitation Division (who owns Lake Tecumseh) in cooperation with the USFWS, installed a weir on Lake Tecumseh to help control sedimentation from the lake into Back Bay.

Existing Conditions

Table 2-2. General Characteristics of NASO DNA Soils.

Soil Series	Soil Type #	Acres	General Description	Drainage Class	Erosion Potential
Hydric Soils					
Acredale silt loam	1	278	Deep, nearly level (0-2% slopes), on broad inland flats, medium fertility, high available water, slow permeability, very slow surface runoff	Poorly drained	Slight
Backbay mucky peat	5	114	Deep, nearly level (less than 1% slope), in broad brackish marshes adjacent to Back Bay, moderate or slow permeability, high available (brackish) water, very slow surface runoff	Very poorly drained	–
Beaches	6	80	Long narrow areas adjacent to the Atlantic Ocean, mostly sandy material deposited by wave action and flooded daily by tides, 0-10% slopes	–	Wind and wave action
Chapanoke silt loam	8	<1	Deep, nearly level (0-2% slopes), on marine terraces on coastal plains, high available water, moderately high water movement, not flooded or ponded	Somewhat poorly drained	–
Corolla-Duckston fine sands	11	26	Deep, nearly level to gently sloping (0-4% slopes), on low flats and in shallow depressions between dunes, very low available water, very rapid permeability, slow surface runoff	Moderately well drained to poorly drained	Wind and water
Duckston fine sand	15	245	Deep, nearly level (0-2% slopes), in shallow depressions between dunes and on low flats between dunes and marshes, low fertility, low available water, very rapid permeability, slow surface runoff	Poorly drained	Slight
Nawney silt loam	21	220	Deep, nearly level (less than 1% slopes), on floodplains and in drainageways, low fertility, moderate available water, moderate permeability, very slow surface runoff	Very poorly drained	Low
Nimmo loam	24	41	Deep, nearly level (0-2% slopes), on broad inland flats, low fertility, moderate available water, moderate permeability, slow surface runoff	Poorly drained	Low
Tetotum loam	36	3	Deep, nearly level (0-2% slopes), on low ridges and side slopes, low fertility, moderate available water, moderate permeability, slow surface runoff	Moderately well drained	Slight
Tomotley loam	38	123	Deep, nearly level on broad inland flats and in shallow drainageways, low fertility, moderate available water, moderate permeability, slow surface runoff	Poorly drained	Slight
Nonhydric Soils					

Existing Conditions

Soil Series	Soil Type #	Acres	General Description	Drainage Class	Erosion Potential
Augusta loam	3	24	Deep, nearly level (0-2% slope), on low inland ridges and side slopes, low fertility, moderate available water, moderate permeability, slow surface runoff	Somewhat poorly drained	Slight
Corolla fine sand	10	10	Deep, nearly level to gently sloping (0-4% slopes), on low coastal dunes and flats, low fertility, low available water, rapid permeability, slow surface runoff	Moderately well to somewhat poorly drained	Moderate by wind
Dragston fine sandy loam	13	57	Deep, nearly level (0-2% slopes), on low ridges and side slopes, low fertility, moderate available water, moderately rapid permeability, slow surface runoff	Somewhat poorly drained	Slight
Munden fine sandy loam	19	30	Deep, nearly level (0-2% slopes), on low inland ridges and side slopes, low fertility, moderate available water, moderately rapid permeability, slow surface runoff	Moderately well drained	Slight
Newhan fine sand	22E	136	Deep, undulating to steep (2-30% slopes), on grass and shrub-covered high sand dunes in coastal areas, low fertility, very low available water, very rapid permeability, slow surface runoff	Excessively drained	Severe by wind
Newhan-Corolla fine sands	23C	46	Deep soils in coastal areas mostly behind the primary foredune (0-15% slopes); Newhan soils occur on low sand dunes and Corolla soils on flats and low knolls	Moderately well drained to somewhat poorly drained	Severe
Udorthents, loamy	40	92	Deep soil material altered by excavation or covered by earthy fill found mostly in and near urban areas and canals, available water and permeability variable, rapid surface runoff, 0-25% slopes	Moderately well drained	Severe on steep unvegetated slopes
Urban Land	42	202	More than 80% of the surface is covered by parking lots, buildings, and other impermeable surfaces, Udorthents included in this unit, 0-2% slopes	Needs site determination	Needs site determination

Source: USDA NRCS 2009b

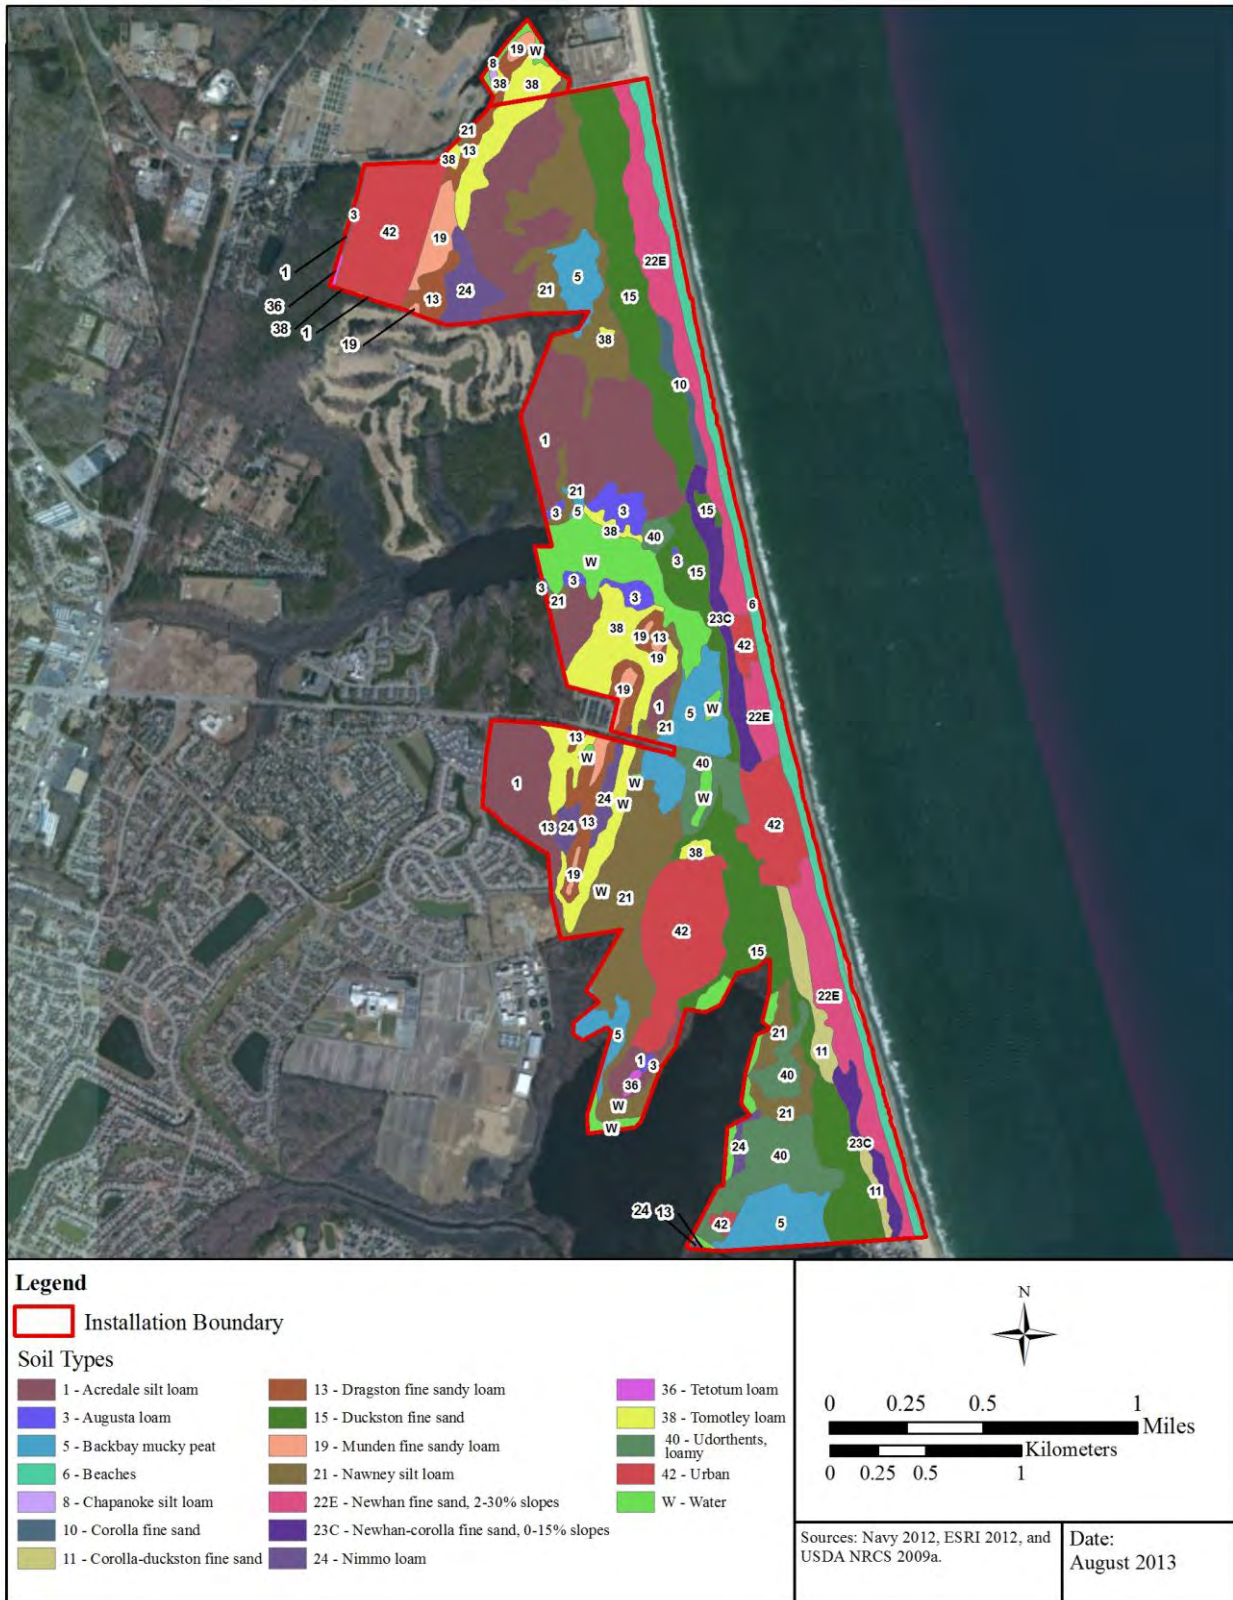

Figure 2-2. Soils of NASO DNA.

The surface waters of NASO DNA are joined to waterbodies located off-site by a number of drainage canals. Surface water flows from the northern portion of NASO DNA to the north into Lake Wesley and Rudee Inlet. Surface waters located within the southern portion of NASO DNA flow to the south into Black Gut, Back Bay, North Bay, and Shipps Bay. Surface water and other water resources at NASO DNA are shown in Figure 2-3.

2.3.2 Groundwater

The shallow aquifer system at Virginia Beach is composed of the Yorktown-Eastover aquifer, the Yorktown confining unit, and the Columbia aquifer. The Yorktown-Eastover aquifer is the principal aquifer in the Atlantic Coastal Plain. This aquifer includes the predominantly sandy deposits of the Yorktown Formation and the upper part of the Eastover Formation. In Virginia Beach, the Yorktown-Eastover aquifer generally lies 90 ft (27 m) below the surface and ranges from 100–280 ft (30–85 m) thick (Smith and Harlow 2002). Freshwater is limited to the upper part of the aquifer, and in some areas, saltwater intrusion has occurred. Other potential contaminants of the shallow aquifer come from the downward migration of nitrates, pesticides, fertilizers, and other toxic substances.

The Columbia aquifer is a water table aquifer (or unconfined aquifer, which consists of the saturated portions of the upper soil profile located above a confining layer) and includes predominantly sandy surficial deposits that lie above the Yorktown confining unit. It generally extends from the ground surface to about 20 ft (6 m) below msl, but the aquifer reaches a maximum thickness along the coast of the Atlantic Ocean in areas with large sand dunes (Smith and Harlow 2002). Groundwater tends to mound beneath the dunes from where it flows downward and outward toward tidal streams. The water table aquifer is vulnerable to contamination by various land uses and is generally used for irrigation or for heat pumps (Smith and Harlow 2002).

Because of concerns about the groundwater withdrawals and declining water levels in southeastern Virginia, the entire region, including the City of Virginia Beach, was designated a Groundwater Management Area by the state in 1976 (Smith and Harlow 2002). The Eastern Groundwater Management Area includes a portion or all of 13 counties and 11 cities located around the Chesapeake Bay and the Potomac River in the Coastal Plain Province, although more than 10 counties are currently being considered for inclusion. An additional Groundwater Management Area exists on the northeastern shore of Chesapeake Bay that includes two counties. In Virginia's two Groundwater Management Areas, the VDEQ has the authority to deny or limit requests for large groundwater withdrawals. Pursuant to the Groundwater Management Act of 1992, state permits are required for withdrawal of more than 300,000 gallons/month (1,135,624 liters/month) from wells in a designated Groundwater Management Area (VDEQ 2012).

Potable water for NASO DNA, supplied by the City of Norfolk, comes primarily from surface water resources including Lake Prince in Suffolk, Virginia and Lake Gaston on the border of Virginia and North Carolina (City of Virginia Beach 2012).

Figure 2-3. Water Resources of NASO DNA.

2.3.3 Watersheds

A majority of NASO DNA lies within the Back Bay Watershed unit of the Southern Watersheds Area. The Southern Watersheds Area, as designated by the Virginia Beach Planning Department, is a collective of the North Landing River, Northwest River, and Back Bay Watersheds in Virginia Beach and Chesapeake (City of Virginia Beach 2003). It covers approximately 325 square miles (mi²) (842 square kilometers [km²]) and is bordered by the Atlantic Ocean on the east, the Great Dismal Swamp on the west, and the North Carolina border on the south. The Southern Watersheds Area contains extensive wetlands, including a variety of rare swamp, pocosin, and marsh communities that drain into Albemarle-Pamlico Sound (VDEQ 2003). The Back Bay Watershed unit supports eight rare ecological communities and a large concentration of rare species and is an important wintering ground for a number of game waterfowl (Family Anatidae), neotropical migratory songbirds and migrating shorebirds. Three of the eight rare ecological community types are associated with the Installation and are described in Section 2.6.3. Rare, threatened, and endangered species associated with the Installation are described in Sections 2.6.1 (plants) and 2.6.2 (fish and wildlife). A small portion of the northern section of the Installation drains into Lake Christine, which drains into Rudee Inlet. This portion of the Installation is located within the Rudee Inlet/Owl's Creek Watershed (Figure 2-3).

2.3.4 Floodplains

The Federal Emergency Management Agency (FEMA) defines the 100-year flood as an area that has a 1% chance (1 year out of every 100 years) of being equaled or exceeded in any given year and is the standard used by federal agencies for floodplain management. The 500-year floodplain is an area that has a 0.2% chance (1 year out of every 500 years) of a flood in a year. Since floodplains cover much of NASO DNA, many buildings, infrastructure, and developed areas occur within floodplains.

The 2013 FEMA flood insurance rate maps (FEMA 2013) indicate a large portion of NASO DNA lies within the 100-year or 500-year floodplains associated with Redwing Lake, and the extensive network of wetlands and drainages that are present (Figure 2-3). A 100-year floodplain also is associated with Lake Tecumseh, which lies adjacent to the NASO DNA boundary to the southeast.

2.3.5 Wetlands

Wetlands delineations were recently completed at NASO DNA, for which preliminary jurisdictional determinations were received in 2011 and 2012 (Appendix E). Wetland delineations were completed pursuant to methods outlines in the 1987 Corps of Engineers Wetland Delineation Manual (1987 Manual) and *The Regional Supplement to the Wetland Delineation Manual: Atlantic and Gulf Coastal Plan Region*. The delineations provide the locations of aquatic resources under the potential jurisdiction of the USACE. After field and desktop review of the jurisdictional determination request package, the USACE has issued a preliminary jurisdictional determination in regards to these delineations in a letter dated 30 January 2012. Under the preliminary jurisdictional terms all delineated wetlands and waterbodies (Figure 2-3) are assumed jurisdictional and regulated by the CWA. Activities involving the discharge of dredged or fill material, including those associated with mechanized land clearing,

into these areas would require a USACE permit, Virginia Water Protection Permit from the VDEQ, and/or a permit from the VMRC. The preliminary jurisdictional determination may be used with USACE permit applications if impacts to these aquatic resources cannot be avoided.

Wetlands surveys have resulted in preliminary jurisdictional determinations for all of NASO DNA, with the exception of the area south of the fenceline that has not been subject to a wetland delineation, but is known to contain wetlands. These wetland delineations identified approximately 922.0 ac (373.0 ha) of wetland habitats at NASO DNA, and Appendix E includes the wetland maps and summary tables for these wetland delineations. Of the 922.0 ac (373.0 ha) of wetland habitat that have been mapped at NASO DNA, approximately 254.5 ac (102.9 ha) of wetlands are located at the northern portion of NASO DNA, and approximately 667.5 ac (270.1 ha) of wetlands are located at the southern portion of NASO DNA.

Delineated wetlands at NASO DNA were classified according to the Cowardin classification of wetlands and deepwater habitats (Cowardin et al. 1979), which groups wetlands into five major systems: marine, estuarine, riverine, lacustrine, and palustrine. Marine systems consist of the open ocean and its associated coastline. Estuarine systems are those that are periodically flooded with tidally influenced salty or brackish waters and have salinity greater than 0.5 parts per thousand (ppt). The lacustrine system includes areas of open water that are greater than 20 ac (8 ha) or deeper than 6.6 ft (2.0 m) at low water. Palustrine systems include nontidal vegetated wetlands or open freshwater habitats less than 20 ac (8 ha) or 6.6 ft (2.0 m) deep that have salinity less than 0.5 ppt. Riverine systems include natural and artificially created wetlands that are contained within a channel and are not dominated by persistent vegetation nor have salinity greater than 0.5 ppt. No riverine wetlands have been delineated at NASO DNA. Appendix E provides detailed maps and tables of the wetland types, and Figure 2-3 identifies the delineated wetlands identified for the Installation.

2.3.6 Nearshore Environment

The nearshore environment is generally defined as the area encompassing the transition from the subtidal marine habitats to associated upland systems. Nearshore environments include subaqueous lands, intertidal zones, and riparian habitats. Significant stressors to the nearshore environment include sea level rise, shoreline hardening, land development, habitat modification, and nutrient enhancement (USEPA 1998).

The Navy defines nearshore environments as: (1) all submerged lands titled to the Navy; and (2) all other submerged lands that are adjacent to installations that extend from the mean high water level, offshore to the boundary of any security areas controlled by the Navy. Security control areas for a shore installation are those waters that abut the installation shoreline that are under access control by the Installation CO or a tenant command.

A majority of the nearshore environment of NASO DNA is associated with the Atlantic Ocean and Back Bay watersheds, with a small area located in the northern portion of the Installation within the nearshore environments of Rudee Inlet/Owl's Creek Watershed (Figure 2-3). Section 2.3.3 provides a description of the Back Bay watershed, and Section 3.2.3 provides information on watershed protection at NASO DNA. The NASO DNA nearshore environment encompasses important habitat such as wetlands and beach and dune habitats, which are vital stopover areas for migrating and wintering bird species. A study of the nearshore environment is scheduled to

be funded in FY 2015 that will generate detailed data of the flora, fauna, and ecological community types associated with the NASO DNA nearshore environment, and will focus on in-water species and habitats.

CFR Part 334 established danger zones and restricted areas for locations along the Atlantic seaboard, including designated areas located off the coast of NASO DNA. The purpose of this regulation is to:

- (a) Prescribe procedures for establishing, amending and disestablishing danger zones and restricted areas;
- (b) List the specific danger zones and restricted areas and their boundaries; and
- (c) Prescribe specific requirements, access limitations and controlled activities within the danger zones and restricted areas.

Sections of CFR Part 334 that are applicable to NASO DNA include §334.380 (Atlantic Ocean south of entrance to Chesapeake Bay off Dam Neck, Virginia; naval firing range); §334.390 (Atlantic Ocean south of entrance to Chesapeake Bay; firing range); and §334.400 (Atlantic Ocean south of entrance to Chesapeake Bay off Camp Pendleton, Virginia; naval restricted area) (Figure 2-3).

The NASO DNA danger zone identified in §334.380 includes all of the water within a sector extending seaward a distance of 7,500 yards between radial lines bearing 35° true and 92° true, respectively, from a point on the shore at latitude 36°47'33" north, longitude 75°58'23" west. The NASO DNA danger zone identified in §334.390 includes a section extending seaward for a distance of 12,000 yards between two radial lines bearing 030° true and 083° true, respectively, from a point on shore at latitude 36°46'48" north, longitude 75°57'24" west; and an adjacent sector extending seaward for a distance of 15 nautical miles between two radial lines bearing 083° true and 150° true, respectively, from the same shore position. Vessels in these areas are instructed to proceed with caution and shall remain therein no longer than necessary for purpose of transit. When firing is in progress during daylight hours, red flags are displayed at conspicuous locations on the beach. When firing is in progress during periods of darkness, red flashing lights are displayed from conspicuous locations, which are visible from the water a minimum distance of four (4) nautical miles. If any vessel is observed within the danger zone firing on the ranges is suspended until the area is observed to be clear of vessels. Lookout posts are manned by the activity or agency operating the firing range at Fleet Combat Center. After darkness, night vision systems are utilized by lookouts to aid in locating vessels transiting the area. During periods of low visibility which would prevent the recognition of a vessel (to a distance of 7,500 yards) which is properly displaying navigational lights, or which would preclude a vessel from observing the red range flags or lights, no firing is permitting on the ranges (U.S. Government Printing Office 2014). These two regulations are enforced by the NASO DNA Fleet Combat Training Center CO, and other such agencies as he/she may designate.

The NASO DNA restricted area identified in §334.400 includes the area beginning at a point on the shore at (former) Camp Pendleton at latitude 36°48'19" north, longitude 75°57'49" west;

thence easterly 200 yards to latitude 36°48'20" north, longitude 75°57'42" west; thence northerly 400 yards to latitude 36°48'32" north, longitude 75°57'45" west; thence westerly 200 yards to latitude 36°48'31" north, longitude 75°57'53" west; and thence southerly 400 yards along the shore to the point of beginning. Persons or vessels, other than those vessels owned and operated by the U.S. shall not enter the area except by permission of the JEB Little Creek CO, Norfolk, Virginia. This regulation is enforced by JEB Little Creek CO, and such agencies as he may designate.

2.3.7 Wetlands Mitigation and Restoration

Several wetland mitigation and restoration efforts have been undertaken at NASO DNA, including:

- Establishment of a 13.2-ac (5.3-ha) mitigation site in the early 1990s as compensation for wetland losses resulting from construction of enlisted personnel housing and the operator's specialist "A" facility. This mitigation site adjoins a preexisting emergent marsh located on the north side of Redwing Lake. Monitoring completed at this mitigation site indicates the site is developing into a complex of emergent and forested wetland habitats with areas of open water.
- Creation of 0.1 ac (0.05 ha) of vegetated drainage ditch in 1991 adjacent to existing wetlands located in the northern and western areas of the Installation to satisfy mitigation requirements associated with the construction of the medical/dental center. An additional 0.07 ac (0.03 ha) of drainage ditch were created in 1991 to satisfy mitigation requirements associated with construction of the Naval Special Warfare Development Group P-335 auxiliary facilities.
- Establishment of a 2.4-ac (0.98-ha) mitigation site in 1994 in the northern portion of NASO DNA as compensation for impacts to wetlands disturbed by construction of the MACS 24 radar compound. Mitigation actions consisted of removing fill material and recontouring a previously disturbed wetland site that had been used for sandblast disposal. The site was monitored for three years to meet permit requirements and to ensure that mitigation goals were achieved (Navy 1998b).
- Establishment of approximately 5.1 ac (2.1 ha) of wetlands (commonly referred to as the Lovetts Marsh mitigation site) in 1996 to satisfy mitigation requirements associated with construction of the Naval Special Warfare Development Group's operations facilities, which resulted in impacts to a portion of wetlands located north of Lovetts Marsh. Lovetts Marsh was historically an open freshwater marsh, but was invaded by red maple (*Acer rubrum*) as a result of extensive alteration of drainage ditches, which altered the natural hydrologic regime (Buhlmann et al. 1992). As part of mitigation requirements a water control weir was installed. Post-construction restoration monitoring determined that the constructed weir was insufficient to restore the historical native habitat, as documented by the continued hardwood invasion. In 2001, the existing weir was modified with a flashboard riser type of water control structure to increase the flooding elevation (Navy 2001a). Subsequent management included maintaining water levels at 3.5 ft (1.1 m) for two years to kill the existing hardwoods. When adequate control is achieved, the water level may be drawn down in the growing season to stimulate

reproduction of emergent marsh vegetation. Monitoring is ongoing to determine when hardwood control is achieved and to assess the need for additional manipulation of water levels to achieve the desired restoration results.

- Preservation of 7 ac (3 ha) of wetlands in 2003 at a site located on Navy land south of the main gate off of Dam Neck Boulevard as part of wetland mitigation requirements associated with expansion of the NAS Oceana golf course.

Additional acreage that could be used for wetland mitigation is located directly southwest of the main gate of Dam Neck Boulevard. Wetland restoration or creation projects could be accomplished in this area by plugging one or two of the main drainage ditches to allow the hydrology of the site to return to pre-disturbance conditions.

2.4 FLORA

NASO DNA is located in an ecoregion classified as the Virginian Barrier Islands and Coastal Marshes, which is part of the Middle Atlantic Coastal Plain ecoregion. The Middle Atlantic Coastal Plain ecoregion is a low, nearly flat plain, with many swampy or marshy areas that extend northeast from Georgia to New Jersey. The Virginian Barrier Islands and Coastal Marshes ecoregion is characterized by beaches, dunes, low terraces, beach ridges, and barrier islands that are fringed by lagoons, bays, tidal salt marshes, mudflats, tidal channels, and ocean. This ecoregion is composed of mostly northern prairie cordgrass (*Spartina pectinata*) and unwooded dunes with hickory-pine forest occurring in better drained, higher areas (Bailey 1995).

Other than the developed areas associated with the MACS 24 compound and the explosives test facility, which comprise about 21 ac (9 ha), the northern portion of NASO DNA remains largely undeveloped and is dominated by forested wetlands. In the northern portion of the Installation hardwood forests (145 ac [59 ha]) are most abundant, followed by areas of mixed hardwood/pine (53 ac [21 ha]) and pine/hardwood (45 ac [18 ha]). Planted pine occurs on about 23 ac [9 ha]. The beaches and dunes complex occupies 71 ac (29 ha), and very small amounts of marsh (5 ac [2 ha]) and open water (2 ac [1 ha]) occur.

In the southern portion of NASO DNA a large portion (approximately 386 ac [156 ha]) of the Installation has been developed and now has an urban landscape that consists of impermeable surface, mowed lawn, shade trees, and ornamental trees and shrubs. Most of the remaining landscape has forested wetlands that are dominated by a mix of hardwood species (181 ac [73 ha]) or a mix of pine and hardwood (121 ac [49 ha] pine/hardwood and 116 ac [47 ha] hardwood/pine). Nonforested communities in the southern portion of NASO DNA include marshes (70 ac [28 ha]), which are equivalent to the palustrine emergent and scrub-shrub wetland classifications, and fallow agricultural fields (68 ac [28 ha]).

A project to develop a forest inventory, which will include Fire Loading information, will be conducted in 2013–2015 at NASO DNA. The results of this inventory will be included in future INRMP updates and in Appendix H once available.

A number of coastal maritime communities also occur at NASO DNA within the beaches and dunes system. The dune communities include beaches and foredunes, maritime dune woodlands,

maritime evergreen forests, maritime dune grasslands, maritime scrub, and interdune ponds. A primary and secondary dune delineation was completed in 2013. A copy of the final report will be included in Appendix H when available.

A cumulative list of plant species encountered during vegetation surveys at NASO DNA is provided in Appendix I. Figure 2-4 illustrates the locations of these vegetative communities at the Installation and Table 2-3 provides a summary of vegetative community acreages.

Table 2-3. Vegetative and Other Communities at NASO DNA.

Community Type	Acres ¹
Urban/Developed	407
Hardwood	326
Beaches and Dunes	277
Pine	176
Hardwood/Pine	170
Pine/Hardwood	166
Marsh	75
Open Water	72
Early Successional (Old Field)	68
Total	1,737

¹ This table does not include areas excluded from the original natural resources survey (Buhlmann et al. 1992).

Areas not coded as a vegetative community on Figure 2-4 were not included in the original natural resources survey (Buhlmann et al. 1992) and are not included in Table 2-3. A Vegetative Community Characterization Mapping survey of NASO DNA is scheduled to be conducted in July–October 2014. Vegetation plot data will be collected and communities will be classified according to the U.S. National Vegetation Classification Standard. Survey results will be included in Appendix H once available. An overlay of the Installation boundary with National Classification NatureServe GIS data in 2011 identified the following ecosystems that may be present: Northern Atlantic Coastal Plain Maritime Forest; Southern Atlantic Coastal Plain Dune and Maritime Grassland; Northern Atlantic Coastal Plain Fresh and Oligohaline Tidal Marsh; Northern Atlantic Coastal Plain Tidal Salt Marsh; Northern Atlantic Coastal Plain Dune and Swale; Marine Nearshore; and Central/Southern Atlantic Coastal Plain Nonriverine Swamp and Wet Hardwood Forest.

A description of the ecological communities that occur at NASO DNA follows. Rare ecological communities that occur at the Installation are discussed in Section 2.6.3.

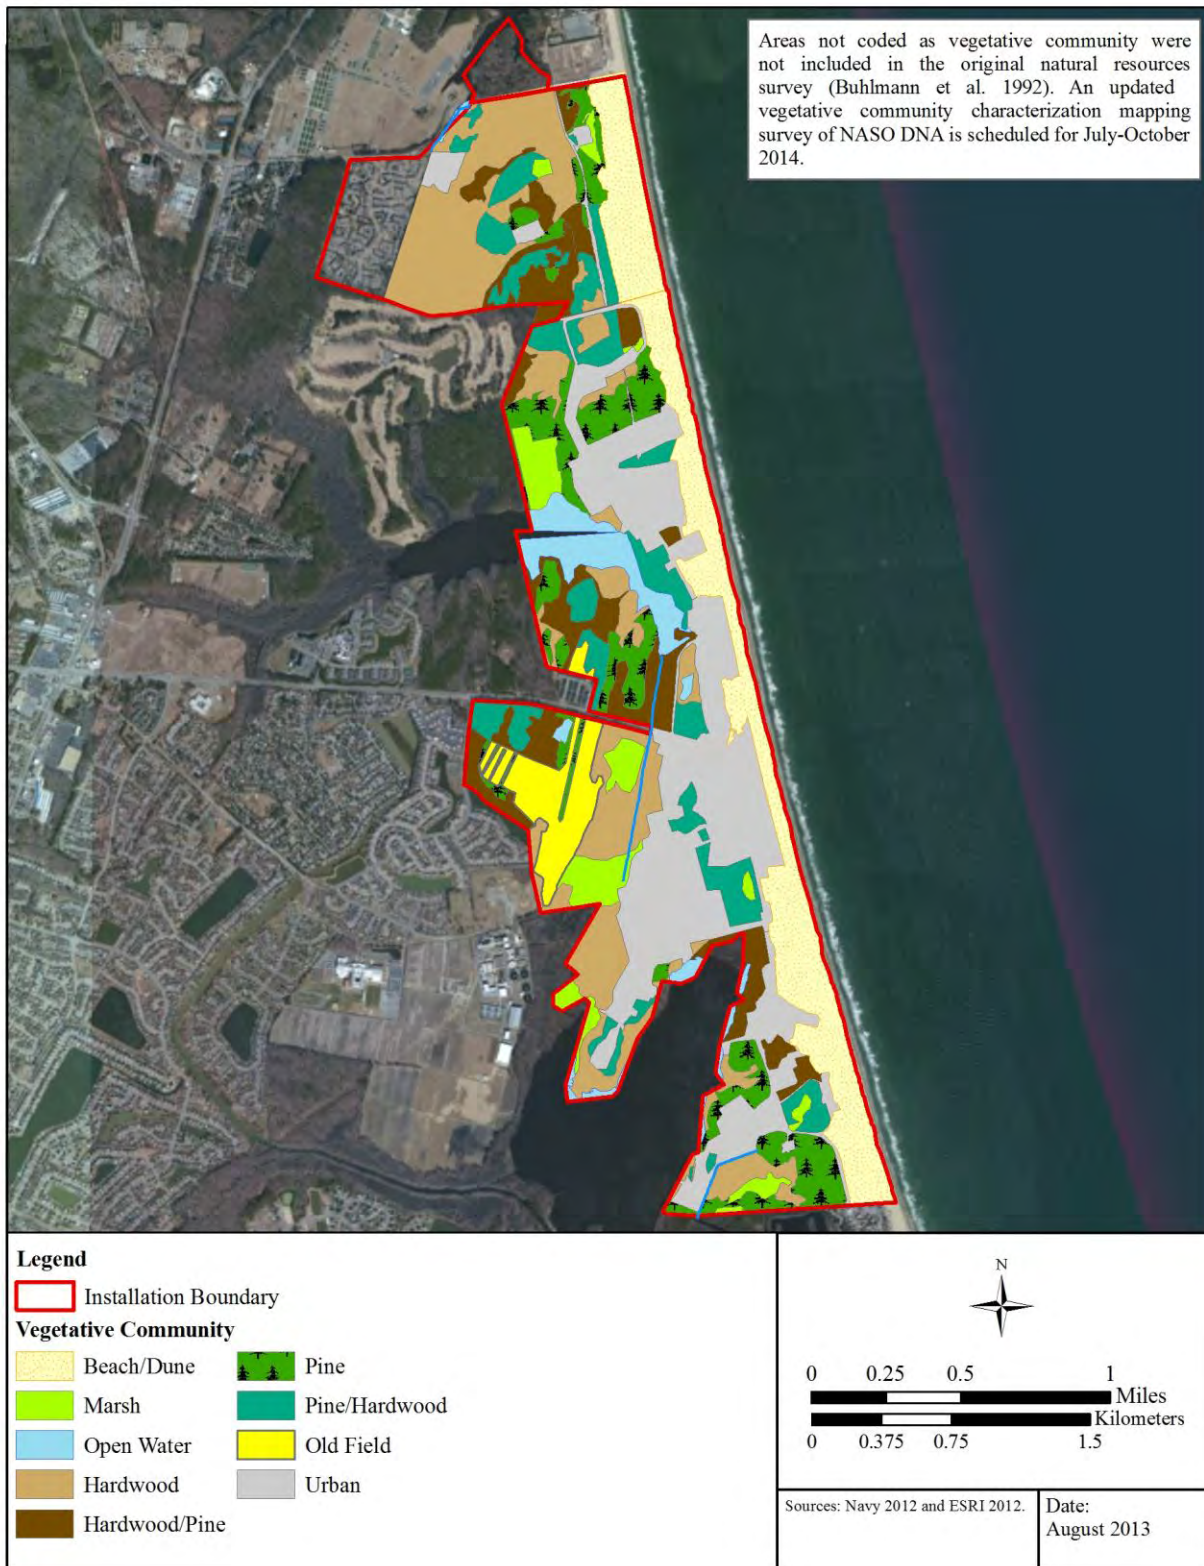

Figure 2-4. Vegetative Communities of NASO DNA.

2.4.1 Beach and Foredune Communities

The upper limit of the beach is marked by flotsam deposited by storm-lashed surf and spring tides. Fragments of vegetation, driftwood, and other debris form the wrack line. No large plants have adapted to the beach community; however, marine phytoplankton are abundant in the subtidal and intertidal portions of sand beaches. The beach of NASO DNA is 4.0 mi (6.4 km) long and covers approximately 277 ac (112 ha). Foredune vegetation consists of plants that are adapted to the harsh conditions, including coastal panic grass (*Panicum amarulum*), sea oats (*Uniola paniculata*), American sea rocket (*Cakile edentula*), and bushy seaside tansy (*Borrchia frutescens*). A primary and secondary dune delineation was completed at NASO DNA in 2013. The final report and maps will be included in Appendix H when available.

2.4.2 Maritime Dune Woodlands

Dune woodlands form the stable leeward side of the dunes and are generally well vegetated. Live oak (*Quercus virginiana*) is the dominant tree species although other trees such as bluejack oak (*Q. incana*) and loblolly pine (*Pinus taeda*) may be present. Black cherry (*Prunus serotina*), sassafras (*Sassafras albidum*), and American holly (*Ilex opaca*) often occur as small tree or shrub species. Wax myrtle (*Morella cerifera*), redbay (*Persea borbonia*), and winged sumac (*Rhus copallinum*) are shrub species frequently found in this community, and greenbrier (*Smilax* spp.), eastern poison ivy (*Toxicodendron radicans*), and muscadine grape (*Vitis rotundifolia*) are common vine species.

2.4.3 Maritime Evergreen Forests

Maritime evergreen forests develop on stabilized dunes located behind foredunes that are large enough to provide sufficient protection from storm exposure. Maritime evergreen forests represent the last phase of vegetative succession on dunes. It is an upland, xeric-to-mesic community that is well drained to excessively well drained and subject to moderate-to-light salt spray. Live oak and loblolly pine are the dominant tree species. Associated trees include black cherry, sassafras, southern red oak (*Quercus falcata*), and turkey oak (*Q. laevis*). American holly and wax myrtle dominate the understory. Highbush blueberry (*Vaccinium corymbosum*), redbay, and winged sumac are shrub species frequently found. Greenbrier, eastern poison ivy, evening trumpetflower (*Gelsemium sempervirens*), Virginia creeper (*Parthenocissus quinquefolia*), and muscadine grape are common vine species. Ground cover is sparse, consisting of scattered herbaceous species such as narrowleaf silkgrass (*Pityopsis graminifolia*), longbranch frostweed (*Helianthemum canadense*), and seedlings of a number of overstory and midstory trees.

2.4.4 Maritime Dune Grasslands

Maritime dune grasslands occur along primary dunes and in the dunes and swales inland of the primary dunes. Salt spray limits the vegetation to salt-tolerant species including coastal panic grass, sea oats, American beachgrass (*Ammophila breviligulata*), and American sea rocket. American sea rocket is a common annual plant that is among the first species to flower and set seed. Although annual plants make a minimal direct contribution to dune building and stabilization, they hold the sand long enough for perennial plants to get established and, through their decomposition, provide nutrients needed by other species. Perennial grasses contribute

significantly to dune building and stabilization. Vertical rhizomes, as deep as 30 ft (9.1 m) below the top of the dune, may develop in some grass species in response to sand burial. Coastal panic grass has a deep fibrous root system that makes it suitable for dune stabilization. Seaside goldenrod (*Solidago sempervirens*) is a common non-grass species of the dune grasslands that is particularly important to migrating monarch butterflies (*Danaus plexippus*).

2.4.5 Maritime Scrub Communities

Maritime scrub communities occur in recently disturbed areas in the beaches and dunes area. Strong winds and salt spray have sculpted dense wedge-shaped canopies. The toxic effects of salt spray kills the tender terminal buds, but the more protected lateral buds survive and develop to form the characteristic wind-swept shape. Live oak and wax myrtle form impenetrable thickets that protect each individual plant from salt and wind damage. The shrub canopy height reaches only 15 ft (5 m). Vines such as eastern poison ivy, Virginia creeper, muscadine grape, and greenbrier intertwine with the shrubby vegetation.

2.4.6 Interdunal Wetlands

Interdunal wetlands are depressions in active or relict dunes that are permanently flooded to intermittently exposed by groundwater or rainwater. They are protected from salt spray and wind shear by adjacent dunes, and support a greater variety of plants and animals than the dry dunes. Except for precipitation, these wetlands are often the only source of freshwater in the coastal environment and support major groups of animals such as frogs, salamanders, water snakes, turtles, aquatic birds, and aquatic mammals. Amphibians, in particular, are directly dependent on the freshwater wetland habitat. Emergent aquatic vegetation that occurs in these communities includes several species of rushes (Family Juncaceae) and sedges (Family Cyperaceae), club mosses (*Lycopodiella* spp.), sphagnum moss (*Sphagnum* sp.), and other herbaceous species. Trees and shrubs associated with interdunal swales include red maple, black gum (*Nyssa sylvatica*), buttonbush (*Cephalanthus* sp.), and highbush blueberry. Maritime wet grasslands, maritime shrub swamps, and interdune ponds are specific community types of interdunal wetlands (Fleming and Patterson 2012).

2.4.7 Hardwood Forests

Much of the forested area at NASO DNA is forested wetland. The wettest of these sites are dominated by hardwood species such as bald cypress (*Taxodium distichum*), red maple, sweetgum (*Liquidambar styraciflua*), and black gum. Shrub species can include wax myrtle, highbush blueberry, and large gallberry (*Ilex coriacea*). Ground cover is generally sparse, consisting of a few scattered ferns except in areas with a giant cane (*Arundinaria gigantia*) cover.

2.4.8 Mixed Forests

Many of the inland forests have been ditched and consist of pine and mixed hardwoods. These habitats may be dominated by loblolly pine with red maple and sweetgum interspersed throughout. The understory includes red maple and sweetgum saplings, as well as wax myrtle, sweetbay (*Magnolia virginiana*), and redbay. Greenbrier, Japanese honeysuckle (*Lonicera japonica*) (an invasive species), and eastern poison ivy are prevalent vines.

2.4.9 Pine Forests

A number of stands dominated by loblolly pine also occur at NASO DNA. These stands were planted as part of reforestation efforts during the 1970s. They largely consist of dense monocultures of pine with very little shrub or herbaceous vegetation occurring in the shrub and herbaceous layers. A long row of longleaf pine was planted as a windrow along Pine Road prior to Navy acquisition of this area of the Installation. Longleaf pine is rare in the region and adds diversity as well as aesthetic value to the Installation flora.

2.4.10 Early Successional Habitat

The abandoned agricultural fields in the northern and southern portions of the Installation provide early successional (old field) habitat not found elsewhere at NASO DNA. The area has not been actively farmed since 1998, and a variety of grasses, forbs (broadleaf herbaceous species), trees, and shrubs now occupies the fields.

2.5 FAUNA

NASO DNA is located in the Virginia Barrier Islands and Coastal Marshes ecoregion. This ecoregion provides unique habitats for wildlife including several of Virginia's rarest birds and sea turtles that nest on the barrier island beaches (Bailey 1995). The diverse assemblage of forested, wetland, and coastal ecological communities at NASO DNA provides habitat that supports a wide variety of fauna.

Faunal surveys at the Installation have primarily consisted of observations made by VDCR-DNH during threatened and endangered species inventories (Buhlmann et al. 1992, Van Alstine et al. 2001, Evans and Belden 2010, and VDCR-DNH 1990) and incidental observations made by biologists during other field surveys (Navy 1998a and 1998b). Bird observations also have been made by individuals involved with the Back Bay Bird Club. A Monitoring Avian Survivorship and Productivity program also was conducted at NASO DNA between 1995 and 2003. The program used constant effort mist netting to provide additional information on land bird populations (Institute for Bird Populations 1999). Marine resources were assessed in a comprehensive marine resources assessment of the region (Navy 2003). An overview of survey results for each faunal group follows, and a list of fish and wildlife species compiled from these studies is in Appendix I. This section of the INRMP describes the general fauna associated with NASO DNA. Fauna associated with the Installation that are considered rare, threatened or endangered are described in Section 2.6.2 (Rare, Threatened, and Endangered Fish and Wildlife). Appendix I also includes a list of fish and wildlife species identified as Species of Greatest Conservation Need for the Mid-Atlantic Coastal Plain in the Virginia State Wildlife Action Plan (SWAP).

2.5.1 Mammals

A total of 19 mammal species have been observed at the Installation (Appendix I) (Buhlman et al. 1992, Evans and Belden 2010, Van Alstine et al. 2001, and VDCR-DNH 1990). Large and medium-sized mammals observed include whitetail deer, gray fox (*Urocyon cinereoargenteus*), raccoon (*Procyon lotor*), nutria (*Myocastor coypus*), muskrat (*Ondatra zibethica*), Virginia

opossum (*Didelphis virginianus*), eastern gray squirrel (*Sciurus carolinensis*), and eastern cottontail (*Sylvilagus floridanus*). Smaller mammals captured in pitfall traps include least shrew (*Cryptotis parva*), southern short-tailed shrew (*Blarina carolinensis*), southeastern shrew (*Sorex longirostris longirostris*), eastern harvest mouse (*Reithrodontomys humulus*), white-footed mouse (*Peromyscus leucopus*), meadow vole (*Microtus pennsylvanicus*), woodland vole (*M. pinetorum*), pine vole (*M. pinetorum*), eastern mole (*Scalopus aquaticus*), and marsh rice rat (*Oryzomys palustris*). A complete list of mammal species observed at the Installation is provided in Appendix I.

Marsh rabbit (*Sylvilagus palustris*) and Pungo white-footed mouse (*Peromyscus leucopus easti*) are two rare mammal species that also occur, and these are discussed in Section 2.6.2 along with the other rare, threatened, and endangered mammals associated with the Installation. Nuisance species such as nutria and coyote (*Canis latrans*) are discussed in more detail in Section 3.12.1.

2.5.2 Birds

The avifaunal community at NASO DNA is diverse and reflects the wide variety of habitats available. A total of 171 species has been observed during various bird surveys conducted on the Installation (Appendix I). A bird monitoring study was completed at NASO DNA that included winter monitoring conducted in February 2013, breeding bird monitoring conducted in April and May 2013, summer monitoring conducted in June and July 2013, and fall monitoring conducted in September and October 2013 (Appendix H). Prior to conducting the survey, Navy, USFWS, VDGIF, USGS, VDCR-DNH, and NCWRC were consulted regarding appropriate field methods and necessary permits. A plan is currently being developed that follows the guidance and protocols of the DoD Coordinated Bird Monitoring Program. The plan will include a comprehensive list of bird species observed at NASO DNA and will be designed to facilitate repeat data collection efforts to maintain and update the list of bird species that occur at the Installation.

NASO DNA is located in the Atlantic migratory flyway and provides important stopover areas for neotropical migrants during spring and fall migration. The forested areas at NASO DNA serve as foraging and resting habitat for a number of species including black-throated blue warbler (*Dendroica caerulescens*) and blackpoll warbler (*Dendroica striata*). Forest-dwelling birds that stay through the summer and are known to nest on the Installation include eastern wood-pewee (*Contopus virens*), pine warbler (*Dendroica pinus*), brown thrasher (*Toxostoma rufum*), ovenbird (*Seiurus aurocapillus*), red-eyed vireo (*Vireo olivaceus*), white-eyed vireo (*V. griseus*), blue-gray gnatcatcher (*Polioptila caerulea*), and various woodpeckers (Family Picidae).

Familiar birds of open areas and urban settings include northern mockingbird (*Mimus polyglottos*), American robin (*Turdus migratorius*), northern cardinal (*Cardinalis cardinalis*), brown-headed cowbird (*Molothrus ater*), house sparrow (*Passer domesticus*), house finch (*Carpodacus mexicanus*), rock dove (pigeon) (*Columba livia*), mourning dove (*Zenaidura macroura*), purple martin (*Progne subis*), and European starling (*Sturnus vulgaris*).

Several birds of prey utilize various habitats at NASO DNA, including red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*B. lineatus*), merlin (*Falco aesalon*), sharp-shinned hawk

(*Accipiter velox*), northern harrier (*Circus cyaneus*), American kestrel (*Falco sparverius*), osprey (*Pandion haliaetus*), and bald eagle (*Haliaeetus leucocephalus*).

The shoreline and aquatic habitats at NASO DNA provide important bird habitats, and are used extensively by waterfowl, shorebirds, seabirds, and other waterbirds. Waterfowl known to occur at the Installation include several species of geese and a large number of ducks. Of these, only four, Canada goose (*Branta canadensis*), mallard (*Anas platyrhynchos*), wood duck (*Aix sponsa*), and American black duck (*Anas rubripes*), are known or are likely to nest at NASO DNA. The remainder are continental migrants that spend summers in the northern part of the continent and winter along the mid-Atlantic coast. Shorebirds known to occur at NASO DNA include sandpiper (*Actitis* spp. and *Calidris* spp.), sanderling (*Calidris alba*), plover (*Charadrius* spp. and *Pluvialis* spp.), and other shorebird species. As with waterfowl, most shorebird species use the Installation as a feeding area during migration to and from nesting areas in the far north. Killdeer (*Charadrius vociferous*) is the only shorebird known to nest on the Installation. Waterbirds that have been observed at the Installation include grebes (Family Podicipedidae), pelican (*Pelecanus occidentalis*), cormorant (*Phalacrocorax* spp.), herons and egrets (Family Ardeidae), loons (*Gavia* spp.), rails (Family Rallidae), and gulls and terns (Family Laridae). Common summer or permanent resident waterbirds that are known or likely to nest on the Installation include great blue heron (*Ardea herodias*), green heron (*Butorides virescens*), little blue heron (*Florida caerulea*), and a large number of gulls and terns.

Rare, threatened, and endangered birds associated with the Installation are discussed in Section 2.6.2. A list of Species of Greatest Conservation Need identified for the Mid-Atlantic Coastal Plain in the Virginia SWAP is included in Appendix I.

2.5.3 Herpetofauna

The extensive wetlands, lakes, and wooded areas at NASO DNA provide habitat for a number of reptile and amphibian species. A total of 14 amphibian and 23 reptile species have been observed at the Installation, including four salamanders, 10 frogs and toads, eight turtles, 11 snakes, and four lizards (Appendix I) (NAVFAC Mid-Atlantic 2013, Buhlmann et al. 1992, Evans and Belden 2010, Van Alstine et al. 2001, and VDCR-DNH 1990). Herpetofauna that occur in and around the freshwater lakes and inundated wetlands include turtles such as the red-eared slider (*Trachemys scripta* ssp. *elegans*), yellow-bellied slider (*T. s.* ssp. *scripta*), and eastern mud turtle (*Kinosternon subrubrum* ssp. *subrubrum*); frogs such as American bullfrog (*Lithobates catesbeiana*), northern green frog (*L. clamitans melanota*), and southern leopard frog (*L. sphenoccephalus*); and several snakes including northern water snake (*Nerodia sipedon sipedon*), brown water snake (*N. taxispilota*), eastern ribbon snake (*Thamnophis sauritus sauritus*), and eastern cottonmouth (*Agkistrodon piscivorus piscivorus*). Species occurring in forested areas adjacent to temporary or isolated wetlands include two species of salamanders, red-backed salamander (*Plethodon cinereus*) and Atlantic coastal slimy salamander (*P. chlorobryonis*); Cope's gray treefrog (*Hyla chrysocelis*); southern toad (*Anaxyrus terrestris*); Fowler's toad (*A. woodhousii*); and eastern box turtle (*Terrapene carolina*). Upland areas on the Installation are home to several other species of snakes, including eastern rat snake (*Elaphe obsoleta*) and eastern hognose snake (*Heterodon platirhinos*), and a number of lizards including common five-lined skink (*Eumeces fasciatus*), eastern fence lizard (*Sceloporus undulatus hyacinthinus*), and little brown skink (*Scincella lateralis*). In addition to the 40 species observed, 35 additional

herpetofaunal species have the potential to occur in habitat located at NASO DNA (NAVFAC Mid-Atlantic 2013). A complete list of herpetofauna known to occur at NASO DNA is provided in Appendix I.

The DoD Partners in Amphibian and Reptile Conservation program is currently updating amphibian and reptile species lists for the approximately 80 Navy installations that have INRMPs (NAVFAC Mid-Atlantic 2013). To date, Navy installations within the NAVFAC Field Engineering Command Washington, Mid-Atlantic, Mid-West, and Northwest areas of responsibility have been updated. Once all the updated species lists are completed, they will be entered into a database that will be stored on the Navy Environmental Portal (<https://eprportal.cnrc.navy.mil/eprwebnet/logon.aspx>). The database will serve to fill numerous needs in the community, as many installations lack an accurate and up-to-date list of amphibian and reptile species found therein. With data calls, INRMP updates, and other relevant planning documents needed to support Navy projects and missions, it is essential that the most accurate species occurrence data be available on which to base natural resources management decisions. This database was reviewed during the development of this INRMP update for NASO DNA and the species list provided in Appendix I reflects herpetofauna observations for the Installation obtained from this database.

Rare, threatened, and endangered herpetofauna associated with the Installation are discussed in Section 2.6.2.

2.5.4 Fish

The ichthyofauna of NASO DNA include a number of native coastal plain freshwater fish, such as gizzard shad (*Dorosoma cepedianum*), common carp (*Cyprinus carpio*), eastern mudminnow (*Umbra pygmaea*), brown bullhead (*Ictalurus nebulosus*), bowfin (*Amia calva*), black crappie (*Pomoxis nigromaculatus*), banded sunfish (*Enneacanthus obesus*), and bluespotted sunfish (*E. gloriosus*), as well as a number of sport fishes that have been introduced into Redwing Lake and Sadler Pond for recreational fishing. Introduced sport fish include largemouth bass (*Micropterus salmoides*), pumpkinseed (*Lepomis gibbosus*), and bluegill (*L. macrochirus*) (Galvez and Swihart 2000).

A large number of saltwater species also are known to occur in the coastal waters offshore of NASO DNA. Because the area is in a transition zone between temperate and subtropical regions, fish fauna is extremely diverse, with approximately 685 species known to occur (Navy 2003). The NOAA NMFS has designated essential fish habitat (EFH) for fish species of particular economic or ecological importance in the area. The Magnuson-Stevens Fishery Conservation and Management Act requires that EFH be identified for all fish which are federally managed. Federal agencies are required to consult with NMFS whenever a construction or funded project, permit, or other action may adversely affect EFH. There are currently 22 fish species for which the Mid-Atlantic Fishery Management Council has designated EFH (NOAA NMFS 2010). Fish species with designated EFH in the nearshore waters adjacent to NASO DNA are identified in Appendix I, and Appendix F contains a summary of EFH and general habitat parameters for federally managed fish species. The EFH information is provided for species that have the potential to occur in the vicinity of the NASO DNA nearshore environment, and not all fish species with EFH identified in Appendix F and Appendix I are known to occur at NASO DNA.

Fish surveys and habitat assessments of selected NASO DNA streams and ponds, including unnamed waterbodies, Redwing Lake, and Sadler Pond, are scheduled to be completed in 2014.

Rare, threatened, and endangered fish associated with the Installation are discussed in Section 2.6.2.

2.6 RARE, THREATENED, AND ENDANGERED SPECIES AND SIGNIFICANT ECOLOGICAL COMMUNITIES

NASO DNA is located within the Atlantic Ocean, Rudee Inlet/Owl's Creek Watershed, and the Back Bay Watershed unit of the Southern Watersheds Area (see Section 2.3.3). The Back Bay Watershed unit supports eight rare ecological communities as well as 40 rare plant occurrences, and 10 rare animals, including the state-listed least bittern (*Ixobrychus exilis*), state-listed canebrake rattlesnake (*Crotalus horridus* ssp. *atricaudatus*), state-listed eastern glass lizard (*Ophisaurus ventralis*), federally-listed loggerhead sea turtle (*Caretta caretta*), and federally-listed Kemp's ridley sea turtle (*Lepidochelys kempii*). Rare plant and animal observations and identification of rare ecological communities for the Installation is based on data collected during rare, threatened and endangered plant and animal surveys, and significant ecological communities surveys completed at the Installation since 1968. The next inventory for rare, threatened and endangered species at NASO DNA is planned for 2014, and includes a rare, threatened, and endangered insect survey, and a bat survey.

A number of species that are considered rare or are listed as threatened or endangered in Virginia, also have been documented at NASO DNA. These species were identified during several inventories of rare, threatened, and endangered species conducted at NASO DNA from 1968 through 2010 (Buhlmann et al. 1992, Corning 1968, Evans and Belden 2010, Galvez and Swihart 2000, Geo-Marine Inc. 2003, Swihart 1982, USFWS, Office of Fishery Assistance 1985 and 1988, Van Alstine et al. 2001, and VDCR-DNH 1990).

Because the status of state and federal threatened and endangered species changes over time, careful tracking and periodic field surveys are needed to confirm the occurrence of rare species on the Installation. The VDCR-DNH tracks the current status of natural heritage resources in a database that is available on its website.

2.6.1 Rare, Threatened, and Endangered Plants

No federally listed plant species have been identified at NASO DNA; however seabeach amaranth (*Amaranthus pumilus*) is a federally threatened plant species that has the potential to occur at NASO DNA, based on the presence of suitable habitat. Seabeach amaranth is an annual plant that grows on sandy beaches along the Mid-Atlantic coast of the U.S. (USFWS 2003). Between 2001 and 2005 populations identified from Maryland and Virginia steadily declined due to habitat destruction, poor timing of beach nourishment projects, beach raking, and outdoor recreational vehicle use (USFWS 2007a).

Several species considered as rare plants in Virginia were identified at NASO DNA during inventories of rare, threatened, and endangered species (Buhlmann et al. 1992, Evans and Belden 2010, Van Alstine et al. 2001, and VDCR-DNH 1990). State-rare plants identified in surveys of

NASO DNA conducted to date include American halfchaff sedge (*Lipocarpa maculata*), Long Beach primrose-willow (*Ludwigia brevipes*), black-fruited spikerush (*Eleocharis melanocarpa*), saltmarsh umbrella-sedge (*Fuirena breviseta*), spoonleaf sundew (*Drosera intermedia*), early white-top fleabane (*Erigeron vernus*), bluejack oak, fasciculate beaksedge (*Rhynchospora fascicularis* var. *fascicularis*), tall horned beaksedge (*R. macrostachya* var. *macrostachya*) glossy-seeded yellow star-grass (*Hypoxis sessilis*, formerly *H. longii*), Elliott’s rush (*Juncus elliotii*), and seaside marsh-elder (*Iva imbricata*). Several other plant species found at NASO DNA that were considered rare at the time of the 1990 survey are no longer tracked by VDCR-DNH, including smooth sawgrass (*Cladium mariscoides*), Virginia pinweed (*Lechea maritima* var. *virginica*), creeping primrose-willow (*Ludwigia repens*), American spongeplant (*Limnobium spongia*), round-headed rush (*Juncus validus* var. *validus*), and Carolina fimbry (*Fimbristylis caroliniana*). The round-headed rush, spoon-leaved sundew (*Drosera spatulata*), and Virginia pinweed are still considered state watch list species by VDCR-DNH (Townsend 2012). Table 2-4 lists the rare plants that have been confirmed at NASO DNA.

2.6.2 Rare, Threatened, and Endangered Fish and Wildlife

Three federally listed wildlife species are known to occur at NASO DNA, including piping plover (*Charadrius melodus*), Kemp’s ridley sea turtle, and loggerhead sea turtle. Loggerhead sea turtle is known to nest at NASO DNA; however, piping plover has not been documented nesting on the Installation. A federal candidate for listing, the red knot (*Calidris canutus*), also has been documented at the Installation, as well as several Virginia rare and state listed species as described below and listed in Table 2-4.

Table 2-4. Rare, Threatened, and Endangered Terrestrial Species and Significant Ecological Communities that Occur at NASO DNA.

Scientific Name	Common Name	Global Rank ²	State Rank ³	Federal Status ⁴	State Status ⁴	Last Observed

¹ G1 = Critically imperiled; G2 = Imperiled; G3 = Vulnerable; G4 = Apparently secure; G5 = Secure; G_T = Intraspecific taxa; signifies the rank of a subspecies or variety; G_? = Inexact numeric rank (Fleming and Patterson 2012)

² S1 = Critically imperiled; S2 = Imperiled; S3 = Vulnerable; S_N = Nonbreeding status; S_B = Breeding status; SH = Possible extirpated, known only from historical occurrences but still some hope of rediscovery; SNA = Not applicable, conservation status rank is not applicable because the species is a not a suitable target for conservation activities (Roble 2010)

³ T = threatened; E = endangered; C = candidate; Tier III (State Wildlife Action Plan [SWAP]) – high conservation need; Tier IV (SWAP) – moderate conservation need;

⁴ Ecological community type changed to align with Fleming and Patterson 2012 (Natural Communities of Virginia: Ecological Groups and Community Types)

⁵ Rarity rankings exist at the community type level, not at the ecological community group (Fleming and Patterson 2012).

Sources: Evans and Belden 2010, Fleming and Patterson 2012, Navy 2006b, Roble 2010 and 2013, Townsend 2012, Van Alstine et al. 2001, and VDGIF 2005.

2.6.2.1 Mammals

Several federal and state listed rare, threatened, and endangered mammals occur or have the potential to occur on the Installation, including various bat species, marine and terrestrial mammals, and birds as described in this section.

2.6.2.1.1 Bats

Populations of several bat species with ranges along the eastern U.S. have succumb to significant declines in recent years due to white-nose syndrome, a fungus that can infect hibernacula and significantly impact overwintering populations. White-nose syndrome has spread from the northeastern to the central U.S. at an alarming rate, and since the winter of 2007–2008, millions of insect-eating bats in 22 states and five Canadian provinces have died from this devastating disease (USGS National Wildlife Health Center 2013). The disease is named for the white fungus, *Geomyces destructans*, which infects skin of the muzzle, ears, and wings of hibernating bats. As a result, the USFWS has initiated reviews of several bat species to determine if population declines and threats from white-nose syndrome warrant ESA listing.

The USFWS initiated a 90-day review on 29 July 2011 to determine if federal listing of eastern small-footed bat (*Myotis leibii*) is warranted. As of August 2013, listing determination of this species was still under review by USFWS. Summer roosts of the eastern small-footed bat typically are within talus (a slope of accumulated rock debris) areas associated with rocky ridge-tops, but they also are known to roost on buildings and bridges, and behind loose bark on trees. Overwintering hibernacula of eastern small-footed bats, includes caves and abandoned mines. Eastern small-footed bats are nocturnal foragers, foraging primarily over streams, ponds, or other waterbodies that have high concentrations of nocturnal insects. They are considered generalist feeders, feeding primarily on soft-bodied prey that they capture during flight, or that they glean from surfaces.

The USFWS initiated a 90-day review on 29 July 2011 to determine if federal listing of northern long-eared bat (*Myotis septentrionalis*) is warranted. On 02 October 2013 USFWS published their proposal to list the northern long-eared bat as endangered throughout its range under the ESA (78 FR 191). On 06 January 2014 the USFWS published their Interim Conference and Planning Guidance that addresses immediate information needs for Section 7 consultations and conservation planning for this species, should it be officially listed as endangered (USFWS 2014).

**USFWS' Northern Long-eared Bat Interim Conference and Planning Guidance
(06 January 2014) is available online:**
<http://www.fws.gov/midwest/endangered/mammals/nlba/pdf/NLEBinterimGuidance6Jan2014.pdf>.

Preferred summer roosts of the northern long-eared bat are generally associated with old-growth forests composed of trees 100 years old or older, and this species is dependent on intact interior forest habitats that have a low edge-to-interior ratio (76 Federal Register [FR] 38095-38106). Relevant late-successional forest features include a high percentage of old trees, uneven forest

structure, single and multiple tree-fall gaps, standing snags, and woody debris. This species appears to favor small cracks or crevices in cave ceilings for hibernation. Northern long-eared bats are opportunistic insectivores, obtaining prey both in flight and by gleaning from surfaces. Prey includes small insects, such as moths, flies, leafhoppers, and beetles. Forested hillsides and ridges are their preferred foraging habitat, with the presence of mature forest stands thought to play an important role in their foraging behavior. Foraging occurs at dusk over small ponds and forest clearings under the forest canopy, or along streams.

The USFWS has not initiated a formal review for the potential listing of little brown bat (*Myotis lucifugus*). Little brown bat reproductive females form maternity colonies in barns, attics, tree cavities, and other places that remain dark throughout the day (Kunz and Reichard 2011). Females tend to have high roost fidelity, returning to their natal roosts each year. Little brown bats also are opportunistic in their selection of roost sites, and are known to quickly exploit new roost sites once identified. Winter hibernacula are typically within caves or mines located 180–620 mi (290–998 km) from summer roosts. Little brown bats forage in flight on insects, often feeding over open water or along the margin of waterbodies and forest habitat. Juveniles tend to forage in clearings or open areas, whereas adults are known to regularly forage in more cluttered environments, as well as open areas.

Acoustic and mist netting surveys for listed bat species will be conducted in the near future dependent on available funding.

2.6.2.1.2 Marine Mammals

Marine mammals include dolphins, porpoises, whales and seals, of which various species occur in the Chesapeake Bay and offshore from NASO DNA. In addition to any federal ESA listings, all marine mammals are protected by the MMPA, although some species are protected under the MMPA, but not the federal ESA.

Due to the coastal location of NASO DNA, a number of marine mammal species are known, or have the potential, to occur along the shore and within the adjacent offshore/nearshore environment. The primary species of marine mammals in the nearshore region of the mid-Atlantic include bottlenose dolphin (*Tursiops truncatus*), harbor porpoise (*Phocoena phocoena*), North Atlantic right whale (*Eubalaena glacialis*), humpback whale (*Megaptera novaeangliae*), killer whale (*Orcinus orca*), and, rarely, the West Indian manatee (*Trichechus manatus*). Harbor seal (*Phoca vitulina*) and gray seal (*Halichoerus grypus*) also have been documented utilizing NASO DNA beaches. Occurrence of these species fluctuates by season. Whales are most common during the winter months and dolphins are most common in the summer. Harbor porpoise sightings and fisheries by-catch are most common in the winter, although strandings occur most frequently in the spring and summer. The rare sightings of manatees have been recorded in all but the winter months (Navy 2001b and 2003). Several of the marine mammals that have the potential to occur in the offshore/nearshore environment of NASO DNA are listed as federal endangered species, including blue whale (*Balaenoptera musculus*), fin whale (*B. physalus*), sei whale (*B. borealis*), and sperm whale (*Physeter macrocephalus*) (Table 2-5). The western North Atlantic coastal stock of bottlenose dolphin is considered “depleted” under the MMPA. With the exception of the West Indian manatee, which is under the jurisdiction of

USFWS, all of the marine mammals that have the potential to occur offshore of NASO DNA are managed under the jurisdiction of NOAA NMFS.

Table 2-5. Rare, Threatened, and Endangered Marine Species Known to Occur in Waters Adjacent to NASO DNA.

¹ G1 = Critically imperiled; G2 = Imperiled; G3 = Vulnerable; G4 = Apparently secure, G5 = Secure

² S1 = Critically imperiled; S_N = Nonbreeding status; S_B = Breeding status; SA = State accidental, not a regular member of the Virginia fauna but recorded in the state at least once; SZN = Long distance migrant whose occurrences outside of the breeding season are not monitored or a species whose wintering populations are transitory and usually do not occur regularly at specific localities; N/A = Not applicable

³ T = threatened; E = endangered; MMPA = Marine Mammal Protection Act; MMPA Depleted = any case in which (1) the Secretary, after consultation with the Marine Mammal Commission and the Committee of Scientific Advisors on Marine Mammals established under MMPA title II, determines that a species or population stock is below its optimum sustainable population; (2) a State, to which authority for the conservation and management of a species or population stock is transferred under section 109, determines that such species or stock is below its optimum sustainable population; or (3) a species or population stock is listed as an endangered species or a threatened species under the ESA; N/A = not applicable

⁴ - = information of last observation not available

Source: Roble 2013

2.6.2.1.3 Terrestrial Mammals

Two state rare mammal species are known to occur at NASO DNA, including marsh rabbit and Pungo white-footed mouse (S1, extremely rare and critically imperiled). The marsh rabbit is restricted to the Coastal Plain of the southeastern U.S. In Virginia, the species is found in several counties in the southeastern portion of the state and is most abundant in the Dismal Swamp. Preferred habitat for the species includes undisturbed marsh, primarily freshwater. The greatest threat to the marsh rabbit's existence is loss of habitat (VDGIF n.d.a). The Pungo white-footed mouse is found from Cape Henry, Virginia south along the barrier beach to Oregon Inlet, North Carolina. Preferred habitat for the species includes thickets of myrtle and poison ivy at the marsh edge, behind dunes (VDGIF n.d.b).

2.6.2.2 Birds

Several federal and state listed rare, threatened, and endangered birds occur or have the potential to occur on the Installation, including the federally listed piping plover, red knot, and roseate tern (*Sterna dougallii* sp. *dougallii*) as described in this section.

As part of the 1988 amendment to the Fish and Wildlife Conservation Act (Public Law 100-653), the USFWS is required to identify species, subspecies, and populations of migratory nongame birds that, without additional conservation actions, are likely to become candidates for listing under the ESA (USFWS 2008). The USFWS published the most recent list of Birds of Conservation Concern (BCC) in 2008, which identified specific species within 37 Bird Conservation Regions across North America. The goal envisioned by the USFWS in identifying these BCC species is to stimulate the implementation of coordinated, proactive management and conservation actions among federal, state, tribal, and private partners to prevent these species from being listed under the ESA. Additionally, the Bird Conservation Region lists are intended to assist federal land-managing agencies and their partners in their efforts to abide by the bird conservation principles embodied in the MBTA and EO 13186 *Responsibilities of Federal Agencies to Protect Migratory Birds* (USFWS 2008). NASO DNA is located within Bird Conservation Region 30, the New England/Mid-Atlantic Coast. Appendix I contains a list of birds that have been observed at NASO DNA, 18 of which are USFWS BCC species for Bird Conservation Region 30.

In addition to identification of BCC species, Appendix I also identifies the federal, state, or SWAP status for the bird species that occur at NASO DNA. Piping plover is the only federally listed bird species that occurs at NASO DNA, and in addition to being federally threatened, it is listed as threatened in Virginia. Red knot is the only federal candidate species for listing that is known to occur at NASO DNA. Wilson's plover (*Charadrius wilsonia*) is a Virginia endangered species that is known to occur. In addition, 12 bird species that occur at NASO DNA are considered Virginia species of concern (Appendix I). Four (4) bird species that occur at NASO DNA are considered Virginia SWAP Tier I species, indicating those species that have critical conservation need. Eight (8) bird species of NASO DNA are considered Tier II species, which are those species identified as having a very high conservation need; three (3) bird species occur that are identified as high conservation need; and 35 bird species that occur at NASO DNA are identified as having moderate conservation need (Appendix I). A complete list of all fish and

wildlife species identified as Species of Greatest Conservation Need for the Mid-Atlantic Coastal Plain in the Virginia SWAP is included in Appendix I.

2.6.2.2.1 Bald Eagle

The bald eagle was removed from the federal list of threatened and endangered wildlife on 07 July 2007 (USFWS 2007b). Due to increased populations of bald eagles documented in the state, Virginia removed the bald eagle from their threatened and endangered species list on 01 January 2013 (VDGIF 2013). In 2011 the breeding population of bald eagles in coastal areas of Virginia was more than 730 pairs and surveys by VDGIF in the Piedmont and Mountain regions of Virginia also documented increases in nesting in these areas as well. At NASO DNA bald eagles are known to feed, hunt, or loaf; however, this species has not been documented nesting at the Installation (Navy 2013). Two bald eagles were observed on the Installation during the April 2013 bird survey (Schaeffer 2013). Guidelines established for the protection of bald eagles are discussed in Section 3.10.4.

2.6.2.2.2 Piping Plover

The piping plover is a federally threatened species that has been observed along the beaches of NASO DNA, most recently on 08 April 2013; however, there is no documentation of this species nesting at NASO DNA (Beatty 2003 and Schaeffer 2013).

Piping plover is a small shorebird that inhabits open sandy beaches and salt flats. It is listed as threatened throughout its range with the exception of individuals belonging to the Great Lakes watershed population, which are federally listed as endangered. Those with the potential to occur at NASO DNA belong to the Atlantic coast population, and are therefore federally threatened. The Atlantic coast population of piping plover was estimated at 1,782 pairs in 2010 (USFWS 2011a). A review of survey data collected in 2011 by VDGIF indicated that the closest population of piping plover occurs at Cedar Island, approximately 14 mi (32 km) southeast of the Installation, where 38 nesting pairs have been observed (VDGIF 2012). General characteristics for piping plover are provided in Table 2-6.

Table 2-6. Piping Plover Characteristics.

Attribute	Description
Size	Approximately 7.25 in (18 cm) in length
Identification	<p>During warmer times of year: pale brown above, lighter below; black band across forehead, orange bill with black tip, orange legs, white rump. Males will have a complete or incomplete black band that encircles the body at the breast, and females will have a paler head band, and incomplete breast band.</p> <p>During the winter: bills are black and all birds will lack black bands on the breast and head.</p>
Nesting	Plovers nest high on the beach, close to dunes. The nest is a simple depression in the sand, and is sometimes lined with small stones or shell fragments. Eggs are very well camouflaged and may be easily missed. When predators or intruders approach a nest or young plover, the parents may attempt to attract attention by feigning a broken wing.

2.6.2.2.3 Red Knot

Red knot is a federal candidate species for listing that is known to utilize tidal flat areas of NASO DNA as a stopover point during their migration. Incidental sightings and Christmas Bird Count records indicate that the red knot is a fairly regular, if infrequent, visitor to the Tidewater area (National Audubon Society 2012). This species conducts one of the longest migrations, travelling more than 9,300 mi (15,000 km) between their nesting grounds located in the Arctic, to their wintering grounds located in southern coastal areas of Chile and Argentina in South America (USFWS Northeast Region 2011).

Red knot is a medium-size shorebird that occupies intertidal habitats, especially those located near coastal inlets and bays. Flocks of red knots converge on staging areas along the entire Atlantic coast and are faithful to specific sites, returning to the same location year after year. The spring migration is timed with the release of horseshoe crab eggs, which provide quick, essential and easily found food for red knots along the Atlantic coast.

One of the primary threats to the red knot population is the increased take of horseshoe crabs for bait in commercial fisheries, as well as habitat degradation along their migratory route. Recent surveys in South America and the southeastern U.S. and at Delaware Bay indicate a substantial decline in red knot populations as compared to baseline information from the 1980s (USFWS 2005). In October 2011 the USFWS made a determination that a listing priority number of 3 should be maintained based on imminent threats of high magnitude (76 FR 66392). General characteristics for red knot are provided in Table 2-7.

Table 2-7. Red Knot Characteristics.

Attribute	Description
Size	Approximately 9–11 in (25–28 cm) in length
Identification	<p>Adults in spring: above finely mottled with grays, black and light ochre, running into stripes on crown; throat, breast and sides of head cinnamon-brown; dark gray line through eye; abdomen and undertail coverts white; uppertail coverts white, barred with black.</p> <p>Adults in winter: pale ashy gray above, from crown to rump, with feathers on back narrowly edged with white; underparts white, the breast lightly streaked and speckled, and the flanks narrowly barred with gray.</p> <p>Adults in autumn: underparts of some individuals show traces of the red markings of spring.</p>
Nesting	Shallow, lined scrape on tundra.

USFWS 2012b

Red knot (*Calidris canutus*)

Source: Wikipedia Commons 2013b

2.6.2.2.4 **Roseate Tern**

~~Although it has not been documented at the Installation,~~ roseate tern is a federally listed species that has ~~the potential~~ to occur at NASO DNA. It is listed as threatened throughout the western hemisphere with the exception of individuals belonging to the northeastern U.S. nesting populations, including Virginia, which are classified as endangered. Roseate tern is strictly a coastal bird species that forages in nearshore surf habitat. In the northeastern U.S., roseate terns nest on beaches, and barrier and offshore islands, with open sandy beaches that are isolated from human activity representing optimal nesting habitat (USFWS n.d.). Substrates used for nesting include pea gravel, open sand, and overhanging rocks, as well as salt marshes. Populations in northeastern North America almost always nest in colonies along with common terns (*Sterna hirundo*). Roseate terns arrive in coastal areas of the western Atlantic during the spring, and nest on coastal beaches and islands from Nova Scotia to New York (USFWS 2012c); they winter off the coast of South America. Roseate tern is most likely to occur at NASO DNA during the migration period in late August to early September, when the species migrates from the northeastern U.S. to waters located off Trinidad and northern South America (USFWS 2011b).

Roseate tern (*Sterna dougallii dougallii*)

Source: Wikipedia Commons 2013c

Roseate tern is a medium-sized bird that nests on small barrier islands and spends most of its life offshore and along the Atlantic coast. Roseate tern populations declined greatly due to hunting in the late 19th century. Currently populations remain in the low range of 2,500–3,300. Primary threats to roseate tern include habitat disruption and development along sensitive barrier island habitats the species relies on for nesting (USFWS 2011b). General characteristics for roseate tern are provided in Table 2-8.

Table 2-8. Roseate Tern Characteristics.

Attribute	Description
Size	Approximately 15.75 in (40 cm) in length
Identification	Light-gray wings and back. First three or four primaries are black, along with cap. The rest of the body is white, with a rosy tinge on the chest and belly during the breeding season. The tail is deeply forked, and the outermost streamers extend beyond the folded wings when perched. During the breeding season the basal three-fourths of the otherwise entirely black bill and legs turn orange-red.
Nesting	Roseate terns nest on small barrier islands, often at ends or breaks, in hollows or under dense vegetation, debris, or rocks to hide from predators. Roseate terns almost always nest in colonies with common terns.

USFWS 2011b and 2012d

2.6.2.3 Herpetofauna

Several federal and state listed rare, threatened, and endangered herpetofauna occur or have the potential to occur on the Installation, including federally listed marine sea turtles discussed in this section. In addition to the sea turtle discussed in the following section, other state rare reptile and amphibian species that are known to occur in freshwater habitats at NASO DNA include greater siren (*Siren lacertina*), documented in 1990 (Roble 2010); and common snapping turtle (*Chelydra serpentina serpentina*) (NAVFAC Mid-Atlantic 2013).

2.6.2.3.1 Sea Turtles

The federally endangered Kemp’s ridley and federally threatened loggerhead sea turtles have had successful nesting attempts on NASO DNA beaches. In 2002, VDGIF began maintaining a statewide sea turtle nesting database, which includes all reported nesting events on the state’s southern mainland beaches and barrier islands (VDEQ 2007). A review of VDGIF, USFWS, and Navy data indicates that two loggerhead sea turtle nests, one Kemp’s ridley sea turtle nest, and four loggerhead sea turtle crawls were documented at the Installation between 1970–2013. A loggerhead sea turtle nest observed in 1992 was successfully relocated to a protected hatchery site within the BBNWR. The loggerhead sea turtle nest identified at the Installation in 2002 was dug up by a bulldozer and the intact eggs were reburied at the BBNWR nursery site. Loggerhead sea turtle crawls were observed in 1992 and 2002 (three) (VDGIF n.d.c). Loggerhead sea turtles are the most common sea turtle in the area.

Most recently a Kemp’s ridley sea turtle nest was observed at the Installation on 15 June 2012 and was wired in place (left in situ). This successful nesting attempt by Kemp’s ridley sea turtle represents the first nesting record for this species in Virginia. Kemp’s ridley sea turtles are observed relatively frequently in the nearshore areas of NASO DNA.

Three other federally listed sea turtles species have been recorded in offshore areas of NASO DNA, and have the potential to occur on the Installation beaches. These include leatherback (*Dermochelys coriacea*), green (*Chelonia mydas*), and Atlantic hawksbill (*Eretmochelys imbricata*) sea turtles. Leatherback sea turtles have been observed relatively frequently, whereas very few Atlantic hawksbill or green sea turtles have been sighted in the area. Green turtles have been documented nesting on beaches located north and south of the Installation, and leatherback

sea turtles have been successfully nesting in North Carolina in recent years. Although sea turtles have the potential to occur year-round in the NASO DNA area, they are most likely to occur during the summer months. Observations of these five sea turtle species on the Installation have occurred as a mix of live and dead strandings.

2.6.2.4 Fish

No rare, threatened, or endangered fish species have been identified at the Installation; however, several federally listed fish species and fish species that have designated EFH have the potential to occur within the offshore/nearshore environment (Appendix F and Appendix I). Federally listed fish species that have the potential to occur include the endangered shortnose sturgeon (*Acipenser brevirostrum*), the Atlantic sturgeon (*Acipenser oxyrinchus oxyrinchus*) (Chesapeake Bay distinct population segment), and scalloped hammerhead shark (*Sphyrna lewini*), which are federal candidate species for listing. All of these fish species are under the management jurisdiction of NOAA NMFS.

2.6.2.4.1 American Eel

American eel (*Anguilla rostrata*) has been identified on the Installation. This species was petitioned for listing under the federal ESA in 2010. In 2011, the USFWS issued a finding that listing of the species may be warranted, and initiated a status review to determine if listing of this species is warranted (76 FR 60431-60444). As of December 2013, the USFWS has not issued a ruling on the listing of American eel.

2.6.2.5 Invertebrates

One state-rare insect, the s-banded tiger beetle (*Cicindela trifasciata*), has been documented at NASO DNA; however, weather conditions at the time of the 2001 survey may have affected survey results (Van Alstine et al. 2001). This survey also noted the presence of habitat that could support two other state-rare insect species, ghost tiger beetle (*Cicindela lepida*) and comet darner (*Anax longipes*). Future surveys for s-banded tiger beetle, ghost tiger beetle and comet darner should be conducted at the Installation.

2.6.3 Significant Ecological Communities

Several of the ecological communities that occur on the Installation are considered significant, rare natural communities in Virginia. The maritime wet grasslands, maritime upland forests, maritime dune woodlands, and interdune swales that occur in the beach and dune area are rare natural communities that are severely threatened by coastal development throughout their natural range. The maritime wet grassland communities at the northern portion of NASO DNA are not considered significant because of the high degree of disturbance that has occurred in this area. Table 2-4 lists species and natural communities of NASO DNA that are currently listed as rare, threatened, or endangered and the date of the last recorded observation by VDCR-DNH. VDCR-DNH descriptions of the ecological community groups identified at NASO DNA in surveys conducted in 1992, 2001, and 2010 (Buhlmann et al. 1992, Van Alstine et al. 2001, and Evans and Belden 2010) are provided in the following sections.

2.6.3.1 Maritime Upland Forest

Maritime upland forest are pine-dominated maritime forest that are distributed along the length of the outer Coastal Plain maritime zone and barrier islands of Virginia in oceanside and bayside dunes and sand flats that are generally protected from salt spray. Overstories contain variable mixtures of southern red oak, water oak (*Quercus nigra*), post oak (*Q. stellata*), hickories (*Carya glabra*, *C. pallida* and *C. alba*), and black cherry, with some loblolly pine usually present. Understory layers of drier stands may be very sparse, whereas more mesic stands often contain American holly, sweetleaf (*Symplocos tinctoria*), devilwood (*Osmanthus americanus*), American beautyberry (*Callicarpa americana*), and “bay” species such as southern bayberry (*Myrica cerifera* var. *cerifera*) and redbay. The herb layer is often covered with dense tangles of common greenbrier (*Smilax rotundifolia*) and muscadine grape; true herbs are typically sparse. All community types in this group are considered globally rare because of restricted ranges, narrow habitat requirements, and threats from coastal development (Fleming and Patterson 2012).

2.6.3.2 Maritime Dune Woodland

Maritime dune woodlands are deciduous, coniferous, and broadleaf evergreen woodlands that occur on back dunes that are protected from regular salt spray. Compared to maritime upland forests, these woodlands are more localized and restricted to xeric dune systems. Along the southeastern Virginia coast, live oak, bluejack oak, and sassafras dominate stands, with loblolly pine, black cherry, and Hercules’ club (*Zanthoxylum clava-herculis*) as less abundant species. Scattered herbaceous plants that occur in these woodlands include seabeach needlegrass (*Aristida tuberculosa*), cottony golden-aster (*Chrysopsis gossypina*), yellow thistle (*Cirsium horridulum* var. *horridulum*), oval-leaved panic grass (*Dichanthelium ovale* var. *ovale*), coast bedstraw (*Galium hispidulum*), longbranch frostweed, woolly ragwort (*Senecio tomentosus*), dune ground-cherry (*Physalis walteri*), eastern jointweed (*Polygonella articulata*), and narrow-leaved golden-aster (*Pityopsis graminifolia* var. *latifolia*). All communities in this group are considered globally and state rare (Fleming and Patterson 2012).

2.6.3.3 Interdune Swales

Interdune ponds are highly variable in composition, which makes them difficult to classify because of seasonal changes in flora, succession of stands over time, temporal hydrological variation, and rapid geomorphic changes in dynamic dune systems. Interdune ponds are the most permanently and deeply flooded interdune wetlands, encompassing both freshwater ponds, in which rainwater and groundwater quickly dilutes infrequent salt-water inputs, and slightly brackish ponds subject to more frequent salt water inputs. Seasonally flooded, freshwater ponds usually contain large cover of bulrushes (e.g., *Scirpus cyperinus*, *Schoenoplectus pungens* var. *pungens*, *S. tabernaemontani*), grasses (e.g., *Panicum virgatum* var. *virgatum*, *P. rigidulum* var. *condensum*, *Spartina patens*), or squarestem spikerush (*Eleocharis quadrangulata*). The marginal zones of some freshwater ponds may be dominated by nearly pure stands of twig rush (*Cladium mariscoides*). Seasonally flooded oligohaline ponds may be dominated by narrow-leaved cattail (*Typha angustifolia*), eastern rose-mallow (*Hibiscus moscheutos* ssp. *moscheutos*), or saltmarsh bulrush (*Scirpus robustus*). Semi-permanently flooded oligohaline ponds are dominated by coastal water-hyssop (*Bacopa monnieri*), white spikerush (*Eleocharis albidum*), and sago pondweed (*Potamogeton pectinatus*). All community types within the group are uncommon to rare, small-patch communities existing in fragile settings. They also support

Existing Conditions

several state rare insects including tiger beetles (*Cicindela* spp.) and comet darner. As with most maritime communities, threats to this group include development and sea-level rise (Fleming and Patterson 2012).

This page intentionally left blank.

3.0 NATURAL RESOURCES MANAGEMENT ISSUES

3.1 COASTAL ZONE PROTECTION

The CZMA encourages states to preserve, protect, and, where possible, restore or enhance valuable coastal resources such as wetlands, floodplains, estuaries, beaches, dunes, barrier islands, and coral reefs, as well as fish and wildlife. Virginia's coastal management area includes the entire Tidewater region. Although federal lands are excluded from state coastal zones, activities on federal lands that are reasonably likely to affect use of lands, waters, or natural resources of Virginia's coastal zone must be consistent, to the maximum extent practicable, with the enforceable policies of Virginia's Coastal Resources Management Program. Federal activities affecting Virginia's coastal zone are subject to consistency review by the VDEQ and other Virginia agencies responsible for the Coastal Resources Management Program. Federal activity affecting Virginia's coastal zone must be fully consistent with Virginia's enforceable policies unless other provisions of federal law prohibit full consistency.

An outline of Virginia's federal consistency review process is available on the VDEQ website:

<http://www.deq.state.va.us/Programs/EnvironmentalImpactReview/FederalConsistencyReviews.aspx>

Enforceable policies of Virginia's Coastal Resources Management Program include the following:

- *Subaqueous Lands Management.* This program establishes conditions for granting or denying permits to use state-owned bottomlands based on considerations of potential effects on marine and fisheries resources, wetlands, adjacent or nearby properties, anticipated public and private benefits, and water quality standards established by the VDEQ, Water Division. The program is administered by the VMRC (Code of Virginia §28.2-1200 through §28.2-1213).
- *Tidal and Nontidal Wetlands Management.* This program preserves tidal wetlands, prevents their despoliation, and accommodates economic development in a manner consistent with wetlands preservation. The Virginia Water Protection Permit Program administered by the VDEQ includes protection of wetlands, both tidal and nontidal. This program is authorized by Code of Virginia §62.1-44.15.5 and the Water Quality Certification requirements of Section 401 of the CWA of 1972. The Tidal Wetlands Program is administered by the VMRC (Code of Virginia §28.2-1300 through §28.2-1320).
- *Nonpoint Source Pollution Control.* Virginia's Erosion and Sediment Control Law requires that soil-disturbing projects be designed to reduce soil erosion and decrease inputs of chemical nutrients and sediments to the Chesapeake Bay, its tributaries, and other waters of the State. This program is administered by VDCR (Code of Virginia §10.1-560 et seq.).

- *Point Source Pollution Control.* The point source program is administered by the State Water Control Board pursuant to Code of Virginia §62.1-44.15. Point source pollution control is accomplished through the implementation of the National Pollutant Discharge Elimination System permit program established pursuant to Section 402 of the CWA and administered in Virginia as the VPDES permit program.
- *Coastal Lands Management.* This program regulates activities within the Chesapeake Bay Resource Management Areas and Resource Protection Areas within 84 localities in Virginia's coastal zone. It is a state-local cooperative program administered by the Chesapeake Bay Local Assistance Department and the 84 localities in Tidewater, Virginia, established pursuant to the Chesapeake Bay Preservation Act (Code of Virginia §10.1-2100 through §10.1-2114) and the Chesapeake Bay Preservation Area Designation and Management Regulations (9 Virginia Administrative Code [VAC] 10-20-10 et seq.).
- *Fisheries Management.* This program stresses the conservation and enhancement of finfish and shellfish resources and the promotion of commercial and recreational fisheries to maximize food production and recreational opportunities. This program is administered by the VMRC (Code of Virginia §28.2-200 through §28.2-713) and the VDGIF (Code of Virginia §29.1-100 through §29.1-570).
- *Shoreline Sanitation.* The purpose of this program is to regulate the installation of septic tanks, set standards concerning soil types suitable for septic tanks, and specify minimum distances that tanks must be placed away from streams, rivers, and other waters of the State. This program is administered by the Department of Health (Code of Virginia § 32.1-164 through § 32.1-165).
- *Air Pollution Control.* This program implements the federal Clean Air Act to provide a legally enforceable State Implementation Plan for the attainment and maintenance of the National Ambient Air Quality Standards. This program is administered by the State Air Pollution Control Board (Code of Virginia § 10-1.1300).

With an expansive and low-lying coastline, the Virginia coast, which includes the nearshore environment at NASO DNA, is severely threatened by the effects of climate change, including higher average air and water temperatures, rising sea level, and more extreme weather events such as floods, droughts and heat waves. Significant change in relative sea level has been documented in numerous places along the Chesapeake Bay, with many places experiencing a 1-ft (0.3-m) increase over the last century, half of which is attributed to climate change and the other half to natural subsiding coastal lands. The Lower Tidewater Region, including the cities of Norfolk and Virginia Beach, is projected to lose 79% of ocean beach by 2100, without extensive beach re-nourishment. One example of the potential impact from projected sea level rise is the conversion of coastal brackish marsh habitats to less ecologically diverse salt marsh or open water. Hundreds of species that rely on nearshore environment in and around the Chesapeake Bay will be affected by lost habitat and widespread shifts in ecosystem composition and the regional food web (National Wildlife Federation 2008).

Sea level rise caused by climate change has the potential to affect existing coastal infrastructure critical to the DoD. DoD facilities located on the coast, such as NASO DNA, are expected to experience significant changes to environmental resources and man-made infrastructure. The DoD's Strategic Environmental Research and Development Program (SERDP) is currently conducting several vulnerability and impact assessments for coastal installations that are threatened by climate change issues such as rising sea-levels. Project RC-1701, Risk Quantification for Sustaining Coastal Military Installation Assets and Mission Capabilities, is examining approaches that can quantify potential impacts to critical infrastructure and mission performance at Naval Air Station Norfolk, Virginia. Project RC-1701 will develop an integrated, multi-criteria, multi-hazard risk assessment framework that will be used to evaluate changes in risks to coastal military installations and mission capabilities in the Hampton Roads region due to global climate change (SERDP n.d.). Although the study is specifically focused on Norfolk Naval Station, the assessment framework will help policymakers and NRMs develop strategies that support mission adaptation and long-term sustainability at DoD installations throughout the Hampton Roads region (SERDP 2013).

Assessing the impacts of climate change is best approached by identifying an environmental baseline for the future that considers the differences in landscape form and function caused by climate change and other stressors on the landscape (Commander, Navy Installations Command [CNIC] 2012). Therefore, NR staff at NASO DNA and other DoD installations in the Hampton Roads region should continue to pursue partnerships with SERDP, South Atlantic Landscape Conservation Cooperative, Society for Ecological Restoration International, and other regional conservation partners in an effort to assess impacts from climate change and develop appropriate adaptation strategies to protect natural resources in the region. Other ongoing and planned projects that will contribute valuable information towards managing coastal resources includes a survey of primary and secondary dune habitats completed in 2013, and a survey of the nearshore environment (funded for FY2015) (Appendix H).

As a federal facility NASO DNA is exempted from inclusion in the state-designated coastal zone; however management of coastal zone resources does occur across the Installation. All Installation activities are reviewed for their potential impact to coastal zone resources and their compliance with the state's enforceable policies of the CZMA. The Navy strives to avoid and minimize impacts to coastal zone resources to the extent practicable when conducting activities that have the potential to impact these resources. Management actions include monitoring non-point source pollution, marine fish and wildlife species and habitat, and wetlands. The Installation has implemented numerous management practices that benefit the coastal zone and nearshore environment, including protection of stormwater quality (see Section 3.2.4), erosion and sediment controls (see Section 3.2.5), riparian buffer restoration (see Section 3.2.3), and measures to protect marine resources (see Section 3.6). These management techniques directly and indirectly benefit plant and wildlife species, water resources, and habitat that exist in the nearshore environment at NASO DNA.

Implementation of shoreline stabilization projects is under the purview of the NAS Oceana PWD, aside from specific measures that are conducted annually to reduce beach erosion and enhance dune stabilization and restoration.

3.2 WETLANDS AND WATER QUALITY PROTECTION

Due to their importance to the health of the ecosystem and the human environment, a large number of state, federal, and local laws regulate land uses and actions that have the potential to impact wetlands and water quality. Executive Order (EO) 12088, *Federal Compliance with Pollution Control Standards*, and the CWA require federal facilities to comply with all substantive and procedural requirements applicable to point and nonpoint sources of pollution. Accordingly, activities at NASO DNA must coordinate with the CRNMA to obtain certifications and permits required by federal and state pollution control laws applicable to federal agencies. To help facilitate wetland identification and the permitting process, regional and Installation NR personnel must receive wetland delineation and regulatory training in preparing joint permit applications.

The VDGIF recommends conducting any in-stream activities during low or no-flow conditions, using non-erodible cofferdams to isolate the construction area, blocking no more than 50% of the streamflow at any given time, stockpiling excavated material in a manner that prevents re-entry into the stream, restoring original streambed and streambank contours, revegetating barren areas with native vegetation, and implementing strict erosion and sediment control measures. Due to future maintenance costs associated with culverts, and the loss of riparian and aquatic habitat, the VDGIF advises that stream crossings are constructed as clear-span bridges. However, if this is not possible, the VDGIF recommends countersinking any culverts below the streambed at least 6 in (15 cm), or use of bottomless culverts, to allow passage of aquatic organisms. The VDGIF also recommends the installation of floodplain culverts to carry bankfull discharges (VDGIF 2007a).

3.2.1 Wetlands Protection

Waters of the U.S., including tidal and non-tidal wetlands, are protected under federal and state laws. As a result efforts to avoid wetland impacts are the first step to wetland protection. However, instances when impacts to wetlands are unavoidable, the Navy will coordinate with the appropriate regulatory agencies to obtain permits prior to activities that will result in disturbance.

Regulatory agencies that have jurisdiction over wetlands in Virginia include USACE, VDEQ, VMRC, and the local wetlands board. Depending on the wetlands impacted, a permit may be required from one or more of the different regulatory agencies. Concurrent federal and state review is made through a Joint Permit Application process. A number of USACE Nationwide Permits and Regional Permits may be used to streamline the permitting process for activities that have minimal adverse effects on aquatic environments. Compensatory mitigation for unavoidable impacts to wetlands and waters of the U.S. may be required.

*Detailed information regarding current regulatory programs of the USACE
is available at:*

<http://www.usace.army.mil/Missions/CivilWorks/RegulatoryProgramandPermits.aspx>

The Virginia Water Protection Permit Program (9 VAC 25-210) requires state permits for any impacts to state waters and wetlands, including isolated wetlands. Activities requiring a permit include dredging, filling, or discharging pollutants into or adjacent to surface waters; otherwise altering the physical, chemical, or biological properties of surface waters; excavating in wetlands; or conducting any of the following activities in wetlands:

- new activities that cause draining which significantly alters or degrades existing wetland acreage or functions;
- filling or dumping;
- permanent flooding or impounding; and
- new activities that cause significant alteration or degradation of existing wetland acreages or functions.

Information on individual and state permit requirements and application procedures is available on the VDEQ website:
<http://www.deq.state.va.us/Programs/Water/WetlandsStreams/PermitsFeesRegulations.aspx>

MILCON and other projects with the potential to disturb wetlands are reviewed individually with regard to wetland impacts, and individual permits are sought as needed. Although permits may be obtained that allow for the filling of wetlands, in accordance with EO 11990, *Protection of Wetlands*, federal agencies may do so only after finding no practicable alternative. Compensatory mitigation for unavoidable impacts to nontidal water and wetlands are generally at the following ratios:

- 2:1 ratio for forested wetlands,
- 1.5:1 for scrub-shrub wetlands,
- 1:1 for emergent wetlands, and
- 1:1 for streams.

3.2.2 Floodplain Protection

Per Executive Order 11988, Floodplain Management requires Federal agencies to avoid to the extent possible the long and short term adverse impacts associated with the occupancy and modification of floodplain development wherever there is a practicable alternative. The EO instructs federal agencies to restore and preserve floodplains and to reduce the risk of flood-related loss by not building in floodplains. Proposed actions should be evaluated to determine if they occur within a floodplain. If the proposed actions are determined to be located within a floodplain the action must comply with applicable FEMA approved floodplain management requirements. If floodplain disturbance is unavoidable, appropriate permits and NEPA documentation must be obtained before any ground-disturbing activities are undertaken.

3.2.3 Watershed Protection

Watersheds associated with the Installation include the Back Bay Watershed and the Rudee Inlet/Owl's Creek Watershed (Figure 2-3), both of which flow into the Atlantic Ocean. The Back Bay Watershed is located within the Southern Watersheds Unit area, which contains some of the most valuable wetland habitat in the region and is recognized as one of the most biologically diverse regions in the state (City of Virginia Beach 2003). The area is particularly important for protecting water quality for the cities of Virginia Beach and Chesapeake. Under the direction of the Hampton Roads Planning District Commission, the cities of Virginia Beach and Chesapeake cooperate in an effort to protect and enhance natural resources, sensitive lands, and water supplies under the Southern Watershed Area Management Program (SWAMP). The mission of the SWAMP, which was developed in 2000, is to protect and enhance natural resources, sensitive lands, and water supplies through a system of cooperative planning and management strategies. A key component of SWAMP is the development of conservation corridors, which provide connectivity for wildlife between primary natural habitats that could otherwise become isolated due to unplanned land use development patterns. The Conservation Plan for the Southern Watershed Area identifies 37 conservation sites throughout the area, some of which are currently protected conservation lands. These sites are prioritized according to site location, size, contribution to SWAMP goals, management needs, vulnerability and immediate or long-term threats, and ecological significance (Erdle et al. 2001). Within the Southern Watershed Area, development activities are regulated through the enforcement of design criteria for sediment control and septic system management and groundwater withdrawal restrictions. At the Installation, development and vegetation clearing within 50 ft (15 m) of any wetland or shoreline will be minimized to the maximum extent practicable.

*An interactive map of the Southern Watersheds Area is available on the website
<http://www.vbgov.com/dept/planning/emc/watershed.asp>*

None of the Installation waterbodies have been identified as impaired by the state; however, several impaired waterbodies are associated with the Back Bay and Rudee Inlet/Owl's Creek Watershed. The Navy supports the protection of watersheds through initiatives such as establishing or enhancing riparian forest buffers along unprotected waterways. Reducing the frequency of mowing or establishing no mowing zones along wetland edges to increase vegetative filters and planting appropriate native trees, shrub, and ground cover vegetation as wetland buffers are effective methods of establishing riparian buffers.

3.2.4 Stormwater Quality

Stormwater management is an important part of water quality protection. The stormwater drainage systems at NASO DNA collect runoff from impermeable surfaces throughout the developed areas of the Installation, which can inadvertently facilitate the transport of pollutants into stormwater drains. Industrial stormwater discharges are regulated by the VPDES and require a permit, and NASO DNA currently is covered by the VPDES stormwater permit that is held for NAS Oceana (expires in 2014).

The NASO DNA SWP3 (Navy 2012) describes the stormwater outflow areas and management standards, stormwater management controls, and best management practices (BMPs) used at NASO DNA to maintain and protect water quality. The only regulated industrial activities on NASO DNA are the boat repair facility in Building 354 and military support activities within the urban warfare compound located in the southern portion of the Installation, which discharges stormwater runoff through Outfall 001. Nonpoint source pollution is monitored at this outfall under the conditions set forth in the Installation's VPDES permit. There are no regulated outflows located in the northern portion of NASO DNA.

To be effective in improving stormwater quality, BMPs must prevent outfall scour, dissipate the erosive energy of concentrated flows, and slow channel flow to help trap sediment and promote infiltration. Sediment basins, pervious pavers, riprap armoring, and rock check dams are useful structural BMPs that may be used. Nonstructural BMPs such as establishing vegetative filters in ditches and on ditch banks are an additional cost-effective way to improve stormwater quality.

Currently the NASO DNA SWP3 does not cover the northern-most area of the Installation (the former Virginia Army National Guard Camp Pendleton and Naval Amphibious Base Little Creek South Virginia Beach Annex portions of the Installation, previously known as Camp Pendleton). The next SWP3 update will be revised to cover stormwater management and BMPs for the northern-most area of the Installation.

The Navy has adopted other practices and participates in programs designed to reduce stormwater runoff and impacts, including applying low impact development (LID) practices and participating in the Leadership in Energy and Environmental Design (LEED) program. LID is an approach to land development that works with nature to manage stormwater as close to its source as possible. By implementing LID principles and practices, water can be managed in a way that reduces the impact of built areas and promotes the natural movement of water within an ecosystem or watershed. The LEED program is a series of rating systems that encourages building owners and operators to be environmentally responsible and maximizes resource efficiency.

More information on LID practices is available at: <http://water.epa.gov/polwaste/green/>

More information on LEED program requirements is available at: <http://www.usgbc.org/leed>

3.2.5 Erosion and Sediment Control

NASO DNA's relatively flat topography results in a low potential for erosion and sedimentation. However, activities that remove vegetation and disturb the soil increase the risk of erosion and sedimentation, and require measures to protect water quality. Proposed construction projects that disturb 1.0 ac (0.4 ha) or more must obtain authorization under a VPDES Storm Water Discharge Permit for Construction Activities. Site-specific SWP3s that address runoff control during and after construction activities must be prepared for all construction projects at the Installation. As with SWP3s for industrial discharges, SWP3s for construction sites must be updated as necessary

to remain consistent with any changes needed to protect surface water resources. Sediment basins are a structural control requirement for sites 3.0 ac (1.2 ha) or more. On sites less than 3.0 ac (1.2 ha), sediment basins are encouraged, but other control methods may be employed. Additional guidance on erosion and sediment control will be available in the erosion control plan that is currently being prepared. A copy of this document will be included in Appendix H once available.

Erosion can also be attributed to wildlife damage. Nuisance wildlife, such as nutria, damage streambanks via burrowing and vegetation removal, which can exacerbate erosion within these systems. A management plan is currently under development for the control and management of nuisance species based on a nuisance wildlife inventory completed in 2013. This plan will be provided in Appendix H once available.

The Virginia Erosion and Sediment Control Handbook (2011) is available online at:
<http://www.deq.virginia.gov/Programs/Water/StormwaterManagement/Publications/ESCHandbook.aspx>

Additional erosion and sediment control is provided by the Virginia Erosion and Sediment Control Law (Code of Virginia §10.1-560). This law requires that an erosion and sedimentation plan be written and approved for any land-disturbing activity equal to or exceeding 10,000 square feet (ft²) (929 square meters [m²]) in area. Land-disturbing activities include, but are not limited to, clearing, grading, excavating, transporting, and filling of land. Regulated land-disturbing activities must comply with minimum standards outlined in the Virginia Erosion and Sediment Control Handbook (VDCR-DNH 2011). NR staff must be familiar with standards and specifications in the handbook and perform frequent site visits during construction to help ensure compliance with erosion and sediment control plans and that appropriate BMPs are being implemented. The VDCR provides training and certification in erosion and sediment control, which would assist the NR staff in enforcing erosion and sediment control plans.

Adherence to LID and LEED practices, as discussed in Section 3.2.4, can minimize problems associated with erosion and sediment control.

3.3 ENVIRONMENTAL RESTORATION PROGRAM

The Navy recognizes that adverse impacts to the natural resources addressed in this INRMP may result from the release of hazardous substances, pollutants, and contaminants into the environment. The Navy Environmental Restoration Program (ERP) manages the Environmental Restoration sites, which consist of chemical hazardous waste, and Munitions Response Program (MRP) sites, including hazards associated with munitions and their chemical constituents. The ERP is responsible for identifying such sites, considering their risks, and assessing the impacts to human health and the environment. This assessment must consider endangered species, migratory birds, and biotic communities. The ERP must develop and select response actions when it is likely that a release could result in an unacceptable risk to human health and the

environment. As of July 1998, environmental restoration activities have been accomplished under the Comprehensive Environmental Response, Compensation, and Liability Act under a Consent Order. MRP sites and Potentially Responsible Party sites are managed under their own programs, with state oversight only. The Armed Forces Bill (10 USC 2701) codifies the Defense Environmental Restoration Account, the funding mechanism for installation restoration.

A final decision document was signed in 1999 for two ERP sites at NASO DNA. The sites included an inactive landfill (Site 1) just south of Regulus Avenue and a former pesticide shop (Site 6) on the same site as the current pesticide shop (Building 613) (Figure 3-1). Based on investigation of site conditions, review of data, and assessment of associated risk, the sites pose no threat to human health or the environment and the Navy does not plan to take further action at the sites (Navy 1999). Four other ERP sites (Sites 1-4) also are inactive (Blackwell 2004).

As of June 2012, there are three active sites in the MRP at NASO DNA. The former Skeet and Trap Range, located on the southwestern portion of NASO DNA on the eastern shore of Lake Tecumseh, composed four skeet ranges and four trap ranges, and encompasses approximately 39 ac (16 ha), with approximately half of the former range area extending into Lake Tecumseh. A Site Investigation (SI) conducted in 2011 found potential unacceptable risks associated with polynuclear aromatic hydrocarbons and lead, and recommended remedial investigation to delineate the extent of soil contamination, evaluate the limited potential risks, establish site-specific background levels for the contaminant, and assess risks. It is anticipated that the site will move into the Remedial Investigation phase in FY 2013 (CH2M HILL 2012).

The Moving Target/Mortar Range-South is located in the southeastern portion of NASO DNA, east of the intersection of Regulus Avenue and Bullpup Street. Approximately 17 ac (7 ha) of the range is eligible for the MRP. An SI conducted in 2011–2012 recommended further investigation and identified several mortar fragments. Remedial Investigation activities will be required at the range and may be initiated in FY 2013. Currently, land use controls restrict and/or prevent unauthorized access to this area (CH2M HILL 2012).

The Mortar Impact Area is a cone-shaped area located in the southernmost portion of NASO DNA. Approximately 24 ac (10 ha) of the area is eligible for the MRP. An SI conducted in 2011–2012 identified several anomalies but no mortar fragments. The area will be recommended for No Further Action. Currently, land use controls restrict and/or prevent unauthorized access to this area (CH2M HILL 2012).

The NRM will coordinate with the ERP manager to obtain up-to-date ERP information and recommendations for any natural resources activities that are proposed in the vicinity of any of the NASO DNA ERP sites.

3.4 OIL AND HAZARDOUS SUBSTANCES

The RCRA of 1976 is the primary federal law governing the disposal of solid and hazardous wastes. RCRA regulations are contained in Title 40 of the CFR, Parts 239–299, and include regulations for solid waste (40 CFR Parts 239–259) and for hazardous waste (40 CFR Part 260–279). Virginia regulations solid waste are described in 9 VAC 20-81, and regulations related to hazardous waste are described in 9 VAC 20-60.

Figure 3-1. Former ERP Sites of NASO DNA.

Oil and hazardous substances (OHS) are managed in accordance with the *Hazardous Materials Reutilization, Hazardous Waste Minimization and Disposal Guide*, which was developed to communicate regulatory requirements and management procedures relevant to the utilization of hazardous materials, and minimization and disposal of hazardous waste for several Hampton Roads installations, including NASO DNA. This guide is provided in Appendix H.

OHS are not stored in significant quantities at NASO DNA; however, the prevention of OHS spills is still important for the protection of natural resources and environmentally sensitive areas. Information on the storage and handling of OHS is provided in detail as part of the Spill Prevention, Control, and Countermeasures Plan (SPCCP) and Oil Discharge Contingency Plan (ODCP) for NASO DNA (Navy 2011b). The SPCCP was prepared in accordance with the provisions of 40 CFR Part 112 and OPNAVINST 5090.1C Ch-1. The purpose of the SPCCP is to prevent the discharge of oil from onshore facilities into or upon the navigable waters of the U.S. or adjoining shorelines as well as to ensure early detection and quick response in the event of a discharge of oil. The ODCP was prepared in accordance with Commonwealth of Virginia Oil Discharge Contingency Plan Requirements (9 VAC 25-91-170) and OPNAVINST 5090.1C Ch-1. This type of plan is required for all installations that have a total aboveground oil storage or handling capacity greater than 25,000 gallons (94,635 liters). The goals of the ODCP are to ensure that the Installation can respond to the threat of an oil discharge, as well as contain, clean up, and mitigate an oil spill within the shortest feasible time. These plans contain an inventory and description of each oil storage tank facility, information regarding environmentally sensitive areas, spill notification and response procedures, assessments of worst-case discharge, and post-discharge review procedures. The northern portion of NASO DNA was not included in the SPCCP/ODCP, and is not likely to require one based on OHS storage capacity. Future updates to the SPCCP/ODCP will be prepared in accordance with OPNAVINST 5090.1C, or the current version of this instruction.

To help identify and prioritize the protection of natural resources and sensitive areas, the NOAA Office of Response and Restoration has developed an Environmental Sensitivity Index that illustrates sensitive coastal areas (NOAA Environmental Sensitivity Index 2005). Natural resources identified on ESI maps include shoreline types; the presence of shellfish beds; nesting areas for various types of birds; common local shellfish, finfish, and bird species; and known locations of threatened and endangered species.

ESI maps may be ordered online from <http://response.restoration.noaa.gov/maps-and-spatial-data/download-esi-maps-and-gis-data.html>.

In the event of an oil spill on or near NASO DNA, environmentally sensitive resources in the region (Figure 3-2) that are given protection priority because of their intrinsic value include the following:

- groundwater used for public and private wells;
- marshes, swamps, and other wetlands;
- streams and rivers with high levels of recreational fishing;

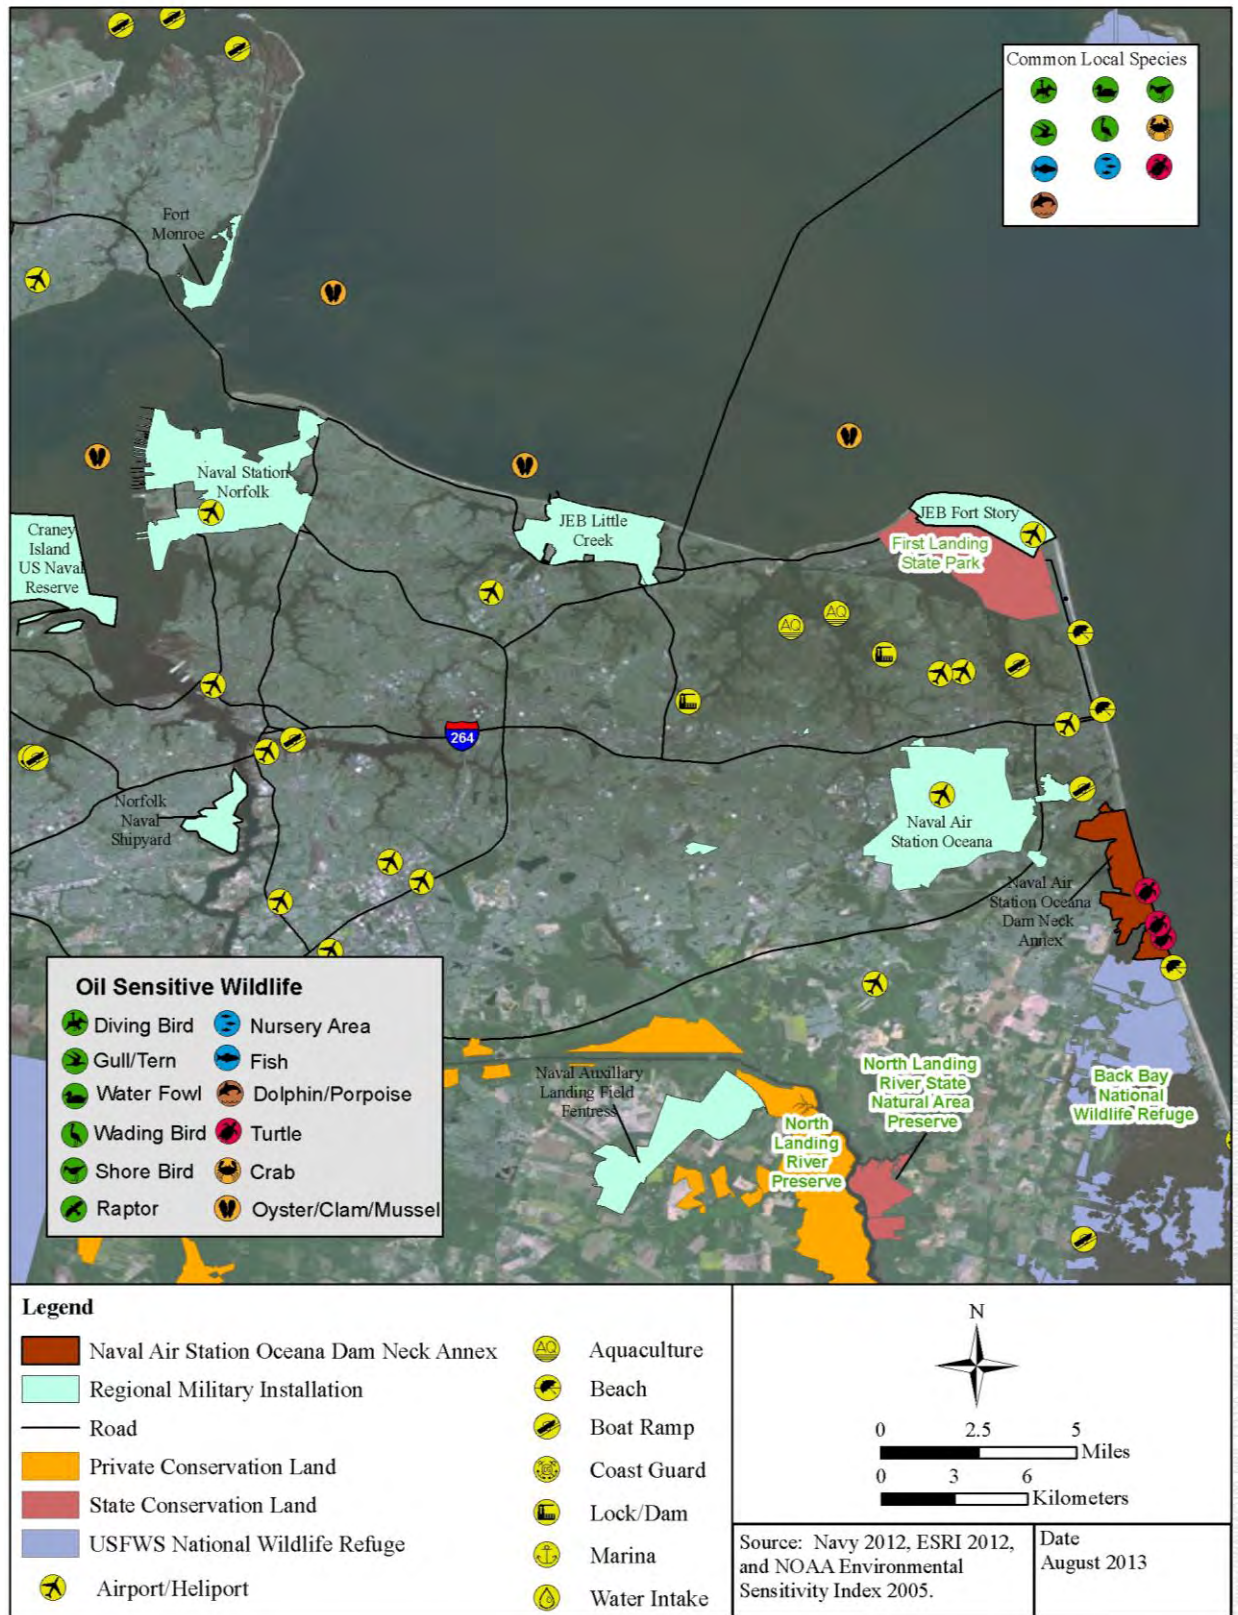

Figure 3-2. Regional Environmentally Sensitive Resources.

- rare, threatened, and endangered species habitats;
- blue crab (*Callinectes sapidus*) habitat;
- waterfowl wintering areas;
- wildlife refuges and sanctuaries;
- SIAs designated by the state of Virginia;
- parks and other recreational areas; and
- residential neighborhoods.

Sensitive areas and resources identified by NOAA within the Installation region are mapped in Figure 3-2.

3.5 THREATENED AND ENDANGERED SPECIES PROTECTION

The primary regulatory protection for threatened and endangered species on military installations is the federal ESA. The federal ESA requires all federal agencies to ensure that any action undertaken is not likely to jeopardize the continued existence of a federally listed threatened or endangered species. Section 7 of the federal ESA requires federal agencies to formally consult with the USFWS (terrestrial species or freshwater fish) or NMFS (marine species) if a proposed action has the potential to affect a listed species. Section 9 of the ESA prohibits the taking of any endangered species without special exemption. The Virginia ESA gives the VDGIF regulatory authority over federally or state-listed fish or wildlife species in Virginia. Therefore, coordination with the USFWS, NOAA NMFS, and/or VDGIF is required when actions have the potential to affect federal or state listed fish and wildlife species.

The Endangered Species Consultation Handbook provides guidance on conducting consultation and conference activities under Section 7 of the federal ESA with USFWS and NMFS and is available on the USFWS website: <http://www.fws.gov/endangered/esa-library/index.html#consultations>.

In 2012, the Navy prepared and issued a Biological Assessment to the USFWS for a shoreline protection project at NASO DNA. The USFWS issued a BO on 03 November 2012 (Appendix F), which contained an update to the 13 July 2011 BO issued to BBNWR to cover NASO DNA. The USFWS concurred with the Navy's determination that the project "may affect, but is not likely to adversely affect" roseate tern and seabeach amaranth. The USFWS determined it was unlikely that piping plover would utilize the Installation; therefore, at the time the USFWS concurred with the Navy's determination of "may affect, but is not likely to adversely affect" for this species. (Note: piping plover has subsequently been documented at NASO DNA.) The USFWS also concurred with the Navy's "no affect" determination for impacts to leatherback and Atlantic hawksbill sea turtles, as no records of nesting attempts by these species have been documented in Virginia. The USFWS requested that the Navy address concerns regarding proposed management for loggerhead, Kemp's ridley, and green sea turtles, and piping plover.

The 13 July 2011 BO includes sea turtle nest monitoring and management protocols. If a loggerhead, Kemp's ridley, or green sea turtle nest is observed at the Installation, it will be left in situ, except in the case when operational uses of the beach would result in the take of a nest. In these cases, the Navy will coordinate with the USFWS BBNWR in accordance with the 13 July 2011 BO. Sea turtle protection is discussed in greater detail in Section 3.5.1.

As discussed in Section 2.6.2.1.1, the USFWS is currently reviewing eastern small-footed bat, northern long-eared bat, and little brown bat for potential listing under the ESA. Management for this species, including protection of potential habitat and conducting surveys for these three species at NASO DNA, is an important component of threatened and endangered species protection at the Installation. The Installation also contains several bat boxes that were installed as part of the Installation Nest Box Program (see Section 3.10.5).

Projected climate change impacts to natural resources, as described in Section 2.1.1 and Section 3.1, could result in significant impacts to threatened and endangered species and their habitats. The effects of climate change on fish and wildlife are highly variable, including geographic range shifts, changes in relative species abundance, phenology, and other ecological aspects of their biotic communities. There is already evidence of disruptions in community dynamics, such as predator-prey and plant-insect interactions, alterations in biogeochemical cycles, and increased disease, pest, and non-native species invasions. The rapid pace of recent environmental change has increased the threat of extinction, as species are not able to adapt to changing environments quickly enough. Specific climate change stressors that can impact threatened and endangered species include increases in sea level; increases in surface and ocean temperatures; increases in carbon dioxide concentrations; changes in precipitation; increases in diseases, pests, and non-native species; and increases in the frequency and severity of storm events (Society for Ecological Restoration International 2009). To address potential impacts to listed species from climate change, the Navy is working with the South Atlantic Landscape Conservation Cooperative to address increasing land use pressures and widespread resource threats and uncertainties amplified by a rapidly changing climate (South Atlantic Landscape Conservation Cooperative 2010). Additionally, as described in Section 3.1, the DoD's SERDP is currently conducting several vulnerability and impact assessments for coastal installations that are threatened by climate change issues such as rising sea-levels, including a project that is examining approaches that can quantify potential impacts to critical infrastructure and mission performance to installations located in the Hampton Roads region.

An update to the rare, threatened, and endangered species inventory of NASO DNA is scheduled for 2014.

3.5.1 Sea Turtle Protection

Five species of sea turtles, including loggerhead, Kemp's ridley, leatherback, Atlantic hawksbill, and green sea turtles are known to occur in the Atlantic Ocean off the coast of NASO DNA. Loggerhead and Kemp's ridley sea turtles have been documented nesting on the beaches of NASO DNA. Green sea turtles have been documented nesting on Virginia beaches located north and south of NASO DNA. Since 2008, beach monitoring has been conducted daily from 15 May through 31 August, when sea turtles are most likely to nest in the area. The monitoring protocol, as described in the Standard Operating Procedures for sea turtles at NASO DNA (Appendix F)

consists of making several passes up and down the approximately 4.0-mi (6.4-km) stretch of beach in an all-terrain vehicle. The vehicle's headlights are covered with a red filter to reduce disturbance to turtles and other wildlife encountered. All observed sea turtle activity including false crawls, attempted nesting, and successful nesting are noted and global position system (GPS)-located by NR personnel and reported to the USFWS and VDGIF. Successful nest sites are marked to alert beachgoers of their existence, and protected with a wire cage to prevent predation. Nests are monitored throughout the incubation period for storm damage, hatching activity, and predation. Nest success evaluations are conducted for all nests subsequent to hatching, predation, or 100 days post-deposition. Nests will only be moved if operational uses of the beach would result in the take of a nest. In such cases, the Navy will coordinate with USFWS, VDGIF, and BBNWR. Nest relocation will be conducted in accordance with the methods outlined in the 13 July 2011 BO (Appendix F).

NR personnel that conduct turtle monitoring and nest relocation are trained by USFWS, VDGIF, and/or NAVFAC personnel in the identification of turtle crawls and the subsequent protection of nests. NR personnel record all sea turtle strandings (alive and dead) that occur on NASO DNA and coordinate with the Virginia Aquarium's Stranding Team. Annual stranding data is obtained from the Virginia Aquarium's Stranding Team and cross-referenced with the Navy's records annually. The consolidated list of strandings is kept in a marine resources stranding database (Appendix F). Data entered into the database includes a Virginia Aquarium and Marine Science Center identification number, species, size, gender, location (in latitude and longitude), and condition of stranding (alive, fresh, moderately decomposed, severely decomposed, etc.).

Stranding information that is applicable to sea turtles and marine mammals is discussed in Section 3.6.

3.5.2 Piping Plover, Red Knot and Roseate Tern Protection

If a piping plover, red knot, or roseate tern is encountered at NASO DNA, the observer should gather as much information as possible, but should not approach the bird. It is a federal violation to harass or otherwise disturb a listed species, or any migratory bird. Gather location (GPS if possible) and time, photograph, and notate the conditions and the bird's behavior. This information should be forwarded immediately to the NAVFAC Mid-Atlantic NR staff at (757) 341-0495 or Michael Wright at (757) 433-4361.

Protective measures for protected bird species known or with the potential to occur at NASO DNA include:

- maintaining at least a ¼-mile (0.4 km) buffer around nesting sites to minimize human disturbance to nesting birds, and avoiding noise and disturbance during the nesting season (late April to late July for piping plover; 15 May through 15 August for roseate terns);
- respecting fenced or posted wildlife protection areas;
- keeping pets, people (other than NRMs), or boating activity away from foraging and resting areas, and seabird nesting islands (roseate tern) during the nesting season—if the birds flush, you are too close;

- keeping pets leashed and cats indoors;
- controlling predators, including but not limited to, gulls, mink (Family Mustelidae), and raccoons;
- disposing of trash and food scraps in appropriate receptacles in beach or dune areas, as garbage can attract predators, which may prey on protected birds, or their eggs or chicks (if nesting);
- managing native vegetation at nest sites and controlling exotic vegetation;
- using artificial nest sites to provide additional cover at some nesting islands (roseate tern); and
- establishing and maintaining an emergency response plan for oil and chemical spills.

3.6 MARINE RESOURCES PROTECTION

Marine resources, including marine mammals, sea turtles, snakes, fish, and shellfish, that occur or have the potential to occur in the nearshore environment and off the coast of NASO DNA, are protected by several federal and state laws and EOs. Regulations such as the MMPA (16 USC §1361 et seq.), the Magnuson-Stevens Fishery Conservation and Management Act (16 USC §1801-1884), and the ESA require the Navy to coordinate with the NMFS and USFWS prior to implementing actions that will impact managed and/or protected species. The MMPA established a moratorium, with certain exceptions, on the “taking” of marine mammals in U.S. waters and by U.S. citizens on the high seas, and on the importing of marine mammals and marine mammal products into the U.S. The NMFS administers NOAA’s programs, which support the domestic and international conservation and management of living marine resources. To these ends, several marine mammal stranding centers were established to assist and aid stranded or beached animals.

Shore patrols and other units that may occasionally encounter stranded marine mammals or sea turtles should adhere to the protocol established by the CNO (OPNAVINST 3100.6H REF A, Special Incident Reporting) Environmental Readiness Division, as outlined in the recommendations provided below and the stranding procedures included in Appendix F, Enclosure 1. These recommendations apply to any stranded marine mammal that appears to be injured, disoriented, or dead:

- The Installation CO will immediately contact the NMFS Regional Stranding Coordinator in the event of a live or dead marine mammal or sea turtle stranding at the Installation, with notification to CNO Environmental Readiness Division (OPNAV N45) occurring immediately thereafter. The NMFS Regional Stranding Coordinators for the Northeast Region, including Virginia, are Mendy Garron and Lani Hall, who can be reached at (978) 282-8478.
- In addition to contacting the NMFS Regional Stranding Coordinator and notifying CNO Environmental Readiness Division (OPNAV N45), the Northeast Region Marine Mammal and Sea Turtle Stranding & Disentanglement Network will be contacted, which is authorized by federal law to respond to marine mammal and sea turtle strandings. The

Virginia Aquarium and Marine Science Center responds to marine mammal and sea turtle strandings in the vicinity of NASO DNA when available and should be contacted immediately in the event of a stranding. The NOAA Fisheries Hotline contact information has been provided as an alternate contact, if necessary.

Virginia Aquarium and Marine Science Center Stranding Hotline
Virginia Beach, VA
(757) 385-7576

NOAA Fisheries Marine Mammal and Sea Turtle Stranding and Disentanglement Hotline
(866) 755-NOAA (6622)

- Monitor the stranded animal from a minimum distance of 100 yards (91 m). Crowding the animal is unsafe for the observer as well as the animal. Do not touch any live or dead animals, as wild animals can carry diseases, parasites, and bacteria, which can be transmitted to humans. Do not attempt to push the animal back into the water and if it goes back into the water on its own, do not attempt to follow after or swim with it.
- Carefully observe the animal's position and monitor its breathing. Wait for responders from NMFS and/or the Northeast Stranding Network to arrive and direct them to the animal. Relay all observations to the responders so that they can provide the best possible care for the stranded mammal or sea turtle.

The VIMS Sea Turtle Stranding Program, established in 1979, responds to strandings in the Chesapeake Bay region. Turtles that require rehabilitation are transported to the Virginia Aquarium's Stranding Program Rehabilitation Center in Virginia Beach. In the event that that Virginia Aquarium is unavailable, the Sea Turtle Stranding Coordinator can be reached at (804) 684-7313.

Dead or injured marine mammals that are sighted offshore should be reported to NR staff who will act as the liaison between the activity and regulatory agency representatives. As a further effort to protect marine resources, NR personnel must receive training in the identification of marine mammals and sea turtles, and should be available to assist other Installation personnel in their identification when needed.

The Virginia Aquarium, formerly the Virginia Marine Science Museum, has studied the large populations of bottlenose dolphins which inhabit the waters of NASO DNA from spring to autumn. The Aquarium is an excellent resource for marine mammal questions concerning habitat and management. The NRM should coordinate with the Virginia Marine Science Museum regarding concerns related to marine mammals at NASO DNA.

To report a stranded marine animal to the Virginia Aquarium's Stranding Response Team, call (757) 385-7576. These lines are open 24 hours a day. More information is available on the Virginia Aquarium website:

<http://www.virginiaaquarium.com/research-conservation/pages/report-a-stranding.aspx>

In accordance with the MMPA, and NAVFAC's Interim Environmental Policy No. 10-001, MMPA Compliance for In-Water Construction (February 2011), the Installation should evaluate any action that produces sound in water where marine mammals are present to determine if a "take" authorization is required in the form of an Incidental Harassment Authorization or a Letter of Authorization from the NMFS Office of Protected Resources. Accordingly, all in-water Installation activities that impact marine mammals will be coordinated with OPNAV N45. Permits, if necessary, will be obtained through the appropriate federal agencies.

EO 13547, *Stewardship of the Ocean, Our Coasts, and the Great Lakes*, adopts the recommendations of the Interagency Ocean Policy Task Force, except where otherwise provided in the order, and directs executive agencies to implement those recommendations under the guidance of a National Ocean Council. This EO establishes a national policy to ensure the protection, maintenance, and restoration of the health of ocean, coastal, and Great Lakes ecosystems and resources, enhance the sustainability of ocean and coastal economies, preserve maritime heritages, support sustainable uses and access, provide for adaptive management to enhance understanding of and capacity to respond to climate change and ocean acidification, and coordinate with our national security and foreign policy interests. This order also provides for the development of coastal and marine spatial plans that build upon and improve existing federal, state, tribal, local, and regional decision-making and planning processes. These regional plans will enable a more integrated, comprehensive, ecosystem-based, flexible, and proactive approach to planning and managing sustainable multiple uses across sectors and improve the conservation of the ocean, our coasts, and the Great Lakes.

The marine resource assessment completed in 2003 for the Cherry Point and Southern Virginia Capes inshore and estuarine areas (Navy 2003) describes the habitat types and species that could be impacted by training and operations that occur on the beaches and nearshore areas of NASO DNA. A habitat assessment and species inventory of the nearshore area will provide information on marine resources within this environment, and will identify rare, threatened, and/or endangered species. The nearshore assessment will assist with natural resources management decisions within this habitat.

3.7 HABITAT CONSERVATION AND RESTORATION

The Navy recognizes the importance of conserving species at risk before they become critically imperiled, requiring protection by the federal ESA. Therefore, conservation and restoration of significant natural habitats that support rare and unusual species at NASO DNA are a key focus of the NRP. Additionally, habitat and conservation efforts at NASO DNA should account for projected impacts from climate change which could result in altered habitat, especially along the coast.

The VDCR-DNH has recognized several SIAs at NASO DNA (Figure 3-3 and Table 3-1) whose protection will help protect such resources as well as enhance biodiversity on the Installation. Site descriptions and management recommendations summarized from VDCR-DNH reports for NASO DNA (Buhlmann et al. 1992, Evans and Belden 2010, Van Alstine et al. 2001, and VDCR-DNH 1990) follow.

Figure 3-3. Special Interest Areas of NASO DNA.

Table 3-1. Special Interest Areas of NASO DNA.

Special Interest Area	Acres
Dune and Swale	143
Lovetts Marsh	129
Interdunal Swale, Dune, and Freshwater Marsh	75
Middle Beach Dunes	43
Southeast Redwing Lake Wetlands	15
Helicopter Pad Wetlands	13

3.7.1 Dune and Swale Special Interest Area

The Dune and Swale SIA at NASO DNA contains the Installation’s most significant maritime forest community, a small interdunal swale, and includes a number of state-rare plant species, including bluejack oak, American halfchaff sedge, Long Beach primrose-willow, fasciculate beaksedge, and early white-top fleabane. Bluejack oak, Long Beach primrose-willow, and early white-top fleabane are both imperiled (S2) and fasciculate beaksedge and American halfchaff sedge are critically imperiled (S1) in Virginia (Townsend 2012). The entire area encompasses approximately 135 ac (54 ha), and consists of an approximately 1.75-mi (1.2-km) long, approximately 0.2-mi (0.3 km) wide section of beach, dunes, and interdune. An interdune pond, which is a significant natural community, occurs immediately south of the MACS 24 radar station. The pond, although apparently altered by dredging and impoundment by a road, supports an interesting assemblage of native vascular plant species, which differs from other interdune ponds of Virginia and indicates the need for further study. The interdunal pond is under increasing pressure from encroaching patches of the invasive species common reed (*Phragmites australis*) (Evans and Belden 2010) (see Section 3.12.1). One state-rare animal, the s-banded tiger beetle, also has been documented at this site.

Past disturbances that have threatened the integrity of the dune and swale system include intensive military training exercises, roadwork, and construction activities, such as the MACS 24 radar site, the remnants of old roadbeds within the interdune areas, and the LCAC access path running from the south end of the Installation to the turnaround area near the center of the site. These activities have eliminated much of the vegetation of the primary and secondary dunes as well as impacted the interdune swales on the site. Navy efforts to prevent further loss of habitat are detailed in the shoreline erosion stabilization plan developed by NAVFAC Atlantic (Navy 1991) and updated in 2010. Restoration of the dunes and shoreline include a variety of infrastructure management, including beach replenishment and dune restoration activities. Specific activities include rebuilding beach contours by relocating and importing sand, placement of Christmas trees to stabilize dunes, installation of sand fences to build dunes and prevent blowouts, planting of beach and dune vegetation to stabilize the dunes, and placement of benchmarks to monitor sand levels. Realignment of the road system in 1993–1994 in the southern portion of the Installation, and removal of concrete from the old roadbed is allowing recovery of the interdune swale system.

Uses of the site that continue to present threats to the rare plants and their habitats are off-road vehicles and training that cut through the dune systems, and a LCAC turnaround area in the center of the protection area. Development of the urban warfare compound adjacent to this SIA resulted in some loss of habitat in the dune and swale systems. Development and off-road vehicle use, including LCAC training, are the primary threats to the integrity of this protected area. To protect these significant natural resources, future development of this area should be avoided, and amphibious training should be restricted to designated training areas. The dune delineation report is currently being developed and should be reviewed once finalized to develop recommendations for prioritizing restoration efforts to prevent further damage to the remaining intact dunes. Additionally, greater stabilization efforts would help build existing dunes.

3.7.2 Lovetts Marsh Special Interest Area

The Lovetts Marsh SIA is approximately 124 ac (50 ha) and contains what remains of an isolated emergent marsh documented on 1891 topographic maps as the only site of its kind from Cape Henry to the North Carolina border. The VDCR-DNH report (Van Alstine et al. 2001) states that open areas of marsh were evident on aerial photographs as late as 1965, and that later ditching and development lowered the water table, increased the drainage rate, and resulted in the succession from open marsh to forested wetland. State-rare plants fasciculate beaksedge and saltmarsh umbrella-sedge also have been reported to occur within the boundaries of this SIA. Fasciculate beaksedge is critically imperiled (S1) in Virginia and saltmarsh umbrella-sedge is possibly extirpated (SH) (Townsend 2012). Developments within the site boundary include roads and the urban warfare compound.

Based on the historical basis for the presence of a freshwater marsh at this site and plot data collected in 2000, VDCR-DNH determined that a significant interdune pond community and the presence of two state-rare plant species, fasciculate beaksedge and saltmarsh umbrella-sedge, at this site were worthy of protection. The boundary of the SIA includes the significant community, rare plants, and the surrounding buffer area needed to protect the hydrology of the site. Current threats to the site include road building, roadwork, and troop activity in the vicinity of the protected area. The interdunal pond is also under increasing pressure from encroaching patches of common reed (Evans and Belden 2010) (see Section 3.12.1).

As described in Section 2.3.7, efforts were undertaken in 1996 to control invading hardwoods by restoring the hydrology of Lovetts Marsh to pre-disturbance conditions. The water level at the site will continue to be maintained at approximately 3.5 ft (1.1 m) until hardwood control is achieved. Some tree canopy removal also may be undertaken if the current hydrological manipulations do not reduce the red maple canopy.

In 2011 the USFWS installed a weir on the southern portion of Lake Tecumseh in an attempt to restore the watershed's hydrology back to more natural conditions (conditions that existed prior to creation of ditches that connected Lake Tecumseh to Back Bay). The installation of the Lake Tecumseh weir is showing positive results upstream, which also is assisting the Navy to achieve their management goals for Lovetts Marsh. The USFWS is tracking the effects of the Lake Tecumseh weir project throughout the watershed and periodically provides collected data for this project to the NRM.

3.7.3 Southeast Redwing Lake Wetlands Special Interest Area

The Southeast Redwing Lake Wetlands SIA provides habitat for the greater siren, a former state watch list species and a Tier IV (Moderate Conservation Need) species identified in the Virginia SWAP. Sewage and stormwater runoff from the NASO DNA housing area located adjacent to this wetland area may be impacting this SIA. Additional site investigations are required to determine special management needs for this SIA.

3.7.4 Middle Beach Dunes Special Interest Area

The Middle Beach Dunes SIA encompasses an extensive area of vegetated primary and secondary dunes and areas of interdunal swale wetlands. The dune system in this protected area is relatively undisturbed and supports a large area of maritime dune woodland, which is considered a significant natural community by the VDCR-DNH. Currently, few roads bisect the area and development has only encroached around the edges. Restricting vehicle use within the dune system and continuing to protect the area from development are the only management actions necessary for maintaining this habitat and its native species.

3.7.5 Helicopter Pad Wetlands Special Interest Area

The Helicopter Pad Wetlands SIA was designed to protect a wetland community that contains American spongeplant and greater siren habitat. The greater siren is currently a Tier IV (Moderate Conservation Need) species in the Virginia SWAP, and is a former state watch list species. The American spongeplant is no longer tracked by the VDCR-DNH; however, it is in the Navy's best interest to continue to protect the habitats of these fairly rare species in order to maintain their current population levels and prevent them from becoming state or federally protected. Special management consideration for this area is needed due to the attractiveness of this habitat to birds and wildlife, which has the potential increase the BASH risk in the vicinity of the helicopter pad located within this SIA.

3.7.6 Interdunal Swale, Dune, and Freshwater Marsh Special Interest Area

The Interdunal Swale, Dune, and Freshwater Marsh SIA in the southern portion of NASO DNA contains the most significant example of interdunal swale wetlands at the Installation. Although this swale is bisected by Regulus Avenue and has been partially filled, it is a unique habitat type that supports two state-rare plant species: the early white-top fleabane, imperiled (S2), and fasciculate beaksedge, critically imperiled (S1). The swale wetland and its unique vegetation extend to the west side of Regulus Avenue to an area that was planted with loblolly pines during the 1970s.

A network of drainage ditches in the western portion of the protected area is promoting succession from open marsh community to swamp forest and pine intrusion from the planted pines. Plugging these ditches would likely increase flooding in the surrounding area and is not considered a management option. Pine removal was recommended by VDCR-DNH (Buhlman et al. 1992) if it can be accomplished without detriment to the existing herbaceous vegetation. In 2003, Hurricane Isabel destroyed a portion of the standing timber, although a storm damage assessment was not conducted. A report is currently under preparation for the dune delineation completed at NASO DNA in 2013. This report should be reviewed once finalized to identify

recommendations for prioritizing restoration efforts within the dune and swale areas of the Installation. A copy of the finalized report will be included in Appendix H once available.

3.7.7 Dune Protection

The NASO DNA dune systems are part of an important natural ecosystem that is being lost to development throughout much of its original range. Dune protection is especially critical at NASO DNA because of the unique training opportunities they support and the protection from storm surges and wave action they provide to the Installation and infrastructure. The dune system and its habitats are extremely sensitive to human disturbances such as vehicular and foot traffic and development. In an effort to protect these significant resources, beach and dune access at NASO DNA is limited to a small number of boardwalks and all beach traffic must be authorized. Appropriate NEPA documentation and a federal coastal consistency determination may be required prior to conducting training or other activities that have the potential to impact the dune area.

In accordance with ecosystem management principles and as a component of habitat conservation, dune restoration projects, such as planting vegetation, posting signs, and installing fences is conducted as needed at NASO DNA. Efforts to reduce erosion and stabilize dunes include a variety of beach replenishment and dune restoration activities, including the placement of sand fencing and recycled Christmas trees around dune bases. The sand fencing and Christmas trees serve to trap windblown sand, discourage disturbance, and encourage the natural growth of new vegetation on the dunes. Clean Christmas trees with no tinsel or ornaments are brought to collection sites. The Disaster Preparation Team installs the Christmas trees and sand fencing in coordination with NR personnel who are trained in coastal ecology and shoreline stabilization.

Planting beach grasses and other appropriate dune vegetation in areas where sand has accumulated would further serve to stabilize the dunes and contribute to dune restoration. Appropriate plant species include American beachgrass, sea oats, coastal panic grass, seaside marsh-elder, and seaside goldenrod. Dune sand is relatively low in plant nutrients, and although dune plants are adapted to this condition, the addition of small amounts of fertilizer, primarily nitrogen and phosphorus, is useful for promoting rapid establishment of transplants and encouraging existing vegetation. Fertilizers however, should not be used indiscriminately in the beach and dune area, and should not be used on well-established dune vegetation. Excess nutrients may encourage non-native, invasive species and increase the occurrence of plant diseases. Excess nitrogen also may leach through beach sand and pollute groundwater (Broome 2004).

Monitoring of dune stabilization and restoration efforts is important to the success of dune protection. Monitoring would best be accomplished through aerial photo interpretation as changes in vegetative cover are easily observable between historic and current aerial imagery. Changes in vegetative cover can be mapped over time including recent changes, which can be correlated to dune stabilization efforts. Specific stabilization activities such as grass sprigging, fertilization, fencing, Christmas tree placement, and sign posting would have to be documented in order to assess their effectiveness. The dune delineation report is currently being prepared and should be reviewed once finalized to identify and prioritize additional dune protection measures that should be implemented. Copies of reports for the Dune Sustainability (Dune Surveys and

Plantings) 2010 survey, and the Cooperative Ecosystems Studies Unit Dune Restoration 2012 survey conducted at NASO DNA are included in Appendix H, and a copy of the dune delineation report will be included in Appendix H once finalized.

3.7.8 Shoreline Stabilization

Shoreline stabilization is another ongoing natural resources issue at NASO DNA. Training facilities and Installation infrastructure that are located along the shoreline or that breach the dune system are particularly vulnerable to storm damage and must be protected through shoreline stabilization and restoration. To date, two major shoreline stabilization and restoration projects have been implemented at NASO DNA: the Bachelors Officers Quarters (BOQ) and Shifting Sands Club beach restoration on the middle portion of NASO DNA, and the LCAC training area in the northern portion of the Installation (Navy 1991).

The shoreline stabilization project in the BOQ area at NASO DNA was implemented to protect the BOQ, the Shifting Sands Club, and the weapons gunline from beach erosion and storm surge damage. The project included the construction of an artificial dune that extends from the BOQ approximately 5,280 ft (1,609 m) along the beach to Building 127, which is south of the weapons gunline on Viking Avenue. Initial dune restoration and beach nourishment was completed in June 1996. The constructed sand dune consists of two sections with natural stone cores that are 37 ft (11 m) wide by 9 ft (2.7 m) high. The stone core was covered by sand to create a dune that is a total of 98 ft (30 m) wide and 22 ft (6.7 m) high. The top of the dune was sprigged with a combination of American beach grass, Atlantic coastal panic grass, sea oats, and bitter panic grass to help stabilize the sand.

The beach in front of the constructed dune was replenished to provide additional storm protection. Approximately 680,000 cubic yards of sand were used for the beach restoration. Periodic beach replenishment using approximately 635,000 cubic yards of beach quality sand will occur on a six-year cycle. In 2003, Hurricane Isabel caused extensive erosion and exposed the rock core of the constructed dune. The beach was refilled in the winter of 2004. Future beach nourishment should be implemented contingent on the results of beach monitoring, and should only proceed after appropriate state and federal permits are obtained.

The shoreline stabilization project in the LCAC training area was designed to repair a breach in the dunes and a severely eroded roadway, and protect significant dune and interdunal swale wetlands. The shoreline and dunes were restored to original contours by relocating and importing sand. Christmas trees were collected from regional Navy installations and were placed to help stabilize the dunes and sand fencing was installed to help build the dunes and prevent wind blowouts. Beach grasses also were planted to further stabilize the dunes. Benchmarks were installed to facilitate future monitoring of sand levels. The project was completed in 1995. Recent surveys of the LCAC training area show that, although some habitat recovery was accomplished, accelerated erosion rates are still critical problems in the area (VIMS 2004).

Copies of reports for the Dune Sustainability (Dune Surveys and Plantings) 2010 survey, and the Cooperative Ecosystems Studies Unit Dune Restoration 2012 survey conducted at NASO DNA are included in Appendix H.

3.7.9 Pollinators

The Navy has recognized the important ecological role played by pollinators, and encourages installations to foster pollinator habitats. As a group, pollinators are threatened worldwide by habitat loss and fragmentation, pesticides, disease, and parasites (USDA NRCS n.d.). According to the USDA NRCS native pollinators are attracted to diverse, colorful floral sources that provide a succession of flowers. Providing flowers of different shapes and sizes will attract pollinators with different body sizes and mouthparts. Use of native plants is preferable since these are usually adapted to Virginia's growing conditions and native pollinators have evolved with these plants.

More information on habitat development for pollinators, including recommended plant species for the Mid-Atlantic Region, is available at <http://www.xerces.org/fact-sheets/>.

3.8 SHADE TREE AND URBAN FOREST MANAGEMENT

Shade tree and urban forest management is an important issue at NASO DNA because of the level of development and large number of people that work and live at the Installation. Shade tree and urban forest resources at NASO DNA, however, are very limited and the dominant urban landscape features are mowed lawn and open field. Improving shade tree and urban forest resources through participation in programs such as Tree City USA and implementation of the Tree Preservation and Replacement Instruction for Navy Region, Mid-Atlantic Installations (Appendix D) is a high priority of the NRP.

Tree City USA certification is awarded to communities with urban forestry programs that meet several qualification criteria. Specifically, the community must:

- have a tree board or department;
- implement a tree care ordinance;
- support a forestry program with an annual budget of \$2 or more per capita; and
- participate in an annual Arbor Day observance and proclamation.

Details about the Tree City USA program qualification standards and certification are on the National Arbor Day Foundation website:

<http://www.arborday.org/programs/treecityusa.html>.

The application for recertification by the Tree City USA program is available online at:

<http://www.arborday.org/programs/treeCityUSA/apply.cfm>

NASO DNA was first awarded certification in 1999. Receiving the Tree City USA award from the National Arbor Day Foundation is recognition that NASO DNA has a progressive urban forest management program that is striving to improve this resource. In order to be recertified each year, NASO DNA must continue to meet these criteria and submit a recertification package to VDOF. A recertification application and a proclamation (2012) are included in Appendix D.

In accordance with the draft Tree Preservation and Replacement Instruction (Appendix D), NR staff are required to review new grounds maintenance contracts prior to issuance and oversee tree pruning or removal orders. Proponents of all projects and activities that may affect existing trees are required to consult with NR staff to identify all trees in the affected area and to develop a project/activity-specific tree preservation plan in accordance with this policy.

3.8.1 Beneficial Landscaping

Direction for grounds maintenance and urban forestry at NASO DNA comes from several sources. Foremost is EO 13148, *Greening the Government Through Leadership in Environmental Management*. This EO requires federal agencies to incorporate the principles and practices of beneficial landscaping as specified in the Presidential Memorandum on Environmentally and Economically Beneficial Landscape Practices on Federal Landscaped Grounds (60 FR 40837). Specifically, federal projects are required, to the extent practicable, to:

- use regionally native plant species,
- use construction practices that minimize adverse effects on the natural habitat,
- reduce fertilizer and pesticide use,
- use water-efficient practices, and
- create outdoor demonstrations to promote awareness of the environmental and economic benefits of beneficial landscaping.

The use of regionally native plant species, which are generally better suited for local site conditions than nonnative species, reduces the need for intensive maintenance and the use of fertilizers and pesticides. Native plant species also are less likely to become invasive pests than nonnative species and serve as better sources of food and cover for native wildlife.

Effective use of native trees and shrubs in landscaping also can provide economic and environmental benefits to NASO DNA. When properly placed around buildings, trees and shrubs reduce energy consumption by moderating the effects of the sun and wind. Planting deciduous trees on the east- and west-facing sides of buildings provides summer shade, and planting evergreens on the north-facing side blocks cold winter winds. Other benefits provided by landscape plants include water conservation and water quality improvement. Trees and shrubs in the landscape reduce the impact of precipitation, reduce flow velocities, and capture and store excess runoff. In addition, landscaping with a variety of trees and shrubs provides habitat that attracts wildlife to the urban environment, which benefits both the wildlife and their human observers.

Selecting species that are suitable for a site requires knowledge of plant characteristics such as the species mature size, longevity, tolerance to soil compaction and pollution, and susceptibility to disease and insect pests. A list of plant species native to the region and suitable for landscaping purposes is in Appendix D. Plant characteristics and site requirements for each species are included in the list. The plant species listed are common commercial plants that may be purchased from the VDOF tree nursery or local nurseries that specialize in native plants. Not all species offered by these nurseries are native, so care must be taken when placing orders.

Beneficial landscaping practices also are associated with LID practices and LEED program requirements, as discussed in Section 3.2.4.

3.8.2 Selection of Plant Materials for Landscaping

The size of plants to be used depends on budget, site conditions, planting season, available labor, and desired results; however, only plants that are native to the coastal plains physiographic province of Virginia should be utilized for vegetation and landscaping activities on the Installation. Final approval of species to be planted should be obtained from the NRM prior to planting.

A list of plants that are native to the coastal plains physiographic province of Virginia is available on the VDCR-DNH website:
http://www.dcr.virginia.gov/natural_heritage/nativeplants.shtml#buy.

Small bare-root seedlings (whips) or cuttings (live stakes) are available in bulk quantities from the VDOF tree nursery. These seedlings are suitable for large-scale reforestation projects. Because they have relatively undeveloped root systems, bare-root seedlings are likely to dry out on poor, compacted, urban soils and are better suited for less disturbed sites. Container-grown stock is more expensive, but is less susceptible to drying and is better able to compete with surrounding vegetation. Sizes of containers vary from 6-in (15-cm) tube-grown seedlings (tublings) to large pots or balled and burlapped saplings. Two- to three-gallon container-grown stock is widely available from private nurseries, survives transplanting better than bare-root, and is appropriate for use on a wide range of sites. Areas up to several acres in size can be planted economically with this size planting stock. Large balled and burlapped stock also has a good survival rate after transplanting in poor or compacted urban soils, but is more costly per plant and is more labor intensive to transport and install than smaller stock. Balled and burlapped stock is most suitable for planting around buildings, along streets, and in high-visibility areas that are required to look good quickly. Planting a mixture of sizes of woody plants is an option that creates more diversity and a more naturalistic appearance.

During vegetation removal and revegetation activities there is an increased risk of BASH incidents until vegetation establishes and matures. Coordination with the onsite USDA BASH biologist and the Installation NRM will minimize potential BASH risk associated with revegetation activities. Vegetation selection should be conducted in such a manner to minimize BASH occurrence. If utilizing seed, it is recommended that slit seeding be utilized to minimize BASH concerns in the vicinity of the helipad.

3.8.3 Planting

The planning process should allow for planting during a suitable season. The type of planting stock used, in part, determines the appropriate time for planting. Bare-root seedlings should be planted in the spring before the emergence of new leaves. Larger woody material is best planted in the late fall after leaves have dropped. At this time transpiration is minimal and root growth increases. Since roots are often damaged in the transplanting process, planting during the fall allows additional time for root development before the summer months when transpiration peaks. Ground cover can be planted at any time, as long as there is adequate rainfall or available supplemental watering.

Proper tree planting is another vital element of a healthy urban forest. Using correct planting methods can increase a tree's ability to become established quickly and improve its health and longevity. Planting techniques differ somewhat with the type of material being planted, although the goal of each is to provide an environment that encourages root growth. Guidelines that apply to most types of planting stock are that the planting hole should be three to five times greater in diameter than the root ball of the material to be planted and only as deep as the root ball. It is important not to bury the roots too deeply or they will not be able to get enough oxygen. Appropriate planting guidelines for various plant materials are presented in Appendix D. Soil amendments should not be added directly to the planting holes for trees and shrubs. These amendments cause problems with soil moisture and root growth. If fertilizers are applied, it is important to use a slow-release product with low solubility so nutrients are not easily leached away. To ensure the greatest chance of survival, urban tree and shrub planting should be performed by trained Installation personnel or qualified tree care professionals.

3.8.4 Tree and Shrub Care

The care that newly planted materials receive after planting is critical to their health and longevity. Ensuring adequate soil moisture immediately after planting and during the first two years of establishment is the key factor in planting success. Overwatering can deprive the tree of air and also should be avoided.

Preventing damage from mowers and string trimmers is a significant problem for landscape managers. Wounds in a tree's bark make the tree more susceptible to disease and pest infestations and reduce its chance of survival. Mulch can be an effective method of protecting trees from mower damage, when used properly. Mulch protects trees by reducing weed growth around the plant's base, which reduces the need to mow near the plant. Mulch should be applied to a weed-free area around the root mat in a layer about 3–4 in (8–10 cm) thick. Mulch should not be applied too close to the tree trunk or too deeply as this creates an environment that promotes fungal growth and decay.

Placing trunk guards around the base of trees is another method of protecting them from mower damage. However, trunk guards are only suitable for use on small diameter trees and must be removed to prevent tree damage once the tree outgrows the guard.

Annual or periodic maintenance is an important part of keeping the urban forest in good health. Of critical importance is the removal of hazardous trees or branches, which if left unattended

could cause damage to persons or property. Other high priority maintenance practices include the removal of large-diameter dead or damaged limbs or limbs infected with disease or pests. Routine maintenance should include removal of small-diameter dead or damaged materials and shaping to avoid future structural problems or conflicts with the surrounding environment. However, since each cut has the potential to cause damage to a tree, no branch should be removed without a reason. As with planting, pruning should only be performed by qualified tree care professionals or trained personnel.

Detailed tree care instructions and a list of certified arborists are available on the International Society of Arborists' website: <http://www.isa-arbor.com/>

Care and maintenance of the Installation's existing urban trees also is important, particularly for the safety of Installation personnel and their dependents and the protection of real estate. Proper training and supervision is necessary for all Installation personnel involved with tree care, pruning and hazardous tree removal. NR staff coordinate with the VDOF to provide such training for personnel from the Field Engineering and Architecture Department (FEAD) and the Disaster Preparation Team. Training sessions will continue to be conducted periodically on an as-needed basis for new Installation employees. Appropriate pruning guidelines are presented in Appendix D.

3.9 FOREST MANAGEMENT

NASO DNA has extensive forest resources. Approximately 838 ac (339 ha) (approximately 48%) of NASO DNA is forested. The forested areas, however, largely consist of forested wetlands, which are not managed for commercial timber production, but as functioning ecosystems that help improve water quality and reduce flooding by slowing stormwater runoff and trapping sediment, nutrients, and other pollutants. The forested areas also provide a noise, safety, and visual buffer between military training activities and the surrounding communities, wildlife habitat, and outdoor recreation opportunities.

NAS Oceana Instruction 5090.2E, *Procedures for Cutting Firewood and Use of Tree Products*, is applicable to NASO DNA (Appendix D). This instruction establishes procedures governing the cutting of trees for firewood and obtaining other forest products at NAS Oceana and NASO DNA.

Because of the extensive area of forested land on NASO DNA, land clearing for MILCON or other projects would likely require the cutting and removal of trees. In instances where proposed projects would affect forestlands, the NAVFAC Regional Forester must review project plans to assess impacts, assess the commercial value of trees to be removed, and, where practicable, arrange timber sales. To limit impacts to migratory birds protected by the MBTA, tree cutting should be conducted during the months of September through February.

In the 1970s, reforestation efforts included the planting of approximately 182 ac (78 ha) of loblolly pine at NASO DNA. Although these areas are not being considered for commercial harvest, they require more active management than the hardwood-dominated forests on the

Installation. Planted pine stands generally consist of dense monocultures of loblolly pine and are prone to insect infestation and wildfire.

In 2009 the maritime forest habitat was damaged due to high winds, salt spray, and heat and water stress associated with storm and weather patterns that occurred that year, resulting in needle and forest kill. No management actions were undertaken, and recovery of this habitat has been observed.

A project to develop a forest inventory, which will include Fire Loading information, will be conducted in 2013–2015 at NASO DNA. The results of this inventory will be included in future INRMP updates and provided in Appendix H once available.

3.9.1 Insect Management

Southern pine beetle (*Dendroctonus frontalis*) is the primary insect pest problem of loblolly pine in the region. Early symptoms of a southern pine beetle infestation are the appearance of multiple pitch tubes or masses of resin and reddish boring dust marking the beetles' entrance. Tree foliage changes from yellow to brown over the course of one or two months and eventually falls as the tree dies. The prompt salvage and utilization of infested trees, including a 40-ft (12-m) buffer strip of green trees in advance of the beetle spot, is considered the best method of preventing additional tree loss. If trees cannot be salvaged, piling and burning or cutting and leaving infested materials also will help stop the spread of the infestation. If trees are to be cut and left on site, infested trees and an additional buffer of uninfested (green) trees should be felled toward the center of the infestation. To quicken the drying process and help eliminate the beetle, felled trees should be cut into 4- to 5-ft (1.2- to 1.5-m) sections. Because the threat of southern pine beetle is high in dense monocultures of loblolly pine, these stands require regular monitoring for southern pine beetle infestations. If an outbreak is detected, salvage activities will be coordinated through the NAVFAC Regional Forester.

3.9.2 Wildland Fire and Controlled Burning

The potential for wildfire is high in pine stands because of pine's inherent flammability and the buildup of fuel loads that occurs. Conducting controlled burns is a cost-effective, practical method of reducing the potential for catastrophic wildfires in such stands. Controlled burns are conducted during the winter or early spring on a 3–5 year rotation or when fuel loads are determined to be excessive. Controlled burning also is used to control pine and other woody vegetation and improve habitat conditions in several stands at NASO DNA. Five burn units at NASO DNA (Figure 3-4) are included in the controlled burn plan for NAS Oceana, which also includes NALF Fentress. Based on the desired habitat structure and wildland fire controls that are assessed periodically, these burn units may be modified or relocated, based on the desired outcome. Controlled burning is conducted according to an approved burn plan, which includes smoke management guidelines and conforms to the NAVFAC Mid-Atlantic Regional Engineer Clean Air Act Compliance Guide (Navy 2002b). The controlled burn plan details the objectives of the burn and provides maps and information for each burn unit. Smoke management is included as part of the plan. The plan is updated annually to address accomplishments and set goals for each year. The 2010 NAS Oceana, NALF Fentress, and NASO DNA Prescribed Burn and Smoke Management Plan is provided in Appendix J. Maintenance of firebreaks around each

Figure 3-4. Prescribed Burn Units of NASO DNA.

burn unit to protect adjacent land and fire lines within each burn unit to facilitate access is an important part of controlled burning. Firebreak and fire line maintenance is conducted prior to ignition by NR personnel.

3.10 FISH AND WILDLIFE MANAGEMENT

The diverse ecological communities of NASO DNA support a variety of types of wildlife including mammals, fish, birds, herpetofauna, and invertebrates. An important function of the NRP is to maintain and enhance habitats that support a full spectrum of native wildlife species. Common wildlife management tools available to natural resources managers include population management and habitat manipulation.

3.10.1 Population Management

Wildlife population management generally entails the controlled harvest or stocking of select game species. Hunting, trapping, fishing, and stocking are the direct forms of population management that may be employed by wildlife managers. The controlled harvest of whitetail deer is the major wildlife population management issue at NASO DNA. Whitetail deer have few remaining natural predators, and their populations could easily surpass the biological and cultural carrying capacity of the Installation and the surrounding area if not managed. The northern portion of NASO DNA has not participated in a public deer harvest since 1998, and the deer population in this area is managed through regulated hunting by NR personnel. Deer management with remaining sections of NASO DNA are managed through a recreational hunting program (see Section 3.11.1).

3.10.1.1 *Whitetail Deer*

NASO DNA participates in the VDGIF Deer Management Assistance Program (DMAP). DMAP is a site-specific management program that allows a more liberal harvest of antlerless deer to more effectively control the deer population. DMAP tags may only be used to harvest antlerless deer. VDGIF deer management objectives are based on the cultural carrying capacity of the community, which is defined as the maximum number of deer that can coexist compatibly with humans (VDGIF 2007b). Prior to 2001 the management objective at NASO DNA was to decrease the deer population. The objective is currently to limit or stabilize the population. Annual hunting seasons and bag limits are set to help achieve management objectives. The NASO DNA hunting program is managed as a voluntary, quality deer management (QDM) program, which prohibits the take of males with small antler beam diameter. The goal of the QDM is to build an older age class of male deer and to improve overall herd quality through reduced populations.

Basic deer harvest data used to characterize deer population and condition include sex, age, weight, antler development, and lactation information. Other useful data include hunter density (hunter man-days), permit types, number of roadkill, season (fall bow, winter bow, muzzleloader), and hoof condition (used as an indicator of disease). Harvest data collected at NASO DNA are maintained by NR staff and submitted to the state annually. The state summarizes the data and provides an annual report to the Installation. A summary of the annual reports provides information on population trends and herd condition, and may be used to assess

success in meeting management objectives. Because deer harvests vary from year to year according to weather or mast crops, as well as the deer population, three to five years of harvest data are needed to discern a harvest trend. NASO DNA harvest data for 1992–2003 and 2007–2012 are summarized in Table 3-2 through Table 3-6. Data summaries included in this section do not include data from years 2004, 2005, or 2006, as these data were not available for inclusion in the analysis.

The total deer harvest at NASO DNA ranged from a maximum of 41 in 1999 and 2008 to a minimum of six in 2001 (Table 3-2). The 2001 hunting season was severely limited for security reasons following the 11 September 2001 attack on the World Trade Center. Over the 18 hunting seasons for which data are available, males accounted for approximately 41% (31% antlered males and 12% males fawns of total harvest), and females accounted for approximately 58% of the total harvest. The number of female deer harvested relative to the male harvest (harvest:sex ratio) is an important index for determining if management objectives are being achieved. To maintain a stable deer population, the female harvest should be 30–40% of the total harvest; however, if the management objective is to reduce deer density, female harvest should exceed male harvest (VDGIF 2007b), which it does for the 18 years of data used in the analysis. The average harvest: sex ratio for the years assessed was approximately 3:2 (i.e., 58% females to 41% males), which is consistent with the Installation's previous goal of reducing the deer herd. If management goals shift towards stabilization of the population, the percent of females in the harvest should be reduced to less than 50%.

The age distribution of harvested deer also gives an indication of herd condition. A young age distribution in the harvest data can mean there is high hunting pressure in older age groups. For the 1992 through 2001 and 2007 through 2012 hunting seasons, fawns and yearlings (1.5 years old) accounted for 58% of deer harvested (Table 3-3). A low percentage (18%) of harvested deer were 3.5 years and older.

The fawn per doe harvest ratio (FDR) is a relative index of the past year's recruitment or reproduction. The FDR is the number of fawns (male and female) divided by the number of yearling and adult (>1.5 years old) females harvested. Healthy, reproductive deer herds are expected to have an FDR that equals or exceeds 1.0. A similar index, the number of fawns per antlerless harvest (number of fawns divided by the total number of antlerless deer harvested), also provides a useful approximation of the past year's recruitment or reproduction. A fawn per antlerless harvest rate that equals or exceeds 50% indicates a good reproduction rate. The FDR (1.0) for the 18 years of harvest data available indicates a healthy reproductive herd is present at the Installation; however, the percent of fawns in the antlerless harvest is 39%, which suggests somewhat of low recruitment within the NASO DNA deer population (Table 3-4).

Table 3-2. Deer Harvest Summary for NASO DNA (1992–2003 and 2007–2012).

Year	Male Fawns	Antlered Males	Females	Total Harvest	Females in Harvest (%)

The average annual reduction rate for males (AARR-M) is the percentage of yearling males in the antlered male harvest. High AARR-M rates (> 60–70%) are characteristic of a young antlered male age structure and high harvest pressure on the antlered segment of the population, with few males surviving to the older age classes (3.5 years old or older). Low rates (<30–40%)

are representative of an older antlered male age structure and low hunting pressure on the antlered segment of the population as more males have an opportunity to reach the older age classes and exhibit large body size and antler development. The AARR-M also can be used as an index of the antlered male harvest per mortality rate (i.e., 60% AARR-M indicates that hunting mortality for antlered males is 60%). The AARR-M for the 18 years of data that were analyzed is 50%, which indicates a moderate harvest pressure on the antlered segment of the population (see Table 3-4).

The average annual reduction rate for females (AARR-F) is the number of yearling females harvested divided by the total number of yearling and adult females harvested. Low hunting pressure on females is indicated by an AARR-F below 20%, moderate hunting pressure is indicated by an AARR-F of 20–30%, and high hunting pressure is indicated by an AARR-F of 35–40 %. The average AARR-F for the 18 years of deer data analyzed is 40%, which indicates there is high harvest pressure on the female segment of the deer population at NASO DNA (Table 3-4).

Records of average dressed weight and antler measurements provide useful indices of the deer herd condition and are useful for identifying changes in population size and habitat conditions. The average dressed weight and antler characteristics for the yearling male age class is important in interpreting the balance between deer population size and habitat conditions because this age class is most affected by changes in population size and carrying capacity. In healthy productive deer herds in the Tidewater region, yearling males have average dressed weights of 85–90 pounds (30–41 kilograms), 4–6 antler points, and an average beam diameter of approximately 18 millimeters (0.7 inches) (VDGIF 2007b). Based on the 18 years of deer data available, yearling males at NASO DNA, on average, were slightly smaller (82 pounds) (37 kilograms), had fewer antler points (2.3), and had smaller beam diameters (13.6 millimeters [0.5 inches]) (Table 3-5) in comparison to the Tidewater region average.

Table 3-5. Average Weight and Antler Development for Male Deer for NASO DNA (1992–2003 and 2007–2012).

	Age			
	Fawn	1.5	2.5	3.5 +
Dressed Weight (pounds)	40	72	87	112
Antler Points	N/A	2.3	4.5	6.4
Beam Diameter (millimeters)	N/A	13.6	19.5	29.3
Spikes in yearlings (%)	N/A	82.2	N/A	N/A

Source: Navy 2006b

The percent of yearling males that are spike-antlered is a good indicator of herd health. As a general rule, as deer density increases, deer condition declines and the percentage of yearling males with spike antlers increases. The percentage of spikes in the yearling male harvest ranges from less than 30% in the best herds to greater than 50% in the poorest herds. Based on the 18 years of deer data available, more than 82% of the yearling males were spike-antlered (see Table 3-5), which indicates a high deer density is present.

Average field dressed weights of females and lactation rates also provide useful indices of the deer herd conditions. In healthy deer herds, lactation rates in adult females (>1.5 years old) should be 60–70%. For the 18 years of deer data analyzed, the average lactation rate for adult females 2.5 years old was 31%, and the average lactation rate for adult females 3.5 years old and older was 33.0% (Table 3-6), which is not suggestive of a healthy adult female population at the Installation.

Table 3-6. Average Weight and Lactation Rates for Female Deer for NASO DNA (1992–2003 and 2007–2012).

	Age			
	Fawn	1.5	2.5	3.5 +
Dressed Weight (pounds)	39.5	54.8	62.4*	66.6*
Lactation Rate (%)	N/A	7.9	31.4	33.3

*averages based on 2007–2012 data only

Source: Navy 2006b

Analysis of the available hunting season harvest data suggests the deer herd at NASO DNA has a stable age structure indicative of moderate hunting pressure on each segment of the population. Data suggests a healthy reproductive herd is present at the Installation; however, a lower than ideal recruitment rate also may be affecting the reproductive rate of the NASO DNA deer population. The number of antler points and weight data indicate that harvested deer are in below average condition for the region and may indicate a stressed population. The AARR-M and AARR-F rates indicate a moderate harvest pressures on male deer, and a high harvest pressure on the female segment of the deer population exists at the Installation. Additionally, the low lactation percentage within the adult female population also is indicative of poor health in a deer herd.

A major health issue associated with a stressed herd is an increase in parasitism and incidence of disease in the deer herd. Of particular concern are two closely related viruses, the epizootic hemorrhagic disease (HD) virus and the bluetongue virus, which are collectively referred to as HD. HD is one of the most important infectious diseases of whitetail deer, and outbreaks are seen almost every year somewhere in the U.S. It is not transmissible to humans. Hoof sloughing and splitting are symptoms of HD and are recorded for each deer harvested. HD is uncommon in the Coastal Plain and only one deer (a female harvested in 2011) at NASO DNA over the 18 year period analyzed had symptoms of HD.

3.10.2 Habitat Management

Habitat management at NASO DNA focuses on ensuring a variety of habitat types are available year-round for native bird and wildlife populations. The diversity of forested and wetland habitats at the Installation fulfills the habitat requirements for many species. Additional habitat is provided by the maintenance of early successional communities. Mowing, prescribed fire, and disking are tools that may be used in the fallow agricultural fields in the southern portion of the Installation for maintaining a variety of old field and scrub-shrub habitat.

The use of prescribed fire is particularly beneficial as it promotes the establishment of native grass and forb species. Native grassland species consist of a number of warm season grasses including big bluestem (*Andropogon gerardii*), little bluestem (*Schizachyrium scoparium*), Indian grass (*Sorghastrum nutans*), eastern gamagrass (*Tripsacum dactyloides*), coastal panic grass, switchgrass (*Panicum virgatum*), and broomsedge (*Andropogon virginica*), along with numerous forbs. The grasses tend to be tall and form persistent clumps that provide year-round habitat for a variety of small mammals and ground-nesting birds. Many of these grass species also produce large seed heads that are eaten by a variety of birds and other wildlife. Besides providing better wildlife cover, native warm season grasses are better suited to the region than introduced cool season grasses because the warm season grasses perform well on the nutrient poor soils of the area, require less water, and can be maintained by infrequent prescribed burns rather than frequent mowing.

To maintain different stages of early successional habitat and ensure the continuous availability of escape and nesting cover, no more than two-thirds of the wildlife cover plot acreage are treated annually. Treatment times may be varied between late summer and winter to increase diversity. Avoiding mowing or otherwise disturbing nests during the breeding season, roughly March through August, is important for successful nesting of grassland bird species.

Although canebrake rattlesnake has not been identified at the Installation, this species is known to occur in the region and has the potential to occur. If this species is observed at the Installation, implementation of mowing restrictions along forest edge habitat for this species is recommended by VDGIF. VDGIF recommendations include restricting mowing of any areas adjacent to forested wetlands to winter months (hibernation periods for the species). Other areas should be mowed frequently enough (weekly) so that the grass does not obscure the location of canebrake rattlesnakes. All mowing contractors should be appropriately trained in the identification and status of this species via distribution of an information sheet.

VDGIF's 2011 Canebrake Rattlesnake Conservation Plan is available online:
<http://www.dgif.virginia.gov/wildlife/reptiles/snakes/canebrake-rattlesnake/conservation-plan/canebrake-rattlesnake-conservation-plan.pdf>

3.10.3 Fisheries Management

Redwing Lake and Sadler Pond have been managed as recreational fisheries to varying degrees at NASO DNA for many years, and support for fisheries management has been provided by the VDGIF and USFWS fisheries biologists since 1961 (Corning 1968). Fish and water quality surveys found that fisheries potential was marginal or worse at Redwing Lake because of extreme shallowness (less than 4.0 ft [1.2 m] maximum depth), water infertility, and high turbidity (Corning 1968, Galvez and Swihart 2000, and Swihart 1982). Turbidity is the most limiting factor because it interferes with successful reproduction in nest-building species and prevents the establishment of a self-sustaining sport fish population. The lakes' high turbidity is attributed to wave action and a high population of common carp, which churn bottom sediments when feeding. Because the sediments in the lake largely results from off-Installation activities, management actions taken at NASO DNA are not expected to be effective in correcting the

situation (Galvez and Swihart 2000). Although Redwing Lake has minimal potential for quality recreational fishing, it provides habitat for a variety of fishes, birds, and other wildlife and provide valuable habitat at NASO DNA and in the region.

Sadler Pond was excavated in 1969 as an alternative site for recreational fishing at NASO DNA. The pond, however, was constructed in a soil formation composed of colloidal clay material. Clay particles are negatively charged, which causes them to repel each other and remain suspended in the water column, creating a turbidity problem at this pond as well. The pond also is located in an open area where wind and wave action erode the shoreline and add to the turbidity problem. Cationic coagulants were applied in 1984 and 1987 (USFWS, Office of Fishery Assistance 1985 and 1988), but such treatments are only considered a temporary solution as runoff and erosion quickly reintroduce sediments into the water. More effective, permanent measures were taken in 1986 when the shoreline was regraded and covered with filter cloth. The filter cloth served to protect the shoreline from erosion and wave action, and by 1987, aquatic vegetation had become established around the pond perimeter and the turbidity had lessened somewhat. Additional recommendations made by the USFWS, Office of Fishery Assistance (1988) were to plant trees and shrubs around the pond to act as a windbreak and to control sedimentation and erosion in the upland areas surrounding the pond. A number of trees have been planted on the site to fulfill this recommendation. Maintaining a no mowing zone around the pond perimeter and planting additional trees and shrubs as a riparian buffer are ongoing management activities that improve water quality and fishery potential at Sadler Pond.

An inventory and assessment of recreational fisheries available at NASO DNA is planned for 2013–2015. A review of the survey results will be conducted, once available, to determine if a recreational fisheries management plan should be developed for the Installation.

3.10.4 Migratory Bird Management

Migratory birds are a large, diverse group of birds that utilize breeding grounds in the U.S. and Canada, and overwinter in southern North America, Central and South America, the West Indies, and the Caribbean. The MBTA (16 USC §703–711) is the primary legislation in the U.S. established to conserve migratory birds. The MBTA prohibits the taking, killing, or possessing of migratory birds, their eggs, parts, and nests unless permitted by regulation. Nonnative species such as house sparrow, European starling, rock pigeon, and mute swan (*Cygnus olor*) are not protected by the MBTA.

The Final Rule on Take of Migratory Birds by the Armed Forces (50 CFR Part 21) allows for the incidental take of migratory birds by DoD during military readiness activities, provided a permit authorizing such activities has been received. Military readiness activities include all training and operations of the Armed Forces that relate to combat, and the adequate and realistic testing of military equipment, vehicles, weapons, and sensors for proper operation and suitability for combat use. Military readiness does not include the routine operation of installation support functions, such as administrative offices, military exchanges, commissaries, water treatment facilities, storage facilities, schools, housing, motor pools, laundries, MWR activities, shops, or mess halls; the operation of industrial activities; or the construction or demolition of facilities listed above (72 FR 8931). To address the unintentional take of migratory birds as a result of activities necessary to support the military mission, a memorandum of understanding (MOU)

was adopted between the DoD and the USFWS, as required by EO 13186, *Migratory Birds*, on 31 July 2006 (Benton et al. 2008). This MOU allows the military to obtain permits for the “unintentional take” of a migratory bird if it is in support of a military readiness operation. The procedures contain significant safeguards to ensure that the taking of birds is minimized when the new rule is used and that conservation measures are employed to compensate for the losses that may occur. Migratory bird management at NASO DNA includes a Nest Box Program (see Section 3.10.5) and promotion and participation in programs including the North American Waterfowl Management Plan, Neotropical Migratory Bird Conservation Act Program, Wetlands Protection and Enhancement Programs, Department of Defense Partners in Flight Strategic Plan, Waterbird Conservation for the Americas, PIF North American Landbird Conservation Plan, United States Shorebird Conservation Plan, and Watchable Wildlife Programs . Per the MOU the Navy must evaluate and coordinate with the USFWS during the annual INRMP review process on any potential revisions to migratory bird conservation measures taken to avoid or minimize take of migratory birds (DoD and USFWS 2006).

The USFWS established National Bald Eagle Management Guidelines in 2007 that include protective measures outlined in the Bald and Golden Eagle Protection Act (BGEPA) (16 USC §668–668c) and the MBTA (16 USC §703–712). Both the BGEPA and MBTA protect bald eagles by prohibiting killing, selling or otherwise harming eagles, their nests or eggs. The BGEPA also protects eagles from disturbance. The National Bald Eagle Management Guidelines provide guidance on restricting aircraft operation in proximity to known bald eagle nesting locations and establish a 1,000-ft (305-m) avoidance zone around bald eagle nests and roost sites. It should be noted that the tolerance level of bald eagles to noise continues to be an ongoing question that lacks sufficient research. Tolerance to noise is subject to spatial and temporal variations in the landscape and the source of the noise.

No bald eagle nests are known to occur at NASO DNA; however, if a bald eagle nest is identified at the Installation in the future, a 500-ft buffer around the nest should be established as recommended by VDGIF. Any project or activity requests within the VDGIF established 500-ft (152-m) buffer around bald eagle nests will require consultation with USFWS and VDGIF.

The Neotropical Migratory Bird Conservation Act (Public Law 106-247), enacted in 2000, provides grants to countries in Latin America and the Caribbean, and the U.S. for the conservation of neotropical migratory birds that winter south of the border and summer in North America. The Act encourages habitat protection, education, research, monitoring, and capacity building to provide for the long-term protection of neotropical migratory birds. Through the Act, a competitive grant program is administered by the Secretary of the Interior to provide financial resources and to foster international cooperation for conservation initiatives.

In 2008, the DoD approved the Coordinated Bird Monitoring Plan. The objective of the plan, jointly designed by the DoD and USGS biologists and managers, is to provide a comprehensive approach for helping the DoD fulfill its responsibilities under regulations that pertain to migratory birds. The plan outlines procedures for insuring that bird monitoring and assessments address important issues for the DoD; follow accepted procedures for design, data collection, and analysis; and preservation of data in long-term archives. A Coordinated Bird Monitoring Database has been established by the USGS, which DoD installations may use for long-term storage of their bird monitoring data. This will assist in the identification of species of concern

on installations and the implementation of appropriate management strategies (DoD 2012b). A DoD Coordinated Bird Monitoring Study is currently being conducted at NASO DNA to update the bird inventory, assist in management of migratory birds, and reduce the number of BASH incidents. Survey reports will be included in Appendix H once available.

BASH concerns associated with migratory bird populations at NASO DNA do exist in regards to aircraft operations as drones and helicopters are utilized at the Installation.

Installation projects and activities should include precautions to avoid negative impacts to migratory birds that have the potential to occur during implementation of the project/activity. Landscape alterations (i.e., tree removal, mowing, land clearing) should occur during the months of November through February, as recommended by USFWS to minimize impacts to migrating and nesting birds. If this cannot be accomplished, additional coordination with Installation NRS or NRM staff is required. As such, if birds of conservation concern are identified as utilizing the affected project/activity area, additional consultation USFWS and compliance with any USFWS-issued permits may be required.

NAVFAC Mid-Atlantic guidance for conducting habitat-disturbing activities (i.e. mowing, herbicide applications, noxious weed control, brush clearing, tree trimming and thinning) requires that these activities be conducted during the non-breeding season (15 August through 28 February) to the extent practicable. For tree trimming and thinning, or brush removal activities that must be conducted during the active breeding season, a pre-project clearance survey must be conducted by a qualified biologist to identify any active nests, and identification of avoidance measures for particular nests identified during the survey. If any nests are found during these surveys, these nests cannot be removed and the NRM must be notified of the nest locations. If significant impacts to nesting birds are anticipated from a project/activity, the project may be delayed until such impacts can be minimized, or other approved mitigation is identified by the Navy or through the agency consultation process.

3.10.5 Nest Box/Platform Program

The Installation NRP installed and maintains a number of bat boxes, osprey platforms, and bluebird and wood duck boxes to enhance nesting capability at NASO DNA (Figure 3-5). Artificial nest boxes and nesting platforms are useful for enhancing habitat conditions for a number of bird and bat species in areas where there are few natural nesting sites or where competition from aggressive nonnative species such as house sparrows and European starlings is high. Placement of structures that benefit insectivorous birds in urban areas also benefit Installation personnel, as these birds consume thousands of insects daily and provide entertainment for human observers. Eastern bluebirds (*Sialia sialis*), tree swallows (*Tachycineta bicolor*), purple martins, owls (Order Strigiformes), wood ducks, and bats are species that commonly utilize artificial structures; however, the Nest Box Program could potentially be expanded to benefit other species. Locations of existing and planned next box locations should be reviewed to ensure these do not increase the BASH risk at the Installation. Any existing boxes or platforms that are identified as potentially increasing the BASH risk should be removed.

Figure 3-5. Nest Boxes and Nesting Platforms of NASO DNA.

3.10.5.1 Osprey

Prior to the ban of dichlorodiphenyltrichloroethane (DDT) in the 1970s, osprey populations declined severely throughout the U.S. In recent years, however, osprey populations have rebounded and ospreys are now common in the Tidewater region. Within the southern portion of NASO DNA, ospreys nest on a variety of structures including constructed nesting platforms and light poles. Because of potential fire and electrocution, nesting platforms or light poles retrofitted with a raised platform are preferable to ospreys nesting on unmodified light poles or utility poles.

The first osprey nest platform at NASO DNA was installed in 1988 in the southern portion of the Installation. In 1996, a new nest platform was installed at the end of Bullpup Street. In addition, several utility poles, which supported active nests, were permanently disconnected from the utility grid to protect nesting birds. Two additional platforms were constructed in 2003. There are currently three known active osprey nests located on platforms or light poles at NASO DNA (Figure 3-5).

As with all migratory birds, ospreys are protected by the MBTA. No operations or maintenance may be performed on a structure if a nest is occupied and no nest may be removed or damaged without a permit from VDGIF. Osprey nesting season begins in April and continues until nestlings are fledged in July or August. NR staff monitor nest activity and can inform PWD personnel of nesting status if maintenance is required on any of the light poles or platforms that are occupied.

Osprey Nest Relocation or Removal

Inactive Nests: An inactive nest is defined as a nest without any eggs or dependent (flightless) young and includes nests under construction. Inactive nests should only be removed if the nest or placement of the nest poses a threat to property integrity, human health, or safety. No authorization or consultation is required for removal of inactive nests from 16 September through 15 April, although affected landowners may call VDGIF or USDA Wildlife Services to informally consult on pending removals or relocations if they so desire. It can be very difficult to discern the status of a nest from below; thus, from 16 April through September 15, inactive nests should only be removed if approved through consultation with USFWS, VDGIF or USDA Wildlife Services.

Active Nests: An active nest is defined as a nest containing eggs or occupied by dependent (flightless) young. All reasonable measures to protect an active nest until the young fledge must be considered before authorization to relocate or remove the nest is sought. Removal of active nests is generally not permitted, but a nest may be relocated or removed if it poses a direct threat to human health or safety or when the birds, nest, or eggs themselves are threatened unless they are moved. In rare situations, relocation or removal of a nest that merely constitutes a nuisance may be authorized if it interferes with the intended use of the structure.

Individuals interested in applying for a USFWS permit to remove or relocate an active nest may do so at: <http://www.fws.gov/migratorybirds/mbpermits/ApplicationForms.html>

VDGIF's "Removal or Relocation of Osprey Nests in Virginia: A Guideline for Landowners" (June 2010) is available online at: <http://www.dgif.virginia.gov/wildlife/birds/osprey/virginia-osprey-nest-guidelines.pdf>

Anyone seeking to have an active osprey nest relocated or removed must contact the NRM, who will coordinate with VDGIF, USFWS, and/or USDA Wildlife Services as appropriate, and obtain any required permits. To comply with Virginia law and VDGIF regulations, active nest relocation or removal may only be undertaken by an authorized federal, state, or local employee in the performance of their official duties as provided in 4 VAC 15-30-50, or by an individual authorized by USFWS for the nest removal. To comply with federal law, active nest relocation or removal may only be undertaken by an individual authorized by USFWS.

For removal of nests that require a permit, the Navy must be able to justify nest removal during the permit application process. For example removal of an active nest may be required if the birds and or nest are negatively impacting the military mission, or if implementation of the military mission would result in negative impacts to osprey or their nests. Once a nest is removed, the nest site should be modified to make it unattractive as a nesting site, such as through construction of a structure over the nest area to make it inaccessible to osprey in the future. Otherwise the site should be monitored every 2–3 days during nesting season (typically March–May, but could extend later if typically spring weather conditions are delayed) to prevent subsequent nest establishment. Other recommendations include coordinating with the NRM to construct a suitable nest platform (e.g., tower, electrical transformer, light poles) in the vicinity of the nest that will be removed that will be attractive to the nesting osprey. Creating a more desirable nesting location could potentially prevent nesting attempts in areas that interfere with the military mission and Installation infrastructure.

3.10.5.2 Eastern Bluebirds

The eastern bluebird has suffered population declines throughout its range because of pesticide use. Other threats to bluebird populations include habitat loss and the introduction of two invasive, nonnative species: the house sparrow and European starling. However, in areas with suitable habitat where nesting boxes have been put up, bluebird populations are increasing (North American Bluebird Society 2003). Ideal habitat consists of an open area for foraging, such as mowed lawn that is fringed by shrubs and hardwood trees. Erecting nest boxes in such areas reduces competition from house sparrows, tree swallows, and other small cavity nesters that also utilize this habitat type. An important consideration in nest box construction is preventing predation by raccoons and cats. Pole guards or entrance hole guards should be used. Mounting bluebird boxes on smooth round pipes also greatly reduces the chance of a loss to a predator. NASO DNA currently has nine bluebird boxes located along the row of longleaf pines (Pine Tree Road) in the southern section of the Installation. NR staff check the nest boxes annually for utilization and condition. If other species such as Carolina wrens (*Thryothorus ludovicianus*), Carolina chickadees (*Poecile carolinensis*), or tree swallows are observed using

the nest boxes, a second box should be placed approximately 25 ft (8 m) from the first. This will reduce competition for the nest box.

3.10.5.3 Wood Ducks

Wood ducks primarily nest in tree cavities in wooded swamps and marshes at the edges of ponds. Appropriate nesting habitat is often limited by the lack of cavity trees; therefore, supplemental wood duck boxes can benefit recruitment of nesting pairs and nesting success. However, nest boxes placed in close proximity to each other can encourage brood parasitism among wood ducks and result in nest abandonment. In order to maximize nest box use and minimizing nest abandonment, nest boxes should be placed several hundred feet apart and should not be visible to one another. Nest boxes can be placed either over the water or on land within 30–100 ft (9–30 m) of suitable brood habitat. Brood habitat includes forested, scrub-shrub, and emergent wetlands that are greater than 10 ac (4 ha). Abundant shrubby or downed woody material also should be available for cover. If located over the water, nest boxes should be placed at least 4 ft (1 m) above the high water level and the entrance hole should face the open water rather than the shoreline. The use of predator guards is another important factor for fledgling success.

The Installation currently has 30 wood duck boxes, five of which are plastic and 25 of which are wood. The plastic boxes are generally in poor condition and will be replaced with wood boxes. Duck box maintenance includes removing old nest material and adding fresh sawdust or wood shavings by 01 February of each year. Occupancy, box condition, and maintenance needs are recorded in a spreadsheet for each wood duck box (see Appendix H).

3.10.5.4 Bats

The bat species that is most likely to use bat houses at NASO DNA is the big brown bat (*Eptesicus fuscus*), which is a common bat in Virginia that utilizes a variety of habitats including urban, agricultural, and wooded areas (Navy 2006b). Bats can be particularly important in controlling nuisance insects as they are reported to eat up to 7,000 insects per night (Minnesota Department of Natural Resources 1992). Five bat houses have been installed in the southern section of the Installation, including two at the campground. Bats are known to use at least two of the bat houses (see Appendix H).

Habitat requirements, natural history, and nest box specifications for these and other species are on the Cornell Lab of Ornithology website: <http://nestwatch.org/>

3.10.6 BASH

NASO DNA contains a helicopter pad and is located within 5 mi (8 km) of the NAS Oceana airfield, which requires that land and wildlife management activities be conducted in a manner that minimizes the BASH risk. Each year military aircraft experience hundreds of collisions with birds and animals, causing millions of dollars in damages, injuries, and hundreds of aborted or delayed missions. The objective of the Navy BASH Program is to decrease animal populations

and attractants in the vicinity of the airfields in an effort to reduce the potential for collisions. The conditions that attract birds and other wildlife, and the potential for bird/wildlife strikes vary at each installation. Birds may flock to airfields or cause hazards en route; hazards may be seasonal or year round; bird/wildlife activity may change as area crop production changes, as sanitary landfills are opened or expanded, or as wildlife refuges are established or expanded.

The primary BASH issue at NASO DNA is associated with bird and wildlife conflicts associated with the use of drones and the active helicopter pad. The Installation has not developed a BASH Plan; however, if needed, the Installation may apply for wildlife depredation and/or migratory bird take permits from USFWS should control of wildlife and birds be necessary to meet the military mission and ensure the safety of military personnel and helicopter pilots. If depredation or take permits are obtained, these will need to be renewed annually by USFWS. Some control of larger game, such as deer, is provided by the Installation hunting program. Wetland and grassland habitats may pose as attractants to birds and wildlife, and improvements to these habitats in and around helipads or active flight areas should be avoided.

The primary management recommendation for addressing potential BASH issues at the Installation is to maintain vegetation to reduce BASH potential. The goal of vegetation management in BASH areas is to protect, conserve, and promote habitat for native terrestrial and aquatic fauna, consistent with Navy BASH Program requirements.

Some focused management strategies related to BASH reduction at the Installation include the following.

1. Discourage ponding of water within areas in proximity to helipad and flight zones to minimize attracting migratory birds and other wildlife, and to minimize the BASH potential.
2. Implement habitat enhancement and maintain habitat diversity for migratory bird species, consistent with BASH Program requirements. Recommendations for habitat enhancement should be made to attract birds and other wildlife away from the flight operations areas.
3. Maintain Migratory Bird Depredation Permits (if applicable) from the USFWS and VDGIF Kill Permits to allow harassment or harm to migratory birds and other species as part of Navy BASH Program requirements, and to maintain helipad and flight zone safety.
4. Procure and maintain BASH response equipment (i.e., propane cans, electronic scare devices, calls).
5. Conduct initial BASH training workshop for staff members with refresher training as needed.
6. Review locations of bird and bat boxes/platforms to determine if any of these should be removed to reduce BASH risks.
7. Review each project proposed on the Installation for BASH concerns and provide guidance for reducing or avoiding BASH concerns.

The BASH potential will be reduced by managing wildlife on undeveloped, semi-developed, and developed areas around helipads and flight zones. By tracking BASH-related incidents using a georeferenced data set, including information on habitat types at and near each incident's location, a more complete understanding of risks and potential causes of strikes can be developed, leading to more effective management actions.

The following references should be used to determine the appropriate management actions that should be implemented in consideration of reducing the BASH risk at the Installation:

- CNIC Instruction 3700, Navy BASH Program Implementing Guidance, establishes policy and procedures for implementing the CNIC BASH Program, establishes mandatory BASH event reporting and remains collection procedures, and establishes BASH program procedures.
- CNIC, BASH Manual, presents additional recommended policies, procedures, and instructional material to serve as an aid to CNIC shore aviation commands in developing local BASH policies and related personnel training programs; and identifies key BASH statutory and regulatory requirements, and provides advisory information for management of Navy airfields.
- OPNAVINST 3750.6R Ch. 4, Naval Aviation Safety Program, issues policies and provisions of the Naval Aviation Safety Program.
- Federal Aviation Administration (FAA), Advisory Circular 150/5200-32A, Reporting Aircraft Wildlife Strikes, explains the importance of reporting collisions between aircraft and wildlife (i.e., wildlife strikes), and examines recent improvements in the FAA's BASH Reporting system; how to report a wildlife strike; what happens to the wildlife strike report data; how to access the FAA National Wildlife Aircraft Strike Database; and the FAA's Feather Identification program.
- FAA, Advisory Circular 150/5200-33B, Hazardous Wildlife Attractants on or Near Airports, provides guidance on certain land uses that have the potential to attract hazardous wildlife on or near airports as well as airport development projects that affect aircraft movement near hazardous wildlife attractants.

3.10.7 General Fish and Wildlife Management

In 2000 Congress began to provide annual funding to supplement existing state fish and wildlife conservation programs. Along with this funding came the responsibility of each state and territory to develop a Comprehensive Wildlife Conservation Strategy—an Action Plan for wildlife—by 01 October 2005.

The Virginia SWAP was adopted in 2005. This SWAP includes an evaluation of the location and relative abundance of wildlife and the habitat required to support these species, an assessment of problems facing Virginia species and habitats, recommended conservation actions to address these problems, and research, monitoring, and survey needs. The SWAP also identified 925 species of greatest conservation need in Virginia, 60% of which are aquatic, and 70% of which are invertebrates. These species are further grouped into four tiers of relative conservation need: critical (I), very high (II), high (III), and moderate (IV) (VDGIF 2005).

The SWAP identifies the species of greatest conservation need for each of the six ecoregions of Virginia, and provides life history, location and relative condition of habitat, specific threats and trends, conservation actions and strategies, and research and monitoring needs for each species (VDGIF 2005). The Installation is located within the Mid-Atlantic Coastal Plain region and a list of fish and wildlife species identified as Species of Greatest Conservation Need for the Mid-Atlantic Coastal Plain in the Virginia SWAP is included in Appendix I.

Five (5) of the 37 Tier 1 (Critical) vertebrate species identified in the SWAP have been identified at NASO DNA. Nine (9) of the 52 Tier II (Very High) vertebrate species that were identified in the SWAP have been observed at NASO DNA. Eight (8) of the 46 Tier III (High) vertebrate species that were identified have been observed at NASO DNA. Thirty-seven (37) of the 142 Tier IV (Moderate) vertebrate species that were identified in the SWAP have been observed at NASO DNA (VDGIF 2005). Species of conservation concern identified in the SWAP that have been observed at NASO DNA are identified in Appendix I.

Natural resources management strategies and recommendations included in this INRMP also satisfy the goals and objectives of the Virginia SWAP in conserving the state's natural resources for future generations.

The Virginia State Wildlife Action Plan contains a list of Species of Greatest Conservation Need for the Mid-Atlantic Coastal Plain region of Virginia, and is available for viewing and downloading at: <http://bewildvirginia.org/wildlifeplan/>

3.11 OUTDOOR RECREATION AND ENVIRONMENTAL AWARENESS

The Sikes Act requires that military installations provide public access for use of natural resources to the extent it is appropriate and consistent with the military mission. A number of outdoor recreation opportunities are available at NASO DNA to active and retired military personnel, Installation civilian employees, and their dependents. Members of the general public also may participate in recreational activities on the Installation, provided that they are sponsored by one or more of the above mentioned list of authorized individuals and they meet Installation access requirements.

Recreational opportunities at the Installation include beach going, picnicking, camping, wildlife watching, boating, hunting, and fishing. The MWR Department administers picnicking, camping, beach going, and boating activities. The NRP manages the hunting and fishing programs. Both MWR and the NRP provide management oversight of facilities/programs that provide wildlife viewing/watching opportunities. The NRP also provides regulatory oversight to ensure all individuals recreating are complying with natural, cultural, and other environmental resources laws and regulations via their CLE program. Coordination and cooperation between the MWR and NR staff is necessary for the protection and management of natural resources on MWR-administered facilities. NR personnel cooperate on issues such as the prevention of nonpoint source pollution, nuisance wildlife control, tree care, and other aspects of natural resources management.

Information, including geographic distribution, plant characteristics, and treatment for the most common poisonous plants in the U.S. is available at:

<http://www.cdc.gov/niosh/topics/plants/>

3.11.1 Hunting

Hunting opportunities at NASO DNA include hunting for deer and waterfowl, and are available to active duty and retired military personnel and their dependents, civilian employees of the Navy and their dependents, reservists, and retired employees of DoD. The above-mentioned persons also may sponsor one guest from the general public, as long as these guests meet access requirements. Hunting within the Naval Special Warfare Development Group compound hunting area is only open to those recreational hunters that can obtain appropriate access approvals into this compound. Hunting at NASO DNA is regulated by state law, the regional hunting and trapping instruction, CNRMA Instruction 11015.2B, and Installation instructions and/or rules and regulations guidance documents (see Appendix J). In accordance with the Sikes Act, user fees are set aside for the protection, conservation, and management of fish and wildlife such as implementation of habitat improvement and related activities.

Safety is a primary management issue in the hunting program. All firearm users must participate in a hunter gun safety course, and all bow hunters must demonstrate competence through a qualification test. Hunters also must obtain appropriate state licenses and regional permits in order to hunt on NASO DNA. Archery qualifications are held at NAS Oceana and shotgun qualifications are held at NASO DNA. Archery, shotgun, and black powder seasons correspond to state hunting seasons.

At NASO DNA, hunting is permitted in three separate areas of the Installation; the north end, which includes the wooded area north of the firing ranges; the central area of the Installation, which includes South Marsh and the adjacent forested areas; and within the southern-most portion of the Installation. Approximately 535 ac (217 ha) are included in the hunting areas. The hunting areas are divided into 44 compartments (Figure 3-6) that can accommodate one to two hunters each depending on the type of hunting and size of the compartment. Nineteen (19) of the compartments are designated as archery only, 13 are designated as shotgun or archery, and 12 are designated as black powder, archery, or shotgun.

Waterfowl hunting at Redwing Lake was formerly authorized; however, this lake has since been closed to hunting due to military mission safety/security requirements. The NRP also formerly managed waterfowl blinds on Lake Tecumseh; however, the Navy no longer manages the recreational resources of Lake Tecumseh as it has been determined to not be Navy property. Hunting at Lake Tecumseh should be coordinated with VDGIF, and the Hampton Roads Sanitation District, who owns the lake.

The NASO DNA hunting program is a dynamic program, and hunting areas can be closed or opened as dictated by military mission and wildlife population management requirements. The

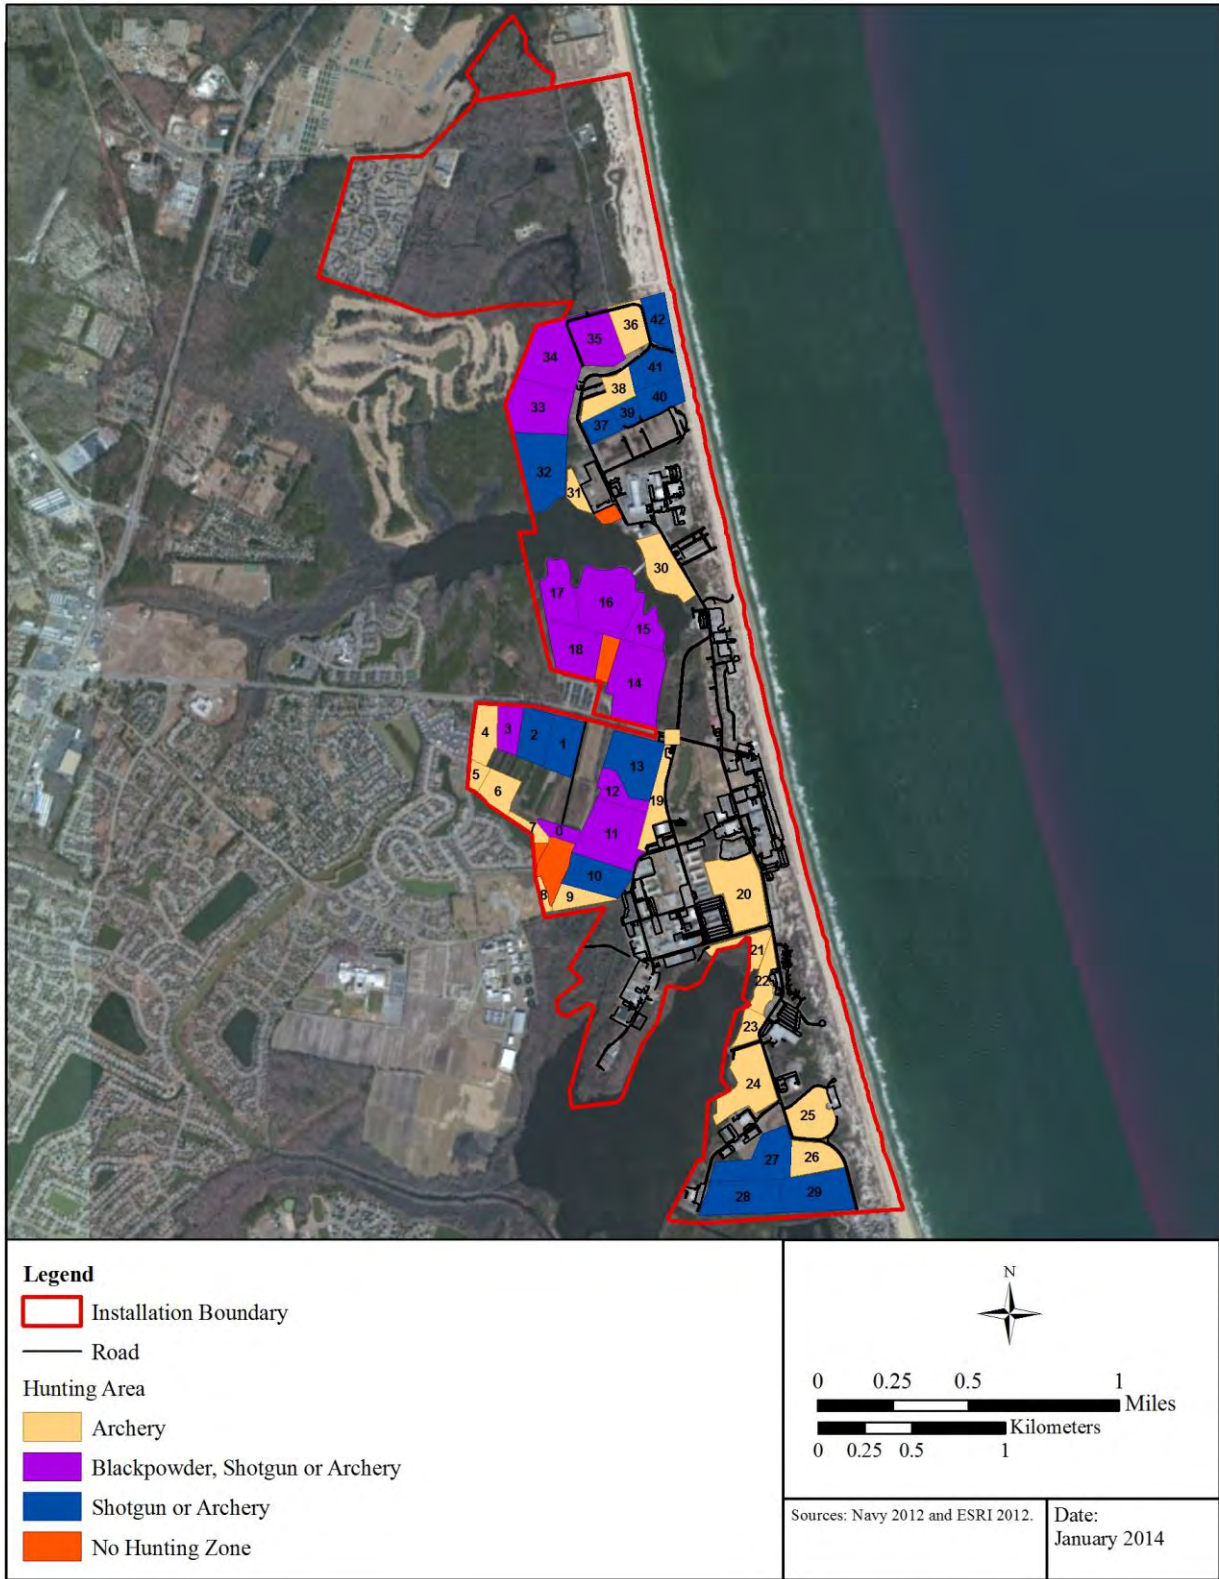

Figure 3-6. Hunting Areas of NASO DNA.

type of hunting allowed in a hunting area also may be changed for safety reasons, or to enhance wildlife population control. Changes that are made prior to the hunting season are reflected in the annual hunting program rules and regulations document, map updates, hunter indoctrination training classes, and NAVFAC Mid-Atlantic environmental and CNIC NAS Oceana NR websites. Changes made during the hunting season are posted at the hunter check in/out location. Currently the northern area of the Installation that constitutes the former Camp Pendleton parcel is not be open to general recreational hunting participants; however, environmental staff still conduct controlled hunts in this area for wildlife population control. This area may be opened to recreational hunting program participants at a later date.

The recent reauthorization of appropriations for implementation of the Sikes Act completed in June 2013 as part of the House of Representatives Bill H.R. 910 identified the need for DoD installations to improve their commitment to implementation of the Disabled Sportsmen's Access Act of 1998. This Act strives to improve access and provide adaptive equipment for disabled active and former military personnel for hunting, fishing, and/or other outdoor recreational activities on military installations. The Installation should assess their ability to provide adaptive equipment for disabled military personnel authorized to participate in hunting and fishing activities at the Installation, as part of implementation of this INRMP and in support of Sikes Act requirements.

3.11.2 Fishing

Popular recreational activities include saltwater fishing along the shoreline and freshwater fishing at the freshwater lakes of NASO DNA. Saltwater shore fishing is allowed between Labor Day weekend and Memorial Day weekend at designated locations, and a beach utilization map is provided by MWR that identifies areas approved for these activities. Freshwater fishing is permitted at Sadler Pond, and fishing also is allowed in the ditches that drain the Installation. Fishing along the shores of Lake Tecumseh also is authorized; however, the Navy NRP does not manage the Lake Tecumseh fisheries, as it has been determined that the lake is owned by the Hampton Roads Sanitation District. Fishing at Lake Tecumseh should be coordinated with VDGIF, and the Hampton Roads Sanitation District. Fishing at Redwing Lake was formerly authorized; however, this lake has been closed to fishing due to military mission/security reasons. The Southeast Redwing Lake Wetlands SIA ponds are currently not authorized for inclusion in the recreational fishing program as this area is being managed as a conservation site. Opening this area to recreational fishing increases the risk of inadvertent introduction of non-native and invasive species.

Appropriate state licenses and an Installation permit for freshwater fishing are required for fishing at NASO DNA. Installation permits can be purchased at the NASO MWR ticket office. Individuals desiring to fish on the Installation must complete an application at Building 78 at NAS Oceana. Updates to fishing areas and requirements are discussed and parking permits are issued during the application process. The regional freshwater fishing instruction is included in Appendix J (Enclosure 1). Similar to policies for the hunting program, areas listed in the instruction can be closed at any time. Coordination with the Installation NRP is required prior to fishing on the Installation to obtain a current listing of approved fishing areas during a given season.

3.11.3 Conservation Law Enforcement

The Sikes Act requires that CLE be provided on military lands (Benton et al. 2008), and that each military department will ensure that professionally trained NR and CLE personnel are assigned responsibility to protect and manage natural resources found on DoD installations, including implementation of INRMPs (DoD Legacy Program 2009). DoD installations must coordinate with the appropriate agencies to support CLE and enforce federal and applicable state laws and regulations that pertain to the management and use of the natural resources under their jurisdiction. This has included a variety of law enforcement options including employment of civilian CLEOs/game wardens, military police, or combinations of civilian CLEOs and military police. According to DoD Instruction 5525.17 (Conservation Law Enforcement Program), it is DoD policy that CLEOs assigned to DoD law enforcement elements may be co-located with the conservation program manager at the installation. In addition, CLE rules and responsibilities must be integrated into an installation's INRMP and Integrated Cultural Resources Management Plan (ICRMP), where CLE is required.

Regional Conservation Officers **serve as game wardens and** have the authority to apprehend and arrest all violators of federal, state, or Installation game laws and regulations on NASO DNA. CLE at NASO DNA is solely the responsibility of the Navy; however, Navy enforcement personnel cooperate with state and federal CLEOs, as needed, to enforce state and federal wildlife laws. Regional Conservation Officers are required to be trained in CLE and state and federal wildlife regulations. It is required that the Conservation Officers attend annual CLE refresher training to remain current on changes in regulations and enforcement policies.

3.11.4 Environmental Awareness

NAVFAC Mid-Atlantic environmental staff or other personnel as appropriate are responsible for coordinating environmental education and outreach efforts at NASO DNA. Environmental staff and other personnel coordinate annual events such as Arbor Day, Earth Day, National Public Lands Day, and Clean the Bay Day celebrations and activities, which are important for promoting environmental awareness at NASO DNA. Through such activities, Installation residents and volunteers have the opportunity to learn about environmental stewardship as well as contribute to protection and enhancement of local ecosystems. NASO DNA residents and volunteers also are encouraged to participate in habitat conservation efforts in the beach and dune areas. Dune stabilization efforts that rely on the participation of volunteers include collecting recycled Christmas trees and planting beach grasses on sections of the training beaches for dune stabilization.

Appendix K contains materials that can be used for educational outreach to the public with regards to natural resources management at NASO DNA, including pamphlets and brochures about safety hazards, wildlife compliance, and hunting, fishing, and archery opportunities at Navy installations in Hampton Roads. In addition to these brochures, natural resources information also is disseminated via the NAS Oceana website and Navy Installation Twitter accounts.

The NRP also accepts requests to conduct NR safety awareness and wildlife training classes/talks at the Installation. Availability of Navy staff to conduct these outreach events is

limited, and staff may not be available during the desired training request time frame; however, staff will attempt to make arrangements for another date or will recommend other sources from which to obtain similar information.

3.11.5 Wildlife Diseases

Individuals who recreate at NASO DNA and other personnel that live or work on the Installation also are at risk for zoonosis, diseases that are communicable from animals to humans under natural conditions. Zoonotic diseases of concern at NASO DNA include Lyme disease, West Nile virus, equine encephalitis, rabies, and distemper. To help prevent the spread of these diseases the NRM should post notices of disease outbreaks that may affect NASO DNA personnel and guests, and promote preventative measures to limit their spread and transmission. Fact sheets on zoonotic diseases of concern at NASO DNA are included in Appendix K.

Information on zoonotic diseases, including how to prevent the spread of the diseases, is provided by the Centers for Disease Control and Prevention and is available at:
<http://www.cdc.gov/ncezid/>

3.11.6 Human and Wildlife Conflicts/Safety Concerns

Individuals who recreate at NASO DNA and other personnel that live or work on the Installation should be aware that there is the potential for venomous snakes and poisonous plants to be present. Wearing protective clothing and hiking boots can reduce the risk of contact with poisonous plants and poisonous snakes. Individuals should remain on designated trails and avoid walking through dense piles of brush. If snakes are observed, individuals should avoid disturbing them, as they are not likely to strike unless provoked. If an individual is bitten by a snake, he or she should seek immediate medical attention. All wildlife incidences should be reported to the local Environmental Office, Safety Office, or Security Office. Fact sheets on poisonous plants and venomous snakes are included in Appendix K.

3.11.7 Wildlife Observation

Providing appropriate facilities for the enjoyment of nature and wildlife can create additional opportunities for outdoor recreation for Navy personnel and their dependents. A wildlife observation deck, constructed as a National Public Lands Day project, overlooks Lotus Pond and provides wildlife watching opportunities at NASO DNA. An associated interpretive trail adds to the educational value of the area. In addition to this site, wildlife observation can be conducted at Sadler Pond and along the recreational beaches of NASO DNA.

3.12 INTEGRATED PEST MANAGEMENT

An IPM Plan has been prepared for NAS Oceana, NALF Fentress, and NASO DNA (Appendix H). The focus of pest management at NASO DNA is to prevent interference with military operations and preparedness by protecting infrastructure, real property, and human health and

safety. NAVFAC Mid-Atlantic environmental staff provides pest management services through the Environmental Services Department. In addition, the Environmental Services Department responds to service calls for removal of nonmigratory birds and control of feral animals. Forest and landscape pests and invasive species are pest management issues that also are of concern to NR staff.

In accordance with OPNAVINST 6250.4C, Pest Management Programs, it is Navy policy to use an integrated pest management (IPM) approach to pest control. IPM uses ecologically, economically, and socially sound strategies to keep pests at tolerable levels. In IPM, the full range of pest control options (cultural, mechanical, biological, and chemical) may be employed after careful consideration of the pest's biology, the damage or infestation thresholds that require action, and the impacts each control alternative will have on the environment. A variety of biological, cultural, and mechanical pest management strategies used in IPM are included in the following discussions of the major types of pest issues that are relevant to the NRP at NASO DNA. Maintaining appropriate pesticide certification and invasive species control training is important for implementation of the IPM program at NASO DNA. Invasive species includes both animal and plants species.

3.12.1 Nuisance and Invasive Wildlife, and Invasive Plants and Noxious Weeds

3.12.1.1 Nuisance and Invasive Wildlife

DoD's Armed Forces Pest Management Board defines nuisance wildlife as wildlife that, because of their feeding or nesting habits, interferes with the military mission or well-being of domestic animals, other wildlife, or humans (Armed Forces Pest Management Board 2012). CNRMA Instruction 11015.3, *Natural Resources Management for Fish and Wildlife, Feral Animals, Invasive Species, and Certain Pests*, assigns responsibilities and provides points of contact for nuisance wildlife issues at NASO DNA. Authority and responsibility for nuisance wildlife ultimately resides with the NAVFAC Mid-Atlantic Core Environmental (EV) director. The NAVFAC Mid-Atlantic Core EV director may delegate this authority to the NAVFAC Mid-Atlantic Core and/or the NAVFAC Mid-Atlantic Installation NRM. The NAVFAC Mid-Atlantic Core EV director or an appointed delegate maintains the permits necessary for controlling species protected by federal or state law. At the Installation, the NRM is responsible for promptly responding to emergency wildlife calls as needed, to ensure the safety of NR personnel, military, civilians, and wildlife.

NR personnel involved in lethal control activities must be properly trained and duly certified for all weapons employed in accordance with applicable regulations. Appropriate equipment such as various sized cages must be maintained by natural resources and environmental services staff to assist in the humane capture and transport of nuisance wildlife. Potential nuisance wildlife problems at NASO DNA include various species of native and non-native animals.

Pursuant to 4 VAC 15-20-160 the following mammal and bird species are designated as nuisance species: house mouse (*Mus musculus*), Norway rat (*Rattus norvegicus*), black rat (*Rattus rattus*), coyote (*Canis latrans*), feral hog (*Sus scrofa*), nutria (*Myocastor coypus*), woodchuck (*Marmota monax*), European starling (*Sturnus vulgaris*), house sparrow (*Passer domesticus*), and rock pigeon (*Columba livia*). Other nonnative species as defined in the Migratory Bird Treaty Reform Act of 2004 and regulated under 50 CFR 10.13 also are included as nuisance species.

Part B of the code states “*It shall be unlawful to take, possess, transport, or sell all other wildlife species not classified as game, furbearer or nuisance, or otherwise specifically permitted by law or regulation.*”

VDGIF defines nuisance wildlife in 4 VAC 15-20-160, and lists those species that are considered by Virginia as nuisance species; however feral pets, Canada goose and other waterfowl are not considered nuisance wildlife by this code. The code further states that “*It shall be unlawful to take, possess, transport, or sell all other wildlife species not classified as game, furbearer or nuisance, or otherwise specifically permitted by law or regulation.*” To ensure compliance with this law, any nuisance wildlife removal or control activities performed by the environmental staff at NASO DNA will be coordinated with VDGIF as necessary, to make certain that methods employed do not violate Virginia law.

Two nuisance wildlife surveys are currently being conducted at NASO DNA to identify nutria and coyote populations at the Installation. Nutria survey methods have been approved by the Chesapeake Bay Nutria Eradication Program and passive herbivory surveys will be used to ascertain the presence or absence of nutria at the Installation. An estimation of the current level of infestation will be made as well as an estimation of the impact potential of nutria within the Installation boundaries based on area of potential habitat and current estimated level of infestation. Artificial scent stations will be used to index coyote abundance at the Installation. Upon completion of the surveys, a nuisance wildlife assessment and management plan will be developed which will identify nuisance wildlife habitat and locations and include suggested removal methods. A copy of this plan will be included in Appendix H once available.

In addition to the nuisance and invasive wildlife species identified in this section, other species that pose a human health and safety concern, or that conflict with the military mission or military operations, may be designated as nuisance and/or invasive wildlife. Control of non-traditional nuisance/invasive species, or of species not listed under state regulation as a nuisance/invasive species may be conducted by NR staff once appropriate permits have been obtained from VDGIF and/or USFWS.

3.12.1.1.1 Red-Eared Slider

Although native to the Mississippi Valley area of the U.S., the red-ear slider is considered invasive along the coastal states of the U.S., Hawaii, and in parts of the Caribbean, Canada, and Mexico. Many of the thriving invasive non-indigenous populations of red-eared sliders are established through the illegal release of pets. Red-eared sliders threaten native species by competing for habitat, food, and nesting sites. Native turtle populations also can be harmed by

parasites and diseases that are transferred from red-eared sliders (USFWS 2011c). Proven effective control methods for removing red-eared sliders include hunting, trapping, and collecting eggs and hatchlings. Education of the public and prevention of the illegal release of red-eared sliders also is important (Columbia University 2002). Red-eared slider has not been observed at the Installation; however, a survey for this species should be conducted. If observed, a removal plan should be developed in cooperation with VDGIF for this nuisance species.

3.12.1.1.2 Birds

When birds nest or roost in objectionable locations, their feces are often unsightly, destructive, and hazardous to human health. Birds that frequently become problem species include house sparrows, European starlings, and pigeons, which are species that have adapted to take advantage of urban environments. NASO DNA discourages roosting in inappropriate places by adding exclusion devices, repellants, and other deterrents to existing structures. Trapping, shooting, and nest removal also are used for pigeon, starling, and house sparrow control. It is important to remember, however, that pigeons and nearly all bird species other than European starlings, house sparrows, and mute swans are protected by the MBTA and cannot be harmed without a permit issued by the USFWS through the USDA, Animal Plant Health Inspection Service's Wildlife Services program.

3.12.1.1.3 Nutria

Nutria are semiaquatic members of the rodent family, and were intentionally or accidentally introduced to the southeastern U.S. in the late 1930s for the fur industry (USGS 2004). Within 20 years of their introduction, nutria became a problem to farmers and native wildlife populations. Because of dense populations, nutria over-harvest preferred food species within their range resulting in the killing of native wetland plants and agricultural fields. This over-harvesting destroys productivity as less desirable species invade the impacted sites and increase erosion potential. Nutria also are known to feed on tree and shrub seedlings and can severely impact regeneration of some species. Burrowing in dams and levees is another type of damage caused by nutria. As their range and population have increased, the environmental and economic problems they cause also have increased. Using hardware cloth tubes or wire mesh plant guards may be necessary to protect bald cypress seedlings in planted wetlands and mitigation sites. Plastic seedling protectors may not deter nutria (USGS 2007).

Shooting can be used as the primary method of nutria control in areas with dense populations. Shooting is most effective when conducted at night with a spotlight at an established bait station. Bait stations can be established on floating rafts or boards that are continuously lit by a spotlight and in view of the shooter. Alternately, increasing the hunting and trapping efforts at the station may help control the population. Controlling nutria populations, however, will mostly be implemented by NRMs as there will not likely be much interest in this species by hunters or commercial trappers. Nutria are designated as nuisance species and may be taken at any time (except on Sunday) by use of a firearm or other weapon (VDGIF 2008).

3.12.1.1.4 Coyote

Coyotes resemble small collie dogs, with pointed ears, a slender muzzle, and a bushy tail. Coyotes are a top predator and can be useful in control of deer, Canada goose (by eating eggs), and

rodents. They are most active at night and early morning, especially in areas where human activity occurs, and during the hot summer months. Coyotes can become a nuisance in urban areas by preying on pets and damaging livestock and crops. Coyotes can constitute a threat to public health and safety when they frequent airport runways and residential areas, and act as carriers for rabies (Internet Center for Wildlife Damage Management 2005). Prohibiting wildlife feeding and making sure pet food and garbage cans are secure are some steps residents can take to deter coyotes from frequenting urban areas. Since rodents can be attracted to fallen bird seed, seeds accumulating underneath bird feeders should also be routinely cleaned up.

3.12.1.1.5 Feral Cats and Dogs

Pets that have been abandoned or left behind by owners often become serious pests on military installations. Feral animals are a health and safety risk for Installation personnel and threaten wildlife populations, especially migratory birds. Removal of feral pets from the environment is a natural resources management goal. Feral animal control is jointly conducted by NR staff and other environmental staff. The CNO Policy Letter of January 2002 on Preventing Feral Cat and Dog Populations on Navy Property outlines the Navy's policy on feral pets (Appendix J). In accordance with Navy policy, the Installation must adopt proactive pet management procedures that prevent the establishment of free-roaming cat and dog populations. Additionally, the Installation must ensure the humane capture and removal of feral cats and dogs, and every effort should be made to find homes for adoptable animals. At NASO DNA, captured feral pets are taken to the local animal control facility.

Feral cat populations are a particular concern because of the threat they pose to native birds and small mammal species. Feral cat populations are controlled at NASO DNA by encouraging responsible pet ownership and limiting access to food and shelter. Vaccination, registration, and tags are required for every pet on the Installation. Spay and neuter programs are promoted and all pets must be kept under strict supervision. Prohibiting the feeding of strays and ensuring all dumpsters are tightly secured are additional steps that control feral cat populations.

3.12.1.1.6 Pigs

Feral pigs (*Sus scrofa*) that have existed in the region since early European settlement are another problem species for native habitats and wildlife. Feral pigs have not been identified on the Installation in recent years. The removal of these animals from the Installation was due to the combination of proactive partnerships with BBNWR, lethal removal efforts, the repair of fences along the Back Bay watershed, and the repair and installation of the Installation's southern boundary security fence. There is still a population of feral pigs within the Back Bay watershed. More information on this population may be obtained from Back Bay NWR and False Cape State Park.

3.12.1.1.7 Miscellaneous Vertebrates

A number of vertebrate species such as groundhogs (*Marmota monax*), squirrels (Family Sciruidae), mice (*Mus* sp.), rats (*Rattus* sp.), skunks (Family Mephitidae), opossums, and nutria can be considered nuisance pests in urban environments. State wildlife regulations prohibit capture and relocation of wildlife to other locations, as this could contribute to the spread of wildlife diseases. As such, wildlife captured at the Installation must be released within another

area of the Installation, preferably within natural areas adjacent to the location of capture. Lethal methods of wildlife will not be used unless imminent danger to NASO DNA personnel exists, or if the species presence is damaging structures, disrupting the mission, causing a severe nuisance, or is otherwise intolerable.

3.12.1.1.8 Invertebrates

Ants, termites, bees, wasps, forest pests, and other invertebrates can cause destruction by invading and damaging structures. Ants are one of the most common household pests. Bees, wasps, and other social insect groups may establish nests in buildings and other Installation structures, causing health and safety hazards. Regular inspections and maintaining good sanitation (properly storing food, cleaning up grease and spills, etc.) can prevent infestations.

Termites can damage structural lumber, utility poles, and other wooden structures, as well as stored foods, books, and household furniture. Signs of termite infestation include swarming of winged forms in fall and spring, and evidence of tunneling in wood. Wood in damaged areas is typically thin and easily punctured with a knife or screwdriver (University of California Integrated Pest Management Online 2001).

Forests pests result when non-native insects and diseases are introduced into an ecosystem and cause environmental or economic damage. Although damage is inflicted on the host species, the impact of infestation can extend to associated plants and animals that depend on forested habitats. Forests pests can threaten forestry resources at NASO DNA, potentially contributing to an increased fire risk if the infestation is severe enough to cause large die offs (National Park Service n.d.). Section 3.12.2 provides additional information on forest and landscape pests.

3.12.1.2 Invasive Plants and Noxious Weeds

Many aggressive, nonnative plant species that have been used in agriculture, erosion control, and as ornamentals have become problematic weed species that are now considered a leading threat to native habitats. EO 11987, *Exotic Organisms*, and EO 13112, *Invasive Species*, address the control of invasive, nonnative species on federal facilities. EO 11987 specifically restricts the introduction of harmful exotic species into native ecosystems, and EO 13112 requires federal facilities, to the extent practicable and permitted by law, to:

- prevent the introduction of invasive species;
- detect and control such species;
- accurately monitor invasive species populations;
- provide for restoration of native species and habitats that have been invaded;
- conduct research on invasive species to prevent their introduction and provide for environmentally sound control; and
- promote public education on invasive species.

Management of invasive plant species at NASO DNA is focused on the species and communities desired rather than on simply eliminating the invasive species. Priorities are set based on

ecological significance, the severity of infestation, and the likelihood of successful control with available resources. Preventive measures keep invasive species from becoming established.

General control methods that are used to combat invasive species infestations include mechanical methods such as cutting, mowing, handpulling, burning, and chemical applications of herbicides. Herbicide applications are most effective with species that have a large percentage of foliage to stems and roots such as grasses and nonwoody vines. For woody species, a combination of practices that includes cutting the larger woody materials and treating resprouting vegetation with a foliar application of herbicides is frequently recommended.

Herbicides may only be applied by licensed DoD employees or contractors in a manner consistent with all label instructions. All herbicides used must be approved by regional entomologists and must be on the authorized user list. In addition, all outdoor pesticide use that is conducted in remote areas must be coordinated with NR personnel to ensure wildlife, plants, or their habitats are not affected. The Invasive Species Inventory Survey report is included in Appendix H.

A list of Virginia's invasive species, methods of control, and fact sheets are available on the VDCR-DNH website: <http://www.dcr.state.va.us/dnh/invinfo.htm>

A noxious weed is a plant that can directly or indirectly injure or cause damage to crops (including nursery stock or plant products), livestock, poultry, or other interests of agriculture, irrigation, navigation, natural resources of the U.S., the public health, or the environment. Currently, no noxious weeds have been identified at the Installation; however, surveys for the presence of noxious weeds are conducted periodically, and the Installation takes precautions to avoid introduction of noxious weeds.

An invasive plant species inventory survey was conducted in 2012–2013 using an adaptive survey methodology with on-the-ground surveys and GPS data recording the location and presence/absence of invasive plant species. The surveys targeted high-risk areas and pathways which have been disturbed, such as roads, trails, and edge habitat, as invasive plant distribution is closely associated with these disturbances. Sixteen (16) invasive plant species were identified at NASO DNA during these surveys, which are typical of the Coastal Plain in Virginia (VDCR-DNH 2009). Invasive species observed include Japanese honeysuckle, Japanese stilt grass (*Microstegium vimineum*), Chinese privet (*Ligustrum sinense*), alligator weed (*Alternanthera philoxeroides*), Johnson-grass (*Sorghum halepense*), common reed, autumn olive (*Elaeagnus umbellata*), border privet (*Ligustrum obtusifolium*), Chinese lespedeza (*Lespedeza cuneata*), common dayflower (*Commelina communis*), English ivy (*Hedera helix*), gill-over-the-ground (*Glechoma hederacea*), multiflora rose (*Rosa multiflora*), pampas grass (*Cortaderia selloana*), Parrot feather milfoil (*Myriophyllum aquaticum*), and thorny Elaeagnus (*Elaeagnus pungens*). Mimosa (*Albizia julibrissin*) was not identified during the survey, but is known to occur on the Installation (M. Wright, personal communication, 18 February 2014). The following sections provide additional details on common reed and alligator weed. Detailed invasive species maps and results of the invasive species survey for all of the invasive species observed at NASO DNA is provided in Appendix H.

3.12.1.2.1 Common Reed

One of the primary invasive plant species of concern at NASO DNA is common reed. This large, invasive perennial grass that can be found throughout the United States. It is an aggressive grass species associated with salt and freshwater marsh habitats where land and hydrological regimes have been disturbed. It grows quickly and forms extensive, and often monotypic, stands that can overwhelm other wetland species. Common spreading mechanisms or vectors have been attributed to nutrient enrichment and an increase in soil disturbance associated with coastal development. It is also a significant problem in freshwater systems, and is difficult to eradicate once it becomes established (Invasive Plant Atlas of the United States 2013).

Aerial spraying of common reed populations at the Installation with Rodeo herbicide was initiated in 2006, and Installation populations were mapped at NASO DNA in 2008. In October 2011 an estimated 8 ac (3 ha) were sprayed with Rodeo Herbicide (Figure 3-7), with spraying conducted along the northern and eastern shoreline of Lake Tecumseh near the southern end of the Installation, as well as two patches east of Lake Tecumseh between Regulus Avenue and the lake. Backpack spraying was also conducted in 2011; however these areas are not depicted in Figure 3-7. Aerial spraying of populations along Redwing Lake also were sprayed prior to 2011; however, since this event sprayed mostly dead or dormant stands, this treatment did not result in preferred results. Aerial spraying of common reed conducted at the Installation between 2006 and 2011 was covered by an EA prepared for invasive species spraying events conducted at Navy installations located within the Hampton Roads region, which targeted common reed and kudzu (Appendix A).

During the 2012-2013 invasive species survey conducted at NASO DNA approximately 160 populations, or stands, of common reed were documented (see Figure 10 in Appendix H, Enclosure 5). The total area occupied by common reed was estimated to be 17.9 ac (7.2 ha). Common reed dominates many of the wet areas and inland shorelines of the Installation, with the largest population observed adjacent to Redwing Lake, which is approximately 2 ac (0.8 ha) in size.

3.12.1.2.2 Alligator Weed

Based on past invasive plant species surveys, one of the primary invasive plant species of concern on the northern portion of NASO DNA was alligator weed. This herbaceous perennial roots on shore or shallow water and also can be partially or wholly terrestrial. Alligator weed is native to South America but was first documented in the U.S. in 1897 in Mobile, Alabama. It is now found in coastal states from Virginia to Texas, the Tennessee Valley, and Puerto Rico as well as in California. Alligator weed is an aquatic plant that invades shallow open water habitats, wetlands, streams, ponds, and shorelines. It is often found in lakes, ponds, estuaries, and irrigation canals; but can also be found growing on dry land. Alligator weed can form thick mats that displace native vegetation, clog waterways, and interfere with agriculture, drainage, and irrigation. Dense mats can also lead to flooding and limit access to waterbodies. It spreads by animals or water, and can reproduce vegetatively from plant fragments that develop into entirely new plants, making it difficult to effectively eradicate. The terrestrial form can develop a massive rhizomatous root system (Invasive Plant Atlas of the Mid-South n.d.).

Figure 3-7. Invasive Species Management at NASO DNA.

The use of mechanical methods of control are expensive and ineffective against alligator weed and may actually hasten the spread of the invasive plant because stem fragments propagate the plant. The optimal control mechanism in Virginia is the use of glyphosate and other herbicides. The use of glyphosate and other nonselective herbicides requires careful knowledge of the chemicals and the use of appropriate application methods to ensure that other green vegetation is not adversely affected (VDCR-DNH 1997).

Invasive species surveys conducted in 2012 and 213 identified alligator weed in eight plot locations, which were distributed in isolated plots (see Figure 5 in Appendix H, Enclosure 5). These sites were located along the perimeter of ponds, canals and drainage ditches.

3.12.2 Forest and Landscape Pests

Proper plant selection and plant health management in landscaped and ornamental areas can reduce the level of effort required with regards to weed and pest management, both in urban and natural environments. Selecting the right plant for the space, limiting abuse (including soil compaction from vehicular and pedestrian traffic and damage from lawnmower and string trimmers), and maintaining or increasing species diversity are methods of promoting plant health. Monocultures of trees or shrubs create an opportunity for devastating pest or disease outbreaks. Stress induced by poor plant selection, insufficient water, wounding, or soil compaction creates avenues of infection or infestation and reduces a plant's ability to defend itself. Poor maintenance practices such as improper pruning also lead to wounding and points of entry for pathogens. The draft Regional Tree Preservation Instruction (Appendix D) addresses many of these issues and NASO DNA makes every effort to enforce this instruction. Although this regional instruction is still a draft instruction, it is included as part of this INRMP as it is an enforceable management requirement for the Installation. This draft regional instruction is largely based on the original instruction prepared for NAS Oceana (NAS Oceana Instruction 4100.2). NR staff are involved in all military construction projects and promote practices that preserve the integrity of the urban forest as well as individual trees.

3.13 CULTURAL RESOURCES MANAGEMENT

Cultural resources, including archaeological sites, historic structures, buildings, landscapes, objects, and districts are nonrenewable resources that illustrate the historical development of the U.S. federal facilities. As stewards of cultural resources; this responsibility is recognized in the National Historic Preservation Act (NHPA) of 1966 as amended; EO 11593, *Protection and Enhancement of the Cultural Environment* and EO 13287, *Preserve America*; and in numerous other federal laws and regulations, and DoD and Navy policies. Under the NHPA each federal agency is tasked with the responsibility of establishing a preservation program to identify and evaluate cultural resources that may be eligible for listing on the National Register of Historic Places. Properties under a federal agency's jurisdiction that are listed or eligible for listing on the National Register of Historic Places shall be managed and maintained in a way that considers the preservation of their historic, archaeological, architectural, and cultural values. The cultural resources program at NASO DNA is the responsibility NAVFAC Mid-Atlantic (Code EV2) under the Regional Historic Preservation Officer..

Several cultural resources surveys were conducted at NASO DNA during the 1980s (Navy 1983a, 1983b, 1983c, 1987a, 1987b, and 1987c). These surveys were conducted in the southern portion of NASO DNA and did not include the northern portion of the Installation. In October 2008, the Navy performed an additional archaeological survey, prepared by the Southeastern Archaeological Research Inc. (*Archaeological Characterization Study of Fleet Training Center Dam Neck, Virginia Beach, Virginia*). The Virginia Department of Historic Resources, also known as the State Historic Preservation Office, concurred with the findings of the report in a letter dated 11 December 2007. Additionally in January 2010, the southern area of the Installation was surveyed and two archaeological sites were evaluated.

To date, 14 archaeological sites have been identified at NASO DNA (figure not included to protect integrity of archaeological sites per the Regional Historic Preservation Officer), and five sites have been determined to be potentially eligible (requiring Phase II testing) or eligible for listing on the National Register of Historic Places. Further archaeological investigations are required for the area formerly known as Camp Pendleton in the northern area of the Installation, areas within the boundaries of the identified eligible or potentially eligible archaeological sites.

An archaeological survey of the northern portion of NASO DNA (Navy 1987d) found no archaeological sites and recommended no further investigation. However, formal concurrence on this finding has not been obtained from the Virginia State Historic Preservation Officer (SHPO).

The most recent architectural survey, Phase I Architectural Survey of Potentially Significant Cold War Era Resources (1948–1962) at Navy Hampton Roads Bases, identified a potential historic district associated with the Surface Launched Guided Missile School. The potential historic district consists of three buildings: Buildings 586, 543 and 572. The findings of the Phase 1 Architectural Survey are currently under review by Virginia Department of Historic Resources (Sadler & Whitehead Architects, PLC 2012).

NASO DNA is not included in the 1999 Programmatic Agreement (PA) for Historic Buildings in Hampton Roads between the Navy, the Virginia SHPO, and the National ACHP as it had not been surveyed prior to execution of the Regional PA. Therefore, in accordance with Section 106 of the NHPA, every action that has the potential to affect resources (e.g., ground-disturbing activities, renovation of buildings, and demolition of buildings) must be coordinated with the Virginia SHPO and other consulting parties as appropriate, prior to implementation.

An Integrated Cultural Resources Management Plan (ICRMP) is required for all DoD facilities per federal and DoD regulations. An ICRMP is a five-year planning document which serves to manage and protect cultural resources under the control of a military installation so that such resources are properly considered and integrated into the facilities decision-making process. The purpose of an ICRMP is to integrate the entirety of the installations' cultural resources program with the ongoing military mission. As such, an ICRMP allows for identification of potential conflicts between the installation's mission and cultural resources, and identifies actions necessary to meet statutory and regulatory requirements. NASO DNA was included in the 2012 regional ICRMP prepared for Naval Installations in Hampton Roads (Sadler & Whitehead Architects, PLC 2012). This document provides additional information and guidance on cultural resources management. Figure 3-8 will be updated if this site is formally designated. The cultural resources information identified in Figure 3-8 is not reflective of all known cultural resources at

Figure 3-8. Cultural Resources Management of NASO DNA.

NASO DNA. To protect the integrity of archaeological sites in accordance with the guidance provided by the Regional Historic Preservation Officer some cultural resources information is not shown. Cemeteries are located at NASO DNA, and any proposed action located within or adjacent to the boundaries of a cemetery shall be coordinated with the Installation facilities management division and the NAVFAC Mid-Atlantic Regional Historic Preservation Officer.

This page intentionally left blank.

4.0 NASO DNA NATURAL RESOURCES MANAGEMENT UNITS

For the purposes of natural resources management on NASO DNA, the Installation has been divided into three management units. The management units are based on general land use types and address specific management issues associated with the primary land use. Included are the Urban Management Unit, the Natural Areas Management Unit, and the Beaches and Dunes Management Unit (Table 4-1 and Figure 4-1). Although the Beaches and Dunes Management Unit includes natural ecosystems, it has specific management needs that distinguish it from management of the Natural Areas Management Unit. The natural resources management units described in this INRMP differ from the zoning classifications delineated in the Regional Shore Infrastructure Plan (Navy 2002a), which are based on the services that an area provides rather than the ecological considerations and natural resources management requirements of an area. Management issues are identified for each land unit, and recommendations for addressing the issues are provided.

Table 4-1. Natural Resources Management Units of NASO DNA.

Natural Resources Management Unit	Acres
Natural Areas	1,115
Urban	444
Beaches and Dunes	271
Total	1,830

4.1 URBAN MANAGEMENT UNIT

The Urban Management Unit is located primarily between the Natural Areas and Beach and Dunes Management Units (Figure 4-1). It encompasses approximately 444 ac (180 ha) and includes the Installation’s central support area, training facilities, and housing and personnel support activities on the Installation. The landscape in this unit is largely developed, but contains mowed lawns and fields, landscaped trees and shrubs, and small patches of forests within the developed areas. Sadler Pond and the surrounding picnic area and recreational trail is the largest undeveloped tract in this unit. This area has more intensive grounds maintenance requirements than other portions of the Installation, as well as other natural resources issues generally associated with urban environments. The primary natural resources management issues are:

- Coastal Zone Protection,
- Wetlands and Water Quality Protection,
- Shade Tree and Urban Forest Management,
- Fish and Wildlife Management,
- Outdoor Recreation and Environmental Awareness, and
- IPM.

Figure 4-1. Natural Resources Management Units of NASO DNA.

4.1.1 Coastal Zone Protection

All development or other activities that are likely to impact land or water use or natural resources within Virginia's coastal management area (coastal zone) will be reviewed to determine if coastal consistency determination is required. Federal lands, the use of which is by law subject solely to the discretion of, or which is held in trust by the federal government, its officers or agents, are excluded from Virginia's coastal zone. However, activities on federal lands with any reasonably foreseeable effects to Virginia's coastal zone must be consistent to the maximum extent practicable with Virginia's Coastal Zone Management Program. NR staff must review plans and proposed actions at NASO DNA to ensure consistency with the Virginia Coastal Zone Management Program and help obtain a consistency determination when required.

4.1.2 Wetlands and Water Quality Protection

Wetlands and water quality protection are important issues in the Urban Management Unit because of the high concentration of roads, parking lots, and other impervious surfaces that contribute oil, petroleum, and other hazardous materials to stormwater runoff. Establishing or enhancing vegetated riparian buffers along all waterways, retaining vegetative cover in drainage ditches, and establishing vegetative buffers around as much impervious surface area as practicable would help to substantially reduce nonpoint source pollution runoff. Past efforts to reduce runoff include the establishment of a vegetative filter strip and planting trees around Sadler Pond. During the performance period of this INRMP, NR staff will continue to work with the FEAD and other appropriate Installation and NAVFAC departments to identify additional areas to enhance or establish riparian buffers. Specific actions will include establishing zones where mowing is reduced to once or twice per year, creating no mowing zones where practicable, and planting appropriate native trees and shrubs where practicable.

Other impacts to wetlands and water quality could result from new construction in this management unit. Wetland delineations were completed pursuant to methods outlines in the 1987 Corps of Engineers Wetland Delineation Manual (1987 Manual) and *The Regional Supplement to the Wetland Delineation Manual: Atlantic and Gulf Coastal Plan Region*. The delineations provide the locations of aquatic resources under the potential jurisdiction of the USACE. After field and desktop review of the jurisdictional determination request package, the USACE has issued a preliminary jurisdictional determination in regards to these delineations in a letter dated 30 January 2012. Under the preliminary jurisdictional terms all waters identified on Figure 2-3 are assumed jurisdictional and regulated by the CWA. Activities involving the discharge of dredged or fill material, including those associated with mechanized land clearing, into these areas would require an USACE permit, Virginia Water Protection Permit from the VDEQ, and/or a permit from the VMRC. A City of Virginia Beach local wetlands board permit also may be required for activities that have the potential to impact tidal wetlands. The preliminary jurisdictional determination may be used with USACE permit applications if impacts to these aquatic resources cannot be avoided. NR staff will assist project proponents of an action in obtaining required local, state, and federal wetlands protection permits. Natural resources and environmental compliance (water program media managers, etc.) staff also will review erosion and sediment control plans for construction projects and actions that are 10,000 ft² (929 m²) or greater in size, and/or review the project SWP3 that would be required for construction projects that disturb one or more ac (0.4 or more ha). Frequent site visits will be conducted during

construction of such projects to help ensure compliance with erosion and sediment control plans and that BMPs are being implemented. The protection of watersheds and wetlands through initiatives such as establishing or enhancing buffer zones and implementing mowing restrictions is discussed in Section 3.2.3. Efforts to protect wetlands and water quality through the establishment and maintenance of buffer zones will continue as practical without detriment to the military mission at NASO DNA. In particular, the NRM will continue to monitor and minimize development/impacts within a 50-ft (15-m) buffer of wetlands and other waterbodies to the maximum extent practicable. The management of buffers on these resources is a conservation management initiative of this INRMP. There is no other regulatory requirement to maintain this buffer. NASO DNA is a narrow installation and upland area suitable for military mission required construction is minimal and further restricted by designating 50-ft (15-m) buffer zones. Construction that is directly linked to military readiness activities may occur within the 50-ft (15-m) buffer zone; however, like with working in wetland areas the project must be designed to avoid and minimize impacts to the buffer zone. The NRM and other NR and EV staff will work with project planners, designers, engineers, etc. to ensure that buffer impacts are avoided and/or minimized to the greatest extent practical.

4.1.3 Shade Tree and Urban Forest Management

Currently, NASO DNA has a small population of shade and ornamental trees and would benefit from an increase in the number and variety of trees and shrubs planted around the Installation. Specific sites or the types of sites that will be targeted for additional plantings include the picnic area and ball fields at Sadler Pond, roadside plantings along Regulus Avenue, and perimeter plantings around several Installation parking lots (i.e., the lot on Regulus Avenue across from Building 127 and the Shifting Sands Club parking lot). Arbor Day and Earth Day will continue to be observed by planting new trees at these and other appropriate sites identified by the NR personnel. Considerations such as species mature size, longevity, tolerance to soil compaction and pollution, and susceptibility to disease and insect pests will be taken into account when selecting appropriate native species for planting. NR personnel will coordinate with the FEAD on any contract that includes tree planting to ensure the contracts include watering of planted areas for one to two years after plantings to ensure survival.

NR personnel also will participate in the National Arbor Day Foundation's Tree City USA program. A recertification application, forest work plan, and proclamation in support of Arbor Day will be submitted to VDOF by 31 December each year, and annual Arbor Day celebrations will be held at NASO DNA. An example of this application packaged is included in Appendix D.

NR staff will review all plans where tree removal is proposed to ensure compliance with this INRMP and associated instructions (Appendix D). NR personnel will recommend tree protection measures, mitigation for lost trees, or selection of alternate sites. Proponents of projects or activities that may affect existing trees must consult with NR personnel to identify all trees in the affected area and to develop a site-specific tree preservation plan for the project in accordance with the this INRMP and associated instructions (Appendix D). All trees designated in the plan to be preserved will be identified on applicable project drawings and marked in the field. Additionally, NR will continue to promote the use of beneficial landscaping practices and the importance of using native species.

In an effort to improve urban tree health at NASO DNA, NR personnel will continue to coordinate with VDOF to provide pruning and tree care instruction for the FEAD, the Disaster Preparation Team, and others concerned with tree care and hazardous tree removal. Training sessions will be offered on an as needed-basis.

In order for future tree plantings to be most effective, an inventory of existing trees should be completed, and an urban forest management plan developed. The urban forest plan should assess tree health, including disease and pest problems and mower damage, and utility/tree conflicts. An urban forest management plan that assesses tree condition and provides guidance for care and maintenance would assist land managers in prioritizing and budgeting tree care work efforts required now and in the future.

4.1.4 Fish and Wildlife Management

Improving fisheries management at Sadler Pond and continuing to provide supplemental nesting habitat by maintaining nesting structures for birds and bats are the primary objectives of fish and wildlife management in the Urban Management Unit.

Ongoing efforts to improve water quality at Sadler Pond will continue. Specific management actions include continuing to maintain a no mowing zone around the pond's perimeter, and planting additional trees and shrubs around the pond. Evergreen species including loblolly pine and eastern red cedar will be planted on the northeast and southwest faces of the pond to form windbreaks to reduce bank erosion. In addition, the drainage ditches that drain into Sadler Pond from the ball fields and other portions of the developed area will be inspected to ensure ditches are well vegetated to help slow runoff and filter stormwater before entering the pond. NR personnel will coordinate with Installation and NAVFAC departments to establish improved vegetative or structural BMPs where required. Periodic water quality surveys will be conducted to assess the success of these management efforts.

There are at least two wooden structures and two concrete columns located within the Urban Management Unit that are designated nesting platforms, and which are used by osprey and other bird species. The wooden platforms were created to keep birds from nesting directly on utility transformers. The concrete columns installed as part of a former aboveground steam line that has since been demolished. NR staff maintain the stand-alone wooden nesting structures. The utilities department and other tenants that construct nesting platforms over utility lines or equipment maintain the concrete column platforms. NR personnel conduct annual inspections of these structures during the fall, and monitor nesting activity throughout the nesting season. Figure 3-5 depicts the most recent data for active nests. Not all nesting locations shown on Figure 3-5 are associated with man-made nesting platforms/structures. Any additional platforms that are installed will be GPS-located, entered into the Installation GIS database, and the data sheet will be revised to include the new platforms. The Navy tracks and monitors all nest locations. Man-made osprey specific nesting platforms are maintained; however, not all of these platforms are maintained by NR staff.

Nuisance and invasive wildlife can interfere with the military mission or well-being of domestic animals, other wildlife, or humans because of their feeding or nesting habits. An example of nuisance wildlife activity that may occur in the Urban Management Unit is osprey nesting on

communication towers and electrical transformers, which can potentially cause damage to these structures and harm the nesting osprey. Other potential nuisance wildlife problems at NASO DNA are associated with various species of native and non-native plants and animals as described in Section 3.12. Control of non-traditional nuisance/invasive species, or of species not listed under state regulation as a nuisance/invasive species may be conducted by NR staff once appropriate permits have been obtained from VDGIF and/or USFWS. Management of pets, especially those that have been abandoned or left behind by owners, is a key component of fish and wildlife management in the Urban Management Unit.

4.1.5 Outdoor Recreation and Environmental Awareness

Most outdoor recreation facilities (ball fields, picnic area, tennis courts, basketball courts, and recreational trail) in the Urban Management Unit support concentrated forms of recreation and are maintained by MWR. NR staff will continue to coordinate with MWR personnel on natural resources issues such as tree care and reducing nonpoint pollution at these recreational facilities on an as needed-basis.

Freshwater fishing is the primary form of outdoor recreation that occurs in the unit. Fishing conditions at designated fishing locations at the Installation are not optimal because of poor water quality. Efforts to improve water quality and recreational fishing at Sadler Pond and ditches will be conducted as described in Section 4.1.4 and Section 4.1.5 of this INRMP. Additional improvements to water quality will be implemented as erosion and sediment repairs are made as recommended in erosion control plan that is currently being prepared. A copy of this document will be included in Appendix H once available.

Most Earth Day and Arbor Day celebrations take place in the picnic areas in this natural resources management unit, which offers significant opportunities for increasing environmental awareness among Installation personnel and their dependents. NR staff will continue to conduct annual Arbor Day and Earth Day celebrations. Tree planting in the picnic area, around the ball fields, and around the perimeter of Sadler Pond will continue to be the focus of these celebrations. NR staff will suggest appropriate species for planting and assist with the planting. Post-planting care must be coordinated with the FEAD for two years to ensure survival.

4.1.6 Integrated Pest Management

Mosquitoes and other insect pests, rodents, and feral cats are the primary pest problems in this management unit, whereas landscape weeds are a minor issue. The NAVFAC Mid-Atlantic Environmental Services staff is responsible for pest management at NASO DNA and, along with independent contractors, performs most pest control activities on the Installation. Qualified NR staff are responsible for controlling nuisance wildlife situations that may involve game animals, migratory birds, or other protected wildlife species.

Control of feral animals is largely an issue of educating NASO DNA personnel and residents on the importance of neutering, keeping pets indoors, and not feeding feral animals. The Installation website and newspaper are venues that will be used for informing Installation personnel and residents about pet and wildlife issues.

4.1.7 Summary of the Urban Management Unit Actions

- Review plans and proposed actions to ensure consistency with the Virginia Coastal Zone Management Program and help obtain a federal coastal consistency determination as required by the CZMA.
- Coordinate with appropriate Installation and NAVFAC departments to identify additional areas to enhance or establish riparian buffers. Establish reduced mowing and no mowing zones along selected ditches and wetlands, and plant appropriate native trees and shrubs where practicable.
- Review plans for projects that have the potential to impact wetlands against NASO DNA wetland delineation maps, and assist the proponent of an action in applying for, reviewing, and obtaining all required state and federal wetlands protection permits.
- Review sediment control plans and SWP3 for construction projects and actions that disturb 10,000 ft² (929 m²) or one or more ac (0.4 or more ha), respectively.
- Update the NASO DNA wetland delineations every five years.
- Promote the use of beneficial landscaping practices and the importance of using native species.
- Focus new urban tree planting efforts in the picnic area and ball fields at Sadler Pond, the roadside along Regulus Avenue, and the perimeter of parking lots such as those on Regulus Avenue across from Building 127 and the Shifting Sands Club.
- Assist with hazardous tree recognition and removal.
- Participate in National Arbor Day Foundation's Tree City USA program. Submit a recertification application, forest work plan, and proclamation in support of Arbor Day to the VDOF by 31 December each year.
- Coordinate an annual, joint Arbor Day–Earth Day celebration event.
- Review all development plans and actions where tree removal and pruning is proposed and provide recommendations for tree protection, mitigation for lost trees, or selection of alternate sites.
- Continue to coordinate with VDOF to provide pruning and tree care instruction for the FEAD, Disaster Preparation Team, and others concerned with tree care. Offer training sessions on an as-needed basis.
- Continue to maintain a no mowing zone around the perimeter of Sadler Pond to reduce bank erosion and improve fish habitat.
- Utilize opportunities such as Earth Day and Arbor Day to plant evergreen species including loblolly pine and eastern red cedar on the northeast and southwest faces of Sadler Pond to form windbreaks to reduce bank erosion.
- Coordinate with appropriate Installation and NAVFAC departments to establish improved vegetative and structural BMPs in and around the drainage ditches that

drain into Sadler Pond from the ball fields and other portions of the developed area.

- Conduct water quality surveys to assess the effectiveness of management activities at Sadler Pond.
- Conduct annual inspections and maintenance of osprey nesting platforms, bat boxes, and bluebird nest boxes during the fall.
- Monitor nesting activity at osprey nesting platforms, and bat and bluebird nest boxes throughout the nesting season.
- Continue to coordinate with MWR personnel on natural resources issues such as tree care and reducing nonpoint pollution at recreational facilities on an as needed-basis.
- Assist with the removal of miscellaneous nuisance and invasive wildlife, and invasive plants and/or noxious weeds in the administrative and housing areas.
- Have appropriate NR staff attend annual CLE refresher courses.
- Complete the Environmental Checklist (see Appendix A), as needed, for those natural resources management actions that may affect a regulated resource, or other Navy managed environmental resource. Conduct associated consultations and required mitigations, and acquire associated permits in coordination with the appropriate Navy environmental media manager.

4.2 NATURAL AREAS MANAGEMENT UNIT

The Natural Areas Management Unit includes areas throughout the Installation that are relatively undeveloped, including forested areas, and the Navy-owned portion of Redwing Lake. The 13-ac (5.3-ha) mitigation wetland site for military construction and the 9-ac (3.6 ha) closed landfill on Regulus Avenue (ERP Site 1) also are included in this unit. This management unit encompasses approximately 1,115 ac (451 ha). The extensive area of undeveloped land in this unit primarily serves as a noise and safety buffer for military training activities at NASO DNA, but also supports a diversity of wildlife species, and offers opportunities for outdoor recreation. As the NASO DNA mission expands, expansion of development into currently undeveloped lands of the Installation also may be needed to accommodate future growth. Important natural resources management issues include:

- Coastal Zone Protection;
- Wetlands and Water Quality Protection;
- Habitat Conservation and Restoration;
- Forest Management;
- Fish and Wildlife Management;
- Outdoor Recreation and Environmental Awareness;
- IPM; and

- Cultural Resources Management.

4.2.1 Coastal Zone Protection

As with the Urban Management Unit, any proposed project that is likely to impact land or water use or natural resources may require a coastal consistency determination. In accordance with the CZMA, NR staff will review plans and proposed actions in this unit to ensure consistency with the Virginia Coastal Zone Management Program and help to obtain a consistency determination when required.

4.2.2 Wetlands and Water Quality Protection

The largest percent of the Installation's wetlands occurs in the Natural Areas Management Unit. Preventing the loss and degradation of wetlands from development is the primary focus of wetlands protection in this area. Wetland delineation field studies have been performed at NASO DNA. Wetland delineations were completed pursuant to methods outlines in the 1987 Corps of Engineers Wetland Delineation Manual (1987 Manual) and *The Regional Supplement to the Wetland Delineation Manual: Atlantic and Gulf Coastal Plan Region*. The delineations provide the locations of aquatic resources under the potential jurisdiction of the USACE. After field and desktop review of the jurisdictional determination request package, the USACE has issued a preliminary jurisdictional determination in regards to these delineations in a letter dated 30 January 2012. Under the preliminary jurisdictional terms all waters identified on Figure 2-3 are assumed jurisdictional and regulated by the CWA. Activities involving the discharge of dredged or fill material, including those associated with mechanized land clearing, into these areas would require an USACE permit, Virginia Water Protection Permit from the VDEQ, and/or a permit from the VMRC. A City of Virginia Beach local wetlands board permit also may be required for tidal wetlands. The preliminary jurisdictional determination may be used with USACE permit applications if impacts to these aquatic resources cannot be avoided. NR staff will review plans for projects that have the potential to impact wetlands, and assist the action proponent in applying for and obtaining required state and federal wetlands protection permits.

Most of the Natural Areas Management Unit located in the northern end of NASO DNA is comprised of forested or emergent wetlands. As surrounding landscapes become more densely developed, the importance of these wetlands for protection of regional water quality and flood protection increases.

A portion of the southern out-parcel area of the Installation located in this management unit has the potential to serve as a wetland mitigation site to compensate for the loss of wetlands elsewhere on the Installation, if needed. Wetland restoration or creation could be accomplished either by plugging several of the main ditches that were formerly used to drain agricultural fields, or by excavating upland areas to create additional wetlands. NR staff will conduct further analysis and produce site-specific plans on an as-needed basis. Other wetland areas that were previously used for agricultural production are no longer mowed, and are being allowed to revert back to natural wetland habitat.

As discussed in 4.1.2, efforts to protect wetlands and water quality through the establishment and maintenance of buffer zones will continue.

4.2.3 Habitat Conservation and Restoration

The Lovett's Marsh SIA, a portion of Dune and Swales SIA, Southeast Redwing Lake Wetlands SIA, Helicopter Pad Wetlands SIA, and a portion of Interdunal Swale, Dune, and Freshwater Marsh SIA are areas with high conservation priority in this management unit. These areas provide habitat for rare species (the state rare early white-top fleabane and fasciculate beaksedge) and a significant interdunal swale community.

Water quality in the Southeast Redwing Lake Wetlands SIA is thought to be impacted by sewage and runoff from the adjacent housing area. The current conditions on this site will be reassessed to determine if corrective action is warranted.

Loblolly pines planted during the 1970s in a portion of the Interdunal Swale, Dune, and Freshwater Marsh SIA are considered a threat to this significant natural area. Storm damage from Hurricane Isabel however, caused significant damage to the trees, which will be assessed and tree removal planned accordingly. Removal of planted pines from the swale wetlands would be consistent with the Navy's policy on ecosystem management and the SAIA, and might qualify for wetland restoration credit.

Four wetland mitigation sites involving restoration of existing wetlands are in this management unit: Redwing Lake, Lovetts Marsh, MACS 24, and southern out-parcel mitigation sites. The Redwing Lake mitigation wetland represents past restoration efforts undertaken in this management unit. The site has a well-developed emergent and open water marsh system and the forested wetland portion is developing. The bald cypress planted on the site is well established and has grown. NR staff will continue to monitor the site for potential problems such as common reed.

At Lovetts Marsh efforts are ongoing to reduce the maple canopy that dominates an area that was historically thought to be an extensive emergent marsh that was part of the Back Bay watershed. A weir, initially installed in 1996, was modified in 2001 to increase the water level to about 3.5 ft (1.1 m) to kill the existing hardwoods. The increased water level is proving successful and additional hardwood treatment such as girdling or herbicide injection will not likely be necessary to reduce the established trees. NR staff will continue to monitor the site to determine when hardwood control is achieved and how to manipulate future water levels. As discussed in Section 3.7.2, USFWS installed a weir on the south end of Lake Tecumseh, and the resulting habitat modification are assisting the Navy in meeting their management goals associated with the Lovetts Marsh mitigation site.

The MACS 24 mitigation site was monitored for three years to comply with permit requirements and to ensure that mitigation goals were achieved. Future monitoring would only be required to document the continued success of the site and identify invasions of common reed. Monitoring currently consists of periodic visual inspections of site conditions.

The southern out-parcel mitigation site was established as part of the mitigation requirements associated with the NAS Oceana Aeropines Golf Course Notice of Violation mitigation requirements.

4.2.4 Forest Management

There is no active management program for timber harvesting at NASO DNA. The forest management strategy is therefore primarily custodial to ensure maintenance of biodiversity and to provide a noise and safety buffer for the Installation's military training activities. Specific management requirements in the planted pine stands include enhancing wildlife habitat, reducing the risk of catastrophic fire, and controlling insect and disease outbreaks. Timber removal is warranted only to prevent the decline of a healthy forest ecosystem from insects and disease, hurricanes, and other such potentially catastrophic events. If timber harvesting or salvage operations are required, NR personnel will coordinate with the NAVFAC Regional Forester. In addition, in instances where proposed MILCON projects would affect forest resources at NASO DNA, NR staff will coordinate with the NACFAC Regional Forester to assess impacts and, where practicable, arrange timber sales.

NAS Oceana Instruction 5090.2E, *Procedures for Cutting Firewood and Use of Tree Products* (Appendix D) provides governing the cutting of trees for firewood and obtaining other forest products at NASO DNA.

NR staff also will continue implementing controlled burning to reduce fuel loads and enhance wildlife habitat. Burning will be conducted on a three- to five-year rotation as weather conditions permit, and as funding is available. NR staff will follow guidelines presented in the NAS Oceana, NALF Fentress, and NASO DNA Prescribed Burn and Smoke Management Plan (2010), and will update the plan annually to reflect accomplishments and to set new goals. Adequate firebreaks around each burn unit and internal fire lines also will be maintained as needed.

Additionally, NR staff will monitor forest stands to control insect and disease outbreaks. Southern pine beetle is the major forest pest in the area and is most likely to be a problem in stressed, overstocked pine stands. If a beetle infestation is detected, NR staff will coordinate with the NAVFAC Regional Forester to implement salvage or control operations.

A Forest Inventory project was awarded in FY13 that will establish forest management stands, provide associated metrics (e.g., moisture, fuel loads), and determine the need, safety, and methodology requirements associated with conducting prescribed burning activities. This inventory is schedule to be completed in 2015. The results of this inventory will be included in future INRMP updates and provided in Appendix H once available.

4.2.5 Fish and Wildlife Management

The combination of forests, wetlands, abandoned agricultural fields, and hedgerows in this management unit creates a mosaic of habitats suitable for a variety of the region's native wildlife. Reductions in agricultural land in the Virginia Beach area have resulted in the loss of early successional habitat, which has become increasingly rare. This habitat type is important for a number of grassland birds and other wildlife species that depend on open fields for foraging or hunting. Early successional habitat is maintained through a combination of treatments. Areas within the fallowed agricultural fields are managed as wildlife food and cover plots and will continue to be disked or bush-hogged periodically to prevent the invasion of woody species.

Treatments throughout the Installation will be limited to one-half to two-thirds of the total area annually so that escape cover is always available. Treatments will not be conducted during the breeding season to avoid disturbing ground nesting species. Prescribed burning will continue to be conducted on three- to five-year intervals to control woody species and promote the establishment of native warm season grasses.

If the canebrake rattlesnake is observed at the Installation, implementation of mowing restrictions along forest edge habitat for this species is recommended by VDGIF, as described in Section 3.10.2. If a canebrake rattlesnake is observed, it should be reported to the NRM and individuals should avoid harming the animal which may strike if provoked.

The forested areas in the northern portion of this management unit provide important habitat for resident and neotropical migrant songbirds and other wildlife species that occur at NASO DNA. Maintaining a variety of habitat types including large contiguous areas of forest and emergent and scrub-shrub wetlands will provide for most of the resident wildlife. Implementation of the Installation's Nest Box Program is another wildlife management priority in this management unit. All of the Installation's bat, bluebird, and wood duck boxes are located in this unit. Annual monitoring and maintenance will continue to be conducted by NR staff prior to 01 February each year. Wood shavings or other suitable nesting material will be replaced in wood duck boxes and repairs made as needed. Additional habitat will be provided by the installation of wood duck boxes in appropriate locations in this unit. Lovetts Marsh and the MACS 24 wetlands mitigation site offer ideal habitat and could support approximately 8–10 wood duck boxes. In addition, a portion of the existing boxes will be removed from their present locations and redistributed to other sites with suitable wood duck habitat. The new sites will be GPS-located, entered into the Installation GIS database, and nest box log sheet revised to document new locations (see Appendix H). The nest box location map (Figure 3-5) also will be updated to reflect the changes.

The Natural Areas Management Unit provides the greatest opportunity for deer population management at NASO DNA. NR staff will continue to administer the NASO DNA hunting program in cooperation with the VDGIF DMAP regulations for QDM. NR staff will continue to cooperate with VDGIF to set annual hunting seasons and bag limits at the Installation. Annual harvest data will continue to be collected, summarized, and reported to VDGIF to help assess deer population levels and herd condition.

4.2.6 Outdoor Recreation and Environmental Awareness

Hunting is a popular form of outdoor recreation in this management unit. Deer hunting is at a maximum level that can be supported given the Installation mission and available area. NR personnel will continue to administer the NASO DNA hunting program with the support of the Sportsman's Quality Management Board.

The presence of trained game wardens is an important component of the hunting and fishing programs as it greatly reduces the potential for fish and game violations on the Installation. NR staff are required to participate in DoD Fish and Wildlife Law Enforcement training and Federal Phase I Law Enforcement training, and should attend annual CLE refresher courses.

A small nature trail/floating boardwalk and wildlife viewing platform located on the west side of the Southeast Redwing Lake Wetlands SIA (Figure 3-3) is maintained by the NRP. This trail is located directly off of a main road on the Installation and there is no parking or defined walkways leading up to this floating boardwalk. Additional maintenance, promotion of, and the establishment of safe access to the site should be conducted for this nature and wildlife viewing area.

4.2.7 Integrated Pest Management

Common reed and alligator weed are the primary invasive plant species that affects this management unit (see Section 3.12.1). Infestations of common reed along the northern and eastern shoreline of Lake Tecumseh were treated under a region-wide eradication program. An estimated 8 ac (3 ha) were aerially sprayed from 13–24 October 2011 around the southeastern edge of NASO DNA, adjacent to Lake Tecumseh, as well as in several locations in the southern portion of the Installation (Figure 3-7). Smaller infestations that need treatment and inaccessible areas that will not be able to be treated under the regional aerial spraying program have been and will be considered for hand-spraying by NR personnel.

Treatment of alligator weed populations is being conducted in the northern section of the Installation by the Virginia Air National Guard–Camp Pendleton NRP.

4.2.8 Summary of the Natural Areas Management Unit Actions

- Review Installation plans and proposed actions in the Natural Areas Management Unit to ensure consistency with the Virginia Coastal Zone Management Program and help to obtain a consistency determination when required.
- Review plans for projects that have the potential to impact wetlands against NASO DNA wetland delineation maps, and assist the proponent of an action in applying for and obtaining all required state and federal wetlands permits.
- Develop site-specific plans on an as-needed basis for wetland mitigation sites within fallow agricultural fields located in the southern portion of the Installation.
- Continue to monitor all mitigation sites for potential problems and infestations of common reed.
- Coordinate common reed control treatments and monitor in identified infestation areas.
- Reassess conditions in the Southeast Redwing Lake Wetlands SIA to determine if sewage and runoff are impacting wetlands. Work with NAVFAC Mid-Atlantic personnel to correct the issue, if necessary.
- Continue to monitor the Lovetts Marsh wetland mitigation site, and implement additional hardwood control and water level manipulations as required to achieve goals.
- Contact the USACE Norfolk District Office, to pursue obtaining mitigation credit for removal of pine in the Interdunal Swale, Dune, and Freshwater Marsh SIA.

- Coordinate timber harvesting or salvage operations with the NAVFAC Regional Forester as required.
- Coordinate with the NAVFAC Regional Forester to assess impacts of any proposed MILCON projects on forest and, where practicable, arrange timber sales.
- Continue implementing controlled burning to reduce fuel loads and enhance wildlife habitat in accordance with the Installation's most current Prescribed Burn and Smoke Management Plan.
- Update the ~~NALF Fentress, and~~ NASO DNA Prescribed Burn and Smoke Management Plan (2010) annually to reflect accomplishments and set new goals.
- Maintain firebreaks and fire lines for each burn unit as needed.
- Monitor forest stands to control southern pine beetle and other insect and disease outbreaks.
- Continue to maintain vegetation within portions of the northern and southern areas of the Installation through a combination of mowing and controlled burning to provide a variety of grassland and scrub-shrub habitats.
- Implement mowing restrictions as recommended by VDGIF if a canebrake rattlesnake is observed on the Installation.
- Continue to use prescribed fire to manage portions of the fallow agricultural fields in the southern portion of the Installation to control woody vegetation and promote a mix of native warm season grasses and forbs.
- Continue to cooperate with VDGIF to set annual hunting seasons and bag limits at the Installation, and continue to collect, summarize, and report deer harvest data annually to VDGIF to help assess deer population levels and herd condition.
- Conduct annual inspections and maintenance of bat, bluebird, and wood duck boxes prior to 01 February each year, and monitor nesting activity throughout the nesting season.
- Develop a plan to install up to 10 wood duck boxes at Lovetts Marsh and the MACS 24 wetland mitigation site. GPS locate the new nest boxes, and update the nest box location on Figure 3-5 and on the monitoring sheet in Appendix H.
- Develop and implement a redistribution plan for wood duck boxes. GPS new locations, correct the GIS data layer for nest box locations, and update the nest box data log (Figure 3-5 and Appendix H).
- Conduct periodic inspections of the nature trail/floating boardwalk and wildlife viewing platforms to ensure appropriate utilization.
- Continue to monitor and treat common reed, alligator weed, and other invasive plants as needed.
- Have appropriate NR staff attend annual CLE refresher courses.

- Complete the Environmental Checklist (see Appendix A), as needed, for those natural resources management actions that may affect a regulated or other Navy managed environmental resource. Conduct associated consultations and required mitigations, and acquire associated permits in coordination with the appropriate Navy environmental media manager.

4.3 BEACHES AND DUNES MANAGEMENT UNIT

The Beaches and Dunes Management Unit encompasses approximately 271 ac (110 ha) along the NASO DNA shoreline. Small arms firing range fans, recreational beaches, and training areas are located in this management unit. The training areas in this unit provide critical areas for amphibious and land-based military exercises. The coastal setting, general topography, and vegetative cover are important components of the training environment. The physical and biological character of the beaches and dunes also is an important component of regional biodiversity. Several uncommon to rare natural communities are represented, and several state rare species are present in the area. A vegetated, intact dune system also is important for protection of facilities located inland from the shore from storm surges and hurricanes. The Regional Shore Infrastructure Plan (Navy 2002a) classifies most of this unit as mission support; however, environmental consideration must be made when planning training activities in the Beaches and Dunes Management Unit. Soil disturbances and root damage to vegetation pose serious threats to this sensitive environment. This management unit includes the Middle Beach Dunes SIA, a portion of the Interdunal Swale, Dune, and Freshwater Marsh SIA, and a majority of the Dune and Swale SIA (see Section 3.7.1 and Figure 3-3). Important natural resources management issues include:

- Coastal Zone Protection,
- Wetlands and Water Quality Protection,
- Fish and Wildlife Management,
- Threatened and Endangered Species Protection,
- Marine Resources Protection,
- Habitat Conservation and Restoration,
- Forest Management,
- Outdoor Recreation and Environmental Awareness, and
- Integrated Pest Management.

A primary and secondary dune delineation was completed at NASO DNA in 2013, and will be used to further refine management of resources within this management unit after the survey report is finalized. The final report and maps will be included in Appendix H when available.

4.3.1 Coastal Zone Protection

The primary dunes located in the Beaches and Dunes Management Unit are an important protected natural resource. Dune utilization activities within this unit should be consistent with

the state's Coastal Zone Management Program. NR staff will review proposed projects for coastal consistency.

4.3.2 Wetlands and Water Quality Protection

Wetland communities in this management unit include the shoreline and a number of small interdunal wetlands, several large interdunal swale wetlands, and extensive palustrine forested wetlands located in the northern portion of NASO DNA. Protection of this habitat type is important to the area's biodiversity, several state-rare plant and animal species, and other local fauna. The wetlands serve as the only freshwater sources in the area and are particularly important for amphibians. Protection from the major threats to these wetlands, including encroachment and vehicular traffic, will be provided through continued enforcement of state and federal wetlands protection laws. Vehicle exclusion fencing and signage also may be used in select areas to prevent trespassing.

Mapping of wetlands in this unit and associated management of these areas are consistent with methodologies and requirements identified in Section 4.1.2 and Section 4.2.2.

4.3.3 Fish and Wildlife Management

Fish and wildlife in the Beaches and Dunes Management Unit are managed similarly to how the resources are managed in the Natural Areas Management Unit (Section 4.2.5).

4.3.4 Threatened and Endangered Species Protection

Rare, threatened, and endangered species surveys conducted at NASO DNA in 1992 (Buhlmann et al. 1992) identified several state rare species and habitats within the Beaches and Dunes Management Unit. Additional rare, threatened, and endangered species inventories also have been conducted on the formerly named Camp Pendleton portion of the Installation, the last of which completed in 2010 (Evans and Belden 2010). Since these past surveys did not cover all Installation areas and did not sufficiently cover all potential species of concern, it is recommended that a comprehensive rare, threatened, and endangered species survey data be completed for NASO DNA in coordination with VDCR-DNH biologists to assess current conditions and occurrence of protected species and significant ecological communities of interest. An update to the rare, threatened, and endangered species inventory of NASO DNA is scheduled for 2014. Section 2.6.2 provides additional information for the federally listed wildlife species, as well as wildlife species proposed for federal listing known to occur at NASO DNA.

The federally endangered Kemp's ridley sea turtle and the federally threatened loggerhead sea turtle have been documented successfully nesting on the beaches of NASO DNA. Beach monitoring will continue to be conducted daily from 15 May through 31 August following the turtle monitoring protocol included in the 13 July 2011 BO issued to BBNWR, and updated to include NASO DNA in 2012 (Appendix F). NR staff also will conduct or coordinate annual sea turtle track and nest identification training for beach patrol personnel. If a loggerhead or other sea turtle nest is observed at the Installation, it will be left in situ, except in the case where operational uses of the beach would result in the take of a nest. In these cases, the Navy will coordinate with the USFWS BBNWR in accordance with the 13 July 2011 BO and 2012 update.

NR staff will coordinate and consult with relevant state and federal regulatory agencies to obtain permits and mitigation requirements for all Installation actions that may impact rare, threatened, and endangered species.

4.3.5 Marine Resources Protection

It is not uncommon to observe marine mammals, reptiles, fishes, and birds along NASO DNA beaches and within the Navy's defined nearshore environment. A habitat assessment and species inventory of the nearshore environment has been identified as a requirement for this INRMP that will be used to guide management practices related to marine resources at the Installation. Any marine animal (e.g., mammal, bird, fish, herpetofauna) sighted on NASO DNA beaches will be reported to NR staff, who will respond, as appropriate, to the site and report the sighting to the Virginia Aquarium and Marine Science Center and additional points of contact consistent with the protocols referenced in Appendix F.

As discussed in Section 2.5.4, several fish species with designated EFH in the nearshore waters adjacent to NASO DNA have the potential to occur in the vicinity of the NASO DNA nearshore/offshore environment. The Navy manages and protects species with designated EFH and other fish species of concern managed under NOAA NMFS.

NR staff will coordinate with and obtain required permits from the appropriate state and federal agencies for any Installation activities that have the potential to impact marine resources. NR personnel also will continue to maintain a database of all sightings and strandings that occur on NASO DNA.

4.3.6 Habitat Conservation and Restoration

4.3.6.1 Beaches and Dunes Protection

This unit includes the Middle Beach Dunes SIA, the majority of the Dune and Swale SIA, and a portion of the Interdunal Swale, Dune, and Freshwater Marsh SIA (see Section 3.7, Figure 3-3, and Figure 4-1). These areas are priority locations for conducting habitat conservation and restoration within this management unit.

A site specific example of restoration within this unit includes the dunes in the northern portion of the Dune and Swale SIA. A restoration project was undertaken in the mid-1990s to repair a section of the dunes. Military training activities caused a blow-out of the dune and resulted in a saltwater intrusion situation. The site has improved; however, recent storm damage and unauthorized dune access issues continue to negatively impact this site. To prevent saltwater intrusion and a full blow-out of the dune, the NRP continues to enter into Cooperative Ecosystems Studies Unit partnerships, to recycle Christmas trees, and enlist the support of Installation and local community supporters to conduct restoration activities (dune grass plantings, sand fencing installation, etc.) to repair this section of dune. In addition, access to the dunes continues to be restricted to minimize dune degradation. Education and outreach regarding the importance of dunes and what is or is not authorized in dune areas, coupled with increased security and CLE patrols of this area are needed to stop/minimize the unauthorized dune access contributing to the degradation and destabilization of the dunes.

The efforts discussed in the above example to continue dune restoration are conducted across the entire Beaches and Dunes Management Unit. These efforts are conducted specifically to reduce erosion, stabilize the dunes, and to increase suitable habitat for native species. Restricting vehicular access to protected areas, the planning of native dune vegetation, and the placement of sand fencing and recycled Christmas trees around the bases of eroding primary dunes helps prevent further soil loss and helps the process of accretion. Clean Christmas trees (no tinsel or ornaments) are obtained from local citizen drop-offs, local vendor drop-offs, and pickup and transfer from the City landfill. NR staff will coordinate with the Disaster Preparation Team and Cooperative Ecosystems Studies Unit partners to install sand fencing and Christmas trees. Additional fencing and signs also will be posted in select areas to block unauthorized vehicle access roads that dissect the dune system and cause additional degradation. NR staff will continue to support a volunteer-based dune vegetation planting program. Annual maintenance and monitoring of these efforts are important to the success of establishing vegetation, stabilizing the dunes, and reducing sand migration in the dunes. Amphibious training and other vehicular access is and should be limited to designated training areas and authorized access roads for which appropriate NEPA analysis has been conducted. If changes in land use or management practices for these sites are contemplated, NR personnel will consult with VDCR-DNH to obtain recommendations for minimizing impacts to these resources.

Mapping changes in dune vegetation over time using a combination of field verification and aerial imagery would help with monitoring and assessing the success of restoration and dune stabilization activities and projects. Assessment of the effectiveness of the dune protection program can be accomplished partly through photo-interpretation. Historic, current, and future imagery can be used to map and assess changes in vegetative cover and other natural features that correlate to dune stabilization efforts. NR staff can update dune protection plans by reviewing maps and documenting any ongoing and future stabilization activities. This monitoring will help with plan development for designated fence and/or vegetation placement locations, and promote restoration of the dunes in this management unit.

4.3.6.2 *Shoreline Erosion Control*

In order to ensure shoreline stability, maintenance and monitoring of the restored shoreline near the BOQ and Shifting Sands Club area and the amphibious training maneuver area (LCAC training beach) should be completed as a facility infrastructure needs requirement. Future beach nourishment should be implemented contingent on the results of beach monitoring, and should only proceed after appropriate state and federal permits are obtained. NR staff will assist in obtaining permits, mitigation requirements, and conducting consultations with all appropriate NRP affiliated regulatory agencies. NR staff will review and provide feedback, and technical advice on all supporting NEPA, Permit Applications, CZMA coastal consistency determinations (CCDs), project design, contract, etc. documentation.

4.3.7 Forest Management

Forest resources located in the Beaches and Dunes Management Unit are managed similarly to forest management described for the Natural Areas Management Unit (Section 4.2.4).

4.3.8 Outdoor Recreation and Environmental Awareness

The beaches and dunes offer recreational opportunities, including sunbathing, fishing, volleyball, picnicking, camping, swimming, surfing, hunting and wildlife viewing. The fishing beach and campgrounds are located at the south end of the Installation. The MWR oversees and administers the sunbathing, volleyball, picnicking, camping, swimming, and surfing activities; however, NR personnel are consulted on issues pertaining to natural resources management and environmental regulation. MWR provides instructions and maps for users of recreational facilities of the Installation that describe accepted and prohibited uses, and identifies approved recreational areas.

Recreational beach users are limited to use of pedestrian walkways, which were constructed to minimize unauthorized access and erosion of the dunes. NR staff will periodically inspect the walkways to ensure safety and appropriate utilization.

Installation residents and volunteers also are encouraged to participate in habitat conservation efforts in the beaches and dunes area. Such activities are generally enjoyed by participants as well as help to increase environmental awareness and understanding. Dune stabilization efforts including collecting recycled Christmas trees and planting beach grasses on sections of the training beaches for dune stabilization will continue to be organized by NR staff.

The NRP manages the hunting and fishing programs as described in Section 4.1.5, Section 4.2.6, and Appendix J. Routinely the CELO patrols the beaches to ensure people recreating are complying with natural resources regulations and policies.

4.3.9 Integrated Pest Management

Integrated pest management in the Beaches and Dunes Management Unit is conducted similarly as in the Natural Areas Management Unit (Section 4.2.7).

4.3.10 Summary of the Beaches and Dunes Management Unit Actions

- Review proposed projects that affect natural resources in the Beaches and Dunes Management Unit for consistency with the Virginia Coastal Zone Management Program, and help to obtain a federal coastal consistency determination when required.
- Review plans for projects that have the potential to impact wetlands against NASO DNA wetland delineation maps, and assist the proponent of an action in applying for and obtaining all required state and federal wetlands protection permits.
- Coordinate with and obtain the required permits from the appropriate state and federal agencies for any Installation activities with the potential to impact marine resources.
- Monitor interdunal swale wetlands for impacts. Install vehicle exclusion fencing and use signage in select areas to prevent trespassing.

- Conduct a habitat assessment and species inventory of the nearshore environment.
- Continue to conduct daily sea turtle surveys from 15 May through 31 August following the sea turtle monitoring protocol in Appendix F.
- Continue to maintain a database of all marine animal strandings that occur at NASO DNA, and report these to the Virginia Aquarium and Marine Science Center
- Continue to coordinate annual sea turtle track and nest identification training for beach patrol personnel.
- Schedule updated rare, threatened, and endangered species surveys with concurrence from VDCR-DNH, continue to routinely monitor state rare species and significant natural ecosystems, and assist in the identification of marine resources as needed.
- Continue to protect the Dune and Swale SIA by restricting training vehicle access across the dunes to the designated training route.
- Provide all beach patrol vehicles with updated copies of the 13 July 2011 BO on the BBNWR Sea Turtle Management Program and 2012 BO update, which identifies proper monitoring and management protocol for sea turtles observed at the Installation.
- Document and map annual dune restoration efforts and designate additional areas that require protection.
- Arrange a consultation with the VDCR-DNH if changes in land use or management practices for the SIAs located within this management unit are contemplated to obtain recommendations for minimizing impacts to these resources.
- Initiate a long-term monitoring plan to assess the effectiveness of the dune protection program.
- Coordinate with the Disaster Preparation Team to install sand fencing and Christmas trees to stabilize and restore dunes.
- Install signs and fencing to restrict unauthorized access to the dunes and identify additional areas where fencing and signs are needed to block vehicle access roads that dissect the dune system and cause degradation, and coordinate installation with the Disaster Preparation Team.
- Coordinate timber harvesting or salvage operations with the NAVFAC Regional Forester as required.
- Coordinate with the NAVFAC Regional Forester to assess impacts of any proposed MILCON projects on forest and, where practicable, arrange timber sales.

- Continue implementing controlled burning to reduce fuel loads and enhance wildlife habitat in accordance with the Installation's most current Prescribed Burn and Smoke Management Plan.
- Update the ~~NALF Fentress, and~~ NASO DNA Prescribed Burn and Smoke Management Plan (2010) annually to reflect accomplishments and set new goals.
- Maintain firebreaks and fire lines for each burn unit as needed.
- Monitor forest stands to control southern pine beetle and other insect and disease outbreaks.
- Continue to maintain vegetation within portions of the northern and southern areas of the Installation through a combination of mowing and controlled burning to provide a variety of grassland and scrub-shrub habitats.
- Conduct periodic inspections of the beach access walkways to ensure appropriate utilization.
- Continue to cooperate with VDGIF to set annual hunting seasons and bag limits at the Installation, and continue to collect, summarize, and report deer harvest data annually to VDGIF to help assess deer population levels and herd condition.
- Continue to monitor and treat common reed, alligator weed, and other invasive plants as needed.
- Have appropriate NR staff attend annual CLE refresher courses.
- Complete the Environmental Checklist (see Appendix A), as needed, for those natural resources management actions that may affect a regulated or other Navy managed environmental resource. Conduct associated consultations and required mitigations, and acquire associated permits in coordination with the appropriate Navy environmental media manager.

This page intentionally left blank.

5.0 INRMP IMPLEMENTATION

Implementation of this INRMP will follow an annual strategy that addresses legal requirements, DoD and Navy directive or policy requirements, funding, implementation responsibilities, technical assistance, labor resources, and technological enhancements. In order for this INRMP to be considered implemented, the following actions will need to be completed.

- Funding is secured for completion of all Environmental Readiness Level (ERL) 4 projects, as described in Section 5.4.
- Installation is staffed with a sufficient number of professionally trained natural resources management staff needed to perform the tasks required by the INRMP.
- Annual coordination with all cooperating offices is performed.
- Specific INRMP accomplishments that are undertaken are documented each year as part of the annual review.

The following sections provide an overview of natural resources consultation requirements, achieving no net loss, NEPA compliance, project development and classification, funding sources, commitment, and use of cooperative agreements. Appendix M provides information on the environmental program requirements (EPR) number, status, prime legal driver and initiative, cost estimate, and funding source for each of the projects proposed in this INRMP.

5.1 NATURAL RESOURCES CONSULTATION REQUIREMENTS

Section 7 of the ESA requires federal agencies to consult (formally or informally, depending on the level of affects to species from the proposed action) with USFWS (inland fish, plants, and wildlife) or NOAA NMFS (marine mammals, fish, or fisheries) when any proposed activity authorized, carried out, or conducted by that agency may affect a federally listed species or designated critical habitat. If adverse effects to listed species are anticipated as the result of proposed actions, formal consultation would be required. As a result of formal consultation, USFWS or NOAA NMFS would issue a BO, which would include actions that the federal agency must complete in order to conduct the proposed activity. If proposed actions may affect, but are not likely to adversely affect listed species, Section 7 consultation can be done informally and without the need to conduct a comprehensive biological assessment. In this case a letter of concurrence would be provided by the interested agency.

If critical habitat is located on federal property and adequate protection and management of the critical habitat has been included in the Installation INRMP, the ESA allows USFWS and or NOAA NMFS to preclude this habitat from the BO. However, in order for the critical habitat to be excluded, the qualifying INRMP must address the maintenance and improvement of the primary constituent elements important to the species, and must manage for the long-term conservation of the species. The USFWS or NOAA NMFS may decline to designate critical habitat where there exists a plan that provides for the adequate management or protection for listed species. The USFWS uses the following three-point criteria to determine if an INRMP provides adequate management or benefit to species. For each criterion, an explanation of how the INRMP addresses the requirement is provided.

1. The plan provides a conservation benefit to the species. The cumulative benefits of management activities identified in a management plan, for the length of the plan, must maintain or provide for an increase in a species' population or the enhancement or restoration of its habitat within the area covered by the plan (i.e., those areas deemed essential for conservation of the species). A conservation benefit may result from reducing fragmentation of habitat, maintaining or increasing populations, insuring against catastrophic events, enhancing and restoring habitats, buffering protected areas, or testing and implementing new conservation strategies.

2. The plan provides certainty that the management plan will be implemented. Persons charged with plan implementation are capable of accomplishing the objectives of the management plan and have adequate funding for implementing the management plan. They have the authority to implement the plan and have obtained all the necessary authorizations or approvals. An implementation schedule (including completion dates) for conservation effort is provided in the plan.

3. The plan provides certainty that the conservation effort will be effective. The following criteria are considered when determining the effectiveness of the conservation effort. The plan includes: (1) biological goals (broad guiding principles for the program) and objectives (measurable targets for achieving the goals); (2) quantifiable, scientifically valid parameters that will demonstrate achievement of objectives, and standards for these parameters by which progress will be measured; (3) provisions for monitoring and, where appropriate, adaptive management; (4) provisions for reporting progress on implementation (based on compliance with the implementation schedule) and effectiveness (based on evaluation of quantifiable parameters) of the conservation effort; and (5) a duration sufficient to implement the plan and achieve the benefits of its goals and objectives.

In addition to USFWS consultation requirements for potential impacts to federally listed species, all project and plans, including INRMPs, must be submitted to USFWS via their online project review system to determine if there are federally listed species, critical habitat, or special status species concerns for the Installation. Submission of the INRMP for USFWS review using this process will ensure all species identified by USFWS as a concern for the Installation have been addressed.

The USFWS online project review process is available at:
http://www.fws.gov/northeast/virginiafield/endspecies/Project_Reviews_Introduction.html

Once finalized, the Navy will provide this INRMP to USFWS for review and comment through the online project review process described above. Once comments from USFWS have been received, and the INRMP updated as necessary, a copy of their concurrence with implementation of this INRMP will be included in Appendix B.

5.2 ACHIEVING NO NET LOSS

Section 101(b)(1)(I) of the Sikes Act states that each INRMP shall, to the extent appropriate and applicable, and consistent with the use of the Installation to ensure the preparedness of the Armed Forces, provide for “no net loss in the capability of military installation lands to support the military mission of the installation.” It is DoD policy that appropriate management objectives to protect mission capabilities of installation lands (from which annual projects are developed) be clearly articulated, and receive high priority in the INRMP planning process (Navy 2006a).

The effectiveness of this INRMP in preventing “net loss” will be evaluated annually. Mission requirements and priorities identified in this INRMP will, where applicable, be integrated into other environmental programs and policies. It is not the intent that natural resources are to be consumed by mission requirements, but rather are sustained for the use of mission requirements. To achieve this, the goal of this INRMP is to conserve the environment for the purpose of the military mission. There may be instances where a “net loss” of mission capability may be unavoidable to fulfill regulatory requirements other than the Sikes Act, such as complying with a BO under the provisions of the ESA, or from the protection of wetlands under the provisions of the CWA. However, both the USFWS and USACE are required to adhere to the Sikes Act provision of no net loss. Loss of mission capability in these instances will be identified in the annual update of the INRMP and will include a discussion of measures being undertaken to recapture any net loss in mission capability.

5.3 NEPA COMPLIANCE

Prior to passage of Sikes Act legislation the extent of natural resources management on military lands was largely discretionary. Although installations with applicable natural resources were required to prepare natural resources plans, it was not a legal requirement. The only legal natural resources requirements for installations were related to compliance with ESA, CWA, and other statutory requirements or DoD directives. Passage of the SAIA brought into effect the requirement for “the Secretary of each military department to prepare and implement an INRMP for each military installation in the U.S. under the jurisdiction of the Secretary” (Navy 2006a). The Council on Environmental Quality (CEQ) defines an INRMP as a major federal action requiring NEPA analysis, and as a result the Navy Office of the Assistant General Counsel (Energy, Installations, and Environment) has established that implementation of an INRMP per SAIA requirements, necessitates the preparation of NEPA documentation prior to approval of the INRMP. The preparation of an EA is usually sufficient to satisfy the NEPA review requirement for most installation INRMPs; however, in cases where implementation of the INRMP will have significant impact on the environment, the preparation of an Environmental Impact Statement (EIS) is required. Annual updates and revisions are covered by the original NEPA documentation unless a major change in installation mission or program scope occurs.

Decisions that affect future land or resource use that are associated with an INRMP require NEPA analysis. The NRM should refer to Secretary of the Navy Instruction 5090.6A and Chapter 5 of OPNAVINST 5090.1C Ch-1 for basic guidance on the preparation of NEPA documents.

CEQ’s “Regulations for Implementing NEPA” (available at: http://ceq.hss.doe.gov/nepa/regs/ceq/toc_ceq.htm) and “NEPA’s 40 Most Asked Questions” (available at: <http://ceq.hss.doe.gov/nepa/regs/40/40p3.htm>) provide further information.

The INRMP and associated NEPA documentation should be prepared as individual documents to ensure that the viability, integrity, and intent of each are maintained. The intent of the INRMP is to outline projects that would fulfill Navy compliance and stewardship obligations, whereas the intent of the NEPA documentation is to analyze the impacts of the various program management options outlined within the INRMP. Although each of these documents are prepared as separate documents, they should be prepared simultaneously, as it is important for installation NRMs to coordinate the two documents at the earliest possible stage to ensure that decisions reflect current environmental values, and avoid potential conflicts.

Preparation of the NEPA documentation should be completed early in the planning process to involve Navy decision-makers in preparation of the document. If a comment period or public notice is required under NEPA, public notice and comment periods should be coordinated and integrated with development and review of the INRMP. A finding of no significant impact (FONSI) must be achieved before an INRMP may be approved. If a FONSI is not achievable, the NEPA process must proceed to development of an EIS. One of the first steps in the NEPA process is to define the proposed action and explain its purpose and need. The proposed action is to develop and implement an INRMP that integrates natural resources management with the installation’s military use in a manner that ensures military readiness and provides for sustainable multipurpose uses and conservation of natural resources (Navy 2006a). The purpose and need for the INRMP is to meet statutory requirements imposed by the SAIA as well as the requirements of various DoD and Navy instructions. The purpose and need section for the proposed action can be further clarified with a brief discussion of the required plan elements (as outlined in the SAIA) applicable to the installation.

The majority of the NEPA document should focus on the discussion of relevant environmental issues and reasonable alternatives. Alternatives that are not feasible because they are inconsistent with the installation mission, unreasonably expensive, or too technically or logistically complex should not be included in the analysis. Additionally, any alternative that is associated with significant environmental impacts cannot be analyzed in an EA (i.e. publication of a FONSI is not possible), and would require preparation of an EIS. The CEQ defines reasonable alternatives as those that are economically and technically feasible, and utilize common sense. Feasibility is a measure of whether the alternative makes sense and is achievable. The analysis should focus on the alternatives and methodologies proposed for accomplishing the management objectives for the program elements. Appendix E of the 2006 Navy INRMP Guidance document recommends that the NEPA analysis for INRMP documents adopt a “programmatic” approach that provides opportunities for the installation to accommodate unforeseen projects that meet pre-established criteria for significance evaluation, as well as changes to the projects, as long as impacts are covered within the overall scope and analysis for the selected alternative (Navy 2006a). Analysis in the NEPA document will focus on evaluation and comparison of alternative plans in association with four management objectives: land management, fish and wildlife management,

forestry management, and outdoor recreation management. Analysis should not focus on the individual projects or practices except in the cases of controversial projects, or projects considered outside the scope of, or a major deviation from a previously existing INRMP (Navy 2006a). The projects and recommendations outlined in an INRMP should provide a framework for reviewing on-going activities, and also will assist in reviewing changes for unforeseen projects or modifications in the future. It is important to distinguish that the NEPA analysis for evaluating plans/programs is different from the project level of analysis used for project specific actions.

The No Action alternative should always be included as an alternative to implementation of the INRMP. The No Action alternative describes impacts that would occur if the installation did not implement the INRMP, and the installation continued to operate without a plan or the existing plan if one is in place. The No Action alternative serves as a baseline to which all other alternatives are compared. Each alternative should describe the general geographical extent applicable to each of the management objectives and program elements. Each of the reasonable alternatives may only represent variable intensities of one or more of the management objectives and program elements; however, differences in funding levels for each alternative would not constitute a valid range of alternatives. For example, it is not acceptable for all required compliance projects to represent an alternative. A brief summary and comparison of all alternatives considered for the INRMP should be included in the NEPA document to provide the agency and public reviewers with the range of management scenarios that were analyzed.

Although specific projects are not required to be analyzed in the NEPA document, a complete list of projects, including description, cost estimate, funding priority designations, and implementation schedule must be included to provide the basis of the proposed action. If agency stakeholders and the Navy determine that potential projects are controversial, sufficient project details must be provided in the INRMP so that a decision can be made regarding significance as part of the NEPA analysis. Additionally, controversial projects, or projects outside the scope or intent of the INRMP, may require a tiered or amended NEPA document for that specific project. All projects must be consistent with the methodologies analyzed in the NEPA document, and the installation should ensure that the NEPA documentation for the INRMP is prepared such that it will accommodate for unforeseen projects, and changes to original projects. Reference Appendix E of the Navy INRMP Guidance document (Navy 2006a) for more information on NEPA requirements associated with evaluation of INRMP documents.

5.4 PROJECT DEVELOPMENT AND CLASSIFICATION

This INRMP is a public document that requires the mutual agreement of the Installation, USFWS, and state fish and wildlife agencies. It is crucial therefore, that these entities reach a common understanding as to which projects are most likely to be funded through the sources identified in Section 5.5. An annual strategy must be adopted for INRMP funding that addresses the Installation's legal requirements. The Navy programming hierarchy is described in Section 5.4.1 and Project Classification is described in Section 5.4.2.

5.4.1 Programming and Budgeting Classification

The Office of Management and Budget and the EPA require federal agencies to classify natural resources projects in order to assist with programming and budgeting priorities. The priority classifications (Class 0 through Class III) are summarized below.

- **Class 0: Recurring Natural Resources Conservation Management Requirements.** Includes activities needed to cover the recurring administrative, personnel, and other costs associated with managing DoD's conservation program. Recurring costs consist of manpower, training, supplies, hazardous waste disposal, recycling activities, permits, fees, testing and monitoring and/or sampling and analysis, reporting and record keeping, maintenance of environmental conservation equipment, and compliance self-assessments.
- **Class I: Current Compliance.** Includes projects and activities needed because an installation is currently out of compliance; has a signed compliance agreement; has received a consent order; has not met requirements based on applicable federal or state laws, regulations, standards, presidential EOs, or DoD policies; and/or are immediate and essential to maintain operational integrity or sustain readiness of the military mission.
- **Class II: Maintenance Requirements.** Includes projects and activities not currently out of compliance but which will be out of compliance if projects or activities are not implemented in time to meet an established deadline beyond the current program year.
- **Class III: Enhancement Actions Beyond Compliance.** Includes those projects and activities that enhance conservation resources or the integrity of the installation mission, or are needed to address overall environmental goals and objectives, but are not specifically required under regulation or EO and are not of an immediate nature.

The Navy funding classification of recurring and non-recurring projects consists of the following four ERLs, in accordance with OPNAVINST 5090.1C Ch-1. The following descriptions of each ERL are presented in decreasing order of priority, with ERL 4 having the highest priority as must fund compliance projects, and ERL 1 representing environmental stewardship projects.

Environmental Readiness Level 4 (ERL 4) – Environmental Compliance:

- supports all actions specifically required by law, regulation or EO (DoD Class I and II requirements) just in time;
- supports all DoD Class 0 requirements as they relate to a specific statute such as hazardous waste disposal, permits, fees, monitoring, sampling and analysis, and reporting and record keeping;
- supports recurring administrative, personnel and other costs associated with managing environmental programs that are necessary to meet applicable compliance requirements (DoD Class 0);
- supports DoD policy requirement to comply with overseas Final Governing Standards and Overseas Environmental Baseline Guidance Document; and

- supports minimum feasible Navy executive agent responsibilities, participation in Office of the Secretary of Defense (OSD) sponsored inter-department and inter-agency efforts, and OSD mandated regional coordination efforts.

Environmental Readiness Level 3 (ERL 3) – Navy Proactive Involvement:

- supports all capabilities provided by ERL 4;
- supports existing level of Navy executive agent responsibilities, participation in OSD sponsored inter-department and inter-agency efforts, and OSD mandated regional coordination efforts;
- supports proactive involvement in the legislative and regulatory process to identify and mitigate requirements that will impose excessive costs or restrictions on operations and training; and
- supports proactive initiatives critical to the protection of Navy operational readiness.

Environmental Readiness Level 2 (ERL 2) – Navy or DoD Policy Requirement:

- supports all capabilities provided under ERL 3;
- supports enhanced proactive initiatives critical to protection of Navy operational readiness;
- supports all Navy and DoD policy requirements; and
- supports investments in pollution reduction, compliance enhancement, energy conservation and cost reduction.

Environmental Readiness Level 1 (ERL 1) – Navy Environmental Stewardship:

- supports all capabilities provided under ERL 2;
- supports proactive actions required to ensure compliance with pending/strongly anticipated laws and regulations in a timely manner and/or to prevent adverse impacts to the Navy mission; and
- supports investments that demonstrate Navy environmental leadership and proactive environmental stewardship.

5.4.2 Project Classification

The list of projects described in this INRMP consist of both “must fund,” compliance-type projects and stewardship-type projects. “Must fund” conservation requirements are those projects and activities that are required to meet recurring natural resources conservation management requirements or current legal compliance needs, including EOs. These projects are designated ERL 4 or 3 in the Navy funding classification system, described in Section 5.4.1.

“Must fund” or ERL 4 or 3 projects could include:

- developing, updating, and revising INRMPs;

- salaries and annual training of professional personnel involved in the development and implementation of INRMPs, in accordance with Individual Development Plans;
- terms and conditions of BOs issued by USFWS or NMFS;
- baseline surveys needed to keep INRMPs current;
- biological surveys to determine population status of rare, threatened, and endangered species;
- survey and monitoring programs to support MBTA and related permits;
- wetland surveys for planning, monitoring and/or permit applications;
- erosion control measures required to remain in compliance with natural resources protection regulations and to maintain land condition for realistic training operations;
- support of leadership roles or executive agent responsibilities such as for the Coastal America, and Chesapeake Bay agreements; or
- Memorandums of Agreement/Understanding commitments.

This list is not meant to be all-inclusive, but is meant to provide an overview of the types of projects that could be classified as compliance or must fund projects.

INRMP projects are developed based on the unique circumstances facing an installation. INRMPs should include only valid projects and programs that enhance an installation's natural resources, promote proactive conservation measures, and support investments that demonstrate Navy environmental leadership and proactive environmental stewardship. These projects are considered "stewardship" projects and fall under ERL 1 or 2 in the Navy classification system. Examples of stewardship projects include, but are not limited to:

- community outreach activities, such as Earth Day and Migratory Bird Day activities;
- education and public awareness projects such as interpretive displays, oral histories, watchable wildlife areas, nature trails, wildlife checklists, and conservation teaching materials;
- biological surveys or habitat protection for non-listed species;
- management and execution of volunteer and partnership programs;
- demonstration plantings of native plant materials;
- experimental conservation techniques;
- agriculture outlease improvements;
- forest stand improvements and other management efforts; and
- wildlife management efforts.

All INRMP Projects must be entered into the EPR network system and receive approval up the chain of command prior to soliciting any signatures on the INRMP. CNO N45 is the final authority for designating the appropriate ERL for a given INRMP Project.

5.5 FUNDING SOURCES

INRMP projects must be validated and entered into the EPR-web before ERL 3 and 4 projects can be programmed into the system for funding. ERL 1 and 2 projects are not usually funded through the EPR-web system, and alternate sources of funding should be sought for these projects. EPR-web project entries should include clear justification of funds being requested so that: (1) natural resources funds are distributed wisely, and (2) funding levels are not threatened by the use of funds in ways that are inconsistent with funding program rules (Navy 2006a). The primary sources for funding Navy NRP projects are: Operations and Maintenance, Navy (O&MN) Environmental Funds, Sikes Act Revenues, Legacy Resource Management Program (Legacy) Funds, Navy Forestry Revenues, Agricultural Outleases, Fish and Wildlife Fees, Recycling Funds, SERDP Funds, and other Non-DoD Funds.

5.5.1 O&MN Environmental Funds

A majority of natural resources projects are funded with O&MN environmental funds, and are primarily restricted to support “must-fund” environmental compliance projects (i.e., Navy ERL 4 projects). O&MN environmental funds are generally not allocated for ERL 1–3 projects. Other limitations for the use of O&MN environmental funds include the following.

- Only the initial procurement, construction, and modification of a facility or project are considered valid environmental funding requirements. The subsequent operation, modification due to mission requirements, maintenance, repair, and eventual replacement is considered a Real Property Maintenance funding requirement.
- When natural resources requirements are tied to a specific construction project or other action, funds for natural resources requirements should be included in project costs.

O&MN environmental funds are expected to be the primary source of funding for NASO DNA INRMP Environmental Compliance (ERL 4) Projects.

5.5.2 Sikes Act Revenues

Sikes Act Revenues include funds received for hunting and fishing permits and fees that are primarily collected as part of installation hunting, fishing or trapping programs. These fees are deposited and used in accordance with the Sikes Act and DoD financial management regulations. The Sikes Act specifies that user fees collected for hunting, fishing or trapping shall be used only on the installation where they are collected, and be used exclusively for fish and wildlife conservation and management at that installation. Permit fees that are collected as part of the NASO DNA hunting and fishing program are used to support natural resources management projects at the Installation.

5.5.3 The Legacy Resource Management (Legacy) Program

Legacy was part of a special Congressional mandated initiative for funding military conservation projects. Although Legacy was originally funded from 1991 to 1996 only, funds for new projects have continued to be available through this program (Navy 2006a). Legacy funds can be used for a variety of conservation projects, such as regional ecosystem management initiatives, habitat

preservation efforts, archaeological investigations, invasive species control, monitoring and predicting migratory patterns of birds and animals, and national partnerships and initiatives, such as National Public Lands Day. Requests for Legacy funds should consider the following:

- The availability of Legacy funds is generally uncertain early in the year.
- Pre-proposals for Legacy projects are due in March and submitted using the Legacy Tracker Website.
- Project proposals are reviewed by the Navy chain of command before being submitted to the DoD Legacy Resource Management Office for final project selection.
- The Legacy Website provides further guidance on the proposal process and types of projects requested.

Legacy funds should be considered as a potential funding source for NASO DNA INRMP Projects.

5.5.4 Navy Forestry Revenues

Forestry Revenues originate from the sale of forest products on Navy lands, and can be used to fund forestry and potentially other natural resources management programs. Forestry revenues are given preference for funding the Annual Navy Forestry Funds and the DoD Forestry Reserve Account. Annual Navy Forestry Funds are used to support commercial forestry operations at installations. Forestry revenues are first used to reimburse commercial forestry expenses, then, as directed by DoD Financial Management Regulation 7000.14-R Volume 11A, 40% of net proceeds for the FY for the installation are distributed to the state in which the installation resides. The state usually uses these funds to support road systems and schools. Once the commercial forestry expenses are reimbursed, and proceeds are distributed among the state counties, any remaining amount is transferred to a holding account known as the DoD Forestry Reserve Account.

Forestry Revenues also can be used to fund the improvement of forested lands; fund unanticipated contingencies associated with administration of forested lands and production of forest products, for which other sources of funds are not available; and natural resources management for implementation of approved plans and agreements. In order for a natural resources project to be eligible for funding from Forestry Revenues it must:

- Be specifically included in an approved management plan, such as an INRMP; and

Provide for:

- fish and wildlife habitat improvements or modifications;
- range rehabilitation where necessary for support of wildlife;
- control of off-road vehicle traffic;
- specific habitat improvement projects and related activities; and
- adequate protection for species of fish, wildlife, and plants considered threatened or endangered.

The amount of funds available through Forestry Revenues varies from year to year. It is important to note that the amount of funds remaining for natural resources management is relatively small, and although installations are not required to have a timber harvesting plan to be eligible for funds from the DoD Forestry Reserve Account, Reserve Account funds cannot be used for “must fund” environmental compliance projects. Due to the amount of forest resources available at NASO DNA, DoD Forestry Reserve Account funds are a potential source of funding for INRMP Projects that are not classified as Environmental Compliance (ERL 4) projects. Funds from any timber sales at NASO DNA will be deposited in the National Forestry Reserves Account.

5.5.5 Agricultural Outleases

Agricultural Outleasing funds are collected through the leasing of Navy-owned property for agricultural use. This money is directed back into the NRP and reallocated throughout the Navy by NAVFAC Headquarters. Agricultural Outleasing funds are primarily allocated for agricultural outlease improvements, but also may potentially be used for natural resources management and stewardship projects once the primary objective is met. In addition to projects related to agricultural outleasing, these funds can be used for implementation of INRMP Stewardship Projects. Although funds available through Agricultural Outleasing varies from year to year, this funding source is one of the more consistent sources for implementing INRMP projects that do not have Level 1 requirements. Agricultural Outleasing funds should be considered as a potential funding source for NASO DNA INRMP Projects that are not classified as Environmental Compliance (ERL 4) projects.

5.5.6 Recycling Funds

Installations that have a Qualified Recycling Program (QRP) may use their proceeds for some types of natural resources projects. Any proceeds collected as part of the installation QRP must first be used to cover QRP costs, and then up to 50% of the net proceeds can be for pollution abatement, pollution prevention, composting, alternative fueled vehicle infrastructure support, vehicle conversion, energy conversion, or occupational safety and health projects, with first consideration given to projects included in the installation’s pollution-prevention plans. Remaining funds may be transferred to the non-appropriated MWR account for approved programs, or retained to cover anticipated future program costs. NASO DNA does not currently include a QRP so Recycling Funds are not expected to be used to support any of the natural resources projects recommended in this INRMP.

5.5.7 Strategic Environmental Research and Development (SERDP) Funds

SERDP is DoD’s corporate environmental research and development program, planned and executing in full partnership with the Department of Energy and EPA, with participation by numerous other Federal and non-Federal organizations (Navy 2006a). SERDP funds are allocated for environmental and conservation project through a competitive process. The focus of SERDP is on Cleanup, Compliance, Conservation, and Pollution Preventions technologies. Due to the competitive process involved with allocation of SERDP Funds, NASO DNA is not expected to receive funds through this source.

5.5.8 Non-DoD Funds

Non-DoD Funds, such as those received from grant programs, are available to fund natural resources management projects, such as watershed management and restoration, habitat restoration, and wetland and riparian area restoration. Federally funded grant programs typically require non-Federal matching funds, however, installations can partner with other groups for preparing proposals for eligible projects. NASO DNA should consider grant funding and partnerships as a potential funding source for INRMP natural resources projects.

5.6 USE OF COOPERATIVE AGREEMENTS

A cooperative agreement is used to acquire goods or services, or stimulate an activity that will be implemented for the public good. Section 103a of the Sikes Act (16 USC 670c-1) provides the authority to enter into cooperative agreements with state and local governments, NGOs, and individuals to provide for the maintenance and improvement of natural resources on, or to benefit natural and historic research on DoD installations. In addition to a standard cooperative agreement, examples of other agreements include MOU, and Cooperative Assistance Agreement. Funds appropriated for multiyear agreements during a FY may be obligated to cover the cost of goods and services provided under a cooperative agreement entered into or through an agency agreement under Section 1535 of Title 31 during any 18-month period beginning in that FY, without regard to whether the agreement crosses FYs. Cooperative agreements entered into are subject to the availability of funds.

EO 13352, *Facilitation of Cooperative Conservation* (26 August 2004), directs that the Secretaries of the Interior, Agriculture, Commerce, and Defense, and the Administrator of the EPA shall, to the extent permitted by law and subject to the availability of appropriations and in coordination with each other as appropriate: carry out the programs, projects, and activities of the agency that they respectively head that implement laws relating to the environment and natural resources in a manner that facilitates cooperative conservation; take appropriate account of and respects the interests of persons with ownership or other legally recognized interests in land and other natural resources; properly accommodate local participation in federal decision making; and provides that the programs, projects, and activities are consistent with protecting public health and safety.

NASO DNA does not currently have any cooperative agreements in place.

5.7 PROJECT IMPLEMENTATION SCHEDULE

For prioritization and budgeting purposes, actions or projects recommended in this INRMP are provided in Appendix M. The prime legal drivers (as described previously in this section), programming and budgeting priority, cost estimate, potential funding source, and completion schedule are identified for each project. Cost estimates may represent annual expenditures for NR staff and other technical support for planning, coordinating, and implementing activities or the cost of materials, personnel, and/or contractors associated with a project. All projects submitted for O&MN funding must be included in this INRMP or a clear justification for their omission must be provided. An INRMP annual increment addendum must be prepared annually to facilitate

implementation of the INRMP. The annual increment addendum should provide concise detail and cost estimates of proposed work or projects planned for each FY.

Relevant legal drivers and initiatives that were identified for each management issue in this INRMP also are summarized in Appendix M. Primary statutes and regulations identified in the project table include the CWA, SAIA, ESA, NEPA, MBTA, MMPA, CZMA, NHPA, Soil and Water Conservation Act, BGEPA, Forest and Rangeland Renewable Resources Planning Act, National Invasive Species Act, and Magnuson-Steven Fishery Conservation and Management Act; state and local conservation laws and plans; Navy and DoD instructions and policies; and presidential EOs.

DEPARTMENT OF DEFENSE
DEPARTMENT OF THE NAVY

FINDING OF NO SIGNIFICANT IMPACT FOR ENVIRONMENTAL
ASSESSMENT FOR THE IMPLEMENTATION OF AN INTEGRATED NATURAL
RESOURCES MANAGEMENT PLAN (INRMP) FOR NAVAL AIR STATION
OCEANA, DAM NECK ANNEX, AND NAVAL AIR STATION OCEANA, SOUTH
VIRGINIA BEACH ANNEX (CAMP PENDLETON)

Pursuant to the Council on Environmental Quality regulations (40 Code of Federal Regulations § 1500-1508) implementing procedural provisions of the National Environmental Policy Act (NEPA), the Department of the Navy, gives notice that an Environmental Assessment (EA) and Finding of No Significant Impact (FONSI) have been prepared for the development and implementation of an Integrated Natural Resources Management Plan (INRMP) for Naval Air Station (NAS) Oceana, Dam Neck Annex (DNA), and NAS Oceana South Virginia Beach Annex (commonly referred to as Camp Pendleton) and an Environmental Impact Statement (EIS) is not being prepared.

Proposed Action:

The proposed action (Alternative 2) is to develop and implement an INRMP consistent with the military use of the property and the goals and objectives established in the Sikes Act Improvement Act (SAIA). The goal of the INRMP is to implement an ecosystem based natural resources program that provides for conservation of natural resources in a manner that is consistent with the military mission; integrates and coordinates all natural resources management activities; provides for sustainable multipurpose uses of natural resources; and provides for public access for use of natural resources subject to safety and military security considerations. The proposed INRMP would address and implement land management, forest management, fish and wildlife management, outdoor recreation, cultural resources protection, conservation education, and natural resources program administration. A total of 62 ongoing and new management actions and projects are proposed to meet compliance and stewardship objectives for natural resources management at the installations.

FINDING OF NO SIGNIFICANT IMPACT FOR ENVIRONMENTAL ASSESSMENT FOR THE IMPLEMENTATION OF AN INTEGRATED NATURAL RESOURCES MANAGEMENT PLAN (INRMP) FOR NAVAL AIR STATION OCEANA, DAM NECK ANNEX, AND NAVAL AIR STATION OCEANA, SOUTH VIRGINIA BEACH ANNEX (CAMP PENDLETON)

Existing Conditions:

Dam Neck Annex and Camp Pendleton are located in the southeastern portion of Virginia Beach on the shore of the Atlantic Ocean in Virginia. Land uses surrounding the bases include industrial, commercial, residential, recreational, and agricultural though most of the agricultural lands are rapidly being converted to residential and recreational developments. Impacts to relevant resources that were evaluated for each alternative included land use, soil resources, wetlands and water quality, coastal zone resources, vegetation, wildlife, threatened and endangered species, cultural resources, air quality, environmental justice and socioeconomics.

Alternatives Analyzed:

The no action alternative (Alternative1) is the continued implementation of the management objectives and practices specified in the natural resources plans for Dam Neck Annex (U.S. Navy 1998) and Camp Pendleton (U.S. Navy 1997). The existing management plans provide valuable information on natural resources management; however, the plans do not set time frames for implementation of or provide cost estimates for natural resources projects. Also, many of the project management recommendations provided in the current natural resources plans have been completed, and new projects described in the proposed INRMP would not be implemented under this alternative. In addition, no EA was completed for development of the existing plans, nor were they provided for public review. Consequently, the existing plans do not meet the SAIA requirements for an INRMP. The no action alternative is carried forward as a baseline for comparison to the other alternatives as required by CEQ regulations.

Environmental Effects:

This EA demonstrated that implementation of the proposed action would result in no impact, positive impacts, or minimal negative impacts to environmental resources. The greatest potential negative impact would be from annual prescribed burning, which has the potential to increase air emissions. However, benefits from prescribed burning, including reducing the risk of catastrophic wildfire and managing early successional habitat, which is important to a number of wildlife species on the bases, would also be

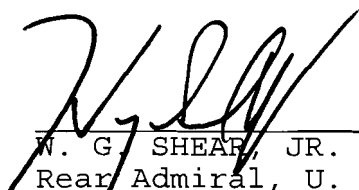

FINDING OF NO SIGNIFICANT IMPACT FOR ENVIRONMENTAL ASSESSMENT FOR THE IMPLEMENTATION OF AN INTEGRATED NATURAL RESOURCES MANAGEMENT PLAN (INRMP) FOR NAVAL AIR STATION OCEANA, DAM NECK ANNEX, AND NAVAL AIR STATION OCEANA, SOUTH VIRGINIA BEACH ANNEX (CAMP PENDLETON)

provided. Additionally, impacts to air quality would be minimized through the use of proper smoke management procedures and optimizing the burning schedule. Because Dam Neck Annex and Camp Pendleton are in a marginal nonattainment area for ozone, an applicability analysis is required under the General Conformity Rule of the CAA. The applicability analysis provided in the EA demonstrates under both alternatives emissions from prescribed burning would be well below *de minimis* levels for annual criteria pollutant emissions.

Findings:

Based on information gathered during preparation of the EA, the Department of the Navy finds that implementing the proposed action will not significantly impact the quality of the environment. The EA and FONSI addressing this action may be obtained by interested parties by contacting Commander, Atlantic Division, Naval Facilities Engineering Command, 1510 Gilbert Street, Norfolk, Virginia 23511-2699 (Attn: Mr. Chris Petersen), telephone (757) 322-4560. A limited number of copies of the EA are available to fill single copy requests.

EXECUTIVE SUMMARY

This Environmental Assessment (EA) analyzes the potential environmental consequences resulting from implementation of the proposed Integrated Natural Resources Management Plan (INRMP) at Naval Air Station (NAS) Oceana, Dam Neck Annex (DNA), and NAS Oceana South Virginia Beach Annex, which is generally referred to as Camp Pendleton (CP) in Virginia Beach, Virginia. The two adjacent properties lie along the Atlantic coast, have an extensive beaches and dunes system, and share other similar natural resources and management issues. To ensure a holistic, ecosystem approach is taken; resource management was combined into a single INRMP for the two bases. The environmental analysis process is designed to ensure that the public is involved in the process and informed about the potential environmental effects of the proposed action and to help decision makers take environmental factors into consideration when making decisions related to the proposed action.

Purpose and Need for the Proposed Action

The purpose of this action is to implement a conservation program that integrates fish and wildlife management, land management, and management of outdoor recreational opportunities, as practicable and consistent with the military mission and planned mission activities. The need for this action is to meet statutory requirements under the Sikes Act Improvement Act (SAIA). In November 1997, the Sikes Act, 16 U.S. Code (USC) § 670a et seq., was amended to require the Secretary of Defense to prepare and implement INRMPs for each military installation in the United States, unless the absence of significant natural resources on a particular installation makes preparation of a plan for that installation inappropriate.

Preferred Action and Alternatives

The Navy proposes to develop and implement an INRMP consistent with the military use of the property and the goals and objectives established in the SAIA. The goal of the INRMP is to implement an ecosystem-based natural resources program that provides for conservation of natural resources in a manner that is consistent with the military mission; integrates and coordinates all natural resources management activities; provides for sustainable multipurpose uses of natural resources; and provides for public access for use of natural resources subject to safety and military security considerations.

The potential impacts of three alternatives; (1) a no action alternative, (2) the proposed action, and (3) an enhanced alternative are analyzed in this EA. The no action alternative would continue to implement the goals and objectives stated in the existing natural resources management plans for the bases. Under the proposed action alternative, only Navy Assessment Level 1 projects as described by the Navy Environmental Requirements Guidebook would be implemented. Navy Level 1 projects are compliance driven and have high funding priority. Under the third alternative, all Navy Assessment Level 1 requirements and, based on the availability of funding, Navy Level 2, 3, 4, and 5 would be implemented. Level 2 requirements are derived from DoD or Navy policy; Level 3 requirements are for pending regulations; Level 4 must meet future needs; and Level 5 requirements are leadership initiatives.

Summary of Environmental Consequences

It is expected that there would be positive long and short term effects associated with implementation of the three alternatives analyzed in this EA. A summary of the potential impacts is contained in Table ES-1.

Table ES-1. Comparison of Alternatives.

Resource	Alternative 1 No Action Alternative	Alternative 2 Proposed action	Alternative 3 Enhanced Alternative
Land Use	No change	Positive effects on the bases' ability to sustain military land use through protecting soil and water resources and providing information for future land planning.	Same as Alternative 2 with enhancement of existing land use resulting from landscaping of select urban areas.
Soil Resources	No change	Positive effects from review of soil erosion and control plans, implementation of dune protection and monitoring, and installation of vehicle exclusion fencing.	Same as Alternative 2 with additional benefits to soil resources resulting from implementing BMPs around Sadler Pond drainage ditches to reduce soil erosion.
Water Resources	No change – Permits will continue to be sought when actions would effect water resources.	Positive effects from increased coordination and review of permitting requirements, compliance with wetlands regulations, and implementation of projects including basewide wetlands delineation and implementing BMPs to minimize impacts to water quality from sedimentation.	Same as Alternative 2 with additional benefits from use of BMPs and reduced mowing around Sadler Pond drainage ditches, conducting water quality monitoring at Sadler Pond, and increasing riparian buffers in other areas.
Marine Resources	No change	Positive impacts to marine resources could result from nightly surveys of beaches for sea turtle tracks and nests and providing sea turtle identification training.	Same as Alternative 2
Coastal Zone Resources	No change	Positive effects from implementing dune protection and monitoring, installation of vehicle exclusion fencing, and the review of projects to ensure consistency with the Virginia CZMP.	Same as Alternative 2
Vegetation	No change	Positive effects from invasive species control, monitoring tree disease and insect infestation, and conducting controlled burns.	Same as Alternative 2 with additional benefits from beneficial landscaping.

Table ES-1. Comparison of Alternatives (cont'd).

Resource	Alternative 1 No Action Alternative	Alternative 2 Proposed Action	Alternative 3 Enhanced Alternative
Fish and Wildlife	No change	Positive effects from game and nongame management and habitat management, the conservation and enhancement of the natural habitats, administering installation hunting and fishing programs, and maintenance of early successional habitat, improved base awareness of feral pet issues.	Same as Alternative 2 with additional benefits from the distribution, maintenance, and monitoring of osprey platforms, bat, bluebird and wood duck boxes,
Threatened and Endangered Species	No change	Positive effects from rare species surveys, tracking of species status, and compliance with regulations.	Same as Alternative 2 with additional benefits resulting from consultations with VDCR-DNH to ensure that future land use changes would not affect rare species habitat.
Cultural Resources	No change	Positive impacts to undiscovered cultural resources from consultation with SHPO during project planning.	Same as Alternative 2
Air Quality	No change	Minimal effect from prescribed fire; action is in conformity with State Implementation Plan.	Same as Alternative 2
Socioeconomics	No change	No change to population, income, or employment.	Same as Alternative 2
Environmental Justice	No change	No disproportionately high adverse impact on minority or low-income populations.	Same as Alternative 2

1.0 PURPOSE AND NEED FOR ACTION

1.1 Introduction

Naval Air Station (NAS) Oceana, Dam Neck Annex (DNA) and NAS Oceana South Virginia Beach Annex, which is generally referred to as Camp Pendleton (CP), are two adjacent Navy installations located in the southeastern portion of the City of Virginia Beach, Virginia (Figure 1-1). DNA encompasses approximately 1,351 acres and is bounded by Virginia Beach to the west, the community of Sandbridge to the south, the Atlantic Ocean to the east, and CP to the north. CP encompasses 351 acres and is bounded to the north by the State Military Reservation Camp Pendleton, the Wadsworth Navy Family Housing complex to the west, and the Atlantic Ocean to the east. Several other military installations including Fort Story, and Naval Amphibious Base Little Creek, and NAS Oceana are also located in Virginia Beach. The Navy owns approximately 36,000 acres in the Hampton Roads area (U.S. Navy 2002).

Land uses surrounding the bases include industrial, commercial, residential, recreational, and agricultural though most of the agricultural lands are rapidly being converted to residential and recreational developments. Because of the intense level of development in the region, DNA, CP, and the other coastal military installations are extremely important to the region's ecology. These bases, along with First Landing State Park to the north and Back Bay National Wildlife Refuge to the south, support the few remaining undeveloped dune systems along the Virginia coast. Together, DNA and CP have nearly 4 miles of coastal primary and secondary sand dunes.

1.2 Proposed Action

DNA and CP propose to develop and implement an Integrated Natural Resources Management Plan (INRMP) consistent with the military use of the property and the goals and objectives established in the Sikes Act Improvement Act (SAIA). The goal of the INRMP is to implement an ecosystem-based natural resources program that provides for conservation of natural resources in a manner that is consistent with the military mission; integrates and coordinates all natural resources management activities; provides for sustainable multipurpose uses of natural resources; and provides for public access for use of natural resources subject to safety and military security considerations. Because the two adjacent properties have similar ecosystems, natural resource attributes, and other natural resources management issues, a single comprehensive INRMP is proposed, which would help ensure a holistic, ecosystem approach to resource management is taken.

1.3 Purpose and Need

The purpose of this action is to implement a conservation program that integrates fish and wildlife management, land management, and management of outdoor recreational opportunities, as practicable and consistent with the military mission and planned mission activities.

Figure 1-1. Location and Regional Setting of DNA and CP.

The need for this action is to meet statutory requirements under the SAIA. In November 1997, the Sikes Act, 16 U.S. Code (USC) § 670a et seq., was amended to require the Secretary of Defense to prepare and implement INRMPs for each military installation in the U.S., unless the absence of significant natural resources on a particular installation makes preparation of a plan for that installation inappropriate.

The principal use of military installations is to ensure the preparedness of the armed forces. The SAIA requires each installation to prepare an INRMP that provides for the following program management activities, to the extent that such activities are consistent with use of the installation for military preparedness:

- The conservation and rehabilitation of natural resources on the installation;
- The sustainable multipurpose use of the resources, including hunting, fishing, trapping, and nonconsumptive uses; and
- Subject to safety requirements and military security, public access to the installation to facilitate such uses.

As required by the SAIA, the plan must, to the extent appropriate and applicable, provide for:

- Fish and wildlife management, land management, forest management, and fish- and wildlife-oriented recreation;
- Fish and wildlife habitat enhancement or modification;
- Wetland protection, enhancement, and restoration, where necessary for support of fish, wildlife, or plants;
- Integration of, and consistency among, the various activities conducted under the plan;
- Establishment of specific, natural resources management goals and objectives and time frames for proposed actions;
- Sustainable use by the public of natural resources, to the extent that the use is not inconsistent with the needs of fish and wildlife resources;
- Public access to the military installation that is necessary or appropriate for the sustainable use of natural resources, subject to requirements necessary to ensure safety and military security;
- Enforcement of applicable natural resource laws (including regulations);
- No net loss in the capability of the installation's lands to support the military mission of the installation; and
- Such other activities as the Navy has determined are appropriate.

In preparing this plan, as required by the SAIA, DNA and CP have worked in cooperation with the U.S. Fish and Wildlife Service (USFWS) and the Virginia Department of Game and Inland Fisheries (VDGIF) so that the plan reflects the mutual agreement of these parties concerning conservation, protection, and management of fish and wildlife resources on the

bases. Also, as required by the SAIA, the INRMP has been provided for public comment, and all comments received were taken into account in finalizing the plan.

1.4 Regulatory Compliance

This environmental assessment (EA) has been prepared pursuant to Section 102 of the National Environmental Policy Act (NEPA) of 1969, 42 USC § 4231 et seq., and in accordance with the regulations of the Council on Environmental Quality (CEQ) that implement NEPA procedures (40 Code of Federal Regulations [CFR] § 1500-1508) and the Navy Environmental and Natural Resources Program Manual (Chief of Naval Operations Operating Instruction [OPNAVINST] 5090.1B). NEPA requires federal agencies to take into consideration the potential environmental consequences of proposed actions in their decision-making process. The intent of NEPA is to protect the environment through providing an assessment of alternative actions and providing the opportunity for public comment on federal actions that have the potential to impact the environment. The information presented in this document will provide sufficient evidence and analysis for determining whether to prepare an environmental impact statement (EIS) or if a finding of no significant impact (FONSI) would be appropriate.

Individual actions identified in the INRMP may require state and federal review to ensure compliance with major environmental legislation such as the Endangered Species Act (ESA), Clean Water Act (CWA), Clean Air Act (CAA), Coastal Zone Management Act (CZMA), and National Historic Preservation Act (NHPA). Potential permits, coordination, and environmental protection plans include, but are not limited to, the following:

- CZMA consistency determination;
- Virginia Erosion and Sediment Control Plan;
- Virginia Water Protection Permit Program;
- Virginia Storm Water Discharge Permit for Construction Activities;
- U.S. Army Corps of Engineers (USACE) applicable permits; and
- Appropriate Joint Permit Application with state and local agencies.

An abbreviated list of pertinent regulations and guidance is in Appendix A.

1.5 INRMP Implementation

1.5.1 Programming and Budgeting Priorities

The Office of Management and Budget (OMB) and the Environmental Protection Agency (EPA) require federal agencies to classify natural resources projects in order to assist with programming and budgeting priorities. Department of Defense Instruction (DoDI) 4715.3, Enclosure 4, provides detailed guidance on programming and budgeting natural resources projects. The priority classifications (Class 0 through Class III) are summarized below.

- **Class 0: Recurring Natural Resources Conservation Management Requirements.** Includes activities needed to cover the recurring administrative, personnel, and other

costs associated with managing the Department of Defense's (DoD's) conservation program. Recurring costs consist of manpower, training, supplies, hazardous waste disposal, recycling activities, permits, fees, testing and monitoring and/or sampling and analysis, reporting and record keeping, maintenance of environmental conservation equipment, and compliance self-assessments.

- **Class I: Current Compliance.** Includes projects and activities needed because an installation is currently out of compliance; has a signed compliance agreement; has received a consent order; has not met requirements based on applicable federal or state laws, regulations, standards, presidential Executive Orders (EOs), or DoD policies; and/or are immediate and essential to maintain operational integrity or sustain readiness of the military mission.
- **Class II: Maintenance Requirements.** Includes projects and activities not currently out of compliance but which will be out of compliance if projects or activities are not implemented in time to meet an established deadline beyond the current program year.
- **Class III: Enhancement Actions Beyond Compliance.** Includes those projects and activities that enhance conservation resources or the integrity of the installation mission, or are needed to address overall environmental goals and objectives, but are not specifically required under regulation or EO and are not of an immediate nature.

An additional assessment level is assigned to projects to assist in recognizing appropriate funding sources in Environmental Program Requirements (EPR) exhibits. The following descriptions of Navy Assessment Levels are summarized from the Navy Environmental Requirements Guidebook (Chief of Naval Operations [CNO] 2003). Navy Level 1 requirements are those prescribed by state or federal laws, regulations, and EOs; Level 1 requirements include OMB/EPA Class 0, I, or II projects and ongoing efforts. Navy Level 2 requirements are derived from DoD or Navy policy; Level 3 requirements are for pending regulation; Level 4 requirements meet future requirements; and Level 5 requirements are leadership initiatives.

1.5.2 Funding Sources

The Navy Environmental Requirements Guidebook (CNO 2003) also describes various potential funding mechanisms for natural resources projects. Operations and Maintenance, Navy (O&MN) environmental funds are the primary source of resources to support Navy Level 1 (OMB/EPA Classes 0, I, and II) actions, though these funds are generally not available for Navy Level 2 through Level 5 actions. In addition, only the initial procurement, construction, or modification of a facility or project is a valid use of O&MN funds. The subsequent operation and maintenance is considered a Real Property Maintenance funding requirement. When natural resources actions are required as part of a military construction (MILCON) project, costs should be paid by MILCON funds as part of the overall construction project.

Forestry revenues from the sale of forest products on Navy lands are a source of funding for two programs: the Annual Navy Forest Funds and DoD Forestry Reserve Account. The DoD Forestry Reserve Account funds can be used for improvement of forestlands and for

implementation of projects described in an approved management plan that provides for habitat improvement and protection. These funds are suitable for many of the types of natural resources management projects identified in the proposed INRMP. User fees collected from the base fishing program may be used only for the protection, conservation, and management of fish and wildlife such as habitat improvement and related activities. National Public Lands Day funds are available for projects that showcase public lands and the importance of protecting natural resources through volunteerism. The National Environmental Education and Training Foundation manages and coordinates this fund. The Legacy Resources Management Program (Legacy) can provide funding for a variety of conservation projects such as habitat preservation efforts and ecosystem management efforts. A project proposal must be submitted in order to be eligible for Legacy, Annual Navy Forest, or DoD Forestry Reserve Account funds. Across the Navy, projects are prioritized and funded annually.

1.5.3 Project Implementation Schedule

For prioritization and budgeting purposes, actions or projects recommended in the INRMP that require a request for funds are listed in a project implementation table in Appendix B. The prime legal drivers, programming and budgeting priority, and potential NEPA and CZMA requirements are identified for each project. All projects submitted for O&MN funding must be included in the INRMP or a clear justification for their omission must be provided. An INRMP increment addendum must be prepared annually to facilitate implementation of the INRMP. The annual increment addendum should provide concise detail and cost estimates of proposed work or projects planned for each fiscal year.

Relevant legal drivers and initiatives that were identified for each management issue in the INRMP are also summarized in the project table. Primary statutes and regulations identified in the project table include the CWA, SAIA, ESA, NEPA, and Migratory Bird Treaty Act (MBTA); state conservation laws; Department of Navy and DoD instructions and policies; and presidential EOs.

All projects would undergo annual review and reprioritization, and would be subject to budget constraints due to the cost of war or other mission related funding cuts. Projects would be assessed on an individual basis for compliance with the NEPA and other compliance related environmental requirements.

1.6 Scope of the Environmental Assessment

This EA has been prepared to evaluate the potential environmental impacts of implementing the proposed INRMP for DNA and CP. The analysis compares and summarizes the environmental consequences of the proposed action and alternative management objectives rather than individual projects or practices and is therefore a programmatic EA. Site-specific environmental analyses that are required for future projects may be tiered to this EA provided the anticipated impacts of a specific project, project components, affected resources, or circumstances do not differ substantially from those evaluated in this EA.

Relevant resources evaluated in this EA include land use; soil resources; water resources; marine resources; coastal zone resources; vegetation; fish and wildlife; rare, threatened, and

endangered species; cultural resources; air quality; socioeconomics; and environmental justice. In compliance with NEPA and OPNAVINST 5090.1B guidelines, the scope of this EA focuses on those resources potentially subject to impact. Implementation of any of the alternatives would not be likely to affect noise. Noise generated from implementation of any of the alternatives would not be above background levels and was therefore not considered relevant to this assessment.

2.0 PROPOSED ACTION AND ALTERNATIVES

This section of the EA describes and compares the proposed action and alternatives, including the no action alternative, as well as alternatives considered but eliminated from further analysis.

- **Alternative 1, No Action Alternative.** Under this alternative, DNA and CP would continue implementation of the objectives and practices outlined in the previous natural resources management plans (U.S. Navy 1997 and 1998a). Ongoing natural resources practices would continue and there would be no change to the objectives outlined in the previous plan.
- **Alternative 2, Proposed Action.** The proposed action is to develop and implement an INRMP that emphasizes compliance with environmental statutes and regulations and is consistent with the military use of the property and the goals and objectives established in the SAIA. Under this alternative, compliance and maintenance projects classified as Navy Level 1 projects (OMB Classes 0 through II), would be implemented.
- **Alternative 3, Enhanced Alternative.** Like Alternative 2, the enhanced alternative would implement an INRMP consistent with the military use of the property and the goals and objectives established in the SAIA. In addition to the compliance and maintenance activities that would be implemented under the proposed action, projects and activities that enhance resources or those that address environmental stewardship goals would also be implemented. These projects are identified as Navy Level 2 through 5 projects (OMB Class III).

2.1 Selection Criteria for Alternatives

Each alternative presented for analysis must be a reasonable alternative that meets the needs and purpose of the proposed action. Each alternative must integrate natural resources management at DNA and CP with the installations' military mission in a manner that ensures military preparedness and meets the requirements of SAIA and other conservation laws that regulate natural resources on federal lands. In order for an alternative to be viable it must maintain compliance with and follow guidance set forth by 32 CFR Part 190, DoDI 4715.3, OPNAVINST 5090.1B, and the Sikes Act (16 USC §670a-f). Specifically, each alternative must:

1. Be based on the principles of ecosystem management;
2. Provide for sustainable multipurpose uses of natural resources;
3. Maintain compliance with relevant environmental regulations;
4. Provide for public access for use of natural resources subject to safety and military security considerations;
5. Establish specific natural resources management objectives and time frames for proposed actions; and

6. Prevent loss in the capability of military lands to support the military mission of the installation.

2.2 Alternatives Eliminated from Consideration

Alternatives to the proposed action that would disproportionately administer one portion of the natural resources program over others or not take multiple uses and ecosystem management into account were considered and eliminated from further discussion. Included was an alternative that proposed the implementation of a natural resources program that maximizes the sustained yield of timber products while minimizing wildlife management, outdoor recreation, and stewardship activities. While this alternative would meet criteria 3, 5, and 6, it would not meet criteria 1, 2, and 4 and therefore would not be compliant with the SAIA, DoDI 4715.3, or OPNAVINST 5090.1B. As such, this alternative is unreasonable and is excluded from further analysis (see 40 CFR § 1502.14(a)).

A second alternative, the implementation of a natural resources program for preservation of land resources that precludes multiple uses of forests, fish and wildlife, land resources, and outdoor recreation was also eliminated from further consideration. While this alternative would meet criteria 3 through 6, it would not meet criteria 1 and 2 and would therefore not be compliant with the SAIA, DoDI 4715.3, or OPNAVINST 5090.1B. As such, this alternative is unreasonable and is also excluded from further analysis (see 40 CFR § 1502.14(a)).

2.3 Mission Constraints on Natural Resources Management

Constraints from training or other mission-related activities at DNA and CP are minor, though access to portions of the beaches and dunes is restricted during live firing exercises at the rifle range. The small arms range firing fans are directed toward the Atlantic Ocean and have little effect on natural resources management.

2.4 Alternatives Considered

2.4.1 Alternative 1 – No Action

The no action alternative involves the continued implementation of the existing natural resources management plans for DNA and CP. The existing management plan for DNA was developed as a stand-alone document (U.S. Navy 1998b). CP was originally annexed as part of Naval Amphibious Base (NAB) Little Creek and was included as part of the NAB Little Creek INRMP (U.S. Navy 1997). However, since then, the CP site has been annexed under NAS Oceana. The existing management plans provide valuable information on natural resources management; however, they do not set time frames for implementation of or provide cost estimates for natural resources projects. Also, many of the program management recommendations provided in the current natural resources plans have been completed. New projects described in the proposed INRMP would not be implemented under the no action alternative. In addition, no EA was completed for development of the existing management plans, nor were the plans provided for public review. Consequently, the existing plans do not meet the SAIA requirements for an INRMP. The no action

alternative is carried forward as a baseline for comparison to the other alternatives as required by CEQ regulations.

Natural resources management issues are addressed under three general program areas (land management, fish and wildlife management, and forest management) in the existing INRMPs for DNA and CP. Program areas address management issues from a multipurpose use perspective, and emphasis is placed throughout on good stewardship of the natural resources entrusted to the Navy. Management actions that would provide for the maximum sustained multipurpose uses are prioritized for implementation. These plans address land management practices that reduce grounds maintenance costs, conserve soil and water, improve real estate value, protect and enhance wetlands and floodplains, protect and restore dunes, abate nonpoint sources of water pollution, control noxious weeds, and prevent erosion. Management practices that conserve and promote conservation of fish and wildlife and their habitats, particularly habitats of state or federally listed rare, threatened, or endangered species, and that manage game fish and wildlife species and their habitats for optimum sustained yield are identified and recommended. In addition, coastal zone management practices that protect wetlands and water quality and promote conservation and biodiversity are identified and recommended.

2.4.2 Alternative 2 – Proposed Action

The proposed action would implement those Navy Level 1 (OMB Classes 0 through II) activities described in the DNA and CP INRMP. The goal of the INRMP is to implement an ecosystem-based natural resources program that provides for the conservation of natural resources; integrates and coordinates all natural resources management activities; provides for sustainable multipurpose uses of natural resources; and provides for public access for use of natural resources subject to safety and military security considerations. The plan discusses a number of management issues relevant to natural resources and describes specific management actions related to each issue. A summary of all projects described in the INRMP including implementation schedules, legal drivers, and source of funding is in Appendix B. Under Alternative 2, only those projects classified as Navy Level 1 (OMB Classes 0 through III) would be implemented. A summary of activities that would be implemented under Alternative 2 follows.

Coastal Zone Management. Under the proposed action, all proposed actions would be reviewed to ensure consistency with the Virginia Coastal Zone Management Plan (CZMP) and assistance with obtaining coastal zone consistency determinations would be provided.

Wetlands and Water Quality Protection. Under the proposed action, water resources would continue to be managed in accordance with relevant federal, state, and local water protection laws and EOs. DNA and CP would obtain all appropriate federal, state, interstate, and local certifications and permits required by point and nonpoint pollution control, groundwater protection, dredge and fill operations, and storm water management programs for any action that may impact water quality. Wetlands and water quality protection projects and activities under this alternative include: conducting basewide wetlands mapping and obtaining jurisdictional determinations on a project-by-project basis; reviewing and updating sedimentation and storm water pollution prevention plans; assisting action proponents in obtaining federal wetlands protection permits; developing site-specific plans for wetland

mitigation; determining whether sewage and runoff are impacting the Southeast Redwing Lakes Wetlands Special Interest Area and correcting any problems identified; and monitoring Lovetts Marsh wetland mitigation site and implementing additional hardwood control and water level manipulation as required to achieve restoration goals.

Rare, Threatened, and Endangered Species. Under the proposed action, all state and federally listed threatened and endangered species occurring at DNA and CP would continue to be protected by the ESA and state regulation. Because it is in the interest of the Navy to help protect and preserve unprotected, but rare species, under the proposed action, DNA and CP would also strive to protect the areas of significant habitat that support these species. Rare, threatened, and endangered species protection activities proposed under this alternative include: restricting use of areas to protect state and federal rare, threatened, and endangered species and their habitats; obtaining an updated rare, threatened, and endangered species survey; conducting nightly beach monitoring for nesting sea turtles; and providing training in identification of sea turtle tracks and nests as well as other marine resources.

Marine Resources Protection. Under the proposed action, the Navy would coordinate with the National Marine Fisheries Service (NMFS) and USFWS to obtain relevant permits prior to implementing any action with potential to impact marine resources. Sightings of stranded marine mammals or sea turtles on DNA and CP beaches would be reported to natural resources staff who would report the incident to the Virginia Marine Science Museum's Stranding Center. Natural resources staff would also maintain a database of all strandings that occur on DNA and CP.

Habitat Conservation and Restoration. Habitat conservation and restoration are important natural resources management issues in the proposed INRMP. Management efforts under Alternative 2 would focus on protection of the bases' special interest areas and restoration of significant natural habitats. The dune systems of DNA and CP comprise a particularly important habitat where restoration efforts would be concentrated. Projects that would be implemented under this alternative include: implementing dune protection and restoration measures; initiating long-term monitoring to assess the effectiveness of dune protection; installing signage and vehicle exclusion fencing to protect swale wetlands; monitoring interdunal swale wetlands for impacts from training; and inspecting and repairing beach access walkways to prevent foot-traffic damage to dune habitats.

Shade Tree and Urban Forest Management. Shade tree and urban forest management is an important issue at DNA because of the level of development at the base. Shade tree and urban forest resources, however, are very limited and the dominant urban landscape features are mowed lawn and open field. The primary goal of urban forest management under the proposed action would be to maintain the health and integrity of the urban forest, ensure the safety of personnel and their dependents, and protect Navy real estate. Under the proposed action, natural resources staff would: review development plans that propose tree removal and provide recommendations for protection, mitigation, or selection of alternative sites; promote the use of beneficial landscaping practices; coordinate with the Virginia Department of Forestry (VDOT) to provide training in tree care; and assist with identification and removal of hazard trees.

Forest Management. Both DNA and CP have extensive forest resources. Approximately 585 acres (43 percent) at DNA and 266 acres (75 percent) at CP are forested. The forested areas, however, largely consist of forested wetlands, which are not managed for commercial timber production, but as functioning ecosystems that help improve water quality and reduce flooding by slowing storm water runoff and trapping sediment, nutrients, and other pollutants. The forested areas also provide a noise, safety, and visual buffer between military training activities and the surrounding communities, wildlife habitat, and outdoor recreation opportunities. All timber harvesting and salvage operations, including clearing land on construction sites, would be coordinated with the regional Navy forester under this alternative. Additionally, forest stands will be monitored for outbreaks of southern pine beetle and other insect and diseases.

Prescribed Burning. Conducting controlled burns is a cost-effective, practical method of reducing the potential for catastrophic wildfires in forest stands with high fuel loads, areas adjacent to firing ranges, or other areas where vegetation manipulation is desired. Prescribed burning projects that would be implemented under Alternative 2 include: implementing controlled burning in accordance with the NAS Oceana controlled burn plan; updating the plan annually to reflect accomplishments and set new goals; and maintaining firebreaks and fire lines as needed.

Fish and Wildlife Management. Under the proposed action, white-tailed deer (*Odocoileus virginianus*) populations would continue to be managed through a quality deer management program that is aimed at building an older age class of male deer and improving overall herd quality through reduced populations. Projects proposed under this alternative include administration of the base hunting and fishing program and the collection and reporting of deer harvest information to the VDGIF.

Outdoor Recreation and Environmental Awareness. The primary objectives of outdoor recreation and environmental awareness initiatives under the proposed action would be to improve the quality of life for installation personnel, their dependents, and the military community by providing for outdoor recreation opportunities to the maximum extent possible within the constraints of the military mission and capability of the natural resources; and foster understanding and awareness of the environment through educational programs. Continued administration of the regional hunting and fishing programs is the primary outdoor recreation and environmental initiative under this alternative.

Pest and Invasive Species Management. The primary objective of pest management at DNA and CP under the proposed action would be to prevent interference with military operations and preparedness by protecting infrastructure, real property, and human health and safety. The Regional Pesticide Compliance and Pest Management Plan (draft), which describes requirements, resources, responsibilities, and procedures for pest management throughout the region, would be implemented when finalized. Integrated pest management efforts would be implemented to control feral pets, Canada geese, and invasive alien plants at DNA and CP. Specific projects would include: monitoring common reed; assisting with the removal of nuisance wildlife in administrative and housing areas; and the purchase of a large cage for animal transport.

Cultural Resources. To date, four archaeological sites have been identified at DNA that require additional evaluation to determine eligibility for the National Register of Historic Places (NRHP). An archaeological survey of CP found no archaeological sites and recommended no further investigation. However, formal concurrence on this finding has not been obtained from the State Historic Preservation Officer (SHPO). Under the proposed action, the SHPO would be consulted during the planning process for new construction or other activities with potential to impact cultural resources to avoid unauthorized or accidental disturbance.

Training and Professional Development. Personnel assigned natural and cultural resources management responsibilities are required to receive training as applicable to their specific job assignments. Under the proposed action, natural resources staff would attend annual law enforcement refresher courses; ArcView, wetlands delineation and regulation, and marine mammal stranding training; and invasive species control and coastal ecology and shoreline stabilization workshops, as appropriate.

2.4.3 Alternative 3 – Enhanced Alternative

The enhanced alternative would implement all projects described in the INRMP for DNA and CP, including those proposed for implementation by Alternative 2 as well as additional environmental stewardship projects not required for compliance or maintenance. A summary of all projects described in the INRMP including implementation schedules, legal drivers, and source of funding is in Appendix B. A summary of those additional activities that would be implemented under the enhanced alternative follows.

Coastal Zone Management. The coastal zone management activities proposed under this alternative are the same as those described above for the proposed action.

Wetlands and Water Quality Protection. In addition to those projects that would be implemented under Alternative 2, the enhanced alternative includes projects that would: establish reduced and no-mowing zones along ditches and wetlands; plant appropriate native trees and shrubs where practicable; maintain a no-mowing zone around Sadler Pond to reduce bank erosion and improve water quality; coordinate with the Resident Officer in Charge of Construction (ROICC) to identify areas to enhance or establish riparian buffers and to improve the vegetative and structural best management practices (BMPs) in and around Sadler Pond drainage ditches; and pursue obtaining mitigation credit for removal of pine in swale wetlands.

Rare, Threatened, and Endangered Species. In addition to those projects that would be implemented under Alternative 2, the enhanced alternative would include consultation with the Virginia Department of Conservation and Recreation-Division of Natural Heritage (VDCR-DNH) on changes in land use or management practices for special interest areas.

Marine Resources Protection. The marine resource protection activities proposed under this alternative are the same as those described above for the proposed action.

Habitat Conservation and Restoration. The habitat conservation and restoration activities proposed under this alternative are the same as those described above for the proposed action

with the addition of the maintenance of scrub shrub and early successional habitat in the north and south outparcels through mowing and controlled burning.

Shade Tree and Urban Forest Management. In addition to those projects that would be implemented under Alternative 2, the enhanced alternative would include the development and implementation of landscaping plans for the picnic area and ball fields at Sadler Pond, the parking lot at Shifting Sands Club, and the parking lot on Regulus Avenue across from building 127.

Forest Management. The forest management activities proposed under this alternative are the same as those described above for the proposed action.

Prescribed Fire. The prescribed fire activities proposed under this alternative are the same as those described above for the proposed action.

Fish and Wildlife Management. Under the enhanced alternative, the following activities are proposed in addition to those described above for the proposed action: develop and implement a plan for redistribution of wood duck boxes, GPS new box locations, update GIS data layer and nest box data log; conduct annual inspections and maintenance of bluebird, bat and wood duck boxes and osprey platforms; monitor nesting activity at osprey nesting platforms and bluebird nest boxes; and conduct water quality surveys at Sadler Pond to assess the effectiveness of management activities around the pond.

Outdoor Recreation and Environmental Awareness. In addition to the projects that would be implemented under Alternative 2, natural resources staff would assist the Regional Outreach Specialist with the environmental awareness programs such as the National Arbor Day Foundation's Tree City USA program. Specific projects proposed under the enhanced alternative include: assisting the regional outreach specialist with the National Arbor Day Foundation's Tree City USA Program and annual Arbor Day and Earth Day events; and submitting a recertification application, forest workplan, and proclamation of support of Arbor Day to VDOF annually.

Pest and Invasive Species Management. In addition to the pest and invasive species management activities proposed under the proposed action, natural resources staff would assist in educating base personnel about the impact and health risks of loose pets and feral animals.

Cultural Resources. The cultural resources activities proposed under this alternative are the same as those described above for the proposed action.

Training and Professional Development. The training and professional development activities proposed under this alternative are the same as those described above for the proposed action.

3.0 AFFECTED ENVIRONMENT

This section describes the relevant existing environmental conditions that would be impacted by implementation of the alternatives discussed in Section 2.0. In accordance with CEQ regulations (§ 1502.15), the descriptions presented below are no longer than necessary to understand the potential effects of implementation of the proposed action or no action alternative. More detailed information on the affected environment is presented in the INRMP for which this EA was developed.

3.1 Land Use

3.1.1 Regional Land Use

DNA and CP are located in the southeastern portion of Virginia Beach on the shore of the Atlantic Ocean in Virginia. Land uses surrounding the bases include industrial, commercial, residential, recreational, and agricultural though most of the agricultural lands are rapidly being converted to residential and recreational developments. Several other military installations including NAS Oceana, Naval Amphibious Base Little Creek, and Fort Story are also located in Virginia Beach.

3.1.2 Base Land Use

DNA and CP are outlying parcels under the command of NAS Oceana. DNA is home to the Fleet Combat Training Center Atlantic (FCTCLANT) along with 13 other tenant commands. The primary land use at DNA and CP is mission support. DNA offers a number of training facilities that support the major command missions including small-arms firing ranges, weapons gunline, Fleet Composite Squadron Six (VC-6) detachment, helicopter pads, weapons compound, and beach and dune training areas. The developed portion of the base includes mission support along with operational, administrative, personnel, and housing activities. CP is used for training in special warfare, ordnance, overland assault, beach assault, and tactical air operations radar. A number of the base facilities have associated noise and safety buffers that constrain land use and resource management.

3.2 Soil Resources

The U.S. Department of Agriculture (USDA), National Resources Conservation Service (NRCS) (formerly the Soil Conservation Service [SCS]) prepared a soil survey report for Virginia Beach in 1985. The survey indicates that approximately half of the soils on DNA and CP have properties that severely constrain development. These restrictive soils include the Newhan-Duckston-Corolla association of the beaches and dunes and the very poorly drained, flood-prone Backbay-Nawney association in the marshes and swamps. The hydric soils at DNA and CP are Acredale silt loam, Backbay mucky peat, Nawney silt loam, Nimmo loam, and Tomotley loam (NRCS 1993). Forty-two percent of the soils at DNA and 57 percent of the soils at CP are hydric. Several of the soils that occur at DNA and CP are considered prime farmland soil types (USDA, SCS 1985). Forty-two percent of the area at DNA, particularly the south outparcel, and 43 percent of the area at CP is prime farmland. Other soil types mapped at DNA and CP are soils indicative of developed lands.

3.3 Water Resources

3.3.1 Groundwater

The shallow aquifer system at Virginia Beach is composed of the Columbia aquifer, the Yorktown confining unit, and the Yorktown-Eastover aquifer. The Columbia aquifer is predominantly composed of sandy surficial deposits that lie above the Yorktown confining unit. The Yorktown confining unit is composed of a series of very fine sandy to silty clay units at or near the top of the Yorktown Formation. The Yorktown-Eastover aquifer is predominantly composed of sandy deposits of the Yorktown Formation and the upper part of the Eastover Formation. The shallow aquifer system is separated from deeper units by the continuous St. Mary's confining unit.

Because of concerns about the groundwater withdrawals and declining water levels in southeastern Virginia, the entire region, including Virginia Beach, was designated a Groundwater Management Area by the state in 1976 (Smith and Harlow 2002). Potable water for DNA and CP, supplied by the City of Norfolk, comes primarily from surface water resources including Lake Prince in Suffolk and Lake Gaston on the border of Virginia and North Carolina (City of Virginia Beach 2003a).

3.3.2 Surface Water

Surface water that occurs on DNA includes approximately 56 acres of Redwing Lake, which lies in the northern portion of the base; Sadler Pond, which is within the central support area; and several small ponds such as Lotus Pond and Lilly Pond and areas of open water, which are associated with the extensive marsh system. Lake Tecumseh (also known as Brinson Lake Inlet) forms the southern boundary of DNA. The base surface water is connected to Back Bay and the Inland Coastal Waterway by open canal.

CP has no surface water other than a small portion (0.5 acre) of Lake Christine, which lies almost entirely within the State Military Reservation to the north of CP. Areas of Lovetts Marsh and a wetland mitigation site in the central portion of CP may be seasonally flooded and have minimal areas of surface water.

3.3.3 Watersheds

DNA and CP lie within the Back Bay watershed unit of the Southern Watersheds Area. The Southern Watersheds Area, as designated by the Virginia Beach Planning Department, is a collective of the North Landing River, Northwest River, and Back Bay Watersheds in Virginia Beach and Chesapeake (City of Virginia Beach 2003b). It covers approximately 325 square miles and is bordered by the Atlantic Ocean on the east, the Great Dismal Swamp on the west, and the North Carolina border on the south. The Southern Watersheds area contains extensive wetlands, including a variety of rare swamp, pocosin, and marsh communities that drain into the Albemarle-Pamlico Sound (Virginia Department of Environmental Quality 2003).

3.3.4 Floodplains

Federal Emergency Management Agency (FEMA) flood insurance rate maps indicate a large portion of DNA and CP lies within the 100-year or 500-year floodplains associated with Redwing Lake, Lake Tecumseh, the extensive wetlands on each base, and drainageways. FEMA defines the 100-year flood as an area that has a 1 percent chance of being equaled or exceeded in any given year and is the standard used by federal agencies for floodplain management. The 500-year floodplain is an area that has a 0.2 percent chance of a flood in a year. Since floodplains cover much of DNA and CP, many buildings, infrastructure, and developed areas occur within floodplains.

3.3.5 Wetlands

Wetlands mapping efforts at DNA have included the USFWS National Wetlands Inventory (NWI), which was produced through photo-interpretation of 1994 color infrared and 2000 black and white aerial photography (USFWS 2003) and a delineation of the 181-acre south outparcel for which a USACE jurisdictional determination was obtained (U.S. Navy 1995). Additional field work was conducted in the northern portion of the base by Geo-Marine Inc., wetland scientist in support of the INRMP in areas that appeared to have a higher percentage of wetlands than were previously mapped. Currently, approximately 522 acres of wetlands are mapped at DNA.

Wetlands mapping efforts at CP include a planning-level wetlands delineation produced in the early 1990s through a memorandum of agreement between the Navy and the USFWS. This delineation indicates a total of 269 acres of wetlands occur on CP. Site-specific delineations and a jurisdictional determination would be required prior to land use changes or site development that could impact wetlands at DNA and CP.

Several wetland mitigation and restoration efforts have been undertaken at DNA and CP to mitigate the loss of wetlands during site development. Included are a 13.2-acre wetland mitigation site on the north side of Redwing Lake at DNA, which was created in the early 1990s; a 2.4-acre mitigation site at CP, which was created in 1994; and an extensive restoration of Lovetts Marsh, which lies on both DNA and CP, which was undertaken in 1996. This restoration project requires additional monitoring to meet USACE requirements.

3.4 Coastal Zone Resources

The federal CZMA of 1972 provides a procedure for the states to review federal actions for consistency with their own approved coastal management program. The CZMA encourages states to preserve, protect, develop, and, where possible, restore or enhance valuable natural coastal resources such as wetlands, floodplains, estuaries, beaches, dunes, barrier islands, and coral reefs, as well as the fish and wildlife supported by those habitats. Virginia's coastal management area includes the entire Tidewater region. Although federal lands are excluded from state coastal management areas, activities on federal lands that are reasonably likely to affect use of lands or waters, or natural resources of Virginia's coastal zone must be consistent to the maximum extent practicable with the enforceable policies of the Virginia Coastal Resources Management Program (CRMP).

The Virginia CRMP establishes policies and objectives to guide the use and development of coastal management areas to ensure their protection and preservation. Included are policies on fisheries management, subaqueous lands management, wetlands, primary dunes, point and nonpoint source water pollution, air pollution, shoreline sanitation, and coastal lands management.

3.5 Vegetation

DNA and CP are located in an ecoregion classified as the Outer Coastal Plain Mixed Forest Province (Bailey 1995). This ecoregion is characterized by extensive coastal marshes and interior swamps. At DNA, however, a large portion (approximately 390 acres) of the base has been developed and now has an urban landscape that consists of impermeable surface, mowed lawn, shade trees, and ornamental trees and shrubs. Most of the remaining landscape has forested wetlands that are dominated by a mix of hardwood species (181 acres) or a mix of pine and hardwood (121 acres pine/hardwood and 117 acres hardwood/pine). Nonforested communities at DNA include marshes (70 acres), which are equivalent to the palustrine emergent and scrub shrub wetland classifications, and fallow agricultural fields (68 acres).

Other than approximately 21 acres of developed area, CP is undeveloped and is dominated by forested wetlands. Hardwood forests (145 acres) are most abundant, followed by areas of mixed hardwood/pine (53 acres) and pine/hardwood (45 acres). Planted pine occurs on about 23 acres. The beaches and dunes complex occupies 71 acres, and very small amounts of marsh (5 acres) and open water (2 acres).

A number of coastal maritime communities also occur on both installations within the beaches and dunes system. Though the specific communities have not been mapped, they include the beaches and foredunes, maritime dune woodlands, maritime evergreen forests, maritime dune grasslands, maritime scrub, and interdune ponds.

3.6 Fish and Wildlife

The diverse assemblage of forested, wetland, and coastal ecological communities at DNA and CP provides habitat that supports a wide variety of fauna. Faunal surveys at the bases have primarily consisted of observations made by VDCR-DNH during threatened and endangered species inventories (Buhlmann et al. 1992; Van Alstine et al. 2001; VDRC-DNH 1990) and incidental observations made by biologists and naturalists during other field visits (U.S. Navy 1998a, 1998b). Marine resources were assessed in a comprehensive marine resources assessment of the region (U.S. Navy 2003).

In 1990 and 1992, VDCR-DNH trapped or observed a total of 17 mammal species on DNA and CP. Large and medium-sized mammals observed were white-tailed deer, gray fox (*Urocyon cinereoargenteus*), raccoon (*Procyon lotor*), nutria (*Myocastor coypus*), opossum (*Didelphis virginianus*), eastern gray squirrel (*Sciurus carolinensis*), and eastern cottontail (*Sylvilagus floridana*). Smaller mammals were captured in pitfall traps and included several species of shrews (*Cryptotis parva*, *Blarina carolinensis*), mice (*Reithrodontomys humulus*, *Peromyscus leucopus*), voles (*Microtus pennsylvanicus*, *Microtus pinetorum*), moles (*Scalopus aquaticus*), and rats (*Oryzomys palustris*). Of the marine mammals that are likely

to utilize the waters adjacent to DNA and CP, bottlenose dolphins (*Tursiops truncatus*) are the most common.

The extensive wetlands, lakes, and wooded areas at DNA and CP provide habitat for a number of reptile and amphibian species. A total of 8 turtle species, 14 amphibian species, four lizard species, and 11 snake species are known to occur on the bases (Buhlmann et al. 1992; VDRC-DNH 1990). The most common herpetofauna to occur include the red-backed salamander (*Plethodon cinereus*), bullfrog (*Rana catesbeiana*), green frog (*Rana clamitans*), leopard frog (*Rana utricularia*), gray treefrog (*Hyla chrysocelis*), Fowler's toad (*Bufo woodhousii*), red-eared slider (*Trachemys scripta elegans*), five-lined skink (*Eumeces fasciatus*), northern fence lizard (*Sceloporus undulatus*), northern water snake (*Nerodia sipedon*), black rat snake (*Elaphe obsoleta*) and eastern garter snake (*Thamnophis carolina*). Five species of sea turtles have been recorded in the area off the DNA and CP coast. These include the loggerhead (*Caretta caretta*), Kemp's ridley (*Lepidochelys kempi*), leatherback (*Dermochelys coriacea*), green (*Chelonia mydas*), and hawksbill (*Eretmochelys imbricata*) turtles. The loggerhead is the most common sea turtle in the area and has been known to nest at DNA on occasion.

The avifaunal community at DNA and CP is diverse and reflects the wide variety of habitats available. A total of 167 species has been observed during various bird surveys conducted on the bases. DNA and CP are located in the Atlantic migratory flyway and are particularly important as stopover grounds for neotropical migrants during spring and fall migration. One large group of birds on the bases is the Passeriformes (perching birds), which utilize the forested, open grounds, and other terrestrial portions of the bases. Typical perching birds include eastern wood-pewee (*Contopus virens*), brown thrasher (*Toxostoma rufum*), ovenbird (*Seiurus aurocapillus*), red-eyed vireo (*Vireo olivaceus*), northern mockingbird (*Mimus polyglottos*), American robin (*Turdus migratorius*), northern cardinal (*Cardinalis cardinalis*), and house finch (*Carpodacus mexicanus*). Many other birds are migratory seabirds and shorebirds that can be found along the bases' shoreline at different times of the year. Common seabirds include pelicans (*Pelecanus occidentalis*), loons (*Gavia* spp.), grebes (*Podiceps auritus* and *Podilymbus podiceps*), and cormorants (*Phalacrocorax* spp.) and common shorebirds include plovers (*Charadrius semipalmatus* and *Pluvialis squatarola*) and sandpiper (*Actitis macularia*). Several species of gulls (*Larus* spp.), terns (*Sterna* spp.), ducks (*Anas* spp.), and geese (*Branta* spp.) are also common offshore and in the beach area. The DNA's lakes and ponds support a number of waterfowl, including resident and migratory ducks and geese, and wading birds such as herons, egrets, and rails. Several birds of prey that utilize various habitats at the bases are the red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), merlin (*Falco aesalon*), sharp-shinned hawk (*Accipiter velox*), northern harrier (*Circus cyaneus*), American kestrel (*Falco sparverius*), osprey (*Pandion haliaetus*), and bald eagle (*Haliaeetus leucocephalus*).

The ichthyofauna of DNA and CP include a number of native coastal plain freshwater fishes, such as gizzard shad (*Dorosoma cepedianum*), common carp (*Cyprinus carpio*), eastern mudminnow (*Umbra pygmaea*), brown bullhead catfish (*Ictalurus nebulosus*), bowfin (*Amia calva*), black crappie (*Pomoxis nigromaculatus*), and several sunfish species (*Enneacanthus obesus* and *E. gloriosus*), as well as a number of sport fishes that have been introduced into Redwing Lake, Lake Tecumseh, and Sadler Pond for recreational fishing. Introduced sport

fishes include largemouth bass (*Micropterus salmoides*), pumpkinseed (*Lepomis gibbosus*), and bluegill (*Lepomis macrochirus*) (Galvez and Swihart 2000). A large number of saltwater species are also known to occur in the coastal waters off the shore of DNA and CP. Because the area is in a transition zone between temperate and subtropical regions, the fish fauna is extremely diverse and up to 685 species are known to occur (U.S. Navy 2003).

3.7 Rare, Threatened, and Endangered Species and Significant Ecological Communities

The federally threatened loggerhead turtle, bald eagle, and piping plover (*Charadrius melodus*) are the only federally listed species known to occur at DNA, though the loggerhead turtle is the only one of these species known to nest on the base. The bald eagle is known to feed at Lake Tecumseh, but is not known to nest on either base (Watts and Byrd 2003). The piping plover has been observed along the beach at DNA, but has not been reported as nesting (Beatty 2003). No federally listed species have been documented at CP.

Besides the federally listed species, a number of species that are considered rare in the state have also been documented at DNA and CP. These species were identified during inventories of rare, threatened, and endangered species through cooperative agreements between Atlantic Division, Naval Facilities Engineering Command (LANTDIV) and the VDCR-DNH (Buhlmann et al. 1992; Van Alstine et al. 2001; VDCR-DNH 1990). The only state-rare animal species recorded at DNA is the king rail (*Rallus elegans*). The king rail is a bird that is considered very rare for breeding in Virginia. The Pungo mouse (*Peromyscus leucopus easti*), greater siren (*Siren lacertina*), and marsh rabbit (*Sylvilagus paulustris*) were documented at DNA in 1990. These species are no longer considered rare by the VDCR-DNH, though they do remain on the watch list.

State-rare plants identified in VDCR-DNH surveys at DNA, to date, include white-topped fleabane (*Erigeron vernus*), bluejack oak, fasciculate beakrush (*Rhynchospora fascicularis* var. *fascicularis*), glossy-seeded star-grass (*Hypoxis sessilis*, formerly *H. longii*), and a rush (*Juncus elliotii*). Several other plant species found at DNA that were considered rare at the time of the 1990 survey are no longer tracked by VDCR-DNH. Included are the American frog's-bit (*Limnobium spongia*), sea-coast marsh elder (*Iva imbricata*), bog rush (*Juncus validus* var. *validus*), and Carolina fimbry (*Fimbristylis caroliniana*). The bog rush and Carolina fimbry are still considered watch list species.

At CP, state-rare plant species recorded during VDCR-DNH surveys include American lipocarpa (*Lipocarpa maculata*), fasciculate beakrush, black-fruited spikerush (*Eleocharis melanocarpa*), umbrella sedge (*Fuirena breviseta*), creeping seedbox (*Ludwigia repens*), long beach seedbox (*Ludwigia brevipes*), bluejack oak, and white-topped fleabane. Several other plant species documented at CP that were previously considered rare include twig rush (*Cladium mariscoides*), spoon-leaved sundew (*Drosera intermedia*), bog rush, Carolina fimbry, and Virginia Beach pinweed (*Lechea maritima* var. *virginica*). The spoon-leaved sundew, bog rush, Carolina fimbry, and Virginia Beach pinweed are still on the state watch list.

Only one state-rare animal species, a tiger beetle (*Cicindela trifasciata*), has been documented at CP. The 2001 survey (Van Alstine et al. 2001) indicated, however, that suitable habitat exists for two other state-rare species, the comet darter (*Anax longipes*) and another rare tiger beetle (*Cicindela lepida*), and better weather may have yielded different results. Future surveys were recommended. Additional surveys for eastern or Rafinesque's big-eared bat (*Corynorhinus rafinesquii*) and a monitoring program for piping plover were also recommended.

In addition to the rare plant and animal species known to occur on DNA and CP, a number of marine species that occur in the nearshore area off the coast of the bases are state and federally listed as threatened or endangered. Included are the loggerhead turtle, green turtle, leatherback turtle, hawksbill turtle, North Atlantic right whale, humpback whale, and West Indian manatee.

Several of the ecological communities that occur on the bases are also considered significant, rare natural communities in Virginia. The interdune ponds, maritime wet grasslands, maritime evergreen forests, and maritime dune woodlands, which occur in the beaches and dunes areas, are rare natural communities that are severely threatened by coastal development throughout their natural range.

3.8 Cultural Resources

Although cultural resources are not a natural resource, their protection is discussed in the INRMP as well as this EA because of potential impacts from project implementation and development at DNA and CP. Several cultural resources surveys were conducted at DNA during the 1980s and although the base has been heavily disturbed, there have been no recent surveys of the facility. A reconnaissance level survey of areas with archaeological potential is planned in fiscal year (FY) 2007. Except for the family housing complex, which was surveyed in 2003, and found to be not eligible, no architectural surveys have been completed for DNA. The report findings are under review by the SHPO. A survey is planned in FY07 to determine the presence of historic buildings or districts.

To date, four archaeological sites have been identified at DNA that require additional evaluation to determine eligibility for the NRHP. Included are an eighteenth and nineteenth century farm site and graveyard, the dam neck mills and Coast Guard life-saving station, an earthworks dating before 1859, an antebellum farm site (called the Fresh Pond site), and a built-up earthen roadbed. A Phase I survey was conducted for the north and south outparcels at the time of acquisition and no sites were found.

An archaeological survey of CP (U.S. Navy 1987a) found no archaeological sites and recommended no further investigation. However, formal concurrence on this finding has not been obtained from the SHPO.

3.9 Air Quality

National Ambient Air Quality Standards (NAAQS) have been established by the EPA for six criteria pollutants: carbon monoxide (CO), sulfur dioxide (SO₂), particulate matter with a diameter less than or equal to a nominal 10 micrometers (PM₁₀), ozone (O₃), nitrogen dioxide

(NO₂), and lead (Pb). In addition, the CAA of 1970 requires that states with designated ozone nonattainment areas regulate volatile organic compounds (VOCs) and oxides of nitrogen (NO_x) because they are precursor pollutants to ozone formation.

DNA and CP are in EPA Region 3, Hampton Roads Air Quality Control Region. In April 2004, Hampton Roads was designated as marginal nonattainment for ozone (EPA 2004). Section 107(d)(3)(E) of the 1990 Clean Air Act Amendments (CAAA) states that the following criteria must be met in order for an area to be redesignated from nonattainment to attainment:

- The EPA has determined that the NAAQS has been attained. This standard is 0.12 parts per million (ppm) for ozone.
- The applicable State Implementation Plan (SIP) has been fully approved by the EPA under Section 110(k).
- The EPA has determined that the improvement in air quality is due to permanent and enforceable reductions in emissions.
- The state has met all applicable requirements for the area under Section 110 and Part D.
- The EPA has fully approved a maintenance plan, including a contingency plan, for the area under Section 175A.

The CAAA states that federal agencies cannot support any action that does not conform to an EPA-approved SIP. A General Conformity Rule applicability analysis is required to demonstrate that the proposed federal action conforms to the SIP. Ongoing actions and actions that are identified in the SIP are exempt from demonstrating conformity. Other actions are assumed to be in conformity if total project emissions are below a minimum threshold level (*de minimis* level) and less than 10 percent of the regional emission inventory. Projects below the *de minimis* level are not subject to the General Conformity Rule; those projects at or above the levels are required to perform a conformity analysis. *De minimis* emissions levels for areas of ozone nonattainment areas are presented in Table 3-1.

Table 3-1. *De Minimis* Exemption Levels in Nonattainment Areas.

Pollutant/Maintenance Classification	Emissions (tons/year)
Ozone (NO _x)	
Marginal nonattainment areas	100
Ozone (VOCs)	
Marginal nonattainment areas	100

3.10 Socioeconomics and Environmental Justice

Socioeconomic analyses generally provide a detailed investigation of the prevailing population, income, employment, and housing conditions of a community or area of interest. This section provides a description of these demographics within the region of influence (ROI) for the social and economic environment, which is defined as the independent cities of Norfolk and Virginia Beach in Virginia.

Environmental justice is another important aspect of a socioeconomic analysis. EO 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, requires that each federal agency ensure that achieving environmental justice is part of its mission by identifying and addressing, as appropriate, disproportionately high human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations. Each year the U.S. Census Bureau (USCB) defines the national poverty thresholds, which are measured in terms of household income dependent upon the number of persons within the household. In 2000, the average threshold was \$17,603 for a family of four and \$13,738 for a family of three (USCB 2001).

3.10.1 Demographics

In 2000, the total population within the ROI had reached 659,660, an approximate increase of 0.8 percent over the 1990 population. The population within Norfolk declined by approximately 10.3 percent to 234,403 during the period, while the population of Virginia Beach increased by 8.2 percent to 425,257 (USCB 1993, 2003).

In 2000, the demographic profile of the ROI was 61.4 percent White non-Hispanic, 27.4 percent Black or African American, 0.4 percent American Indian or Alaska Native, 4.1 percent Asian, 4.1 percent Hispanic, and 2.8 percent all other races or combination of races. The ROI would not be considered an area with a concentrated minority population. However, Norfolk with 53.1 percent of the population being minority would be considered an area with a concentrated minority population. The largest minority component population within Norfolk was Black or African American, accounting for 43.3 percent of the total population (USCB 2003).

3.10.2 Employment and Income

Unemployment in the ROI varied approximately 3.0 percent between the highest unemployment rates in 1992 and the lowest unemployment rates in 2000. Norfolk had higher unemployment rates than either Virginia Beach or the state during this period. The labor forces increased in the state and in Virginia Beach between 1990 and 2000, while the labor force in Norfolk decreased by approximately 11.4 percent. Norfolk had the highest unemployment rate of 7.4 percent in 1992. During this period, the unemployment rate in Virginia Beach was 5.3 percent, and in the state it was 6.4 percent. In 2000, the unemployment rates were 4.0 percent, 2.2 percent, and 2.2 percent in Norfolk, Virginia Beach, and the state, respectively (Bureau of Labor Statistics [BLS] 2004). Total full- and part-time employment between 1990 and 2000 fell by approximately 34,000 positions in Norfolk (Bureau of Economic Analysis [BEA] 2002a). Total employment positions during this period in Virginia Beach increased by approximately 49,000 positions (BEA 2002a).

Total personal income within the ROI nominally increased 47.9 percent to \$18.5 billion between 1990 and 2001 (BEA 2002b). Total nonfarm personal income increased 48.0 percent to \$18.5 billion and total farm personal income declined by 64.8 percent to \$3.3 million during this period (BEA 2002b). Total nonfarm earnings increased 44.5 percent to \$16.0 billion (BEA 2002b). Total personal earnings from wage and salary employment increased 117.6 percent in the finance, insurance, and real estate industry and 71.6 percent in services between 1990 and 2001 (BEA 2002b). In 2001, private earnings accounted for 57.5

percent of total earnings from wage and salary employment (BEA 2002b). Government and government enterprises accounted for the remaining 42.5 percent (BEA 2002b).

In 2000, the median household income in the ROI ranged from \$48,705 in Virginia Beach to \$31,815 in Norfolk. The per capita personal income also varied in 2000, from \$22,365 in Virginia Beach to \$17,372 in Norfolk. In 2000, the poverty rate (10.8 percent) within the ROI declined 0.1 percent over the 1990 rate (10.9 percent) (USCB 1993, 2003). Within the immediate area of DNA and CP, the combined poverty rate of the census tracts in 2000 was 11.2 percent, and in the combined block groups it was 11.0 percent (USCB 2003). None of these areas would be considered a concentrated poverty area.

4.0 ENVIRONMENTAL CONSEQUENCES

This section presents an analysis of the potential environmental consequences of the alternatives described in Section 2.0. The potential impacts to the human and natural environment are evaluated relative to the existing environment described in Section 3.0. Resource areas analyzed in this EA include land use, soil, water, vegetation, marine resources, coastal zone resources, fish and wildlife, threatened and endangered species, cultural resources, air quality, socioeconomics, and environmental justice. Environmental consequences are evaluated relative to the existing environment

Land use would be impacted if natural resources management activities caused inconsistencies that reduced the viability of existing land use activities; created threats to public health, safety, and welfare of adjacent or nearby land users; or conflicted with the military mission. Soils would be impacted if current or proposed activities resulted in severe soil loss such that the areas could no longer maintain the existing land use or caused sedimentation in adjacent water bodies. Impacts to biological resources would be significant if species or habitats of concern are adversely affected or disturbances cause reductions in population size or distribution of a species of concern. Water resources would be impacted if activities resulted in a change to the groundwater or surface water quantity or quality and wetlands. Impacts to cultural resources would occur if natural resources management activities resulted in disturbance to significant historic structures or archaeological deposits. Air quality would be impacted if activities resulted in an exceedance of the NAAQS, exceedance of *de minimis* exemption levels, or the exposure of sensitive receptors to increased pollutant concentrations. Socioeconomic resources would be impacted if activities resulted in a change to the population, employment, or income potential of DNA, CP and the ROI. Environmental justice impacts would be considered if minority and/or low-income populations within or adjacent to DNA and CP would experience disproportionate adverse effects from implementing the current or proposed natural resources management activities.

The natural resources management activities evaluated were designed to avoid negative environmental impacts and include planning measures for compliance with applicable laws and regulations. Therefore, none of the activities are currently being conducted nor any of the project actions recommended in the preferred or enhanced alternatives would have the potential to cause significant environmental impacts. The proposed action (Alternative 2) would provide greater environmental benefits than continuing the no action alternative (Alternative 1) because many additional management issues are addressed in the proposed INRMP and most management recommendations provided in the current natural resources plans have been completed. The enhanced alternative (Alternative 3) would provide additional benefits to the environment through the implementation of projects that are beyond the compliance level. The environmental consequences of each alternative are summarized in Table 4-1.

Table 4-1 Comparison of Alternatives.

Resource	Alternative 1 No Action Alternative	Alternative 2 Proposed action	Alternative 3 Enhanced Alternative
Land Use	No change	Positive effects on the bases' ability to sustain military land use through protecting soil and water resources and providing information for future land planning.	Same as Alternative 2 with enhancement of existing land use resulting from landscaping of select urban areas.
Soil Resources	No change	Positive effects from review of soil erosion and control plans, implementation of dune protection and monitoring, and installation of vehicle exclusion fencing.	Same as Alternative 2 with additional benefits to soil resources resulting from implementing BMPs around Sadler Pond drainage ditches to reduce soil erosion.
Water Resources	No change	Positive effects from review of permitting requirements, compliance with wetlands regulations, and implementation of projects including basewide wetlands delineation and implementing BMPs to minimize impacts to water quality from sedimentation.	Same as Alternative 2 with additional benefits from use of BMPs and reduced mowing around Sadler Pond drainage ditches, conducting water quality monitoring at Sadler Pond, and increasing riparian buffers in other areas.
Marine Resources	No change	Positive impacts to marine resources could result from nightly surveys of beaches for sea turtle tracks and nests and providing sea turtle identification training.	Same as Alternative 2
Coastal Zone Resources	No change	Positive effects from protecting implementing dune protection and monitoring, installation of vehicle exclusion fencing, and from the review of projects to ensure consistency with the Virginia CZMP.	Same as Alternative 2
Vegetation	No change	Positive effects from invasive species control, monitoring tree disease and insect infestation, and conducting controlled burns.	Same as Alternative 2 with additional benefits from improved landscaping at select urban locations

Table 4-1. Comparison of Alternatives (cont'd).

Resource	Alternative 1 No Action Alternative	Alternative 2 Proposed action	Alternative 3 Enhanced Alternative
Fish and Wildlife	No change	Positive effects from game and nongame management and habitat management, the conservation and enhancement of the natural habitats, administering installation hunting and fishing programs, and maintenance of early successional habitat, improved base awareness of feral pet issues.	Same as Alternative 2 with additional benefits from the distribution, maintenance, and monitoring of osprey platforms, bat, bluebird and wood duck boxes.
Threatened and Endangered Species	No change	Positive effects from rare species surveys, tracking of species status, and compliance with regulations.	Same as Alternative 2 with additional benefits resulting from consultations with VDCR-DNH to ensure that future land use changes would not affect rare species habitat.
Cultural Resources	No change	Positive impacts to undiscovered cultural resources from consultation with SHPO during project planning.	Same as Alternative 2
Air Quality	No change	Minimal effect from prescribed fire; action is in conformity with State Implementation Plan.	Same as Alternative 2
Socioeconomics	No change	No change to population, income, or employment.	Same as Alternative 2
Environmental Justice	No change	No disproportionately high adverse impact on minority or low-income populations.	Same as Alternative 2

4.1 Alternative 1 – No Action Alternative

Under the no action alternative, natural resources would continue to be managed in accordance with existing plans and programs. However, without implementation of the INRMP, future actions and projects would not be planned and accounted for as required by the SAIA. Baseline conditions of the affected environment would not change under the no action alternative, nor would the full benefits realized under the INRMP be achieved.

4.1.1 Land Use

Selecting the no action alternative would not adversely impact land use on DNA and CP since the continuation of the current natural resources program would not reduce the capability of lands to support the military mission nor affect surrounding land use. Whereas mission activities must consider protection measures for natural resources as part of standard operating procedures, implementation of the natural resources program does not formally constrain mission activities or dictate land use. Mission security and safety and/or regulatory requirements are primary considerations for imposing land use restrictions.

4.1.2 Soil Resources

Under the no action alternative, baseline conditions for soil resources would continue at DNA and CP. Digital maps of base soils would continue to be used for planning purposes to protect and manage soil resources. In addition, sediment control plans and BMPs would continue to be used to minimize potential impacts from soil disturbance.

4.1.3 Water Resources

Selection of the no action alternative would not result in changes to the baseline condition of water resources at DNA and CP. Management actions would continue to be conducted in accordance with state and federal regulations for water quality and wetlands protection. Review of permitting requirements for storm water management plans and compliance with wetlands regulations would continue under the current management program. Implementation of current natural resources management practices such as erosion and sediment control measures and BMPs would continue to protect water resources.

4.1.4 Marine Resources

Selecting the no action alternative would not change baseline conditions for marine resources due to the continuation of current management practices. The Navy would continue to comply with any relevant regulations prior to implementing an action having the potential to impact these protected resources. Sightings of stranded marine mammals or sea turtles on DNA and CP beaches would also continue to be reported to the Virginia Marine Science Museum's Stranding Center.

4.1.5 Coastal Zone Resources

There would be no change to coastal zone resources under the no action alternative. All projects and actions would continue to be consistent to the maximum extent possible with the Virginia CRMP.

4.1.6 Vegetation

Selecting the no action alternative would not result in adverse impacts to vegetation resources since current management practices would continue. No additional vegetative management actions would be implemented; therefore, benefits from invasive species control, oversight of the regional tree protection and replacement instruction, riparian buffer enhancements, and other habitat enhancement would not be achieved.

4.1.7 Fish and Wildlife

Selecting the no action alternative would not result in adverse impacts to fish and wildlife resources since current management practices would continue. Positive effects would continue through the management of important habitats.

4.1.8 Rare, Threatened, and Endangered Species

Under the no action alternative, there would be no effect to threatened and endangered species since current management practices and abidance of regulations would continue. Prior to any planned disturbance appropriate regulatory agencies would be contacted concerning threatened and endangered species protection.

4.1.9 Cultural Resources

Selecting the no action alternative would not change baseline conditions for cultural resources due to the continuation of current management practices. Protection and management of cultural resources under the no action alternative would continue as a compliance requirement in the natural resources program. Section 106 consultations would be conducted as necessary with the SHPO prior to implementing any ground-disturbing activities.

4.1.10 Air Quality

Implementing the no action alternative would not change the local or regional air quality. There are no stationary pollution sources involved in the current natural resources management programs.

4.1.11 Socioeconomics and Environmental Justice

Implementing the no action alternative would not result in significant impacts to the social or economic resources within the ROI. Under this alternative, natural resources management at DNA and CP would continue to follow existing natural resources management plans and no additional activities would be undertaken. This alternative would not increase regional spending; therefore, there would not be any effects to the employment or income of the ROI.

Additionally, since there would be no new employment opportunities, there would be no changes to the population or demographics due to this alternative. Since there would be no social or economic impacts associated with this alternative, there would be no impacts to minority or low-income populations within the ROI. Therefore, implementing this alternative would not result in environmental justice impacts.

4.2 Alternative 2 – Proposed Action

Selecting the proposed action would implement a broad range of natural resources management activities and practices, which support Navy policy ecosystem management. Adaptive management would be used to assess and improve management practices and help ensure stated objectives are achieved. Baseline conditions would remain unchanged or improve under this alternative.

4.2.1 Land Use

Implementing the proposed action would not result in change to land use, would not impact existing or future land uses in terms of achieving the military mission, and would not affect planned land uses in the regional area. However, benefits to DNA's and CP's ability to sustain military training and other land use by maintaining ecosystem integrity would result by protecting soil and water resources and providing information for future land use management decisions. Delineation of wetlands and other natural resources management actions would provide basic information for planning purposes. Implementing the proposed action would not result in adverse impacts to land use or impact planned land uses in the regional area.

4.2.2 Soil Resources

Implementation of the proposed action would not result in adverse impacts, but would create positive effects on soil resources. Review of erosion and sediment control plans; implementation of dune protection, restoration, and monitoring; and installation of vehicle exclusion fencing would protect soil resources at DNA and CP.

4.2.3 Water Resources

Implementation of the proposed action would result in positive effects on water resources. Under Alternative 2, water resources would continue to be protected in accordance with state and federal water quality and wetlands protection laws. Additional projects that would enhance water quality and protect and enhance wetlands include: conducting basewide wetlands delineation and obtaining jurisdictional determination; obtaining required state and federal wetlands protection permits; developing wetlands mitigation plans as needed; ensuring that wetlands at Southeast Redwing Lake Special Interest Area are not impacted by runoff; and conducting water quality surveys at Sadler Pond. Avoiding development in wetland areas and forest riparian buffers and implementing other BMPs would minimize impacts to water quality and wetlands from sedimentation. In addition, wetlands protection would enhance groundwater recharge, surface water quality, and floodplain protection.

4.2.4 Marine Resources

Positive effects would occur as a result of implementation of the proposed action. As with Alternative 1, the Navy would continue to comply with any relevant regulations prior to implementing an action having the potential to impact these protected resources. Sightings of stranded marine mammals or sea turtles on DNA and CP beaches or in the bay would also continue to be reported to the Virginia Marine Science Museum's Stranding Center. Additionally, nightly beach monitoring for sea turtles and training in the identification of sea turtle tracks and nests will ensure that nests are identified and protected.

4.2.5 Coastal Zone Resources

There would be benefits to coastal zone resources as a result of implementing the proposed action. Proposed management activities that would benefit coastal zone resources include the protection, enhancement, and monitoring of dunes, interdunal swales and their vegetation, vehicle exclusion in significant dune habitats, and maintenance of designated beach access walkways. All projects and actions would be reviewed to ensure consistency with the Virginia CZMP to the maximum extent practicable.

4.2.6 Vegetation Resources

Under the proposed action, there would be overall positive short- and long-term impacts to vegetation resources at DNA and CP. Implementing hardwood control measures in Lovetts Marsh and monitoring and controlling common reed at Redwing Lake and other sites would enhance the integrity of the natural ecological communities. The use of beneficial landscape practices including use of native species in landscaping and the review of development plans to minimize or mitigate the loss of trees would provide benefits to vegetative communities. Using controlled burning to reduce fuel loads and maintaining firebreaks and fire lines will help prevent the occurrence of wildfire that could destroy vegetative communities.

4.2.7 Fish and Wildlife Resources

Implementing the proposed action would result in positive effects on fish and wildlife populations and game and nongame management activities. Because of the high level of development in the region and at DNA and CP, the conservation and enhancement of the remaining natural habitats is important to protecting the bases' wildlife resources. Conservation efforts would focus on maintaining a diversity of habitats that provide year-round food and cover for wildlife. Administering the hunting and fishing programs and reporting deer harvest data to VDGIF would support the game management on the installation.

4.2.8 Rare, Threatened, and Endangered Species

Implementation of the proposed action would have positive effect on federally listed species. All state and federal threatened and endangered species protection laws would continue to be complied with under the proposed action. Because state and federal lists of threatened and endangered species change over time, careful tracking and periodic field surveys are needed to monitor the potential presence of threatened and endangered species. In addition to these

ongoing activities, obtaining an updated rare, threatened, and endangered species survey, would result in positive impacts to these resources.

4.2.9 Cultural Resources

Implementation of the proposed action would result in positive impacts to cultural resources due to the integration of natural resources programs and projects with the cultural resources management plans for DNA and CP. The four archaeological sites that have been identified at DNA that require additional evaluation to determine eligibility for the NRHP would continue to be protected under Alternative 2. Although no structures at CP are eligible for list on the NRHP, it is possible that unknown archaeological resources may be disturbed by ground-disturbing activities. To avoid accidental disturbance, the SHPO would be consulted during the planning of any activity with the potential to impact cultural resources to ensure compliance with applicable laws.

4.2.10 Air Quality

Under the proposed action, impacts to air quality would be the same or slightly greater than the no action alternative. Prescribed burning would be the only activity proposed in the INRMP with the potential to impact air quality. Prescribed fire would be used for the hazardous fuels reduction and wildlife habitat enhancement. Prescribed fires would be implemented in compliance with all applicable laws and regulations related to air quality, including the 1998 EPA Interim Air Quality Policy of Wildland and Prescribed Fires, to minimize air pollutant emissions and prevent deterioration of air quality and NAAQS violations. Potential air quality impacts have been addressed by conducting an applicability analysis and estimating emissions.

Applicability Analysis

The major pollutants from prescribed fires would be PM₁₀, CO, and VOCs. NO_x emissions would be emitted at a relatively low rate and SO_x emissions would be negligible (EPA 1996). To ensure federal actions do not interfere with the state's timely attainment of the NAAQS, the CAA requires that federal agencies demonstrate that their actions in nonattainment and maintenance areas conform to the purposes of the SIP.

Section 93.153 of the General Conformity Rule of the CAA sets the applicability requirements for projects subject to the rule through the establishment of *de minimis* levels for annual criteria pollutant emissions. These *de minimis* levels are set according to criteria pollutant nonattainment area designations. Projects below the *de minimis* threshold are not subject to the rule, while those at or above the levels are required to perform a conformity analysis as established in the rule.

To determine the applicability of the General Conformity Rule to the proposed action, potential emissions were estimated for the ozone precursor pollutants NO_x and VOC. VOC emissions are represented by total hydrocarbon (as methane [CH₄] a primary source of VOC from wildfires). The *de minimis* for marginal nonattainment areas for ozone is 100 tons per year for each ozone precursor pollutant. Emissions from other management activities, such as heavy equipment operation and soil disturbance, were considered to be negligible and

were not included in this analysis. The following assumptions and methodology were used to estimate potential emissions from the proposed action:

7. Emissions factors were based on estimated fuel consumed by wildfires in forests in the southern U.S. (EPA 1996).
8. Emissions were estimated using the following equation, in accordance with EPA procedures for estimating atmospheric emissions from forest fires:

$$E_i = P_iLA$$

Where:

- P_i = yield for pollutant "i" (mass of pollutant/unit mass of forest fuel consumed)
 - = 24 pounds/ton for total hydrocarbon (as CH₄)
 - = 4 pounds/ton as NO_x
- L = fuel loading consumed (average fuel loading for the southern United States is 9 tons/acre [mass forest fuel/unit land area burned])
- A = land area burned
- E = total emissions of pollutant "i" (mass pollutant)

Total estimated emissions for CH₄ and NO_x would be 0.12 tons per acre burned and 0.02 ton per acre burned, respectively. As shown in Figure 4-1, the *de minimis* value of 100 ton per year for CH₄ would be exceeded if controlled burning were conducted on more than 900 acres per year. The *de minimis* value for NO_x would not be exceeded. Under no circumstances would the number of acres burned approach 900 acres and exceed the *de minimis* levels for CH₄ emissions. Therefore, impacts to air quality would not be significant and the General Conformity Rule does not apply to the proposed action. A signed Record of Non-Applicability (RONA) of the General Conformity Rule is in Appendix D.

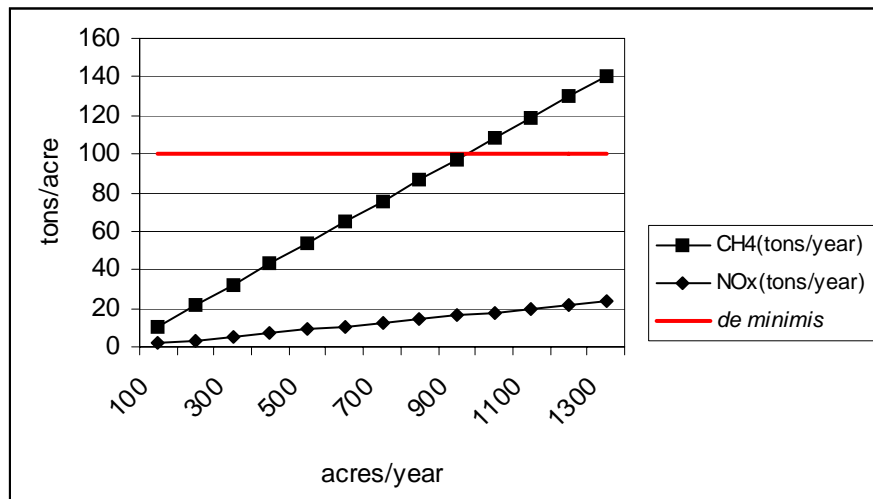

Figure 4-1. Estimated CH₄ and NO₂ Emissions from Prescribed Fire.

4.2.11 Socioeconomics and Environmental Justice

Selecting Alternative 2 would not result in negative impacts to the social or economic resources within the ROI. Under this alternative, DNA and CP would undertake those Navy Level 1 natural resources management activities recommended in the INRMP. Social and economic benefits generated through implementation of this alternative include improved water quality, increased conservation benefits, increased recreational opportunities, and increased conservation awareness through educational programs. Since there would be no adverse social or economic impacts associated with this alternative there would be no adverse impacts to minority or low-income populations within the ROI. Therefore, selecting this alternative would not result in environmental justice impacts.

4.3 Alternative 3 – Enhanced Alternative

Selecting the enhanced alternative would implement all of the projects proposed under the proposed action as well as additional projects not considered compliance or maintenance projects. Like the proposed action, the enhanced alternative would support Navy ecosystem management, as well as environmental stewardship.

4.3.1 Land Use

As with the proposed action, the enhanced alternative would not result in change to land use, would not impact existing or future land uses in terms of achieving the military mission, and would not affect planned land uses in the regional area. The benefits to DNA's and CP's ability to sustain military training and other land use by maintaining ecosystem integrity would be the same as that realized by implementing the proposed action. Under the enhanced alternative, enhancement to current land use would result from the proposed landscaping of the ball fields at Sadler Pond.

4.3.2 Soil Resources

Under the enhanced alternative, all the projects proposed by the proposed action would be carried out and benefits to soil resources would be the same. Additional benefits would result from an additional project, improving vegetative and structural BMPs around the Sadler Pond drainage ditches, which would stabilize banks and reduce soil erosion.

4.3.3 Water Resources

Implementing the enhanced alternative would result in the all of the programs and benefits to water resources described for the proposed action. Additional benefits to water resources would result from the establishment of riparian buffers, and the implementation of BMPs including reduced mowing and no-mowing areas adjacent to drainage ditches and wetlands including Sadler Pond.

4.3.4 Marine Resources

If the enhanced alternative were chosen, the same projects proposed by the proposed action would be carried out and benefits to marine resources would be the same as those resulting from the proposed action.

4.3.5 Coastal Zone Resources

If the enhanced alternative were chosen, the same projects proposed by the proposed action would be carried out and benefits to coastal zone resources would be the same as those resulting from the proposed action.

4.3.6 Vegetation Resources

If the enhanced alternative were chosen, the same projects proposed by the proposed action would be carried out and benefits to vegetation resources would be the same as those resulting from the proposed action.

4.3.7 Fish and Wildlife Resources

Implementing the enhanced alternative would result in all of the programs and benefits to fish and wildlife resources described for the proposed action. Additional benefits to nongame wildlife would be realized from the distribution, maintenance, and monitoring of osprey platforms, bat, bluebird, and wood duck boxes, and education efforts concerning loose pets and feral animals.

4.3.8 Rare, Threatened, and Endangered Species

Implementation of the enhanced alternative would result in the same projects proposed by the proposed action being carried out and the same benefits to threatened and endangered species as those recognized under the proposed action. In addition to those projects proposed by the proposed action, the enhanced alternative proposes consultations with VDCR-DNH on any changes in land use or management practices for special interest areas were contemplated, reducing the risk that future development would have on these resources.

4.3.9 Cultural Resources

Under the enhanced alternative, the same coordination described for the proposed action is proposed. Therefore, the positive impacts to cultural resources would be the same under this alternative.

4.3.10 Air Quality

The impacts to air quality under the enhanced alternative are expected to be the same as those resulting from implementation of the proposed action. None of the additional projects proposed by the enhanced alternative is expected to result in measurable impacts to air quality.

4.3.11 Socioeconomics and Environmental Justice

The impacts to socioeconomics and environmental justice under the enhanced alternative are expected to be the same as those resulting from implementation of the proposed action. None of the additional projects proposed by the enhanced alternative is expected to result in measurable impacts to these resources.

4.4 Cumulative Impacts

Cumulative impacts are the incremental impacts of an action when added to the impacts of other federal or nonfederal past, present, or reasonably foreseeable future actions. Implementing any of the alternatives analyzed in this EA would not result in any negative cumulative impacts to the environment at or in the vicinity of DNA and CP.

In addition to the current management practices conducted at the installation, the proposed action and enhanced action alternatives would implement projects that directly support regional ecosystem management initiatives and would enhance and protect the human and natural environment, including state and federally listed threatened and endangered species. Monitoring programs, annual reviews, and five-year reviews of the INRMP would allow continuous reassessment of management goals and objectives (adaptive management) and would help to avoid undesirable cumulative impacts. Additionally, appropriate NEPA procedures and coordination with stakeholders such as the USFWS and VDGIF would be undertaken for any actions that could result in cumulative impacts.

DNA and CP are two of 22 Navy installations (including annexes and other supporting facilities) in the Mid-Atlantic region. In order to minimize cumulative impacts and conflicts with current and future planned actions on Navy lands, the Navy has developed a Regional Shore Infrastructure Plan (RSIP) (U.S. Navy 2002). The goal of the RSIP is to optimize use of Navy land, facilities, and infrastructure to achieve maximum cost-effectiveness and operational efficiency. The RSIP is a planning process that includes facility programming and site planning. Land use changes, construction, renovations, and other actions resulting from RSIP recommendations would require appropriate NEPA analysis and documentation. No cumulative impacts would result from any foreseeable future actions of the RSIP and implementation of the proposed INRMP.

The proposed INRMP would complement Navy planning efforts and would provide information on sensitive resources and other natural resources issues that must be considered in developing an overall regional vision and land use zones. Regional and base environmental protection and land use planning initiatives consulted during the development of the proposed INRMP that would avoid or minimize cumulative impacts and conflicts in management include:

- Mid-Atlantic RSIP (U.S. Navy 2002);
- Draft Dam Neck and Camp Pendleton Ocean Coast Beach and Dune Assessment Evaluation (VIMS 2004);
- Spill Prevention, Control, and Countermeasures Plan and Oil Discharge Contingency Plan, Naval Air Station Oceana, Dam Neck Annex (U.S. Navy. 2000a); and

- Storm Water Pollution Prevention Plan, Naval Air Station Oceana, Dam Neck Annex, Virginia Beach, Virginia (U.S. Navy 2000b).

4.5 Irreversible and Irrecoverable Commitment of Resources

Irreversible and irretrievable resource commitments are related to the use of nonrenewable resources and the effects that the uses of these resources have on future generations. Irreversible effects primarily result from the use or destruction of a specific resource (such as energy and minerals) that cannot be replaced within a reasonable time frame. Irretrievable resource commitments involve the loss in value of an affected resource that cannot be restored as a result of the action (such as extinction of a threatened or endangered species or the disturbance of a cultural resources site).

For the preferred and enhanced alternatives, most resource commitments are neither irreversible nor irretrievable. Most impacts are short-term and temporary, or longer lasting but negligible. Implementation of the proposed action would, however, require the use of energy for natural resources management activities. This energy would be in the form of fossil fuels and labor and would be used as these activities continue.

5.0 COORDINATION AND PUBLIC INVOLVEMENT

In accordance with the SAIA, DNA and CP have worked cooperatively with the USFWS and VDGIF to ensure that the INRMP reflects the mutual agreement of these agencies concerning the conservation, protection, and management of fish and wildlife resources on the installations. Copies of the Draft INRMP were provided to these agencies for review. All comments were considered in the preparation of the final INRMP, and letters of mutual agreement from each agency were obtained (Appendix D).

To facilitate public involvement, also required by the SAIA, a copy of the Draft INRMP was placed in the Virginia Beach Public Library, Central Library Branch for one month and a notice announcing its availability was published in *The Virginian-Pilot* newspaper for three days (see Appendix D). No comments were received from the public.

The following persons and agencies were consulted in preparation of the INRMP:

Federal Agencies

Karen Mayne
U.S. Fish and Wildlife Service
Virginia Field Office
Gloucester, Virginia

Marvin E. Moriarty
U.S. Fish and Wildlife Service,
Region 5
Hadley, Massachusetts

State Agencies

Raymond T. Fernald
Nongame and Environmental Programs
Virginia Department of Game and Inland Fisheries
Richmond, Virginia

Nancy Van Alstine
Virginia Department of Conservation and Recreation, Division of Natural Heritage
Richmond, Virginia

6.0 LIST OF PREPARERS

Joseph Campo, Ph.D.
Sr. Wildlife Biologist/Forester
Geo-Marine, Inc.

Meegan Wallace
Environmental Project Manager
Geo-Marine, Inc.

Paul A. Block
Environmental Scientist/Ecologist
Geo-Marine, Inc.

Rae Lynn Schneider
NEPA Project Manager/Economist
Geo-Marine, Inc.

Elizabeth Pruitt
Program Manager
Geo-Marine, Inc.

APPENDIX B
Project Summary Table

DNA and CP Natural Resources Implementation Schedule (2005-2009).

Project #	Project Description	INRMP Page Ref.	Implementation Schedule (FY)	Prime Legal Driver/ Initiative¹	Class²	Navy Level³	NEPA	CCD
Coastal Zone Protection								
1	Review base plans and proposed actions to ensure consistency with the Virginia CZMP and help obtain a coastal zone consistency determination.	4-8, 4-13 5-1, 5-5	As needed	H	0	1	No	No
Wetlands/Water Quality Protection								
2	Conduct basewide wetlands mapping.	4-3, 4-6	2006	G, K, L, Q	II	1	No	No
3	Obtain USACE jurisdictional determinations as required.	4-3, 4-6	As needed	G, K, L, Q	II	1	No	No
4	Coordinate with the ROICC to identify additional areas to enhance or establish riparian buffers.	4-3, 4-6	2006	K, Q	III	2	No	No
5	Establish reduced mowing and no mowing zones along identified ditches and wetlands, and plant appropriate native trees and shrubs where practicable.	4-3, 4-6	2006	K, Q	III	2	No	No
6	Maintain a no mowing zone around the perimeter of Sadler Pond to reduce bank erosion and improve water quality.	4-4, 4-7	Ongoing	K, Q	III	2	No	No
7	Coordinate with the ROICC and establish improved vegetative and structural BMPs in and around the drainage ditches that drain into Sadler Pond.	4-5, 4-7	2005	G, I, K, Q	III	2	No	No
8	Review sedimentation control plans for disturbances > 10,000 square feet and SWP3s for disturbances > than 1 acre.	4-3, 5-3	Ongoing	G, I, K, Q	0	1	Yes	Yes
9	Assist action proponents in applying for, reviewing, and obtaining required state and federal wetlands protection permits.	4-3, 5-3	Ongoing	G, H, I, K, Q	0	1	Yes	Yes
10	Develop site-specific plans on an as-needed basis for wetland mitigation sites on the fallow agricultural fields in the south outparcel.	4-8	Recurring	G, K	II	1	Yes	Yes

DNA and CP Natural Resources Implementation Schedule (2005-2009) (cont'd).

Project #	Project Description	INRMP Page Ref.	Implementation Schedule (FY)	Prime Legal Driver/ Initiative¹	Class²	Navy Level³	NEPA	CCD
11	Reassess conditions in the Southeast Redwing Lake Wetlands Special Interest Area to determine if sewage and runoff are impacting the wetlands. Work with PWC personnel to correct the issue, if necessary	4-9	2005	G, K	II	1	No	No
12	Contact the Norfolk District USACE to pursue obtaining mitigation credit for removal of pine in swale wetlands in the Interdunal Swale, Dune, and Freshwater Marsh Special Interest Area	4-9	2005	G, K	III	4	No	No
13	Monitor the Lovetts Marsh wetland mitigation site, and implement additional hardwood control and water level manipulations as required to achieve restoration goals.	5-3	Annual	G, K	I	1	No	No
Rare, Threatened, and Endangered Species Protection								
14	Restrict use of special interest areas to protect state and federal rare species and significant habitats.	4-15, 5-5	Ongoing	A, B, C, F	0	1	No	No
15	Arrange a consultation with the VDCR-DNH if changes in land use or management practices for special interest areas are contemplated	4-13	As Needed	A, B, C, F	III	2	No	No
16	Schedule an update to the rare, threatened, and endangered species and significant natural communities survey..	4-13, 5-5	2006	A, B, C, F	II	1	No	No
17	Conduct nightly beach monitoring from mid-May through mid-August following the sea turtle monitoring protocol (Appendix E).	4-13, 5-5	Annual	F, T	0	1	No	No
18	Provide annual sea turtle track and nest identification training and assist in the identification of marine resources as needed.	4-14, 5-5	Recurring	F, T	0	1	No	No
Marine Resources Protection								
19	Coordinate with and obtain the required permits from the state and federal agencies for any installation activities with potential to impact marine resources.	4-14, 5-5	Recurring	F, H, T	0	1	Yes	Yes

DNA and CP Natural Resources Implementation Schedule (2005-2009) (cont'd).

Project #	Project Description	INRMP Page Ref.	Implementation Schedule (FY)	Prime Legal Driver/ Initiative¹	Class²	Navy Level³	NEPA	CCD
20	Maintain a database of all strandings that occur on DNA and CP.	4-14, 5-5	Ongoing	F, T	0	1	No	No
21	Ensure any sea turtle and marine mammal strandings are reported to the Virginia Marine Science Museum's Stranding Center.	4-14, 5-5	Ongoing	F, T	0	1	No	No
Habitat Conservation and Restoration								
22	Implement dune protection and restoration measures including installing fencing, posting informational signs, and planting beach grasses.	4-14, 5-5	Recurring	A, B, C, H	II	1	No	No
23	Initiate a long-term monitoring plan to assess the effectiveness of dune protection efforts.	4-14, 5-5	2005	A, B, C, H	II	1	No	No
24	Install vehicle exclusion fencing and use signage to protect interdunal swale wetlands.	4-13	As Needed	A, G, H, O	II	1	No	No
25	Monitor interdunal swale wetlands for impacts from training and off road vehicles.	4-13	Recurring	A, G, H, O	0	1	No	No
26	Conduct periodic inspections and repairs on the beach access walkways to ensure safety and utilization.	4-15	Recurring	H	II	1	No	No
27	Maintain vegetation within portions of the north and south outparcels through a combination of mowing and controlled burning to provide a variety of grassland and scrub shrub habitats.	4-10	Annual	A, B, C	III	2	No	No
Shade Tree and Urban Forest Management								
28	Review all development plans and actions where tree removal is proposed and provide recommendations for tree protection, mitigation for lost trees, or selection of alternate sites.	4-4	Ongoing	C, P, S	0	1	No	No
29	Promote the use of beneficial landscaping practices and the importance of using native species in landscaping.	4-4	Ongoing	C, P, S	0	1	No	No

DNA and CP Natural Resources Implementation Schedule (2005-2009) (cont'd).

Project #	Project Description	INRMP Page Ref.	Implementation Schedule (FY)	Prime Legal Driver/ Initiative¹	Class²	Navy Level³	NEPA	CCD
	Develop and implement landscaping plans for:	4-3						
30	Picnic area and ball fields at Sadler Pond		2006	A, C, P, S	III	2	No	No
31	Parking lot at Shifting Sands Club		2007	A, C, P, S	III	2	No	No
32	Parking lot on Regulus Ave. across from Build. 127.		2008	A, C, P, S	III	2	No	No
33	Coordinate with VDOF to provide pruning and tree care instruction for the ROICC, Disaster Preparation Team, and others concerned with tree care. Provide training sessions on an as-needed basis.	4-4	Recurring	C, P, S	0	1	No	No
34	Assist with identifying and removing hazard trees.	4-4	Ongoing	A, C, P, S	0	1	No	No
Forest Management								
35	Coordinate with the regional forester to assess the impacts of any proposed MILCON projects on forestlands and, where practicable, arrange timber sales.	4-9	Ongoing	A, B, C	0	1	Yes	Yes
36	Coordinate timber harvesting or salvage operations with the regional forester.	4-9	Recurring	A, B, C	0	1	Yes	Yes
37	Monitor forest stands to control southern pine beetle and other insect and disease outbreaks.	4-9	Recurring	A, B, C, E	0	1	No	No
Prescribed Fire								
38	Implement controlled burning to reduce fuel loads and enhance wildlife habitat in accordance with the NAS Oceana controlled burn plan.	4-9	Recurring	A, B, C, E	0	1	No	No
39	Update the NAS Oceana controlled burn plan annually to reflect accomplishments and set new goals.	4-9	Annual	A, B, C, E	0	1	No	No

APPENDIX C
Record of Non-Applicability

RECORD OF NON-APPLICABILITY
IN ACCORDANCE WITH THE
CLEAN AIR ACT - GENERAL CONFORMITY RULE
FOR
IMPLEMENTATION of the INTEGRATED NATURAL RESOURCE MANAGEMENT PLAN
(INRMP)
AT
NAVAL AIR STATION OCEANA, DAM NECK ANNEX and CAMP PENDLETON,
VIRGINIA

August 15 2006

The Clean Air Act (CAA) requires federal actions in air pollutant non-attainment or maintenance areas to conform to an applicable State Implementation Plan (SIP). The SIP is designed to achieve or maintain an attainment designation of air pollutants as defined by the National Ambient Air Quality Standards (NAAQS). The regulations governing this requirement are found in 40 CFR Parts 51 and 93, also known as the "General Conformity Rule". The subject facilities are located in the Hampton Roads Intrastate Air Quality Control Region in Virginia, which is currently under a maintenance plan for the control of ozone through the control of the ozone precursor compounds: Nitrogen oxides (NO_x) and Volatile Organic Compounds (VOCs). As a result, the proposed action must comply with the requirements of the General Conformity Rule.

The Navy proposes to develop and implement an INRMP consistent with the military use of the property and the goals and objectives established in the SAIA. The goal of the INRMP is to implement an ecosystem-based natural resources program that provides for conservation of natural resources in a manner that is consistent with the military mission; integrates and coordinates all natural resources management activities; provides for sustainable multipurpose uses of natural resources; and provides for public access for use of natural resources subject to safety and military security considerations.

Provisions in the CAA regulations (40 CFR Sect 51.853(c)(1)) allow for exemptions from performing a conformity determination if total emissions of individual non-attainment or maintenance area pollutants resulting from the action fall below specific threshold values (i.e., *de minimis* levels). As demonstrated by the information in Figure 1, the change in the levels of NO_x and VOCs caused by this proposed action do not exceed the *de minimis* levels of 100 tons per year for each. Therefore, the action is exempt from requirements of the General Conformity Rule.

To the best of my knowledge, the information provided is correct and accurate and I concur in the finding that the proposed implementation of the INRMP will conform to the SIP.

**NAVAL AIR STATION OCEANA, DAM NECK ANNEX and CAMP PENDLETON,
VIRGINIA**

Applicability Analysis

To determine the applicability of the General Conformity Rule to the proposed action, potential emissions were estimated for actions related to prescribed burning, for the ozone precursor pollutants NO_x and VOC. VOC emissions are represented by total hydrocarbon (as methane [CH_4] a primary source of VOC from wildfires). The *de minimis* for marginal nonattainment areas for ozone is 100 tons per year for each ozone precursor pollutant. Emissions from other management activities, such as heavy equipment operation and soil disturbance, were considered to be negligible and were not included in this analysis. The following assumptions and methodology were used to estimate potential emissions from the proposed action:

Assumptions:

- Emissions factors were based on estimated fuel consumed by wildfires in forests in the southern U.S. (EPA 1996).
- Emissions were estimated using the following equation, in accordance with EPA procedures for estimating atmospheric emissions from forest fires:

$$E_i = P_i LA$$

Where:

P_i = yield for pollutant "i" (mass of pollutant/unit mass of forest fuel consumed)
= 24 pounds/ton for total hydrocarbon (as CH_4)
= 4 pounds/ton as NO_x

L = fuel loading consumed (average fuel loading for the southern United States is 9 tons/acre [mass forest fuel/unit land area burned])

A = land area burned

E = total emissions of pollutant "i" (mass pollutant)

Summary:

Total estimated emissions for CH₄ and NO_x would be 0.12 tons per acre burned and 0.02 ton per acre burned, respectively. As shown in Figure 1, the *de minimis* value of 100 tons per year for CH₄ would be exceeded if controlled burning were conducted on more than 900 acres per year. The *de minimis* value for NO_x would not be exceeded. Under no circumstances would the number of acres burned approach 900 acres and exceed the *de minimis* levels for CH₄ emissions. Therefore, impacts to air quality would not be significant and the General Conformity Rule would not apply to the proposed action.

Figure 1 . Estimated CH₄ and NO_x Emissions from Prescribed Fire.

Re: Integrated Natural Resources
Management Plan, Naval Air Station
Oceana, Dam Neck Annex and
Naval Amphibious Base, Little
Creek, Camp Pendleton Annex, City
of Virginia Beach, Virginia

Dear Mr. Hostetter:

The U.S. Fish and Wildlife Service (Service) received your Draft Integrated Natural Resources Management Plan (INRMP) for Naval Air Station Oceana, Dam Neck Annex and Naval Amphibious Base, Little Creek, Camp Pendleton Annex, City of Virginia Beach, Virginia. The following comments are provided under provisions of the Endangered Species Act of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 *et seq.*) and the Fish and Wildlife Coordination Act of 1958 (48 Stat. 401, as amended; 16 U.S.C. 661 *et seq.*).

The Virginia Field Office (VAFO) and the Gloucester Fishery Resources Office (GFRO) have reviewed the INRMP and provide the following comments.

- 1) The Service considers sea turtle nesting season in Virginia to run from May 15 to August 31. Please make changes to pages 3-10, 4-13, and 5-5.
- 2) Page 3-10: The citation, Mayne 2003, is a concurrence letter, not a Biological Opinion. Biological Opinions are submitted when there is an adverse effect to a federally listed species. They typically provide an incidental take statement. The concurrence letter is the Service's statement that a proposed action is not likely to adversely affect federally listed species.

Mr. Hostetter

Page 2

Please make the changes, submit the final INRMP to this office, and we will forward it to our Regional Office in Hadley, Massachusetts for signature. The Service appreciates this opportunity to work with the U.S. Navy. The point of contact is Mr. Eric Davis (VAFO) at (804) 693-6694, extension 104.

Sincerely,

A handwritten signature in cursive script that reads "Karen L. Mayne".

Gloucester, VA 23061

Dear Ms Mayne:

Thank you for your comments on the Draft Integrated Natural Resources Management Plan (INRMP) for Naval Air Station Oceana, Dam Neck Annex and Camp Pendleton dated September 10, 2004. Your comments are appreciated and were incorporated into the Final INRMP. Please note that subsequent to issuing the Draft INRMP, NAS Oceana assumed command of Camp Pendleton. Minor edits were made to the document to reflect this change. Included are the document title and references to NAVPHIBASE Little Creek in Section 1.2, page 1-1 and Section 1.5.2, page 1-5.

As requested, I am enclosing a Final INRMP for you to forward to your regional office for final concurrence. If you have any questions, please contact Mr. Brian Hostetter (757) 462-8564 ext. 391. Please send the final letter of concurrence to:

Mr. Brian Hostetter

Dear Ms. Wallace:

We have received your final Integrated Natural Resources Management Plan (Plan) for the Naval Air Station Oceana, Dam Neck Annex, and the Naval Air Station Oceana, South Virginia, Beach Annex (Camp Pendleton), Virginia Beach, Virginia. Our Virginia Ecological Services Field Office (VAFO) has consulted with you on this Plan based on the provisions of the Sikes Act (16 U.S.C. 670 et seq.).

Based on the VAFO's concurrence with this Plan, please accept this letter as confirmation of the U.S. Fish and Wildlife Service's approval of this Plan. If you have any questions, please contact Karen Mayne, Project Leader, VAFO, at 804-693-6694.

Sincerely,

RE: Naval Air Station Oceana, Dam Neck Annex
Naval Amphibious Base Little Creek, Camp
Pendleton Annex – Virginia Beach, Virginia
Draft Integrated Natural Resources Management Plan
ESSLOG# 19789

Dear Mr. Hostetter:

We have reviewed the above referenced draft Integrated Natural Resource Management Plan (INRMP) and offer the following comments. The Department of Game and Inland Fisheries (VDGIF), as the Commonwealth's wildlife and freshwater fish management agency, exercises enforcement and regulatory jurisdiction over those resources, inclusive of state or federally endangered or threatened species, but excluding listed insects. We are a consulting agency under the U.S. Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.), and we provide environmental analysis of projects or permit applications coordinated through the Virginia Department of Environmental Quality, the Virginia Marine Resources Commission, the Virginia Department of Transportation, the U. S. Army Corps of Engineers, the Federal Energy Regulatory Commission, and other state or federal agencies. Our role in these procedures is to determine likely impacts upon fish and wildlife resources and habitats, and to recommend appropriate measures to avoid, reduce, or compensate for those impacts.

The draft INRMP sufficiently addresses issues that relate to the operation of the Naval Air Station Oceana, Dam Neck Annex and Naval Amphibious Base Little Creek, Camp Pendleton Annex to minimize conflicts between facility operations and natural resources in the project area. The draft INRMP addresses the habitat needs and management of wildlife populations in the project area and we generally support the plan of action described in this document. We offer the following comments and recommendations related primarily to habitat management.

We support all efforts to protect wetlands and water quality through the establishment and maintenance of riparian buffer zones. This includes establishing "No Mowing" areas and introducing native trees and shrubs to improve diversity and habitat value. We recommend undisturbed vegetated buffer zones of at least 100 - 300 feet in width around all wetlands.

Brian Hostetter
ESSLOG 19789
Page 2

We support the establishment of warm season grasses where practicable. This management strategy is beneficial to a large number of grassland species. We recommend mowing these areas in late summer and implementing prescribed burns in late winter or early spring to maximize habitat value for wildlife while avoiding the breeding season for most grassland species.

We support all efforts to restore wetlands on-post. As described, this could be accomplished by plugging drainage ditches to restore hydrology, as well as by planting appropriate wetland vegetation. We generally do not support proposals to create wetlands by excavating upland areas.

We support the placement, annual monitoring, and maintenance of artificial nesting and roosting structures in areas containing appropriate habitat.

We support all efforts to control exotic invasive species, particularly common reed.

We support the continued program to monitor sea turtle and marine mammal activities. This includes conducting nightly beach monitoring during the sea turtle nesting season, providing sea turtle track and nest identification training coordinated through VDGIF, and reporting any strandings to the Virginia Marine Science Museum's Stranding Center.

Thank you for the opportunity to comment on this draft INRMP. Please call Andrew Zadnik or me at (804) 367-6913 if we may be of further assistance.

Sincerely,

For Raymond T. Fernald, Manager

RE: Naval Air Station Oceana, Dam Neck Annex
South Virginia Beach Annex (Camp Pendleton)
Integrated Natural Resources Management Plan
ESSLOG# 19789

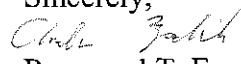

Dear Ms Wallace:

This letter is to serve as the Virginia Department of Game and Inland Fisheries' (VDGIF) letter of concurrence for the Integrated Natural Resources Management Plan (INRMP) for the above referenced Navy installations. The VDGIF, as the Commonwealth's wildlife and freshwater fish management agency, exercises enforcement and regulatory jurisdiction over those resources, inclusive of state or federally endangered or threatened species, but excluding listed insects. We are a consulting agency under the U. S. Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.), and we provide environmental analysis of projects or permit applications coordinated through the Virginia Department of Environmental Quality, the Virginia Marine Resources Commission, the Virginia Department of Transportation, the U. S. Army Corps of Engineers, the Federal Energy Regulatory Commission, and other state or federal agencies. Our role in these procedures is to determine likely impacts upon fish and wildlife resources and habitats, and to recommend appropriate measures to avoid, reduce, or compensate for those impacts.

This INRMP sufficiently addresses issues that relate to the operation of the Naval Air Station Oceana, Dam Neck Annex and South Virginia Beach Annex (Camp Pendleton) to minimize conflicts between facility operations and natural resources in the project area. The INRMP addresses the habitat needs and management of wildlife populations in the project area and we generally support the plan of action described in this document.

Thank you for the opportunity to comment on this INRMP. Please call Andrew Zadnik or me at (804) 367-6913 if we may be of further assistance.

Sincerely,

Raymond T. Fernald, Manager
Nongame and Environmental Programs

July 28, 2004

Dear Librarian:

The Department of the Navy is seeking public comment on the enclosed Integrated Natural Resources Management Plan for NAS Oceana, Dam Neck Annex and Naval Amphibious Base Little Creek, South Virginia Beach Annex. We respectfully request that you make this plan available to the public for their review. The public is encouraged to send written comments to the address shown in the following Public Notice (as published in the Virginian Pilot), by September 7th, 2004. After September 7th, you may return the plan to the address shown in the Public Notice or discard the plan.

Public Notice

The Department of the Navy is seeking public comment on the Integrated Natural Resources Management Plan (INRMP) for NAS Oceana, Dam Neck Annex and NAB Little Creek, Camp Pendleton Annex. Under the authority of the Sikes Act (16 USC Section 670a), the Department of Defense is required to prepare an INRMP for the conservation and rehabilitation of natural resources on military installations. A draft INRMP has been prepared for Dam Neck and Little Creek Annex, and is available for public review and comment at the Virginia Beach Public Library, Central Library Branch, 4100 Virginia Beach Boulevard.

Written comments must be post-marked by September 7th 2004. Mail comments to Mr. Brian Hostetter, Regional Natural Resources Specialist, 1450 Gator Blvd. Norfolk, VA 23521.

Re: Sea Turtle Management, Naval Air
Station Oceana – Dam Neck Annex
and Virginia Army National Guard –
Camp Pendleton, Virginia Beach, VA,
Project # 2016-F-2328

Dear Mr. Jones:

This letter acknowledges the U.S. Fish and Wildlife Service's March 3, 2016 receipt of your February 29, 2016 letter requesting initiation of formal section 7 consultation under the Endangered Species Act of 1973 (16 U.S.C. 1531-1544, 87 Stat. 884), as amended. The referenced action involves sea turtle management activities, which include sea turtle stranding response, sea turtle nest monitoring and nest management at Naval Air Station Oceana – Dam Neck Annex and Virginia Army National Guard – Camp Pendleton, Virginia Beach, VA. The federally listed endangered Kemp's ridley (*Lepidochelys kempii*) and federally listed threatened green (*Chelonia mydas*) North Atlantic distinct population segment, and loggerhead sea turtle (*Caretta caretta*) Northwest Atlantic Ocean distinct population segment are likely to be adversely affected by the proposed action. All information required to initiate consultation was either included with your letter or is otherwise accessible for our consideration and reference.

We concur with your determination that the federally listed endangered leatherback (*Dermochelys coriacea*) and hawksbill (*Eretmochelus imbricata*) sea turtles are not likely to be adversely affected by the proposed action.

Section 7 implementing regulations (50 CFR 402.14) provide the U.S. Fish and Wildlife Service up to 90 days to conclude formal consultation and an additional 45 days to prepare our biological opinion, unless we mutually agree to an extension. Therefore, we expect to provide the biological opinion on or before July 15, 2016.

As a reminder, the Endangered Species Act requires that after initiation of formal consultation, the Federal action agency shall make no irreversible or irretrievable commitment of resources that limits future options. This practice ensures agency actions do not preclude the formulation or implementation of avoidance and minimization measures or development of reasonable and prudent alternatives that avoid jeopardizing the continued existence of endangered or threatened species or destroying or modifying their critical habitat.

If you have any questions, please contact Sarah Nystrom of this office at (804) 824-2413, or via email at Sarah_Nystrom@fws.gov.

Sincerely,

For Cindy Schulz

RE: Naval Facilities
Integrated Natural Resources Management Plan
Yorktown, Northwest Annex, Oceana Fentress, Dam Neck
Camp Pendleton
ESSLog#s 19076, 20545, 19789, 19789; respectively

Dear Ms. Huxley:

We have reviewed the Integrated Natural Resources Management Plans (INRMP) for the following Naval Facilities: Yorktown, Northwest Annex, Oceana Fentress, Dam Neck Camp Pendleton. We offer the following comments regarding the INRMPs. The Department of Game and Inland Fisheries (VDGIF), as the Commonwealth's wildlife and freshwater fish management agency, exercises enforcement and regulatory jurisdiction over those resources, inclusive of state or federally endangered or threatened species, but excluding listed insects. We are a consulting agency under the U. S. Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661 et seq.), and we provide environmental analysis of projects or permit applications coordinated through the Virginia Department of Environmental Quality, the Virginia Marine Resources Commission, the Virginia Department of Transportation, the U. S. Army Corps of Engineers, the Federal Energy Regulatory Commission, and other state or federal agencies. Our role in these procedures is to determine likely impacts upon fish and wildlife resources and habitats, and to recommend appropriate measures to avoid, reduce, or compensate for those impacts.

Yorktown

Pg 1-9; 1.7 Partnerships - We recommend expanding on the definition of the partnership between the Navy and the VDGIF. VDGIF provides input and recommendations regarding wildlife and fisheries management as well as the management and protection of rare, threatened and endangered species.

Pg 2-21; 2.6.1 Mammals. Throughout the INRMP, whitetail deer are referred to as "White-tailed deer", which is incorrect. We recommend updating the spelling for this animal throughout the entire document.

Pg 2-22; 2.6.2 Herpetofauna. We recommend making the changes to the text as suggested in the revised paragraph below. Please note that the southern toad is not known from York County and has been removed from the text.

A variety of reptiles and amphibians is known to inhabit the area. The most common snakes include the northern watersnake (*Nerodia sipedon*), eastern (=black) rat snake (*Elaphe alleganiensis*), black racer (*Coluber constrictor*), and rough green snake (*Opheodrys aestivus*). The copperhead (*Agkistrodon contortix*) is the only species of venomous snake known to occur on the Station, though eastern cottonmouth (*Agkistrodon piscivorus piscivorus*) and state-listed timber (canebrake) rattlesnake [(*Crotalus horridus*) Coastal Plain population] have known populations in York County. Common turtles include the eastern snapping turtle (*Chelydra serpentina serpentina*), northern red-bellied cooter (*Pseudemys rubriventris*), eastern mud turtle (*Kinosternon subrubrum subrubrum*), and eastern box turtle (*Terrapene carolina carolina*). Lizards found on the Station include the ground skink (*Scincella lateralis*) and the five-lined skink (*Plestiodon (=Eumeces) fasciatus*). Of the amphibians that inhabit the area, frogs and toads comprise the largest group. Common frogs and toads found on the Station include the northern green frog (*Lithobates (=Rana) clamitans melanota*), southern leopard frog (*Lithobates (=Rana) sphenoccephala utricularia*), spring peeper (*Pseudacris crucifer*), green treefrog (*Hyla cinerea*), southeastern chorus frog (*Pseudacris feriarum*) and American toad (*Anaxyrus (=Bufo) americanus*). Salamanders include spotted salamander (*Ambystoma maculatum*), marbled salamander (*Ambystoma opacum*), red-spotted newt (*Notophthalmus viridescens*), and the state-listed Mabee's salamander (*Ambystoma mabeei*).

Pg 2-22; 2.6.3 Fish. We recommend adding some text to this section that describes the anadromous fish resources known to occur at the installation and which are described below

CAX – The York River has been designated a Confirmed Anadromous Fish Use Area. In addition, Queen Creek, King Creek, and Jones Millpond Creek have been designated Potential Anadromous Fish Use Areas. These resources are particularly valuable fisheries resources that should be protected to the greatest extent possible.

WPNSTA – The York River and Indian Field Creek have been designated Confirmed Anadromous Fish Use Areas. Felgates Creek, Black Swamp and its tributaries, and King Creek have been designated Potential Anadromous Fish Use Areas. These resources are particularly valuable fisheries resources that should be protected to the greatest extent possible.

Pg 2-23; 2.6.4 Birds. The common names do not need capitalization unless part of the name is a proper noun.

Pg 2-23; 2.7 Rare, Threatened and Endangered Species and Significant Natural Communities. Throughout the document, including table 2-4, the bald eagle is referred to as federally listed. This species has been de-listed at a federal level, but continues to retain state Threatened status. We recommend updating the document to reflect the change in federal status.

Pg 3-30; 3.5.6 Water Quality and Wetlands Protection. We recommend that at least 100-foot naturally vegetated buffers be maintained on all streams and wetlands on site. In those waters that have been designated anadromous fish use areas, we recommend that all instream work adhere to a time of year restriction from February 15 through June 30 of any year. We recommend conducting any in-stream activities during low or no-flow conditions, using non-erodible cofferdams to isolate the construction area, blocking no more than 50% of the streamflow at any given time, stockpiling excavated material in a manner that prevents reentry into the stream, restoring original streambed and streambank contours, revegetating barren areas with native vegetation, and implementing strict erosion and sediment control measures. Due to future maintenance costs associated with culverts, and the loss of riparian and aquatic habitat, we prefer stream crossings to be constructed via clear-span bridges. However, if this is not possible, we recommend countersinking any culverts below the streambed at least 6 inches, or the use of bottomless culverts, to allow passage of aquatic organisms. We also recommend the installation of floodplain culverts to carry bankfull discharges.

Pg 3-32; 3.6.1 Game Species. We recommend that waterfowl hunting be allowed at the installations. We recommend updating the deer herd and population section with updated data from VDGIF. It has come to our attention that this installation has not met the Deer Management Objectives. We recommend evaluation of this and an increase in the number of hunter hours/days at the installation.

Pg 3-64; 3.11.2 Nuisance Species – Beaver. VDGIF discourages trapping and relocating of beavers because it is unlawful, not because habitats that support beaver already have them. Beaver can lawfully be killed in the event they are damaging crops or property. We recommend clarification in this section.

Pg 3-64; 3.11.2 Nuisance Species – Groundhog (Woodchuck). It is unlawful to trap and relocate this species, or any species of wildlife. As they are defined as a nuisance species, they may lawfully be killed at any time of year. We recommend clarification in this section.

Northwest Annex

Pg 2-15; 2.5.1 Mammals. Throughout the INRMP, whitetail deer are referred to as “White-tailed deer”, which is incorrect. We recommend updating the spelling for this animal throughout the entire document.

Pg 2-17; 2.5.3 Birds. The common names do not need capitalization unless part of the name is a proper noun.

Pg 2-18; 2.6 Rare, Threatened and Endangered Species. Timber and canebrake rattlesnakes are listed as occurring on the base. These species are one in the same. However, VDGIF recognizes the Coastal Plain population (canebrake) as a unique geographic variation of the timber rattlesnake. The canebrake rattlesnake should be referred to as: **timber (canebrake) rattlesnake [(*Crotalus horridus*) Coastal Plain population]**. This information needs to be updated in the document text as well as in Table 2-5. To further protect this species, we recommend that the mowing of any areas adjacent to forested wetlands be performed only during the winter months (hibernation periods for the species) to avoid striking them with mowers. Other areas should be mowed frequently enough (weekly) so that the grass does not obscure the location of canebrake rattlesnakes which make them more vulnerable to strikes. We further recommend that all mowing contractors be appropriately trained in the identification and status of this species. This could be accomplished via an appropriate information sheet distributed to those working on the project (see attached). Information also can be found on our website, <http://www.dgif.virginia.gov/wildlife/species/display.asp?id=030013>. If a canebrake rattlesnake is observed, please report this observation to the Base Environmental Manager and avoid harming the animal.

Pg 2-19; 2.6 Rare, Threatened and Endangered Species. We recommend re-writing the paragraph regarding jurisdictional authorities to clearly state that VDGIF is responsible for the protection and management of all of the Commonwealth's wildlife species, including Threatened or Endangered species, excluding listed insects.

Pg 3-4; 3.3 Wetlands and Water Quality Protection. We recommend that at least 100-foot naturally vegetated buffers be maintained on all streams and wetlands on site. We recommend conducting any in-stream activities during low or no-flow conditions, using non-erodible cofferdams to isolate the construction area, blocking no more than 50% of the streamflow at any given time, stockpiling excavated material in a manner that prevents reentry into the stream, restoring original streambed and streambank contours, revegetating barren areas with native vegetation, and implementing strict erosion and sediment control measures. Due to future maintenance costs associated with culverts, and the loss of riparian and aquatic habitat, we prefer stream crossings to be constructed via clear-span bridges. However, if this is not possible, we recommend countersinking any culverts below the streambed at least 6 inches, or the use of bottomless culverts, to allow passage of aquatic organisms. We also recommend the installation of floodplain culverts to carry bankfull discharges.

Oceana Fentress

None of the maps were included with the version of the document we were provided to review. We recommend making sure these are available to all reviewers of the document.

Pg 27; 2.5 Mammals. Throughout the INRMP, whitetail deer are referred to as "White-tailed deer", which is incorrect. We recommend updating the spelling for this animal throughout the entire document.

Pg 27; 2.5 Reptiles and Amphibians. We recommend making the changes to the text as suggested in the revised paragraph below.

A variety of reptiles and amphibians is known to inhabit the area. The most common snakes include the northern watersnake (*Nerodia sipedon*), eastern (=black) rat snake (*Elaphe alleghaniensis*), black racer (*Coluber constrictor*), and rough green snake (*Opheodrys aestivus*). The copperhead (*Agkistrodon contortix*) is the only species of venomous snake known to occur on the Station, though eastern cottonmouth (*Agkistrodon piscivorus piscivorus*) and state-listed timber (canebrake) rattlesnake [(*Crotalus horridus*) Coastal Plain population] have known populations in York County. Common turtles include the eastern snapping turtle (*Chelydra serpentina serpentina*), northern red-bellied cooter (*Pseudemys rubriventris*), eastern mud turtle (*Kinosternon subrubrum subrubrum*), and eastern box turtle (*Terrapene carolina carolina*). Lizards found on the Station include the ground skink (*Scincella lateralis*) and the five-lined skink (*Plestiodon* (= *Eumeces*) *fasciatus*). Of the amphibians that inhabit the area, frogs and toads comprise the largest group. Common frogs and toads found on the Station include the northern green frog (*Lithobates* (= *Rana*) *clamitans melanota*), southern leopard frog (*Lithobates* (= *Rana*) *sphenocephala utricularia*), spring peeper (*Pseudacris crucifer*), green treefrog (*Hyla cinerea*), southeastern chorus frog (*Pseudacris feriarum*), southern toad (*Anaxyrus* (= *Bufo*) *terrestris*), and American toad (*Anaxyrus* (= *Bufo*) *americanus*). Salamanders include spotted salamander (*Ambystoma maculatum*), marbled salamander (*Ambystoma opacum*), red-spotted newt (*Notophthalmus viridescens*), and the state-listed Mabee's salamander (*Ambystoma mabeei*).

Pg 30; Rare, Threatened and Endangered Species. We recommend rewriting a section in the first paragraph that says "state-recommended-endangered species, the canebrake rattlesnake" to read "state Endangered species, the canebrake rattlesnake".

Pg 39; 3.3 Wetlands/Water Quality Protection. We recommend that at least 100-foot naturally vegetated buffers be maintained on all streams and wetlands on site. We recommend conducting any in-stream activities during low or no-flow conditions, using non-erodible cofferdams to isolate the construction area, blocking no more than 50% of the streamflow at any given time, stockpiling excavated material in a manner that prevents reentry into the stream, restoring original streambed and streambank contours, revegetating barren areas with native vegetation, and implementing strict erosion and sediment control measures. Due to future maintenance costs associated with culverts, and the loss of riparian and aquatic habitat, we prefer stream crossings to be constructed via clear-span bridges. However, if this is not possible, we recommend countersinking any culverts below the streambed at least 6 inches, or the use of bottomless culverts, to allow passage of aquatic organisms. We also recommend the installation of floodplain culverts to carry bankfull discharges.

Pg 82; 3.10 Habitat Conservation. We recommended including language in this section that states that coordination with VDGIIF regarding the protection and management of wildlife including threatened or endangered species, exclusive of listed insects, and their habitats is

performed. We also recommend including reference to VDGIF's online wildlife database, the Virginia Fish and Wildlife Information Service (VAFWIS).

Dam Neck Camp Pendleton

Pg 1-10; 1.6 Partnerships. We recommend including in the pertinent paragraph that VDGIF also provides guidance regarding the management and protection of Threatened or Endangered wildlife, exclusive of listed insects.

Pg 2-19; 2.5.2 Mammals. Throughout the INRMP, whitetail deer are referred to as "White-tailed deer", which is incorrect. We recommend updating the spelling for this animal throughout the entire document.

Pg 2-20; 2.6 Rare, Threatened and Endangered Species and Significant Ecological Communities. The bald eagle has been de-listed federally. It continues to be listed state Threatened. We recommend updating the status of this species throughout the document.

Pg 3-2; 3.2 Wetlands and Water Quality Protection. We recommend that at least 100-foot naturally vegetated buffers be maintained on all streams and wetlands on site. We recommend conducting any in-stream activities during low or no-flow conditions, using non-erodible cofferdams to isolate the construction area, blocking no more than 50% of the streamflow at any given time, stockpiling excavated material in a manner that prevents reentry into the stream, restoring original streambed and streambank contours, revegetating barren areas with native vegetation, and implementing strict erosion and sediment control measures. Due to future maintenance costs associated with culverts, and the loss of riparian and aquatic habitat, we prefer stream crossings to be constructed via clear-span bridges. However, if this is not possible, we recommend countersinking any culverts below the streambed at least 6 inches, or the use of bottomless culverts, to allow passage of aquatic organisms. We also recommend the installation of floodplain culverts to carry bankfull discharges.

Pg 3.36; 3.12.1 Nuisance Wildlife. It is unlawful to trap and relocate wildlife. Any species defined as a nuisance species may lawfully be killed at any time of year. We recommend clarification in this section.

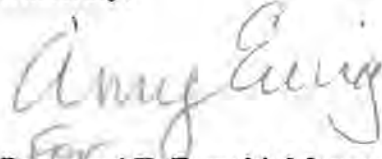

Pg 3-37; Miscellaneous Vertebrates. We recommend clarification on this section. As stated above, the relocation of wildlife is unlawful.

Pg 3-38; 3.12.3 Invasive Species. We recommend adding red-eared slider (*Trachemys scripta elegans*) to the current list of invasive species. We further recommend that a removal plan for this species be developed and reviewed by VDGIF.

Thank you for the opportunity to comment on the INRMPs. We are willing to assist the Navy, when possible, in implementing the actions identified in this plan. Please contact our Region 1 Wildlife, Fisheries, and Wildlife Diversity biologists at 804-829-6580 if we can be of further assistance in this regard. Please contact Amy Ewing at 804-367-2211 with any questions regarding this environmental review.

Sincerely,

A handwritten signature in cursive script that reads "Amy Ewing".

RE: VMRC #91-1782

Dear Sir:

You have inquired regarding a permit to restore a coastal primary sand dune by placing approximately 17,000 cubic yards of sand fill within a man-made breach measuring 194 feet in width at Camp Pendleton in Virginia Beach.

Provided your proposed project does not extend channelward of the mean low water mark, no authorization is required from the Marine Resources Commission.

For your information, however, you may need a permit from your local wetlands board and/or authorization from the U. S. Army Corps of Engineers, Norfolk District, 803 Front Street, Norfolk, Va. 23510, prior to commencing your project. Your application is currently being processed by both these agencies.

If we may be of further assistance, please do not hesitate to call on us.

Sincerely,

Randal D. Owen
Environmental Engineer

c/o Commanding Officer
Naval Amphibious Base, Little Creek
Norfolk, Virginia 23521-5140

Re: Dune Restoration and LCAC Training Area Modifications,
Application No. 91-1782

Dear Ms. Maddox:

We have received your application to restore an area of primary sand dunes, and reduce the training area for LCAC vehicles from 96 acres (including 9 acres of wetlands) to an area of approximately 20 acres with less than one acre of wetland impact in NAB Camp Pendleton annex. The purpose of the proposed project is to provide an acceptable training area for the LCAC's while reducing the impacts to wetlands within the activity zone.

We understand that less than an acre of wetland impact will occur from the modification of the training area. After careful consideration of this and other factors by staff of the State Water Control Board, we have determined that your project will have minimal impact to the water quality of state waters.

Therefore the State Water Control Board by this letter states that no Water Quality Certificate under section 401 of the Clean Water Act (33 U.S.C. 1251 et. seq.) will be required for this activity. If the proposed project should undergo significant change, modification, or addition, no further communication is required with this agency.

You are advised however, that the activity you propose may require permits from the Virginia Marine Resources Commission and the Norfolk District, U.S. Army Corps of Engineers prior to

commencing any construction activity. Should you have any questions regarding the status of your application we suggest you contact these agencies directly.

Sincerely,

David W. Byrd

REPLY TO
ATTENTION OF:
CENAO-CO-R (1145b)
91-1782-27 (Atlantic Ocean)

8 April 1992

MEMORANDUM FOR Commanding Officer, Naval Amphibious Base (NAB) Little Creek,
Norfolk, Virginia 23521-5140

SUBJECT: Department of the Army Permit Application Number 91-1782-27, for the
Landing Craft Air Cushion (LCAC) activity zone at the Little Creek Annex
(Camp Pendleton), Virginia.

1. After evaluating your Permit Application Number 91-1782-27 to develop an activity zone that may result in the filling of up to 1 acre of interdunal swale wetlands, we have determined that it qualifies for our Abbreviated Standard Permit 87-ASP-18 for activities of minimal environmental consequence. If your project adheres to the proposal which you submitted (drawings enclosed), a 200-foot reduction of the activity zone length as measured from the northern most proposed project boundary, the conditions enumerated below, and the conditions of the Abbreviated Standard Permit (Enclosure), no further authorization will be required from this office. If you should decide to change any aspect of your proposal, you must first apply for and be granted a permit modification. Your authorization to perform work under this Abbreviated Standard Permit expires on December 31, 1995.

2. Prior to manipulation of the activity zone, the activity zone perimeter shall be marked and inspected by the Corps. Markers should be highly visible, permanent poles or timbers that indicate the activity zone boundary. The marking plan shall be submitted to the Corps and must be approved in writing prior to implementation.

3. As a condition of this permit, there shall be no vehicular access across the dune system. Furthermore, no training activities are authorized within the exclusion zone. Crossing of the exclusion zone on foot, by individuals who are participating in training approved by NAB Little Creek, is authorized. In the event that other activities are desired in the exclusion zone, NAB Little Creek shall restore the impacted pine forest, secondary dune, and interdunal swale habitats to the satisfaction of the Corps prior to commencement of any other activities (See condition #10 of the permit). Any violation of this condition may result in a Notice of Violation, revocation of the permit, and initiation of the agreement to completely restore the impacted habitats.

4. This permit is directly associated with training activities subject to Naval Amphibious Base Little Creek Notice 3000. A copy of this permit shall be provided to the Port Operations Department (N3) and any other Department or Division associated with activities at the Pendleton annex.

5. NAB Little Creek should review and implement, to the maximum extent practicable, the Virginia Department of Natural Heritage report entitled An Inventory of the Rare, Threatened & Endangered Species of Camp Pendleton, dated 1 September 1990.

CENAO-CO-R

SUBJECT: Department of the Army Permit Application Number 91-1782-27, for the Landing Craft Air cushion (LCAC) activity zone at the Little Creek Annex (Camp Pendleton), Virginia.

6. Before you may begin work, you should obtain a permit from the Virginia Marine Resources Commission. You must obtain a 401 Certificate or waiver from the Virginia State Water Control Board. Any conditions which are made a part of your State Water Control Board 401 Certificate will automatically become a part of your Corps authorization under the Abbreviated Standard Permit 87-ASP-18.

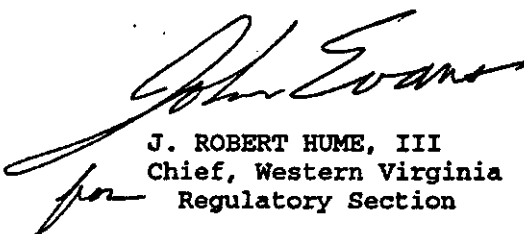

7. The party performing the work authorized by this permit will have a copy of this letter and the enclosed documents with them at the project site during earth moving activities within the activity zone. These documents will be made available to any Corps representative upon their request.

8. Dune management should be closely coordinated with the Mr. Lee Hill at the Virginia Shoreline Erosion Advisory Service (SEAS), at (804) 642-7121.

9. John Evans is the project manager for this permit application. You should address any future correspondence to Mr. Evans, who may also be reached at (804) 441-7794. Please do not hesitate to contact Mr. Evans should you have any questions regarding work authorized by this permit.

FOR THE COMMANDER:

Enclosure

J. ROBERT HUME, III

DEPARTMENT OF THE ARMY
NORFOLK DISTRICT, CORPS OF ENGINEERS
FORT NORFOLK, 803 FRONT STREET
NORFOLK, VIRGINIA 23510-1096

DEPARTMENT OF THE ARMY ABBREVIATED STANDARD PERMIT

The people of the Commonwealth of Virginia are hereby authorized by the Secretary of the Army and the Chief of Engineers (under provisions of Section 10 of the Rivers and Harbors Act of March 3, 1899 (33 U.S.C. 403) and Section 404 of the Clean Water Act (P.L. 92-217) to perform work determined by the district engineer to be of minimal environmental consequence.

The procedure that a prospective permittee would follow in order to qualify for this abbreviated standard permit will be very similar to the standard procedure for applying for Corps permits. A Joint Permit Application must be completed and submitted to the Virginia Marine Resources Commission (VMRC) even when VMRC does not require a permit. After copying the application, VMRC will send the original to the Corps. A public notice will be prepared and circulated. Projects will be coordinated with the U. S. Fish and Wildlife Service, the Environmental Protection Agency and the National Marine Fisheries Service at a monthly interagency permit processing meeting at which time it will be determined whether or not particular projects qualify for this abbreviated standard permit. If the Corps or the Federal agencies recommend a modification or special condition to the proposal and the applicant agrees to incorporate that recommendation into his final plans, the modified project will be determined to qualify for the abbreviated standard permit. In either case, a letter will be sent to the applicant advising that no additional Corps permit will be necessary, but that necessary State and/or local permits should be obtained before he begins work. If the project is determined not to qualify for this abbreviated standard permit, the application will continue to be processed as per 33 CFR 320-330. This abbreviated standard permit is subject to the following conditions:

1. Prior to the commencement of any work authorized by this permit, the permittee shall advise the district engineer, in writing, of the time the authorized activity will be commenced and of the name, address, and telephone number of all contractors or other persons undertaking the work and shall furnish to them, before the commencement of the work, a complete copy of this permit along with all drawings and special conditions. In addition, it is the permittee's responsibility to notify the district engineer when the authorized work has been completed.
2. The permittee and contractor will be held equally liable for any construction outside the limits and scope of this abbreviated standard permit.
3. The permittee will make every reasonable effort to prosecute the construction or operation of the work authorized by this permit in a manner so as to minimize any adverse impact on fish, wildlife and natural environmental values.
4. The construction or work authorized by this permit will be prosecuted in a manner so as to minimize any degradation of water quality.
5. The permittee shall allow representatives from this office to inspect the authorized activity at any time deemed necessary to ensure that it is being or has been accomplished in accordance with the terms and conditions of this permit.
6. The permittee shall maintain the activity authorized by this permit in good condition and in conformance with the terms and conditions of this permit as well as all attached plans and drawings.

1798
CORPSE

16. This office may reevaluate its decision on individual authorizations under this abbreviated standard permit at any time the circumstances warrant. Circumstances that could require a reevaluation include, but are not limited to, the following:

- a. The permittee fails to comply with the terms and conditions of this permit.
- b. The information provided by the applicant in support of his permit applications proves to have been false, incomplete, or inaccurate.
- c. Significant new information surfaces which this office did not consider in reaching the original public interest decision.

Such a reevaluation may result in a determination that it is appropriate to use the suspension, modification, and revocation procedures contained in 33 CFR 325.7 or enforcement procedures such as those contained in 33 CFR 326.4 and 326.5. The referenced enforcement procedures provide for the issuance of an administrative order requiring the permittee to comply with the terms and conditions of the permit and for the initiation of legal action where appropriate. The permittee will be required to pay for any corrective measures ordered by this office, and if he fails to comply with such directive, this office may in certain situations (such as those specified in 33 CFR 209.170) accomplish the corrective measures by contract or otherwise and the permittee shall have a duty to reimburse this office for the cost.

17. Failure to comply with the terms and conditions of this abbreviated standard permit can result in enforcement actions against the permittee and/or contractor.

18. All dredging and/or filling will be done so as to minimize disturbance of the bottom or turbidity increases in the water which tend to degrade water quality and damage aquatic life.

19. Any deposition of dredged or excavated materials on shore, and all earthwork operations on shore will be carried out in such a way as to minimize erosion of the material and preclude its entry into the waterway.

20. Upon completion of earthwork operations, all fills on shore and other areas on shore disturbed during construction will be seeded, riprapped or given some other type of protection from subsequent soil erosion.

21. The permittee will employ measures to prevent or control spills of fuels or lubricants from entering the waterway.

22. This abbreviated standard permit does not authorize any activity which might affect a threatened or endangered species as identified under the Endangered Species Act (16 U. S. C. 1531) or adversely modify designated critical habitat of such species without consultation with the U. S. Fish and Wildlife Service and the National Marine Fisheries Service.

23. If the Craney Island Disposal Area becomes unavailable for use as a disposal area during the terms of this permit, the permittee will be responsible for finding an upland disposal area and having it approved by this office prior to any further dredging.

24. Quantities of material dredged and placed in the Craney Island Rehandling Basin and/or the Craney Island Disposal Area will be furnished by the applicant to . Before and After Dredging Hydrographic Surveyors and Yardage Calculations shall be performed and certified by a Professional Engineer or Land Surveyor. For local survey and tidal datum information, the applicant is referred to Mr. Brian Shannon at the District Office (441-7664). All surveys, maps, and calculations will conform to recognized professional standards and be sent to the district engineer. The attached form will be completed prior to the deposition of material into the Craney Island Disposal Area or the Craney Island Rehandling Basin.

7. This permit does not obviate the need to obtain other Federal, State or local authorization required by law, nor does it grant any property rights or exclusive privileges or authorize any injury to the property rights of others.

8. In issuing this abbreviated standard permit, the Federal Government does not assume any liability for the following:

- a. Damages to the permitted project or uses thereof as a result of other permitted or unpermitted activities or from natural causes.
- b. Damages to the permitted project or uses thereof as a result of current or future activities undertaken by or on behalf of the United States in the public interest.
- c. Damages to persons, property, or to other permitted or unpermitted activities or structures caused by the activity authorized by this permit.
- d. Design or construction deficiencies associated with the permitted work.
- e. Damage claims associated with any future modification, suspension, or revocation of this permit.

9. The use of this abbreviated standard permit may be summarily suspended, in whole or in part, upon a finding by the district engineer that immediate suspension would be in the general public interest. Such suspension shall be effective upon receipt by the permittee of a written notice thereof which shall indicate (1) the extent of the suspension, (2) the reasons for this action, and (3) any corrective or preventative measures to be taken by the permittee which are deemed necessary by the district engineer to abate imminent hazards to the general public interest. The permittee shall take immediate action to comply with the provisions of this notice. Within ten days following receipt of this notice of suspension, the permittee may request a hearing in order to present information relevant to a decision as to whether his permit should be reinstated, modified or revoked. If a hearing is requested, it shall be conducted pursuant to procedures prescribed by the Chief of Engineers. After completion of the hearing, or within a reasonable time after issuance of the suspension notice to the permittee if no hearing is requested, the permit will either be reinstated, modified or revoked.

10. Should the permittee wish to cease to maintain the authorized activity or desire to abandon it without a good faith transfer, he must obtain from this office a modification of his authorization under this permit, which may require restoration of the area. In order to transfer this permit, the transferee must supply the district engineer with a written agreement to comply with all of the terms and conditions of this abbreviated standard permit.

11. All provisions of the abbreviated standard permit shall be binding on any assignee or successor in interest of the permittee.

12. The permittee's use of the permitted activity must not interfere with the public's right to free navigation on all navigable waters of the United States.

13. The permittee shall advise the district engineer verbally or in writing when unusual or complicated foundation conditions are encountered requiring debris removal (e.g. stumps, broken concrete, etc.) and shall not take measures to remove the obstruction or change the location of the structure until written or verbal approval by the district engineer or his authorized representative is received.

14. This permit does not authorize interference with any existing or proposed Federal project.

15. The permittee must install and maintain, at his expense, any safety lights and signals prescribed by the United States Coast Guard (USCG), through regulations or otherwise, on the authorized facilities. The USCG may be reached at the following address and telephone number: Commander (oan), Fifth Coast Guard District, Federal Building, 431 Crawford Street, Portsmouth, Virginia 23704, ATTN: Mr. John Walters, telephone number (804) 398-6230.

25. VDOT shall pay to the district engineer certain tolls which have been established to cover the Federal legislation authorizing construction of the Craney Island DMMA Project. The rates are established at amounts which will cover amortization of the facilities used plus operation, maintenance and rehandling costs. Since cost of operation, maintenance and rehandling vary from year to year, the tolls will vary. The applicable rate in effect on the date of issuance of this letter of permission is listed below. A review of the rates will be made annually on or about 1 July to determine whether any revisions should be made. If changes in these rates become necessary during the life of this letter of permission, VDOT will be notified of the change and the effective date thereof.

Deposit in Rehandling Basin (Scow)	\$2.06 per cu.yd. (Place and/or Scow measurement less 10%)
Direct deposit in DMMA	86¢ per cu.yd. (Place measurement)
Deposit in DMMA by Barge Rehandler	9¢ per cu.yd. (Place measurement)
Deposit in DMMA by Hopper Dredge	4¢ per cu.yd. (Place measurement)

The above toll is for use of dredged material management facilities only, and is in addition to any charges for inspection, supervision and surveys.

26. The following security requirements must be adhered to for all dredging projects where direct pumping into Craney Island is proposed: Entry to the Reservation for vehicular traffic shall be through the main gate on the entrance road. This gate will be open during normal working hours. At all other times this gate shall remain locked in order to deny access to unauthorized persons. The permittee shall assure that satisfactory arrangements are made for security at the gate. In the event security at the gate is considered unsatisfactory by the Chief of the Craney Island Project Office, the permittee will be required to furnish a watchman who shall be responsible for keeping the gate locked and admitting only authorized personnel.

27. Bottom dump scows can only be filled to a point where no overflow occurs. No overflow pipes can be used by the scows.

28. The permittee must have a copy of this permit available on the vessel used for the authorized transportation and placement of dredged material.

29. Any discharge will be carried out in conformity with the goals and objectives of the EPA Guidelines established pursuant to Section 404(b) of the Clean Water Act and published in 40 CFR 230.

30. Any discharge will consist of suitable material free from toxic pollutants in toxic amounts.

31. Any fill will be properly maintained to prevent erosion and other non-point sources of pollution.

32. Should the permittee discover any previously unknown historic or archaeological remains while accomplishing the activity authorized by this permit, he must immediately notify this office of what he has found. The Norfolk District Corps of Engineers will initiate the Federal and State coordination required to determine if the remains warrant a recovery effort or if the site is eligible for listing in the National Register of Historic places.

33. If a conditioned water quality certification has been issued for the project, the permittee must comply with the conditions specified in the certification as special conditions to this permit.

34. This abbreviated standard permit, unless modified, suspended or revoked, will be in effect until 10 September 1992. Before expiration, it may, if the public interest so dictates, be considered for revalidation.

Enclosure 1 Natural Resources Managers

DEPARTMENT OF THE NAVY

NAVAL AIR STATION OCEANA
1750 TOMCAT BOULEVARD
VIRGINIA BEACH, VIRGINIA 23460-2191

IN REPLY REFER TO
5090
Ser N4/375
13 Nov 14

From: Commanding Officer, Naval Air Station Oceana
To: Ms. Michael F. Wright, Natural Resources Manager

Subj: APPOINTMENT AS NAVAL AIR STATION OCEANA NATURAL RESOURCES MANAGER

Ref: (a) OPNAVINST 5090.1D Manual 5090.1
(b) INRMP NASO & NALFF
(c) INRMP NASO DNA

1. Reference (a) requires that Naval Installations have a formally appointed Natural Resources Manager/Coordinator. By notice of this letter, you are appointed to this position for Naval Air Station Oceana.

2. Your responsibilities are:

a. Develop, coordinate and ensure implementation of the installation Integrated Natural Resource Management Plans (INRMP), references (b) and (c), and that they are reviewed and updated annually.

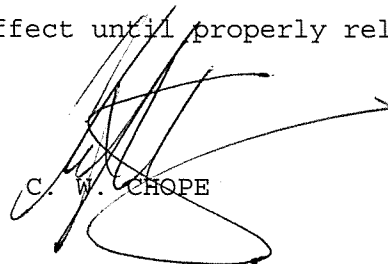

b. Function as the primary point of contact for the installation's natural resource management program and serve as natural resource management liaison between public works, environmental, medical, supply, housing, tenant commands and pest management program.

c. Ensure that the Commanding Officer is informed regarding natural resources issues, conditions of natural resources, objectives of the INRMP (if applicable) and potential or actual conflicts between mission requirements and natural resources mandates.

d. Ensure that applicable governmental decisions made on behalf of the installation and Commanding Officer are in compliance with the Sikes Act.

e. Function as the primary point of contact for acquiring and maintaining consistency with all natural resources permits.

3. This designation will remain in effect until properly relieved or upon your transfer.

C. W. CHOPE

DEPARTMENT OF THE NAVY

COMMANDER
NAVY REGION, MID-ATLANTIC
1510 GILBERT ST.
NORFOLK, VA 23511-2737

IN REPLY REFER TO:

From: Commander, Navy Region Mid-Atlantic
To: Emmett Carawan, Natural Resources Manager, NAVFAC MIDLANT
SUBJ: APPOINTMENT AS THE INSTALLATION INTEGRATED NATURAL
RESOURCE COORDINATOR

Ref: (a) OPNAV Instruction 5090.1C, Chapter 24: Natural Resource Management Program

1. Reference (a) requires that Navy installations have a formally appointed Natural Resource Coordinator. By notice of this letter, you are appointed to this position for all Navy installations in Hampton Roads under your cognizance.

2. Your responsibilities are:

- a. Develop, coordinate, and ensure implementation of the installation Integrated Natural Resource Management Plan (INRMP), if applicable, and that it is reviewed and updated annually.
- b. Function as the primary point of contact for the installation's natural resource management program and serve as natural resource management liaison between public works, environmental, medical, supply, housing, tenant commands, and pest management program as needed.
- c. Ensuring that the CO is informed regarding: natural resources issues, conditions of natural resources, objectives of the INRMP (if applicable), and potential or actual conflicts between mission requirements and natural resources mandates.
- d. Ensuring that inherently governmental decisions made on behalf of the installation and CO with regards to Sikes Act compliance.
- e. Function as the primary point of contact for acquiring and maintaining consistency with all natural resources permits and the State Coastal Zone Program.

3. This appointment is effective immediately and remains in effect unless revoked or until you are properly relieved.

Sincerely,

W. DAVID NOBLE

W. DAVID NOBLE
By Direction
Commanding Officer

Enclosure 2 ICO Environmental Policy

NAVAL AIR STATION OCEANA ENVIRONMENTAL POLICY

1. Environmental stewardship is essential to the safe, healthful and compliant execution of our mission and the protection and preservation of our natural resources. I expect all commands and personnel onboard Naval Air Station (NAS) Oceana, Dam Neck Annex and Naval Auxiliary Landing Field Fentress to be active stewards of the environment in their day-to-day operations and planning
2. To that end, NAS Oceana will establish, maintain and communicate an Environmental Management System that will:
 - a. Comply with applicable laws, regulations and policies.
 - b. Integrate environmental stewardship with operational decisions.
 - c. Implement, modify and sustain practices that minimize and prevent creation of waste and pollutants at their source.
 - d. Develop objectives and targets to minimize environmental risk and monitor progress towards those goals.
 - e. Educate our workforce and supported commands on their responsibility to the environment.
 - f. Foster communication throughout the installation on our environmental commitments and performance.
 - g. Sustain our partnerships with public agencies and community organizations to mutually monitor and improve the quality of the environment.
3. These actions can be summarized through the acronym "CARE". We will:
 - a. Comply with the rules
 - b. Always improve
 - c. Reduce waste
 - d. Eliminate pollution

R. J. MEADOWS

Enclosure 3 Authorization to Carry/Use Firearms

14 May 14

From: Commanding Officer, Naval Air Station Oceana
To: Public Works Officer, Naval Air Station Oceana

Subj: AUTHORIZATION TO CARRY FIREARMS IN PERFORMANCE OF
OFFICIAL DUTIES

Ref: (a) NASO PWD Environmental, PRA4 MEMO of 30 April 2014
(b) COMNAVREGMIDLANTINST 11015.3
(c) OPNAVINST 5530.14E
(d) OPNAVIST 3591.1F
(e) DoDI 5525.17
(f) NASOINST 8000.16

1. Per references (a) through (f), authorization is granted for Mr. Lawrence McGrogan (GS-9), Mr. Mark Edwards (GS-9), Ms. Michael Wright (GS-12), and Mr. Wilbur Carawan (GS-12) to carry firearms (specifically .22 caliber rifles, .177 and .22 caliber air rifles, 12-gauge shotguns and 15mm launchers) onboard Naval Air Station (NAS) Oceana, Dam Neck Annex and Naval Auxiliary Landing Field Fentress in performance of official duties. Additional approval is granted to Mr. Lawrence McGrogan (GS-9) to carry a 9mm pistol. This approval is subject to the following conditions:

a. Use of firearms is restricted to disposal of wounded, nuisance and/or diseased wildlife, or control of invasive species.

b. Personnel listed will be in radio or phone contact with Security Dispatch at all times when performing disposal or control procedures and keep Security Dispatch aware of their location.

c. Weapons will not be used for law enforcement purposes, except in cases where warranted under the Conservation Law Enforcement Program via a qualified Conservation Law Enforcement Officer (CLEO). Mr. McGrogan is currently the only designated CLEO for the Hampton Roads installations of Mid-Atlantic Region.

d. Per reference (c), all weapons will be government-owned. The use of privately-owned weapons is prohibited, unless additional authorizations/exceptions are obtained. The only ammunition authorized will be government-owned, officially procured and issued for use in the specific weapon carried, unless additional authorizations/exceptions are obtained.

Subj: AUTHORIZATION TO CARRY FIREARMS IN PERFORMANCE OF
OFFICIAL DUTIES

e. Personnel listed will receive documented training in the use of these firearms. Training will be equivalent, or similar to the training and qualification program outlined in references (d) and (f). Specifically, for the 12-gauge shotgun, the course of fire outlined in reference (d) shall be utilized. Additionally, personnel listed shall be familiar with safety precautions for weapons handling that are detailed in reference (d).

f. Weapons and ammunition will be properly stored, secured and checked at the NAS Oceana, Natural Resources Center, Building 78.

g. Personnel listed will keep tenant commands informed of disposal or control procedures conducted in restricted areas.

2. My point of contact for this matter is Michael Wright, Natural Resources Team Leader, and can be reached at 433-3461 or via e-mail at michael.f.wright@navy.mil.

Tree City USA

2014 Application for Certification

The Tree City USA award is in recognition of work completed by the community during the 2014 calendar year.

As Mayor or Equivalent of the Community of NAS Dam Neck Annex

I herewith make application for this community to be officially certified/recertified as a Tree City USA for 2014, having achieved the standards set forth by the Arbor Day Foundation as noted below.

Standard 1: A Tree Board or Department

Community has a Tree Board only

Tree Board Chair

Michael Wright Tree Board Chairperson 757-433-3461 michael.f.wright@navy.mil

Standard 2: A Community Tree Ordinance

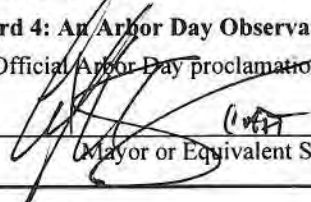

✓ Our community ordinance is on record

Standard 3: A Community Forestry Program with an Annual Budget of at Least \$2 Per Capita

Total Community Forestry Expenditures	\$351433.34
Community Population	5100
Per Capita Spending	\$68.91

Standard 4: An Arbor Day Observance and Proclamation

✓ Official Arbor Day proclamation is on record

	Commanding Officer	31 Dec 14
Mayor or Equivalent Signature	Title	Date

Application Certification
To Be Completed By The State Forester:
NAS Dam Neck Annex

The above named community has made formal application to this office. I am pleased to advise you that we reviewed the application and have concluded that, based on the information contained herein, said community is eligible to be certified as a Tree City USA community, for the 2014 calendar year, having in my opinion met the four standards required for recognition.

DEPARTMENT OF THE NAVY

NAVAL AIR STATION OCEANA
1750 TOMCAT BOULEVARD
VIRGINIA BEACH, VIRGINIA 23460-2191

IN REPLY REFER TO

Naval Air Station Oceana Dam Neck Annex

Proclamation

Whereas, In 1872, Arbor Day founder, J. Sterling Morton set aside a special day for the planting of trees; that first Arbor Day resulted in the planting of more than a million trees in Nebraska; and

Whereas, Naval Air Station Oceana Dam Neck Annex is committed to managing and enhancing its natural resources for multiple uses while fulfilling its assigned missions in support of the Departments of Defense and Homeland Security; and

Whereas, Naval Air Station Oceana Dam Neck Annex celebrates Arbor Day with the planting of a tree; and

Whereas, trees reduce erosion, clean the air, produce oxygen, cut heating and cooling costs, and provide habitat for wildlife; and

Whereas, the personnel assigned to Naval Air Station Oceana Dam Neck Annex take great pride in their installation through participation in activities and programs designed to improve the appearance and the quality of life onboard Naval Air Station Oceana Dam Neck Annex; and

Whereas, Naval Air Station Oceana Dam Neck Annex takes pride in supporting various community environmental events and activities including Arbor Day, Earth Day, and National Public Lands Day; and

Whereas, I, Lieutenant Commander Roger W. Mitchell, Officer in Charge of Naval Air Station Oceana Dam Neck Annex, on behalf of the Installation Commanding Officer, Captain Christopher W. Chope, do hereby proclaim 23 April 2014 as,

“The Annual Naval Air Station Oceana Dam Neck Annex Arbor Day Celebration”

In Witness Whereof, I sign this proclamation,

A handwritten signature in black ink, appearing to read "Roger W. Mitchell".

Roger W. Mitchell
Lieutenant Commander, U.S. Navy
Officer in Charge

TREE PRESERVATION AND REPLACEMENT ON INSTALLTION

1. Purpose

a. This policy establishes a program for forest conservation and tree protection during development or maintenance activities. The hierarchy for tree protection initiatives begins with preservation of existing trees wherever practical, and ends with planting replacement trees at specified ratios to compensate for unavoidable loss.

b. The policy parallels the intent of local ordinances. Local municipalities have determined that the planting and preservation of trees is not only desirable but essential to the present and future health, safety and welfare of all citizens.

2. Policy

a. It is the intent of this policy to prevent the unauthorized destruction or disfigurement of existing trees. It is further intended to perpetuate tree growth, to encourage tree preservation and to provide adequate tree canopy and numbers.

b. Where tree preservation is not practicable, replacement tree establishment is required. The determination of justified loss will be made in concert with the appropriate installation and or Regional Environmental Natural Resources Manager, who will also assist with preparation of tree inventories at potential development areas. Such inventories and determinations will be made during the preliminary siting phase of a project.

c. Where concurrence with the finding of justified loss is received from the Natural Resources personnel, it is the intent to require the replacement planting of trees as mitigation. Previously planted and approved tree mitigation banks may be acceptable as replacement. The overall goal is "no net loss" of trees or tree canopy cover.

d. Commercial forestry operations, conducted under an approved Integrated Natural Resources Management Plan or Forest Management Plan are exempt from the requirements of this instruction.

3. Application

a. The terms and provisions of this policy shall apply to:

(1) Development and expansion of existing facilities, including roadway, utilities and other infrastructure development.

(2) Negligent grounds maintenance activities.

b. Actions involving tree removal necessary to meet critical military mission requirements are excluded from this instruction. All such projects will be reviewed for compliance with this instruction by the appropriate installation Natural Resources Manager who may recommend tree protection measures, mitigation for lost trees or selection of alternative sites. Forest products will not be given away, abandoned, carelessly destroyed, used to offset costs of contracts or traded for products, supplies, or services. Natural Resources personnel will review contracts involving removal of significant amounts of timber to ensure these conditions are met.

c. Maintenance activities within NAVFAC P80.3 standards for the airfield clear zones or required for maintenance of ordnance areas, communication systems, security, or right-of-ways are also exempt from the requirements of this instruction.

d. Special accommodations may be made to support Morale, Welfare and Recreation operations and improvements to comply with professional recommendations for the program involved and to assist in furthering these programs at a minimal cost to station personnel.

4. Tree Preservation Plans and Tree Protection

a. Proponents of all projects and activities, which may affect existing trees, shall team with the Natural Resources Manager to identify all trees in the affected area and to develop a project/activity-specific tree preservation plan in accordance with this policy. All trees designated in the plan to be preserved shall be identified on all applicable project drawings, and also shall be marked in the field. Existing trees designated for retention shall be protected in accordance with Attachment A.

b. Certain trees and forests are considered priority areas for tree protection, and shall be left in an undisturbed condition unless no practicable alternative is identified by the Natural Resources Manager. The following areas are designated as priority areas for tree protection:

(1) Trees in wetlands, floodplains, Chesapeake Bay Protection Areas and designated drainage ditches or riparian buffers. Drainage ditch flow routes are exempt from these requirements in order to maintain design flow volumes.

(2) Contiguous forests - forested corridors that connect with other forested tracts.

(3) Critical habitat - protection areas for rare, threatened or endangered species.

(4) Historic trees - associated with historic sites.

(5) Specimen trees - trees 30 inches in diameter or larger, or trees with 75 percent or more of the diameter of the state champion tree.

5. Compensation for Unavoidable Losses

a. Due to the difficulty and time required to replace the function provided by mature trees, replacement ratios shall be based on the size of the individual trees scheduled for removal. In lieu of performing tree replacement activities, the project proponent may elect to fund the replacement.

b. The ratio for determining the number of required replacement trees shall be one replacement tree for every 6" increment in the dbh (diameter breast height) of the tree to be removed, with the replacement ratio to be rounded upwards to the next increment. A minimum 1:1 replacement ratio shall be accomplished. As an example, the following replacement ratios shall be implemented:

- (1) Removal of 1" to 5.9" dbh tree: 1:1 replacement
- (2) Removal of 6" to 11.9" dbh tree: 2:1 replacement
- (3) Removal of 12" to 17.9" dbh tree: 3:1 replacement

c. Replacement tree species and planting locations must be approved by the installation Natural Resources Manager. Replacement planting shall be conducted in accordance with the requirements set forth in Attachment (D). The following guidelines shall be used in developing appropriate tree replacement procedures for each project:

(1) Size. At the time of planting, replacement trees shall be a minimum of two (2) inches caliper.

(2) Siting. Tree locations shall be based on sound urban forestry practices, and shall ensure adequate distance from buildings, sidewalks, roads, utilities, and other development to preclude the need for future tree removal. The location of replacement trees shall favor the benefits provided by trees in an urban setting, including noise attenuation, shading of cooling units and buildings, storm water management benefits, and sensible placement with respect to turf management areas.

(3) Reforestation. In instances where space or conditions at the project site are undesirable for tree replacement, the Natural Resources Manager will assist in identifying priority reforestation locations on installation. Priority planting areas include buffers for drainage ditches, corridors to connect existing forests, buffers

between differing land uses, plantings to achieve energy conservation and expansion of existing forests.

(4) Planting Seasons. Trees shall be planted during the proper planting season to benefit survival rates. For most shade tree species this is the dormant season or leaf-off period and runs from November through March, except when the ground is frozen.

6. Unauthorized Destruction of Trees

a. Instances where trees have been willfully damaged or are found in physically or structurally poor condition as a result of improper protection shall be adjudged as destruction of government property.

b. In instances where compensation for destruction cannot be agreed upon based on the replacement criteria outlined in Section 5 of this enclosure, the Natural Resources Manager may use procedures detailed by reference (m) to calculate tree value. The appraisal process includes valuation of the tree species, size, condition and location. Tree replacement and reimbursement will be the responsibility of the person or persons who caused the destruction.

ATTACHMENT A
TREE PROTECTION STANDARDS

1. Purpose. Proper tree protection during construction and grounds maintenance activities is essential to the long-term survival of trees in development areas.

2. Construction. Existing trees to be saved shall be protected by measures outlined in Attachment (B) to enclosure (1). In addition the following conditions apply:

a. An inventory and map of trees within the footprint of construction activity must be completed. This data should be used to minimize impacts from structures and improvements.

b. Whenever possible, protection areas should include groups rather than individual trees.

c. Excavating equipment should not be used to prune roots inside a protection area. Roots should be severed using a root pruner. If roots outside the tree protection area are encountered during construction, they should be severed using a sharp chainsaw, axe or handsaw.

d. Tunneling of utilities should be utilities whenever possible to reduce damage to tree roots. If tunneling or altering the route of utilities is not possible, roots should be pruned with a root pruner.

3. Grounds Maintenance. Grounds maintenance personnel shall be responsible for damage to trees and shrubbery in accordance with current grounds maintenance contract requirements. At a minimum, the following standards shall apply:

a. Contractors shall not subject trees, shrubs or hedges to damage by lawn mowers, string trimmers or other equipment. Damage includes wounds inflicted to bark, limbs or exposed roots.

b. Extreme care shall be exercised when performing grounds maintenance work around any of the defined priority areas for tree protection.

4. Tree planting and Care. All tree pruning shall be done in accordance with the information in Attachment (C) to enclosure (1). All tree plantings must be first approved by the installation Natural Resources Manager to ensure selection of proper species and siting. Planting of trees shall be done in accordance with procedures outlined in attachment (D) to enclosure (1). When determining planting locations, long-term survivability shall be considered based on sound forestry practices. Trees shall be planted in locations that favor the benefits of trees and to avoid future tree removal.

TREE PROTECTION DETAIL

1. Prior to any clearing, grading, or construction, tree protection fences (See Detail) shall be placed around all trees to be retained on the site to prevent the destruction or damaging of trees.

- Option 1. If site conditions permit, the radius of the tree protection fence shall be equal to 1 foot for every inch of tree diameter at breast height measured at four and a half (4½) feet above the surface of the ground.
- Option 2. If site conditions do not permit a fence system as large as described above then, the fence shall be located in a circular pattern with a radius equal to the length of the widest or longest branch, or drip line.

Attachment (B) to Enclosure (1)

a. Fence material shall be made of polypropylene or similar plastic material, and the color shall be safety orange and shall not be less than 48 inches in height.

b. Metal fence stakes or 4-inch x 4-inch wood posts shall be used to erect the fence. Sufficient stakes shall be used to ensure that the fence material remains upright without sagging. Spacing between wood or metal stakes shall not exceed 8 feet.

c. Signs (16 inch x 12 inch) shall be spaced every 50 feet along the fence indicating the site is a tree preservation area.

2. Materials shall not be stockpiled within the tree protection area, and vehicles and other equipment shall be excluded to avoid soil compaction and root damage. Equipment operator shall not damage tree trunks, limbs and roots during clearing, grading or construction operations.

3. Protected trees shall be kept free of nails or other fastening devices, signs, survey makers, and electrical wires.

4. In cases where the construction drawings indicate that utilities, sidewalks or other structures enter the tree protection area, the following protection measures shall be implemented.

a. Minimize disturbance to the root area by adjusting the tree protection fence and staying as far away from the tree as possible. Disturbance shall be minimized within the critical zone, which are 3 to 10 feet from the tree trunk.

b. Place 16 to 20 inches of wood chips (from trees already removed) or bark mulch over the root zone to reduce soil compaction from equipment.

c. Bridge the root area with plates of steel supported on wood ties.

d. Spread a heavy plastic tarp over the roots prior to placing excavated material on the ground. The tarp will serve as a marker for equipment operators indicating the existing grade and roots systems as they place the spoil material back into the excavated trench.

e. Pump concrete through conveyor pipes instead of driving vehicles over the tree roots.

TREE PRUNING DETAIL

1. The Contractor shall contact the Natural Resources Manager prior to initiating pruning on the trees designated for protection. Additional pruning techniques may be provided.
2. All cuts shall be made as close as possible to the trunk or parent limb without cutting into the branch collar or leaving a protruding stub (see Figure 1). Bark at the edge of all pruning cuts shall remain firmly attached.
3. All branches too large to support with one hand shall be precut (see Figure 1) to avoid splitting or tearing the bark. Where necessary, ropes or other equipment shall be used to lower large branches or stubs to the ground.
4. Treatment of cuts and wounds with wound dressing or paint shall not be permitted.
5. Equipment that will damage the bark or cambium layer shall not be used on or in the tree. The use of climbing spurs (hook, irons) shall not be permitted. Sharp tools shall be used so that clean cuts will be made at all times. Trucks and other support vehicles shall not be permitted inside the drip line of the tree canopy. Temporary removal of the tree protection fence shall be permitted to facilitate pruning, and removal of limbs and other woody material from under the drip line. The tree protection fence shall be erected immediately after pruning is complete.
6. All cut limbs and woody material shall be removed from the crown upon completion of pruning. All limbs, brush, leaves, and other woody material shall be removed from government property by the Contractor.
7. Pruning shall conform to the American National Standard for Tree Care Operations - Tree, Shrub, and Other Woody Plant Maintenance - Standard Practices, ANSI A300-1995 and International Society of Arboriculture Tree-Pruning Guidelines. Copies of both documents can be purchased by contacting the International Society of Arboriculture, PO Box 3129, Champaign, IL 61826-3129, tel 217-355-9411 or <http://www.isa-arbor.com>.
8. All work performed shall adhere to the American National Standard for Tree Care Operations-Pruning, Trimming, Repairing, Maintaining, and Removing Trees, and Cutting Brush - Safety Requirements, ANSI Z133.1-1994. Contact the International Society of Arboriculture, PO Box 3129, Champaign, IL 61826-3129, phone 217-355-9411, fax 217-355-9516, or web site www.isa-arbor.com to obtain a copy of ANSI Z133.1.
9. Tree maintenance contractors shall have an ISA Certified Arborist on-site during all tree maintenance operations.

TREE PRUNING DETAIL

1. Locate the branch ridge
2. Find target a - outside of branch bark ridge
3. Find target b - swelling where branch meets branch collar
4. If b is hard to find - drop a line at ax. angle $xac =$ to angle xab
5. Stub branch to be pruned
6. Make cut at line AB

Do not

- Cut behind the branch bark ridge
- Leave stubs
- Cut branch collar
- Paint cuts
- Use dull tools
- Use climbing spurs

TREE PLANTING DETAIL

Remember: Select
a Native Tree.

1. Growing Stock Inspection

a. All trees and shrubs shall meet the American Standard for Nursery Stock, ANSI Z60.1-1996. Contact the American Nursery & Landscape Association, 1250 I Street NW, Suite 500, Washington, DC 20005, tel 202-789-2900 or web site www.anla.org to obtain a copy of ANSI Z60.1-1996.

b. All trees shall be true to type or name as ordered or shown on the plans and shall be individually tagged or tagged in-groups by species and cultivar.

c. All trees shall be healthy, have a form typical for the species or cultivar, be well rooted, and stand upright without support. Tree size shall be not larger than 1-1/2" to 2" in caliper diameter.

d. All trees shall comply with federal and state laws requiring inspection for plant diseases and insect pest infestations.

e. The rootball of all trees shall be moist throughout and solid with little or no movement at the trunk. The crown shall show no signs of moisture stress. Check that the tree is free of girdling roots (roots that develop and grow across or around other roots), and free of knees (roots protruding above the soil). The roots should be abundant and white. Brown or black roots indicate a health problem.

f. Except for small-growing, multistemmed ornamentals, select trees that have a single, straight trunk and leader, and spreading branches. Reject trees with double leaders (codominant stems) or vigorous, upright branches competing with the leader. Radial and vertical distribution of branches shall form a symmetrical crown. Foliage should be evenly distributed on the upper 2/3 of the tree, and not concentrated at the top. The Government shall reject trees that have been severely pruned or headed back, with trunk injury, and without an abundance of healthy, green leaves.

2. Planting

a. Planting season is from November through March, except when the ground is frozen.

b. Site factors that influence long-term survivability must be considered: overhead and underground utilities, sidewalks, signage conflict, traffic visibility, light poles, etc. Utilities must be marked prior to excavation.

c. Balled and Burlapped (B&B) Stock: All synthetic or non-degradable material such as nylon rope or treated burlap must be

Attachment (D) of Enclosure (1) removed from the root ball prior to planting. All material including biodegradable material must be removed from the upper 1/3 of the root ball. Prevent remaining pieces from extending above the soil or they will act as wicks, drying the soil. Take extra care not to loosen or break the soil ball. If trees are planted

with wire baskets around the root ball, cut and remove the top two tiers of the wire after the ball is set in the hole.

d. Container Grown and Containerized Stock: Carefully remove the container at the planting site. Cutting the containers may be necessary. Remove all containers, including biodegradable paper-mache pots. Newly containerized stock may be only slightly rooted; the container must be removed with care so as not to disturb the root ball. In contrast, container grown stock may be rootbound. If roots are growing in a spiral around the soil ball, the plant is root bound. These roots need to be separated or they will eventually girdle the plant. Make vertical cuts on the sides of the ball just deep enough to cut the net of roots. Also, make a criss-cross cut across the bottom of the ball.

e. Mark out a planting area 3-5 times the diameter of the root ball. Use a rototiller or shovel to loosen and mix the soil in this entire area to a depth of 12 inches. Organic matter can be added to the loosened soil as long as the new material is used uniformly throughout the area. In the center of the prepared area, dig a hole as only as wide enough and deep enough to accept the root ball. The hole should allow the root ball to sit on solid ground rather than on loose soil. Once the ball is set in the hole, its upper surface should be level with or slightly above the surrounding ground.

f. Position the tree so that it is vertical and plumb to the ground and the main stem is growing straight up.

g. Backfill with soil from the planting site if the soil is not contaminated. Remove large rocks and construction debris from the soil. Amending the backfill soil with organic matter does not increase survival or growth of woody plants.

h. When the hole is half full, slowly water to saturate the soil, then continue to fill the hole. Settle the soil by watering or lightly tamping to ensure that all air pockets are eliminated. Do not pack the soil by using equipment or feet. Do not create an earthen berm around the tree.

i. Water thoroughly to remove air pockets, secure the soil around the roots, and provide nourishment.

j. Rake soil evenly around the entire planting area.

3. Mulching

a. Mulch an area at least 3 times the diameter of the root ball to a depth of 2-4 inches with wood chips, bark mulch, shredded leaves, or pine needles. Do not mound the mulch around the base of the tree.

4. Staking

a. Only stake the tree if it will not stand on its own, and use only one stake on the opposite side of the leaning tree. The stake is to be placed outside of the root ball.

b. Do not use wire even if the wire is in-cased by hose. Use a flexible tie attached to a single stake. Biodegradable material is recommended.

c. Do not wrap tree with protective tape. If tree arrives on the site with a protective tree wrap, remove it immediately after the tree is planted.

d. Remove stakes and ties after 1 year.

5. Pruning

a. At the time of planting dead, damaged and rubbing or cross branches can be removed.

b. Do not remove any other living branches. Do not apply any type of wound dressing.

c. Remove sucker sprouts from the base of the tree.

6. Watering

a. During the first growing season, irrigate the root ball with 5 gallons of water every three days after a rain event. Slow deep watering is recommended. Soil should be moistened to a depth of 12-18 inches. Water the soil within the root zone. Do not water the tree trunk.

7. Fertilizing

Fertilizer must be phosphorus free.

a. Use no fertilizer during the establishment period. The establishment period is about one year for every 1 inch of caliper. So, a 2-inch caliper tree would require two years to reestablish the top:root ratio.

b. Once the trees are established, nitrogen fertilization should be applied at a rate of 2-lbs. N/1,000 square feet/year. Established, mature trees require minimal nitrogen, 1 lb. N/1,000 square feet/two to four years. All tree fertilizers must be slow or controlled release versus water-soluble.

c. Mature trees growing in fertilized turf should not be fertilized.

d. Apply fertilizers during October through April, except when the ground is frozen or covered with snow.

TREE PLANTING DETAIL

Pruning Trees

Pruning is the most common tree maintenance procedure. Although forest trees grow quite well with only nature's pruning, landscape trees require a higher level of care to maintain their safety and aesthetics. Pruning should be done with an understanding of how the tree responds to each cut. Improper pruning can cause damage that will last for the life of the tree, or worse, it will shorten the tree's life.

Reasons for Pruning

Since each cut has the potential to change the growth of the tree, no branch should be removed without a reason. Common reasons for pruning are to remove dead branches, to remove crowded or rubbing limbs, and to eliminate hazards. Trees may also be pruned to increase light and air penetration to the inside of the tree's crown or to the landscape below. In most cases, mature trees are pruned as a corrective or preventative measure.

When to Prune

Most routine pruning to remove weak, diseased or dead limbs can be accomplished at any time during the year with little effect on the tree. As a rule, growth is maximized and wound closure is fastest if pruning takes place before the spring growth flush. Some trees, such as maples and birches, tend to "bleed" if pruned early in the spring. This may be unsightly, but is of little consequence to the tree.

A few tree diseases, such as oak wilt, can be spread when pruning wounds allow spores access into the tree. Susceptible trees should not be pruned during active transmission periods.

Heavy pruning just after the spring growth flush should be avoided. This is when trees have just expended a great deal of energy to produce foliage and early shoot growth. Removal of a large percentage of foliage at this time can stress the tree.

Making Proper Pruning Cuts to Mature Trees

Pruning cuts should be made just outside the branch collar. The branch collar contains trunk or parent branch tissue and should not be damaged or removed. If trunk collar has grown out on a dead limb to be removed, make the cut just beyond the collar. Do not cut the collar (see figure).

On a dead branch that has a collar of live wood, the final cut should be made just beyond the outer edge of the collar.

If a large limb is to be removed, its weight should first be reduced. This is done by making an undercut about 12-18 inches from the limb's point of attachment. A second cut is made from the top, directly above or a few inches further out on the limb. This removes the limb leaving the 12-18 inch stub. The stub is removed by cutting back to the branch collar. This technique reduces the possibility of tearing the bark

Use the 3-cut method to remove a large limb.

How Much Should be Pruned?

The amount of live tissue that should be removed depends on the tree size, species, and age, as well as the pruning objectives. Younger trees will tolerate the removal of a higher percentage of living tissue than mature trees. A common mistake is to remove too much inner foliage and small branches. It is important to maintain an even distribution of foliage along large limbs and in the lower portion of the crown. A widely accepted rule of thumb is never to remove more than one fourth of a tree's leaf bearing crown. In a mature tree, pruning even that much could have negative effects. Removing even a single, large-diameter limb can create a wound that the tree may not be able to close. The older and larger a tree becomes, the less energy it has in reserve to close wounds and defend against decay or insect attack. The pruning of large, mature trees is usually limited to the removal of dead or potentially hazardous limbs.

Wound Dressings

Wound dressings were once thought to accelerate wound closure, protect against insects and diseases, and reduce decay. However, research has shown that dressings do not reduce decay or speed closure, and rarely prevent insect or disease infestations. Most experts recommend that wound dressings not be used. If a dressing must be used for cosmetic purposes, then only a thin coating of a non-toxic material should be applied.

Newly Planted Trees

Pruning of newly planted trees should be limited to corrective pruning. Remove torn or broken branches. Save other pruning measures for the second or third year. The belief that trees should be pruned when planted to compensate for root loss is misguided. Trees need their leaves and shoot tips to provide food and the substances, which stimulate new root production. Unpruned trees establish faster, with a stronger root system than trees pruned at the time of planting.

(From International Society Arboriculture at <http://www.isa-arbor.com/consumer/pruning.html>)

New Tree Planting

The ideal time to plant trees and shrubs is during the dormant season, in the fall after leafdrop or early spring before bud-break. Weather conditions are cool and allow plants to establish roots in the new location before spring rains and summer heat stimulate new top growth. However, trees properly cared for in the nursery or garden center, and given the appropriate care during transport to prevent damage, can be planted throughout the growing season. In either situation, proper handling during planting is essential to ensure a healthy future for new trees and shrubs. *Before you begin planting your tree, be sure you have had all underground utilities located prior to digging.*

If the tree you are planting is balled and burlapped, or bare rooted, it is important to understand that the tree's root system has been reduced by 90-95% of its original size during transplanting. As a result of the trauma caused by the digging process, trees will commonly exhibit what is known as **transplant shock**. Transplant shock is indicated by slow growth and reduced vigor following transplanting. Proper site preparation before and during planting, coupled with good follow up care will reduce the amount of time the plant experiences transplant shock and will allow the tree to quickly establish in its new location. Carefully follow eight simple steps and you can significantly reduce the stress placed on the plant at the time of planting.

1. **Dig a shallow, broad planting hole.** Make the hole wide, as much as three times the diameter of the root ball, but only as deep as the root ball. It is important to make the hole wide because the tree roots on the newly establishing tree must push through surrounding soil to establish. On most planting sites in new developments, the existing soils have been compacted and are unsuitable for healthy root growth. Breaking up the soil in a large area around the tree provides the newly emerging roots room to expand into loose soil to hasten establishment.
2. **Identify the trunk flare.** The trunk flare is where the roots spread at the base of the tree. This point should be partially visible after the tree has been planted (see diagram). If the trunk flare is not partially visible, you may have to remove some soil from the top of the root ball. Find it so you can determine how deep the hole needs to be for proper planting.
3. **Place the tree at the proper height.** Before placing the tree in the hole, check to see that the hole has been dug to the proper depth, and no more. The majority of the roots on the newly planted tree will develop in the top 12" of soil. If the tree is planted too deep, new roots will have difficulty developing due to a lack of oxygen. It is better to plant the tree a little high, 1-2" above the base of the trunk flare, than to plant it at or below the original growing level. This will allow for some settling (see diagram). To avoid damage when setting the tree in the hole, always lift the tree by the root ball, and never by the trunk.

4. **Straighten the tree in the hole.** Before you begin backfilling have someone view the tree from several directions to confirm the tree is straight. Once you begin backfilling it is difficult to reposition.
5. **Fill the hole, gently but firmly.** Fill the hole about 1/3 full and gently but firmly pack the soil around the base of the root ball. Then, if the tree is balled and burlapped, cut and remove the string and wire from around the trunk and top 1/3 of the root ball (see diagram). Be careful not to damage the trunk or roots in the process. Fill the remainder of the hole, taking care to firmly pack soil to eliminate air pockets that may cause roots to dry out. To avoid this problem, add the soil a few inches at a time and settle with water. Continue this process until the hole is filled and the tree is firmly planted. It is not recommended to apply fertilizer at the time of planting.
6. **Stake the tree, if necessary.** If the tree is grown and dug properly at the nursery, staking for support is not necessary in most home landscape situations. Studies have shown that trees will establish more quickly and develop stronger trunk and root systems if they are not staked at the time of planting. However, protective staking may be required on sites where lawn mower damage, vandalism or windy conditions are concerns. If staking is necessary for support, two stakes used in conjunction with a wide flexible tie material will hold the tree upright, provide flexibility, and minimize injury to the trunk (see diagram). Remove support staking and ties after the first year of growth. Leave protective staking in place as long as necessary.
7. **Mulch the base of the tree.** Mulch is simply organic matter applied to the area at the base of the tree. It acts as a blanket to hold moisture, protect against harsh soil temperatures, both hot and cold, and reduces competition from grass and weeds. Some good choices are leaf litter, pine straw, shredded bark, peat moss, or wood chips. A two to four inch layer is ideal. More than four inches may cause a problem with gas exchange. When placing mulch, care should be taken so that the actual trunk of the tree is not covered. This may cause decay of the living bark at the base of the tree. A mulch-free area, one to two inches wide at the base of the tree, is sufficient to avoid moist bark conditions and prevent decay.

8. **Follow-up care.** Keep the soil moist but not soaked; overwatering will cause leaves to turn yellow or fall off. Water trees at least once a week, barring rain, and more frequently during hot weather. When the soil is dry below the surface of the mulch, it is time to water. Continue until mid-fall, tapering off for lower temperatures that require less frequent watering. Other follow-up care may include minor pruning of branches damaged during the planting process. Prune sparingly immediately after planting, and wait to begin necessary corrective pruning until after a full season of growth in the new location.

(Taken from the International Society of Arboriculture at <http://www.isa-arbor.com/consumer/planting.htm>)

How to Plant with a Dibble Bar

1. Push the blade vertically into the soil then pull the handle toward you to open the hole.

2. Set the seedling 1 to 3 inches deeper than the nursery depth with the roots straight.

3. Push the blade into the soil just behind the planting hole then pull the handle back to close the bottom of the hole. Push the handle forward to close the top of the hole.

4. Pack the soil firmly with your heel.

(From South Carolina Forestry Commission at www.state.sc.us/forest/refplant.htm)

How to Plant Bare-root Trees

1. It is best to plant bare-root trees immediately, in order to keep the fragile roots from drying out. If you can't plant because of weather or soil conditions, store the trees in a cool place and keep the roots moist.
2. Unpack tree and soak in water 3 to 6 hours. Do not plant with packing materials attached to roots, and do not allow roots to dry out.
3. Dig a hole, wider than seems necessary, so the roots can spread without crowding. Remove any grass within a three-foot circular area. To aid root growth, turn soil in an area up to 3 feet in diameter.
4. Plant the tree at the same depth it stood in the nursery, without crowding the roots. Partially fill the hole, firming the soil around the lower roots. Do not add soil amendments.

5. Shovel in the remaining soil. It should be firmly, but not tightly packed with your heel. Construct a water-holding basin around the tree. Give the tree plenty of water.
6. After the water has soaked in, place a 2-inch deep protective mulch area 3 feet in diameter around the base of the tree (but not touching the trunk).
7. Water the tree generously every week or 10 days during the first year of establishment.

Recognizing Hazardous Trees

Hazardous Trees & Utility Lines. Trees that fall into utility lines have additional serious consequences. Not only can they injure people or property near the line, but hitting a line may cause power outages, surges, fires and other damage. Downed lines still conducting electricity are especially dangerous. A tree with a potential to fall into a utility line is a very serious situation.

Tree Hazard Checklist

Consider these questions . . .

1. Are there large dead branches in the tree?
2. Are there detached branches hanging in the tree?
3. Does the tree have cavities or rotten wood along the trunk or in major branches?
4. Are mushrooms present at the base of the tree?
5. Are there cracks or splits in the trunk or where branches are attached?
6. Have any branches fallen from the tree?
7. Have adjacent trees fallen over or died?
8. Has the trunk developed a strong lean?
9. Do many of the major branches arise from one point on the trunk?
10. Have the roots been broken off, injured or damaged by lowering the soil level, installing pavement, repairing sidewalks or digging trenches?
11. Has the site recently been changed by construction, raising the soil level or installing lawns?
12. Have the leaves prematurely developed an unusual color or size?
13. Have trees in adjacent wooded areas been removed?
14. Has the tree been topped or otherwise heavily pruned?

Managing Tree Hazards

One of these treatments may help make your tree safer. Reducing the risk associated with hazardous trees can take many forms.

1. **Prune the tree.** Remove the defective branches of the tree. Since in appropriate pruning may also weaken a tree,

2. **Provide routine care.** Mature trees need routine care in the form of water, fertilizer (in some cases), mulch and pruning as dictated by the season and their structure.

A number of treatments are best done by a Certified Arborist

1. **Cable and brace the tree.** Provide physical support for weak branches and stems to increase their strength and stability.
2. **Remove the tree.** Some hazardous trees are best removed. If possible, plant a new tree in an appropriate place as a replacement.

ABOUT THE NATIVE PLANTS FOR CONSERVATION, RESTORATION AND LANDSCAPING PROJECT

This project is a collaboration between the Virginia Department of Conservation and Recreation and the Virginia Native Plant Society. VNPS chapters across the state helped to fund the 2011 update to this brochure.

The following partners have provided valuable assistance throughout the life of this project:

The Nature Conservancy – Virginia Chapter • Virginia Tech Department of Horticulture • Virginia Department of Agriculture and Consumer Services • Virginia Department of Environmental Quality, Coastal Zone Management Program • Virginia Department of Forestry • Virginia Department of Game and Inland Fisheries • Virginia Department of Transportation

FOR MORE INFORMATION

Virginia Department of Conservation and Recreation
Natural Heritage Program

Native Plants

FOR CONSERVATION, RESTORATION & LANDSCAPING

VIRGINIA COASTAL PLAIN

WHAT ARE NATIVES?

Native species evolved within specific regions and dispersed throughout their range without known human involvement. They form the primary component of the living landscape and provide food and shelter for native animal species.

Native plants co-evolved with native animals over many thousands to millions of years and have formed complex and interdependent relationships. Our native fauna depend on native flora to provide food and cover. Many animals require specific plants for their survival.

BENEFITS OF NATIVE PLANTS

Using native species in landscaping reduces the expense of maintaining cultivated landscapes and minimizes the likelihood of introducing new invasive species. It may provide a few unexpected benefits as well.

Native plants often require less water, fertilizer and pesticide, thus adding fewer chemicals to the landscape and maintaining water quality in nearby rivers and streams. Fewer inputs mean time and money saved for the gardener.

Native plants increase the presence of desirable wildlife, such as birds and butterflies, and provide sanctuaries for these animals as they journey between summer and winter habitats. The natural habitat you create with native plants can become an outdoor classroom for children, or a place for you to find peace and quiet after a busy day.

Native plants evoke a strong sense of place and regional character. For example, live oak and magnolia trees are strongly associated with the Deep South. Redwood trees characterize the Pacific Northwest. Saguaro cacti call to mind the deserts of the Southwest.

BUYING AND GROWING NATIVE PLANTS

More gardeners today are discovering the benefits of native plants and requesting them at their local garden centers. Because of this increased demand, retailers are offering an ever-widening selection of vigorous, nursery-propagated natives.

Once you've found a good vendor for native plants, the next step is choosing appropriate plants for a project. One of the greatest benefits of designing with native plants is their adaptation to local conditions. However, it is important to select plants with growth requirements that best match conditions in the area to be planted.

If you're planning a project using native plant species, use the list in this brochure to learn which plants grow in your region of Virginia. Next, study the minimum light and moisture requirements for each species, noting that some plants grow well under a variety of conditions. Many of the recommended species are well-suited to more than one of these categories.

For more information, refer to field guides and publications on local natural history for color, shape, height, bloom times and specific wildlife value of the plants that grow in your region. Visit a nearby park, natural area preserve, forest or wildlife management area to learn about common plant associations, spatial groupings and habitat conditions. For specific recommendations and advice about project design, consult a landscape or garden design specialist with experience in native plants.

WHAT ARE NON-NATIVE PLANTS?

Sometimes referred to as "exotic," "alien," or "non-indigenous," non-native plants are species introduced, intentionally or accidentally, into a new region by humans. Over time, many plants and animals have expanded their ranges slowly and without human assistance. As people began cultivating plants, they brought beneficial and favored species along when they moved into new regions or traded with people in distant lands. Humans thus became a new pathway, enabling many species to move into new locations.

WHAT ARE INVASIVE PLANTS?

Invasive plants are introduced species that cause health, economic or ecological damage in their new range. More than 30,000 species of plants have been introduced to the United States since the time of Columbus. Most were introduced intentionally, and many provide great benefits to society as agricultural crops and landscape ornamentals. Some were introduced accidentally, for example, in ship ballast, in packing material and as seed contaminants. Of these introduced species, fewer than 3,000 have naturalized and become established in the United States outside cultivation. Of the 3,500 plant species in Virginia, more than 800 have been introduced since the founding of Jamestown. The Virginia Department of Conservation and Recreation currently lists more than 100 of these species as invasive.

In the United States, invasive species cause an estimated \$120 billion in annual economic losses, including costs to manage their effects. Annual costs and damages arising from invasive plants alone are estimated at \$34 billion.

NATIVE PLANTS VS. INVASIVE PLANTS

Invasive plants have competitive advantages that allow them to disrupt native plant communities and the wildlife dependent on them. For example, kudzu (*Pueraria montana*) grows very rapidly and overtops forest canopy, thus shading other plant species from the sunlight necessary for their survival. A tall invasive wetland grass, common reed (*Phragmites australis* ssp. *australis*), invades and dominates marshes, reducing native plant diversity and sometimes eliminating virtually all other species.

Invasive species can marginalize or even cause the loss of native species. With their natural host plants gone, many insects disappear. And since insects are an essential part of the diet of many birds, the effects on the food web become far reaching. Habitats with a high occurrence of invasive plants become a kind of "green desert." Although green and healthy in appearance, far fewer native species of plants and animals are found in such radically altered places.

Virginia Coastal Plain

Virginia's Coastal Plain extends from the sands of Virginia Beach west to the fall line. Formed by marine sediments eroded from the Appalachian Highlands, the Coastal Plain varies in topography from north to south. In the north, the Northern Neck is somewhat hilly and well-drained. On the Middle Peninsula and Lower Peninsula, hills are less steep. South of the James River, the landscape levels off to about a 1-degree slope toward the ocean. In places, streams cut easily through the sands, gravels and clays to form well-developed ravine systems, and tidal rivers widen as the topography flattens. The Eastern Shore, separated from the mainland by the Chesapeake Bay, exhibits relatively little topography across the uplands extending from the Atlantic on the east to the bay on the west. From white sand beaches of the barrier islands, to tidal freshwater marshes, to blackwater swamps, to upland mixed hardwood and pine forests, the Coastal Plain has a diverse array of habitats for many native plant species.

Recommended Uses

W = Wildlife
H = Horticulture & landscaping
C = Conservation & restoration
D = Domestic livestock forage

Minimum Light Requirements

S = Shade
P = Partial sun
F = Full sun

Moisture Requirements

L = Low moisture
M = Moderate moisture
H = High moisture

Some species are marked with the following footnote symbols:

+ May be aggressive in a garden setting

* Due to the rarity and sensitivity of habitat in Virginia, these species are recommended for horticultural use only. Planting these species in natural areas could be detrimental to the survival of native populations.

25 OCT 1999

NAS OCEANA INSTRUCTION 5090.2E

Subj: PROCEDURES FOR CUTTING FIREWOOD AND USE OF TREE PRODUCTS

Ref: (a) OPNAVINST 5090.1B
(b) NAVFAC P-73

Encl: (1) Chainsaw Safety

1. Purpose. To establish procedures governing cutting of trees for firewood and obtaining other forest products on board Naval Air Station (NAS) Oceana, Fleet Combat Training Center (FCTC) Dam Neck and Naval Auxiliary Landing Field (NALF) Fentress.

2. Cancellation. NASOCEANAINST 5090.2D. Because of numerous revisions, paragraph markings have been omitted.

3. Definition. Forest products, for the purpose of this instruction include: Pine straw, live and felled trees and scrap lumber or pallets.

4. Policy. It is the continuing policy of the Secretary of the Navy that all Navy facilities and installations having land areas with a potential for timber production have an active program for the conservation and management of forest resources as outlined in reference (a).

5. Responsibilities

a. Natural Resources Manager, Regional Environmental Group Oceana shall administer and oversee the Firewood Program by designating areas for cutting, issuing permits, collecting fees and monitoring cutting. Methods of dispersal, sales and handling of funds shall be per references (a) and (b). Reference (a) notes that forest products will not be given away, abandoned, carelessly destroyed, used to offset costs of contracts or traded for products, supplies or services.

b. Base Security, with support from the designated Game Wardens, shall be responsible for enforcing this instruction and any conditions of firewood permits. At NALF Fentress woodcutters shall sign out in the visitor's logbook at the Crash Captain's Desk, Building 100.

c. Cutters and Gatherers shall comply with this instruction, applicable state and federal regulations and enclosure (1).

25 OCT 1999

6. General

a. Authorized Personnel. The following persons are authorized to cut firewood and obtain other forest products on NAS Oceana, FCTC Dam Neck and NALF Fentress:

- (1) Active duty military personnel
- (2) Retired military personnel
- (3) Federal civilian employees of NAS Oceana or FCTC Dam Neck
- (4) Reservists

b. Utilization. All purchased wood is for the sole benefit of the purchaser's personal home use and is not to be resold.

7. Procedures

a. Permits. All persons cutting or collecting firewood or other wood products on NAS Oceana, FCTC Dam Neck or NALF Fentress shall have a firewood permit.

(1) Firewood permits are obtainable only from the Regional Environmental Group Oceana, Building 830 or Natural Resources Center, Building 78. A permit will be issued for a specific day and area and displayed on the vehicle dashboard. Cutting outside of designated days or areas may constitute a charge of trespassing.

(2) At the time of permit issuance, individuals shall be required to complete and sign a general release statement which relieves the federal government of all liability in case of accident or injury.

(3) There is a nominal charge for tree products. Prices may vary due to changes in marketability of a product. Loads larger or smaller than the standard fees listed below shall be priced by the Natural Resources Manager according to seasonal demand and availability.

- Firewood - \$20.00/small pickup truck load (cut-your-own)
- Firewood - \$30.00/small pickup truck load (cut and split, when available)
- Firewood - \$25.00/standard 8 foot bed pickup truck load (cut-your-own)
- Firewood - \$40.00/standard 8 foot bed pickup truck load (cut and split, when available)

25 OCT 1999

Scrap lumber, crates, and pallets - \$ 10.00/pickup truck load

Pine straw - \$ 5.00/pickup truck load

Live trees - \$ 10.00 - \$25.00/tree. Varies with species and availability. Requires prior approval from the Natural Resources Manager.

(4) Permits shall specify the date of harvest and/or collection and can be used only for the specified number of loads.

(5) Individuals may not remove more than three cords of wood per calendar year.

b. Harvesting

(1) Individuals shall provide their own cutting and hauling equipment.

(2) Wood shall be cut only in locations on NAS Oceana, FCTC Dam Neck and NALF Fentress designated by the Natural Resources Manager.

(3) Firewood shall be cut during daylight hours only.

(4) Unless otherwise specified on the permit, only trees within the designated area that have been previously felled may be taken.

(5) No minors (under the age of 18) shall be allowed to operate a chainsaw or any other sharp tools, such as a saw, hatchet or axe.

(6) Limbs and/or brush shall be removed at least twenty feet away from any road or firebreak and removed from any stream or standing body of water.

(7) Young trees shall be protected and there shall be no ground disturbances that could cause erosion.

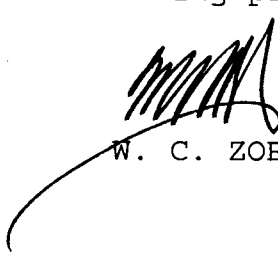

(8) Littering is prohibited at all times. Individuals found littering shall have their woodcutting privileges suspended.

(9) Operating a chainsaw while under the influence of alcohol is prohibited. Individuals found guilty of consuming alcoholic beverages while on the worksite shall have their privileges revoked.

NASOCEANAINST 5090.2E

25 OCT 1999

8. Violations. Individuals found violating the provisions of this instruction may have wood cutting privileges suspended or revoked.

W. C. ZOBEL

Distribution:

25 OCT 1999

CHAINSAW SAFETY

1. Wear snug fitting clothes, gloves, and heavy boots.
2. Wear ear and eye protection.
3. Avoid kick-back. Never cut with the nose of the guidebar.
4. Avoid over reaching and cutting above shoulder height.
5. Have non-alcoholic beverages on hand to prevent dehydration in hot and cold weather.
6. Use a sharp chain, set at the proper tension.
7. Stay clear of the cutting path of the chainsaw.

Enclosure 1 Preliminary Wetland Jurisdictional Determination

DEPARTMENT OF THE ARMY
NORFOLK DISTRICT CORPS OF ENGINEERS
FORT NORFOLK 803 FRONT STREET
NORFOLK VIRGINIA 23510-1096

MARCH 10, 2011

PRELIMINARY JURISDICTIONAL DETERMINATION

Southern Virginia Regulatory Section
NAO-2010-2830 (Redwing Lake/Atlantic Ocean)

Mr. David Noble
Environmental Planning and Conservation
Navy Region, Mid-Atlantic
1510 Gilbert Street
Norfolk, Virginia 23511-2737

Dear Mr. Noble:

This letter is in regard to your request for a preliminary jurisdictional determination for waters of the U.S. (including wetlands) on property known as NASO Dam Neck DEVGRU Compound, located on a 208-acre parcel at Naval Air Station Oceana Dam Neck (NASO Dam Neck), in Virginia Beach, Virginia (GPIN #24253926610000 and 24257432440000).

The maps titled "Figure 4 Sheet Key. Aquatic Resources Map for DevGru Compound on NASO Dam Neck, Virginia Beach, Virginia; Figure 4a. Aquatic Resources Map for DevGru Compound on NASO Dam Neck, Virginia Beach, Virginia; and Figure 4b. Aquatic Resources Map for DevGru Compound on NASO Dam Neck, Virginia Beach, Virginia", prepared by Tetra Tech, dated March 2011 and Corps date stamped as received March 4, 2011 (copies enclosed) provides the locations of waters and/or wetlands on the property listed above. The basis for this delineation includes application of the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Atlantic and Gulf Coastal Plain Region and the positive indicators of wetland hydrology, hydric soils, and hydrophytic vegetation and/or the presence of an ordinary high water mark.

Discharges of dredged or fill material, including those associated with mechanized landclearing, into waters and/or wetlands on this site may require a Department of the Army permit and authorization by state and local authorities including a Virginia Water Protection Permit from the Virginia Department of Environmental Quality (DEQ), a permit from the Virginia Marine Resources Commission (VMRC) and/or a permit from the City of Virginia Beach Wetlands Board. This letter is a confirmation of the Corps preliminary jurisdiction for the waters and/or wetlands on the subject property and does not authorize any work in these areas. Please obtain all required permits before starting work in the delineated waters/wetland areas.

This is a preliminary jurisdictional determination and is therefore not a legally binding determination regarding whether Corps jurisdiction applies to the waters or wetlands in question. Accordingly, you may either consent to jurisdiction as set out in this preliminary jurisdictional determination and the attachments hereto if you agree with the determination, or you may request and obtain an approved jurisdictional determination. This preliminary jurisdictional

determination and associated wetland delineation map may be submitted with a permit application.

This delineation of waters and/or wetlands is valid for a period of five years from the date of this letter unless new information warrants revision prior to the expiration date.

Enclosed is a copy of the "Preliminary Jurisdictional Determination Form". Please review the document, sign, and return one copy to Ms. Katy Damico, of my staff, either via email (katy.r.damico@usace.army.mil) or via standard mail to US Army Corps of Engineers, Regulatory Office, and ATTN: Katy Damico, 803 Front Street Norfolk, Virginia 23510 within 30 days of receipt and keep one for your records.

If you have any questions, please contact Katy Damico, of my staff, either via telephone at (757) 201-7121 or via email at katy.r.damico@usace.army.mil .

Sincerely,

FOR Lynette R. Rhodes
Chief, Southern Virginia Regulatory Section

PRELIMINARY JURISDICTIONAL DETERMINATION FORM

BACKGROUND INFORMATION:

A. REPORT COMPLETION DATE FOR PRELIMINARY JURISDICTIONAL DETERMINATION (JD): Thursday, March 10, 2011

B. NAME AND ADDRESS OF PERSON REQUESTING PRELIMINARY JD:

Mr. David Noble
Environmental Planning and Conservation
Navy Region, Mid-Atlantic
1510 Gilbert Street
Norfolk, Virginia 23511-2737

C. DISTRICT OFFICE: Norfolk District (CENAO-REG)

FILE NAME: NASO Dam Neck DEVGRU Compound JD

FILE NUMBER: NAO-2010-2830

D. PROJECT LOCATION(S) AND BACKGROUND INFORMATION:
(USE THE ATTACHED TABLE TO DOCUMENT MULTIPLE WATERBODIES AT DIFFERENT SITES)

State: **VIRGINIA** County/parish/borough: Virginia Beach City: Virginia Beach

Center coordinates of site (lat/long in degree decimal format):

Latitude: 36.79830508680 ° N Longitude: -75.9665745751 ° W

Universal Transverse Mercator: n/a

Name of nearest waterbody: Redwing Lake (to the south, Lovetts Marsh (to the north)
and the Atlantic Ocean (to the east)

Identify (estimate) amount of waters in the review area:

Non-wetland waters: linear feet; width (ft); and/or acres.

Cowardin Class: manmade swales and drainage ditches

Stream Flow: n/a

Wetlands: 134.10 +/- acres

Cowardin Class: PFO / PSS/ PEM

Name of any water bodies on the site that have been identified as Section 10 waters:

Tidal: Atlantic Ocean

Non-Tidal: Redwing Lake

E. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):

Office (Desk) Determination. Date: March 10, 2011

Field Determination. Date(s): February 23, 2011

1. The Corps of Engineers believes that there may be jurisdictional waters of the United States on the subject site, and the permit applicant or other affected party who requested this preliminary JD is hereby advised of his or her option to request and obtain an approved jurisdictional determination (JD) for that site. Nevertheless, the permit applicant or other person who requested this preliminary JD has declined to exercise the option to obtain an approved JD in this instance and at this time.

2. In any circumstance where a permit applicant obtains an individual permit, or a Nationwide General Permit (NWP) or other general permit verification requiring “pre-construction notification” (PCN), or requests verification for a non-reporting NWP or other general permit, and the permit applicant has not requested an approved JD for the activity, the permit applicant is hereby made aware of the following: (1) the permit applicant has elected to seek a permit authorization based on a preliminary JD, which does not make an official determination of jurisdictional waters; (2) that the applicant has the option to request an approved JD before accepting the terms and conditions of the permit authorization, and that basing a permit authorization on an approved JD could possibly result in less compensatory mitigation being required or different special conditions; (3) that the applicant has the right to request an individual permit rather than accepting the terms and conditions of the NWP or other general permit authorization; (4) that the applicant can accept a permit authorization and thereby agree to comply with all the terms and conditions of that permit, including whatever mitigation requirements the Corps has determined to be necessary; (5) that undertaking any activity in reliance upon the subject permit authorization without requesting an approved JD constitutes the applicant’s acceptance of the use of the preliminary JD, but that either form of JD will be processed as soon as is practicable; (6) accepting a permit authorization (e.g., signing a proffered individual permit) or undertaking any activity in reliance on any form of Corps permit authorization based on a preliminary JD constitutes agreement that all wetlands and other water bodies on the site affected in any way by that activity are jurisdictional waters of the United States, and precludes any challenge to such jurisdiction in any administrative or judicial compliance or enforcement action, or in any administrative appeal or in any Federal court; and (7) whether the applicant elects to use either an approved JD or a preliminary JD, that JD will be processed as soon as is practicable. Further, an approved JD, a proffered individual permit (and all terms and conditions contained therein), or individual permit denial can be administratively appealed pursuant to 33 C.F.R. Part 331, and that in any administrative appeal, jurisdictional issues can be raised (see 33 C.F.R. 331.5(a)(2)). If, during that administrative appeal, it becomes necessary to make an official determination whether CWA jurisdiction exists over a site, or to provide an official delineation of jurisdictional waters on the site, the Corps will provide an approved JD to accomplish that result, as soon as is practicable.

3. This preliminary JD finds that there “*may be*” waters of the United States on the subject project site, and identifies all aquatic features on the site that could be affected by the proposed activity, based on the following information:

SUPPORTING DATA:

Data reviewed for preliminary JD (check all that apply) - checked items should be included in case file and, where checked and requested, appropriately reference sources below.

Table 1. Wetland Feature Summary for DEVGRU Compound, NASO Dam Neck.

Wetland Label	Field Wetland Classification¹	On Base Area (acre)	Comment
Wetland W1	PSS/PEM	0.26	Depressional, small wetland that continues of northern boundary adjacent to back-dune community.
Wetland W2	PSS/PEM	0.28	Depressional, isolated wetland located adjacent to back-dune community.
Wetland W3	PEM/PSS	0.41	Depressional, isolated near northern shoreline within back-dune community
Wetland W4	PFO/PSS	24.01	Forested wetland bound by Regulus Road.
Wetland W5	PFO/PEM/PSS	28.50	Forested wetland surrounding deep, emergent wetland; abuts Redwing Lake.
Wetland W6	PFO	12.20	Adjacent to Known Distance (KD) Range.
Wetland W7	PFO/PEM	13.72	Forested wetland adjacent to KD Range.
Wetland W8	PEM	1.13	Depressional, isolated emergent wetland within maintained field of KD Range.
Wetland W9	PFO	2.41	Depressional, forested wetland that abuts coast dune community and is adjacent to KD Range.
Wetland W10	PFO	5.75	Forested wetland that is connected to W6 via W18.
Wetland W11	PFO	0.19	Depressional, small forested wetland within back-dune community.
Wetland W12	PFO	0.03	Depressional, small forested wetland within back-dune community.
Wetland W13	PFO	0.27	Depressional, forested wetland near security gate and east of Regulus Road
Wetland W14	PFO	0.87	Depressional, forested wetland east of Regulus Road and north of W13.
Wetland W15	PFO	0.21	Depressional, small forested wetland adjacent to KD Range.
Wetland W16	PFO	43.28	Extensive forested wetland in northeast portion of Project area.
Wetland W17	PSS/PEM	0.52	Southern edge of extensive forested wetland located to north of Project area.
Wetland W18	PEM	0.06	Depressional, small emergent wetland that connects W6 and W10.

MARCH 10, 2011

Supplemental Preapplication Information

Project Number: NAO-2010-2830
Applicant: Mr. David Noble, NAVFAC MIDLANT
Project Location: NASO Dam Neck DEVGRU Compound

1. A search of the Virginia Department of Historic Resources data revealed the following:

- No known historic properties are located on the property.
- The following known architectural resources are located on the property:
- The following known archaeological resources are located on the property:
 - 44VB0082: - eligibility unknown
 - 44VB0085: - eligibility unknown
 - 44VB0308: - eligible (7/19/2004)
 - 44VB0091: - eligibility unknown
- The following known historic resources are located in the vicinity of the property (potential for effects to these resources from future development):

NOTE:

- 1) *The information above is for planning purposes only. In most cases, the property has not been surveyed for historic resources. Undiscovered historic resources may be located on the subject property or adjacent properties and this supplemental information is not intended to satisfy the Corps' requirements under Section 106 of the National Historic Preservation Act (NHPA).*
- 2) *Prospective permittees should be aware that Section 110k of the NHPA (16 U.S.C. 470h-2(k)) prevents the Corps from granting a permit or other assistance to an applicant who, with intent to avoid the requirements of Section 106 of the NHPA, has intentionally significantly adversely affected a historic property to which the permit would relate, or having legal power to prevent it, allowed such significant adverse effect to occur, unless the Corps, after consultation with the Advisory Council on Historic Preservation (ACHP), determines that circumstances justify granting such assistance despite the adverse effect created or permitted by the applicant.*

2. A search of the data supplied by the Virginia Department of Conservation and Recreation and the Virginia Department of Game and Inland Fisheries revealed the following:

- No known populations of federally listed threatened or endangered species are located on the property or within a one-half (0.50) mile radius.
- The following federally-listed species are known to be within a one to two mile radius of the property:
- The following state-listed (or other) species are known to be within a one to two mile radius of the property:

Please note this information is being provided to you based on the preliminary data you submitted to the Corps relative to project boundaries and project plans. Consequently, these findings and recommendations are subject to change if the project scope changes or new information becomes available and the accuracy of the data.

PRELIMINARY JURISDICTIONAL DETERMINATION

Southern Virginia Regulatory Section
NAO-2008-3381 (NASO Dam Neck Annex)

Mr. David Noble
Environmental Planning and Conservation
Navy Region, Mid-Atlantic
1510 Gilbert Street
Norfolk, Virginia 23511-2737

Dear Mr. Noble:

This letter is in regard to your request for a preliminary jurisdictional determination for waters of the U.S. (including wetlands) on property known as Naval Air Station Oceana Dam Neck (NASO Dam Neck), located at the end of Dam Neck Road in Virginia Beach, Virginia.

The maps entitled "Figure 4-4l. Aquatic Resources Map for NASO Dam Neck Annex Wetland Delineation Virginia Beach, Virginia", prepared for the Naval Facilities Engineering Command, by Tetra Tech, dated December 2011, and Corps date stamped as received December 15, 2011 (copy enclosed) provides the locations of waters and/or wetlands on the property listed above. The basis for this delineation includes application of the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Atlantic and Gulf Coastal Plain Region and the positive indicators of wetland hydrology, hydric soils, and hydrophytic vegetation and the presence of an ordinary high water mark.

Discharges of dredged or fill material, including those associated with mechanized landclearing, into waters and/or wetlands on this site may require a Department of the Army permit and authorization by state and local authorities including a Virginia Water Protection Permit from the Virginia Department of Environmental Quality (DEQ), a permit from the Virginia Marine Resources Commission (VMRC) and/or a permit from your local wetlands board. This letter is a confirmation of the Corps preliminary jurisdiction for the waters and/or wetlands on the subject property and does not authorize any work in these areas. Please obtain all required permits before starting work in the delineated waters/wetland areas.

This is a preliminary jurisdictional determination and is therefore not a legally binding determination regarding whether Corps jurisdiction applies to the waters or wetlands in question. Accordingly, you may either consent to jurisdiction as set out in this preliminary jurisdictional determination and the attachments hereto if you agree with the determination, or you may request and obtain an approved jurisdictional determination. This preliminary jurisdictional determination and associated wetland delineation map may be submitted with a permit application.

Enclosed is a copy of the "Preliminary Jurisdictional Determination Form". Please review the document, sign, and return one copy to Ms. Katy Damico, of my staff, either via email (katy.r.damico@usace.army.mil) or via standard mail to US Army Corps of Engineers, Regulatory Office, and ATTN: Katy Damico, 803 Front Street Norfolk, Virginia 23510 within 30 days of receipt and keep one for your records. This delineation of waters and/or wetlands is valid for a period of five years from the date of this letter unless new information warrants revision prior to the expiration date.

If you have any questions, please contact Katy Damico, of my staff, either via telephone at (757) 201-7121 or via email at katy.r.damico@usace.army.mil.

Sincerely,

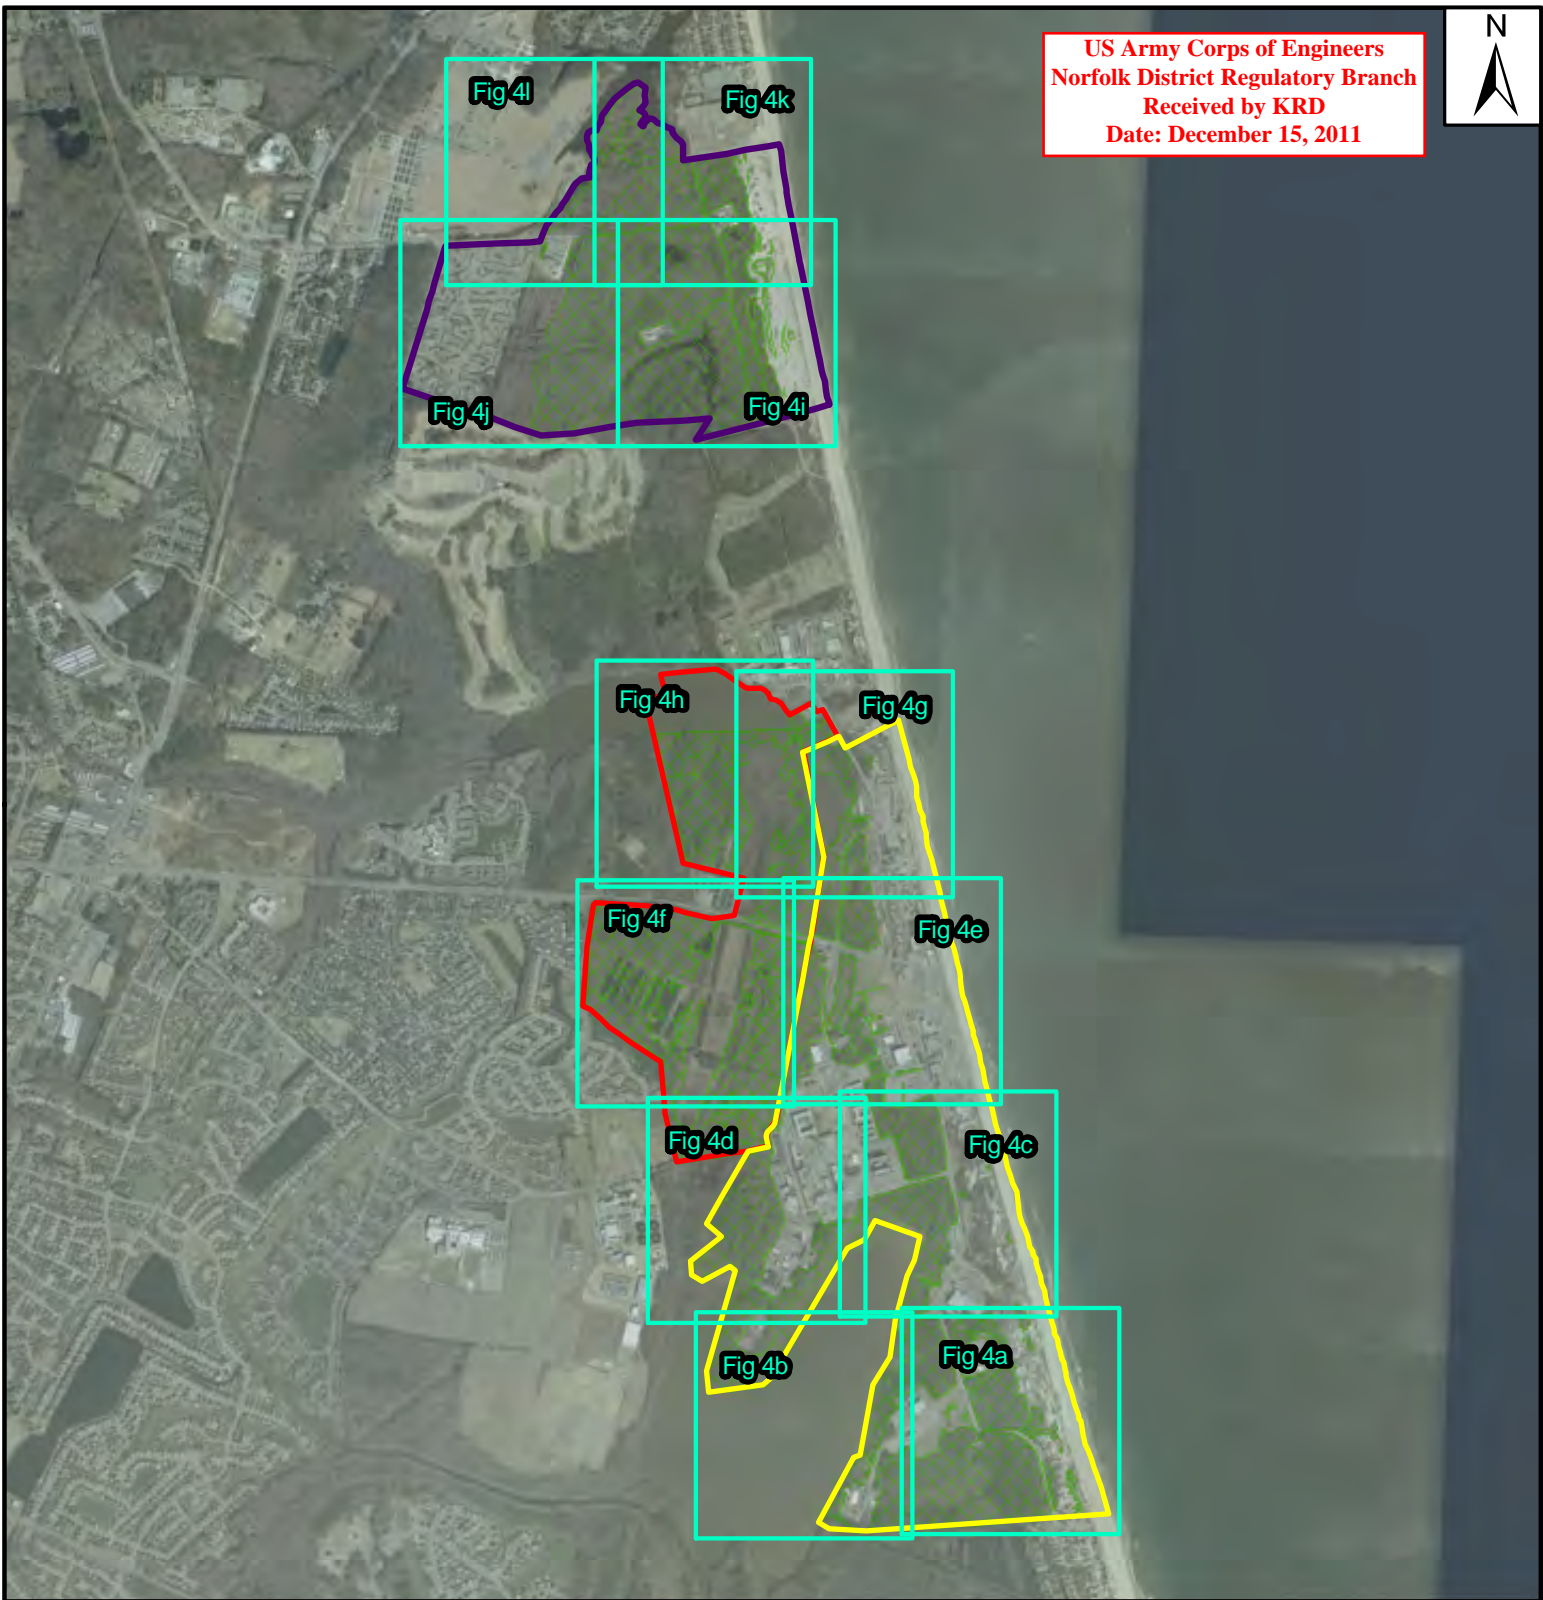

FOR Lynette R. Rhodes
Chief, Southern Virginia Regulatory Section

PRELIMINARY JURISDICTIONAL DETERMINATION FORM

BACKGROUND INFORMATION:

A. REPORT COMPLETION DATE FOR PRELIMINARY JURISDICTIONAL DETERMINATION (JD): Monday, January 30, 2012

B. NAME AND ADDRESS OF PERSON REQUESTING PRELIMINARY JD:
David Noble
Environmental Planning and Conservation
Navy Region, Mid-Atlantic
1510 Gilbert Street
Norfolk, Virginia 23511-2737

C. DISTRICT OFFICE: Norfolk District (CENAO-REG)

FILE NAME: NASO Dam Neck Preliminary Jurisdictional Determination / Delineation Confirmation

FILE NUMBER: NAO-2008-3381

D. PROJECT LOCATION(S) AND BACKGROUND INFORMATION:
(USE THE ATTACHED TABLE TO DOCUMENT MULTIPLE WATERBODIES AT DIFFERENT SITES)

State: **VIRGINIA** County/parish/borough: Virginia Beach City: Virginia Beach

Center coordinates of site (lat/long in degree decimal format):

Latitude: 36.78265 ° N Longitude: -75.95857 ° W

Universal Transverse Mercator: N/A

Name of nearest waterbody: Atlantic Ocean / Redwing Lake / Lake Tecumseh / Lake Christine

Identify (estimate) amount of waters in the review area:

Non-wetland waters: N/A linear feet; N/A width (ft); and/or N/A acres.

Cowardin Class: N/A

Stream Flow: N/A

Wetlands: 787.90+/- acres

Cowardin Class: PFO, PSS, PEM

Name of any water bodies on the site that have been identified as Section 10 waters:

Tidal: Atlantic Ocean

Non-Tidal: Lake Christine / Lake Tecumseh / Redwing Lake

E. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):

Office (Desk) Determination. Date: January 30, 2012

Field Determination. Date(s): January 18, 2012

1. The Corps of Engineers believes that there may be jurisdictional waters of the United States on the subject site, and the permit applicant or other affected party who requested this preliminary JD is hereby advised of his or her option to request and obtain an approved jurisdictional determination (JD) for that site. Nevertheless, the permit applicant or other person who requested this preliminary JD has declined to exercise the option to obtain an approved JD in this instance and at this time.

2. In any circumstance where a permit applicant obtains an individual permit, or a Nationwide General Permit (NWP) or other general permit verification requiring “pre-construction notification” (PCN), or requests verification for a non-reporting NWP or other general permit, and the permit applicant has not requested an approved JD for the activity, the permit applicant is hereby made aware of the following: (1) the permit applicant has elected to seek a permit authorization based on a preliminary JD, which does not make an official determination of jurisdictional waters; (2) that the applicant has the option to request an approved JD before accepting the terms and conditions of the permit authorization, and that basing a permit authorization on an approved JD could possibly result in less compensatory mitigation being required or different special conditions; (3) that the applicant has the right to request an individual permit rather than accepting the terms and conditions of the NWP or other general permit authorization; (4) that the applicant can accept a permit authorization and thereby agree to comply with all the terms and conditions of that permit, including whatever mitigation requirements the Corps has determined to be necessary; (5) that undertaking any activity in reliance upon the subject permit authorization without requesting an approved JD constitutes the applicant’s acceptance of the use of the preliminary JD, but that either form of JD will be processed as soon as is practicable; (6) accepting a permit authorization (e.g., signing a proffered individual permit) or undertaking any activity in reliance on any form of Corps permit authorization based on a preliminary JD constitutes agreement that all wetlands and other water bodies on the site affected in any way by that activity are jurisdictional waters of the United States, and precludes any challenge to such jurisdiction in any administrative or judicial compliance or enforcement action, or in any administrative appeal or in any Federal court; and (7) whether the applicant elects to use either an approved JD or a preliminary JD, that JD will be processed as soon as is practicable. Further, an approved JD, a proffered individual permit (and all terms and conditions contained therein), or individual permit denial can be administratively appealed pursuant to 33 C.F.R. Part 331, and that in any administrative appeal, jurisdictional issues can be raised (see 33 C.F.R. 331.5(a)(2)). If, during that administrative appeal, it becomes necessary to make an official determination whether CWA jurisdiction exists over a site, or to provide an official delineation of jurisdictional waters on the site, the Corps will provide an approved JD to accomplish that result, as soon as is practicable.

3. This preliminary JD finds that there “*may be*” waters of the United States on the subject project site, and identifies all aquatic features on the site that could be affected by the proposed activity, based on the following information:

SUPPORTING DATA:

Data reviewed for preliminary JD (check all that apply) - checked items should be included in case file and, where checked and requested, appropriately reference sources below.

- Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant:
 Tetra Tech

Table 1. Wetland Feature Summary for the Dam Neck Annex, NAS Oceana.

Wetland Label	Field Wetland Classification ¹	On Base Area (acres)	Comment
Study Area 1			
WA	PFO	65.30	Extensive wetland bounded by the South Road. Continues off Project area at southwest corner of Study Area 1.
WB	PEM	0.44	Small depressional wetland within maintained field at the intersection of S Bullpup Road and Regulus Ave.
WC	PEM	0.10	Small depressional wetland within maintained field at intersection of S Bullpup Road and Regulus Ave.
WD	PFO	155.77	Extensive forested wetland that fringes Lake Tecumseh in the southern portion of Study Area 1 and a canal that connects to Redwing Lake in the northern portion of Study Area 1.
WE	PEM	0.17	Northern edge of extensive wetland that occurs at south end of Dam Neck Annex where it extends into Project area. Appears to be connected to Wetland F south of Project area.
WF	PEM	0.14	Northern edge of extensive wetland that exists to south of Dam Neck Annex where it extends into Project area. Appears to be connected to Wetland E south of Project area.
WG	PFO/PSS	12.02	Extensive forested wetland that fringes the southeast end of Redwing Lake and the canal that connects to Lake Tecumseh. Wetland is bounded to the south by Dam Neck Ave. and is connected to Wetland D by a canal under Dam Neck Ave.
WH	PFO	7.02	Forested wetland fringing Lake Tecumseh and a continuation of Wetland G. Wetland continues off the survey area to the north.
W13	PFO	0.01	Delineated in 2010; portion of depressional wetland near security gate and east of Regulus Rd. Majority of wetland to north of study area.
WI	PFO	0.26	Isolated depressional wetland between Regulus Ave. and dune complex at northern end of Study Area 1.
WJ	PFO	14.50	Medium sized wetland bounded to the west by Terrier Ave., to the east by development along Regulus Ave. and to the south by Vanguard St.
WK	PFO/PEM/PSS	11.52	Wetland complex in the middle of Study Area 1 that includes a section fringing PSS wetland around Sadler Pond and an

Wetland Label	Field Wetland Classification ¹	On Base Area (acres)	Comment
			extensive forested wetland with emergent vegetation on edges that are within maintained fields.
WL	PFO/PEM	1.09	An extension of Wetland K that is separated by a paved walking path. Emergent vegetation dominates edges that are within maintained fields.
WM	PEM/ PFO	0.90	Linear wetland located between Regulus Ave. and dune complex at the south end of Study Area 1.
WN	PSS/PEM	0.01	Small, manmade feature separated from Wetland O by a berm.
WO	PFO/PEM	1.97	Primarily forested wetland bounded by Regulus Ave. to west and dune complex to the east in the southern portion of Study Area 1.
WP	PSS	0.04	Small, inter dune swale in the southern portion of Study Area 1.
WQ	PFO	0.85	Forested wetland bounded to the north by Talos St., to the south by a paved walkway, and to the west and east by parking areas.
WR	PFO/PSS	21.78	Extensive wetland with scrub-shrub area dominated by buttonbush in the southwest corner. Connected to Wetland D via culver at end of manmade canal along southern edge.
WS	PSS	0.15	Small wetland located in drainage basin. Connected to WT and WR via grassy spillway.
WT	PSS	0.11	Small wetland located in drainage basin. Connected to WS via grassy spillway.
WU	PEM	0.03	Narrow – approximately 3 feet wide – manmade drainage located in parking area and dominated by herbaceous emergent vegetation.
WV	PSS/ PFO	12.24	Extensive wetland bounded by Regulus Ave. or access roads on all sides.
WW	PFO/PEM	6.98	Extensive wetland bounded by dunes to the east and development and roads to the north, west, and south. Wetland W is connected to Wetland JJ via culverts under and overgrown roadbed
WX	PSS	0.04	Small, inter dune swale in the southern portion of Study Area 1.
WY	PEM/PSS	0.17	Small, inter dune swale in the southern portion of Study Area 1.
WZ	PEM	0.09	Small, inter dune swale in the southern portion of Study Area 1.

Wetland Label	Field Wetland Classification ¹	On Base Area (acres)	Comment
WAA	PEM/PSS	0.01	Small, inter dune swale in the southern portion of Study Area 1.
WBB	PSS	0.04	Small, inter dune swale in the southern portion of Study Area 1.
WCC	PSS	0.01	Small, inter dune swale in the southern portion of Study Area 1.
WDD	PSS/PEM	0.14	Small, inter dune swale in the southern portion of Study Area 1.
WEE	PSS	0.04	Small, inter dune swale in the southern portion of Study Area 1.
WFF	PSS/PEM	0.01	Small, inter dune swale in the southern portion of Study Area 1.
WGG	PSS/PEM	0.04	Small, inter dune swale in the southern portion of Study Area 1.
WHH	PFO	0.04	Small forested wetland in southern portion of Study Area 1.
WII	PEM	0.04	Narrow – approximately 3 feet wide – manmade drainage connecting Wetlands W and JJ and dominated by herbaceous emergent vegetation.
WJJ	PFO	1.80	Forested wetland connected to Wetland W via culvert under old, overgrown road and to Wetland D via culvert under Regulus Ave.
WKK	PSS/PEM	0.20	Medium-sized inter dune wetland in southern portion of Study Area 1.
WLL	PSS	0.02	Small inter dune wetland in southern portion of Study Area 1.
WMM	PEM/PSS	0.85	Relatively large inter dune wetland in southern portion of Study Area 1.
WNN	PEM	0.01	Small, manmade borrow pit wetland dominated by wetland graminoids.
WOO	PSS	0.04	Small inter dune wetland in central portion of Study Area 1.
WPP	PSS	0.04	Small inter dune wetland in central portion of Study Area 1.
WQQ	PSS	0.03	Small inter dune wetland in central portion of Study Area 1.
WRR	PFO	0.13	Small forested wetland located between the base of dune complex and Regulus Ave.
Study Area 1 Total		317.2	
Study Area 2			
WAAA	PFO/PSS	171.77	Extensive wetland at south end of Study Area 2 that is connected to wetland at north end of DEVGRU facility via several culverts under access road.
WBBB	PFO/PEM	3.41	Fringing wetland along finger of Lake Christine that continues off the survey area to the west.
WCCC	PFO	24.48	Extensive forested wetland bounded by South Birdneck Rd. to

Wetland Label	Field Wetland Classification ¹	On Base Area (acres)	Comment
			the south, Regulus Ave. to the east, Rifle Range Rd. to the north and upland forest to the west.

Study Area 2 Total		254.5	

Study Area 3			
North Parcel ²	PFO	77.89	Wetland area to the north of Dam Neck Road. This parcel was delineated and verified by the USACE in 2007 (Corps Project # NAO-2003-01785). Impacts to the original wetland resources occurred as a result of the P-899 Operations Facility that was constructed in 2009-2011. The acreage listed here reflects the current, post-construction wetland area.
South Parcel ³	PFO/PEM	138.29	The portion of Study Area 3 that is south of Dam Neck Road. This parcel was delineated and verified by the USACE in 2008 (Corps Project #s NAO-2008-3381 and NAO-2008-00523). During the 2011 field activities, Tetra Tech wetland biologists conducted a field verification of the previously delineated wetland boundaries. No changes to the property have occurred since the JDs were obtained.
Study Area 3 Total		216.2	

¹From *Classification of Wetlands and Deepwater Habitats of the United States* (Cowardin et al. 1979): PFO = Palustrine Forested, PSS=Palustrine Scrub Shrub, and PEM=Palustrine Emergent

²This wetland was delineated in 2007.

³The majority of this wetland was delineated in 2008.

FORT NORFOLK 803 FRONT STREET
NORFOLK VIRGINIA 23510-109

JANUARY 30, 2012

Supplemental Preapplication Information

Project Number: NAO-2008-3381

Applicant: United States Navy - Naval Facilities Engineering Command Mid-Atlantic (NAVFAC-MIDLANT)

Project Location: Naval Air Station Oceana - Dam Neck Annex (NASO Dam Neck) in Virginia Beach, VA

1. A search of the Virginia Department of Historic Resources (VDHR) data revealed the following:
 - No known historic properties are located on the property.
 - The following known architectural resources are located on the property: *See attached Regulatory Report.*
 - The following known archaeological resources are located on the property: *See attached Regulatory Report.*
 - The following known historic resources are located in the vicinity of the property (potential for effects to these resources from future development): *See attached Regulatory Report.*

NOTE:

- 1) *The information above is for planning purposes only. In most cases, the property has not been surveyed for historic resources. Undiscovered historic resources may be located on the subject property or adjacent properties and this supplemental information is not intended to satisfy the Corps' requirements under Section 106 of the National Historic Preservation Act (NHPA).*
 - 2) *Prospective permittees should be aware that Section 110k of the NHPA (16 U.S.C. 470h-2(k)) prevents the Corps from granting a permit or other assistance to an applicant who, with intent to avoid the requirements of Section 106 of the NHPA, has intentionally significantly adversely affected a historic property to which the permit would relate, or having legal power to prevent it, allowed such significant adverse effect to occur, unless the Corps, after consultation with the Advisory Council on Historic Preservation (ACHP), determines that circumstances justify granting such assistance despite the adverse effect created or permitted by the applicant.*
2. A search of the data supplied by the Virginia Department of Conservation and Recreation and the Virginia Department of Game and Inland Fisheries revealed the following:
 - No known populations of threatened or endangered species are located on the property or within a one to two mile radius.
 - The following federally-listed species are known to be within a one to two mile radius of the property: *See attached Regulatory Report.*
 - The following state-listed (or other) species are known to be within a one to two mile radius of the property: *See attached Regulatory Report.*

Please note this information is being provided to you based on the preliminary data you submitted to the Corps relative to project boundaries and project plans. Consequently, these findings and recommendations are subject to change if the project scope changes or new information becomes available and the accuracy of the data.

Endangered Species and Historic Locations

Introduction

This document provides the standard operating procedures (SOP) associated with managing Naval Air Station Oceana's (NASO) sea turtle program.

There are 5 species of sea turtles known off of the coast of NASO and NASO Dam Neck Annex (DNA), in southeastern Virginia: Green (*Chelonia mydas*); Hawksbill (*Eretmochelys imbricata*); Kemp's ridley (*Lepidochelys kempii*); Leatherback (*Dermochelys coriacea*); and Loggerhead (*Caretta caretta*). Of these 5 species 3 are known to have successfully nested along the coast of southeastern Virginia: Loggerhead, Kemp's ridley, and Green. Both the Loggerhead and the Kemp's ridley have been documented as nesting on NASO DNA. Leatherback sea turtles are known to have nested in North Carolina, but have yet to be documented nesting in Virginia. All 5 species of turtles have been documented as strandings in southeastern Virginia.

The NASO shoreline does not have typical suitable nesting habitat, but could have random stranding occurrences, particularly associated with tidal wash-up during storm events. The NASO DNA coastline (~4 miles) provides suitable nesting habitat and annually reports sea turtle strandings.

NASO and United States Fish & Wildlife Service (USFWS) Back Bay National Wildlife Refuge (BBNWR) work cooperatively to manage the sea turtle program at NASO DNA. The guiding documents associated with this cooperative working partnership are the Endangered Species Act (ESA), the NASO DNA Integrated Natural Resources Management Plan (INRMP) mandated by the Sikes Act (available upon request), the BBNWR Biological Opinion as amended on 25 May 2012 (Appendix A), and the 2008 NASO & BBNWR nest relocation agreement (Appendix B).

NASO staff and authorized associates perform daily sea turtle patrols to locate nests, crawls, and strandings at NASO DNA and Virginia Army National Guard-Camp Pendleton (VAARNG-CP) during the sea turtle nesting season. For nests located on NASO DNA, NASO and BBNWR biologists collaboratively determine if a nest should be left in place (in situ) or relocated. Relocated nests are buried on the closest adjacent land suitable site available to the originating nest location or to an established beach front nursery site on NASO DNA or BBNWR. The nests are protected by a predator enclosure that allows for unattended hatching and release of hatchlings. Nests are checked daily and are more closely monitored when the estimated hatching date approaches.

Nests located on VAARNG-CP property are collaboratively managed between BBNWR and VAARNG-CP biologists. NASO staff will notify both BBNWR and VAARNG-CP biologists if a crawl is located on their property.

All observed turtle strandings on NASO DNA and VAARNG-CP will be reported to the VA Aquarium Stranding Team (VAST).

Lighting assessments starting in 2015 are planned to be completed every 5 years (appendix J) to identify and address on installation lighting concerns associated with sea turtles.

Projects, training, and other activities on NASO DNA are reviewed to determine potential impacts to sea turtles and guidance is provided to minimize and or avoid identified concerns (appendix L)

Turtle Patrols

General Information

Morning patrols for nesting sea turtle crawls and nests, as well as for marine mammal and sea turtle strandings are conducted from 15 May through 31 Aug on NASO DNA and VAANG-CP. NASO Natural Resources staff and other authorized individuals conduct the patrols.

Patrollers attend a training session on turtle patrol procedures and crawl recognition (Appendix C). In addition to the patrol procedures training, ATV safety training presented by a Navy designated safety trainer is required for all volunteers, interns, and staff who will be operating an ATV or utility vehicle (refresher training required every 5 years). Patrols are done by ATV, or other four/all-wheel drive vehicle as approved by the installation Natural Resources Manager (NRM).

Appendix D provides a map of the NASO DNA patrol area. Due to Military Mission requirements the North end of NASO DNA is patrolled 1st (north of the building 127 beach access).

Patrollers arrive on site no-later-than 30 minutes prior to sunrise as identified by the Sunrise/Sunset table (Appendix E). If patrols start before daylight, headlights of vehicles will be covered with red filters before proceeding onto the beach. Patrollers first scout the beach along the water's edge looking for turtle crawls and strandings. Patrollers then return along the middle beach looking for crawls and high tide line strandings. Due to the narrow beaches and potential for nesting Piping plover, patrollers do not patrol above high tide line. If a stranded sea turtle or a crawl is sighted, procedures outlined in crawl and nest procedures section of this SOP are followed.

While on patrol, patrollers concurrently scout for and identify any unauthorized vehicles, temporary artificial lighting or other beach activities that may interfere with turtles. If such items are identified patrollers should notify base security, the conservation law-enforcement officer/"Game Warden" (CLEO), and the installation NRM. Security or the CLEO will escort any unauthorized vehicles, with headlights turned off, from the beach and will address any other concerns as appropriate referring to the appropriate Executive Order 11989, ESA, the Coastal Zone Management Act, or other regulatory document as appropriate.

At the completion of each patrol, the patroller records patrol information in the Sea Turtle Patrol Log (Appendix F). BBNWR employees respond as soon as possible to nest/crawl reports made by or relayed to BBNWR staff, volunteers, visitors, and partnering agencies.

Equipment and Supplies

- All-Terrain-Vehicle (ATV)
 - The patroller is responsible for wearing appropriate personal protective equipment (PPE). PPE includes but is not limited to: eye protection, safety vest, helmet, gloves, hearing protection, closed toed shoes, long shirt, long pants, and scarf under the helmet (for personal hygiene when sharing helmets). **A helmet must be worn ANY time an ATV is operated.**
 - Before patrol begins individuals should inspect the ATV and ensure:
 - ATV has adequate fuel, oil, and brake fluid levels. If not then those fluids should be filled appropriately.
 - ATV has adequate tire pressure for patrolling on the beach, if not adjust tire pressure accordingly.
 - ATV's nuts, bolts, toolbox, wiring, etc. are adequately secured.
 - ATV lights and gauges are working appropriately.
 - ATV lights if on beach before daylight are covered with red film/lens.
 - After patrol is completed individuals should inspect the ATV and ensure:
 - ATV is rinsed off daily after exiting the beach to minimize damage to the equipment from salt and sand.
 - ATV is refueled after each usage, if fuel gauge drops below ½ full.
 - ATV did not become damaged during patrol and all equipment/controls are in full working order.
 - ATV is stored and locked in the Natural Resources ATV storage shed behind Building 127.
 - ATV issues are documented on the patrol log and reported to the Natural Resources Manager.
- Turtle Patrol Log Book
 - Includes:
 - Data Sheets
 - Access & Notification Procedures (Contact List)
 - Copy of appropriate SOPs
 - Crawl and Turtle Identification Guide
 - Patrol Calendar
 - Brochures
- ATV Toolbox
 - Ensure before leaving on patrol that all required supplies/equipment are present and replace used items once patrol is completed)
 - Pens & Pencils
 - Latex gloves
 - Goggles
 - Hearing Protection
 - Helmet
 - Safety Vest
 - Tire gauge
 - Bright colored wire flag markers to flag off nest
 - Bags for trash and other various uses
 - First aid kit

- Paper towels
- Large hook to drag dead stranding to high beach
- “Do Not Cross” tape and pink tape to flag off turtle crawl/nest
- Digital camera
 - Check Battery Status after each patrol. If Low swap battery out with charged battery kept by Natural Resources Manager.
- GPS unit with extra batteries
- Binoculars
- Fluorescent orange spray paint (used for remarking previously spray painted turtles whose paint has degraded to a point where it is or will quickly become hard to identify that that turtle has already been reported and recorded)
- Storage Shed
 - ATV
 - Fuel (kept in appropriately marked Navy Authorized Storage Container)
 - Oil (kept in appropriately marked Navy Authorized Storage Container)
 - Restocking Supplies for ATV Toolbox
 - Response Equipment (Signs, Cages, Posts, Post-hole Pounder, Auger, Wire, Fencing, ATV Loading Ramp, Spot-light with Red-cap, live stranding Cooler, towels, live stranding shade tent/umbrella, Shovels, Rakes, Nuts & Bolts, foldable chairs, etc.).

Sea Turtle Strandings

All stranded turtles on NASO DNA and VAANG-CP are reported to the VA Aquarium Stranding Team (VAST), formerly the Virginia Marine Science Museum (VMSM), at 757-385-7575 (during business hours 0830-1630) or at 757-385-7576 (during afterhours for live stranding emergencies) .

Notifications regarding strandings found elsewhere in Virginia Beach, VA are referred to BBNWR and VAST.

Notifications regarding strandings found in North Carolina are referred to the North Carolina Aquarium’s Network for Endangered Sea Turtles (NEST) team at 252-441-8622.

See Appendix G for details regarding all marine animal stranding reporting procedures.

Dead Strandings

The procedures for dead strandings found on NASO, NASO DNA and VAARNG-CP are as follows:

- 1) If turtle is already spray painted, the turtle is not reported.
- 2) If spray paint is not seen on turtle, report turtle to the VAST at 757-385-7575 and the NRM at 757-433-3461. Ensure you relay day, time of finding, base name, location (preferably GPS point and physical location description), your name and contact information. If sea turtle is in the surf drag it up onto the beach so that it does not wash away before VAST arrives on the scene. Be sure to document on

the datasheets and notify VAST that the turtle was originally located in the surf and dragged up onto the beach.

- 3) Assist, as needed, the VAST with access to the stranding.
- 4) Assist, as needed/as able, the VAST with data collection and removal of the stranding.
- 5) Complete Turtle patrol log & appropriate other datasheets, include location description, GPS location, and note if pictures were taken (pictures should be taken and sent to the installation NRM). All other data will be obtained and recorded by the responding VAST personnel on a standard National Marine Fisheries Service (NMFS) sea turtle stranding form.

Live Strandings

The procedures for live strandings found on NASO, NASO DNA and VAARNG-CP are as follows:

- 1) If it is a hatchling, VAST and installation NRM is contacted. The turtle is kept in a moist dark environment until further instructions are given.
- 2) If the turtle is injured, VAST and installation NRM is contacted. The turtle's nose and eyes are kept moist and the body kept shaded, while the patroller awaits further instructions.
- 3) If the turtle is uninjured determine if it is a stranding or a nesting attempt. If it is a nesting attempt follow procedures in crawl and nest procedures section of this SOP. If it is a stranding, VAST and installation NRM should immediately be contacted. The patroller awaits further instructions.
- 4) If the turtle is in the water, no attempt is made to catch it. If the turtle appears to be in distress, VAST and installation NRM is contacted. As much information as possible is collected and recorded on the appropriate logs and is reported to VAST.
- 5) Assist, as needed, the VAST with access to the stranding.
- 6) Assist, as needed/as able, the VAST with data collection and removal of the stranding.
- 7) Complete Turtle patrol log & other appropriate datasheets, include location description, GPS location, and note if pictures were taken (pictures should be taken and sent to the installation NRM). All other data will be obtained and recorded by the responding VAST personnel on a standard NMFS sea turtle stranding form.

Note: If a live stranding is found while conducting nesting sea turtle patrol, immediately call in the stranding to VAST and the installation NRM with all appropriate information. After notifying VAST and installation NRM, continue and complete the nesting turtle patrol. After completing the turtle patrol collect live stranding supplies from the storage shed and proceed back to the turtle to provide the turtle appropriate protection until VAST can arrive on the scene. If the turtle is a hatchling, you should collect it on the spot and place it in the hatchling cooler with moist sand (no standing water) and continue on your patrol, be sure to let VAST know where to meet you to pickup the hatchling. [If

another natural resources staff member is available, they can be called in to assist with either completing the patrol or taking care of the live stranding situation.]

Crawl and Nest Procedures

General Information

A crawl is the entry and/or exit flipper and drag markings/impressions left in the sand from a sea turtle exiting and entering back into the Ocean, crawling up and off of the beach. The crawl area includes the entry, and exit crawl and any nesting area.

The nesting area is the disturbed area (“body cavity”) created by the turtle as she digs a hole, deposits and buries eggs, and turns away from the dunes towards the ocean for reentry. Usually there is mounded sand, as well as a flattened area. Sometimes sand disturbance from turning looks like a nesting area. In this case, hard sand usually with unbroken layers of dark sand can be found underneath the softer, disturbed sand. A crawl without any evidence of an attempt to dig a hole is termed a “false crawl.” A crawl that contains a nesting area that does not contain eggs is termed a “false nest.”

When a nesting or crawling turtle is encountered, usually spotted by a crawl observed in the ATV path, patrollers/responders immediately extinguish the headlights and park the ATV at a safe distance from the turtle. Patrollers should take extreme care to not startle turtle(s) and to stop anyone else from entering into the turtle nesting/crawling area. Patrollers should keep a good distance away from the turtle until the turtle has either engaged in egg laying or is returning to the surf. Patrollers cordon off the area from access, record the time the turtle was first spotted, GPS the nest location, determine whether the individual is carrying tags and record any tagging information or identifying characteristics, and take pictures from a distance (only if no flash is required or a picture can be taken utilizing an infrared lens, **NO WHITE LIGHT FLASHES**).

Patrollers report the nesting activity immediately to BBNWR and the installation NRM, and then continue all other required notifications. Other notifications may include but are not limited to range control, security, VA Department of Game and Inland Fisheries (VDGIF) sea turtle program manager, Command Duty Officer, Public Affairs Officer, Installation Environmental Program Director, Public Works Officer, etc.

When a sea turtle crawl is found, BBNWR employees will respond as quickly as possible following notification. All crawl and nest sightings are recorded on the Nest and Crawl Data Sheet (Appendix H).

Once appropriate notifications have been made, area marked, and immediate need data collected the patroller should complete the remainder of the patrol to determine if any other potential nesting activity occurred on base. If the turtle is in the process of digging a body cavity, she will most likely attempt to nest. Once active egg laying begins, to save time place a marker (survey flag) at least one foot behind the cavity to indicate the position of the nest, before continuing patrol. If additional nesting activity is identified, the same process should be followed as for the original nest. The patroller should request

additional support to aide in protecting crawls and nests until BBNWR staff can get on site to obtain appropriate biological data. **No one is allowed to enter into the nest/crawl area until authorization has been given by USFWS or the installation NRM.**

BBNWR, in support of an agreement with the Virginia Aquarium (formerly the Virginia Marine Science Museum), retains four hatchlings from the first successful loggerhead sea turtle nest they manage. These hatchlings are transferred to the Virginia Aquarium and used in an exhibit for about one year. After that time, they are transported by boat to the Gulf Stream and released.

BBNWR, in support of an agreement with Warnell School of Forestry and Natural Resources at the University of Georgia, collects a single egg from nests. These eggs are used as part of the “Genetic Mark-Recapture of the Northern Recovery Unit (GA, SC, NC [and VA]) and Mitochondrial Genomics for Characterizing Genetic Structure of Loggerhead Turtles” project/study. **The project duration is from 01 June 2010 to 31 May 2013.** Detailed information regarding this project is available upon request.

Crawl Procedures

BBNWR and Virginia Department of Game and Inland Fisheries (VDGIF) will be notified if a crawl is found on property.

BBNWR employees will respond immediately to reports of crawls and/or nests.

BBNWR Procedures are as follows:

- 1) Upon notification of a crawl, BBNWR staff will collect required equipment and supplies to respond to the site. Equipment will be utilized for biological data collection, protecting the nest and if required relocating the nest.
- 2) The perimeter of the entire nesting area (including incoming and outgoing tracks) is marked with wire flags. *(may be completed in advance by Navy staff)*
- 3) If necessary, the area is cordoned off with flagging to keep the public off of the tracks and possible nesting area. *(may be completed in advance by Navy staff)*
- 4) The data required in Section I, II, and III of data sheet is collected (Appendix H). This includes the date, weather conditions, names of observers, and crawl measurements. Track width measurements are taken from the lower, wetter portions of the beach where flipper impressions are more noticeable. Time of emergence from the ocean and return is estimated based on tide marking and tide tables.
- 5) A GPS location for the nest area is obtained.
- 6) The crawl is photographed. A small dry-erase board noting the date, crawl number, location, and so forth is included in every photo.
- 7) BBNWR biologist will make a determination if the site is a false crawl, false nest, or if a nest is present. BBNWR biologist will examine any nest body cavities by carefully digging out any body cavities to determine if eggs are present. (See Nest Procedures Section of this SOP for additional details.)
 - a. The BBNWR biologist will closely examine any circular, indented or mounded areas within the nesting area for front flipper impressions to

determine how the turtle was positioned when she laid the clutch of eggs before stepping near or inside it.

- b. If flipper impressions are found, the area directly opposite them will be targeted as the most probable nest location and will be excavated first.
- c. If impressions are not found, the flattened circular area at the end of the tracks will be targeted, followed by other flattened areas.
- d. The nest will be carefully excavated by hand to ensure eggs (if present) are not damaged. The observer will usually find a small, soft section of sand, unlike the surrounding harder sands. Eggs are usually a few inches below this soft, 2"-3" opening, so extreme care must be taken.

Nest Procedures

The BBNWR biologist and installation NRM will jointly make a determination regarding the status of the nest [nest relocation or left in place (In Situ)].

Appendix K depicts the Sea Turtle Nest Management Zones for NASO DNA.

VDGIF will be notified of any nest relocation or excavation efforts.

This determination is made by examining many factors associated with the nest location, such as: height on the beach (preferably close to the toe of the dunes), above average high tide line (regular inundation by water will result in embryonic mortality); width of the beach; amount of public use; located in a military training area; area susceptible to erosion; and sloughing escarpment (susceptible to being buried too deep). If the nest is at risk from several wash-overs during high tide, and/or the beach has a lot of public use the nest will be relocated. If the nest is located well above the high tide line, and in an area with a low amount of public use, then the nest will be left in situ, unless there are other extenuating circumstances. If, for any reason, the BBNWR Biologist or installation NRM determines that the nest will be in danger of destruction if left in place, the nest will be relocated to a safer location on the closest available suitable adjacent land.

In Situ Nests

Nests located in undisturbed, wide, high, beach areas adjacent to the toe of the dunes, will be left in situ. Each nest will be protected from predators by a wire predator enclosure.

The nest will be surrounded by informational signs, wire, flagging, and reflectors to educate the public, deter human disturbance and alert permittees driving on the beach.

The nest will be checked daily to ensure no unauthorized disturbance of the nest has been made, to determine if hatching has commenced, and to document any signs of predatory disturbance and plant or pest invasion. No later than ten days before the estimated hatch date, nest sitting/monitoring procedures will be implemented (Appendix I). Nest sitting is the process where individuals watch over the nest nightly until the nest has been confirmed via excavation that no further hatching will occur from that particular nest.

Individuals conducting nest sitting are called nest sitters. The nest sitters help protect emerging sea turtle hatchlings from predators as the turtles make their way to the ocean.

Two to three weeks after the hatchlings have emerged and no more signs of hatching are present, the nest will be excavated and data will be collected. In situ nests threatened by hurricanes or storms with expected beach erosion may be relocated to the next approved most suitable adjacent ocean front beach property.

BBNWR procedures are as follows:

- 1) Once eggs have been determined present and the nest identified to stay in place, the depth from beach surface is measured (using a board placed level with the sand surface, over the nest), to the top of eggs, with a tape measure.
- 2) The nest is then covered back up ensuring sand is placed back over the eggs in the same order as removed (moist sand first).
- 3) Eggs are left in place to naturally hatch out.
- 4) Once all data has been recorded, the tracks will be raked over.
- 5) The nest will be excavated two to three weeks after the majority of hatchlings have emerged. Hatchlings may continue to emerge for two weeks after initial emergence. Data on remaining unhatched eggs including developmental stage will be recorded. Dead hatchlings and infertile eggs will be frozen in the BBNWR biology freezer.

Relocated Nests

Excavating Nests

If it is determined necessary to move a nest, it will be relocated to either a suitable ocean front beach nursery site on NASO DNA or to the nearest approved suitable adjacent land to the originating nest location. If conditions change at NASO DNA and there are no suitable nest relocation sites available on the installation or on immediately adjacent land owner property nests will be relocated to a designated nursery site at BBNWR.

- 1) The BBNWR biologist will closely examine any circular, indented or mounded areas within the nesting area for front flipper impressions to determine how the turtle was positioned when she laid the clutch of eggs before stepping near or inside it.
- 2) If flipper impressions are found, the area directly opposite them will be targeted as the most probable nest location and will be excavated first.
- 3) If impressions are not found, the flattened circular area at the end of the tracks will be targeted, followed by other flattened areas.
- 4) The nest will be carefully excavated by hand to ensure eggs (if present) are not damaged. The observer will usually find a small, soft section of sand, unlike the surrounding harder sands. Eggs are usually a few inches below this soft, 2"-3" opening, so extreme care must be taken
- 5) Before the eggs are removed, the depth from beach surface is measured (using a board placed level with the sand surface, over the nest), to the top of eggs, with a tape measure.
- 6) Using excavated sand from the original nest, a 2" layer of sand will be placed in the bottom of a cooler.
- 7) Keeping exposed eggs shaded with an umbrella, the BBNWR biologist will remove them individually from the nest being careful not to rotate the eggs. They will be placed into the cooler with a 1" border of sand between the eggs and cooler. The eggs will be placed in the cooler in a methodical and consistent manner with note taken of the order. The number of eggs in each layer will be counted and recorded. Eggs will be packed in such a manner that they are not

- touching and with two inches of sand between each layer of eggs. With large nests, a second cooler will be needed.
- 8) After all eggs are removed, the "bottom nest depth," (the depth from board level with sand surface, to bottom of empty nest) is measured. The length and width of the nest cavity at the widest and longest points is also measured.
 - 9) Once all eggs are placed in the cooler, extra sand from the nest is placed over them, and also into a separate container. This sand will be used to surround the reburied eggs at the nursery site.
 - 10) Once all data has been recorded, the tracks will be raked over and the nest cavity refilled
 - 11) Eggs will be kept at a moderate temperature, out of direct sunlight, and jolting or shifting will be avoided during the trip to the nursery.

Items Needed for Nest Response/Relocation

BBNWR equipment for nest response/relocations (Navy equipment is identified under the Equipment and Supplies section of this SOP):

- Coolers (3)
- Aluminum wire (40 feet)
- In-situ predator exclosure
- Relocation predator exclosure
- Shovels (3)
- Umbrellas (2)
- Measuring tape (40 meter)
- Post hole diggers (2)
- Dry erase board and markers (2)
- Rake
- Digital camera and extra batteries
- Extra hand-held radio and cellular phone
- Pen and notepad
- Nest and Crawl data sheet
- Black indelible marker (to mark nest # on cage)
- Wire flags
- BBNWR Sea turtle nest box
- BBNWR Sea turtle patrol box

Nest Relocation

BBNWR procedures:

- 1) At the designated relocation site a hole is dug with a shovel that will allow the reconstruction of the original nest dimensions with sand from the originating nest.
- 2) The bottom and sides of reconstructed nest cavity will be filled with sand from original nest and compacted firmly. Dry sand will be prevented from entering the cage while the shape and size of the original nest is recreated as closely as possible. The remainder of the relocated nest cavity is filled with the extra sand brought from the original nest.
- 3) The same person who removed the eggs from the original nest will transfer the eggs from the cooler(s) to the nest-cage. **THE EGGS WILL NOT BE ROTATED**

- or packed tightly. Eggs will be placed into the nest-cage in the reverse order in which they were removed from the original nest. For example, the first egg put in the cooler will be the last one to go into the cage.
- 4) For any eggs that are broken how the break occurred is recorded, and a copy of the nest data sheet is included in the freezer with the specimens.
 - 5) Once the nest is in place and fully buried a trench will be dug around the nest cavity in which to place and secure the predator enclosure cage. This is the same cage utilized for in situ nests. The cage allows hatchlings to hatch and be released without human assistance. The nest number will be affixed to the top of the cage.
 - 6) Once predator enclosure is in place, for nests not located in a nursery site a large post with sea turtle information and protection notices will be placed on all 4 sides of the nest, approximately 1-2 feet away from the cage. If a nursery site is established the nursery site will be posted and cordoned off, as such each individual nest will not receive posts and signs.
 - 7) The Nest and Crawl Data Sheet is completed and placed in the turtle nest binder in the office with photos of the nest and crawl.
 - 8) Once data collection is completed, all foot prints/tracks leading from the beach into the dunes are smoothed out with grass rakes and/or boards to reduce the chance of curious members of the public following the tracks from the beach to the nest.

Nest Monitoring

After an appropriate length of incubation (40 days for Kemps Ridley and 50 days for Loggerhead and Green sea turtle nests), **nests will be monitored** via 2 daytime nest checks and overnight “nest sitting,” in approved zones (figure 1). Day time checks will be made once in the morning and once in the afternoon. Nest sitting will occur from 8PM to 5AM. Day and night checks are looking to initially identify a cone shaped depressions in the center of the nest and for evidence of prior/undocumented emergence. The time a depression is first seen is recorded on the Hatching Data Sheet, as well as on the original Nest Data Sheet.

The majority of nests hatch out at night. Nest sitters prepare the path to the surf, count the hatchlings and protect the hatchlings from predators such as gulls, raccoons, ghost crabs and foxes.

See Appendix I for detailed Standard Operating Procedures for Nest Monitoring.

Release of Hatchlings and Nest Excavation

When hatchlings begin emerging, Navy and BBNWR personnel will be contacted immediately. Hatchlings from in situ nests will be counted and observed.

The emergence time will be recorded on the Hatching Data Sheet.

The hatchlings will be allowed to crawl to the ocean on their own. It is very important that the hatchlings make this journey without assistance. Observers will frighten off any potential predators, if necessary.

The nest will be excavated two to three weeks after the majority of hatchlings have emerged. Hatchlings may continue to emerge for two weeks. The final judgment lies with Refuge Biologist. Data on remaining unhatched eggs including developmental stage will be recorded. Dead hatchlings and infertile eggs will be frozen in the biology freezer located in the brick building.

See Appendix I for detailed SOP for nest monitoring and hatchling release procedures.

Attn: Ben McGinnis, Environmental Planning and Conservation

Re: Section 7 Consultation on Repairs to
the Shoreline Protection System at
Naval Station Oceana, Dam Neck
Annex, Virginia Beach

Dear Mr. Noble:

On November 3, 2012, the U.S. Fish and Wildlife Service (Service) delivered our response to the Biological Assessment (BA) prepared by the Navy for the referenced project and its effects on the federally listed endangered roseate tern (*Sterna dougallii dougallii*) and the federally listed threatened Atlantic piping plover (*Charadrius melodus*), loggerhead sea turtle (*Caretta caretta*), green sea turtle (*Chelonia mydas*), and seabeach amaranth (*Amaranthus punilus*) in accordance with section 7 of the Endangered Species Act of 1973 (16 U.S.C. 1531-1544, 87 Stat. 884), as amended (ESA). In our November 3, 2012 response, the Service concurred with the Navy's determination of may affect, but is not likely to adversely affect for the roseate tern and seabeach amaranth. The Service requested that the Navy address concerns regarding proposed management for loggerhead sea turtles, green sea turtles, and piping plovers.

In a letter dated April 20, 2012, the Navy requested the Service's concurrence with the determination of may affect, but is not likely to adversely affect for the loggerhead sea turtle, green sea turtle, and piping plover based on modifications made by the Navy to their Integrated Natural Resource Management Plan (INRMP). Additionally, the Navy requested the Service's concurrence with a no effect determination for nesting federally listed endangered leatherback sea turtle (*Dermochelys coriacea*), hawksbill sea turtle (*Eretmochelys imbricate*), and Kemp's ridley sea turtle (*Lepidochelys kempii*). The Service concurs with the Navy's no effect determination for these three species of sea turtle because no records of nesting attempts by these species have been documented in Virginia.

Regarding loggerhead and green sea turtles, the Navy's INRMP includes a Sea Turtle Monitoring Protocol section, which sets criteria for daily monitoring of nesting sea turtles and nests, nest protection, and nest relocations. The Navy has agreed to leave nests in situ rather than

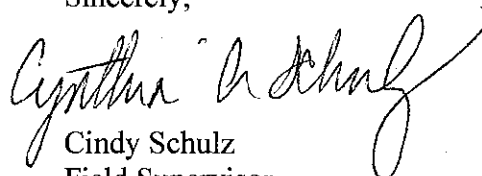

relocating nests, only moving nests when operational uses of the beach would result in the take of a nest. In such cases, the Navy will coordinate with the Service's Back Bay National Wildlife Refuge (NWR). All nest relocations by the Navy will be conducted in accordance with the methods outlined in the July 13, 2011, biological opinion issued to Back Bay NWR (copy enclosed) that provides ESA compliance for such activities at False Cape State Park, Back Bay NWR, Sandbridge Beach, Virginia Beach Resort Area, and Fort Story.

The Service does not concur with the Navy's determination of may affect, but is not likely to adversely affect for nesting loggerhead and green sea turtles, because take of turtles may occur. However, this letter amends the Loggerhead Sea Turtle Nest Monitoring and Management on Back Bay NWR biological opinion issued by the Service on July 13, 2011, to add Naval Station Oceana, Dam Neck Annex. This letter will be appended to that biological opinion and maintained as part of the decision document and administrative record. The biological opinion, this amendment, and the criteria in the INRMP together provide ESA compliance for the Navy related to monitoring of nesting sea turtles and nests, nest protection, and nest relocations for both loggerhead and green sea turtles that may occur at Naval Station Oceana, Dam Neck Annex.

The Navy has included in their INRMP guidelines for migratory bird monitoring and management. The INRMP includes protocols to ensure surveys and daily observations during sea turtle nesting periods will include monitoring for both piping plover and the federal candidate red knot (*Calidris canutus rufa*). There are no records of piping plovers nesting on beaches south of the Chesapeake Bay, where the species is considered to be an uncommon transient. Because it is unlikely that the piping plover will utilize this area and the monitoring protocols will be implemented, the Service concurs with the Navy's determination of may affect, but is not likely to adversely affect for piping plovers.

If you have any questions, please contact Mike Drummond of this office at (804) 693-6694, extension 122, or via email at mike_drummond@fws.gov.

Sincerely,

Cindy Schulz

Memorandum

To: Project Leader, Back Bay National Wildlife Refuge
(Attn: Geralyn Mireles, Wildlife Biologist)

From: Supervisor, Virginia Ecological Services *Cynthia A. Schuyz*

Subject: Biological Opinion on the Back Bay National Wildlife Refuge Sea Turtle Management Program, Virginia Beach, Virginia

This document transmits the U.S. Fish and Wildlife Service's (Service) biological opinion based on our review of the subject project and its effects on the federally listed threatened loggerhead sea turtle (*Caretta caretta*) and green sea turtle (*Chelonia mydas*). The Service's Back Bay National Wildlife Refuge (BBNWR) proposes to conduct sea turtle nest management activities on BBNWR and adjacent properties along the Atlantic coast beaches extending from the Virginia/North Carolina border to the mouth of the Chesapeake Bay. This biological opinion is submitted in accordance with section 7 of the Endangered Species Act of 1973 (16 U.S.C. 1531-1544, 87 Stat. 884), as amended (ESA). Formal consultation was initiated on January 27, 2011.

This biological opinion is based on the BBNWR Comprehensive Conservation Plan (CCP) (Service 2010), emails, telephone conversations, a sea turtle management meeting, and other information provided by the Service, Virginia Department of Game and Inland Fisheries, and others. A complete administrative record of this consultation is on file in this office.

CONSULTATION HISTORY

- 08-03-10 BBNWR requested section 7 consultation on their revised CCP.
- 08-03-10 to 9-13-10 The Virginia Field Office (VAFO) and BBNWR coordinated on a management plan to review and revise sea turtle and beach management on BBNWR.
- 09-13-10 VAFO and BBNWR completed review of BBNWR CCP and completed informal consultation. BBNWR and VAFO committed to conducting a meeting and evaluation of sea turtle management prior to the 2011 sea turtle nesting season to review and revise sea turtle management and complete formal section 7 consultation, if necessary.

- 01-19-11 VAFO held a sea turtle management meeting which included BBNWR and other agencies conducting sea turtle nest management and beach management in Virginia.
- 02-02-11 VAFO received draft intra-Service section 7 consultation form on BBNWR sea turtle management.
- 02-02-11 VAFO and BBNWR reviewed and revised sea turtle nest management protocol to 06-15-11 and intra-Service consultation form.
- 06-15-11 VAFO received final revisions of the nest management protocol and intra-Service consultation from BBNWR.

BIOLOGICAL OPINION

DESCRIPTION OF THE PROPOSED ACTION

The proposed activity is to continue monitoring and managing loggerhead sea turtle nests within all sea turtle nesting areas including the beaches of BBNWR, the Virginia Beach resort area, Fort Story, the City of Sandbridge, and False Cape State Park (FCSP). These management practices will continue until the loggerhead sea turtle is no longer listed. If nests of other sea turtle species are found, including the green sea turtle, the same protocol will be followed. Activities within sea turtle nesting habitat include crawl and nest searches as well as nest relocations.

A limited number of permit holders drive vehicles on the beach at BBNWR. Permits are issued to continue traditional ingress and egress along the BBNWR beach between the permittee's residence and their full-time employment in the Norfolk-Virginia Beach area. These permits are not transferrable and will be terminated when the current permit holder is no longer able to drive, or when alternate access becomes available during the permit period. Permittee access on BBNWR beach is prohibited between 12:00 am and 5:00 am from May 1 – September 30, to reduce negative impacts on sea turtles.

Monitoring Methods -

Turtle crawl and nest searches - Morning patrols for turtle crawls and nests are conducted from about June 1 through August 31. FCSP employees patrol BBNWR and FCSP, while BBNWR staff and volunteers are responsible for the north mile of BBNWR and Sandbridge Beach. A BBNWR volunteer patrols the Fort Story and Virginia Beach resort area beaches. Personnel use ATVs for the surveys, but vehicles may be used on the beaches where permitted beach driving is allowed.

When a turtle crawl is found, BBNWR staff determine whether the crawl resulted in a nest. The presence of a "body pit" in a sea turtle crawl usually indicates the turtle attempted to lay eggs. BBNWR biologists closely examine the body pit for indented impressions and/or mounded areas that indicate the location of the female's front flippers. This dictates her position when the eggs

were deposited. If flipper impressions are found, the area directly to the rear is targeted as the most probable nest location and is carefully excavated by hand first. The fingertips are used to probe the sand for a small, soft spot, unlike the surrounding more densely packed sand. This indicates the nest location. If flipper impressions are not found, the flattened circular area at either end of the tracks is targeted. Eggs are usually a few inches below this soft, 2-3 inch opening, so extreme care is taken. The biologist gently digs by hand into the body pit to locate the egg chamber and determine if eggs are present (Service 2007). The location and date of the crawl will be recorded, whether a nest is found or not.

Nest relocation - The construction of dunes on FCSP and BBNWR beaches in the 1930s resulted in blockage of overwash and dune blowout areas which otherwise would have allowed nesting sea turtles access to higher beach elevations. Current turtle nesting is limited to lower elevation sections of the beach which are susceptible to extensive saltwater inundation, beach erosion and complete nest loss during monthly high tides, "northeaster" storms, and hurricane activity in the mid-Atlantic. Other potential threats including vehicular beach traffic and public use activity also exist on these beaches.

The following risk analysis is performed by BBNWR biologists to determine if a nest needs to be relocated. If the answer to either of the two questions below is affirmative, the nest is relocated:

- Is the nest/body pit located below the estimated mean high tide lines -- as evidenced by the wrack lines and reference to tidal conditions when personnel survey the beach?
- Is the nest in an area where there is a likelihood that vehicles will run over the nest with signage and markers installed, or that there is a likelihood that intense artificial lighting will result in hatchling disorientation?

Once nests are determined to be present, biologists wear nitrile gloves prior to handling any eggs. This minimizes potential harm to the handlers (i.e., salmonella) and to the eggs (human carried bacteria, temperature change, etc.).

Before eggs are removed, the depth from beach surface to the top of eggs is measured. Using excavated sand from the original nest, a 2 inch layer of moist sand is placed in the bottom of a cooler (Sill et al. 2000). Keeping exposed eggs shaded with an umbrella, BBNWR staff remove eggs individually from the nest, being careful not to rotate them in the process. Eggs are placed into the cooler with a 1 inch border of sand between the eggs and the sides of the cooler. The eggs are placed in the cooler in a consistent and methodical manner with note taken of the order. The number of eggs in each layer are counted and recorded. Eggs are packed in such a manner that they are not touching and with 2 inches of sand between each layer of eggs. Usually two coolers are used. After all eggs are removed, the distance from the beach surface to the bottom of the nest depth is measured (Boulon 1999, Service 2007). The length and width of the nest cavity at the widest and longest points is also measured. Once all eggs are placed in the cooler, extra sand from the nest is placed over them and into a separate container. This sand is used to surround the reburied eggs at the nursery site located on BBNWR behind the primary dune. Once all the data has been recorded, the nest cavity is refilled and the crawl brushed out with

rakes and shovels. Eggs are kept out of direct sunlight; jolting or shifting is avoided during the trip to the nursery (Mortimer 1999).

At the designated nursery site a vertical shaft large enough for the predator-proof cage is dug with a spade/shovel. The predator-proof cage is placed in the hole with the middle rib of cage at least an inch above the sand as long as bottom and top nest depths are near the original nest's depths (Service 2007). The same person who removed the eggs from the original nest transfers the eggs from the coolers to the nest cage. The eggs are not rotated or packed tightly (Jones and Musick 1988, Mortimer 1999). Eggs are placed into the nest cage in the reverse order in which they were removed from the original nest (i.e., the first egg put in the cooler will be the last one to go into the cage). The bottom and sides of the cage are filled with sand from the original nest. Dry sand is not allowed to enter the cage through the mesh while the shape and size of the original nest is recreated as closely as possible. The remainder of the relocated nest cavity is filled with the extra sand brought from the original nest. The top of the predator-proof cage is secured with three 6-inch pieces of aluminum wire, and the nest number is written on the top. For any eggs that are broken, the cause of break is recorded on a copy of the nest data sheet. The sheet is then bagged with the specimen and placed in the biology freezer at BBNWR. The Nest and Crawl Data Sheet is completed and filed at BBNWR. Digital photos of the nest and crawl are downloaded and catalogued. This information and more is included in the 2007 "Back Bay NWR Sea Turtle Nest Standard Operating Procedures."

In situ nest management - Nests that are identified and left in situ are marked with reflectors, signs identifying the site as a sea turtle nest, and flagging tape placed in the immediate vicinity of the nest (within 9.8 feet [ft]) to help prevent nests from being run over by vehicles or inadvertently disturbed. A predator guard, constructed of galvanized fence wire with a rectangular mesh size of approximately 2 inches by 4 inches is used. A trench is excavated around the nest, and the fence material is placed over the nest with flaps placed in the trenches and re-buried to prevent excavation by predators. In situ nests are monitored daily near the hatch window to determine if they are successful, and after all hatching is anticipated to be completed, the nests are excavated and the number and condition of hatched eggs, unhatched eggs, and young turtles are counted.

Action Area - The "action area" is defined as all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action. The Service has determined that the action area for this project consists of the beaches of BBNWR, FCSP, the Virginia Beach resort area, Fort Story, and Sandbridge.

STATUS OF THE SPECIES AND CRITICAL HABITAT RANGEWIDE

The loggerhead sea turtle was listed as threatened in the U.S. in 1978 (NMFS and Service 1991a) and the green sea turtle was listed as endangered in 1978 (NMFS and Service 1991b). In March 2010, the Service and NMFS published a proposed rule in the Federal Register to recognize nine distinct populations of loggerhead sea turtles worldwide. Under this proposed rule, the loggerhead sea turtle population that would be affected by the proposed actions is the north

Atlantic population and it is proposed to be listed as endangered (72 FR 12598). There is designated critical habitat outside of Virginia for the green sea turtles, but none has been designated for the loggerhead sea turtle.

Species/Critical Habitat Description and Life History – This account emphasizes loggerhead and green sea turtle nesting and breeding biology, which is the subject of this biological opinion. Additional information about the life history of these sea turtle species and their habitat use, behavior, and survival at sea can be found in other documents, including the loggerhead and green sea turtle recovery plans (National Marine Fisheries Service [NMFS] and Service 1991a, b, respectively), loggerhead and green sea turtle five-year status reviews (NMFS and Service 2007a, b, respectively), and other sources (National Research Council 1990).

The loggerhead is smaller, with a mean carapace length of 3 ft and a mean mass of 293 pounds (NMFS and Service 2008), compared to 3.35 ft and 300 pounds for the green sea turtle (National Research Council 1990). Green sea turtles nest primarily in the tropics and are rarer nesters at higher latitudes, while loggerheads have significant nesting populations outside the tropics (National Research Council 1990).

Life History and Population Dynamics - Loggerhead females are believed to reach sexual maturity at a minimum age of 30 years (Snover 2002). At the start of the breeding season, they migrate from foraging areas on the continental shelf to mating areas in the waters near their nesting beaches (Schroeder et al. 2003). Reproductive females exhibit the desire to return to their birthplace to lay their eggs (Miller et al. 2003). Females may be inseminated by multiple males (Bollmer et al. 1999). After mating, males return to their foraging areas while females remain in the waters near their natal beaches to emerge onto their nesting beaches to lay eggs. The following account of nesting biology is a synopsis of Miller et al. (2003).

Loggerhead females tend to nest on high wave energy, sandy ocean beaches. Gravid females emerge from the wash zone and crawl toward the dune line until they encounter a suitable nest site, typically on open sand at the seaward base of a dune, but sometimes in vegetation. The female clears away surface debris with the front flippers, creating a "body pit," then excavates a flask shaped nest cavity with her hind flippers. Loggerheads lay an average of 112 eggs per nest. After laying, the female covers the nest with sand using all four flippers. Once the nest covering phase is complete, she crawls back into the sea. Individual females may nest 1 to 6 times per nesting season, at intervals of 12-16 days, during the late spring to late summer. Intervals between nesting shorter than 10 days indicate that the previous nest attempt was likely aborted due to disturbance. Mature loggerheads nest every two to three years, on average (Schroeder et al. 2003). Nest incubation period (from laying to hatching) depends on temperature and ranges from 48 to 90 days at the extremes. Emergence of hatchlings from the nest cavity usually occurs within four days of hatch, but may take up to two weeks longer. Hatchling emergence from nests usually occurs at night when temperatures are lower and diurnal predators are inactive. Hatching success typically approaches 80 percent; after hatchlings leave the beaches, they typically fall prey to a variety of predators, including birds, fish, and sharks (National Research Council 1990).

Within the Northwest Atlantic, the majority of loggerhead sea turtle nesting activity occurs from April through September, with a peak in June and July (Williams-Walls et al. 1983, Dodd 1988, Weishampel et al. 2006). Nesting occurs within the Northwest Atlantic along the coasts of North America, Central America, northern South America, the Antilles, Bahamas, and Bermuda, but is concentrated in the southeastern U.S. and on the Yucatán Peninsula in Mexico on open beaches or along narrow bays having suitable sand (Sternberg 1981, Ehrhart 1989, Ehrhart et al. 2003, NMFS and Service 2008).

Sex ratio of hatchlings depends on temperature during incubation. Below 84° Fahrenheit (29° Celsius), more males are produced than females and above that temperature more females are produced (Carthy et al. 2003). Furthermore, fluctuating incubation temperatures often produce more females than stable temperatures, and temperature, hydration, and gas exchange during incubation can determine hatchling size, early swimming behavior, growth rate, and hatchling robustness (Carthy et al. 2003). Newly emerged hatchlings immediately head for the sea, most likely orienting toward the water by moving toward the brightest horizon and away from dark silhouettes (Lohmann and Lohmann 2003). Sea turtles are most negatively sensitive to blue and green light and loggerheads in particular are averse to yellow light (Witherington and Martin 1996). Once in the sea, hatchling loggerheads swim into the waves and eventually enter the open ocean, where they will spend the first 6.5 to 11.5 years of their lives primarily at the top of the water column, until finally moving to foraging areas on the continental shelf (Bolten 2003).

Green sea turtles nest in two, three, or four year intervals, and may lay as many as nine clutches within a nesting season (NMFS and Service 1991b). Clutch size varies from 75-200 eggs, and incubation ranges from about 45-75 days (NMFS and Service 1991b).

Nesting habitat - Less is known about factors that cue nest site selection than about anthropogenic disturbances that discourage nesting (Miller et al. 2003). Typical nesting areas are sandy, wide, open beaches backed by low dunes, with a flat, sandy approach from the sea (Miller et al. 2003). Nesting is nonrandom along the shoreline, but studies of the physical characteristics associated with nests versus random or non-nesting sites on the beach have produced varying results. Some factors found to determine nest selection are beach slope (3 of 3 studies), temperature (2 of 3 studies), distance to ocean (1 of 3 studies), sand type (2 of 2 studies), and moisture (1 of 3 studies), although the results were occasionally contradictory (Miller et al. 2003). Other factors examined but not found to be significant were sand compaction, erosion, pH, and salinity. Although the process of nest site selection is not well understood, a successful nest must be laid in a low salinity, high humidity, and well-ventilated substrate that is not prone to flooding or burying due to tides and storms and where temperature is optimal for development (Miller et al. 2003).

Status and Distribution – Approximately 58,000 loggerhead nests were estimated in the U.S. Atlantic in 1983 (NMFS and Service 1991a) and between 53,000 and 92,000 nests from 1989 to 1998 (Turtle Expert Working Group 2000). Within the northern subpopulation (north Florida to Virginia), studies in South Carolina and Georgia have documented a decline in number of nests

(Ehrhart et al. 2003). Based on genetic evidence, male loggerheads disperse freely among sites within the U.S. Atlantic population, while females are faithful to their natal sites (Bowen et al. 2005). Because sex ratio is determined by temperature during incubation (Miller et al. 2003), the northern part of the U.S. Atlantic population, apparently provides a disproportionate number of males to the larger population (Mrosovsky et al. 1984a, Hanson et al. 1998, Hawkes et al. 2007).

“Analyses of historic and recent abundance information by the Marine Turtle Specialist Group (MTSG) indicate that extensive population declines for the green sea turtle have occurred in all major ocean basins. The MTSG analyzed population trends at 32 index nesting sites around the world and found a 48-65 percent decline in the number of mature females nesting annually over the past 100-150 years. The two largest nesting populations of green turtles are found at Tortuguero, on the Caribbean coast of Costa Rica, and Raine Island, on the Great Barrier Reef in Australia, where an annual average of 22,500 and 18,000 females nest per season, respectively. In the U.S., green turtles nest primarily along the central and southeast coast of Florida; present estimates range from 200 - 1,100 females nesting annually” (NMFS 2008). In the southeast U.S., the majority of green turtle nesting occurs in Florida. The green turtle nesting population of Florida appears to be increasing based on 19 years (1989-2007) of index nesting data from throughout the state (http://research.myfwc.com/features/view_article.asp?id=27537).

Factors Affecting the Species – Numerous factors affect sea turtle growth, survival, and behavior while at sea from when they leave natal beaches as hatchlings until they mature and return to beaches to breed. These factors are discussed in detail in the 5-year status reviews for the two turtle species (NMFS and Service 2007a, b). The discussion herein is limited to factors affecting turtle nesting. Threats to loggerhead sea turtles on the nesting grounds are similar to those faced by green sea turtles. The following threats affect both species, though there may be some differences in susceptibility between the species.

Weather and tides - Storm events may erode beaches and destroy nests or cause nest failure due to flooding or piling of eroded sand on the nest site. Beach erosion due to wave action may also decrease the availability of suitable nesting habitat (Steinetz et al. 1998), leading to a decline in nesting rate on a particular beach. Sea level rise, often in combination with human development along beaches, is contributing to erosion, changes in beach characteristics, and more intensive management of many beaches.

Predation - Predation of eggs and young by mammals, birds, and ghost crabs may eliminate up to 100 percent of the nests and any hatchlings that emerge on beaches where predation is not managed (National Research Council 1990). This is a natural phenomenon that has always affected sea turtle populations, but due to reduced turtle population sizes, reduced turtle habitat availability, and unnatural population increases of nest predators in some areas, predation is a significant threat to remaining breeding populations and is actively controlled through predator exclusion and predator control on most beaches where turtles nest.

Human activities - Crowding of nesting beaches by pedestrians can disturb nesting females and prevent laying (NMFS and Service 2008). Furthermore, the use of flashlights and campfires may

interfere with sea-finding behavior by hatchlings. Beach driving, including pedestrian traffic and vehicle use, and beach cleaning pose a risk of injury to females and live stranded turtles, can leave ruts that trap hatchlings attempting to reach the ocean (Hosier et al. 1981, Cox et al. 1994), can disturb adult females and cause them to abort nesting attempts, and can interfere with sea-finding behavior if headlights are used at night (NMFS and Service 2008). Driving directly over incubating egg clutches can cause sand compaction, which may decrease hatching and emergence success and directly kill pre-emergent hatchlings (NMFS and Service 2007a). Artificial lighting on structures may affect turtle behavior in a similar manner (Witherington and Martin 1996). Beach cleaning can directly destroy nests. Poaching is a problem in some countries and occurs at a low level in the U.S. (NMFS and Service 2007a). An increased human presence may also lead to an increase in the presence of domestic pets that can depredate nests and an increase in litter that may attract wild predators (National Research Council 1990).

The rate of habitat loss due to erosion and escarpment formation may be increased during shoreline stabilization efforts, either through renourishment (Dolan et al. 1973) or placement of hard structures such as sea walls or pilings (Bouchard et al. 1998). Vehicle traffic may alter the beach profile leading to steeper foredunes (Anders and Leatherman 1987), which may be unsuitable for nesting. Improperly placed erosion control structures such as drift fencing can act as a barrier to nesting females. Non-native and/or invasive vegetation may be introduced in conjunction with beach development, which can overrun nesting habitat, make the substrate unsuitable for digging nest cavities, invade nests and desiccate nests, or trap hatchlings.

Reduced nesting success on constructed/augmented beaches could result due to sand compaction, escarpment formation, and changes in the beach profile. Sand compaction has been shown to negatively impact sea turtles, particularly concerning beach nourishment projects. Placement of very fine sand and/or the use of heavy machinery can cause sand compaction on nourished beaches (Nelson et al. 1987, Nelson and Dickerson 1988). Significant reductions in nesting success (i.e., false crawls occurred more frequently) have been documented on severely compacted nourished beaches (Nelson and Dickerson 1987, Nelson et al. 1987), and increased false crawls may result in increased physiological stress to nesting females. Sand compaction may also increase the length of time required to excavate nests and result in increased physiological stress (Nelson and Dickerson 1988).

ENVIRONMENTAL BASELINE

Status of the Species/Habitat Within the Action Area – Sea turtle nesting has regularly occurred within the action area since the 1970s. Since 1970, 93 nests have been recorded, ranging from 0-7 nests per year. The majority of nests have occurred on BBNWR and FCSP (49 and 28, respectively, BBNWR 2011). Up to 8 false crawls have also been recorded among all the sites within a year (2002; BBNWR 2011), and a total of 45 false crawls have been recorded.

Since monitoring began, 9 nests have been left in situ, and most of these occurred from 2003 to 2005, when BBNWR staff tested and evaluated in situ hatch success of nests. The majority of nests left in situ failed to hatch, presumably as a result of tropical storms causing prolonged

inundation and beach erosion, but at least one nest left in situ hatched successfully at a rate comparable to nests placed in the hatchery. Most nests have been relocated to a sea turtle hatchery on BBNWR, located behind the primary dune. Hatch success of the hatchery-produced young is high, generally ranging from 80 to 95 percent.

In 2010, preliminary genetic analysis of 9 sea turtle nests in Virginia was conducted in conjunction with a larger study of the population genetics of the northern recovery unit of loggerhead sea turtles. The 9 nests were laid by 4 different females, 2 of which also nested in North and South Carolina within the same year, as well as individuals that had not been recorded nesting outside of Virginia (Nairn and Shamblin 2011).

At BBNWR there is an artificial dune system that creates a narrow beach with a high primary dune. This combination creates poor quality nesting habitat due to the high probability of erosive washovers, egg exposure to saltwater and air, or entombment. Beaches in Sandbridge, Virginia Beach oceanfront, and other sites are generally larger, but are also subject to high levels of human activity, extensive illumination, and human traffic. Beaches at several sites are periodically renourished to maintain them in a condition to support public recreation.

Factors Affecting Species Environment Within the Action Area – The artificial dunes on BBNWR and FCSP result in narrow beaches that lack the upper beach zones and at high tides water is generally at or near the base of the dunes. The upper beach berm to dune transitional habitat, and all associated plants and animals, are generally lacking.

Beach driving results in ruts, compaction of sand, and disturbance of beach flora and fauna, and further contributes to the degraded condition of upper beach habitat. Vehicle operation on the beach may also reduce beach stability and result in increased levels of sand transport both on and off of the beaches of BBNWR and FCSP.

Human recreational use of the beaches, including grooming of the most heavily used recreational beaches in the City of Virginia Beach, result in highly disturbed beaches that lack natural beach contours, and may be more compacted than natural beaches. These areas also generally lack vegetation, and the beaches lie immediately in front of heavily developed hotel/resort areas. These areas are generally illuminated, and lack most characteristics of suitable sea turtle nesting beaches, with the exception of a broad beach profile that is maintained through periodic beach renourishing. Direct disturbance of sea turtles is also likely to occur on beaches that have high levels of human use or vehicle operation.

Beach renourishment may result in unsuitable beach conditions, including unnatural profiles, beach sand composition that is different from natural beaches in color, density, compaction, drainage, and other characteristics. These beaches may be suitable for sea turtle nesting, but may result in differences in nest success, hatchling gender, and hatchling fitness.

EFFECTS OF THE ACTION

Adverse Effects – The effects to sea turtles from nest relocation are not well studied, and vary depending on the specific practices involved in relocation. Because it is not practical to monitor the long-term survival or success of hatchling turtles, the specific effects of nest management action on BBNWR on hatchling turtles are not known.

Many studies indicate reduced hatch success of relocated sea turtle nests. Handling alone can result in damage to embryos by disrupting membrane attachment and result in reduced hatch success (Limpus et al. 1979, Parmenter 1980). Differences in the moisture regime, temperature regime, and gas exchange between nest sites selected by turtles and sites where nests are relocated also have the potential to affect hatch success (Ackerman 1980, McGehee 1990).

Movement of sea turtle nests to a hatchery site alters sex ratios of sea turtles compared to those that would occur in natural nests as a result of different incubation temperatures (Harvey and Slatkin 1982; Limpus et al. 1982; Mrosovsky et al. 1984a, b; Dalrymple et al. 1985; Dutton et al. 1985; Standora and Spotila 1985). The use of a hatchery site that is more far-removed from the beach likely generally results in warmer incubation temperatures than those which would occur at natural nest sites, and this would tend to increase the proportion of female hatchlings (Mrosovsky et al. 1984a, b). However, because the sex ratios that would naturally occur are expected to vary among years and sites depending on weather conditions, date that the nest is laid, nest depth, soil conditions, and other factors, it is not possible to determine how the sex ratio at the hatchery site would differ from what would occur naturally. Additionally, it is not possible to determine what biological, demographic, or genetic effects to the population may result from altered sex ratios, except that differences should be expected, and we presume that the naturally occurring sex ratios and the variation in those ratios over time, are appropriate to maintain the sea turtle populations.

As a result of the refinement of methods and implementation of a detailed protocol to excavate, transport, and re-bury turtle nests that are relocated by BBNWR personnel, hatch success rates are generally comparable to those that may occur naturally. Similarly, the identification and routine use of a carefully selected hatchery site at BBNWR has apparently reduced the adverse effects to turtle embryos and hatching success.

Emerging research on the homing abilities of sea turtles continues to indicate a strong tendency for sea turtles to return to their natal beaches to nest. However, to date, the cues that sea turtle hatchlings use to allow them to return to natal beaches are unknown. Irwin et al. (2004) have measured distorted magnetic fields within sea turtle egg enclosures similar to those used by BBNWR. Based on evidence that sea turtles navigate at sea using magnetic fields Lohmann et al. (1999) and Irwin et al. (2004) speculate that magnetic fields may be an important mechanism for imprinting on natal beaches, and distortion in magnetic fields may affect homing behavior and the ability to return to natal beaches.

Condition of hatchling turtles may be more important than hatch success in terms of the likelihood of survival and recruitment of young turtles. Hatchling size in some turtle species is related to the water balance of eggs while in the nest, with larger young generally resulting from eggs that occurred in wetter conditions (Janzen et al. 1995). While the relationship of hatchling size to nest environment during development has not been well studied in sea turtles, larger young may be more likely to survive (Janzen et al. 1995).

Manual release of hatchlings from the enclosed egg chamber used at the BBNWR hatchery may result in higher than normal susceptibility to predation. Release of hatchlings during daytime hours can result in higher predation, and release of hatchlings en masse may also increase predation vulnerability by attracting predators to the group of young being released. Under natural conditions, night-time emergence and emergence of relatively small numbers of individuals over time (particularly at more northerly latitudes) may result in reduced risk of loss of all young.

Additionally, holding hatchlings after emergence may result in expenditure of energy attempting to escape, interference with normal behaviors, and elevated levels of stress that may detrimentally affect the physiological condition of hatchlings. After release into the ocean, this may result in reduced likelihood of survival and reduced probability of reaching nursery areas.

While the risk of catastrophic loss of clutches cannot be estimated, relocating turtle nests to a common hatchery area increases the likelihood of catastrophic loss resulting from accidents, adverse environmental conditions, and disease and predation.

It is uncertain whether the effects of intensive nest management discussed above occur, and to what degree they affect hatchling survival. The types of effects may vary depending on the environmental conditions within the specific nesting season, and the specific conditions that each nest is subjected to during management activities and relocation. The combination of these factors results in highly uncertain effects to the sea turtle population. While hatch success has often been used as a proxy to assess reproductive success, the factors discussed above may reduce recruitment, affect population demography, and affect future use of turtle nesting beaches in the action area. For the purposes of this analysis and in the absence of specific information that would allow us to consider the expected magnitude and severity of effects that may result, we make the conservative assumption that all of these factors affect hatchling sea turtles to a degree that cumulatively results in significantly reduced survival and recruitment probability.

Beneficial Effects – Monitoring and in situ nest protection provides good information on the sea turtle nesting effort within the action area. Nest marking and predator protection reduce the potential for anthropogenic impacts including disruption of nests and predation that may result from artificially abundant predators. The educational component of the monitoring aids in improving beach visitor consideration of sea turtle nesting in the vicinity of recreational areas. While unknown, the controlled conditions of the turtle hatchery likely result in higher nest success rates than would occur if turtle nests were left in the wild, but it remains unclear whether the greater productivity results in improved recruitment of juvenile sea turtles.

Interrelated and Interdependent Actions - An interrelated activity is an activity that is part of the proposed action and depends on the proposed action for its justification. An interdependent activity is an activity that has no independent utility apart from the action under consultation. The Service is not aware of any such actions associated with this project.

CUMULATIVE EFFECTS

Cumulative effects include the effects of future state, tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the ESA. Cumulative effects likely to adversely impact nesting sea turtles include management of beaches by private individuals and municipalities, and use of beaches for recreational purposes. Management and use of beaches degrades the habitat quality for nesting sea turtles and minimizes the likelihood of successful nesting and hatching of young. Shoreline development adjacent to beaches, primarily along the developed Virginia Beach oceanfront and Sandbridge, results in disturbance of adult female sea turtles attempting to nest, minimizing the likelihood of successful nesting.

CONCLUSION

After reviewing the status of the loggerhead and green sea turtle, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the proposed BBNWR sea turtle nest management program is not likely to jeopardize the continued existence of the loggerhead and green sea turtles. No critical habitat has been designated for this species within the action area; therefore, none will be affected.

INCIDENTAL TAKE STATEMENT

Section 9 of the ESA and federal regulations pursuant to section 4(d) of the ESA prohibit the take of endangered and threatened species, respectively, without a special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harm is further defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns such as breeding, feeding, or sheltering. Harass is defined by the Service as intentional or negligent actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns, which include, but are not limited to, breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the ESA provided that such taking is in compliance with the terms and conditions of this incidental take statement.

The measures described below are nondiscretionary, and must be undertaken by BBNWR so that they become binding conditions of any grant or permit issued to any applicant, as appropriate, for the exemption in action 7(o)(2) to apply. BBNWR has a continuing duty to regulate the activity covered by this incidental take statement. If BBNWR (1) fails to assume and implement the terms and conditions or (2) fails to require the applicant to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to the permit or grant document, the protective coverage of section 7(o)(2) may lapse. To monitor the impact of incidental take, BBNWR must report the progress of the action and its impact on the species to the Service as specified in the incidental take statement.

AMOUNT OR EXTENT OF TAKE ANTICIPATED

The Service anticipates incidental take of all sea turtle nests that are relocated within the action area. While there is potential for some individual hatchlings to survive and recruit into the breeding population, the degree of uncertainty in the expected effects that relocation has on sea turtles requires expectation of loss of all relocated nests. Because the decision to relocate nests is dependent on the specific location, setting of the nest, and determination of BBNWR personnel, all nests that occur in any year may be relocated.

EFFECT OF THE TAKE

In the accompanying biological opinion, the Service determined that this level of anticipated take is not likely to result in jeopardy to the species or adverse modification or destruction of critical habitat.

REASONABLE AND PRUDENT MEASURES

The Service believes the following reasonable and prudent measures are necessary and appropriate to minimize take of nesting sea turtles.

- Conduct sea turtle monitoring and management to minimize anthropogenic intervention and maximize protection of nests.

TERMS AND CONDITIONS

To be exempt from the prohibitions of section 9 of the ESA, BBNWR must comply with the following terms and conditions, which implement the reasonable and prudent measures described above and outline required reporting/monitoring requirements. These terms and conditions are nondiscretionary.

The proposed action includes appropriate measures to avoid and minimize adverse effects to sea turtles, and no additional terms and conditions are needed to implement the reasonable and prudent measures.

The following relates to reporting requirements:

- Care must be taken in handling any dead specimens of proposed or listed species that are found to preserve biological material in the best possible state. In conjunction with the preservation of any dead specimens, the finder has the responsibility to ensure that evidence intrinsic to determining the cause of death of the specimen is not unnecessarily disturbed. The finding of dead specimens does not imply enforcement proceedings pursuant to the ESA. The reporting of dead specimens is required to enable the Service to determine if take is reached or exceeded and to ensure that the terms and conditions are appropriate and effective. Upon locating a dead specimen, notify the Service's Virginia Law Enforcement Office at 804-771-2883, 5721 South Laburnum Avenue, Richmond, Virginia 23231, and the Service's Virginia Field Office at 804-693-6694 at the address provided above.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the ESA directs federal agencies to utilize their authorities to further the purposes of the ESA by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to further minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

BBNWR should work with other beach owners and managers in the region to implement beach management programs for sea turtles that include efforts to minimize threats to sea turtle nesting such as artificial lighting, beach grooming, and vehicle operation on beaches.

BBNWR should develop a beach management plan that allows for overwash and natural beach processes in at least limited areas of BBNWR that will allow for sea turtle nesting. If sea turtle nest relocation continues, identify an alternate hatchery location on the beach that will allow for natural and unassisted emergence.

For the Service to be kept informed of actions minimizing or avoiding adverse effects or benefiting listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

REINITIATION NOTICE

This concludes formal consultation on the action(s) outlined in the request. As provided in 50 CFR § 402.16, reinitiation of formal consultation is required where discretionary federal agency involvement or control over the action has been retained (or is authorized by law) and if: (1) the amount or extent of incidental take is exceeded; (2) new information reveals effects of the agency action that may affect listed species or critical habitat in a manner or to an extent not considered in this opinion; (3) the action is subsequently modified in a manner that causes an effect to the listed species or critical habitat not considered in this opinion; or (4) a new species is listed or critical habitat designated that may be affected by the action. In instances where the

amount or extent of incidental take is exceeded, any operations causing such take must cease pending reinitiation.

If you have any questions, please contact Tylan Dean of this office at (804) 693-6694, extension 166, or via email at tylan_dean@fws.gov.

NASO & BBNWR Nest Relocation Agreement

DEPARTMENT OF THE NAVY

NAVAL AIR STATION OCEANA
1750 TOMCAT BOULEVARD
VIRGINIA BEACH, VIRGINIA 23460-2191

IN REPLY REFER TO:
5090
Ser 00/202
May 29, 2008

Mr. Jared Brandwein
Refuge Manager
U.S. Fish and Wildlife Service
Back Bay National Wildlife Refuge
4005 Sandpiper Road
Virginia Beach, VA 23456-4325

SUBJECT: RELOCATION OF SEA TURTLE NESTS FROM NAVAL AIR STATION
(NAS) OCEANA, DAM NECK ANNEX TO BACK BAY NATIONAL
WILDLIFE REFUGE

Dear Mr. Brandwein:

The Navy requests the assistance of the U.S. Fish and Wildlife Service (USFWS) Back Bay National Wildlife Refuge (BBNWR) staff, as an authorized agency for the relocation of endangered species nests, in the relocation of sea-turtle nests found on NAS Oceana, Dam Neck Annex.

Per the NAS Oceana, Dam Neck Annex Integrated Natural Resources Management Plan (INRMP) signed by the U.S. Navy, USFWS, Virginia Department of Game and Inland Fisheries, Navy Natural Resources personnel or trained authorized volunteers will conduct patrols of NAS Oceana, Dam Neck Annex beaches in an attempt to locate endangered loggerhead sea turtle (*Caretta caretta*) nests. The patrol covers approximately four miles and is located north of Sandbridge, and south of Camp Pendleton State Military Reservation. Patrols are to begin May 15, 2008, and end August 31, 2008, of each year.

Loggerhead sea turtles have nested on site. The frequency of nesting is sporadic and infrequent. It has been almost eight years since the last recorded nest was identified on NAS Oceana, Dam Neck Annex.

The high tide line on the majority of the beaches laps at the toe of the dune line. Beaches are also utilized for recreation and military training. These three factors combined lead the Navy Natural Resources Specialist to determine that the beaches are unsuitable for successful nest hatching on-site.

Pending concurrence with the USFWS BBNWR staff, the Navy Natural Resources Specialist recommends that in the event of a sea-turtle crawl on NAS Oceana, Dam Neck Annex, the Navy patroller immediately notify USFWS BBNWR staff of the crawl. The Navy patroller or other Navy representative would then coordinate access for the USFWS BBNWR staff onto NAS Oceana, Dam Neck Annex. USFWS BBNWR staff would then determine if a nest is present and facilitate the relocation. Navy Natural Resources staff will remain onsite to assist as needed.

5090
Ser 00/

Please inform us if you require further information.
Concurrence letters or questions concerning this request should
be directed to my point of contact, Mrs. Michael F. Wright, at
(757) 433-2883 or E-Mail michael.c.farrell@navy.mil.

Sincerely,

A handwritten signature in black ink, appearing to read "M. R. HUNTER", with a long horizontal flourish extending to the right.

Subject: Sea Turtle Nest Relocation from Oceana/Dam Neck Base
Date: Friday, June 06, 2008 11:44:14

Hi Mike,
Got the (your) official request from CO Captain Hunter of Oceana Naval Air Station to have us move sea turtle nests from the Dam Neck Naval Base beach to the nursery at Back Bay NWR. Do you need a response from us on this? Or not? Please let me know.
Thanks!

John G.

Subject: Re: Sea-turtle Nest Relocation

Hi Mike,
Likewise, it was nice talking sea-turtle stuff again.
Sure. Our (FWS) policy is that we be contacted about all sea turtle nests in the Virginia Beach area (even the Virginia Aquarium doesn't have authority to relocate sea turtle nests). So, please do contact me or Erica Locher if a nest turns up on Dam Neck Naval Base. Thanks for asking, and looking forward to continuing work with you.

Subject
Sea-turtle Nest Relocation

Hi John:

As always it was a pleasure chatting with you today regarding sea-turtle patrols and nesting.

We are drafting a formal letter per your request; however, this may take a week or so before it is ready for official submission.

In the interim and in the event that we do have a crawl, would it still be okay for us to contact your staff regarding potential nest relocations?

R,

Mike

Training Materials

Natural Resources: Personnel Training (*Sea-Turtle Nesting & Marine Species Strandings*)

Michael Wright
Natural Resource Specialist
PWD NAS Oceana

Natural Resources Mission

- **Implement and maintain a balanced and integrated program for the management of natural resources on Navy-owned lands in support of the installation mission.**
- **Ensure military readiness and sustainability while complying with natural resources protection laws.**
- **Conserve and manage natural resources entrusted to Navy care.**

Today's Topics

- **Endangered Species, Sea Turtle Nest Surveys**
- **Marine Species Stranding Patrols & Reporting**

Sea Turtle Patrols/Nesting Activity Surveys

- **Dates: 15 May – 31 August**
- **Start Time: 30min prior to sunrise, NLT 0600**
- **Location: NASO DNA & VAANG-CP Beaches**
- **Procedures:**
 - **Turtle Patrol Log Manual**
 - **ATV**
 - Preventative Maintenance
 - Safety (Operation & PPE)
 - **Beach Patrol**
 - **Contacts**

- **Perform a figure 8**

- **Patrol Begins at the Middle of DNA. Continuing North 1st to cover firing range beaches 1st.**

- If Firing Ranges are active do not go past the firing range warning signs, see attached photo(s).

- **Patrol Shoreline First**

- **Patrol Middle Beach Second**

NASO DNA Sea Turtle Patrol Reference Map (Rev May 2013)

If firing range red flags or lights are flying stop at the 1st tower with these flags or lights and wait for the guard to say or give you the thumbs up to proceed up/down the firing range beach. Active ranges should cease fire to allow you thru and there should not be an extended wait time (5 minutes max). If you have difficulties give Michael Wright a call on her cell phone.

Note: You should be clearing these beaches 1st, you should be completed with the Firing Range, MACS24, and VAANG beaches NLT 0700, unless you locate a crawl.

Ideally, unless something major happens you should be done with your entire patrol by 0730.

0.5

Miles

Meters

-  Storage Shed
-  Vehicle Beach Access
-  ATV Beach Access
-  Walkover Beach Access
-  Range Restricted Beach Access
-  Alternate Route

No Alt. Route
as of May 2014

South End of Patrol Area (Sandbridge/Dam Neck Annex border)

North End of Patrol Area (VAANG-CP/Croatan Beach border)

Firing Range Warning Signage

- **Read Sea Turtle Standard Operating Procedures (SOP) Manual and all associated Appendices.**
 - **Sign Signature Page Acknowledging Receipt and Review of the Sea-turtle SOP. Signature page to remain on file at the installation Natural Resource Office, Building 820.**
 - **Note: Face to Face/Classroom training, goes over the SOP and Appendices, but one should read the SOP to ensure they understand the full details.**
 - **If there are any questions, contact the installation Natural Resources Manager.**

• **Identification of Crawls & Sea Turtles:**

- **Attached Photos were provided by the installation Natural Resources Program or from Michael Wright's personal photos.**
- **Photocopies of the sea turtle sections of the following book/guide are utilized in this training presentation to help explain how to identify sea turtles species: "Guide to Marine Mammals and Turtles of the U.S. Atlantic and Gulf of Mexico," published in 1999, authored by Kate Wynne and Malia Schwartz. Copies of the book have been purchased and are available for use.**

Examples of Loggerhead Sea Turtle Crawls

Crawl with Nesting Pit (normal tracks)

False Crawl (Crawl w/no Nest)

Crawl with Nesting Pit (X-cross tracks)

Example of Uncovered Loggerhead Sea-Turtle Nest

Note: Eggs look like white ping-pong balls. Nest typically contains anywhere from 60 to 120+ eggs. A turtle can nest multiple times in a season.

Example of Hatched Loggerhead Sea Turtles ("Hatchlings")

Note: These photos are of hatchlings from a nest just south of NASO Dam Neck Annex (NASO DNA) on the north end of Back Bay National Wildlife Refuge near the community of Sandbridge adjacent and directly south of NASO DNA.

Hatchlings fit in the palm of an average sized human hand. They typically hatch after dark and just before sun-rise and are guided by the light of the moon towards the water. City lights typically interfere with this process and misguide the hatchlings exhausting them and leaving them vulnerable to predation.

During early morning patrols keep an eye out for hatchlings starting in July, in the possible but unlikely event that a nest/crawl was missed during daily patrols.

15 June 2012 Kemps Ridley Sea Turtle Nesting NASO Dam Neck Annex

Unlike the Green or Loggerhead Turtles, which rarely lay nests during the afternoon daylight hours, it is not uncommon for Kemps Ridley's to lay nests during the day. This turtle was on the beach from ~1430-1530.

Adult Female Turtle Laying Nest:

Adult Turtle Crawl:

Notice the difference in the width of the tracks and the body cavity between the Loggerhead and the Kemps Ridley crawls. Kemps Ridleys (up to ~100 lbs.) are the smallest and Loggerheads (up to ~300 lbs) are the largest sea turtles currently nesting on our beaches.

Adult Turtle Flipper Prints & Closer view of Crawl Prints:

Nest Left In-Situ with Predator Guard/Cage and Signage:

Nests left on site (in-situ), not relocated, are protect with a predator guard to keep out predators such as foxes and racoons during egg incubation. The predator guard is designed to allow the turtles to hatch and work their way to the ocean without being held captive in the cage. Nests relocated to dunal nursery sites have enclosed cages.

In-situ nest are clearly marked and posted to provided general information, to clearly indicate that disturbance of the nest is prohibited and is a violation of Federal Law, and minimize the potential for vehicles to drive over and crush the nest.

Unlike all the other animals in this book, sea turtles are reptiles—taxonomically distant and distinct from marine mammals. They have dry, scaly skin, which is relatively impermeable to water; are ectothermic; and like many reptiles, lay eggs. The most distinguishing characteristic of sea turtles is their shell, a defining trait they share with all turtles. From terrestrial ancestors, marine turtles evolved secondarily to a marine existence. This resulted in a strongly tapered, streamlined shell and powerful, rigid, paddlelike forelimbs that “fly” through the water with amazing speed, without compromising the ability to move on land—an incapable confine for animals that must come ashore to lay their eggs.

Strong swimmers, sea turtles are capable of making deep, repetitive dives to search for food and can remain submerged for long periods of time, such as when resting on the ocean bottom. In fact, sea turtles spend little time at the water surface—often just long enough to take a breath of air—though some sea turtles, such as the leatherback and loggerhead, can be found basking at the water

surface. Basking in the sun may aid in maintaining a body temperature higher than that of the surrounding water, allowing for survival in colder Atlantic waters.

Life History

Sea turtles migrate, sometimes long distances, from foraging grounds to shallow-water nesting grounds to mate, nest, and lay their eggs. The female emerges from the water and digs a flask-shaped nest in the sand with her hind flippers, then lays 50 to 170 (depending on the species) ping-pong ball-shaped eggs. After covering the nest with sand, she returns to the water. She will nest several times in one season. After the nesting season, she migrates back to the foraging grounds. In most species of sea turtles, mature females do not nest every year, remaining instead at the foraging grounds in off years.

Following an 8-to-10-week incubation, the eggs hatch, and the hatchlings dig their way out of the nest, usually emerging at night. They make their way to the water, orienting them-

selves to the brightest horizon (hatchlings disoriented by brightly lit beaches become more vulnerable to hazards such as predation and dessication). Once in the water, they swim rapidly—“swimming frenzy”—until they reach the open ocean, where many species spend the “lost years” living and feeding in floating sargassum. They “reappear” as juveniles in feeding grounds shared with adults or, in some cases, migrate to developmental feeding grounds. But some species, such as the leatherback, spend their entire lives in a pelagic existence, coming inshore only to mate and nest.

Courtesy of CEE

Conservation

Probably the single greatest threat to sea turtle survival in U.S. Atlantic waters is entanglement in active and discarded fishing gear. Sea turtles that become entangled and cannot reach the surface to breathe become increasingly anoxic (oxygen depleted) and comatose. Not all turtles in this condition are dead. Although they are inactive and their heart rate is negligible, recent research shows that they may be able to recover.

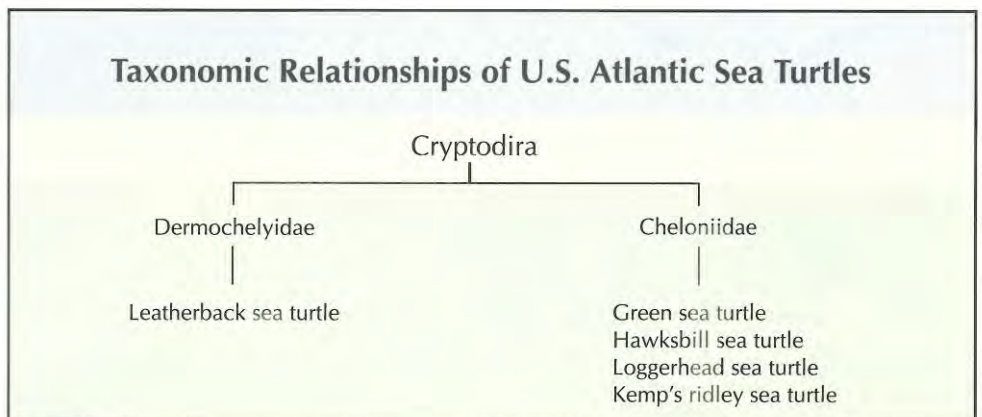

You can help sea turtles found in this condition: Place the turtle in the shade, carapace-up, and keep it moist with seawater until flipper activity resumes. Recovery may take more than 2 hours. Remember: Regulations require that you return the turtle to the water.

Dermochelyidae

Carapace and plastron lack horny shell scutes, being covered instead by leathery skin. Underlying bones of the shell are almost completely lost, their place taken by a mosaic of thousands of tiny bones imbedded below the leathery skin. Forelimbs are smooth, broad, and paddlelike and lack claws. This family is represented by a single living species, *Dermochelys coriacea*, the leatherback sea turtle.

Cheloniidae

Family composed of the “hard-shelled” sea turtles. Shell is covered with horny scutes, variable in number, but usually including 5 vertebral scutes, 4 or 5 pairs of costal scutes, and 3 or 4 pairs of inframarginal scutes. Carapace is oval to heart-shaped. Forelimbs are covered with scales, are paddlelike, with elongated digits and 1 to 2 claws on each forelimb.

Note: Sex of sea turtles is difficult to determine through external morphology.

HAWKSBILL SEA TURTLE

KEMP'S RIDLEY SEA TURTLE

GREEN SEA TURTLE

LEATHERBACK SEA TURTLE

LOGGERHEAD SEA TURTLE

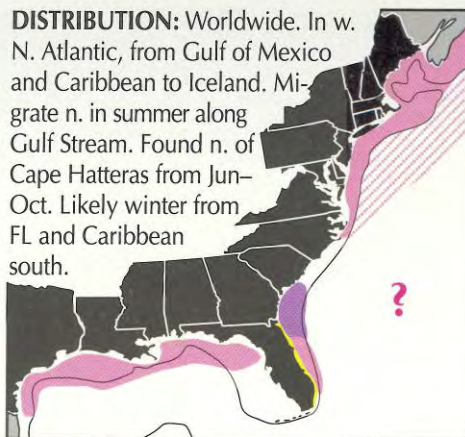

SIZE: Adult shell to 1.8 m SCL (6 ft), 727 kg to 1 ton.

BODY/SHELL: Largest living turtle. **Lacks shell scutes, head and body scales.** Covered by **leathery skin.** Carapace divided longitudinally by 7 ridges; hingeless plastron divided by 5 ridges; head short, blunt, with **2 cusps projecting from upper jaw.** Limbs **clawless.**

COLOR: **Only black marine turtle in Atlantic,** but often spotted with white or pinkish blue on undersides of head, limbs, body.

BEHAVIOR: Solitary at sea, but adults may congregate off nesting beaches or while feeding on jellyfish. Relatively fast swimmers (>10 knots), breach occasionally. Spend majority of time feeding or basking near or at water surface. Most dives <200 m (660 ft), <20 min; but can dive to 1,300 m (4,290 ft).

DISTRIBUTION: Worldwide. In w. N. Atlantic, from Gulf of Mexico and Caribbean to Iceland. Migrate n. in summer along Gulf Stream. Found n. of Cape Hatteras from Jun–Oct. Likely winter from FL and Caribbean south.

HABITAT: Highly pelagic, migratory. Occasionally enter shallow waters of bays and estuaries.

DIET: Primarily jellyfish.

LIFE HISTORY: Courtship and mating thought to occur off nesting beaches. In w. Atlantic, nesting occurs Apr–Nov on e. coast of FL, Caribbean, and s; rarely in TX, GA, SC, NC. Mature females may oviposit >6 times per year, laying 50–170 eggs per clutch. Incubation lasts 53–74 days. Little is known about hatchling, juvenile movements.

STATUS AND HUMAN INTERACTIONS: Endangered. Principal threats in U.S. Atlantic are entanglement in fixed fishing gear, boat collisions, debris ingestion. Threats to eggs and hatchlings include nesting beach alteration and artificial lighting.

Right photo: The leatherback lacks a bony shell. Instead, the shell is covered by a thin, black, leathery skin raised in 7 ridges.

The two cusps on the upper jaw of a leatherback assist in grasping slippery jellyfish prey. ▼

Larry Wood/MCJB

Scott Kraus/NEA

NOTE: Mortality of marine turtles found entangled/entrapped can be reduced: Place turtle carapace-up; keep moist and in shade until flipper activity resumes.

SIZE: Avg adult shell 1 m SCL (3.3 ft); avg weight 150 kg.

BODY/SHELL: Largest hard-shelled sea turtle. **Carapace smooth**, heart-shaped or oval, covered with horny scutes, with **4 pairs costals**, **nuchal scute not touching first costal**. **Head relatively small, rounded, with 1 pair prefrontals**. One claw on each forelimb.

COLOR: Carapace and head olive to brown, some with mottled, radiating, or wavy pattern on scutes; plastron yellowish white. Hatchlings black above, white below.

BEHAVIOR: Can migrate great distances from nesting beaches to foraging grounds.

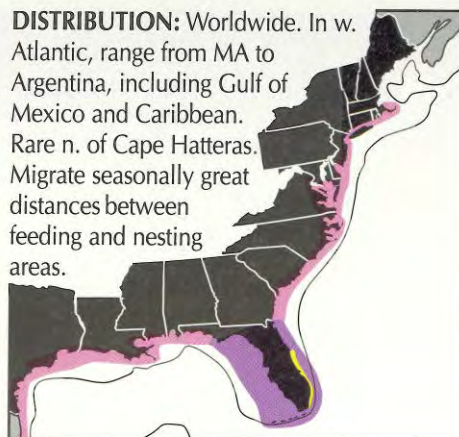

HABITAT: Pelagic as hatchlings (to 0.25 m SCL), then move to benthic feeding grounds; juveniles and adults congregate in relatively shallow, protected waters containing seagrass, macroalgae "pastures;" also coral reefs, worm reefs, rocky bottoms.

CAN BE CONFUSED WITH:

Greens can be distinguished by their smooth carapace and only 1 pair of prefrontal scales between the eyes. Note that carapace color is highly variable. ▶

DIET: Pelagic-stage hatchlings and juveniles eat molluscs, jellyfish, crustaceans. Diet shifts to seagrasses, macroalgae as juveniles mature and move inshore.

LIFE HISTORY: Mating occurs off nesting beaches close to shore. Mature females nest Mar–Oct (peak May–Jun). U.S. nesting occurs on tropical beaches in FL, Puerto Rico, U.S. Virgin Islands. Females oviposit avg 2–3 times per season, laying 100–150 eggs per clutch. Incubation lasts 45–60 days.

STATUS AND HUMAN INTERACTIONS: Breeding population endangered in FL; threatened elsewhere. Historically exploited for eggs, meat. In U.S. Atlantic, degradation of nesting and feeding habitats, boat collisions, fishing gear entanglement, and disease are serious problems.

Tom Doty/CETAP

NOTE: Mortality of marine turtles found entangled/entrapped can be reduced: Place turtle carapace-up; keep moist and in shade until flipper activity resumes.

SIZE: Avg adult shell 0.92 m SCL (3 ft), can reach 1.2 m; avg adult weight 115 kg.

BODY/SHELL: Carapace covered with horny scutes, with **5 pairs costals, nuchal scute touches first costal; 3 pairs inframarginals present on bridge.** Head large, broad, with 2 pairs prefrontals; jaws powerful for crushing prey. Two claws on each forelimb.

COLOR: Carapace and head yellow-orange to reddish brown, often covered by barnacles, fouling organisms; plastron yellowish to light brown. Hatchlings light brown to almost black.

BEHAVIOR: Hatchlings engage in "swimming frenzy" for about 20 hrs after hatching, carrying them offshore. May live in sargassum rafts until reach approx 0.45 m SCL. Juveniles, adults tend to congregate at same nearshore feeding grounds each year. Loggerheads may hibernate in winter.

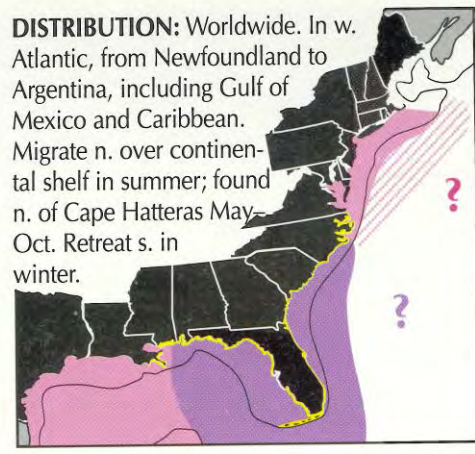

HABITAT: Pelagic as hatchlings, then migrate to nearshore waters. Adults, juveniles inhabit subtropical continental shelf and coastal waters (bays, lagoons, river mouths).

CAN BE CONFUSED WITH:

Loggerheads have a large, broad head and often have fouling organisms, such as barnacles, on the shell and body.

DIET: Primarily benthic feeders on crustaceans, molluscs.

LIFE HISTORY: Sexes thought to migrate together from foraging sites to nesting beaches, where mating occurs in surface waters. Nest Apr–Sep (peak Jun–Jul) on temperate beaches from s. NJ to FL; major U.S. nesting area is e. FL. Mature females may oviposit 3–6 times per season, laying 95–150 eggs per clutch. Incubation lasts 49–71 days.

STATUS AND HUMAN INTERACTIONS: Threatened. In U.S. Atlantic, greatest known mortality is entanglement in towed or fixed fishing gear. Boat collisions are also a serious problem. Threats to eggs, hatchlings include nesting beach degradation (development, erosion control, etc.) and artificial lighting.

NOTE: Mortality of marine turtles found entangled/entrapped can be reduced: Place turtle carapace-up; keep moist and in shade until flipper activity resumes.

SIZE: Avg adult shell 0.66–0.86 m SCL (2.2–2.8 ft); avg weight 82 kg.

BODY/SHELL: Carapace shield-shaped, covered with **thick, horny, overlapping scutes, with 4 pairs costals, nuchal scute not touching first costal.** Head narrow with 2 pairs prefrontals, **beak-like snout.** Two claws on each forelimb.

COLOR: Carapace pattern “tortoiseshell,” with radiating brown, black, amber streaks; head scales dark brown with yellow margins; plastron yellow.

BEHAVIOR: Migrate between feeding and nesting grounds. Adults, large juveniles capable of making deep dives (>100 m) to forage on deep-water sponges.

HABITAT: Pelagic as hatchlings and juveniles (to 0.25 m SCL), then move to feeding grounds in rocky or coral reef waters in the tropics, subtropics. Pelagic and benthic habitats poorly understood. Juveniles favor shallow waters, adults may forage in deeper waters.

Hawksbill Sea Turtle

CAN BE CONFUSED WITH:

Green Sea Turtle

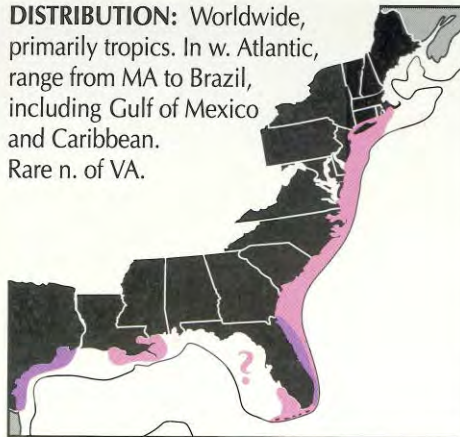

Loggerhead Sea Turtle

Kemp's Ridley Sea Turtle

DISTRIBUTION: Worldwide, primarily tropics. In w. Atlantic, range from MA to Brazil, including Gulf of Mexico and Caribbean. Rare n. of VA.

DIET: Primarily sponges and benthic invertebrates.

LIFE HISTORY: Nesting occurs year-round. In w. Atlantic, nest on beaches in Caribbean, C. and S. America. Rare nesting in FL. Mature females oviposit avg 4–6 times per season, laying 140–160 eggs per clutch. Incubation lasts 47–77 days.

STATUS AND HUMAN INTERACTIONS: Endangered. Highly exploited worldwide for tortoiseshell, and more recently, whole stuffed turtles. In U.S. Atlantic and Caribbean, degradation of coral reefs and nesting beaches remains a serious problem.

Rob Nawojchik/MA

NOTE: Mortality of marine turtles found entangled/entrapped can be reduced: Place turtle carapace-up; keep moist and in shade until flipper activity resumes.

The bird-like “beak” of the hawksbill aids in feeding from crevices and hard surfaces, such as coral reefs.

SIZE: Smallest sea turtle; adult shell 0.58–0.80 m SCL (1.9–2.6 ft); weight 40–50 kg.

BODY/SHELL: Carapace heart-shaped, covered with horny scutes, with 5 costals, nuchal scute touches first costal; 4 inframarginals with pores present on bridge. Head broad, but pointed, with 2 pairs prefrontals; jaws powerful and strongly ridged. One claw on each forelimb.

COLOR: Carapace light olive to gray; head and limbs gray; plastron white. Hatchlings dark gray to black.

BEHAVIOR: Adults found at feeding grounds primarily in the Gulf of Mexico. Juveniles feed in nearshore waters along the East Coast and Gulf; migrate s. for winter. Some remain too long, are caught in cold water, become cold-stunned, and die.

HABITAT: Pelagic as hatchlings (to 0.20 m SCL), then enter nearshore waters, primarily those with seagrass beds or mud bottoms favored by crabs. Adults, juveniles utilize similar inshore coastal waters.

Kemp's Ridley Sea Turtle

CAN BE CONFUSED WITH:

Loggerhead Sea Turtle

Hawksbill Sea Turtle

Green Sea Turtle

The smallest sea turtle, Kemp's ridley can be distinguished by a heart-shaped carapace and a large, broad head.

DISTRIBUTION: Atlantic, primarily w. N. Atlantic. Range: Nova Scotia to Mexico. Adults and juveniles found year-round in Gulf of Mexico; many juveniles migrate n. along the East Coast in summer, then retreat s. in fall.

DIET: Primarily crabs but also shrimp, molluscs.

LIFE HISTORY: Both sexes migrate to waters off nesting beaches to mate. Ridleys are unique: Females may nest in mass aggregations called "arribadas" (Spanish for "arrival"); they nest during the day; and 99% of all nesting occurs on several beaches near Rancho Nuevo, Mexico. Some single nesting occurs on beaches in Mexico, TX, FL, SC, NC. Nest Apr–Aug (peak Apr–Jun) and oviposit avg 3 times per season, laying avg 103 eggs per clutch. Incubation lasts 48–65 days.

STATUS AND HUMAN INTERACTIONS: Endangered. Egg collection, taking of nesting females, and entanglement in towed fishing gear have decimated the species. Mexican and U.S. law now prohibits taking of eggs and turtles. Entanglement in trawls remains the primary source of mortality despite TED regulations.

NOTE: Mortality of marine turtles found entangled/entrapped can be reduced: Place turtle carapace-up; keep moist and in shade until flipper activity resumes.

Appendix F

Sea Turtle Patrol Log

Appendix G

Stranding Reporting Procedures and Datasheet

STRANDING REPORTING PROCESS

1. Contact the VA Aquarium Stranding Team (757-385-7575, 0830-1630 hours or 757-385-7576 for afterhours live stranding emergencies) for sea turtle, sturgeon, and marine mammal strandings. For fish strandings (such as Sharks, mass non-shark fish strandings, sturgeon, large unusual fish strandings, or any other protected fish species of concern) contact the Virginia Aquarium's Curator of Fishes, Beth Firchau, 757-434-0745.
2. Fill-out the STRANDING REPORT FORM (see below) for on-land or open water identified strandings and Return to your installation Natural Resources Manager (NRM), ASAP.
3. Notify your NRM of the Stranding(s), immediately. If the stranding involves marine mammals or sturgeon provide them the information in the stranding report form. (Michael Wright, 757-373-8531) The NRM will notify the NAVFAC MIDLANT EV22 Subject Matter Expert (SME) and NOAA POCs, as appropriate.
4. The NRM will Call OPNAVINST 3100.6H Reportable Strandings into CNO N45, Washington DC 703-695-5271 (Frank Stone), 703-342-6455 (Bob Gisiner) &/ or the NOC Battalion Watch Captain (703-692-9284); COMLANTFLT 757-836-5221 (Richard "Jene" Nissen); and NAVFAC MIDLANT Core (Jessica Bassi, 757-341-0493).
 - o The following strandings are OPNAVIST reportable events:
 - Any stranding that involves a Northern Right Whale or Beaked Whale.
 - Any stranding that involves a floating whale in open water.
 - Any discovery of a whale stranded ashore.
 - Any mass stranding (two or more animals) of whales, or dolphins that results in coverage by the local or national media.
 - Claims of unusual marine mammal behavior reported in the media, or by National Marine Fisheries Service, a private party or non-governmental entity in which naval operations, exercises or training have been implicated are reportable events.
 - Any other incident involving marine mammals, which have significant media interest and may implicate naval operations at sea are also reportable events. Examples of such marine mammal events might include manatee strandings or mass strandings (two or more) of dolphins, seals, sea lions, otters, etc.
5. If it is determined that an OPREP 3 Navy Blue report is required related to the stranding event the Natural Resources Manager will coordinate with the CDO to complete the initial report.
6. Enter Stranding Report Data into the NASO Natural Resources Access Database.

Note: Regarding Sea turtles, Marine Mammals, Sturgeon and/or other Protected Species, ONLY an individual/organization containing the appropriate Regulatory Issued Permits (e.g., USFWS, NOAA, VAST, VDGIF, VCU, etc.) is legally authorized to relocate/touch these animals. The NASO NRM has obtained a NOAA-NMFS issued permit regarding sturgeon salvage and is inquiring regarding obtaining permits regarding sea turtles with USFWS via VDGIF.

Key Contacts:

- Navy on Scene Coordinator (NOSC) = 757-341-0449(o);
757-636-4378(c)
- Regional Operations Center (ROC) = 757-322-2609(24hrs);
757-322-3093
- NASO Command Duty Officer (CDO) = 757-438-3159 (24hrs)
- NASO Natural Resources Manager (NRM) = 757-433-3461(o);
757-373- 8531(c)
- NASO Conservation Law-enforcement Officer (CLEO) =
757-433-2151(o); 757-635-5436(c)
- NASO Environmental Program Director = 757-433-3437(o)
- NAVFAC MIDLANT Core Marine Animal Media Manager = 757-341-0493(o)
- NAVFAC MIDLANT Core Natural Resources Supervisor =
757-341-0495(o)
- NAVFAC MIDLANT Core Environmental Conservation and Planning
Director = 757-341-1988(o)
- NOAA Sturgeon POC = 978-282-8473(o)
- Virginia Aquarium Stranding Team (VAST) = 757-385-7575;
757-385-7576(emergency#)

Note: The ROC and the CDO should be able to assist with locating and getting equipment (if available) for emergency response. Jessica Bassi has developed the NAVFAC MIDLANT Regional Stranding Investigation Assistance Plans (RSIAP), which has received final approvals.

Note: The RSIAP indicates that the CDO will coordinate trying to obtain equipment to assist with marine animal stranding response, when needed. The need would be for large animal (e.g., whales) and mass stranding events (e.g., multiple dolphins stranding at the same time). Heavy equipment that can access and operate on a beach would be needed, primarily fork-lift type vehicles and vehicles that can dig large deep holes for burials.

- MACS-24 has provided emergency assistance previously.
 - Sgt. Leonard Oleson 757-492-6465 x229
 - GySgt Eric Orth 757-492-3878/3891

STRANDING REPORT FORM

1. Date of incident: _____
2. Time of incident(local vice zulu time): _____
3. Type of incident (turtle, dolphin, whale, seal, shark, sturgeon, other):
-

4. Location of incident(include lat/long; base or property name; and geographical location, floating in Atlantic Ocean nearshore, laying on beach in surf, laying on beach in rack line, laying on beach between the dune and the rack line, etc.) :
_____ / _____

5. Identity of person who discovered event (e.g. military, civilian, other government personnel):

6. Identity of person preparing this report (name, command, job position):

7. Time strandings commenced: _____

8. Time of last stranding: _____

9. Stranded Marine Animal Condition:

Species	Total #	Alive	Dead	Severely Decayed	Necropsy Completed (Yes, No, In Process)

10. Who performed or will be performing the necropsy.

11. Date & Time VA Aquarium Stranding Team was notified:

12. Date & Time VA Aquarium Stranding Team Responded on site:

13. Were Photos Taken, If so by whom, attach photos to report (send digital copies to the installation Natural Resources Manager):

REGIONAL STRANDING
INVESTIGATION ASSISTANCE PLAN

BETWEEN

NORTHEAST REGION, NATIONAL MARINE FISHERIES SERVICE OF THE
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION
DEPARTMENT OF COMMERCE
AND
MID-ATLANTIC REGION, UNITED STATES NAVY
DEPARTMENT OF DEFENSE

I. PURPOSE

The purpose of this Regional Stranding Investigation Assistance Plan (RSIAP or Plan) is to implement the National Memorandum of Understanding (MOU) (Attachment 1). The MOU establishes a framework consistent with federal fiscal law requirements whereby the Navy may assist the National Marine Fisheries Service (NMFS) with the Phase 1 and 2 investigations (See attachment (2) for definition of Phase 1 and 2, USE and MTEs) of uncommon stranding events (USE) during major training exercises (MTE) in specific geographical locations through the provision of in-kind services as specified later in this document. This Plan is intended to act as an instrument to more effectively respond to USEs during MTEs, subject to fiscal and procurement law requirements, and consistent with resource availability, military security, logistical feasibility, and operational or installation commitments. Additionally, this RSIAP ensures the optimum efficiency and maximum benefit to the United States by establishing a framework for cooperation and coordination between NMFS Northeast Region and Mid-Atlantic Region, U.S. Navy (the Parties) on marine mammal health and stranding responsibilities. This Plan is necessary and essential to further the mission of the Parties in that it will serve as an umbrella agreement that sets forth the general terms and conditions under which the Parties may seek cooperative programs and activities.

II. BACKGROUND

a. Through a National Coordinator and six regional coordinators, NMFS oversees, coordinates, and authorizes marine mammal stranding responses, associated activities and training to personnel. To respond to strandings, volunteer stranding networks have been established in all coastal states and are authorized through Letters of Authority from the NMFS regional offices.

b. Pursuant to the Atlantic Fleet Active Sonar Training (AFAST), Southern California Range Complex (SOCAL), Hawaii Range Complex (HRC), Mariana Islands Range Complex (MIRC), and Gulf of Alaska (GOA) Marine Mammal Protection Act (MMPA) Final Rules, the National MOU was created to establish a framework whereby the Navy can assist NMFS with Phase 1 and Phase 2 Investigations of USEs during MTEs. The National MOU requires completion of

RSIAPs for these areas to further identify regional assets that might be requested by NMFS during a USE. In addition, the National MOU requires each RSIAP to identify high priority species based on the USE species identified below:

(1) Uncommon Stranding Event (USE) – A stranding event that takes place during a major training exercise (MTE) and involves any one of the following:

(i) Two or more individuals of any cetacean species (not including mother/calf pairs), unless of species of concern listed in the next subparagraph found dead or live on shore within a 2-day period and occurring within 30 miles of one another.

(ii) A single individual or mother/calf pair of any of the following marine mammals of concern: beaked whale of any species, dwarf or pygmy sperm whales, melon-headed whales, pilot whales, right whales, humpback whales, sperm whales, blue whales, fin whales, or sei whales.

(iii) A group of 2 or more cetaceans of any species exhibiting indicators of distress.

III. AUTHORITIES

a. NMFS and Navy regions are authorized to enter into RSIAPs pursuant to the Marine Mammal Protection Act, 16 U.S.C. § 1361 et seq., and other authorities, as described in the National MOU (See paragraphs 3 & 5.e. of MOU).

b. The Economy Act, 31 U.S.C. § 1535, which provides that an agency may place an order with a major organizational unit within the same agency or another agency for goods or services if:

(A) Amounts are available;

(B) The ordering agency decides the order is in the best interest of the United States Government;

(C) The agency to fill the order is able to provide or get by contract the ordered goods or services; and

(D) The agency decides ordered goods or services cannot be provided by contract as conveniently or cheaply by a commercial enterprise (payments must be made on the basis of the actual cost of goods or services provided)

IV. SCOPE

a. INSTALLATIONS AND POCs FOR EACH INSTALLATION.

This Regional Stranding Investigation Assistance Plan is intended to address an agreement between Navy Region MIDLANT and NMFS Northeast Region. Navy installations covered by this agreement include the following:

1.

Cheatham
Annex,

Yorktown, VA

POC: Trevor Manning (IEPD), telephone 757-887-4086, e-mail;
trevor.manning@navy.mil and (PWO) LT Trevor Bingham, telephone 757-887-4636,
email; trevor.bingham@navy.mil

2. Naval Weapons Station (NWS) Yorktown, Yorktown, VA
POC: Trevor Manning (IEPD), telephone 757-887-4086, e-mail;
trevor.manning@navy.mil and (PWO) LT Trevor Bingham, telephone 757-887-4636,
email; trevor.bingham@navy.mil

3. Naval Station Norfolk, Norfolk, VA
POC: Sharon Bauman (IEPD), telephone 757-341-0523, email; Sharon.bauman@navy.mil and (Port Ops) LCDR Morris Oxendine, telephone 757-442-0942, email; morris.oxendine@navy.mil

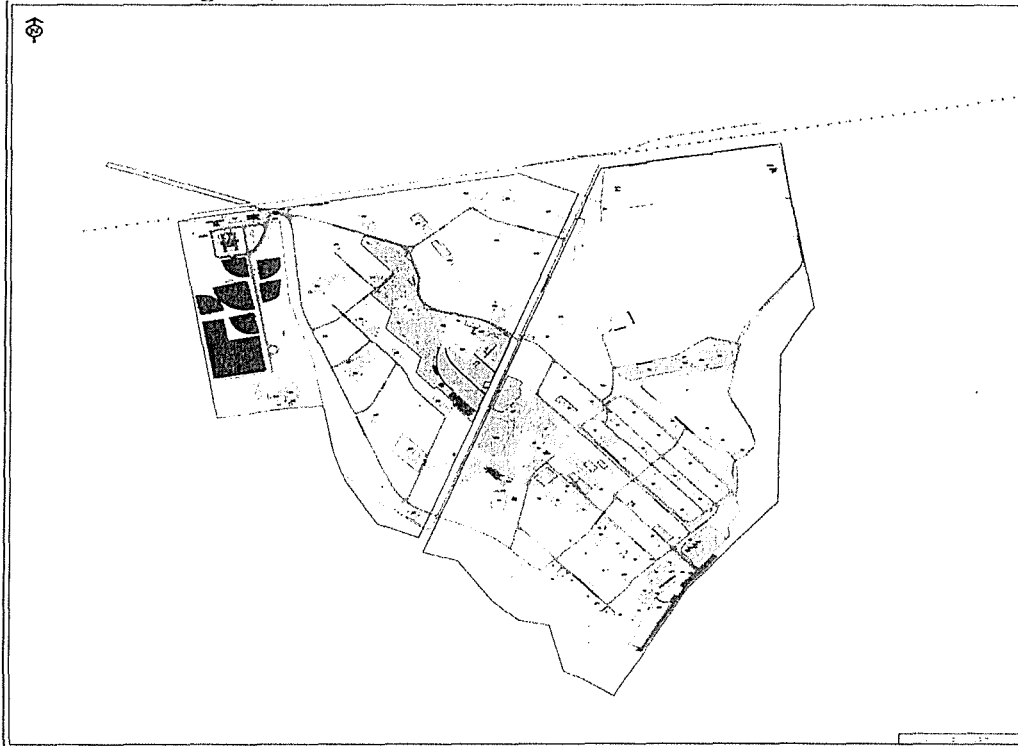

4. Norfolk Naval Shipyard, Portsmouth, VA
POC: Valerie Walker (IEPD), telephone 757 396-8270, email; valerie.walker@navy.mil.

5. Craney Island Fuel Depot, Portsmouth, VA
POC: Caren Hendrickson, telephone 757-445-3113, email;
caren.hendrickson@navy.mil.

6. St. Julian's Creek Annex, Portsmouth, VA
POC: Valerie Walker (IEPD), telephone 757-396-8270, email;
Valerie.walker@navy.mil

7. Joint Expeditionary Base Little Creek-Fort Story

POC: Sharon Waligora (IEPD), telephone 757-462-5350, email;
Sharon.waligora@navy.mil

Little Creek:

Fort Story:

8. Dam Neck Annex, Virginia Beach, VA
POC's: Michael Wright (NRS), telephone 4757-433-3461, cell 757-373-8531, email; Michael.wright@navy.mil and Conservation Law Enforcement Officer (CLEO), telephone 757-433-2151, Cell 757-635-5436

9. Naval Weapons Station (NWS) Earle, Earle, NJ

POC: Eric Helms, telephone 732-866-2540, email; eric.helms@navy.mil and LCDR Matthew Tolhurst (PWO), telephone 732-866-2317, email: matthew.tolhurst@navy.mil

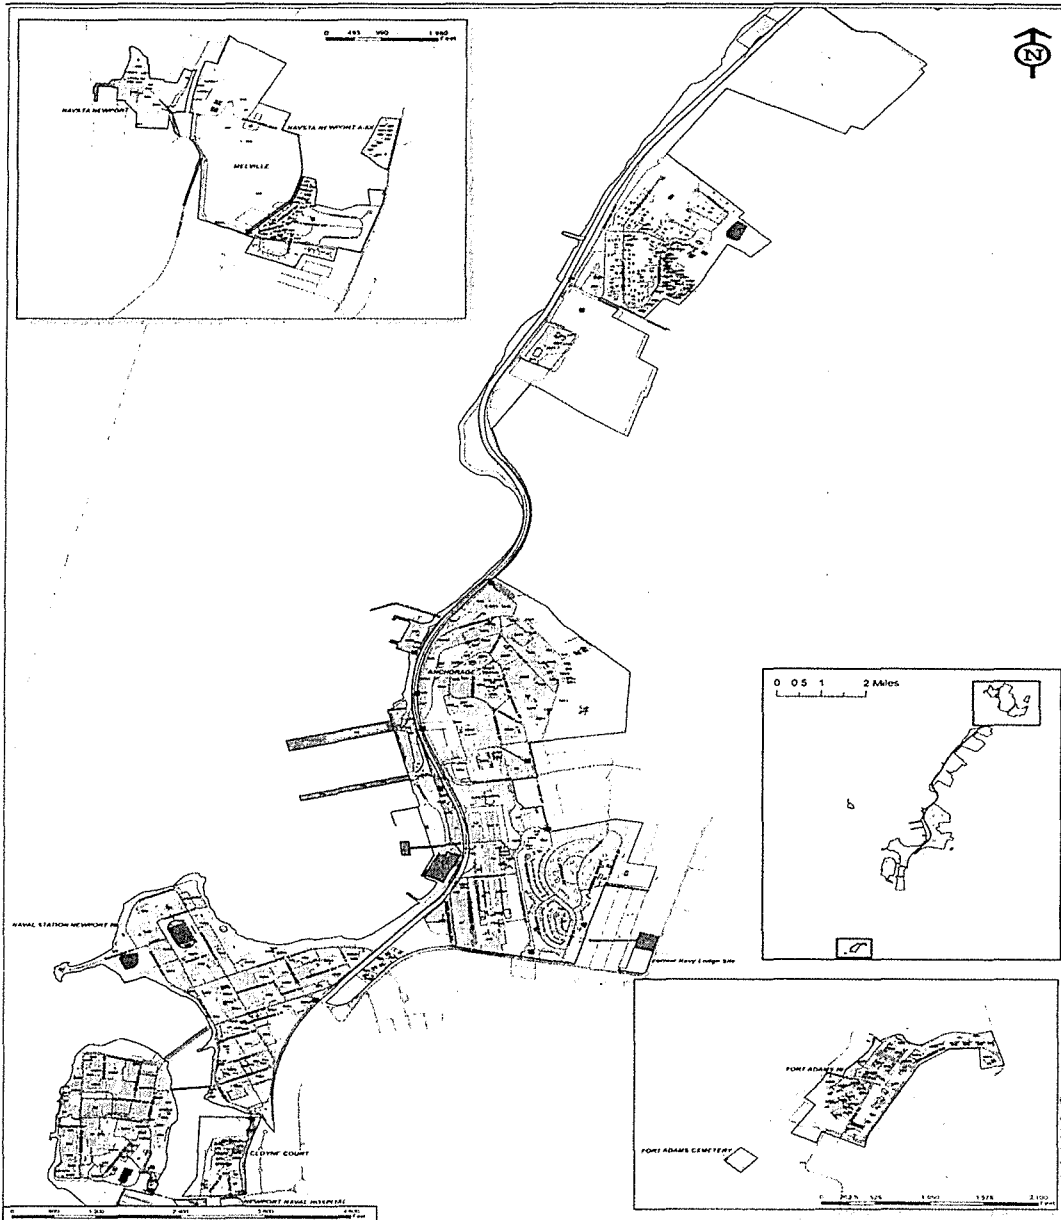

10. Naval Submarine Base New London, Groton, CT

POC: Michael Brown (IEPD), telephone 860-694-3976, email; michael.brown13@navy.mil

11. Naval Station Newport, Newport, RI

POC: Shannon Kam, (NRS), telephone 401 841-6377, email; shannon.kam@navy.mil

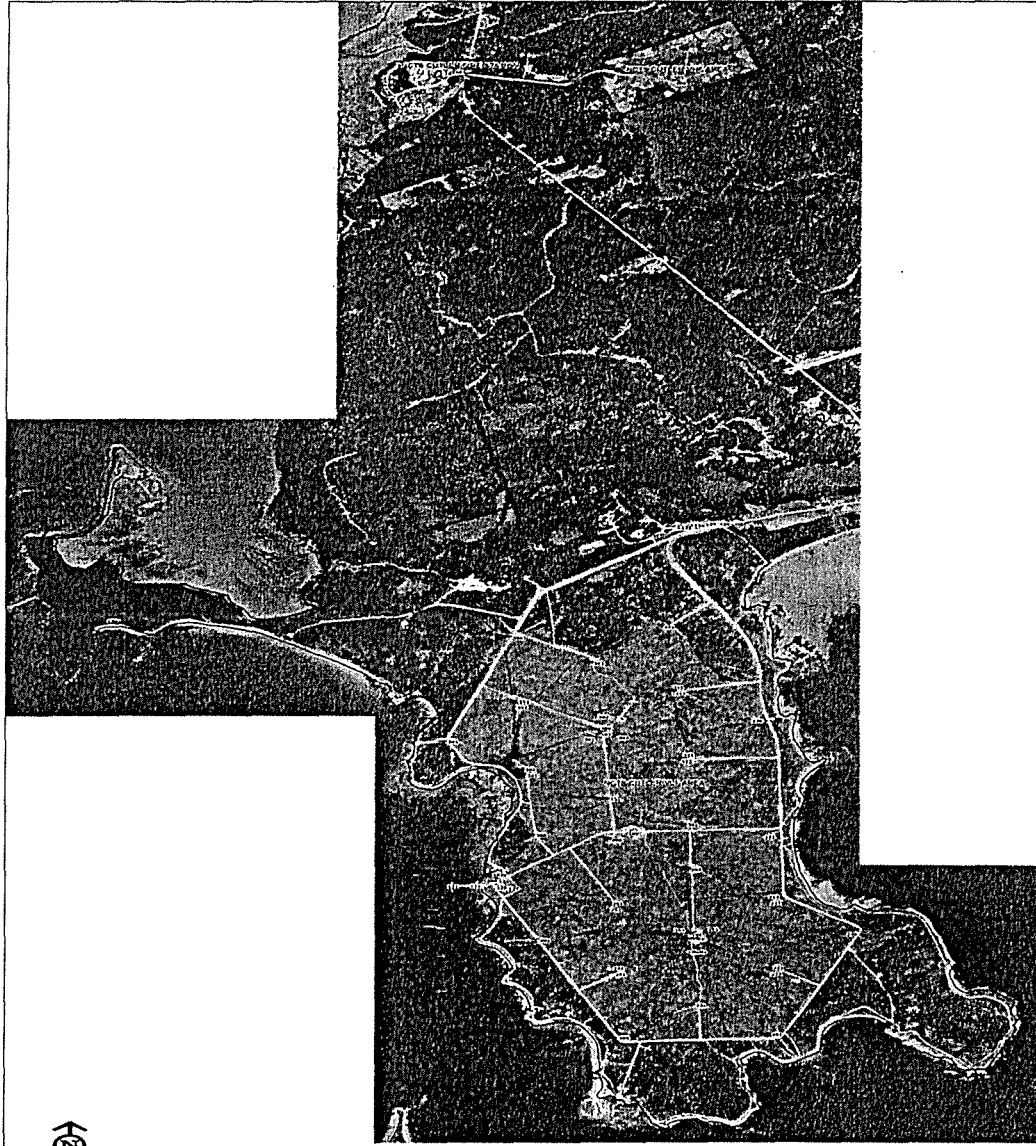

12. Portsmouth Naval Shipyard, Kittery, ME

POC: Ian Trefry (NRM), telephone 207-438-4362, email: ian.trefry@navy.mil and Lisa Joy (IEPD), telephone 207-438-4707, email: lisa.joy@navy.mil.

13. Naval Computer and Telecommunications (NCTAMS) Cutler, Cutler, ME
POC: Ian Trefry (NRM), telephone 207-438-4362, email: ian.trefry@navy.mil and Clifford
"Mark" Staggs (EPS), telephone 207-259-8282, email: clifford.staggs@navy.mil

V. GOALS AND OBJECTIVES

a. The Fleets and NMFS have developed a Stranding Protocol and Communication Plan that includes a flowchart with points of contact if a USE occurs. This is a related but separate requirement that remains unaffected by this document. This Plan is being developed to provide a consistent process for Navy support for Marine Mammal Stranding Investigations and Assistance when there is a USE during a MTE. This process may enable scientists to obtain better data on mechanisms involved in a marine mammal stranding.

b. Subject to the limitations in paragraph VI of this Plan, the Parties agree to cooperate on stranding response and investigations through the use of U.S. Navy and NMFS in-kind services when available. In-kind services by installation may include:

1. Cheatham Annex

- GROUND VEHICLES: Three front end loaders, 3 backhoes, 1 rubber tire excavator, 1 track excavator, and 2 skid steer loaders.
- PERSONNEL: Five equipment operators, as well as escorts to locations of stranding occurrences on the installation.

2. Naval Weapons Station Yorktown

- Same resources as Cheatham Annex.

3. Naval Station Norfolk (NSN)

- PERSONNEL: Operators for equipment listed below.
- BOATS: NSN can provide 1 small service boat.
- GROUND VEHICLES: NSN has four 6K forklifts and 2 pickup trucks.
- ACCESS TO BASE: The IEPD contact will provide Security with the information of who will be responding (agency and/or individual, and an example of a badge, if possible) and security will ensure they obtain access.

4. Norfolk Naval Shipyard (NNSY)

- BOATS: NNSY has limited small boat support through Port Operations.
- ACCESS TO BASE: Base access protocol is to contact the security office. The security POC is Glenn Hawthorne, Security Director, phone 757-396-5131.

5. Craney Island Fuel Depot

- ACCESS TO BASE: Coordinate with installation POC Caren Hendrickson.

6. St. Julian's Creek Annex

- BOATS: NNSY has limited small boat support through Port Operations.
- ACCESS TO BASE: Base access protocol is to contact the security office. The security POC is Glenn Hawthorne, Security Director, phone 757-396-5131.

7. Joint Expeditionary Base Little Creek-Fort Story

- No resources identified at this time.

8. Dam Neck Annex

- The Command Duty Office (CDO) will assist with locating and obtaining equipment. The CDO is manned 24 hours a day and can be reached by telephone at 757-433-2366.

9. NWS Earle

- ACCESS TO BASE: Temporary access can be coordinated on a case by case basis in accordance with the needs of the stranding response.
- BOATS: Vessels and operators are available for sighting animals in the vicinity of the Earle piers. Other small vessels may be available.
- GROUND VEHICLES: Cranes, backhoes, and frontend loaders are available. Personnel transport vehicles are available as well as dump trucks and flatbed trucks.
- PERSONNEL: Heavy equipment operators are available and security personnel are available on a case by case basis.
- OTHER SERVICES AND EQUIPMENT: Lifting straps, chains, and cargo nets available. The installation has a waste disposal contract if dumpsters need to be requested.

10. Subase New London

- GROUND VEHICLES: New London can offer 1 tractor trailer and flat bed truck and one landing craft mechanized (LCM) boat.
- ACCESS TO BASE: Contact Michael Brown, IEPD, for installation access.

11. Naval Station Newport

- Naval Station Newport has a current memorandum of agreement (MOA) with the NMFS NERO (Attachment 2). All protocols specified in the MOU will be adhered to and this MOA provides the following information:
- ACCESS TO BASE: The NMFS will be granted base access to perform necropsies at the Stillwater Basin boat ramp and parking lot, contingent upon ramp operations, and the beaches as a backup necropsy site. NMFS will be allowed to bring a vessel into the installation's restricted waters provided it stays 100 feet from any Navy or Coast Guard vessel. Security must be notified 3 days in advance of NMFS intentions to come onto the installation, except in emergency situations. Installation and/or security POCs will assist NFMS in obtaining the necessary camera and equipment passes.

12. Portsmouth Naval Shipyard

- ACCESS TO BASE: There is a landing site at Jamaica Island Beach and a temporary response set up location can be available at Jamaica Island.
- Anti-Terrorism Office (ATO) may be able to provide tug boat assistance provided mission requirements are not compromised. The Facility Response Team (FRT) has several small vessels available for nearshore operations.
- GROUND VEHICLES: Bob Landry (Transportation), phone 207-438-5557 may be able to secure an excavator, skid-steer, rubber tire crane, flat bed trucks, and/or passenger vans (for personnel transport).
- PERSONNEL: Heavy equipment operators, public relations coordination, enforcement, labor.
- OTHER SERVICES AND EQUIPMENT: Lifting straps, chains, shackles, and life jackets.

13. NCTAMS Cutler

- ACCESS TO BASE: There are landing sites at Davis Beach, Little Holly Cove, and Little Machias Bay Coastline. A temporary response set up location can be available at the old Coast Guard Landing Area, Davis Beach, and Little Holly Cove.
- PERSONNEL: Enforcement and general labor.

c. The Parties agree to share data (as clearance procedures allow) relevant to projects and activities conducted under this plan pursuant to the Atlantic Fleet Active Sonar Training (AFAST), Southern California Range Complex (SOCAL), Hawaii Range Complex (HRC), Mariana Islands Range Complex (MIRC), and Gulf of Alaska (GOA) Marine Mammal Protection Act (MMPA) Final Rules.

d. The Parties recognize that NMFS possesses limited marine mammal stranding response and investigation resources and may not be in a position to fully implement all of the tests and procedures listed as part of Phase 1 and Phase 2 Investigations. If NMFS identifies that specific tests, procedures, or analyses are needed to complete Phase 1 and Phase 2 Investigations, NMFS may request assistance from the Navy to do so. NMFS and the Navy may enter into additional implementing agreements to authorize the Navy to transfer funds to NMFS consistent with federal fiscal law, to support the implementation of the necessary investigational procedures/tests/analyses.

e. As soon as practical, upon completion of a project or activity year, NMFS agrees to provide an accounting of each project's expenditures for projects or activities with applicable statutes, regulations, and policies.

f. The Parties will meet annually in March to discuss the implementation and progress of the prior year(s) projects and activities, provide contact updates, and submit a report documenting data collected supported by this MOU. A template will be developed for submitting the annual report. The plan will be reviewed during the annual meeting for operation and effect.

g. NMFS will work with Navy POCs to ensure Navy personnel providing assistance have knowledge and expertise consistent with NMFS' stranding response protocols, procedures and guidelines.

VI. LIMITATIONS

This RSIAP is meant to serve as a regional framework for cooperation between the U.S. Navy and NMFS for assistance and response related to USEs during MTEs. Actions or activities agreed to in this Plan may not exceed the agreement between the Navy and NMFS in the National MOU. Nothing in this Plan obligates either Party to expend appropriations, provide in-kind services or equipment, or enter into any contract or other obligation. Projects or activities conducted under this Plan must comply with all applicable statutes and regulations, including those statutes and regulations applicable to procurement and the Economy Act, further, the projects or activities are contingent upon resource availability and logistic feasibility and must not negatively affect Navy operational or installation commitments or military security.

MAY 29 2015

Dear Mr. Wright:

By this letter you are hereby designated to act as the primary contact and Co-Investigator for the DoD Partners in Flight Rep. (VA), Naval Air Station Oceana, Public Works Department, Environmental Program Division, for the Greater Atlantic Regional Fisheries Office under Endangered Species Act scientific research Permit No. 17273 to maximize the use of dead Atlantic (*Acipenser oxyrinchus oxyrinchus*) and shortnose (*Acipenser brevirostrum*) sturgeon parts for research and educational purposes. The Naval Air Station Oceana is acting as a Cooperating Facility under Permit No. 17273. Sturgeon samples may be obtained from individuals authorized to collect them in the course of salvage activities or any U.S. facility authorized to hold captive sturgeon. Sturgeon parts and samples may be used to support law enforcement actions, research studies, and outreach education. This authorization shall be subject to the following conditions:

1. A copy of this permit shall be in your possession during the proposed work.
2. Please read the permit and note the research conditions relating to activities authorized under the permit and detailed reporting requirements.
3. This letter authorizes you to utilize whole sturgeon or parts and pieces resulting from sturgeon salvage incidents for research and education purposes as well as respond to sturgeon salvage incidents.
4. This authorization is in force until August 9, 2018. This permit expires on the date indicated and is non-renewable. This permit may be extended by the Director, NMFS Office of Protected Resources, pursuant to applicable regulations and the requirements of the ESA.

Sincerely,

Jessica A. Pruden
Principal Investigator

Enclosure - Permit No. 17273, Appendices 3a-c

Permit No. 17273
Expiration Date: August 9, 2018
Reports Due: November 9th, annually

PERMIT TO TAKE/COLLECT, RECEIVE/POSSESS, AND IMPORT/EXPORT PROTECTED SPECIES¹ PARTS FOR SCIENTIFIC PURPOSES

I. Authorization

This permit is issued to NOAA Fisheries Northeast Region, Protected Resources Division (hereinafter "Permit Holder"), One Blackburn Drive, Gloucester, MA 01930, [Responsible Party: Mary Colligan], pursuant to the provisions of the Endangered Species Act of 1973 (ESA; 16 U.S.C. 1531 *et seq.*); the regulations governing the taking, importing, and exporting of endangered and threatened species (50 CFR Parts 222-226).

II. Abstract

The objective of the permitted activity, as described in the application, is to maximize the use of dead Atlantic (*Acipenser oxyrinchus oxyrinchus*) and shortnose (*A. brevirostrum*) sturgeon parts for research and educational purposes. Sturgeon samples may be obtained from individuals authorized to collect them in the course of scientific research, salvage activities, any U.S. facility authorized to hold captive sturgeon, or taken during other authorized activities. Sturgeon parts and samples may be used to support law enforcement actions, research studies (primarily genetics), and outreach education.

III. Terms and Conditions

The activities authorized herein must occur by the means, in the areas, and for the purposes set forth in the permit application, and as limited by the Terms and Conditions specified in this permit, including all attachments and appendices. Any permit noncompliance constitutes a violation and is grounds for permit modification, suspension, or revocation, and for enforcement action.

A. Duration of Permit

1. Personnel listed in Condition C.1 of this permit (hereinafter "Researchers") may conduct activities authorized by this permit through August 9, 2018. This permit expires on the date indicated and is non-renewable. This permit may be extended by the Director, NMFS Office of Protected Resources, pursuant to applicable regulations and the requirements of the ESA.

¹ "Protected species" include species listed as threatened or endangered under the ESA, and marine mammals.

2. Researchers must suspend all permitted activities occurring in the field in the event harassment, serious injury, or mortality² of protected species occurs during specimen collection in the field, or if authorized take³ or receipt/import/export of specimens is exceeded. The Permit Holder must submit a written incident report as described in Condition E.2. The Permits Division may grant authorization to resume permitted activities based on review of the incident report and in consideration of the Terms and Conditions of this permit.

B. Number and Kind(s) of Protected Species, Location(s) and Manner of Taking

1. The table below outlines the number of animals, by species, and the number of parts/specimens authorized to be taken/collected, and the locations and time periods in which these activities may occur.

Table 1: Activities authorized under Permit No. 17273, annually. Specimens may be salvaged from U.S. East coast rivers from Maine to Florida. Sturgeon parts/carcasses of any Distinct Population Segment (i.e., range-wide) may be collected.

SPECIES	PRODUCTION /ORIGIN	LIFESTAGE/ SEX	EXPECTED TAKE	TAKE ACTION	DETAILS
Sturgeon, shortnose	Wild	All	100	Import/export/ receive only	collection, receipt, and transport of dead animals
Sturgeon, shortnose	Captive	All	350	Import/export/ receive only	take action = receipt and transport only
Sturgeon, Atlantic	Wild	All	100	Import/export/ receive only	collection, receipt, and transport of dead animals
Sturgeon, Atlantic	Captive	All	75	Import/export/ receive only	take action = receipt and transport only

² This permit does not allow for unintentional harassment, serious injury, or mortality caused by the presence or actions of researchers in the field when collecting specimens from dead marine mammals. This includes, but is not limited to, harassment, injury, or death of animals attempting to avoid researchers (e.g., a pinniped stampede).

³ By regulation, a take under the MMPA includes the collection of dead animals, or parts thereof.

2. This permit does not authorize the harassment of any protected species.
3. In the case of an unusual mortality event, takes may be increased up to 1,000 animals with written approval from the Director, Office of Protected Resources.
4. Researchers must comply with all provisions specified in Appendix 1 of this permit for biological samples taken/collected, received/possessed, or imported/exported under authority of this permit.
5. Researchers working under this permit may collect visual images (*i.e.*, any form of still photographs, film, video, or other footage) as needed to document the permitted activities, provided the collection of such images in the field does not result in harassment of protected species.
 - a. The Permit Holder may use these images in printed materials (including commercial or scientific publications) and presentations provided the images are accompanied by a statement indicating that the activity depicted was conducted pursuant to Permit No. 17273. This statement must accompany the images in all subsequent uses or sales.
 - b. Annual reports required pursuant to Condition E.3 must note such incidental scientific, educational, or commercial uses of the images.
6. Upon written request from the Permit Holder, approval for photography, filming, or audio recording activities not essential to achieving the objectives of the permitted activities in the field, including allowing personnel not essential to the research (*e.g.* a documentary film crew) to be present, may be granted by the Chief, Permits Division.
 - a. Where such non-essential photography, filming, or recording activities are authorized they must not influence the conduct of permitted activities in any way or result in takes of protected species.
 - b. Personnel authorized to accompany the Researchers during permitted activities for the purpose of non-essential photography, filming, or recording activities are not allowed to participate in the permitted activities.
 - c. The Permit Holder and Researchers cannot require or accept compensation in return for allowing non-essential personnel to accompany Researchers to conduct non-essential photography, filming, or recording activities.

C. Qualifications, Responsibilities, and Designation of Personnel

1. At the discretion of the Permit Holder, the following Researchers may participate in the conduct of the permitted activities in accordance with their qualifications and the limitations specified herein:
 - a. Principal Investigator – Jessica Pruden;
 - b. Co-Investigators – See Appendix 3;
 - c. Research Assistants – any personnel identified by the Permit Holder or Principal Investigator and qualified to act pursuant to Conditions C.2, C.3, and C.4 of this permit.
2. Individuals conducting permitted activities must possess qualifications commensurate with their roles and responsibilities. The roles and responsibilities of personnel operating under this permit are as follows:
 - a. The Permit Holder is ultimately responsible for all activities of any individual who is operating under the authority of this permit. Where the Permit Holder is an institution/facility, the Responsible Party is the person at the institution/facility who is responsible for the supervision of the Principal Investigator.
 - b. The Principal Investigator (PI) is the individual primarily responsible for the taking, import, export and any related activities conducted under the permit. The PI must be on site during any activities conducted under this permit unless a Co-Investigator named in Condition C.1 is present to act in place of the PI.
 - c. Co-Investigators (CIs) are individuals who are qualified to conduct activities authorized by the permit without the on-site supervision of the PI. CIs assume the role and responsibility of the PI in the PI's absence.
 - d. Research Assistants (RAs) are individuals who work under the direct and on-site supervision of the PI or a CI. RAs cannot conduct permitted activities in the absence of the PI or a CI.
3. Personnel involved in permitted activities in the field must be reasonable in number and essential to conduct of the permitted activities. Essential personnel are limited to:
 - a. Individuals who perform a function directly supportive of and necessary to the permitted activity;

- b. Individuals included as backup for those personnel essential to the conduct of the permitted activity; and
 - c. Individuals included for training purposes.
4. Persons who require state or Federal licenses to conduct activities authorized under the permit must be duly licensed when undertaking such activities.
5. The Permit Holder or PI may designate additional CIs provided that a copy of the letter designating the individual, and a copy of the individual's curriculum vitae, is provided to the Permits Division via the online permits system (APPS: <https://apps.nmfs.noaa.gov>) on the day of designation and confirmed by mail. The Permit Holder cannot require or receive any direct or indirect compensation in return for requesting authorization for such person to act as a PI, CI, or RA under the permit.

D. Possession of Permit

1. This permit cannot be transferred or assigned to any other person.
2. The Permit Holder and all other persons operating under the authority of this permit must possess a copy of this permit: when engaged in a permitted activity; when a protected species part is in transit incidental to a permitted activity; and during any other time when any protected species part taken under such permit is in the possession of such persons.
3. A duplicate copy of this permit must be attached to the container, package, enclosure, or other means of containment in which a protected species part is placed for purposes of storage, transit, supervision, or care.

E. Reports

1. The Permit Holder must submit annual, final, and incident reports, and any papers or publications resulting from the research authorized herein to the Chief, Permits Division, Office of Protected Resources, NMFS, 1315 East-West Highway, Room 13705, Silver Spring, MD 20910; phone (301) 427-8401; fax (301) 713-0376. The Permit Holder must submit annual, final, and incident reports, and any papers or publications resulting from the research authorized herein to the Permits Division. Reports may be submitted:
 - through the online system at <https://apps.nmfs.noaa.gov>;
 - by email attachment to the permit analyst for this permit; or
 - by hard copy mailed or faxed to the Chief, Permits Division, at the address listed above.

2. Written incident reports related to harassment, serious injury, or mortality events or to exceeding authorized take or receipt/import/export collection takes, must be submitted to the Chief, Permits Division within two weeks of the incident. The incident report must include a complete description of the events and identification of steps that will be taken to reduce the potential for additional incidents.
3. An annual report must be submitted to the Chief, Permits Division by November 9th for each year the permit is valid (August 9th – August 8th of each year). The annual report describing activities conducted during the previous permit year must follow the format in Appendix 2.
4. A final report must be submitted to the Chief, Permits Division within 180 days after expiration of the permit (February 9, 2019), or, if the research concludes prior to permit expiration, within 180 days of completion of the research. The final report must follow the format in Appendix 2.
5. Research results must be published or otherwise made available to the scientific community in a reasonable period of time.

F. Coordination

1. To the maximum extent practical, the Permit Holder must coordinate collection activities in the field with activities of other Permit Holders conducting the same or similar studies on the same species, in the same locations, or at the same times of year to avoid disturbance of animals.

G. Observers and Inspections

1. NMFS may review activities conducted pursuant to this permit. At the request of NMFS, the Permit Holder must cooperate with any such review by:
 - a. Allowing any employee of NOAA or any other person designated by the Director, NMFS Office of Protected Resources to observe permitted activities; and
 - b. Providing any documents or other information relating to the permitted activities.

H. Modification, Suspension, and Revocation

1. All permits are subject to suspension, revocation, modification, and denial in accordance with the provisions of subpart D [Permit Sanctions and Denials] of 15 CFR part 904.

2. The Director, NMFS Office of Protected Resources may modify, suspend, or revoke this permit in whole or in part:
 - a. In order to make the permit consistent with any change made after the date of permit issuance with respect to any applicable regulation prescribed under section 4 of the ESA;
 - b. In any case in which a violation of the terms and conditions of the permit is found;
 - c. In response to a written request⁴ from the Permit Holder;
 - d. If NMFS determines that the application or other information pertaining to the permitted activities (including, but not limited to, reports pursuant to Section E of this permit and information provided to NOAA personnel pursuant to Section G of this permit) includes false information; and
 - c. If NMFS determines that the authorized activities will operate to the disadvantage of threatened or endangered species or are otherwise no longer consistent with the purposes and policy in section 2 of the ESA.
3. Issuance of this permit does not guarantee or imply that NMFS will issue or approve subsequent permits or amendments for the same or similar activities requested by the Permit Holder, including those of a continuing nature.

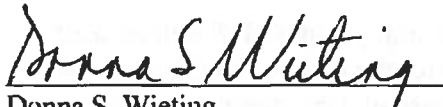

I. Penalties and Permit Sanctions

1. Any person who violates any provision of this permit, the ESA, or the regulations at 50 CFR parts 222-226 is subject to civil and criminal penalties, permit sanctions, and forfeiture as authorized under the ESA, and 15 CFR part 904.
2. NMFS shall be the sole arbiter of whether a given activity is within the scope and bounds of the authorization granted in this permit. The Permit Holder must contact the NMFS Permits Division for verification before conducting the activity if they are unsure whether an activity is within the scope of the permit. Failure to verify, where NMFS subsequently determines that an activity was outside the scope of the permit, may be used as evidence of a violation of the permit, the ESA, and applicable regulations in any enforcement actions.

⁴ The Permit Holder may request changes to the permit related to: the objectives or purposes of the permitted activities; the species or number of animals taken; and the location, time, or manner of taking/collecting, possessing, importing and exporting protected species. Such requests must be submitted in writing to the Chief, Permits Division in the format specified in the application instructions.

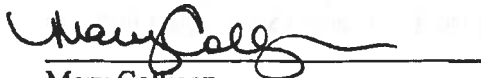

J. Acceptance of Permit

1. In signing this permit, the Permit Holder:
 - a. Agrees to abide by all terms and conditions set forth in the permit, all restrictions and relevant regulations under 50 CFR Parts 222-226, and all restrictions and requirements under the ESA;
 - b. Acknowledges that the authority to conduct certain activities specified in the permit is conditional and subject to authorization by the NMFS Office Director; and
 - c. Acknowledges that this permit does not relieve the Permit Holder of the responsibility to obtain any other permits, or comply with any other Federal, State, local, or international laws or regulations.

Appendix 1

Disposition of Biological Samples

1. All biological samples collected or received under the authority of this permit must be maintained according to accepted curatorial standards. The Terms and Conditions of this permit shall remain in effect as long as the biological samples authorized hereunder are maintained under the authority and responsibility of the Permit Holder.
2. Unless other disposition is specified in the permit application, the Permit Holder may retain biological samples not consumed in analysis or otherwise disposed of during or after research or enhancement activities authorized by this permit if the specimens are maintained in a properly curated collection and made available for research or enhancement purposes at the request of the Office Director. Remaining samples may be archived for analysis by the Permit Holder not described in the permit application provided that the project descriptions are provided to the Permits, Conservation and Education Division for inclusion in the permit file. NMFS encourages Researchers to transport any remaining samples to the National Ocean Service (NOS), Marine Forensics Laboratory, 219 Fort Johnson Road, Charleston, South Carolina 29412, phone (843)762-8547, fax (843)762-8700.
3. The Responsible Party [Mary Colligan, Assistant Regional Administrator; One Blackburn Drive; Gloucester, MA 01930; phone (978) 281-9116] must be contacted prior to, and where necessary, approve and authorize the transfer of biological samples to persons not listed in the permit application. Researchers may transfer parts collected or received under this permit for scientific research, curation, or educational purposes to recipients authorized as Co-Investigators by the Responsible Party.
4. Under no circumstances may any endangered species parts collected or obtained under the authority of this permit be bought or sold. Recipients of any biological samples taken under the authority of this permit must adhere to the conditions of this permit.
5. The Permit Holder must maintain a record of all biological specimens obtained under this permit. This record must include the number and type of specimens; a description of each animal from which specimen materials were taken including, species, age, size, weight, sex, reproductive condition; date and location of acquisition; preservative; and circumstances causing death or nature of specimen collection. Where samples are received from facilities (*i.e.*, power plants) documentation regarding the original legal take must also be maintained by the Permit Holder.
6. No animals may be intentionally killed for the purpose of providing specimens under this permit, and no remuneration, either financial or in-kind, can be offered for the taking of animals from the wild. This does not preclude legitimate logistical collection and transportation expenses.

Appendix 2: Protected Species Parts Permit Report Form

Reports may be submitted

- through the online system at <https://apps.nmfs.noaa.gov>
- by email attachment to the permit analyst for this permit
- by hard copy mailed or faxed to the Chief, Permits Division, Office of Protected Resources, NMFS, 1315 East-West Highway, Room 13705, Silver Spring, MD 20910; phone (301)427-8401; fax (301)713-0376.

The following is only an EXAMPLE of the report form. If you do not intend to submit your report online, please contact your permit analyst for an electronic report form to fill out and return.

Date: _____ **Reporting Period:** _____

Permit Number: _____ **Permit Holder's Name:** _____

Contact Name: _____ **Contact Email:** _____

Contact Phone #: _____
(Contact = person submitting report)

Part I: Take Table. Enter information on the actual number of animals from which parts were collected, received, or imported/exported during this reporting period according to the table in your permit. Note: You must complete a table that looks like the Permit Table (Take Table 1 of your permit), with an additional column for you to enter the "actual number of animals taken" in the last permit year. You must contact your permit analyst for an electronic version of this table or use the on-line report system.

Also provide the information in the following table (Table 2). You must contact your permit analyst for an electronic version of this additional table and provide it as an attachment to your report.

Date	Type of activity (e.g., receipt or import)	Species (common and scientific name)	Description of and number of parts (e.g., 2 teeth)	Description of animal from which part was taken (age, size, sex, reproductive condition)	Sample origination (e.g., subsistence hunt); and date and location of collection	Country of origin and authorizing government agency (include NMFS permit number if applicable)	Disposition of part ⁵

⁵ Indicate whether part was consumed in analysis, is curated (if so, how), or was transferred. For transfers to other researchers, include the sample ID, person and location to which the part was transferred, description of secondary use, and how the person was authorized to receive the part from you.

Part II: Narrative. Provide responses to the following, as applicable:

1. Describe any problems or unforeseen events encountered during the permitted activities and any steps taken or proposed to resolve such problems.
2. Describe what measures were taken to minimize incidental effects of permitted activities on animals in the wild, such as disturbance to nearby animals, and the effectiveness of these measures, as applicable.
3. Describe steps taken to coordinate the permitted activities with other permit holders.
4. Summarize any preliminary findings. Did you accomplish the goals of your permitted activities?
5. List titles of reports, publications, etc. resulting from this reporting period. Attach copies of any final documents as available. If these documents are not yet available, indicate when you anticipate that they will be completed and submitted. When reports and publications are available, send to the Chief, Permits Division, and include the permit number in subject line.
6. Note the number and type of non-permitted species harassed or otherwise taken, and the observed effects of such taking.
7. Note any incidental (non-research related) use of photographs, film, or other images (e.g., on websites, in commercial publications or documentaries).
8. Indicate any additional findings, results, or information you would like to report or comment on.
9. Copies of the following must be submitted with this report:
 - a. Foreign collection and export authorizations; and
 - b. Foreign CITES export permits and stamped wildlife declaration forms, and Form 3-177 for each import.

Guidance for Co-Investigators

Thank you for your interest in being a Co-Investigator on permit (File No. 17273) to collect, necropsy, sample, and salvage dead shortnose and Atlantic sturgeon, etc., as specified in the permit and permit application for the purposes of education and scientific research.

During the review of the application we were advised to develop guidance for the many Co-Investigators named on the application. Also, we were asked to name which type of Co-Investigator each of you might be. We divided Co-Investigator activities into the following three categories: Response, Research and Education. Accordingly, this document serves as guidance for all Co-Investigators broken down by type of anticipated activity. See Attachment A to determine which categories you fall under.

I. Response:

Co-Investigators responding to reports of dead shortnose and Atlantic sturgeon are generally natural resource managers, researchers from the various states or Federal services, or researchers from Universities. Dead sturgeon are likely to be found washed ashore or, in some cases, floating. Since dead sturgeon may be located in sensitive areas such as protected islands, wildlife management areas, National refuges, state parks and historical sites, etc., you are urged to work with local officials to gain access to these areas. Be aware and mindful of any sensitive habitats/protected resources you may encounter as you attempt to investigate and/or retrieve a sturgeon carcass. You are advised to seek permission before entering these areas and to obtain additional permits as necessary.

Please be aware that your activities may disrupt other wild animals, including protected species such as other fishes, waterfowl, seabirds and marine mammals. This permit does not allow the harassment of any protected species other than shortnose and Atlantic sturgeon; please be sure to conduct research in such a manner that disturbance of any non-target species does not occur. Information on keeping a safe distance from protected marine wildlife can be found at: <http://www.nmfs.noaa.gov/pr/education/viewing.htm>. Additional guidance for working around wildlife may be obtained at: http://www.watchablewildlife.org/publications/marine_wildlife_viewing_guidelines.htm. Lastly, in some cases, the area may be too sensitive to enter and the Co-Investigator should refrain from responding (i.e., should not disturb nesting piping plovers to access a sturgeon carcass).

All Co-Investigators responding to a dead sturgeon are required to fill out a sturgeon salvage form (Attachment B) or provide data to NMFS for insertion in the form, for each sturgeon carcass you collect/obtain and submit it within 30 days to the appropriate regional contact:

Greater Atlantic Regional Fisheries Office

Jessica Pruden, Shortnose Sturgeon Recovery Coordinator

Phone: 978-282-8482

Fax: 978-281-9394

E-Mail Jessica.Pruden@noaa.gov

Lynn Lankshear

Atlantic Sturgeon Recovery Coordinator

Phone: 978-282-8473

Fax: 978-281-9394

E-Mail Lynn.Lankshear@noaa.gov

Southeast Region

Kelly Shotts, Atlantic and Shortnose Sturgeon Recovery Coordinators

Phone: 727-551-5603

Fax: 727-824-5309

E-Mail Kelly.Shotts@noaa.gov

Please find and review Attachment B, the sturgeon salvage form, as you read the following instructions for filling out form. This is a working document; we appreciate your help in field testing the form and hope you will provide comments for improving it. Comments should be sent to Jessica Pruden (contact information given above). Instructions are based on blocks in the salvage form as pictured below.

- Record investigator's (responding Co-Investigator) contact information.

INVESTIGATORS'S CONTACT INFORMATION	
Name: First _____	Last _____
Agency Affiliation _____	Email _____
Address _____	

Area code/Phone number _____	

- Call appropriate NMFS regional contact identified above to obtain a unique identifier and record it in the top block.
- Record the date sturgeon carcass was first reported to investigator.
- Record the date sturgeon carcass was collected/examined by investigator.

UNIQUE IDENTIFIER (Assigned by NMFS)

DATE REPORTED:

Month Day Year 20

DATE EXAMINED:

Month Day Year 20

- Identify to species (if possible).

SPECIES: (check one)

shortnose sturgeon

Atlantic sturgeon

Unidentified *Acipenser* species

Check "Unidentified" if uncertain. See reverse side of this form for aid in identification.

- Record location where carcass was found.

LOCATION FOUND: <input type="checkbox"/> Offshore (Atlantic or Gulf beach) <input type="checkbox"/> Inshore (bay, river, sound, inlet, etc)	
River/Body of Water _____	City _____ State _____
Descriptive location (be specific) _____	

Latitude _____ N (Dec. Degrees)	Longitude _____ W (Dec. Degrees)

- Determine stage of decomposition at the time of examination. Record carcass condition.
 - Fresh dead = Normal appearance, usually with little scavenger damage; fresh smell (edible); minimal drying and wrinkling of skin, eyes and mucous membranes; eyes clear; carcass not bloated, muscles firm, viscera intact and well-defined; body intact and easily moved.
 - Moderately decomposed = Carcass intact, bloating evident, possible scavenger damage; mild odor; mucous membranes dry, eyes sunken or missing; muscles soft and poorly defined; viscera soft, friable but still intact; body fragile but can usually be moved intact.
 - Severely decomposed = Carcass may be intact, but collapsed; often severe scavenger damage; strong odor; muscles nearly liquefied and easily torn; viscera often identifiable but friable, easily torn, and difficult to dissect; body fragile and comes apart if moved.
 - Dried carcass = Skin may be draped over skeletal remains; any remaining tissues are desiccated.
 - Skeletal, scutes & cartilage = Only pieces of carcass can be found and identified.

CARCASS CONDITION at time examined: (check one) <input type="checkbox"/> 1 = Fresh dead <input type="checkbox"/> 2 = Moderately decomposed <input type="checkbox"/> 3 = Severely decomposed <input type="checkbox"/> 4 = Dried carcass <input type="checkbox"/> 5 = Skeletal, scutes & cartilage
--

Record sex and how this was determined.

SEX: <input type="checkbox"/> Undetermined <input type="checkbox"/> Female <input type="checkbox"/> Male How was sex determined? <input type="checkbox"/> Necropsy <input type="checkbox"/> Eggs/milt present when pressed <input type="checkbox"/> Borescope
--

- Examine externally and record signs of external injury etc (see back of form).

Describe any wounds / abnormalities (note tar or oil, gear or debris entanglement, propeller damage, etc.). Please note if no wounds / abnormalities are found.

- Record length and weight measurements and circle the unit of measurement used. Also indicate if the length and weight measurements were actual or estimates. (i.e., some length measurements of severely decomposed carcasses are estimates because carcass may not be intact).

MEASUREMENTS:	<i>Circle unit</i>
Fork length	_____ cm / in
Total length	_____ cm / in
Length <input type="checkbox"/> actual <input type="checkbox"/> estimate	
Mouth width (inside lips, see reverse side)	_____ cm / in
Interorbital width (see reverse side)	_____ cm / in
Weight <input type="checkbox"/> actual <input type="checkbox"/> estimate	_____ kg / lb

- Examine the fish externally for tags and scan for internal tags. Record any tag information.
- Note: All tag information recorded on this form will be shared with the US Fish and Wildlife Cooperative Sturgeon Tagging Database (NMFS will share tag information with staff at the MD Fishery Resource Office using salvage forms submitted by Co-Investigators).
<http://www.fws.gov/northeast/marylandfisheries/mfrofactsheet.htm>

TAGS PRESENT? Examine for external tags including fin clips? <input type="checkbox"/> Yes <input type="checkbox"/> No		Scanned for PIT tags? <input type="checkbox"/> Yes <input type="checkbox"/> No
Tag #	Tag Type	Location of tag on carcass
_____	_____	_____
_____	_____	_____

- Take photo/video and record where the images will be maintained.

PHOTODOCUMENTATION: Photos/video taken? <input type="checkbox"/> Yes <input type="checkbox"/> No Disposition of Photos/Video: _____ _____ _____
--

- If possible/appropriate, necropsy carcass. Record the date the fish was necropsied and the name of the person who conducted the necropsy.
- Record any observations during necropsy and submit this information with the salvage form.

Carcass Necropsied? <input type="checkbox"/> Yes <input type="checkbox"/> No Date Necropsied: _____ Necropsy Lead: _____

- If possible/appropriate, sample carcass. Record what samples were collected, how they were preserved and where they were sent/archived. Please be aware that sturgeon parts and tissues may only be sent to persons/labs that are listed as a CI on this permit.
- All responders are required to sample shortnose and Atlantic sturgeon carcasses for genetic tissue. The tissue sampling and shipment must be coordinated with Julie Carter. Julie Carter will send sampling instructions, chain of custody form and vials for the tissue samples (see also Attachment C for sampling instructions):
 - Julie Carter
 NOS Marine Forensic Branch
 219 Fort Johnson Road
 Charleston, SC 29412
 phone: 843-762-8547
 fax: 843-762-8700
 Email: Julie.Carter@noaa.gov
- Permanently label all samples with a unique identifier assigned by NOAA fisheries. [Call appropriate NMFS regional contact identified above to obtain number – See top right block on salvage form].

SAMPLES COLLECTED? <input type="checkbox"/> Yes <input type="checkbox"/> No		
Sample	How preserved	Disposition (person, affiliation, use)
_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____

- Record the final disposition of the majority of the remains.

CARCASS DISPOSITION: (check one or more)

1 = Left where found

2 = Buried

3 = Collected for necropsy/salvage

4 = Frozen for later examination

5 = Other (describe)

- Record any additional comments at the bottom of the front page.

Comments:

- Submit Completed forms to appropriate NMFS regional contact identified above within 30 days of the date the carcass was reported.

Submit completed forms (within 30 days of date of investigation) to: Greater Atlantic Regional Fisheries Office
Contacts – Shortnose Sturgeon Recovery Coordinator (Jessica Pruden, Jessica.Pruden@noaa.gov, 978-282-8482) or Atlantic Sturgeon Recovery Coordinator (Lynn Lankshear, Lynn.Lankshear@noaa.gov, 978-282-8473); **Southeast Region Contacts**- Shortnose and Atlantic Sturgeon Recovery Coordinator (Kelly Shotts, Kelly.Shotts@noaa.gov, 727-551-5603).

Safety:

- Shortnose and Atlantic sturgeon carcasses will be in various stages of decomposition and may harbor diseases, parasites etc. Practice common sense in examining and sampling dead shortnose sturgeon. Wear protective clothing including gloves and a mask. Wash yourself and your gear thoroughly after handling a dead sturgeon.
- Maintain appropriate training, licenses and certificates and use caution in the operation of motorized vehicles (boats, trucks, cars, etc.).
- Safely transfer specimens to authorized researchers, educators, laboratories, etc., following Material Safety Data Sheet (M.S.D.S) protocol for shipment and handling. Please be aware that shortnose sturgeon parts and tissues may only be sent to persons/labs that are listed as a CI on this permit.
- Safely dispose of unused portions of shortnose sturgeon carcasses

Data Access Policy for shortnose sturgeon salvage form

Upon written request, information submitted to National Marine Fisheries Service (NOAA Fisheries) on this form will be released to a requestor provided that the requestor credits the collector of the information and NOAA Fisheries. NOAA Fisheries will notify the collector that these data have been requested and the intent of their use.

II. Research:

Those Co-Investigators interested in research activities may receive sturgeon specimens from responders as they become available. There are many researchers who are also interested in response and in this case will directly use the specimens they collect themselves under the permit.

Anticipated uses for scientific research: morphology; genetics; histopathology; contaminants; age, growth and maturity analyses; cryopreservation of sperm; food habits; parasitology; examination for potential human impacts (oil spill, ship strike, bycatch in fisheries, dredging, blasting, impingement/entrainment etc.) and investigation of unusual mortality events/fish kills.

Researcher responsibilities include the following:

1. Credit contributing responders (i.e. those Co-Investigators that provided the data or specimens) and NOAA Fisheries. Any research published as a result of work performed on samples or information received under this permit must acknowledge the cooperating Co-Investigators, NOAA Fisheries, and the permit number in any publications or other reports resulting from the use of the transferred material/data
2. Share copies of any resultant publications/unpublished reports with Co-Investigators by submitting these reports to the appropriate NMFS regional contact.

Additional research needs may be identified during the 5-year term of the permit. Contact the appropriate NMFS regional contact to relay your research interests. Please be aware that responders are acting on a voluntary basis and there are generally relatively few sturgeon carcasses reported dead each year (~10) so it may take some time to meet your needs.

III. Education:

Many Co-Investigators that are responders and researchers also have an interest in obtaining and maintaining specimens for outreach and education. The permit will authorize the retention and maintenance of sturgeon (whole and parts) for education. The anticipated educational uses follow:

Educational uses: taxidermy; collection of hard parts such as individual scutes, bones and entire cartilaginous skeleton; clear and stain of small fish; casts of sturgeon carcasses, plastomer reproductions, dissection (necropsy) and development of sampling and necropsy procedures and manuals.

Educator responsibilities include the following:

1. As appropriate, credit contributing responders, NOAA Fisheries, and cite the permit number in resultant publications/outreach materials.
2. Share copies of any resultant publications/outreach materials with Co-Investigators by submitting them to the appropriate NMFS regional contact.

Additional educational needs may be identified during the 5-year term of the permit. Contact the appropriate NMFS regional contact to relay your education or outreach interests. Please be aware that responders are acting on a voluntary basis and there are generally relatively few sturgeon carcasses reported dead each year (~10) so it may take some time to meet your needs.

IV: Instructions for Transfer and Shipment of Specimens

Transfer:

Because shortnose and Atlantic sturgeon are listed species under the Endangered Species Act, transfer of specimens must be carefully documented and the persons/labs receiving

specimens must be authorized to have them. Therefore, once specimens are salvaged from a dead sturgeon, they may only be transferred to other Co-Investigators or cooperating diagnostic labs listed on this permit, No 17273 (see Attachment A). Transfer of specimens to Co- Investigators/cooperators must be documented on the “SAMPLES COLLECTED” block of the Sturgeon Salvage Form. All samples must be labeled with the Unique Identifier recorded in the top right block of the salvage form.

Any further transfer of specimens among Co-Investigators/cooperating diagnostic labs (i.e. beyond what was recorded on the salvage form) may be permissible on a case by case basis. You must contact the appropriate NMFS regional contact to arrange for the transfer. NMFS must report annually all sturgeon salvaged and collected under this permit and the disposition of all samples and subsamples.

Shipment:

Follow Material Safety Data Sheet (M.S.D.S) protocol for safe shipment and handling. Double check that all specimens are labeled with the Unique Identifier recorded in the top right block of the Sturgeon Salvage Form.

Include the following documentation with each shipment:

- Copy of Sturgeon Salvage Form
- Copy of the NMFS research permit authorizing the collection of the sample(s)
- Chain of Custody Form (as requested or appropriate)

Place the samples in leak-proof containers/bags; place the documentation on top of the samples. Seal the samples and documents together in the shipping container and send to authorized Co-Investigator(s)/cooperating diagnostic lab(s).

V. Adding Co-Investigators to the permit:

The permit, if issued, is expected to be valid for five years from the date of issuance. Qualified Co-Investigators or Cooperating Diagnostic Labs may be added to this permit on a case by case basis through an authorization provided by the Responsible Party of the permit. Interested persons should contact Jessica Pruden for more information:

¹ Instructions on next page.

² If multiple samples are shipped, attach summary sheet in Appendix 3b.

Instructions: Collecting, Certifying, Identifying & Shipping Tissue Samples Collected from Sturgeon.

1. **Species Certification:**

For each shipment a “*Certification of Species Identification*” (Section A) must be provided. This form documents the collector has identified the fish or fishes sampled in the shipment as either a shortnose or Atlantic sturgeon. If there is any doubt about the identity of a sample, then mark unknown and include comments on the take.

2. **Sample Identification:**

Assign a unique number identifying each individual fish captured and subsequently sampled. This number must be recorded in Section B and on the collection vial for each sample taken. Record tissue type; preservative used; date of capture; location of capture (river & description, lat/long, river km, and nearest city); length of specimen; weight; and sex, if known. Check the box provided if you are submitting multiple samples, and provide a hard-copy and/or email a copy of the sample spreadsheet with information for each of the data fields listed above.

3. **Tissue Sampling Instructions:**

a. Cleanliness of Samples: Cross contamination should be avoided. For each fish, use a clean cutting tool, syringe, etc. for collecting and handling samples.

b. Preserving & Packaging Samples:

- i. Label vial with fish’s unique ID number.
- ii. Place a 1-2 cm² section of pelvic fin clip in vial with preservative (95% absolute ETOH (un-denatured), recommended).
- iii. Seal individual vials or containers with leak proof positive measure (e.g., tape).
- iv. Package vials and absorbent within a double sealed container (e.g., zip lock baggie).
- v. Label air package properly identifying ETOH warning label (**See Appendix 3c**).

c. Shipping Instructions:

When shipping samples, place separately Appendix 3a, 3b and 3c (Sample ID and Chain of Custody Forms and Shipping Training Form) in container and seal the shipping box to maintain the chain of custody. (**Note:** A copy of the ESA permit authorizing the collection of the sample(s) must also accompany the sample(s)).

Important Notice: You must be certified before shipping tissue samples preserved with 95% ETOH in “excepted quantities” (A Class 3 Hazardous Material Due to Flammable Nature). See **Appendix 3c: “NMFS Guidelines for Air-Shipments of Excepted Quantities of Ethanol Solutions”** to comply with the DOT/IATA federal regulations.

4. **Chain of Custody Instructions:**

The “*Chain of Custody*” (Section C) should be maintained for each shipment of tissue samples and must accompany the sample(s) at all times. To maintain the chain of custody, when sample(s) are transferred, the sample(s) and the documentation should be packaged and sealed together to ensure that no tampering has occurred. All subsequent handlers breaking the seal must also sign and document the chain of custody section.

5. **Contact Information:**

A. NMFS, Office of Protected Resources:

i. Primary Contact: (Greater Atlantic Regional Fisheries Office) Shortnose Sturgeon Recovery Coordinator (Jessica Pruden, jessica.pruden@noaa.gov, 978/282-8482); Atlantic Sturgeon Recovery Coordinator (Lynn Lankshear, lynn.lankshear@noaa.gov, 978/282-8473)

ii. Primary Contact: (Southeast) Shortnose Sturgeon and Atlantic Sturgeon Recovery Coordinator (Kelly Shotts, kelly.shotts@noaa.gov, 727/551-5603)

i. Secondary Contact: Malcolm Mohead (malcolm.mohead@noaa.gov) Phone: 301/713-2289

ii. Secondary Contact: Jennifer Skidmore (jennifer.skidmore@noaa.gov) Phone: 301/713-2289

B. NOS Archive:

i. Primary Contact: Julie Carter (julie.carter@noaa.gov) Phone: 843/762-8547

Appendix 3b Summary Sheet for Genetic Tissue Samples Collected^{1,2}

Date	Species	Unique ID No.	Genetic Tissue Type	Preservative	Location: (River)	Location (River-km)	Location (Lat/Long)	Total Length (mm)	Weight (g)	Sex	Comments

1. Please coordinate with NMFS to receive a file copy of this appendix in spreadsheet format and include file on disk with shipment.
2. If multiple samples are shipped, attach this form to supplement Appendix 3a.

Appendix 3c

NMFS Guidelines for Air-Shipment of "Excepted Quantities" of Ethanol Solutions

These guidelines have been adapted with permission from the University of New Hampshire-Office of Environmental Health & Safety; our appreciation is to Andy Glode for providing reference materials upon which this guide was created.

The U.S. Department of Transportation (DOT: 49 CFR 173.4) and the International Air Transport Association (IATA: 2007 Dangerous Goods Regulations, Sec. 2.7) regulate shipments of ethanol (ETOH) in *excepted quantities*. As a result, specific procedures must be followed as well as certifying proper training of individuals prior to packaging and shipping specimens preserved in ETOH. These guidelines will inform proper shipping and also satisfy certifying requirements. Failure to meet such requirements could result in regulatory fines and/or imprisonment.

Therefore, prior to submitting ETOH preserved samples and appropriate documentation (*e.g.*, a FedEx Airbill) to a carrier, please read, initial and sign this document, affirming you have understood the requirements as outlined. Please include this document in the shipping package and retain a copy for your records.

- 1) Packages and documents submitted to a carrier must not contain any materials other than those described in this document (*i.e.* containers holding ethanol-preserved specimens and related absorbent and packaging materials). Also, laboratory or sampling equipment, *unrelated documents*, or other goods must be packaged and shipped in separate boxes. (Note: ETOH solutions are not permitted to be transported in checked baggage, carry-on baggage, or airmail.) **I understand (____)**
- 2) Please read the manufacturer's Material Safety Data Sheet (MSDS) for ETOH recognizing ETOH (55 - 100%) is classed as hazardous flammable material (NFPA Rating = 3). Note also, its vapor is capable of traveling a considerable distance to an ignition source causing "flashback." Properly packaging and labeling shipments of ethanol solutions will minimize the chance of leakage, and would also communicate the potential hazard to transport workers in the event of a leak. **I understand (____)**
 - a) **Quantity Limits:** Small quantities (inner container less than 30 ml, with a maximum net quantity of 500 ml for the entire package) of ETOH can be shipped with "Excepted Quantities" labels without completion of a Dangerous Goods Declaration. (*e.g.*, If shipping vials having a maximum volume of 10 ml each, you may put up to 50 vials in one box.) **I understand (____)**
 - b) **Package Components:**
 - i. **Inner (primary) packaging (*e.g.*, vial, tube, jar, etc.):** Do not completely fill inner packaging; allow 10% head-space for liquid expansion. Liquids must not completely fill inner packaging at a temperature of 55°C (130°F). Closures of inner packaging (*e.g.*, vials with tops) must be held securely in place with tape or other positive means. **I understand (____)**
 - ii. **Intermediate (secondary) packaging (*e.g.* Ziplock or other plastic bag):** Place inner container(s) (*e.g.*, vials with ETOH) into a high-quality plastic bag. Then add an absorbent material capable of absorbing any spillage without reacting with the ethanol. Seal the first bag tightly and then tape the locking seals. Next, seal the inner bag within a second bag for added safety. **I understand (____)**
 - iii. **Outer packaging (*e.g.*, cardboard box):** Ethanol solutions may not be shipped in envelopes, Tyvek® sleeves, or other non-rigid mailers. The dimensions of the outer box must be at least 100 mm (~4 inches) on two sides. Any space between the inner packing containers placed in the outer packaging should be eliminated with additional filler. **I understand (____)**
 - c) **Package Labels:**
 - i. **Dangerous Goods in Excepted Quantities Label (Figure 1):** The label must display a "3" as the ethanol hazard class number using a black marker. You may obtain self-adhesive labels from NMFS, or else, order online. **I understand (____)**
 - ii. **Name and Address:** The outer container must display the name and address of the shipper and consignee. When using shipping boxes, completely remove or black out all unnecessary labels or marks. **I understand (____)**

Figure 1. Dangerous Goods in Excepted Quantities label

Appendix 3c (continued)

d) **Package Tests:**

A representative example of packaging used for excepted quantities of ethanol solutions must pass a drop test and compressive load test without any breakage or leakage of any inner packaging and without any significant reduction in package effectiveness. Perform the following tests on a representative example of your packaging and keep a record of the results.

i. **Drop Test:** Drop a representative package from a height of 1.8 m (5.9 feet) directly onto a solid unyielding surface:

Test Results

- a. One drop flat on the base; (_____)
- b. One drop flat on top; (_____)
- c. One drop flat on the longest side; (_____)
- d. One drop flat on the shortest side; and (_____)
- e. One drop on a corner. (_____)

ii. **Compressive Load Test:** Apply a force to the top surface of a representative package for a duration of 24 hours, equivalent to the total weight of identical packages if stacked to a height of 3 meters. (_____)

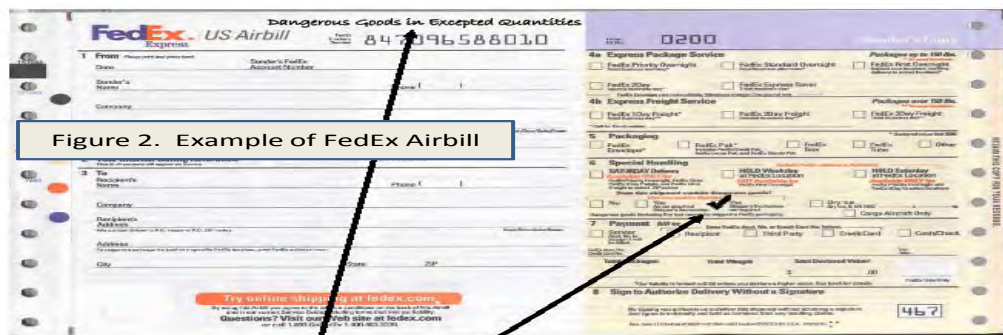

e) **Package Documentation:**

Proper documentation is required for all shipments of hazardous materials. Incorrect documentation is the most common cause for package refusal. If using documentation for couriers other than FedEx, UPS and DHL, please contact NMFS for assistance.

i. **FedEx:** For domestic shipments with FedEx Express, fill out the standard US Airbill. Fill out the form completely including the following information:

- a. In Section 6, Special Handling, check the box “Yes, Shipper’s Declaration not required.”
- b. On the top of the form above the FedEx tracking number, include the statement, “**Dangerous Goods in Excepted Quantities**” See example in **Figure 2**. I understand (_____)

ii. **DHL:** The “*Nature and Quantity of Goods*” box of the air waybill must include “**Dangerous Goods in Excepted Quantities.**” I understand (_____)

Include this statement and check this box.

By signing this document, I affirm I understand the hazards associated with ethanol and the shipping requirements for ethanol solutions, as outlined in this guide. I also understand I am required to include a copy of this document in the package and that it should be appended to an ESA permit (if listed samples are shipped).

Comments:

Distinguishing Characteristics of Atlantic and Shortnose Sturgeon (version 01-30-2014)

Characteristic	Atlantic Sturgeon, <i>Acipenser oxyrinchus</i>	Shortnose Sturgeon, <i>Acipenser brevirostrum</i>
Maximum length	> 9 feet/ 274 cm	4 feet/ 122 cm
Mouth	Football shaped and small. Width inside lips < 55% of bony interorbital width	Wide and oval in shape. Width inside lips > 62% of bony interorbital width
*Pre-anal plates	Paired plates posterior to the rectum & anterior to the anal fin.	1-3 pre-anal plates almost always occurring as median structures (occurring singly)
Plates along the anal fin	Rhombic, bony plates found along the lateral base of the anal fin (see diagram below)	No plates along the base of anal fin
Habitat/Range	Anadromous; spawn in freshwater but primarily lead a marine existence	Freshwater amphidromous; found primarily in fresh water but does make some coastal migrations

* From Vecsei and Peterson, 2004

Describe any wounds / abnormalities (note tar or oil, gear or debris entanglement, propeller damage, etc.). Please note if no wounds / abnormalities are found.

Data Access Policy: Upon written request, information submitted to National Marine Fisheries Service (NOAA Fisheries) on this form will be released to the requestor provided that the requestor credit the collector of the information and NOAA Fisheries. NOAA Fisheries will notify the collector that these data have been requested and the intent of their use.

Submit completed forms (within 30 days of date of investigation) to: Greater Atlantic Regional Fisheries Office
Contacts – Shortnose Sturgeon Recovery Coordinator (Jessica Pruden, Jessica.Pruden@noaa.gov, 978-282-8482) or Atlantic Sturgeon Recovery Coordinator (Lynn Lankshear, Lynn.Lankshear@noaa.gov, 978-282-8473); **Southeast Region Contact**- Shortnose and Atlantic Sturgeon Recovery Coordinator (Kelly Shotts, Kelly.Shotts@noaa.gov, 727-551-5603).

NOAA Marine Biotoxins Program – Analytical Response Team

Sampling Protocol for Algal Identification and Toxin Analysis

Supplies

- * Bucket
- * Plastic bottles (100 ml and 1 liter)
- * Plankton net (10 µm nylon mesh) if available
- * Lugol's iodine fixative
or
- * glutaraldehyde fixative

Lugol's iodine: - dissolve 10 g potassium iodide (KI) in 100 ml distilled water
- add 5 g crystalline iodine (I₂)
- add 10 ml glacial acetic acid

Protocol

1. Look for discolored water patches (record observations). *There may not be discolored water in association with some toxic algal events.* Record temperature, salinity, and dissolved oxygen if possible.
2. For qualitative analysis, collect sample with a plankton net, if available, using vertical tow (bottom to surface). Transfer ~100 ml of concentrated sample to a 100 ml plastic bottle. Add preservative: Lugol's to make a tea color (1-2 ml) or glutaraldehyde to make 2% final concentration (2 ml).
3. For quantitative analysis, collect surface water samples using bucket.
 - a. Transfer water into two 1 L bottles (rinsed soda bottles are acceptable) for toxin analysis. Wrap bottles with wet paper towels. Store in a cool, dark place (do not freeze). Ship overnight if possible in styrofoam cooler containing wet paper towels and refrigerated blue ice packs (keep these from actually touching the bottle).
 - b. Transfer ~100ml sub-sample to 100 ml plastic bottles. Add preservative: Lugol's to make a tea color (1-2 ml) or glutaraldehyde to make 2% final concentration (2 ml). Store in cool, dark place until shipping.

Sampling Protocol for Toxin Analysis in Animals

Supplies

- * Normal sized samples: 50-mL plastic centrifuge tubes or other plastic tubes
- * Large samples: sealable/ziplock plastic bags or bottles

** Prior to collection, obtain required permits or licenses in order to comply with state and/or federal regulations for shellfish or protected species (marine mammals, sea turtles).

Invertebrates, (clams, oysters, mussels, scallops, crustaceans)

Generally collect entire animal. Freeze whole or shucked – 100 g meat/tissue. Samples can be stored in ziplock bags on ice until they can be frozen. Freeze (-20°C) and ship on dry ice.

Collection of shellfish is most easily accomplished by the use of available harvesting methods (rakes, dredges, etc.)

Prey Fish

If possible, the species should be identified before freezing. Small fish should be collected and frozen, then shipped whole. For large species, stomach contents (whole stomach), liver and flesh should be sampled and stored separately. Minimum of 50 g flesh should be obtained. All tissues can be stored frozen (-20°C) in ziplock bags until shipment on dry ice.

Mammals

(also see Geraci, J.R. and Lounsbury, V.J. 2005. Marine Mammals Ashore: A Field Guide for Strandings. National Aquarium, Baltimore, MD, 372 pp. for detailed necropsy sampling procedures). Limit sampling to code 1 or 2 animals (see above reference for definition), as changes in toxin structure and tissue matrix may occur in degraded tissue samples.

The most useful tissues/fluids for confirming biotoxin exposure are generally feces, urine and stomach contents. However, samples from additional tissues (gastric fluid, liver, kidney, lung, brain, serum) are important for metabolism and body burden studies. All samples should be immediately placed in a cooler on ice and frozen (-20°C) as soon as possible after collection. Samples should be shipped on dry ice to the laboratory for analysis. Prior to shipping samples, please contact receiving laboratory to ensure proper receipt of the samples.

All samples must be labeled with animal ID, date, species in indelible ink. Additionally, a small tag containing sample information inserted inside the sample container may be useful in some cases. Additional details, including location (latitude/longitude or closest landmark), animal length, weight, condition code, sex, and additional relevant information must be recorded on a sample log and a hard copy must accompany samples. In addition, also send a digital version to your contact at the laboratory. See the attached sample information sheet as an example.

Urine - Collect a minimum of 0.5 ml urine, more if available (5-10 ml). Store frozen (-20°C) in capped plastic centrifuge tubes.

Feces – Collect a minimum of 5 g (preferably 50 g). Store frozen (-20°C) in capped plastic centrifuge tubes or other container suitable for freezer storage.

Intestinal contents - Collect a minimum of 5 g (preferably 50 g). Store frozen (-20°C) in capped plastic centrifuge tubes or other container suitable for freezer storage. Indicate which portion of the intestine was sampled (e.g. upper, mid-, lower intestine)

Stomach contents – Collect a minimum of 5 g (preferably 50 g) of solid or semi-solid contents if available. Store frozen (-20°C) in capped plastic centrifuge tubes or other container suitable for freezer storage. If stomach fluid only is available, collect at least 5ml in a plastic tube or vial.

Gastric fluid, liver, kidney, lung, spleen, brain – collect 100 g (or mL) if possible. Store frozen (-20°C) in separate ziploc bags.

Serum – obtain serum by centrifugation (1500-3000 x g; 5 minutes) of whole, heparinized blood. The top layer is the serum. Collect >0.5 ml of serum and store frozen (-20°C) in a plastic tube.

Whole blood -Heparinized whole blood can be spotted directly onto blood collection cards and stored at room temperature in the presence of dessicant pouches. Blood cards with detailed instructions can be obtained from your contact at the Marine Biotoxins Program laboratory.

Birds

Collect as above for mammals, substituting cloacal contents for feces and urine, and with the addition of gizzard contents.

Marine Mammal Stranding Response Agreement

Between

Northeast Region
National Marine Fisheries Service
National Oceanic and Atmospheric Administration
Department of Commerce

AND

Virginia Aquarium & Marine Science Center
Stranding Response Program

Articles III, IV, V, and VI are reserved and issued at the discretion of the NMFS Regional Administrator.

Table of Contents

Article I: General Provisions.....	3
Article II: Purpose and General Responsibilities.....	5
Article III: Dead Animal Response.....	11
Article IV: Live Animal Response: First Response.....	14
Article V: Live Animal Response: Rehabilitation and Final Disposition.....	18
Article VI: Northeast Region Good Standing Agreement.....	23
Article VII: Northeast Region Communication Agreement.....	25
Article VIII: Participant’s Authorized Personnel.....	28
Article IX: Rights of States and Local Governments.....	29
Article X: Effective Dates, Renewal, and Application Procedures.....	30
Article XI: Review, Modification, and Termination.....	31

Article I: General Provisions

A. Authority

1. This Marine Mammal Stranding Response Agreement (hereinafter Agreement) is entered into between the Department of Commerce, National Oceanic and Atmospheric Administration (NOAA), National Marine Fisheries Service (NMFS) Northeast Region, and the Stranding Network Participant Virginia Aquarium & Marine Science Center Stranding Response Program (Participant), under the authority of section 112(c) and section 403 of the Marine Mammal Protection Act of 1972 (MMPA), as amended. **This Agreement supersedes all pre-existing Stranding Agreements between these parties. An organizational representative with signatory authority (e.g. Executive Director, President, CEO) must sign this Agreement on behalf of the Stranding Network Organization.**
2. NMFS has been delegated authority by the Department of Commerce to administer the MMPA. To assist in the implementation and administration of the MMPA, the Stranding Network has been established to respond to stranded marine mammals within NMFS' Northeast Region of the United States. The Northeast Region consists of the following coastal states and territories: Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania, New Jersey, Delaware, Maryland and Virginia.

B. Scope

1. Under the MMPA, NMFS is responsible for mammals of the **Order Cetacea** and the **Order Pinnipedia** other than walruses (hereinafter marine mammals).
2. The geographic response area assigned to Participant consists of the following: coastal and tidal waters of Virginia, including the Virginia portion of Chesapeake Bay and its tributaries. The Participant may assist in stranding response within the Region outside of their assigned response area, if requested by NMFS or by another Participant. Outside the Northeast Region, the Participant may assist with stranding response upon request from the appropriate NMFS Regional Stranding Coordinator(s).

C. Limitations

1. This Agreement creates an authorization for the Participant to take marine mammals, which would be otherwise prohibited by the MMPA. This taking authorization only applies to the Participant and its authorized personnel (see Article VI) for activities that are consistent with this Agreement.
2. In particular, this Agreement does not authorize:

- a. The taking of any marine mammal species listed as endangered or threatened under the Endangered Species Act of 1973 (ESA), as amended. Authorization to take ESA listed species is provided under an MMPA/ESA Permit No. 932-1489-09, as amended, issued to the NMFS National Marine Mammal Health and Stranding Response Program Coordinator and **requires authorization and direction from the NMFS Regional Stranding Coordinator in the event of a stranding involving a threatened or endangered marine mammal.**
- b. The sale or offer of sale of any marine mammal or marine mammal parts including cells, gametes, or cell cultures.

D. Definitions

All terms used in the Agreement shall be interpreted to have the meaning specified in the MMPA section 3 and section 409 and NMFS implementing regulations 50 CFR 216.3 unless the context or specific language requires otherwise. For ease of reference, those definitions, as well as additional terms and definitions for this Agreement, are provided in Attachment A.

Article II: Purpose and General Responsibilities

A. Purpose of Agreement. NMFS and the Participant enter into this Agreement for the following purposes:

1. To provide for rapid response and investigation of stranded marine mammals (Order Cetacea and Order Pinnipedia) within the Northeast Region in accordance with the purposes and policies of the MMPA.
2. To implement Title IV (Marine Mammal Health and Stranding Response Program) of the MMPA:
 - a. to facilitate the collection and dissemination of reference data on the health of marine mammals and health trends of marine mammal populations in the wild;
 - b. to correlate the health of marine mammals and marine mammal populations in the wild with available data on physical, chemical, and biological environmental parameters; and
 - c. to detect and coordinate effective responses to Marine Mammal Unusual Mortality Events (UMEs).
3. To specify the activities during which the Participant may take stranded marine mammals (Order Cetacea and Order Pinnipedia) or marine mammal parts for the primary purpose of ensuring the appropriate response, rehabilitation, disposition, and utilization of stranded marine mammals or marine mammal parts under MMPA sections 109(h), 112(c), and 403 and the Agreement.
4. To define the nature and extent of services that the Participant will provide NMFS under this Agreement and NMFS' responsibilities to the Participant.
5. To specify the requirements for the preparation and maintenance and reporting of records containing scientific data obtained from dead and live stranded marine mammals or parts from dead stranded marine mammals.
6. To provide for the timely exchange of information for use by both parties and other network members in furthering the objectives of the MMPA under this Agreement.

B. Joint Responsibilities

NMFS and the Participant will work cooperatively to:

1. Implement Title IV of the MMPA;

2. Effectively respond to and investigate the causes and impacts of UMEs;
3. Collect the appropriate data for determination of serious injuries and mortalities due to human interactions;
4. Collect reference data on marine mammal health and diseases;
5. Collect data on the frequency and causes of strandings; and
6. Interpret findings and identify health trends and diseases of concern to include emerging, reportable, and zoonotic diseases.

C. NMFS Responsibilities

NMFS Shall:

1. Provide the Participant with notice of any changes to laws, regulations, policies and/or guidelines applicable to or promulgated by NMFS that may apply to the Participant's activities. This includes criteria for issuance, renewal and termination of stranding agreements. Notwithstanding this provision, it is the responsibility of the Participant to comply with all laws, regulations, policies and/or guidelines that apply to the Participant's activities.
2. Conduct periodic compliance reviews of Stranding Agreements as stated in Article IX.
3. Provide guidance and assistance regarding investigation of marine mammal unusual mortality events including financial and physical resources (example: NOAA laboratory assistance) and financial resources when available and authorized (in accordance with section 405 of the MMPA – UME National Contingency Fund) and in coordination with the Working Group on Marine Mammal Unusual Mortality Events.
4. Alert the Participant when NMFS has been notified that there are diseases of concern that are emerging, reportable, and/or zoonotic within the Northeast Region.
5. Pursuant to criteria established under the MMPA section 407, provide access to the National Marine Mammal Health and Stranding Response Program Database, as developed, and access to marine mammal tissues in the National Marine Mammal Tissue Bank following NMFS data and tissue access procedures and policies.
6. As needed and as resources are available, provide specialized marine mammal stranding response equipment and investigation training on a local, regional or national basis.

7. Pursuant to MMPA section 402, collect and update periodically and make available to stranding network participants and other qualified scientists, existing information on:
 - a. procedures and practices for rescuing and rehabilitating stranded marine mammals;
 - b. species by species criteria used by the stranding network participants, for determining at what point a marine mammal undergoing rescue and rehabilitation is returnable to the wild based on its ability to survive in the wild and risk to the wild population of marine mammals;
 - c. procedures and practices for collecting, preserving, labeling, and transporting marine mammal tissues for physical, chemical, and biological analyses;
 - d. relevant scientific literature on marine mammal health, disease, and rehabilitation;
 - e. compilation and analyses of strandings by region to monitor species, numbers, conditions, and causes of illness and death in stranded marine mammals; and
 - f. other life history and reference level data, including marine mammal tissue analyses that would allow comparison of the causes of illness and death in stranded marine mammals with physical, chemical, and biological environmental parameters.
8. Identify a Northeast Region Marine Mammal Stranding Response Program Coordinator who will serve as the Participant's primary point of contact for notification, coordination, reporting, response and rehabilitation activities as specified throughout this Agreement. The NMFS Regional Administrator will serve as the Participant's primary point of contact for administration of the Agreement, as well as dispositions and other management activities as specified throughout the Agreement. **The NMFS Regional Administrator's designated point of contact for this Agreement is the NMFS Northeast Region Marine Mammal Stranding Coordinator, Northeast Regional Office, Protected Resources Division.** (see Attachment B for contact information).
9. In certain circumstances such as large scale events (e.g. mass stranding, unusual mortality events, live right whale stranding), NMFS may establish a formal Incident Command System (ICS) for response, including the identification of an Incident Commander. Events such as oil spills, NMFS will follow direction from United States Coast Guard (USCG). Opportunities for ICS training can be accessed through the Federal Emergency Management Agency (see <http://www.training.fema.gov/EMIWeb/IS/is100.asp>), USCG, or NMFS. If necessary, guidance will be provided by NMFS on a case-by-case basis.

10. Relay reports of stranded marine mammals (live or dead) within the Participant's geographic range to the Participant and inquire whether the Participant has the capability to respond. If the Participant cannot respond, the Stranding Coordinator may make requests to other regional Stranding Participants to respond.
11. Coordinate regional activities to maximize geographic coverage while facilitating appropriate division of responsibilities among regional Participants according to institutional abilities and authorities.
12. Respond to the Participant's completed requests for authorizations such as requests for parts authorizations, parts transfers, and release determinations.
13. Provide information regarding availability of Prescott Grants and any other relevant NMFS funding opportunities.
14. For emergency stranding events (live or dead), provide and maintain a 24-hour stranding hotline number: 1-866-755-NOAA (6622).

D. Participant Responsibilities

The Participant shall:

1. Comply with laws, regulations, policies and/or guidelines applicable to or promulgated by NMFS that apply to activities under this Agreement; or any Federal, state or municipal laws that pertain to stranding network operations (e.g., municipal water management laws).
2. Cooperate with other members of the Northeast Region Stranding Network and the National Marine Mammal Stranding Program as well as Federal, state, and local officials and employees in matters supporting the purposes of this Agreement.
3. Be subject to the direction of a designated employee (e.g., NMFS Marine Mammal Stranding Coordinator or NMFS Special Agent) representing the NMFS Northeast Regional Administrator or Office of Law Enforcement with respect to the taking of a stranded marine mammal.
4. Manage any and all expenses that the Participant incurs associated with the activities authorized by this Agreement. NMFS does not have funds to reimburse volunteers for expenses incurred in responding to stranding events. However under the marine mammal UME process, funding may be available for costs associated with specific analyses and additional requests in accordance with section 405 of the MMPA UME National Contingency Fund and in coordination with the Working Group on Marine Mammal Unusual Mortality Events. Additionally, competitive funding opportunities for Stranding Network Participants may be available through the Prescott Stranding Assistance Grant Program (see

<http://www.nmfs.noaa.gov/pr/health/prescott/>). Non-competitive funds to supplement equipment and training needs may become available on a year by year basis. NMFS will provide notification of the availability of these funds.

5. Promote human and public safety by taking precautions against injury or disease to any network personnel, volunteers, and the general public when working with live or dead marine mammals.
6. Notify immediately the NMFS Stranding Coordinator upon learning of any diseases of concern (e.g., emerging, reportable, and/or zoonotic diseases) that are detected and/or confirmed that could be a potential hazard for public health or animal health (NMFS will provide guidance on reportable diseases as it becomes available);
7. Transfer of marine mammal parts (50 CFR 216.22 and 216.37):
 - a. Non-diagnostic parts, tissues, cells, gametes, or cell cultures to be used for scientific research, species enhancement, or education shall be transferred only to persons or labs that have received prior written authorization from the NMFS MMPA/ESA scientific research permit or a Regional Parts Authorization Letter. A unique field number assigned by NMFS (e.g., NMFS Registration Number) or the Participant must be marked on or affixed to the marine mammal part or container.
 - b. Diagnostic parts, tissue samples, fluid specimens, parts, or cells may be transferred to labs within the United States for diagnostic use without any additional authorizations.
8. Work cooperatively with the NMFS and the USCG in a hazardous waste spill (i.e., oil spills) ICS if implemented.
9. Notify the NMFS Regional Administrator in writing within 30 days of any changes in its Designee organizations, key personnel (see Attachment A), capabilities, and/or geographic area of response.
10. If requested, the Participant shall coordinate with NMFS to develop and implement a media plan relating to stranding events.
11. Photo documenting (still or video) for other than diagnostic or identification purposes (such as dorsal fin identification, documentation of lesions, scars, etc.) must not interfere or influence the conduct of the stranding responders and response in any way or cause additional harassment to marine mammals.
12. If requested by the NMFS Regional Stranding Coordinator, the Participant will provide copies of any photographs, films, and/or videotapes documenting any stranding, particularly for those strandings when human interactions are

reported or suspected. Reimbursement for this request is subject to negotiation between NMFS and the Participant. Any photography, film and/or videotape of the stranding response use for educational or commercial purposes of stranding response by the Participant should include a credit, acknowledgment, or caption indicating that the stranding response was conducted under a Stranding Agreement between NMFS and the Participant under the authority of the MMPA. NMFS will not reproduce, modify, distribute, or publicly display the photograph, film and/or videotape without consent of the owner, unless required to release a copy under Federal law or order (such as the Freedom of Information Act).

13. By its nature, the handling of stranded marine mammals (dead or alive) is potentially a dangerous activity. The Participant shall indemnify and hold harmless the United States Government from any and all losses, damages, or liability -or claims therefore -on account of personal injury, death, or property damage of any nature whatsoever, arising out of the activities of the Participant, his/her/its employees, his/her/its qualified representatives, designees, subcontractors, volunteers, or agents. Liability for person(s) acting under this agreement is addressed in sections 406(a) and (b) of the MMPA [16 U.S.C. 1421(e)].
14. Provide accurate and honest information in all reports to NMFS.
15. Except where a longer period is specified (e.g., 15 years for rehabilitation cases, see Attachment D *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release – Standard for Rehabilitation Facilities*), maintain records upon which required reports are based for at least 3 years on-site.
16. Upon request by the NMFS Regional Administrator, allow the Regional Stranding Coordinator, other appropriate NMFS employees, or any other appropriate person duly designated by the Regional Administrator, to inspect the facilities and inspect and/or request records that pertain to stranding network activities.
17. Verbally report any right whale sightings that occur or are reported as part of their normal activities. See Attachment B for contact information.

Article III: Dead Animal Response

A. The Participant may take species of marine mammals under the MMPA for the purpose of dead animal investigation and response.

Subject to the conditions contained in this Agreement, the MMPA, and the implementing regulations, the Participant may take dead stranded marine mammals or parts there from for the collection of data on the health and health trends of wild populations, for the detection of marine mammal UMEs, for the detection of signs of human interaction, for research or education on marine mammal biology and life history, for the determination of cause of death, for the detection of human caused and natural mortality, or for other research as deemed appropriate by the NMFS. These activities specifically include: obtaining measurements and biological samples from dead stranded marine mammals; disposing, or assisting in the disposal, of dead stranded marine mammals at an appropriate landfill or other suitable location; and taking and transporting dead stranded or floating dead marine mammals, or parts there from, to facilities or individuals approved pursuant to 50 CFR. 216.22 for scientific research, maintenance in a properly curated, professionally accredited scientific collection, or for educational purposes.

B. Terms and Conditions for Dead Animal Response

1. Response

- a. The Participant shall respond as practicable to reports of dead stranded marine mammals within the geographic range or response specified under Article I, Number B.2. If the Participant is the closest and/or first responder, the Participant is considered to be the on-site coordinating organization and is in charge of all on-site activities. In certain circumstances such as a UME, mass stranding, or endangered marine mammal stranding, NMFS may implement the ICS structure and designate an on-site coordinator to be in charge of the event (see Article II C9). In all situations, the Participant will cooperate with Federal, state and local government officials and employees and other stranding network participants when responding to these strandings. If the Participant receives a verified report of a dead stranded marine mammal and does not have the capability to respond appropriately to the report, the Participant shall notify the NMFS Regional Stranding Coordinator and/or adjacent stranding network participants within 24 hours if feasible.
- b. If the Participant leaves a dead animal at the stranding site or in the case of a UME or mass stranding response, the Participant shall, if feasible, mark each animal with a tag or mark, such as roto-tags or grease stick, to assist with data collection and to prevent multiple reports on the same animal(s).

- c. If requested by NMFS Regional Stranding Coordinator and if feasible and practicable, the Participant will assist with stranding response in neighboring areas outside the Participant geographic range (specified in Article I B2).

2. Data Collection and Reporting. The Participant shall collect and provide the following information for each stranded marine mammal they respond to:

- a. Complete the NOAA Form 89-864, OMB #0648-0178 (the Marine Mammal Stranding Report - "Level A" Form) for each stranded marine mammal. Completed forms shall be sent to the NMFS Regional Stranding Coordinator via the NMFS National Marine Mammal Stranding Database or in writing (see Attachment B), no later than 30 days after responding to the stranding event. If requested by the NMFS Regional Stranding Coordinator and if feasible, the Participant shall provide preliminary data (verbal or written) from the Level A - Marine Mammal Stranding Report within 24 hours.
- b. As resources are available, collect additional Level B and Level C data.
- c. Notify the Regional Stranding Coordinator of the following cases within 24 hours or according to the specific reporting guidance provided by the Stranding Coordinator:
 - 1. possible or confirmed human interactions (including military activity),
 - 2. suspected UMEs,
 - 3. extralimital or out-of-habitat situations,
 - 4. mass stranding events and/or mass mortalities,
 - 5. large whale strandings, and
 - 6. any stranding involving endangered or threatened species or identified species of concern.
- d. In certain circumstances (e.g., listed or rare species stranding, UME, possible human interaction case, extralimital or out-of-habitat situation), the NMFS Regional Stranding Coordinator may request necropsies be conducted by a Necropsy Team Leader, or that additional and expedited reporting (verbal or written) of Level B and C data such as analytical results and necropsy reports if available. NMFS will not reproduce, modify, distribute, or publish the data without consent of the Participant unless required to release the data under Federal law or order (such as the Freedom of Information Act);
- e. Collect and make available any gear, debris, or other objects (e.g., bullets, arrows, net webbing, etc.) recovered from a stranded marine mammal that may be evidence of human interaction. The Participant must comply with chain of custody procedures

or any other instructions as specified and supported by NMFS Northeast Region and/or NMFS Office of Law Enforcement personnel.

3. **Parts Disposition.** Diagnostic parts, tissue samples, fluid specimens, parts or cells may be transferred to labs within the United States for diagnostic use without any additional authorizations. For non-diagnostic parts or samples:
 - a. **Retention:** Marine mammal parts may be retained by the Participant for education and/or research purposes, provided they are properly indicated in the "Specimen Disposition" field of NOAA Form 89-864, OMB #0648-0178 (the Marine Mammal Stranding Report - "Level A" Form). Parts and/or containers must be marked with the field identification number assigned by the Participant or by NMFS (i.e., NMFS registration number). Authorization to take parts from ESA listed species in the Northeast Region is currently provided under MMPA/ESA Permit No. 932-1489-09, as amended, issued to the NMFS Marine Mammal Health and Stranding Response Program Coordinator, and requires authorization and direction from the NMFS Regional Stranding Coordinator in the event of a stranding involving a threatened or endangered marine mammal, prior to any action by the Participant.
 - b. **Transfer:** Report to the NMFS Regional Administrator (See Attachment B) within 30 days of the stranding event, the transfer of any parts salvaged from the stranded marine mammal collected under this Agreement as required by 50 CFR 216.22 or 50 CFR 216.37. The Participant must provide the institution name where specimen materials have been deposited and ensure that the retained or transferred parts are marked with the field identification number or assigned NMFS Registration number in the "Specimen Disposition" field on the NOAA Form 89864, OMB #0648-0178 (the Marine Mammal Stranding Report - Level "A" Form) and ensure that retained or transferred parts are marked with the field identification number or the NMFS Registration Number. If parts are being transferred, the Participant must ensure the receiving institution is authorized by the NMFS Regional Administrator to receive marine mammal parts.
4. **Site cleanup.** The Participant shall make every reasonable effort to assist in the clean up of beach areas where their activities (e.g., necropsy or specimen collection) under this Agreement that may contribute to soiling of the site.

Article IV: Live Animal Response – First Response

A. The Participant may take species of marine mammals covered under the MMPA for the purpose of live stranding first response (initial assessment and care at the site of stranding and assist in the appropriate disposition of the animal), beach triage, beach release, temporary holding for assessment and triage, translocation and/or transportation to a NMFS authorized rehabilitation center within the Northeast Region.

1. The Participant must take live stranded marine mammals in a humane manner (as defined in 50 CFR 216.3, see Attachment A) for the protection or welfare of the marine mammal. If the animal dies during the course of response and/or investigation, then the terms and responsibilities contained in Article III of this Agreement become operative. In addition to the activities authorized in Articles I, II, and III, the Participant is authorized to implement the following activities under this article:
 - a. Take measurements and collecting blood or other diagnostic samples from live stranded marine mammals for health assessment.
 - b. Return live stranded marine mammals, as directed by the NMFS Regional Stranding Coordinator, to their natural habitat and tagging such animals.
 - c. Transport live stranded marine mammals for rescue and rehabilitation to a NMFS approved rehabilitation facility or temporary holding facility.
 - d. Perform humane euthanasia. Euthanasia shall only be performed by the attending veterinarian or by a person acting under the direction of the attending veterinarian and following approved guidelines such as those referenced in Attachment C (2007 Report of the American Veterinary Medical Association Panel on Euthanasia, 2nd Edition of the CRC Handbook of Marine Mammal Medicine, 2006 Journal of the American Association for Zoo Veterinarians). When using controlled drugs, such person(s) shall comply with all applicable state and Federal laws and regulations (i.e., registered with the Drug Enforcement Administration). Authorization for euthanasia of ESA-listed species provided under MMPA/ESA Permit No. 932-1489-09, as amended, and requires prior approval and direction from the NMFS Regional Stranding Coordinator.
2. This Agreement does not authorize any projects involving “intrusive research” (as defined in 50 CFR 216.3). Measurements or sampling for scientific research purposes (i.e., outside the scope of accepted diagnostic and treatment practices for the care of an animal) must be authorized under a NMFS MMPA/ESA scientific research permit.

B. Terms and Conditions for Live Stranding - First Response

1. Response

- a. The Participant shall respond to reports of live stranded marine mammals (Order Cetacea and Order Pinnipedia). If the Participant is the closest and/or first responder, the VAQS is considered to be the on-site coordinator and is in charge of all on-site activities. In certain circumstances such as a UME, mass stranding, or endangered marine mammal stranding, NMFS may implement the ICS structure and designate an on-site coordinator to be in charge of the event (see Article II C9). In all situations, the Participant will cooperate with Federal, state and local government officials and employees and other stranding network participants when responding to these strandings. If the Participant receives a verified report of a live stranded marine mammal and does not have the capability to respond appropriately to the report, the Participant shall notify the NMFS Regional Stranding Coordinator without delay. Also, if the NMFS Regional Stranding Coordinator receives a report of a live stranded marine mammal, the Regional Stranding Coordinator may contact the Participant to determine whether the Participant has the capability to respond to the stranding. If the Participant cannot respond in a timely manner, the NMFS Regional Stranding Coordinator may request another Stranding Network participant to respond.
- b. The Participant shall take all steps reasonably practicable under the circumstances to prevent further injury to any live stranded marine mammal, injury to any network personnel, volunteers, government personnel and the general public.
- c. The Participant shall tag or mark any animals that are immediately released to their natural habitat using a NMFS approved tag, such as one-bolt roto tag, cattle ear tags, or freeze branding. Application of other tagging methods must first be approved by the NMFS Regional Stranding Coordinator. Tagging and post-tagging activities are restricted to monitoring the success of marine mammals released to the wild. Any projects outside the scope of monitoring the success of a release must be authorized under a NMFS MMPA/ESA scientific research permit.
- d. If the Participant determines that it is necessary to temporarily hold or triage a stranded marine mammal at a separate site from the NMFS approved rehabilitation facility, the animal(s) cannot be moved until the Participant obtains verbal approval from the NMFS Regional Stranding Coordinator.

- e. Written documentation of the need for an interim location and written concurrence from the NMFS Regional Stranding Coordinator with any associated conditions must be provided at the earliest time practicable within 24 hours.
 - f. If the Participant considers responding to an “out-of-habitat” or free-swimming marine mammal in distress (e.g., entanglement), the Participant must first contact the NMFS Regional Stranding Coordinator for approval and discuss plans for live capture and/or needs for assistance. The NMFS Regional Stranding Coordinator may require a NMFS employee to be present at the time of capture.
 - g. The Participant shall follow the guidance provided by the Northeast Region in Attachment E, Disposition of Live Stranded Marine Mammals, and shall consult with the NMFS Stranding Coordinator and the attending veterinarian to make a determination regarding immediate release, rehabilitation, or euthanasia of live stranded marine mammals or cetaceans.
2. **Data Collection and Reporting.** The Participant shall collect and provide the following information for each stranded marine mammal they respond to:
- a. Complete the NOAA Form 89-864, OMB #0648-0178 (the Marine Mammal Stranding Report - “Level A” Form) for each stranded marine mammal. Completed forms shall be sent to the NMFS Regional Stranding Coordinator via the NMFS National Marine Mammal Stranding Database or in writing (see Attachment B), no later than 30 days after responding to the stranding event. If requested by the NMFS Regional Stranding Coordinator and if feasible, the Participant shall provide preliminary data (verbal or written) from the Level A - Marine Mammal Stranding Report within 24 hours.
 - b. If temporarily holding a stranded animal prior to transferring to a NMFS approved rehabilitation facility acting in accordance with this Article, the Participant shall complete the NOAA Form 89878, OMB # 0648-0178 (the Marine Mammal Rehabilitation Disposition Report). This report shall be sent to the NMFS Regional Stranding Coordinator via the NMFS National Marine Mammal Stranding Database or in writing (see Attachment B), no later than 30 days after responding to the stranding event. If requested by the NMFS Regional Stranding Coordinator and if feasible, the Participant shall provide preliminary data (verbal or written) from the Marine Mammal Rehabilitation Disposition Form within 24 hours.
 - c. As resources are available, collect additional Level B and Level C data.

- d. Notify the NMFS Regional Stranding Coordinator of the following cases within 24 hours or according to the specific reporting guidance provided by the Stranding Coordinator:
 - 1). possible or confirmed human interactions (including military activity),
 - 2). suspected UMEs,
 - 3). extralimital or out-of-habitat situations (see B.1.e. of this Article),
 - 4). mass stranding events and/or mass mortalities,
 - 5). large whale strandings, and
 - 6). any stranding involving endangered or threatened species or identified species of concern.
 - e. In certain circumstances (e.g., UME, possible human interaction case, extralimital or out-of-habitat situation), the NMFS Regional Stranding Coordinator may request additional and expedited reporting (verbal or written) of Level B and C data such as analytical results and necropsy reports if available. NMFS will not reproduce, modify, distribute, or publish the data without consent of the Participant unless required to release the data under Federal law or order (such as the Freedom of Information Act);
 - f. Collect and make available any gear, debris, or other objects (e.g., bullets, arrows, net webbing, etc.) recovered from a stranded marine mammal that may be evidence of human interaction. The Participant must comply with chain of custody procedures or any other instructions as specified and supported by NMFS Northeast Region and/or NMFS Office of Law Enforcement personnel.
4. **Site Cleanup.** The Participant shall make every reasonable effort to assist in the clean up of beach areas where their activities (e.g., euthanasia, necropsy, or specimen collection) under this Agreement.

Article V: Live Animal Response – Rehabilitation and Final Disposition

A. The Participant may take live stranded marine mammals in a humane manner with the goal of rehabilitation and release. If the animal dies during the course of rehabilitation, then the terms and responsibilities contained in Article III of this Agreement become operative. In addition to the activities authorized in Articles I, II, III, and IV of this Agreement and subject to the conditions contained in this Agreement, the MMPA, and the implementing regulations, the Participant is authorized to implement the following activities under this article:

1. In accordance with applicable regulations and NMFS guidelines and best practices, transfer marine mammals to another NMFS approved rehabilitation facility within the Northeast Region for:
 - a. release back to the wild;
 - b. temporary placement in a scientific research facility holding a current NMFS scientific research permit and a United States Department of Agriculture Animal and Plant Health Inspection Service (APHIS) Research License; or
 - c. permanent disposition at an authorized facility (i.e. holds an APHIS exhibitors license {7 U.S.C. 2131 *et seq.*}) after consultation with, and authorization by, the NMFS Office of Protected Resources Permits, Conservation and Education Division.
2. Conduct scientific research on stranded animals in a rehabilitation facility, only if the responsible individual has a NMFS scientific research permit and the facility holds an APHIS research license in accordance with the Animal Welfare Act (see 50 CFR 216.27 (c)(6)).
3. Return rehabilitated stranded marine mammals to their natural habitat. A decision regarding whether or not a marine mammal has the potential to be released must be made as early as possible during the rehabilitation period. Any marine mammal eligible for release must be released as early as possible and no later than six months after being taken for rehabilitation unless the attending veterinarian determines that: the marine mammal might adversely affect marine mammals in the wild; release is unlikely to be successful due to the physical condition and behavior of the marine mammal; or more time is needed to make a determination. Release plans must be submitted to the NMFS Regional Administrator at least 15 days prior to the release, unless advanced notice is waived by the NMFS Regional Administrator. The NMFS Regional Administrator may require the participant to provide additional information, modify the release plan, or dispose of the marine mammal in another manner (see 50 CFR 216.27(a) and the *NMFS/FWS Best*

Practices for Marine Mammal Stranding Response, Rehabilitation, and Release – Standards for Release.)

4. Tag rehabilitated stranded marine mammals, strictly for purposes of monitoring success of release to the wild using a NMFS approved tag, such as one-bolt roto-tag, cattle ear tags, or freeze branding. Application of other tagging methods must first be approved by the NMFS Regional Stranding Coordinator. Tagging and post-tagging activities are restricted to monitoring the success of marine mammals released to the wild. Any projects outside the scope of monitoring the success of a release must be authorized under a NMFS MMPA/ESA scientific research permit.
5. Perform humane euthanasia. Euthanasia shall only be performed by the attending veterinarian or by a person acting under the direction of the attending veterinarian and following approved guidelines such as those referenced in Attachment C (*2007 Report of the American Veterinary Medical Association Panel on Euthanasia, 2nd Edition of the CRC Handbook of Marine Mammal Medicine, 2006 Journal of the American Association for Zoo Veterinarians*). When using controlled drugs, such person(s) shall comply with all applicable state and Federal laws and regulations (i.e., registered with the Drug Enforcement Administration). Authorization for the euthanasia of ESA-listed species provided under MMPA/ESA Permit No. 932-1489-09, as amended, and requires prior approval and direction from the NMFS Regional Stranding Coordinator.

B. Terms and Conditions for Live Animal Response: Rehabilitation, Release, or Final Disposition Determination

1. Rehabilitation

- a. The Participant shall comply with laws, regulations, policies, and/or guidelines applicable to or promulgated by NMFS that apply to activities under this Agreement. The Participant must also have all applicable Federal, state, and local permits for rehabilitation facilities, and must comply with all Federal, state, and municipal laws related to operations of the facility.
- b. The Participant shall be responsible for the custody of any living marine mammal taken pursuant to this Article using standards for humane care and for practicing accepted medical evaluation and treatment as described in the *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release – Standard for Rehabilitation Facilities* (Attachment D).
- c. The Participant shall not exceed their maximum holding capacity for cetaceans and pinnipeds based on the minimum standard space requirements, the number of animals housed in each holding area, and the availability of qualified personnel as described in the *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release – Standard*

for Rehabilitation Facilities (Attachment D) unless a written waiver is first received from the NMFS Regional Administrator. The NMFS Regional Stranding Coordinator may offer assistance for relocating animals to another rehabilitation facility and in supporting decisions to euthanize when necessary. Other considerations for determining maximum holding capacity include:

- (1) On-site veterinary care, volunteer support, and experienced staff;
 - (2) Adequate food and medical supplies and medical test capabilities;
 - (3) Isolation for marine mammals;
 - (4) Adequate water quality;
 - (5) Limited public access; and
 - (6) Ability to maintain current, accurate and thorough records.
- d. The Participant shall follow contingency plans approved by NMFS for the care of marine mammals in rehabilitation during planned events (e.g., construction) or unexpected events such as mass strandings, UMEs, natural disasters (e.g., hurricanes, harmful algal blooms, El Niño), and/or hazardous waste spills.
- e. The Participant shall isolate rehabilitating marine mammals from other wild or domestic animals and from any animal in permanent captivity.
- f. The Participant shall prohibit the public display and training for performance of stranded rehabilitating marine mammals as required by 50 CFR 216.27(c)(5). This includes any aspect of a program involving interaction with the public.
- g. The Participant shall follow any additional requirements for rehabilitation (e.g. isolation) and release prescribed by NMFS in consultation with the Working Group for Marine Mammal Unusual Mortality Events during a marine mammal UME, as recommended in the *National Contingency Plan for Response to Unusual Marine Mammal Mortality Events*; D.W. Wilkinson, NOAA Technical Memorandum NMFS-OPR-9, September 1996.
- h. The Participant must temporarily refuse admittance of new cases of stranded marine mammals due to the severity of a disease outbreak when instructed by the NMFS Regional Stranding Coordinator, in consultation with the UME Working Group or other experts, if diseases of concern have been reported (e.g. diseases associated with a UME, or any emerging or zoonotic diseases).
- i. The Participant shall not transfer a marine mammal being rehabilitated

under this Agreement to another facility without prior approval from the NMFS Regional Stranding Coordinator.

- j. If a marine mammal dies while in rehabilitation, Article III applies.

2. Release

- a. Release Recommendation. The Participant shall make a final written recommendation for each animal in rehabilitation as early as possible, and no more than six months after its date of rescue, for release or non-release determination to the NMFS Regional Administrator according to any applicable NMFS release guidelines and regulations including 50 CFR 216.27 (release, non-releasable, and disposition under special exception permits for rehabilitated marine mammals). This final recommendation shall include a release recommendation signed by the Participant's attending veterinarian, attesting that the marine mammal is medically and behaviorally suitable for release in accordance with the NMFS Standards for Release, and a concurrence signature from the Participant's Authorized Representative or Signatory of the Stranding Agreement (see Attachment D, *NMFS /FWS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release – Standards for Release*).
- b. Release Plan. If the Participant recommends release, a release plan must also be included with the final recommendation letter. This information must be submitted to and approved by the NMFS Regional Administrator at least 15 days prior to the release, unless advanced notice is waived by the NMFS Regional Administrator, as required by 50 CFR 216.27(a).

3. Data Collection and Reporting

- a. Diseases of Concern Reporting. The Participant shall notify immediately the NMFS Regional Stranding Coordinator upon learning of any diseases of concern (e.g., emerging, reportable, and/or zoonotic diseases) that are detected and/or confirmed that could be a potential hazard for public health or animal health (NMFS will provide guidance on Reportable Diseases);
- b. Disposition Reports. Upon release or other disposition of any marine mammal under this Article, the Participant shall complete the NOAA Form 89878, OMB # 0648-0178 (the Marine Mammal Rehabilitation Disposition Report Form). Completed forms shall be sent to the NMFS Regional Stranding Coordinator via the NMFS National Marine Mammal Stranding Database or in writing (see Attachment B), no later than 30 days after final disposition of the marine mammal. If requested by the NMFS Regional Stranding Coordinator and if feasible, the Participant shall provide preliminary data (verbal or written) from the Marine Mammal Rehabilitation Disposition Report within 24 hours.

- c. Annual Summary Reports. The Participant shall submit an annual report (due January 31 each year) summarizing the Participant's rehabilitation activities for the past calendar year. NMFS will not reproduce, modify, distribute, or publish the data without consent of the Participant unless required to release the data under Federal law or order (such as the Freedom of Information Act). The reports shall include the following for each animal in rehabilitation:
- i. Species and field number
 - ii. If the animal was released:
 - a. Date, location of release (latitude and longitude).
 - b. Type and specifics of post-release monitoring (roto-tag, satellite, etc.) and any roto-tag or freeze brand numbers used.
 - c. Photos if possible.
 - d. Duration of post-release monitoring.
 - e. Status of post-release monitoring.
 - f. Indications from monitoring relative to the success of the rehabilitation effort.
 - g. Disposition of tracking data if applicable.
 - iii. If the animal was transferred to permanent care:
 - a. Date of physical transport (if applicable).
 - b. Location of permanent care.
 - iv. If the animal was euthanized, provide the date of euthanasia.
 - v. If the animal died, provide the date of death.

Article VI: Good Standing Agreement

Northeast Region Marine Mammal Stranding Network Good Standing Agreement

To be considered in “good standing” the Northeast Marine Mammal Stranding Network Member (Network Member) must meet all of the following criteria:

General Criteria

- (1) If the Network Member is a designated Principal Investigator of an MMPA or Endangered Species Act (ESA) scientific research or enhancement permit holder, the applicant must have fulfilled all permit requirements, including but not limited to submission of all reports, and must have no pending or outstanding enforcement actions under the MMPA or ESA.
- (2) The Network Member must comply with the terms and responsibilities of its Stranding Agreement (SA), MMPA Section 109(h) authorization, or researcher authorization letter. This includes, but is not limited to, the following response and reporting requirements:
 - a. Timely (within 24 hours) response to all stranding reports in Network Member’s area of responsibility in accordance with SA;
 - b. Respond to stranding in an effective manner that protects both the health and safety of the responders and the stranded animals;
 - c. Timely (immediate) notification to NMFS regarding any unusual stranding circumstances (UME, out of habitat, large cetacean stranding, etc) according to the timelines as specified in the SA;
 - d. Adhere to the *Policies and Best Practices for Marine Mammal Stranding Response, Rehabilitation and Release*;
 - e. Reporting of stranding events to NMFS as specified in SA;
 - f. Submission of complete reports on basic or Level A data to the Regional Coordinator (includes investigator’s name, species, stranding location, number of animals, date and time of stranding and recovery, length and condition, and sex; marine mammal parts retention or transfer; annual reports) as specified in SA;
 - g. Collecting information or samples as necessary and as requested; and
 - h. Prompt notification to NMFS for any article of SA (or points above) with which the Network member cannot comply.
- (3) The Network Member must cooperate with NMFS in collecting and submitting Level B (supplementary information regarding sample collection related to life history and to the stranding event) and Level C (necropsy results) data and samples, when requested and within the requested timeframe.
- (4) The Network Member must have no current enforcement investigation for the ‘take’ of marine mammals in violation of the Marine Mammal Protection Act and Endangered Species Act.

- (5) The Network Member must have no record of a pending NMFS notice of violation(s) regarding the policies governing the goals and operations of the Stranding Network and Stranding Agreement, if applicable (e.g., probation, suspension, or termination).

Coordination and Cooperation Criteria

The following coordination/cooperation requirements must be satisfied:

- (1) Cooperation with state, local, and Federal officials;
- (2) Cooperation with state and local officials in the disposition of stranded marine mammals; and
- (3) Cooperation with other stranding network participants.

If the Network Member feels they are in danger of not being in “good standing”, please refer to *Communication Agreement*.

If NMFS determines a Network Member is in danger of not being in “good standing”:

1. The Network Member will receive a written warning from the Regional Administrator
2. The Network Member must reply to this warning within 30 days
3. The reply must include remediation efforts with a proposed timeline
4. Efforts and timeline must be agreed to by the Regional Administrator

If the Network Member fails to meet the timeline, and no further remediation letter is received from the Network Member, the Network Member will no longer be considered in “good standing”.

AGREEMENT

I have read and understand the conditions above for participating as a member of the Northeast Region Stranding Network. I agree to abide by all applicable provisions of the Good Standing Criteria established by National Marine Fisheries Service Northeast Region. By signing this agreement I understand and acknowledge the consequences of not complying with The Good Standing Criteria will lead to ineligibility for Prescott Grant funding and suspension or termination of the Stranding Network Member’s SA.

Article VII: Communications Agreement

Northeast Region Marine Mammal Stranding Program Communication Agreement

If the Northeast Marine Mammal Stranding Network Member (Network Member) foresees a problem or potential for non-compliance with their Stranding Agreement (SA), the Network Member will notify NOAA's National Marine Fisheries Service (NMFS) regional stranding staff immediately, no matter how small the problem. Should a Network Member foresee a problem or potential for non-compliance with their SA, the Network Member must:

1. Contact Marine Mammal Stranding Coordinator, or if not available;
 2. Contact Assistant Stranding Coordinator, or if not available;
 3. Contact Marine Mammal Stranding Data Assistant Coordinator.
- * If an emergency situation; call the Stranding HOTLINE: 866-755-6622**

If NMFS foresees a problem or potential for non-compliance with a Network Members SA, NMFS will provide a written warning to the Network Member (see Good Standing Criteria) and will work with the Network Member to identify the deficiency as:

1. Minor
2. Intermediate
3. Major

Minor Deficiency : a deficiency that will likely require little or no time to correct. Minor deficiencies have little impact on the operational capability of the Network Member and do not directly affect the rescue or care of live animals or the collection of data from live and dead animals.

Intermediate Deficiency : a deficiency that may require a short period of time to correct (less than 6 months) and require a small amount of resources (expense) to address. Intermediate deficiencies may cause the Network Member to become non-compliant with the NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release and may impact the operational capability of the Network Member. These deficiencies may also affect the rescue and care of live animals and data collection capabilities from live and dead stranded animals.

Major Deficiency : a deficiency that will require a prolonged period of time to correct (greater than 6 months) and require significant resources (expense) to address. Major deficiencies will cause the Network Member to become non-compliant with Federal, state and local laws and regulations as well as the NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release and will impact the operational capability of the Network Member. These deficiencies will likely be controversial and affect the

rescue and care of live animals and data collection capabilities from live and dead stranded animals.

The roles and responsibilities for each level of deficiency is as follows:

Minor Deficiency

Network Member responsibilities

1. Notify NMFS Regional Stranding Staff immediately
2. Submit remediation efforts within timeframe specified by NMFS
3. Work with NMFS on correcting the problem
4. Keep NMFS informed of progress on meeting deadline (if applicable)
5. Notify NMFS immediately if problem progresses or new issues develop
6. Submit report verifying steps taken to correct deficiency and future steps to prevent deficiency from reoccurring

NMFS responsibilities

1. NMFS staff will provide consultation to help correct problem if applicable
2. NMFS staff will develop timeline for corrective measures and consider an extension if requested

Intermediate Deficiency

Network Member responsibilities

1. Notify NMFS Regional Stranding Staff immediately
2. Develop an Action Plan to correct the problem, in consultation with NMFS
3. Keep NMFS informed of progress on meeting deadlines (if applicable)
4. Notify NMFS immediately if problem progresses or new issues develop
5. Seek guidance from NMFS staff or external experts
6. Submit report verifying steps taken to correct deficiency and future steps to prevent deficiency from reoccurring

NMFS responsibilities

1. NMFS staff will provide consultation to help correct problem if applicable
2. NMFS will develop a timeline for corrective measures and consider an extension if requested
3. NMFS staff will work with Network Member to identify cause of problem and identify solutions
4. Seek guidance from additional NMFS staff or external experts

Major Deficiency

Network Member responsibilities

1. Notify NMFS Regional Stranding Staff immediately
2. Develop an Action Plan to correct the problem, in consultation with NMFS
3. Keep NMFS informed of progress on meeting deadlines (if applicable)
4. Notify NMFS immediately if problem progresses or new issues develop
5. Seek guidance from NMFS staff or external experts
6. Convene other staff members to meet with NMFS to address problems: such as board members, attending veterinarians and veterinary technicians, upon request.
7. Provide requested data and files to NMFS as requested.
8. Submit report verifying steps taken to correct deficiency and future steps to prevent deficiency from reoccurring

NMFS responsibilities

1. NMFS staff will provide consultation to help correct problem if applicable
2. NMFS will develop a timeline for corrective measures and consider an extension if requested
3. NMFS staff will work with Network Member to identify cause of problem and identify solutions
4. Outside consultation from experts in the field may be sought to help address solutions to deficiencies
5. If applicable, NMFS staff will seek consultation of NOAA Office of Law Enforcement and General Council

If deadlines are disregarded without correction of deficiency, the Network member will be subject to disciplinary action: probation, suspension and/or termination (as outlined in the SA). NMFS will make every effort to notify the Network Member in writing of failure to comply with agreed upon remedies for deficiency. In cases of willfulness, or those in which public health, interest, or safety requires immediate attention, NMFS, Northeast Regional Administrator reserves the right to immediately suspend or terminate the Network Member's stranding agreement (as outlined in the SA).

AGREEMENT

I have read and understand the conditions above for participating as a member of the Northeast Region Stranding Network. I agree to abide by all applicable provisions of the Communication Agreement established by National Marine Fisheries Service Northeast Region.

Article VIII: Participant's Authorized Personnel

A. Personnel and Volunteers

Takings of marine mammals authorized in this Agreement may only be directed by the Participant's personnel and trained volunteers identified by the Participant in writing to the NMFS Regional Administrator. The Participant may use other (i.e., not previously identified to NMFS) volunteers to carry out activities in this Agreement only if they are under the close direction of previously identified trained personnel or volunteers. The Participant may not delegate authority to take marine mammals to another person except as provided in this article.

In the event of changes in key personnel, the prospective Participant shall notify the NMFS Regional Administrator in writing (see Attachment B) within 30 days and provide a description of the experience of new key personnel for review and approval by NMFS. New key personnel must meet the qualification terms identified in the *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release - Evaluation Criteria for a Marine Mammal Stranding Agreement* (Attachment D).

B. Untrained Citizens

If the Participant requests the assistance of untrained citizens (e.g., during a mass stranding), the Participant is responsible for the actions of those citizens during the response; must take precautions against injury or disease to those volunteer citizens; and must ensure that the citizens' actions do not cause unnecessary harassment of marine mammals.

Article IX: Rights of States and Local Governments

Rights of States and Local Governments

Nothing in this Agreement shall be construed to affect the rights or responsibilities of other Federal, state, or local government officials or employees acting in the course of their official duties with respect to taking of marine mammals in a humane manner (including euthanasia) for protection or welfare of the marine mammal, protection of public health and welfare or non-lethal removal of nuisance animals (MMPA section 109(h)).

Article X: Effective Dates, Renewal and Application Procedures

A. Effective Date

The terms of this Agreement shall become effective upon the signature by both VAQS and the NMFS Northeast Regional Administrator.

B. Period of Agreement

1. **Duration:** Unless terminated as provided in this Agreement, this Agreement shall expire at the end of the following applicable period:
 - 1 year for new Stranding Network Participants
 - 1 year for a Stranding Network Participant on probation
 - 3 years for a live animal responder and rehabilitator (Articles IV and V)
 - 6 years for a dead animal only responder (Article III only)
2. **Stranding Agreement Renewals:** No later than 90 days prior to the expiration date of this Agreement, NMFS will provide the Participant with a written notice of expiration, and prescribe information needed from the Participant for renewal (see *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release - Evaluation Criteria for a Marine Mammal Stranding Agreement*, Attachment D). No later than 60 days prior to the expiration date, the Participant shall indicate in writing to NMFS (see Contacts, Attachment B.) that a renewal of this Agreement is requested and shall provide the prescribed information. Following NMFS review of the submitted information to determine if Participant meets applicable requirements, the Agreement may be renewed if agreed to in writing by both parties.

If no written renewal request is received from the Participant, this Agreement becomes null and void upon the above expiration date.

3. **Denial of Stranding Agreement Renewal:** The decision to renew or deny a Stranding Agreement is solely at the discretion of the NMFS Regional Administrator and is not compelled by the Participant's adherence to the Stranding Agreement criteria. If the NMFS Regional Administrator denies a renewal request, the denial will be issued in writing by certified mail from the NMFS Regional Administrator to the Participant within 30 days of the Participant's submission of a completed application, and will be based upon the Regional Administrator's judgment of:
 - a. Past performance of the Participant;
 - b. Existing capabilities of the Participant; and
 - c. Geographic and programmatic needs of NMFS' stranding program.

A Stranding Agreement for which renewal is denied by the NMFS Regional Administrator becomes null and void upon the expiration date listed above.

Article XI: Review, Modification and Termination

A. Review

The NMFS Northeast Region ARA for Protected Resources shall review this Agreement from time to time for performance adequacy and effectiveness.

B. Modification

The Participant or the Northeast Regional Administrator may request a modification to the Stranding Agreement, including, but not limited to, procedural or administrative changes, such as a change in contact information, and a request for expansion or reduction of activities authorized by this Agreement. A request for authority for additional activities may require submission of information identified in Attachment D, *NMFS Best Practices for Marine Mammal Stranding Response, Rehabilitation, and Release - Evaluation Criteria for a Marine Mammal Stranding Agreement*. Modifications and reductions in authority, as well as notice of issuance or denial of a request for increased authorizations, will be given in writing within 30 days of receipt of a completed request. The Participant and the NMFS Regional Administrator may determine that a new Stranding Agreement is warranted.

C. Suspension or Termination request by Participant

The Participant may request suspension of all or part of this Stranding Agreement for a stated period of time, or may terminate this Agreement, upon 30 days written notice to the NMFS Regional Administrator. Suspension of the authorization of activities at the request of the Participant may be given without prejudice to the reinstatement of authorization or renewal of a Stranding Agreement.

D. Non-Compliance with Stranding Agreement or Violations of Law by Participant

Except in cases of willfulness, or those in which public health, interest, or safety requires immediate suspension, or termination of this Agreement, NMFS shall provide the Participant with notice and an opportunity to correct any deficiencies within a time period specified by NMFS, in writing, if the Participant fails to satisfy the terms and condition of this Agreement or violates any laws, regulations, or guidelines applicable to this Agreement, or Federal, state or municipal laws related to stranding network operations. The NMFS Region may take the following actions based on the circumstances:

1. **Probation.** The Participant may be put on probation for up to three years if deficiencies are not corrected. The NMFS Regional Stranding Coordinator and the Participant will develop a timetable with reasonable and measurable milestones that must be achieved to correct deficiencies during the probation period. Probation requires annual reviews of the Participant's activities for up to three years.

A participant on probation may not be in “good standing” with the Stranding Network.

2. **Suspension.** The NMFS Regional Administrator may suspend the Participant’s authority, or any portion of their authority, as appropriate (e.g., suspend rehabilitation authority, but not live or dead animal response), with 30 days written notice, for up to 1 year or until NMFS is satisfied that all deficiencies and violations have been adequately addressed. A notice of suspension listing deficiencies and a timetable with reasonable and measurable milestones required to correct those deficiencies will be issued in writing, delivered in person or by certified mail, from the NMFS Regional Administrator if, in the judgment of the Regional Administrator, the Participant has:
 - a. Submitted false information or statements in applications or reports;
 - b. Not satisfied the terms and conditions of the Stranding Agreement;
 - c. Failed to correct deficiencies in a timely manner; or
 - d. Violated applicable Federal, state, or municipal laws, regulations, guidelines, or other requirements.

A participant on suspension is not in “good standing” with the Stranding Network.

3. **Immediate suspension.** The NMFS Regional Administrator may require immediate suspension of authorization under a Stranding Agreement, or any part of the Agreement, without prior notice if, in the judgment of the Regional Administrator, suspension is needed to protect marine resources, in cases of willfulness, or as otherwise required to protect public health, welfare, interest, or safety, (which includes interest in the welfare of marine mammals). During the suspension period, the NMFS Regional Stranding Coordinator may ask other Stranding Network participants to respond in the Participant’s area of geographic coverage. If the Participant’s Stranding Agreement is suspended while animals are in rehabilitation, NMFS reserves the right to either confiscate the animals or to arrange for another participant to take over rehabilitation or take custody of the animals. A written notice of immediate suspension will be issued in person or by certified mail.

A participant on immediate suspension is not in “good standing” with the Stranding Network.

4. **Termination.** The NMFS Regional Administrator may terminate this Agreement, or any part thereof, upon at least 30 days written notice to the Participant, delivered in person or by certified mail. The Agreement may be terminated for any reason, including the Participant’s:
 - a. Submission of false information or statements in applications or reports;

- b. Failure to satisfy the terms and conditions of the Stranding Agreement;
- c. Failure to correct deficiencies in a timely manner; or
- d. Violation of applicable Federal, state, or municipal laws, regulations, guidelines, or other requirements.

The NMFS Regional Stranding Coordinator may ask another Stranding Network participant to respond in the Participant's area of geographic coverage. If the Participant's Stranding Agreement is terminated while animals are in rehabilitation, NMFS reserves the right to either confiscate the animals or to arrange for another participant to take over rehabilitation of or to take custody of the animals.

Termination of the Agreement for any reason shall automatically terminate any designations by the Participant to any designee organizations under this Agreement.

Acceptance of Agreement

Pursuant to the terms and conditions described above in this Stranding Agreement between the Northeast Region and Virginia Aquarium & Marine Science Center the Participant is authorized:

- Under Article III to response to strandings of dead marine mammals (Order Cetacea and Order Pinnipedia);
- Under Article IV to provide first response to live stranded marine mammals;
- Under Article V to rehabilitate and release live stranded marine mammals (Order Pinnipedia).

THIS STRANDING AGREEMENT IS ENTERED INTO AND MADE EFFECTIVE THIS

In Reply Refer To:
FWS/Region 5/ES-TE

DEC 06 2013

Mr. John K. Bullard
Regional Administrator
National Marine Fisheries Service
1 Blackburn Drive
Gloucester, Massachusetts 01930

Dear Mr. Bullard:

This is in response to your application dated May 31, 2013, requesting renewal of your existing valid U.S. Fish and Wildlife Service (Service) endangered species recovery subpermit, which was issued on May 22, 2008 (enclosed). The subpermit was issued to the Northeast Region Sea Turtle Stranding and Salvage Network (STSSN) under the Service's Regional Endangered Species Recovery Permit #TE-697823 (Permit #TE-697823). The subpermit authorizes the National Oceanic and Atmospheric Administration (NOAA) National Marine Fisheries Service (NMFS), in its role as administrative coordinator for the Northeast Region STSSN, to continue scientific research activities and recovery activities to enhance the propagation and survival of endangered and threatened sea turtles as provided for in section 10(a)(1)(a) of the Endangered Species Act of 1973, as amended.

Your request is hereby approved, and your subpermit is renewed.

I. Covered Species

Green sea turtle (*Chelonia mydas*)
Kemp's ridley sea turtle (*Lepidochelys kempi*)
Hawksbill sea turtle (*Eretmochelys imbricate*)
Leatherback sea turtle (*Dermochelys coriacea*)
Loggerhead sea turtle (*Caretta caretta*)

II. Conditions

All of the terms and conditions remain the same except the following:

1. Additional Stranding Response Organization

Pursuant to Permit #TE-697823 and in response to NMFS' request, one additional organization is being added to the list of authorized Response Organizations contained in the May 22, 2008, letter of authorization. We understand that the Marine Mammals of Maine (MMoME) is a

DEC 10 2013

nonprofit marine animal stranding response organization located in Portland, Maine, and is well-situated geographically to provide sea turtle stranding response coverage along the Maine coast from Rockland south to the Maine-New Hampshire border, an area which is currently lacking a dedicated response organization. As a subpermittee to the Northeast Region STSSN, the MMoME is authorized to aid and/or possess any live stranded or injured sea turtles, to salvage any dead specimens or parts, and to conduct the other authorized activities contained in the May 22, 2008, letter of authorization, provided all necessary State permits are obtained.

2. Service Contacts

For the purpose of general compliance with the terms and conditions of this subpermit, the current Service contacts, mailing addresses, and telephone numbers are:

Chief, Division of Endangered Species
Attention: Permits Coordinator
Ecological Services
U.S. Fish and Wildlife Services
300 Westgate Center Drive
Hadley, Massachusetts 01035

Field Supervisor
New England Field Office
U. S. Fish and Wildlife Service
70 Commercial Street, Suite 300
Concord, New Hampshire 03301

The Chief, Division of Endangered Species, is Martin Miller. His contact information is: telephone 413-253-8615, electronic mail martin_miller@fws.gov

The New England Field Office Supervisor is Tom Chapman. His contact information is: telephone 603-223-2541, electronic mail tom_chapman@fws.gov

The Endangered Species Recovery Permit Coordinator is Deb Carter. Her contact information is: telephone 703-358-2402, electronic mail deb_carter@fws.gov

3. Reporting Requirements

In the event that it becomes necessary to euthanize a sea turtle, the subpermittee must contact Ms. Carter, the Service's Recovery Permits Coordinator prior to the procedure. If Ms. Carter cannot be reached, the subpermittee should provide Federal notification by leaving a message, including contact information, at the phone number or electronic mail address for Ms. Carter, provided above.

4. Reservation of Authority

The Service reserves its authority to amend the conditions of the subpermit, including the expiration date.

5. Expiration

In accordance with 50 Code of Federal Regulations 13.22(a), the expiration date of this subpermit is indefinite pending renewal of the Service's Regional Endangered Species Recovery Permit #TE-697823. After Permit #TE-697823 is renewed, we will provide a copy of it and an expiration date for this subpermit.

If you have any questions, please contact Tom Chapman, Supervisor, New England Field Office, at 603-223-2541, or Deb Carter, Regional Endangered Species Recovery Permits Coordinator, at 703-358-2402.

Sincerely,

Martin Miller
Chief, Division of Endangered Species
Ecological Services

- E. Acceptance of this permit serves as evidence that the permittee understands and agrees to abide by the 'Special Conditions for Native Endangered and Threatened Species' (copy attached).
- F. Authorized to take listed species identified on the attached sheets for scientific purposes or the enhancement of propagation or survival for approved recovery activities and as conditioned below.
- G. Prior to conducting any activities not excluded under the Service's NEPA categorical exclusions (516 DM 6, Appendix I the permittee must ensure that all NEPA requirements have been satisfied).
- H. Permittee must monitor each action taken under this permit to assure that the limits specified in each subpermit are not exceeded, that research efforts and handling of individual species is not duplicated by overlapping research.
- I. This permit is conditioned upon all applicable policy and guidance.
- J. Subpermittee's may be designated in writing.
- K. Subpermittee's must be required to hold and transport living specimens captured in the wild according to the provisions and procedures outlined in professionally established protocols for the handling and transport of the affected species.
- L. Procedures must be instituted to ensure that disease transmission does not occur during tissue sampling or other invasive procedures and that such activities are only performed by persons skilled in the techniques of handling the affected species.
- M. The permittee must ensure that all appropriate section 7 consultation requirements have been completed prior to initiating any otherwise permitted activities and that no action taken under this permit will violate subsection 7(a)(2) of the Endangered Species Act.

Threatened/Endangered Species Permit

Permit Type: **Renewal**

FeePaid: **\$20.00**

VADGIF Permit No.

052977

Description

Scientific Name

Atlantic Sturgeon	1 <i>Acipenser oxyrhynchus</i>
Barking Treefrog	1 <i>Hyla gratiosa</i>
Blackbanded Sunfish	12 <i>Enneacanthus chaetodon</i>
Blackside Dace	6 <i>Phoxinus cumberlandensis</i>
Canebrake Rattlesnake	2 <i>Crotalus horridus</i>
Carolina Darter	6 <i>Etheostoma collis</i>
Duskytail Darter	6 <i>Etheostoma percnurum</i>
Eastern Tiger Salamander	1 <i>Ambystoma tigrinum tigrinum</i>
Fin Whale	6 <i>Balaenoptera physalus</i>
Green Sea Turtle*	1 <i>Chelonia mydas</i>
Greenfin Darter	<i>Etheostoma chlorbranchium</i>
Hawksbill Sea Turtle*	<i>Eretmochelys imbricata</i>
Humpback Whale	<i>Megaptera novaeangliae</i>
Kemp's Ridley Sea Turtle *	1 <i>Lepidochelys kempii</i>
Leatherback Sea Turtle*	<i>Dermochelys coriacea</i>
Loggerhead Sea Turtle *	6 <i>Caretta caretta caretta</i>
Northern Right Whale	<i>Eubalaena glacialis</i>
Sei Whale	<i>Balaenoptera borealis</i>
West Indian Manatee	<i>Trichechus manatus</i>
Western Sand Darter	12 <i>Ammocrypta clara</i>
Wood Turtle	1 <i>Glyptemys insculpta</i>
Yellowfin Madtom	6 <i>Noturus flavipinnis</i>

Virginia Department of Game and Inland Fisheries
4010 West Broad Street, P.O. Box 11104, Richmond, VA 23230-1104
(804) 367-6913 FAX (804) 367-2427

Under Authority of § 29.1-412, § 29.1-417, & § 29.1-568 of the Code of Virginia and Policy E-1-90

Threatened/Endangered Species Permit -- Standard Conditions

- **This permit, or a copy, must be carried by the above named individuals during collection activities.**
- **The permittee is required to submit to this Department a report of all specimens collected under this permit by the report due date. Report form may be found at <http://www.dgif.virginia.gov/permits/guide.asp>. FAILURE TO RETURN THIS REPORT WILL RESULT IN NON-ISSUANCE OF FUTURE PERMITS. If no activity occurs under this permit, an email should be sent to collectionpermits@dgif.virginia.gov containing the following statement: No activity occurred under Permit #insert permitID during insert year (i.e. 2006). Permit reports are due by January 31.**
- Permittee **MUST** notify VDGI within the seven (7) day period prior to EACH sampling event. Notification must be made via email to: collectionpermits@dgif.virginia.gov.
- This permit does not support any activities outside of those associated with the application and proposal submitted to and approved by DGIF.
- If incidental death or injury of threatened or endangered species occurs, the permittee is required to notify this Department at collectionpermits@dgif.virginia.gov within twenty-four (24) hours of occurrence.
- If incidental *collection and live release* of threatened or endangered species occurs *for species other than those authorized under this permit*, the permittee is required to notify this Department at collectionpermits@dgif.virginia.gov within four (4) working days. The following information must be reported: collector, date, species, location (county, quad, waterbody, and specific location, either in latitude and longitude to nearest second, or by way of a photocopied 7.5' topographic map), general habitat associations, and number collected.
- No species may be retained unless specifically authorized by this permit.
- All traps must be marked with the name and address of the trapper or an identification number issued by the Department (Code of Virginia §29.1-521.7). Steel foothold traps, Conibear-style body gripping traps, and snares must be marked with a nonferrous metal tag bearing this information (Virginia Administrative Code 4 VAC 15-40-170).
- All traps must be checked at least once a day and all captured animals removed, except completely submerged body-gripping traps which must be checked at least once every 72 hours (Code of Virginia §29.1-521.9).
- The permittee is required to report any incidences of wildlife deaths or diseases observed during the course of collection activities. Reports should be made to: collectionpermits@dgif.virginia.gov within seven (7) days.
- This permit satisfies only the Department's requirement for collection permits and is issued with the understanding that no collections will be made on federal, state, or private property without the prior approval and necessary permits from the landowners involved. The permittee is responsible for obtaining any additional permits required for collection.
- Sampling gear, boats, or trailers which have been used in states harboring zebra mussels must be cleaned and prepared following the guidelines specified in the attached summary prior to use in waters in the Commonwealth.
- For safety reasons, it is recommended that all permittees display at least 100 square inches of solid blaze orange material at shoulder level within body reach and visible from 360 degrees, especially during hunting season.

Appendix H

Nest & Crawl Datasheet

Nest# _____
Crawl# _____

DATA SHEET FOR CRAWLS & NEST RELOCATIONS

I. General Information (weather, time, tide level, wind speed, location, etc.)

Date: _____ Tide height: _____ Estimated air temperature: _____
General weather conditions (ie. % cloud cover, rainfall): _____

Wind speed & direction _____
Location of crawl (~, include markers): _____

Latitude of Crawl: _____ Longitude of Crawl: _____

Notes: _____

II. Parties Involved

Refuge: _____

Navy: _____

III. Data to be collected for Each Set of Tracks

Crawl # (ie. 1,2, 3,...): _____ Time crawl detected: _____ Date: _____

Track measurements: (from where first visible near surf to nest site or end of crawl)

Length of incoming tracks (m): _____ Width of incoming tracks (cm): _____

Length of outgoing tracks (m): _____ Width of outgoing tracks (cm): _____

Flipper impressions alternate or opposite: _____ Were tracks prominent?: _____

Distance from center of disturbed nesting area to toe of dunes: _____

Topographical feature at end of tracks (CIRCLE area on diagram): _____

Was a nest found?: _____ False nest?: _____ False crawl only?: _____

Notes: _____

IV. Data to be collected for Each Nest (measurements of nest, egg #, etc.)

Original Nest Data:

NEST CAVITY

Nest # (ie. 1, 2, 3 ...): _____ Crawl# : _____
Time nest excavated: _____ until _____
Width of disturbed nesting area: _____ cm
Length of disturbed nesting area: _____ cm
Nest cavity width at widest pt.: _____
Nest cavity length at longest pt.: _____
Total # eggs: _____
 #damaged eggs: _____
 # broken or predated eggs: _____
Temperature of soil in nest cavity: _____

Notes: _____

Relocated Nest Data: _____

NEST CAVITY

Time nest reburied: _____ until _____
Temperature of soil in nest cavity: _____
Air temperature (C): _____
Estimated hatch date: _____

Notes: _____

V. Data to be Collected on Hatchlings/Hatch:

Turtle nest #(ie. 1,2, 3...): _____ Time hatch detected: _____

Hatch Period: _____ Estimated hatch date: _____

Incubation period (days): _____

Total # hatchlings counted: _____ (See table below if hatch is extended.)

Location of Nursery (estimate, include markers): _____

Latitude of Nursery: _____ Longitude of Nursery: _____

Date of relocated nest's excavation: _____

#unhatched eggs: _____ # dead hatchlings: _____

unhatched eggs hatched later at Visitor's Center: _____

Storage location of dead hatchlings (if not disposed of): _____

Notes: _____

Date	Time Hatchlings discovered	# of Hatchlings	AirTemp/ Soil Temp	Weather Conditions	Time of Hatchling Release	# of Hatchlings Released	Status of Hatchlings	Weather Conditions and Type of Tide (incoming or outgoing)
Total # of Hatchlings		<input type="text"/>		Total # of Hatchlings Released		<input type="text"/>		

VI. Additional Comments and Observations (diagram of tracks and nest, opinions, etc.)

Attach photos or slides and brief narrative for each nest/ hatch.

Appendix I

Nest Monitoring SOP

Acknowledgements

Thanks to the many people who make the sea turtle nesting program at NASO DNA a success no matter how many nests we have. Thanks to the morning patrollers, to the interns, student hires, and bio-techs who respond to strandings, keep up the ATVs, and do a million other things, and to the dedicated corps of nest-sitters who brave insects, sand and sleeplessness to safely escort vulnerable sea turtle hatchlings into the ocean and start them on their adventurous lives.

Introduction

Naval Air Station Oceana (NASO) and United States Fish & Wildlife Service Back Bay National Wildlife Refuge (BBNWR) work cooperatively to manage the sea turtle program at NASO Dam Neck Annex (NASO DNA). The guiding documents associated with this cooperative working partnership are the NASO DNA Integrated Natural Resources Management Plan (INRMP) mandated by the Sikes Act, the BBNWR Biological Opinion as amended on 25 May 2012, and the 2008 NASO & BBNWR nest relocation agreement.

NASO Natural Resources staff and authorized associates perform daily sea turtle patrols to locate nests, crawls, and strandings at NASO DNA and Virginia Army National Guard-Camp Pendleton (VAARNG-CP). For nests located on NASO DNA, NASO and BBNWR biologists collaboratively determine if a nest should be left in place (in situ) or relocated. Then the nest is either surrounded by an in situ predator enclosure or relocated within a buried cylindrical predator enclosure at the BBNWR designated nursery area. Hatchlings can self-release from in situ predator enclosures, and must be aided in releasing from relocation predator enclosures. In either case, nests are monitored when the estimated hatching date approaches.

Nests located on VAARNG-CP property will be collaboratively managed between BBNWR and VAARNG-CP biologists. NASO staff will notify both BBNWR and VAANG-CP biologists if a crawl is located on their property.

All turtle strandings on NASO DNA and VAARNG-CP will be reported to the VA Aquarium Stranding Team (VAST).

Nest Monitoring

After an appropriate length of incubation (40 days for Kemps Ridley and 50 days for Loggerhead and Green sea turtle nests), nests will be monitored via 2 daytime nest checks and overnight “nest sitting.” Day time checks will be made once in the morning and once in the afternoon. Nest sitting will occur from 8PM to 5AM. Day and night checks are looking to initially identify a cone shaped depression in the center of the nest and for evidence of prior/undocumented emergence. The time a depression is first seen is recorded on the Nest Sitting Log, as well as on the original Nest Data Sheet.

The majority of nests hatch out at night. Nest sitters prepare the path to the surf, count the hatchlings and protect the hatchlings from predators such as gulls, raccoons and foxes.

Nest-Sitting Guidelines

- **Tents:** A tent is provided as part of the nest-sitting kit. The tent should only be used in inclement weather and/or when mosquitoes are overly abundant. Please take down the tent and pack it with the other nest sitting supplies when you leave each morning.
- **Flashlights:** No white lights on beach after dark. Use flashlights with red filters/lens/light-bulbs or cover white light flashlights with red acetate, provided.
- **Radios/ MP3 players:** No open/public music. Please use headphones.
- **No cameras during or following hatching that utilize Flashes.** The flash is a big no-no, and if the turtles hatch, you will be really busy. Once any signs of emergence begin, please put cameras away. We can e-mail pictures of emerging turtles to you for a memento, if you like. **No pictures should be taken of any buildings or military training at any time.**
- **UNDER NO CIRCUMSTANCES IS ALCOHOL ALLOWED.**
- **NO** Unauthorized Guests. All nest-sitters **MUST** be signed up to provide this service with the Navy.
- Campfires are **NOT** permitted.
- If you smoke, make sure you pick up all cigarette butts.
- **Do not handle the hatchlings**, unless directed to do so by Michael Wright, Geralyn Mireles, or John Gallegos.
- If there is lightning, please get off the beach **IMMEDIATELY**. Sitting in a vehicle is much safer than sitting on the beach.
- Remember- **SAFETY ALWAYS COMES FIRST!** Be smart and safe out there. If you ever feel uncomfortable while nest-sitting because of weather, presence of unauthorized people, or for whatever reason, do what you need to do to feel safe (i.e., leave the nest site). If you cannot check the nest(s) every half hour at a minimum, please contact Michael Wright. If there is an **EMERGENCY**, especially if you feel like you are in danger, you may contact the Base Emergency Line 757-433-9111.
- These nests are in remote locations and access to restroom facilities is not immediately available. One person should remain at the nest site at all times. Nest sitters may access the dunes **ONLY** to relieve themselves. Be aware while working on NASO DNA even in the dunes, you may be being watched. If you enter the dune you must: bury your deposit; and cover/smooth out your tracks on the way out to discourage unauthorized dune access. There are restroom facilities available at the MWR Sea Mist Camp Ground. Depending on the nest location you may be able to walk to the camp ground via walking or you may need to walk to your/the vehicle and drive to the restroom. An access code to these restrooms will be provided.

Nest-Sitting Procedures

- 1) Drive your personal vehicle or government work vehicle, as appropriate to the NASO DNA Building 127 Natural Resources storage facility (prefabricated “stone” building), located in the North East corner adjacent to the dunes of the Building 127 parking lot, north of the Building 127 beach access, and pick up appropriate supplies. Storage facility key is located in a lockbox attached to the storage facility door. An access code will be provided to authorized individuals.
- 2) Ensure that you have all the required items before you leave to attend to the nest (cell phone, rake, data log, personal items, etc.)
- 3) Read the update in the front of the binder. Reread nest-sitting procedures, if necessary.
- 4) Drive to the closest beach access point (see attached map) to the nesting site and park your vehicle. **Ensure you place the Vehicle Parking Permit on the dashboard of your vehicle before you park and leave you vehicle to go nest sit.**
- 5) Carry all items to the nest-sitting area.
- 6) Nest is marked with reflectors, signs identifying the site as a sea turtle nest, and flagging tape placed in the immediate vicinity of the nest to help prevent nests from being run over by vehicles or inadvertently disturbed. A predator guard, constructed of galvanized fence wire with a rectangular mesh size of approximately 2 inches by 4 inches covers the nest.
- 7) **If you see a depression, or if hatchlings start to emerge**
 - a. Initiate calling the individuals on the phone list. 1st call Michael Wright, then Geralyn Mireles, then John Gallegos, and then Ruth Boettcher. Since this will be after normal business hours utilize cell phone numbers. Ensure that you speak with Michael Wright directly. If you cannot reach her: leave a voice message with date, time, brief message, and phone numbers to call you back on; continue contacting the other individuals; attempt to contact Ms. Wright again; upon second attempt to contact Ms. Wright if you still cannot reach her contact the Conservation Law-enforcement Officer “Mac” McGrogan.
 - b. Note time of first emergence, and time of main emergence (“boil”, if there is one), number, etc. (binder, data sheets, pencils, watch) Err on the side of too many notes, rather than too few
 - c. Rake out tire ruts (rake, board) to make pathway to the ocean from the high tide line. (Recommend, conducting this action each night as the 1st duty of the night once on site.)
 - d. Ascertain that the hatchlings make it into water. If a hatchling turns upside down you may turn it back over. If it gets stuck in a rut for more than a few minutes, you can help it out. If one starts crawling parallel to the ocean for more than a few meters, you can redirect it, if a turtle gets snatched by a ghost crab you may attempt to retrieve it. Outside of these conditions, the hatchlings may not be handled without further approval from Navy or USFWS biologist.

- e. Patrol beach for $\frac{1}{4}$ mile to either side of release area after all have made it into water to make sure none were washed back in
- 8) Be sure to fill out the Sea-Turtle Nest Sitting Log
 - 9) **When you are ready to go home:**
 - a. Drive back to the NASO DNA Natural Resources Storage Facility.
 - b. Place all equipment back in the shed in their designated locations. Ensure you have returned the vehicle parking permit to the nest sitting toolbox for the next user.
 - c. If you have used up anything, make a note of it in the Nest Sitting binder so that a staff member can replace it for the next night.
 - d. Place the key back in the lock box, and ensure that the box is locked.
 - e. Drive safely, and get some well-deserved sleep!!!

Supplies

- **Navy provides:**
 1. Latex gloves of several sizes
 2. Flashlights covered with red acetate (or flashlight with other red lighting filter) and extra batteries
 3. Rake (leave in truck, sharp side down)
 4. Cell phone with numbers programmed into it
 5. List of phone numbers
 6. Binder with data sheets and log book
 7. Pencils, pens
 8. First aid kit
 9. Red acetate and tape
 10. Tent
 11. Vehicle Parking Permit
 12. Handheld Radios
- **Nest-sitter provides:**
 1. Watch
 2. Flashlight/headlamp for personal use
 3. Water & Snacks/Food
 4. Personal Protective Equipment (PPE): insect repellent, raincoat, hacket/warm clothing, etc.
 5. Chair, reading material, etc.
 6. Personal cell phone (optional and highly recommended in the event the Navy provided cell phone malfunctions)

Cell Phone Instructions

1. Push and Hold the End/Power button, located on the right side of the phone. The lettering on the button is red.
2. Select the contacts button, located on the top right side of the phone.
3. Utilize the up and down arrows to scroll through and highlight/shade the list of names in the contact list. Nesting sitting Points of Contacts will be preceded by

“#NS” and then the person’s last name (example: in the contacts list Michael Wright will show up as “#NS Wright”).

4. Select the appropriate highlighted/shaded name utilizing the OK button.
5. If the phone number is not highlighted, utilize the up and down arrows to scroll to and highlight/shade the phone number.
6. Select the send button located on the left side of the phone. The lettering on the button is green.
7. For Reference the phone number for this cell phone is 757-613-0320.

Important Phone Numbers

ON BASE EMERGENCIES/REPORTING ILLEGAL ACTIVITIES

- Call = 757-433-9111.

Navy Natural Resources:

- Natural Resources Specialist (NRS), Michael Wright = 757-433-3461(o); 757-373-8531(c)...contact regarding any hatching activity, if there are any emergencies, and if there are any signs of illegal nest tampering by humans, or if it appears the nest has been predated by wildlife.
- Conservation Law-Enforcement Officer (CLEO), Lawrence McGrogan = 757-433-2151(o); 757-635-5436(c)... contact regarding access issues and if there are any signs of illegal nest tampering by human and if you cannot get a hold of the NRS.
- Biological Science Technician (BST), Mark L. Edwards = 757-433-2151(o); 757-406-3764 (pc)...contact if you cannot get a hold of the NRS or the CLEO.
- Installation Environmental Program Director (IEPD), Terry Chamberlain, = 757-433-3437(o); 757-288-6005(c)...contact in case of an emergency, and if you were unable to get a hold of anyone listed above.

USFWS Back Bay National Wildlife Refuge:

- Main Office = 757-301-7329
- Refuge Biologist, Geralyn Mireles = 757-778-5828(c); 757-301-7329 xt 153 (o) ...contact regarding any hatching activity.
- Refuge Biologist, John Gallegos = 757-493-1870 (c); 757-301-7329 xt154 (o) ...contact regarding any hatching activity.
- Refuge Biologist, Chris Hernandez = 757-301-7329 xt158(o); 757-268-4640(c) ...contact if you cannot get a hold of Ms. Mireles or Mr. Gallegos regarding any hatching activity.

VA Dept. of Game and Inland Fisheries:

- VA State Sea Turtle Coordinator, Ruth Boettcher = 757-787-5911(o); 757-709-0766 (c) ...contact regarding any hatching activity.

Radio Instructions

Radios are for communication between you and the other nest sitter monitoring the nest and hatchlings that have emerged and are making their way to the water. Radios may be needed if someone is patrolling the ¼ mile distance looking for hatchlings, if someone is working near the surf while the other person is at the nest, if someone has taken a break and is not immediately available when hatching activity is observed, etc.

1. Turn the radio on by turning the volume knob.

2. Ensure the radios are on the same frequency. To adjust and check the frequency, push the menu button and scroll down to frequency.
3. To talk to one another, hold in the button on the left side of the radio and TALK into the radio. Do not put your mouth right on the radio or you will be difficult to hear.
4. When you finish talking, you must let go of the button in order to hear the other person.

Datasheets

(Current examples provided from 2012 season, datasheets will be updated with current season's data, when and if needed.)

USFWS Data Sheet for Crawls & Nest Relocations:

Nest#3

Nest# 3
Crawl# 3

DATA SHEET FOR CRAWLS & NEST RELOCATIONS

I. General Information (weather, time, tide level, wind speed, location, etc.)

Date 6/15/2012 Tide height 2" MLLW Estimated air temperature 71 F
General weather conditions (ie. % cloud cover, rainfall) No rain
Wind speed & direction 13 mph NE (3:00 pm)
Location of crawl (~, include markers) Dam Neck Naval Air Station, end of Bldg # 127, 30 yards south of South Beach Access.
Latitude of Crawl N 36 degrees 46'28.861" Longitude of Crawl W 75 degrees 57'16.259"

II. Parties Involved

Refuge: John Gallegos, Chris Hernandez, Geralyn Mireles, Camille Sims, Lee Ann Barger, Samantha Smith.
Dam Neck: Michael Wright and Terry Chamberlain

III. Data to be collected for Each Set of Tracks

Crawl # (ie. 1,2, 3,...) 3 Time crawl detected Visitors saw turtle digging nest between 2:30 – 3:00 pm Date 6/15/2012
Track measurements: (from where first visible near surf to nest site or end of crawl)
Length of incoming tracks (m) 23.12 m Width of incoming tracks (cm) 87 cm, 87 cm
Length of outgoing tracks (m) 21.59 m Width of outgoing tracks (cm) 78.5 cm, 87 cm

Flipper impressions alternate or opposite ALT Were tracks prominent? some, footprints throughout tracks

Distance from center of disturbed nesting area to toe of dunes 0 (on toe of dunes)
Topographical feature at end of tracks (CIRCLE area on diagram) Located at # 4 on graph

Was a nest found? Yes false nest? _____ false crawl only? _____

IV. Data to be collected for Each Nest (measurements of nest, egg #, etc.)

Original Nest Data:

NEST CAVITY

Nest # (ie. 1, 2, 3, ...) 3 Crawl# 3
Time nest excavated _____ until _____
Width of disturbed nesting area 122 cm
Length of disturbed nesting area 130.5 cm
Nest cavity width at widest pt. _____
Nest cavity length at longest pt. _____
Total # eggs _____
 #damaged eggs _____
 # broken or predated eggs _____
Temperature of soil in nest cavity _____

Notes: The distance from the ground surface to top nest depth was 38 cm. Nest was left “in -situ”.

An outer protective cage was placed over nest. One egg was removed from nest for a genetic analysis of parentage of sea turtle nesting. The couple, who saw the turtle digging, took pictures and sent them to the Virginia Aquarium Standing Team, who identified the turtle as a Kemp’s ridley. Refuge staff met Dam Neck personnel at 7:00 pm and finish data collection and placing protective cage at 8:15 pm.

Relocated Nest Data: Nest left “in-situ”

NEST CAVITY

Time nest reburied _____ until _____
Temperature of soil in nest cavity _____
Air temperature (C) _____
Estimated hatch date August 4 -14 (24Jul-23Aug)

V. Data to be Collected on Hatchlings/Hatch:

Turtle nest #(ie. 1,2, 3,...) _____ Time hatch detected _____

Hatch Period _____ Estimated hatch date _____

Incubation period (days) _____

Total # hatchlings counted _____ (See table below if hatch is extended.)

Location of Nursery (estimate, include markers) _____

Latitude of Nursery _____ Longitude of Nursery _____

Date of relocated nest's excavation _____

unhatched eggs _____ # dead hatchlings _____

unhatched eggs hatched later at Visitor's Center _____

storage location of dead hatchlings (if not disposed of) _____

Date	Time Hatchlings discovered	# of Hatchlings	AirTemp/ Soil Temp	Weather Conditions	Time of Hatchling Release	# of Hatchlings Released	Status of Hatchlings	Weather Conditions and Type of Tide (incoming or outgoing)
Total # of Hatchlings				Total # of Hatchlings Released				

VI. Additional Comments and Observations (diagram of tracks and nest, opinions, etc.)

Attach photos or slides and brief narrative for each nest/ hatch.

Two SeaMist Camp Ground campers, Doug and Yvonne Gilbert, saw and reported the nesting sea turtle. They took photos which confirmed that the turtle was a Kemps Ridley (VAST, USFWS, VDGIF, and Navy all concurred). Turtle had a healed damaged carapace. Campers reported that turtle was on beach digging between 1430-1500 and was gone, back in the water, by 1530.

Those Notified:

Base Watch Captain, Lt. Glass.

VA Aquarium Stranding Team

USFWS-BBNWR Biologists

VDGIF-SeaTurtle Coordinator

Base Conservation Law-enforcement Officer

Base Natural Resources Specialist/NRS (rec'd ~1615)

Installation Environmental Program Director/IEPD

NRS on site ~1700. IEPD on site ~ 1800. USFWS on site ~1900.

NRS confirmed crawl was not a hoax and notified USFWS so that they would respond and bring all appropriate equipment.

	1 st Night	2 nd Night	3 rd Night	4 th Night	5 th Night	6 th Night
Date						
# of Hatchlings Emerged						

TOTAL NUMBER OF OBSERVED HATCHLINGS THAT EMERGED FROM THE NEST: _____

HATCHING/NEST INVENTORY DATA

Date of first hatchling emergence (if first emergence was seen *after* midnight, record that day's date; if first emergence was seen *before* midnight, record the next day's date) _____

Date of last hatchling emergence (if last emergence was seen *after* midnight, record that day's date; if last emergence was seen *before* midnight, record the next day's date) _____

Nest inventory date: _____ Excavated by: _____

Perform the following steps to assist with the determination of the nest's hatch success rate:

- To obtain number of hatched eggs, separate whole eggshells (>50%) from pieces (<50%); only count whole eggshells (each whole eggshell represents one hatched egg):
- Add together the number of unhatched eggs and pipped eggs with dead hatchlings to obtain the total number of unhatched eggs:
- Count the # of dead hatchlings that emerged from eggs but did not leave the nest:
- Count the # of live hatchlings that emerged from eggs but did not leave the nest, irrespective of their condition.

Lighting Assessment

WHAT ARE LIGHTING INSPECTIONS?

During a lighting inspection, a complete census is made of the number, types, locations, and custodians of artificial light sources that emit light visible from the beach. The goal of lighting inspections is to locate lighting problems and to identify the property owner, manager, caretaker, or tenant who can modify the lighting or turn it off.

WHICH LIGHTS CAUSE PROBLEMS?

Although the attributes that can make a light source harmful to sea turtles are complex, a simple rule has proven to be useful in identifying problem lighting under a variety of conditions:

An artificial light source is likely to cause problems for sea turtles if light from the source can be seen by an observer standing anywhere on the nesting beach.

If light can be seen by an observer on the beach, then the light is reaching the beach and can affect sea turtles. If any glowing portion of a luminaire (including the lamp, globe, or reflector) is directly visible from the beach, then this source is likely to be a problem for sea turtles. But light may also reach the beach indirectly by reflecting off buildings or trees that are visible from the beach. Bright or numerous sources, especially those directed upward, will illuminate sea mist and low clouds, creating a distinct glow visible from the beach. This “urban skyglow” is common over brightly lighted areas. Although some indirect lighting may be perceived as nonpoint-source light pollution, contributing light sources can be readily identified and include sources that are poorly directed or are directed upward. Indirect lighting can originate far from the beach.

Although most of the light that sea turtles can detect can also be seen by humans, observers should realize that some sources, particularly those emitting near-ultraviolet and violet light (e.g., bug-zapper lights, white electric-discharge lighting) will appear brighter to sea turtles than to humans. A human is also considerably taller than a hatchling; however, an observer on the dry beach who crouches to the level of a hatchling may miss some lighting that will affect turtles. Because of the way that some lights are partially hidden by the dune, a standing observer is more likely to see light that is visible to hatchlings and nesting turtles in the swash zone.

HOW SHOULD LIGHTING INSPECTIONS BE CONDUCTED?

Lighting inspections to identify problem light sources may be conducted either under the purview of a lighting ordinance or independently. In either case, goals and methods should be similar.

GATHER BACKGROUND INFORMATION

Before walking the beach in search of lighting, it is important to identify the boundaries of the area to be inspected. For inspections that are part of lighting ordinance enforcement efforts, the jurisdictional boundaries of the sponsoring local government should be determined. It will help to have a list that includes the name, owner, and address of each property within inspection area

so that custodians of problem lighting can be identified. Plat maps or aerial photographs will help surveyors orient themselves on heavily developed beaches.

PRELIMINARY DAYTIME INSPECTIONS

An advantage to conducting lighting inspections during the day is that surveyors will be better able to judge their exact location than they would be able to at night. Preliminary daytime inspections are especially important on beaches that have restricted access at night. Property owners are also more likely to be available during the day than at night to discuss strategies for dealing with problem lighting at their sites.

A disadvantage to daytime inspections is that fixtures that are not directly visible from the beach will be difficult to identify as problems. Moreover, some light sources that can be seen from the beach in daylight may be kept off at night and thus present no problems. For these reasons, daytime inspections are not a substitute for nighttime inspections. Descriptions of light sources identified during daytime inspections should be detailed enough so that anyone can locate the lighting. In addition to a general description of each luminaire (e.g., HPS floodlight directed seaward at top northeast corner of the building at 123 Ocean Street), photographs or sketches of the lighting may be necessary. Descriptions should also include an assessment of how the specific lighting problem can be resolved (e.g., needs turning off; should be redirected 90° to the east). These detailed descriptions will show property owners exactly which luminaires need what remedy.

NIGHTTIME INSPECTIONS

Surveyors orienting themselves on the beach at night will benefit from notes made during daytime surveys. During nighttime lighting inspections, a surveyor walks the length of the nesting beach looking for light from artificial sources. There are two general categories of artificial lighting that observers are likely to detect:

1. **Direct lighting.** A luminaire is considered to be direct lighting if some glowing element of the luminaire (e.g., the globe, lamp [bulb], reflector) is visible to an observer on the beach. A source not visible from one location may be visible from another farther down the beach. When direct lighting is observed, notes should be made of the number, lamp type (discernable by color), style of fixture, mounting (pole, porch, *etc.*), and location (street address, apartment number, or pole identification number) of the luminaire(s). If exact locations of problem sources were not determined during preliminary daytime surveys, this should be done during daylight soon after the nighttime survey. Photographing light sources (using long exposure times) is often helpful.

2. **Indirect lighting.** A luminaire is considered to be indirect lighting if it is not visible from the beach but illuminates an object (e.g., building, wall, tree) that is visible from the beach. Any object on the dune that appears to glow is probably being lighted by an indirect source. When possible, notes should be made of the number, lamp type, fixture style, and mounting of an indirect-lighting source. Minimally, notes should be taken that would allow a surveyor to find the lighting during a follow-up daytime inspection (for instance, which building wall is illuminated

and from what angle?).

WHEN SHOULD LIGHTING INSPECTIONS BE CONDUCTED?

Because problem lighting will be most visible on the darkest nights, lighting inspections are ideally conducted when there is no moon visible. Except for a few nights near the time of the full moon, each night of the month has periods when there is no moon visible. Early-evening lighting inspections (probably the time of night most convenient for inspectors) are best conducted during the period of two to 14 days following the full moon. Although most lighting problems will be visible on moonlit nights, some problems, especially those involving indirect lighting, will be difficult to detect on bright nights.

A set of daytime and nighttime lighting inspections before the nesting season and a minimum of three additional nighttime inspections during the nesting-hatching season are recommended. The first set of day and night inspections should take place just before nesting begins. The hope is that managers, tenants, and owners made aware of lighting problems will alter or replace lights before they can affect sea turtles. A follow-up nighttime lighting inspection should be made approximately two weeks after the first inspection so that remaining problems can be identified. During the nesting-hatching season, lighting problems that seemed to have been remedied may reappear because owners have been forgetful or because ownership has changed. For this reason, two midseason lighting inspections are recommended. The first of these should take place approximately two months after the beginning of the nesting season, which is about when hatchlings begin to emerge from nests. To verify that lighting problems have been resolved, another follow-up inspection should be conducted approximately one week after the first midseason inspection.

WHO SHOULD CONDUCT LIGHTING INSPECTIONS?

Although no specific authority is required to conduct lighting inspections, property managers, tenants, and owners are more likely to be receptive if the individual making recommendations represent a recognized conservation group, research consultant, or government agency. When local ordinances regulate beach lighting, local government code-enforcement agents should conduct lighting inspections and contact the public about resolving problems.

WHAT SHOULD BE DONE WITH INFORMATION FROM LIGHTING INSPECTIONS?

Although lighting surveys serve as a way for conservationists to assess the extent of lighting problems on a particular nesting beach, the principal goal of those conducting lighting inspections should be to ensure that lighting problems are resolved. To resolve lighting problems, property managers, tenants, and owners should be given the information they need to make proper alterations to light sources. This information should include details on the location and description of problem lights, as well as on how the lighting problem can be solved. One should also be prepared to discuss the details of how lighting affects sea turtles. Understanding the nature of the problem will motivate people more than simply being told what to do.

Lighting Survey Form

The lighting survey must be conducted to include a landward view from the seaward most extent of the beach profile. The survey must occur after 9 p.m. The survey must follow standard techniques for such a survey and include the number and type of visible lights, location of lights and photo documentation.

1 **2. BACKGROUND INFORMATION**

2 **a. Contractor**

3 GMI-AECOM Joint Venture
4 6850 Versar Center #201
5 Springfield, Virginia 22151

6 **b. Contract Number**

7 N62470-13-D-8017, TO WE04

8 **c. Project Name**

9 Lighting Survey and Biological Assessment for Sea Turtle Nest Management at Joint Expeditionary Base
10 Little Creek Fort Story, Virginia Beach, VA

11 **d. Brief Project Description of Work**

12 The GMI-AECOM JV is subcontracting this task order to Versar, Inc.

13 The purpose of this survey is to conduct artificial lighting surveys along the beaches of Naval Air Station
14 Oceana-Dam Neck Annex (NASO-DNA) and Virginia Army National Guard Camp Pendleton (VAANG-
15 CP) in Virginia Beach, VA. These lighting surveys will document all observable lighting sources from
16 installation beaches.

17 Versar would utilize a group of experienced scientists in performing the tasks specified in the SOW for
18 performing a survey of artificial lighting sources that may impact sea turtle nesting on installation
19 beaches. The project team’s experience includes extensive biological and ecological work throughout the
20 southeast. Versar’s technical approach will be to adhere closely to the SOW as described in the contract.
21 Specifically, we will adhere to all guidance and complete each task as directed in order to successfully
22 complete surveys for each installation. The project areas for NASO-DNA and VAANG-CP are shown in
23 Figures 1 and 2, respectively. A total of five surveys will be conducted at each location. The following
24 steps will be undertaken to perform lighting surveys at each installation:

- 25 1. The plans and maps developed for each installation survey plan will be used by the surveyors to
26 assist in determining potential light sources and identifying survey boundaries.
- 27 2. Each installation survey will begin with a daytime survey. Day time surveys allow surveyors a
28 first look to help with orientation at night and allows for the identification of potential light
29 sources to be sought at night.
- 30 a. Daytime surveys will occur both along the beach face and behind the rear dunes in order
31 to identify potential light source locations that will be sought out during night surveys.
- 32 b. Identification of potential light sources will be sufficiently detailed (location and type) so
33 that they can be easily located during night surveys.
- 34 3. Nighttime surveys will consist of at least two surveyors walking the beach at night along the
35 water line in the swash zone.
- 36 a. Surveys will be conducted 2 to 14 days following a full moon. See Table 1 for the full
37 moon calendar and survey opportunities. The PM will coordinate all visits with the NTR

- 1 and IR at least three weeks in advance to ensure beach access and entry to restricted
2 areas, if necessary, to obtain coordinates.
- 3 b. The first nighttime survey will be conducted prior to the nesting season which begins
4 early summer.
- 5 c. Three subsequent surveys will occur during the nesting (May – September) and hatching
6 season (approximately 55 – 80 days after eggs are laid).
- 7 d. Both direct and indirect light sources will be identified. Identification will consist of the
8 classification of the type of light source with GPS coordinates of the actual light source.
9 Survey forms will also document building number, parking area, or other identifier of the
10 location on the installation. The number of lights, type, color and potential disruption (as
11 reviewed in Witherington and Martin [2003]) will be included in the survey forms.
- 12 4. The windows for surveys is provided in Table 1. Specific dates will be coordinated with the
13 Installation Representatives (IR) and the Naval Technical Representative (NTR).
- 14 Hazards associated with the activities conducted under this scope of work include hazards encountered
15 with exposure from being outdoors; encounters with wildlife; trips and falls; and working in close
16 proximity to the water. Section 10, Risk Management Processes, of this APP discusses the associated
17 hazards involved with each activity and an activity hazard analysis (AHA).

18 **Table 1. Lighting Survey Windows**

Survey	Survey Window
Initial (Pre-nesting) Daytime Survey	30 Mar - 3 Apr
Initial (Pre-nesting) Night Survey (Night Survey 1)	13-17 April
Midseason Nesting/Hatching Survey (Night Survey 2)	4-8 Jun
Midseason Nesting/Hatching Survey (Night Survey 3)	12-16 Jun
Final Nesting/Hatching Survey (Night Survey 4)	31 Aug – 4 Sep

3. STATEMENT OF SAFETY AND HEALTH POLICY

The personal safety and health of each employee of the Versar Team is of primary importance. The prevention of work-induced injuries and illness is of such importance that it will be given precedence over operating productivity whenever necessary. To the greatest degree possible, management will provide all training, mechanical, and physical facilities required for personal safety and health in keeping with the highest standards of the industry.

The Versar Team will maintain a safety and health program conforming to the best practices of organizations within the environmental and construction services. To be successful, such a program must embody the proper attitudes toward injury and illness prevention on the part of both supervisors and employees. It also requires cooperation in all safety and health matters, not only between supervisor and employee, but also between each employee and his or her fellow workers. Only through such a cooperative effort can a safety record in the best interest of all be established and preserved.

The objective is a safety and health program that will reduce the number of disabling injuries and illnesses to an absolute minimum, not merely in keeping with, but surpassing, the best experience of other similar operations.

The Versar Team safety and health program includes:

- Providing mechanical and physical safeguards to the maximum extent possible;

- Conducting a program of safety and health inspections to find and eliminate unsafe working conditions or practices; to control health hazards; and to comply fully with the safety and health standards for every job;
- Training all employees in good safety and health practices;
- Providing necessary personal protective equipment (PPE) and instructions for its use and care;
- Developing and enforcing safety and health rules; and requiring that employees cooperate with these rules as a condition of employment;
- Investigating, promptly and thoroughly, every accident to find out what caused it and to correct the problem so that it will not happen again; and
- Recognizing and awarding outstanding safety service or performance.

The Versar Team recognizes that the responsibilities for safety and health are shared:

- The company is responsible for leadership of the safety and health program, for its effectiveness and improvement, and for providing the safeguards required to ensure safe conditions;
- The person responsible for administration of the company safety program is the Company President. Some items in the safety program may be delegated to others, but the primary responsibility remains with this person.
- Supervisors are responsible for developing the proper attitudes toward safety and health in themselves and in those they supervise and for ensuring that all operations are performed with the utmost regard for the safety and health of all personnel involved, including themselves.

Employees are responsible for cooperation with all aspects of the safety and health program, including compliance with all rules and regulations, and for continuously practicing safety while performing their duties.

4. RESPONSIBILITIES AND LINE OF AUTHORITY

a. Statement of Employer’s Ultimate Responsibility for Implementation of Safety and Occupational Health Program

The provisions of this Accident Prevention Program (APP) along with the applicable regulations issued by governmental entities will be strictly adhered to by site personnel and visitors. Each subcontractor will be held accountable for the safe and healthful performance of work by each of their employees, subcontractors, or support personnel who may enter the site. It is Versar’s policy to ensure that every reasonable precaution is taken to prevent accidents. Always use the safety equipment provided for your protection. Unsafe conditions, unsafe practices, property damage or personal injuries, regardless of how slight, must be reported to your supervisor immediately.

b. Identification and Accountability of Personnel Responsible at Corporate and Project Level

(1) GMI-AECOM JV

John Ouellette, Program Manager

(2) Versar

Mark Housand, Safety Officer
Brian Bishop, Project Manager

c. Requirements that No Work Shall be performed unless a Designated Competent Person is Present of the Job Site

The services outlined in Section 2 require specific skills sets and no services will be rendered without a trained, competent person present. All services are provided with a minimum of two employees present.

d. Requirements of Pre-task Safety and Health Analysis

Every employee is required to go through an on-sight safety briefing outlining daily tasks, equipment needs, and specific hazards that may be encountered during the course of daily activities. Additionally, employees are not allowed to operate any specific equipment without being briefed by the owner and illustrating competency with said item. This includes establishing corporate requirements that each employee discloses any health concerns that would impact their ability to operate equipment and perform assigned tasks.

e. Lines of Authority

(1) Project Manager

In effectively executing their safety responsibilities, project managers will:

- Familiarize themselves with the safety program and ensure its effective implementation.
- Be aware of all safety considerations when introducing a new process, procedure, machine or material to the workplace.
- Give maximum support to all programs and committees whose function is to promote safety and health.
- Actively participate in safety activities as required.
- Review serious accidents to ensure that proper reports are completed, and appropriate action is taken to prevent recurrences.

(2) Foremen (Crew Lead)

In effectively executing their safety responsibilities, foremen will:

- Familiarize themselves with company safety policies, programs and procedures.
- Provide appropriate safety training to employees prior to the assignment of duties.
- Consistently and fairly enforce all company safety rules.
- Investigate injuries to determine cause, and then take action to prevent recurrence.
- See that all injuries, no matter how minor, are treated immediately and referred to the front office to ensure prompt reporting to the insurance carrier.
- Inspect work areas often to detect unsafe conditions and work practices. Use company self-inspection checklists as required.

(3) All Employees

Employee responsibilities for safety include the following:

- Adhere to all safety rules and regulations.
- Wear appropriate safety equipment as required.
- Maintain equipment in good condition, with all safety guards in place when in operation.
- Report all injuries and near misses, no matter how minor, immediately to their supervisor, safety personnel or management.
- Encourage coworkers to work safely.
- Report unsafe acts and conditions to their supervisor, safety personnel, or management.
- Halt site operations in the event of an emergency or to correct unsafe work practices.
- Notifying emergency response personnel in the event of an emergency; and
- Review this APP.

f. Policy Regarding Noncompliance

Employees who fail to comply with safety rules will be subject to disciplinary action up to and including termination. Supervisors will follow the normal disciplinary procedures as follows:

- 1. Verbal counseling - must be documented in the employee's personnel file.
- 2. Written warning - outlining nature of offense and necessary corrective action.
- 3. Suspension without pay - one (1) working day without pay - the third step or a separate disciplinary action resulting from a serious violation.
- 4. Termination - if an employee is to be terminated, specific and documented communication between the supervisor and the employee must occur.

g. Procedures for Holding Managers and Supervisors Accountable to Safety

Supervisors will be subject to disciplinary action for the following reasons:

- Repeated safety rule violation by their department employees.
- Failure to provide adequate training prior to job assignment.
- Failure to report accidents and provide medical attention to employees injured at work.
- Failure to control unsafe conditions or work practices.
- Failure to maintain good housekeeping standards and cleanliness in their departments.

Supervisors who fail to maintain high standards of safety within their departments will be demoted or terminated after three documented warnings have been levied during any calendar year.

5. SUBCONTRACTORS AND SUPPLIERS

a. Identification of Subcontractors

Versar
6850 Versar Center
Springfield, VA 22151
(703) 750-3000

Virginia Aquarium & Marine Science Center
717 General Booth Blvd
Virginia Beach, VA 23451
(757) 385-3474

b. Safety Responsibilities of Subcontractors

Subcontractors and suppliers shall comply with all applicable federal, state, and local laws, rules, regulations, and orders in effect on the date of this order, including, but not limited to the following, as amended: (a) the Fair Labor Standards Act of 1938; (b) the Federal Occupational Safety and Health Act of 1970 (OSHA); (c) the Toxic Substances Control Act of 1976; (d) the Walsh-Healy Public Contracts Act; and (e) any other federal law concerning labor relations, nondiscrimination in employment, minimum wages, overtime compensation, and hours of employment. Seller agrees to indemnify and hold Contractor harmless against any loss or liability due to Seller's violation or noncompliance with such regulations. Upon Contractor's request, Seller shall furnish evidence demonstrating such compliance.

6. TRAINING

a. Requirements for New Employees

Each subcontractor or department manager must employ a program for new employee acclimation and orientation, including current employees who are reassigned and directed towards familiarization with:

- Safety rules, procedures and standards with which compliance is expected
- Inherent hazards of the job and surroundings
- Safe work methods, motions and habits
- Emergency procedures, alarms and telephone numbers related to reporting injury, illness, fire and other catastrophes
- Physical layout of the properties, including exits, emergency signal devices, first-aid facilities, and fire extinguishers and other emergency equipment
- PPE required on the job including its maintenance and proper use
- Safety committees, safety meetings, and safety educational materials.

While on-site, the Project Manager will brief all newly arriving workers and visitors to aid in protecting their safety. The training will familiarize personnel with hazards associated with the site and associated controls, describe work zone boundaries and access and exit procedures, explain emergency procedures, and describe the use of PPE required during activities on the site. The briefing will include a review of the requirements of this APP including the safety checklists in Appendix A.

b. Mandatory Training and Certifications Applicable to this Project

There are no mandatory or certifications required for this project.

c. Procedures for Periodic Safety and Health Training

Annual refresher training is required, even if there has been no change in a worker's job tasks.

d. Emergency Response Training

When a medical facility or physician is not accessible within five minutes of an injury to a group of two or more employees for the treatment of injuries, a minimum of two representatives, on site at all times, will be certified in both first aid and cardiopulmonary resuscitation. Certifications are contained Appendix B.

7. SAFETY AND HEALTH INSPECTIONS

a. Internal Inspections

Inspections should be performed by personnel who have been trained in recognizing hazards that have a tendency to “slip out” of controls designed to reduce employee exposure to them. All inspections should be documented in writing, and where hazards are identified, corrective actions should be developed as soon as possible, based on the severity of the hazard involved.

(1) Mechanical Equipment

The two general classifications are “frequent” and “periodic.”

- Frequent inspection: Daily to monthly intervals.
- Periodic inspection: 1- to 12-month intervals, or as specifically recommended by the manufacturer.

The operator should check the following items daily:

- All control mechanisms for maladjustment interfering with proper operation
- Deterioration or leakage in air or hydraulic systems if applicable
- All safety devices for malfunction

The following items should be checked weekly or monthly, depending on how much the equipment is used:

- All control mechanisms for excessive wear of components and contamination by lubricants or other foreign matter.
- Electrical apparatus for malfunctioning, signs of excessive deterioration, dirt, and moisture accumulation.

Complete inspections of all mechanical equipment must be performed at periodic intervals depending upon its activity, severity of service, and environment or as specifically indicated below. These inspections have to include all “frequent” inspection items and in addition, items such as the following:

- Loose bolts or rivets
- Worn, cracked, or distorted parts such as pins, bearings, shafts, gears, rollers and locking devices
- Excessive wear on brake and clutch system parts, linings, pawls, and ratchets
- Gasoline, diesel, electric, or other power plants for improper performance or noncompliance with safety requirements
- Excessive wear of chain-drive sprockets and excessive chain stretch
- Travel steering, braking, and locking devices, for malfunction

c. Immediate Notification of Major Events

Immediate (8 hour) reporting to OSHA is required under 29 CFR 1904 if a fatality or catastrophe (3 or more people sent to the hospital with injuries that require an overnight stay) occurs. This reporting is done only by the Versar Safety Officer or Project Manager. All other personal injuries requiring first aid or resulting in lost time will be recorded on an OSHA Form 300 by the manager/project manager.

The following require immediate accident notification:

- A fatal injury
- A permanent total disability
- A permanent partial disability
- The hospitalization of three or more people resulting from a single occurrence
- Property damage of \$200,000 or more.

The investigation and reporting of occupational injuries, illnesses and dangerous occurrences is essential for project management to be able to take the steps necessary to avoid additional injuries or illnesses. A complete investigation will provide information regarding the elements of the incident and the process by which they came together to cause the injury, illness, or dangerous occurrence. By identifying the elements and processes, further incidents can be avoided. Timely reporting also permits project contractors to remain in compliance with OSHA recordkeeping regulations.

9. PLANS REQUIRED BY THE SAFETY MANUAL

a. Emergency Response Plans

(1) Spill Plans

In the event of a chemical spill, the company who caused the spill is responsible for prompt and proper clean-up. It is also their responsibility to have spill control and PPE appropriate for the chemicals being handled readily available.

The following are general guidelines to be followed for a chemical spill.

- Immediately alert area occupants and supervisor, and evacuate the area, if necessary.
- If there is a fire or medical attention is needed, contact the installation SPOC.
- Attend to any people who may be contaminated. Contaminated clothing must be removed immediately and the skin flushed with water for no less than fifteen minutes.
- If a volatile, flammable material is spilled, immediately warn everyone, control sources of ignition and ventilate the area.
- Don PPE, as appropriate to the hazards. Refer to the Material Safety Data Sheet or other references for information.
- Consider the need for respiratory protection. The use of a respirator or self-contained breathing apparatus requires specialized training and medical surveillance. Never enter a contaminated atmosphere without protection or use a respirator without training. If respiratory protection is

used, be sure there is another person outside the spill area in communication, in case of an emergency.

Using the list below, determine the extent and type of spill. If the spill is large, if there has been a release to the environment the company will contact the POC at the installation immediately

<u>Category Size</u>	<u>Response / Treatment Materials</u>
Small up to 300cc	Chemical treatment or absorption neutralization or absorption spill kit
Medium 300 cc - 5 liters	Absorption spill kit
Large more than 5 liters	Call public safety outside help

Loose spill control materials should be distributed over the entire spill area, working from the outside, circling to the inside. This reduces the chance of splash or spread of the spilled chemical. Bulk absorbents and many spill pillows do not work with hydrofluoric acid. POWERSORB (by 3M) products and their equivalent will handle hydrofluoric acid. Specialized hydrofluoric acid kits also are available. Many neutralizers for acids or bases have a color change indicator to show when neutralization is complete.

When spilled materials have been absorbed, use brush and scoop to place materials in an appropriate container. Polyethylene bags may be used for small spills. Five gallon pails or 20 gallon drums with polyethylene liners may be appropriate for larger quantities. Complete a hazardous waste sticker, identifying the material as Spill Debris involving the given chemical, and affix onto the container. Spill control materials will probably need to be disposed of as hazardous waste. Decontaminate the surface where the spill occurred using a mild detergent and water, when appropriate. Report all spills to your supervisor or the manager/principal manager, installation POC, and ESA project manager. A certified hazardous waste disposal company must be contacted to pick up and dispose of the contained material. The installation Environmental Regulated Waste Manager's signature is required the accompanying waster manifest, which is required with every disposal shipment for the base.

(2) Firefighting Plan

MAINTENANCE

The Project Manager will ensure that equipment is maintained according to manufacturers' specifications. The project manager will also comply with requirements of the National Fire Protection Association (NFPA) codes for specific equipment. Only properly trained individuals shall perform maintenance work.

GOOD HOUSEKEEPING

To limit the risk of fires, employees shall take the following precautions:

- Minimize the storage of combustible materials
- Make sure that all exit routes are kept free of obstructions
- Dispose of combustible waste in covered, airtight, metal containers
- Use and store flammable materials in well-ventilated areas away from ignition sources
- Use only nonflammable cleaning products

- Keep incompatible (i.e., chemically reactive) substances away from each other
- Perform “hot work” (i.e., welding or working with an open flame or other ignition sources) in controlled and well-ventilated areas
- Keep equipment in good working order (i.e., inspect electrical wiring and appliances regularly and keep motors and machine tools free of dust and grease)
- Ensure that heating units are safeguarded
- Report all fuel leaks immediately
- Repair and clean up flammable liquid leaks immediately
- Keep work areas free of dust, lint, sawdust, scraps, and similar material.

EXTINGUISHERS

Know the location of the nearest fire extinguisher and how to operate it. Know the type of the fire on which it should be used by checking and reading the label. Be aware that certain toxic gases or vapors may be generated by a fire.

A carbon dioxide, dry chemical or equivalent fire extinguisher is kept in the cab or vicinity of all mechanical equipment.

Fire extinguishers of the proper type and size must be within 30 feet of each open flame operation that is performed. Return all extinguishers for servicing promptly after any use.

COMBUSTIBLE AND FLAMMABLE MATERIALS

The project manager shall regularly evaluate the presence of combustible materials at the job site. Certain types of substances can ignite at relatively low temperatures or pose a risk of catastrophic explosion if ignited. Such substances obviously require special care and handling.

1. Class A combustibles.

These include common combustible materials (wood, paper, cloth, rubber, and plastics) that can act as fuel and are found in non-specialized areas such as offices.

To handle Class A combustibles safely:

- a. Dispose of waste daily.
- b. Keep trash in metal-lined receptacles with tight-fitting covers (metal wastebaskets that are emptied every day do not need to be covered).
- c. Keep work areas clean and free of fuel paths that could allow a fire to spread.
- d. Keep combustibles away from accidental ignition sources, such as hot plates, soldering irons, or other heat- or spark-producing devices.
- e. Store paper stock in metal cabinets.
- f. Store rags in metal bins with self-closing lids.

- g. Do not order excessive amounts of combustibles.
- h. Make frequent inspections to anticipate fires before they start.

Water, multi-purpose dry chemical (ABC), and halon 1211 are approved fire extinguishing agents for Class A combustibles.

2. Class B combustibles.

These include flammable and combustible liquids (oils, greases, tars, oil-based paints, and lacquers), flammable gases, and flammable aerosols.

To handle Class B combustibles safely:

- a. Use only approved pumps, taking suction from the top, to dispense liquids from tanks, drums, barrels, or similar containers (or use approved self-closing valves or faucets).
- b. Do not dispense Class B flammable liquids into containers unless the nozzle and container are electrically interconnected by contact or by a bonding wire. Either the tank or container must be grounded.
- c. Store, handle, and use Class B combustibles only in approved locations where vapors are prevented from reaching ignition sources such as heating or electric equipment, open flames, or mechanical or electric sparks.
- d. Do not use a flammable liquid as a cleaning agent inside a building (the only exception is in a closed machine approved for cleaning with flammable liquids).
- e. Do not use, handle, or store Class B combustibles near exits, stairs, or any other areas normally used as exits.
- f. Do not weld, cut, grind, or use unsafe electrical appliances or equipment near Class B combustibles.
- g. Do not generate heat, allow an open flame, or smoke near Class B combustibles.
- h. Know the location of and how to use the nearest portable fire extinguisher rated for Class B fire.

Water should not be used to extinguish Class B fires caused by flammable liquids. Water can cause the burning liquid to spread, making the fire worse. To extinguish a fire caused by flammable liquids, exclude the air around the burning liquid. The following fire-extinguishing agents are approved for Class B combustibles: carbon dioxide, multi-purpose dry chemical (ABC), halon 1301, and halon 1211. (NOTE: Halon has been determined to be an ozone-depleting substance and is no longer being manufactured. Existing systems using halon can be kept in place.)

SMOKING

Smoking is prohibited in all company buildings, vehicles, and equipment. Certain outdoor areas may also be designated as no smoking areas. The areas in which smoking is prohibited outdoors will be identified by NO SMOKING signs.

STRIKE ANYWHERE matches are not permitted. On certain projects, permits are required for welding, burning, or other types of open flames.

(3) Employees working alone

Employees working alone shall be provided an effective means of emergency communication. This may be cellular phone, two-way radio or other acceptable means. The selected means of communication must be readily available and must be in working condition.

(4) Posting of Emergency Phone Numbers

Emergency telephone numbers and reporting instructions for ambulance, physician, hospital, fire, and police will be conspicuously and clearly posted at the work site.

(5) Medical Support

If the incident is serious/life threatening, the contractor is to **contact the JEBLCFS Emergency Dispatch Center at 757-443-9111 for the installation emergency dispatch**. In the event of an onsite incident that results in a need for first aid care, the closest hospital with acute care facilities to JEB Little Creek is Bon Secours DePaul Medical Center in Norfolk and the closest to JEB Fort Story is Sentara Princess Anna in Virginia Beach. To reach off-site hospitals, follow the driving directions in Appendix D.

Following an accident/injury or near miss, work will immediately stop and the POC will be contacted. Emergency contact information is located in Table 2. The POC will then contact the Safety Office to respond/document the incident. No work shall take place until the Installation Safety Office turns the site back over to the contractors.

Table 2. Emergency Contacts

Contact	Person or Agency	Telephone No.
Dam Neck Annex POC	Michael Wright	Office: (757) 433-3461 Cell: (757) 373-8531
Dam Neck Annex Emergency Dispatch		(757) 492-6911
Camp Pendleton POCs	Ken Oristaglio 1st Sgt Carter	Office: (434) 298-6416 Cell: (434) 264-4929 Cell: (434) 294-2100
Camp Pendleton Emergency Dispatch	Main Gate	911 757-491-5144
Off-base Hospital (Fort Story): Sentara Princess Anna	2025 Glenn Mitchell Dr, Virginia Beach, VA 23456	(757) 507-1000
Poison Control Center	Directs to appropriate state center	(800) 222-1222
NAVFAC MIDLANT NTR	Jessica Bassi	
GMI-AECOM JV Program Manager	John Ouellette	(757) 265-2901
Versar Project Manager	Brian Bishop	(757) 265-2903

Contact	Person or Agency	Telephone No.
Virginia Aquarium	Mark Swingle	(757) 384-3474

The above table shall be posted in a prominent location at the work area.

b. Plan for Prevention of Alcohol and Drug Abuse

While working the site, no personnel assigned to this project may use, possess, distribute, sell, or be under the influence of alcohol or engage in the unlawful manufacture, distribution, dispensation, possession, or use of illegal drugs. Violations of this policy may lead to disciplinary actions, up to and including immediate and permanent prohibition of the individual(s) from performing work on this project.

The policy to be implemented at this project site will involve drug testing for cause or suspicion. This means that any individual assigned to this project, who is observed behaving in such a manner that leads the project manager to suspect he or she is under the influence of alcohol or illegal drugs, will be immediately directed to stop work and report to the project manager. The individual under suspicion will be escorted off of the site and asked to submit to testing for illegal substances and alcohol. Individuals who agree to be tested will be provided transportation to an appropriate medical facility for evaluation. Individuals who decline to be tested will be provided transportation to their nearby residence or lodging and directed not to return to the project. Those who test positive for use of illegal substances may not return to the project until such time as they can demonstrate no further use of the substances.

Individuals with questions or concerns about substance dependency or abuse may wish to discuss these matters with their employer, supervisor, or appropriate resources in the community. The intent of this policy is to offer a helping hand to project personnel who suffer from the illness of addiction and to encourage those personnel to pursue recovery. The clear message is that continued drug use or alcohol abuse is incompatible with continuing work on this project. Any employee under a physician's treatment and taking prescribed narcotics or any medication that may prevent one being ready, willing and able to safely perform position duties shall provide a medical clearance statement to his supervisor.

c. Drinking Water Provisions, Toilet and Washing Facilities

All employees will either bring or Versar will provide an adequate supply of drinking water. The closest restroom and washing facilities on Dam Neck Annex are located behind the dunes in Bldg 153, which is located across the parking lot from the Shifting Sands Beach Club (Appendix E). On Camp Pendleton, portable latrines are located directly behind the dunes.

d. Health Hazard Control Program

Operations, materials, and equipment involving potential exposure to hazardous or toxic agents or environments shall be evaluated by the manager and project manager for each activity. Based on the scope of work outlined in Section 2, neither company anticipates operating equipment or using materials that may construed as health hazards to perform these tasks.

e. Heat/Cold Stress Monitoring plan

The following guidelines will be followed to prevent heat related injury:

1. Drinking water shall be made available to employees and employees encouraged to frequently drink small amounts, e.g., one cup every 15-20 minutes; the water shall be kept reasonably cool.
2. Tool box training in hot environments shall include training on the symptoms of heat related problems, contributing factors to heat related injuries, and prevention techniques.
3. When possible, work should be scheduled for cooler periods during the day.
4. Individuals shall be encouraged to take breaks in a cooler location, and use cooling devices as necessary, such as cooling vests, to prevent heat related injury.
5. A buddy system shall be established to encourage fluid intake and watch for symptoms of heat related injury.
6. The foreman shall monitor those individuals who have had a previous heat-related injury, are known to be on medication, or exhibits signs of possibly having consumed large amounts of alcohol in the previous 24 hours for signs, or indicating symptoms of heat related injuries.
7. Individuals who are not acclimatized shall be allowed additional breaks. The period and number should be determined by the SSHO and provided to the supervisor and employee for implementation.

Cold weather sheltering and clothing requirements include:

1. If wind chill is a factor at a work location, the cooling effect of the wind shall be reduced by shielding the work area or requiring employees to wear an outer windbreak layer garment.
2. An AHA and/or PHA shall be prepared as an attachment to the site-specific, cold-stress monitoring plan and shall identify specific controls to minimize employee exposure to extreme cold.
3. Extremities, ears, toes, and nose shall be protected from extreme cold by proper clothing such as hats, gloves, masks, etc.
4. Employees whose clothing may become wet shall wear an outer layer of clothing that is impermeable to water.
5. Outer garments must provide for ventilation to prevent wetting of inner clothing by sweat.
6. If clothing is wet, the employee shall change into dry clothes before entering a cold environment.
7. Employees shall change socks and removable felt insoles at regular daily intervals or shall use vapor barrier boots.
8. Due to the added danger of cold injury due to evaporative cooling, employees handling evaporative liquid (such as gasoline, alcohol, or cleaning fluids) at air temperatures below 40 °F (4 °C) shall take precautions to avoid soaking of clothing or contact with skin.

f. Contingency Plan for Severe Weather

When there are warnings or indications of impending severe weather (heavy rains, thunderstorms, damaging winds, tornados, hurricanes, floods, lightning, etc.), weather conditions shall be monitored using a weather station that is part of the National Oceanic and Atmospheric Administration (NOAA) weather radio all hazards network or similar notification system. Appropriate precautions shall be taken to protect personnel and property from the effects of the severe weather.

Notification of inclement weather in progress after working hours will be done by phone. Notifying employees at this time can assist management in letting workers know if and when to report to work.

10. RISK MANAGEMENT PROCESS

a. Standard Safe Work Practices

(1) General

The following general safe work practices will be followed:

- Eating, drinking, chewing gum or tobacco, and smoking are prohibited in the Work Zone.
- Spillage shall be prevented, to the extent possible. In the event that spillage occurs, the liquid shall be contained, if possible.
- Field crewmembers shall use all their senses to alert themselves to potentially dangerous situations (i.e., presence of strong, irritating, or nauseating odors).
- Field crew members shall be familiar with the physical characteristics of the site, including:
 - Wind direction in relation to the ground Work Zone
 - Accessibility to associates, equipment, and vehicles
 - Communications
 - Site access
 - Nearest water sources
 - Routes and procedures to be used during emergencies.
- All wastes generated during activities at the site must be disposed of as directed by the Project Manager.

(2) Personal Protective Equipment

Personnel Protective Equipment (PPE) is worn to minimize exposure to serious workplace injuries and illnesses. Injuries and illnesses may result from contact with chemical, radiological, physical, electrical, mechanical, or other workplace hazards. PPE include items such as gloves, safety glasses and shoes, earplugs or muffs, hard hats, respirators, or coveralls, vests and full body suits. PPE should be of sound design and construction, and well maintained.

- Work clothing - Minimum Requirements.
 - Employees shall wear clothing suitable for the weather however minimum requirements for work shall be short-sleeve shirt, long pants (excessively long or baggy pants are prohibited) and leather work shoes.
 - If analysis determines that safety-toed (or other protective) footwear is necessary (i.e., mowing, weedeating, chain saw use, etc.), they shall be worn. The Navy has requested that safety-toed shoes be worn while performing duties on these installations.
- Eye and Face Protection.
 - Eye and face protection shall be worn as determined by an analysis of the operations being performed
 - However, all involved in chain saw use, chipping, stump grinding, pruning operations, grass mowing, weedeating and blowing operations shall be provided safety eyewear (Z87.1) as a minimum.

- **Hearing Protection.**
 - Hearing protection must be worn by all those exposed to high noise activities (to include grass mowing and trimming, chainsaw operations, tree chipping, stump grinding and pruning). Ear plugs are required when working near operating beach replenishment equipment on Dam Neck Annex.
- **Head Protection.**
 - Hard hats shall comply with ANSI Z89.1 and shall be worn by all workers when a head hazard exists.
 - At a minimum, hard hats shall be worn when performing chain saw use, chipping, stump grinding, pruning operations, grass mowing, weedeating, and blowing operations.
 - Hard hats are required when working within the beach replenishment area on Dam Neck Annex.
- High Visibility Apparel shall comply with ANSI/ISEA 107, Class 2 requirements at a minimum and shall be worn by all workers exposed to vehicular or equipment traffic.
- Protective Leg chaps shall be worn by all chainsaw operators.
- Gloves of the proper type shall be worn by persons involved in activities that expose the hands to cuts, abrasions, punctures, burns and chemical irritants.
- If work is being performed around water and drowning is a hazard, PFDs must be provided and worn as appropriate.

(3) Machine Guards and Safety devices.

- Power tools must have appropriate guards and safety devices in place and operational.

(4) Buddy System

Workers will conduct all site activities with a buddy who is able to:

- Provide his or her partner with assistance.
- Observe his or her partner for signs of heat exposure.
- Notify the project manager if emergency help is needed.

b. Site Hazards and Standard Operation Procedures

(1) Noise

Noise, or unwanted sound, is one of the most pervasive occupational health problems. It is a by-product of many industrial processes.

Hearing protection is required of all field personnel throughout the course of this project when noise generating activities (e.g. saw cutting) are taking place. Exposure to high levels of noise causes hearing loss and may cause other harmful health effects as well. The extent of damage depends primarily on the intensity of the noise and the duration of the exposure.

Noise-induced hearing loss can be temporary or permanent. Temporary hearing loss results from short-term exposures to noise, with normal hearing returning after period of rest. Generally, prolonged exposure to high noise levels over a period of time gradually causes permanent damage.

Hearing protection will be provided to all workers exposed to 8-hour time-weighted average (TWA) noise levels of 85 dB or above. Employees must wear hearing protectors:

- For any period exceeding 6 months from the time they are first exposed to 8-hour TWA noise levels of 85 dB or above, until they receive their baseline audiograms if these tests are delayed due to mobile test van scheduling;
- If they have incurred standard threshold shifts that demonstrate they are susceptible to noise; and
- If they are exposed to noise over the permissible exposure limit of 90 dB over an 8-hour TWA.

(2) Venomous Snakebites

Of the 8,000 people bitten by snakes annually in the United States, fewer than 12 die. Most deaths occur because the victim has an allergic reaction, weakened body systems, or because too much time passes before the victim receives medical care. Reactions from snakebites are aggravated by acute fear and anxiety. Other factors that affect the severity of local and general reactions include: the amount of venom injected and the speed of absorption of venom into the victim's circulation; the size of the victim; protection from clothing including shoes and gloves; quick antivenin therapy; and location of the bite.

Elaborate care for a snakebite is usually unnecessary because in most cases the victim can reach professional medical care within 30 minutes. The most important step in first aid procedures is to transport the victim to the hospital quickly. Meanwhile, take action with the first aid procedures listed below.

First Aid for Snakebite:

- Call EMS (Emergency Medical System) for a victim of snakebite.
- Keep the victim calm. Monitor airway, breathing, and circulation.
- Wash the wound and keep the affected part still. Splint a bitten arm or leg. Keep the affected area lower than the heart to slow down the progress of the venom from the bite site to the heart.
- **Do not apply ice, do not cut the wound, and do not apply a tourniquet.** If in a remote area, contact EMS via radio, then carry the victim or have him or her walk slowly.

Other factors to consider in providing first aid treatment:

- Shock - Keep the victim lying down and comfortable if possible, and maintain his or her body temperature.
- Breathing and Pulse - Constantly monitor airway, breathing, and respiration. Administer artificial resuscitation or CPR if needed.
- Observing the Snake - If feasible without injuring additional persons, observe and take notes of the size, color, and markings of the snake.
- Medications - Do not give the victim alcohol, sedatives, aspirin, or any other medication while transferring to the medical facility.

Other Hazardous Bites

Mosquitoes

West Nile Virus has been spreading quickly throughout the United States, especially in areas with higher mosquito populations. Although this disease has been affecting immuno-compromised individuals, it is best to protect oneself against mosquito bites, which can carry other diseases besides the West Nile Virus.

Repellents containing DEET have been shown to be effective against mosquitoes when applied to exposed skin. Using a repellent with a higher percentage of DEET does not mean that one's protection is better, just that it will last longer. The Federal Centers for Disease Control and Prevention (CDC) has stated that a product containing an approximately 25% concentration lasts an average of five hours, whereas a product with much less DEET will last for one or two hours. Concentrations over 50% do not increase the length of protection.

When using DEET, be cautious against:

- Applying the product indoors. Apply the repellent outdoors and use sparingly.
- Spraying the product directly in one's face. Rather apply to your hands and rub the material on your face, but not on your mouth or around your eyes.
- Do not apply to cuts, irritated skin, or beneath clothing.

Products containing Permethrin, such as Permanone, have been effective when applied directly to clothing. Apply products specified for use on clothing outdoors. Do not apply it to your skin.

The CDC recently announced that products containing two other repellents — the chemical picaridin and natural oil of lemon eucalyptus — are also effective in repelling mosquitoes. In using these for Mosquito control, however, be aware that they are not alternatives to DEET when it comes to battling deer ticks that spread Lyme disease.

If feasible, control the amount of standing water on the site, emptying containers with accumulated water so as not to provide a breeding ground for mosquito larvae. Non-registered pesticides are available to kill larvae in pools of standing water if it is feasible to exercise this level of control over the surroundings.

Be cautious if spraying an insecticide inside a closed space such as in a construction trailer or inside the cab of an excavator or other piece of construction equipment. A toxic environment can quickly be created. Use pesticide sparingly and vacate the space for a short period of time immediately after application to allow the material to settle out of the air.

Spiders

Spiders in the United States are generally harmless, with two notable exceptions: the Black Widow spider (*Latrodectus Mactans*) and the Brown Recluse or violin spider (*Lox Osceles Reclusa*).

The symptoms of such a spider bite are: slight local reaction, severe pain produced by nerve toxin, profuse sweating, nausea, painful cramps in abdominal muscles, and difficulty in breathing and speaking. Victims recover in almost all cases, but an occasional death is reported. The bite of a Black Widow spider is the more painful and often the more deadly of the two.

Field personnel shall exercise caution when lifting covers off manholes or sumps or rummaging through wood, rock, or brush piles, etc. since both the Black Widow and Brown Recluse spiders are typically found in these areas.

(3) General First Aid for Poisonous Insect Bites

1. Minor Bites and Stings

- Cold applications.
- Soothing lotions, such as calamine.

2. Severe Reactions

- Give artificial respiration if indicated.
- Apply a constricting band above the injection site on the victim's arm or leg (between the site and the heart). Do not apply tightly. You should be able to slip your index finger under the band when it is in place.
- Keep the affected part down, below the level of the victim's heart.
- If medical care is readily available, leave the band in place; otherwise, remove it after 30 minutes.
- Apply ice contained in a towel or plastic bag, or cold cloths, to the site of the sting or bite.
- Give home medicine, such as aspirin, for pain.
- If the victim has a history of allergic reactions to insect bites or is subject to attacks of hay fever or asthma, or if he or she is not promptly relieved of symptoms, call a physician or take the victim immediately to the nearest location where medical treatment is available. In a highly sensitive person, do not wait for symptoms to appear, since delay can be fatal.
- In case of a bee sting, remove and discard the stinging apparatus and venom sac.

(4) Tick-borne Diseases

Lyme Disease

Lyme disease is an illness caused by a bacterium, which may be transmitted by the bite of a tick (*Ixodes scapularis*), commonly, referred to as the "Deer Tick." The tick is about the size of a sesame seed, as distinguished from the Dog Tick, which is significantly larger. The Deer Tick is principally found along the Atlantic coast, living in grassy and wooded areas, and feeds on mammals such as mice, shrews, birds, raccoons, opossums, deer, and humans. Not all ticks are infected with the bacterium, however. When an infected tick bites, the bacterium is passed into the bloodstream of the host, where it multiplies. The various stages and symptoms of the disease are well recognized and, if detected early, can be treated with antibiotics.

Removal of ticks is best accomplished using small tweezers. Do not squeeze the tick's body. Grasp it where the mouth parts enter the skin and tug gently, but not firmly, until it releases its hold on the skin. Save the tick in a jar labeled with the date, body location of the bite, and the place where it may have been acquired. Wipe the bite thoroughly with an antiseptic and seek medical attention as soon as possible.

The illness typically occurs in the summer and is characterized by a slowly expanding red rash, which develops a few days to a few weeks after the bite of an infected tick. This may be accompanied by flu-like symptoms along with headache, stiff neck, fever, muscle aches, and/or general malaise. At this stage

treatment by a physician is usually effective; but, if left alone, these early symptoms may disappear and more serious problems may follow. The most common late symptom of the untreated disease is arthritis. Other problems that may occur include meningitis and neurological and cardiac abnormalities. It is important to note that some people do not get the characteristic rash but progress directly to the later manifestations. Treatment of later symptoms is more difficult than early symptoms and is not always successful.

When in an area suspected of harboring ticks (grassy, bushy, or woodland area) the following precautions can minimize the chances of being bitten by a tick:

1. Wear long pants and long-sleeved shirts that fit tightly at the ankles and wrists.
2. Wear light colored clothing so ticks can be easily spotted.
3. Wearing tick repellents may be useful.
4. Inspect clothing frequently while in tick habitat.
5. Inspect your head and body thoroughly when you return from the field.
6. Remove any attached ticks by tugging with tweezers where the tick's mouth parts enter the skin. Do not squeeze or crush it.

Rocky Mountain Spotted Fever

In the United States this tick-borne disease is primarily transmitted by infected Dog Tick (*Dermacentor variabilis*). It is important to note that the Dog Tick is significantly larger than the Deer Tick. Nearly all cases of infection occur in the spring and summer, generally several days after exposure to infected ticks. The onset of illness is abrupt and often accompanied by high fever, headache, chills, and severe weakness. After the fourth day of fever, victims develop a spotted pink rash that usually starts on the hands and feet and gradually extends to most of the body. As with Lyme disease, early detection and treatment significantly reduces the severity of illness. The disease responds to antibiotic therapy with tetracycline or chloramphenicol.

(5) Poisonous Plants

Characteristic Reactions

The majority of skin reactions following contact with offending plants is allergic in nature and characterized by general symptoms of headache and fever, itching, redness, and a rash.

Some of the most common and most severe allergic reactions result from contact with plants of the Poison Ivy group including Poison Oak and Poison Sumac. The most distinctive features of Poison Ivy and Poison Oak are their leaves, which are composed of three leaflets each. Both plants also have greenish-white flowers and berries that grow in clusters. Such plants produce a severe rash characterized by redness, blisters, swelling, and intense burning and itching. The victim can also develop a high fever and become very ill. Ordinarily, the rash begins within a few hours after exposure, but it may be delayed for 24 to 48 hours.

First Aid Procedure

1. Remove contaminated clothing.
2. Wash all exposed areas thoroughly with soap and water, followed by rubbing alcohol.
3. Apply calamine or other soothing skin lotion if the rash is mild.
4. Seek medical advice if a severe reaction occurs, or if there is a known history of previous sensitivity.

c. Activity Hazard Analyses

Tabular Activity Hazard Analysis (AHA) is presented here to prescribe hazards and controls associated with the work on the site. The AHAs are prepared based upon a review of the planned work on the site and the recognized physical and biological hazards associated with the work. The AHAs for this project are contained in Appendix F.

Appendix A
Job Safety Checklists

This page intentionally left blank

Pre-Job Hazard Survey

A Tailgate Meeting is required every day before starting work in order to identify and minimize HAZARDS on the job. PLEASE place a check mark in the box next to each of the following HAZARDS that are most relevant to this particular job and DISCUSS them. Keep a copy of the completed form in an office file.

Date ____ Crew Leader _____ Job Location _____
Type of job _____

HAZARD

- day of the week
- extreme weather conditions
- inexperienced personnel
- improper use of PPE
- distance to electrical conductors
- terrain
- noise levels
- new equipment
- obstacles
- traffic control

- moving/lifting heavy objects
- chemicals
- (Other)

DISCUSS

- more accidents on Mon, Fri, & bef/aft holidays & vacation days
- frost bite, heat exhaustion, effect on driving their ability to detect hazardous conditions
- head, eye, hearing, foot, hand, leg injuries
- direct and/or indirect contact
- slips, trips, and falls
- necessity of hand signals
- proper use and maintenance
- overhead and/or ground level
- being struck, protection of the work area, cones & signs
- proper techniques and/or equipment
- contact with or exposure to

New Employee Safety Checklist

Employee: _____ Department: _____

Date Hired: _____ Supervisor: _____

Supervisor: Check off each item as you discuss it with the new employee prior to having that employee start work.

1. Employee provided company safety policy statement and safety rule. _____
2. Explained functions of company safety committee. _____
3. Reviewed injury-reporting procedures. _____
4. Issued safety equipment - glasses, ear plugs, respirator, etc., and explained use and care. _____
5. Reviewed lock-out and tag procedures. _____
6. Reviewed safe lifting procedures. _____
7. Will forklift training be required? If yes, when _____ _____
8. Reviewed housekeeping and clean-up procedures. _____
9. Located first aid kits/medical service provider(s)/hospital. _____
10. Reviewed hazard communication program, location of material safety data sheets, and how to read an MSDS _____
11. Reviewed evacuation procedures and any specific duties. _____
12. Does the employee understand the above? _____

I acknowledge that information on the above subjects was furnished to me during my orientation.

Employees Signature _____ Department _____

I have instructed the above named employee in the fundamentals of safety practices.

Supervisor's Signature _____ Date _____

6. A. Accident Description (Describe in your own words) (Use additional paper if necessary)

- B. Who provided first aid and/or cleanup of mishap site?
- C. Any blood borne pathogen exposure by other than EMT's? If so who?
- D. Was site secured and witness interviews taken immediately?
- E. List OSHA and EM 385-1-1 standards/requirements that were violated?

7. Causal Factors (Explain yes answers on a supplementary sheet)	YES	NO
Design - Was design of facility, workplace, or equipment a factor?		
Inspection/Maintenance - Were inspection & maintenance procedures a factor?		
Persons Physical Condition - In your opinion, was the physical condition of the person a factor?		
Operating Procedures - Were operating procedures a factor?		
Job Practices - Were any job safety/health practices not followed when the accident occurred?		
Human Factors - Did any human factors such as size or strength of person etc. contribute to the accident?		

Environmental Factors - Did heat, cold, dust, sun, glare, etc., contribute to the accident?		
Chemical & Physical Agent Factors - Did exposure to chemical agents, such as dust, fumes, mists, vapors or physical agents such as noise, radiation, etc., contribute to the accident?		
Office Factors - Did office setting such as lifting office furniture, carrying, stopping, etc., contribute to the accident?		
Support Factors - Were inappropriate tools/resources provided to properly perform the activity task?		
Personal Protective Equipment - Did the improper selection, use, or maintenance of personal protective equipment contribute to the accident?		
Drugs/Alcohol - In your opinion, were drugs or alcohol a factor?		
Activity Hazard Analysis - Was the lack of an adequate (IAW EM 385-1-1 Sec 01.A.09) Activity Hazard Analysis a contributing factor? - Was it site specific and address the type of work/operations performed when the mishap occurred?		
Management - Did the lack of adequate supervision contribute to the accident? - Was inadequate information provided at pre-con meeting?		
8. Training:		
A. Was/were person(s) trained to perform activity/task?		
B. Type of training?		
C. Date of most recent formal training? / /		
D. List topics discussed		
9. Fully Explain What Allowed or Caused The Accident, Include Direct and Indirect Causes:		
A. Direct Cause		
B. Indirect Cause		
C. Action(s) taken to prevent re-occurrences or provide on-going corrective actions		
D. Corrective Action Dates

OSHA's Form 301 Injury and Illness Incident Report

Attention: This form contains information relating to employee health and must be used in a manner that protects the confidentiality of employees to the extent possible while the information is being used for occupational safety and health purposes.

Revised approval OSHA 301 (2)

This *Injury and Illness Incident Report* is one of the forms you must fill out when a recordable work-related injury or illness has occurred. Together with the *Log of Work-Related Injuries and Illnesses* and the accompanying *Summary*, these forms help the employer and OSHA develop a picture of the extent and severity of work-related incidents.

Within 7 calendar days after you receive information that a recordable work-related injury or illness has occurred, you must fill out this form or an equivalent. Some state workers' compensation, insurance, or other reports may be acceptable substitutes. To be considered an equivalent form, any substitute must contain all the information asked for on this form.

According to Public Law 91-596 and 29 CFR 304, OSHA's recordkeeping rule, you must keep this form on file for 5 years following the year to which it pertains.

If you need additional copies of this form, you may photocopy and use as many as you need.

Completed by _____
 Title _____
 Date () - () - ()

Information about the employee

- 1) Full name _____
- 2) Street _____
 City _____ State _____ ZIP _____
- 3) Date of birth _____
- 4) Date hired _____
- 5) Male
 Female

Information about the physician or other health care professional

- 6) Name of physician or other health care professional _____
- 7) If treatment was given away from the workplace, where was it given?
 Facility _____
 Street _____
 City _____ State _____ ZIP _____
- 8) Was employee treated in an emergency room?
 Yes
 No
- 9) Was employee hospitalized overnight as an inpatient?
 Yes
 No

Information about the case

- 10) Case number from the Log _____ (Obtain the case number from the Log after you finish this case.)
- 11) Date of injury or illness () / () / ()
- 12) Time employee began work _____ AM / PM
- 13) Time of exit _____ AM / PM Check if time cannot be determined
- 14) **What was the employee doing just before the incident occurred?** Describe the activity, as well as tools, equipment, or material the employee was using. Be specific. Examples: "climbing a ladder to carry roof materials"; "spraying chlorine from hand sprayer"; "daily computer key-entry."
- 15) **What happened?** Tell us how the injury occurred. Examples: "When ladder slipped on wet floor, I fell 20 feet"; "Worker was sprayed with chlorine when gasket broke during replacement"; "Worker developed soreness in wrist over time."
- 16) **What was the injury or illness?** Tell us the part of the body that was affected and how it was affected—more specific than "hurt," "pain," or "sore." Examples: "strained back"; "chemical burn, hand"; "tunnel syndrome."
- 17) **What object or substance directly harmed the employee?** Examples: "concrete floor"; "chlorine (radia) area sign." If this question does not apply to the incident, leave it blank.
- 18) **If the employee died, when did death occur?** Date of death _____

Activity/Work Task: Lighting Survey for Sea Turtle Management		Overall Risk Assessment Code (RAC) (Use highest code)				M	
Project Location: Naval Air Station Oceana-Dam Neck Annex and VA Army National Guard Camp Pendleton		Risk Assessment Code (RAC) Matrix					
Contract Number: N62470-13-D-8017-WE04		Severity	Probability				
Date Prepared: 04/03/2015			Frequent	Likely	Occasional	Seldom	Unlikely
Prepared by (Name/Title):		Catastrophic	E	E	H	H	M
Brian Bishop / Project Manger		Critical	E	H	H	M	L
Reviewed by (Name/Title):		Marginal	H	M	M	L	L
Mark Housand / Versar, Inc. Safety Manager		Negligible	M	L	L	L	L
Notes: (Field Notes, Review Comments, etc.)		Step 1: Review each "Hazard" with identified safety "Controls" and determine RAC (See above)					
		"Probability" is the likelihood to cause an incident, near miss, or accident and identified as: Frequent, Likely, Occasional, Seldom or Unlikely.					
		RAC Chart					
		"Severity" is the outcome/degree if an incident, near miss, or accident did occur and identified as: Catastrophic, Critical, Marginal, or Negligible					
		E = Extremely High Risk					
		H = High Risk					
		M = Moderate Risk					
		L = Low Risk					
		Step 2: Identify the RAC (Probability/Severity) as E, H, M, or L for each "Hazard" on AHA. Annotate the overall highest RAC at the top of AHA.					
Job Steps		Hazards		Controls		RAC	
General Safety		Slips, Trips and Falls		Use caution and pay particular attention to uneven and rough terrain while working on the site.		M	
		Muscle strain/ Back strain		Stretch muscles prior to working. Use proper methods for digging. Wear gloves. Stop work to rest if feeling strain or fatigue.		M	
		Wildlife		Avoid contact with wildlife. In case of animal bite, perform first aid and seek medical attention for bites from mammals or reptiles (snakes and lizards).		L	
		Insects		Utilize insecticide with DEET to eliminate mosquito bites, West Nile Virus and Lyme Disease. Treat clothing with Permethrin and allow appropriate amount of drying time prior to wearing the clothes.		M	
		Venomous Insect Stings/Bites		For minor stings/bites carefully remove stinger (if necessary) and wash area; apply dressing and cold pack. If the person seems to be having an allergic or anaphylactic reaction call 911 or Installation Emergency Response number.		M	
Walking on uneven ground		Trips, falls, sprains, broken bones, lacerations and contusions		Be observant while walking. Use sturdy leather work boots with ankle support and non-slip soles Slopes of 30 degrees or greater will be avoided. Climbing up or down vertical areas will be avoided		L	
Working near water		Stay cognizant of surf zone		Do not enter the water, stay cognizant of tides and surf Stay within eye sight of partner Wear high visibility vests		L	
Working at night		Hit by vehicles		Be observant while walking. Stay clear of oncoming traffic Wear high visibility vests		M	
Weather Hazards		Hypothermia		Watch for shivering, altered mental status. Care for life-threatening problems, get patient to a warm place if possible, remove wet clothing, warm patient slowly.		M	
		Heat Stress		Adjust work schedule to cooler hours of the day; Sufficient fluid intake; Monitor employees for heat related illness.		M	
		Sun Exposure		Besides head protection, use sunscreen of SPF 30 rating or better as protection against UVA and UVB. Reapply sunscreen often. Sunscreen should be no more than one year old. Wear sunglasses to protect eyes from UV exposure.		M	
Construction Areas		Struck by equipment, noise		Be observant Attend specialized orientation training Wear required PPE while inside construction zone		M	
Equipment to be Used		Training Requirements/Competent or Qualified			Inspection Requirements		
Long pants, shirt with sleeves		Only trained and authorized persons will use excavation equipment and power tools.			Pre-operation inspection on front end loader		
Hard hat, steel-toed boots, hearing protection is construction zones							
High visibility vests							
Designated Competent/Qualified Person(s):							
Brian Bishop							
Chris Lotts							
Susan Barco							
Sarah Rose

NASO DNA Restricted Access Coordination Area

Survey Area 1

Firing Range

Survey Area 2

Maneuver Training Area

Survey Area 3, with 3 potential subsections (A-north, B-center, C-south)

Firing Range

Firing Range

South of Red Line = Escort Required and must report to Building 301 via the installation main gate off of Dam Neck Blvd. Photo are NOT authorized in this area. Only under VERY special conditions will photos be authorized. DO NOT bring cameras, phones with cameras, iPads or other items with Camera like capabilities into this area. ***If you identify a must photo opportunity (e.g., T&E species) in a no PHOTO zone, take a point location and contact Mike Wright immediately.***

North of Red Line = An escort is NOT required and access to this area may be obtained via the Birdneck Road Gate. Photos are authorized in this area for individuals who obtain a photo authorization letter.

Orange Polygon is a Drone Launch Range. When active the beach will be posted with signs and lookout personnel that will deny access. Individuals can check to see if the range is active or is preparing to be active, before the range goes "hot" sometimes they will let personnel on official business access until they go "hot." There are also red flags posted on the two roads that surround the White Polygon that indicate the range is active.

Survey Area 4

White Polygon is UXO Area. No Access without appropriately trained Explosive Safety Officer on site. Navy does not supply ESOs.

Survey area 5

Attachment 2 Artificial Light Source and Fixture Descriptions

Source: Witherington, B. and R. E. Martin. 2003. Understanding, Assessing, and Resolving Light-Pollution Problem on Sea Turtle Nesting Beaches. FMRI Technical Report TR-2 Third Edition, Revised. Florida Fish and Wildlife Conservation Commission.

APPENDIX A

The following is a list of artificial light sources grouped by the level of disruption they are likely to cause sea turtles. The criteria used to group the sources came from studies of physiological spectral sensitivity (Granda and O'Shea, 1972), hatchling orientation with respect to laboratory light sources (Mrosovsky and Carr, 1967; Mrosovsky and Shettleworth, 1968; Mrosovsky, 1972; Witherington and Bjorndal, 1991a; Witherington, 1992b) and commercial light sources (Dickerson and Nelson, 1988, 1989; Witherington, 1989; Witherington and Bjorndal, 1991b; Ferreira *et al.*, 1992; Nelson, 1992; Witherington, 1992b), and spectral profiles of commonly used lamps (Anonymous, 1983; Rossotti, 1983; Anonymous, 1989; Witherington and Bjorndal, 1991b). Effects are described as being extremely disruptive, highly disruptive, moderately disruptive, or minimally disruptive.

White, broad-spectrum, short-arc lighting (*extremely disruptive*).—These light sources include xenon and mercury arc lamps and are the brightest and highest-energy light sources commonly used. They emit wavelengths rather evenly across the visible spectrum (which is why they appear white) and in the ultraviolet spectrum as well. They are used principally for temporary, intense lighting needs.

White, broad-spectrum, electric-discharge lighting (*extremely disruptive*).—Mercury-vapor, metal-halide, and fluorescent-tube lighting are included in this group. Like sources in the preceding group, these sources emit wavelengths across the visible spectrum. They are used both indoors and outdoors. Fluorescent-tube lighting is becoming more common as an indoor source and is frequently used to light porches and outdoor signs.

Color-phosphor and tinted-fluorescent lighting ("blacklight" ultraviolet, violet, blue, green, and mixtures of these colors) (*extremely disruptive*).—As revealed to some extent by their colors, these electric-discharge tube lamps emit light principally in the short-wavelength end of the visible spectrum. The so-called "blacklight"-type fluorescent tubes, however, emit much of their light in the near-ultraviolet region. These blacklight tubes appear as a dim violet color to humans but are very disruptive to sea turtle hatchlings. Blacklights are often used as insect attractants in insect-electrocuting "bug-zappers." Tubes of other colors are principally used for decorative applications.

White, broad-spectrum, incandescent lighting (*extremely disruptive*).—Light emitted from incandescent sources comes from a glowing filament. This group includes quartz-tungsten-halogen and simple tungsten-filament sources. Without tinting, these sources emit wavelengths throughout the visible spectrum but less so in the short-wavelength end of the spectrum than the sources described above. Incandescent sources are commonly used as outdoor

floodlights, as indoor lighting (*i.e.*, the common light bulb), and as transient lighting (flashlights, lanterns, and electric torches).

Color-tinted incandescent lighting (blue and green) (*extremely disruptive*).—These colored sources are tinted so that they emit principally short-wavelength light; they are often used in decorative applications.

White, pressurized-fuel, glowing-element lanterns (*extremely disruptive*).—These portable lanterns are used for camping, fishing, and other transient nighttime activities.

High-pressure sodium vapor (HPS) lighting (*highly disruptive*).—HPS sources emit light with minor wavelength peaks in the blue and green regions and major peaks in the yellow and orange regions of the visible spectrum. The color of HPS sources is whitish golden to peach. Although less disruptive than the broad-spectrum white sources above, HPS is one of the most commonly used outdoor light sources in the USA and many other countries and is one of the most common causes of hatchling misorientation and mortality.

Open fires (*moderately to highly disruptive*).—Although fires are temporary light sources and emit less short-wavelength light than the sources above, they have been documented as a significant source of hatchling mortality. Unlike other attractive light sources, fires can kill hatchlings quickly (hatchlings are known to crawl into fires and die). The size and temperature of a fire determines how attractive it is to hatchlings.

Yellow-phosphor and amber-tinted fluorescent lighting and red tubes (*moderately disruptive*).—Yellow and amber fluorescent tubes emit principally red, yellow, and green wavelengths but do not exclude light in the blue region of the spectrum as well as yellow incandescent bulbs do. Yellow and amber fluorescent tubes are not generally marketed as "bug lights." Although they are more disruptive to

sea turtles than yellow incandescent bulbs, yellow and amber fluorescents are far better than white or other colored tubes for use near nesting beaches. However, the hue of these yellow fluorescent lamps varies between manufacturers and can have a varied effect on sea-finding in hatchlings. Red tubes are typically used for decoration and can be of two types: red (or reddish), phosphor-fluorescent tubes and red, neon tubes. Reddish or red-purple fluorescent tubes can be very disruptive, depending upon the amount of short-wavelength light that they emit (purplish lights emit both blue and red light). Neon tubes are covered below.

Lamps with yellow or orange dichroic long-pass filters (*minimally to moderately disruptive*).—Because these filters are very good at attenuating short wavelengths, the type of lamp used with them matters little. Consequently, these filters may allow the use of lamps like metal-halide and HPS that have small and easily focused elements. These lamps can be used in more directional fixtures in order to reduce stray light. Dichroic filters are not standard off-the-shelf accessories for commercial fixtures but they have been used in some outdoor applications near nesting beaches.

Color-tinted incandescent lighting (yellow and red) (*minimally to moderately disruptive*).—Yellow or amber incandescent light bulbs (bug lights) are generally only weakly attractive to hatchlings for the same reason that they attract few insects — they emit little short-wavelength light. Although they are minimally disruptive for the most part, bug lights can interfere with sea-finding if they are numerous, of high wattage, or close to the nesting beach. Red-tinted incandescent sources are more variable in color than bug lights. Some red sources can turn purple or pinkish over time (an indication of greater short-wavelength emission) and become more attractive to hatchlings.

Low-pressure sodium vapor (LPS) lighting (*minimally disruptive*).—LPS is by far the least disruptive light source among those commonly used. LPS sources emit a light that is pure (monochromatic) yellow, a region of the spectrum that is only weakly attractive or even aversive (at higher intensities for loggerheads only) to orienting hatchlings. Because

LPS sources have poor color rendition, they are used principally for outdoor applications.

Red light-emitting diode (LED) lighting (*minimally disruptive*).—LEDs are miniature lamps that are not commonly used outdoors. In the future, LEDs may be used to a greater extent as sign lighting and pathway lighting. Red LEDs come close to being ideal for use near sea turtle nesting beaches. Red LEDs emit a pure-red light that does not vary in color over the life of the lamp, and because they are small, they light only a limited area. They are easy to hide from the beach and have a very long life. Green and amber LEDs are marketed but are much less preferred than red.

Neon tubes (*minimally disruptive*).—True neon tubes (not tinted tubes) are a pure-red light source. At present, neon is used almost exclusively for decorative purposes. Neon tubes can be difficult to shield, but their color makes them minimally disruptive. Potential applications include pathway and ground-level lighting.

Transient light sources (flashlights, electric torches, flash photography) (*disruptive characteristics vary*).—This lighting is placed in a separate category because it is generally in use for relatively short time periods. Most of these sources have white incandescent lamps and can be expected to affect sea turtles as the incandescent sources above do. Transient sources are well-known disruptors of sea-finding behavior in hatchlings and adults, but researchers are less certain about how transient sources may affect nesting turtles or those emerging from the ocean to nest. Many workers in the field believe that flashlights and flashes from cameras can turn emerging turtles back to the sea and alter the behavior of nesting turtles. Until additional evidence suggests otherwise, transient light sources should be used sparingly on sea turtle nesting beaches. If handheld lighting is to be used, deep-red filters should be fastened over the lens of the source. Red light appears much brighter to humans than it does to sea turtles and does not degrade the night vision of people using it. People using red light are able to acclimate to the dark, and most are surprised by how well they can see by starlight and moonlight alone.

APPENDIX E

Diagrams of common lighting fixtures showing mounting position, light distribution, and overall suitability for use near sea turtle nesting beaches. For purposes of recommending suitable mounting distances from nesting beaches, the crest of the primary dune is considered to be the landward limit of the beach. Fixtures are assessed for their suitability in minimizing direct and indirect lighting of the beach. For all fixtures, glowing portions of luminaires (including reflectors and globes) should not be visible from the nesting beach.

WALL-MOUNTED AREA LIGHTING

MOUNTING SUITABILITY:

Poor. Very poor when mounted on upper stories.

DIRECTIONAL SUITABILITY:

Poor.

OVERALL SUITABILITY:

Poor. Not suitable for the beach sides of buildings.

WALL-MOUNTED AREA LIGHTING, "WALL PAK"

MOUNTING SUITABILITY:

Poor. Very poor when mounted on upper stories.

DIRECTIONAL SUITABILITY:

Poor.

OVERALL SUITABILITY:

Poor. Not suitable for the beach sides of buildings.

DECORATIVE CUBE LIGHT

MOUNTING SUITABILITY:

Fair if mounted at heights lower than 2 m. Poor if mounted higher.

DIRECTIONAL SUITABILITY:

Very poor.

OVERALL SUITABILITY:

Very poor. This fixture is difficult to shield and should not be used near nesting beaches.

POLE-MOUNTED FLOODLIGHTING WITH FULL VISOR

MOUNTING SUITABILITY:

Good if directed downward and away from the beach.

DIRECTIONAL SUITABILITY:

Good.

OVERALL SUITABILITY:

Good if directed downward and away from the nesting beach and if light does not illuminate objects visible from the beach.

POLE-TOP-MOUNTED CUTOFF LIGHTING, "SHOEBOX" FIXTURE

MOUNTING SUITABILITY:

Good to poor, depending on mounting height. Mounting height should be no more than 5 m within 100 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Fair to good, as determined by reflectors.

OVERALL SUITABILITY:

Fair to good when mounting heights are low.

DECORATIVE GLOBE LIGHT

MOUNTING SUITABILITY:

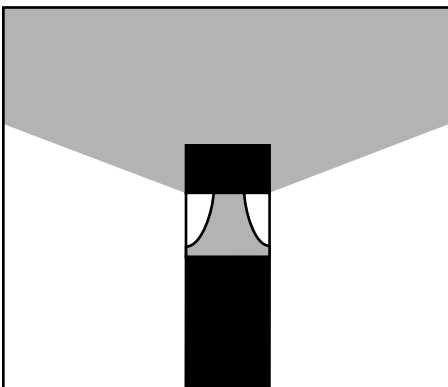

Fair if mounted at heights lower than 2 m. Poor if mounted higher.

DIRECTIONAL SUITABILITY:

Very poor.

OVERALL SUITABILITY:

Very poor. This fixture is difficult to shield and should not be used near nesting beaches.

LIGHTING BOLLARD WITH HIDDEN LAMP

MOUNTING SUITABILITY:

Good if mounting height is near 1 m.

DIRECTIONAL SUITABILITY:

Poor to fair.

OVERALL SUITABILITY:

Fair. Good if additional shields on the beach side of the fixture are used.

LOW-LEVEL “MUSHROOM” LIGHTING

MOUNTING SUITABILITY:

Good if mounted at foot level.

DIRECTIONAL SUITABILITY:

Poor.

OVERALL SUITABILITY:

Fair. Good to excellent if used so that vegetation and topography block its light from the beach.

LOW-LEVEL “TIER” LIGHTING

MOUNTING SUITABILITY:

Good if mounted at foot level.

DIRECTIONAL SUITABILITY:

Poor but can be good if the fixture has louvers that eliminate lateral light.

OVERALL SUITABILITY:

Fair. Good to excellent if used so that vegetation and topography block its light from the beach.

LIGHTING BOLLARD WITH LOUVERS

MOUNTING SUITABILITY:

Good if mounting height is near 1 m.

DIRECTIONAL SUITABILITY:

Good.

OVERALL SUITABILITY:

Good.

GROUND-MOUNTED FLOODLIGHTING

MOUNTING SUITABILITY:

Poor, because of its upward aim.

DIRECTIONAL SUITABILITY:

Fair to good.

OVERALL SUITABILITY:

Fair to poor if directed away from the beach. Very poor if directed toward the beach.

POLE-MOUNTED FLOODLIGHTING

MOUNTING SUITABILITY:

Fair if directed downward and away from the beach.

DIRECTIONAL SUITABILITY:

Fair to good.

OVERALL SUITABILITY:

Fair to good if aimed downward and directly away from the nesting beach and if light does not illuminate objects visible from the beach. Otherwise, poor to very poor.

ARM-MOUNTED AREA LIGHTING, "OPEN-BOTTOM" OR "BARN LIGHT" FIXTURE

MOUNTING SUITABILITY:

Poor to very poor, depending upon mounting height. Should not be mounted higher than 5 m within 150 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Poor if unshielded. Fair if shielded.

OVERALL SUITABILITY:

Poor.

ARM-MOUNTED AREA LIGHTING, DECORATIVE "PENDANT" FIXTURE

MOUNTING SUITABILITY:

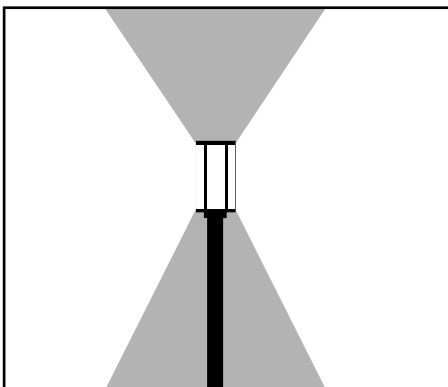

Poor to very poor, depending upon mounting height. Should not be mounted higher than 5 m within 150 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Poor. Difficult to shield properly.

OVERALL SUITABILITY:

Poor.

DECORATIVE "CARRIAGE" LIGHTING

MOUNTING SUITABILITY:

Fair if mounted at heights lower than 2 m. Poor if mounted higher.

DIRECTIONAL SUITABILITY:

Very poor. Fair if properly shielded.

OVERALL SUITABILITY:

Poor.

ARM-MOUNTED CUTOFF LIGHTING, "SHOEBOX" FIXTURE

MOUNTING SUITABILITY:

Good to poor, depending on mounting height. Mounting height should be no more than 5 m within 100 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Fair to good, as determined by reflectors.

OVERALL SUITABILITY:

Fair to good when mounting heights are low and fixtures are aimed directly downward.

ARM-MOUNTED AREA LIGHTING, "COBRAHEAD" FIXTURE

MOUNTING SUITABILITY:

Poor to very poor, depending on mounting height. Mounting height should be no more than 5 m within 150 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Poor. Difficult to shield properly.

OVERALL SUITABILITY:

Poor.

ARM-MOUNTED AREA LIGHTING, "FLAT-FACE" CUTOFF FIXTURE

MOUNTING SUITABILITY:

Good to poor, depending on pole height. Mounting height should be no more than 5 m within 100 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Fair to good, as determined by reflectors.

OVERALL SUITABILITY:

Fair to good when mounting heights are low.

SIGN LIGHTING, BOTTOM-UP STYLE

MOUNTING SUITABILITY:

Poor, because of its potential for producing uplight scatter.

DIRECTIONAL SUITABILITY:

Poor to good.

OVERALL SUITABILITY:

Poor. Signs near nesting beaches should be lighted from the top down. In no case should lighted signs be visible from the beach.

SIGN LIGHTING, TOP-DOWN STYLE

MOUNTING SUITABILITY:

Good.

DIRECTIONAL SUITABILITY:

Poor to good.

OVERALL SUITABILITY:

Generally good if the sign is not visible from the beach and if the lighting is well aimed.

ARM-MOUNTED AREA LIGHTING, FIXTURES WITH REFRACTING GLOBES OR CONVEX LENSES

MOUNTING SUITABILITY:

Poor to very poor, depending upon mounting height. Mounting height should be no more than 5 m within 150 m of a nesting beach.

DIRECTIONAL SUITABILITY:

Poor. Fair to good if shielded properly.

OVERALL SUITABILITY:

Poor.

CEILING-MOUNTED AREA LIGHTING, FIXTURES WITH REFRACTING GLOBES OR CONVEX LENSES

MOUNTING SUITABILITY:

Poor if mounted on the beach sides of buildings or on upper stories. Good if shielded from the beach by buildings.

DIRECTIONAL SUITABILITY:

Poor.

OVERALL SUITABILITY:

Poor to fair, depending upon mounting location.

CEILING-RECESSED DOWNLIGHTING WITH BAFFLES TO ELIMINATE LATERAL LIGHT

MOUNTING SUITABILITY:

Good to excellent when mounted in lower-story ceilings and soffits.

DIRECTIONAL SUITABILITY:

Excellent.

OVERALL SUITABILITY:

Good to excellent.

**WALL-MOUNTED AREA LIGHTING,
“JELLY-JAR” PORCH LIGHT FIXTURE**

MOUNTING SUITABILITY:

Poor. Very poor when mounted on upper stories.

DIRECTIONAL SUITABILITY:

Poor.

OVERALL SUITABILITY:

Poor.

LINEAR TUBE LIGHTING

MOUNTING SUITABILITY:

Excellent if mounted at foot level.

DIRECTIONAL SUITABILITY:

Fair to poor, but this lighting is of concern only if mounted high or if large numbers of high-wattage (>3 W) lamps are used.

OVERALL SUITABILITY:

Excellent if low-wattage strips are used sparingly in recessed areas.

LOUVERED STEP LIGHTING

MOUNTING SUITABILITY:

Excellent if mounted at foot level.

DIRECTIONAL SUITABILITY:

Excellent.

OVERALL SUITABILITY:

Excellent.

WALL-MOUNTED DOWNLIGHTING

MOUNTING SUITABILITY:

Good to excellent when mounted on lower-story walls.

DIRECTIONAL SUITABILITY:

Excellent.

OVERALL SUITABILITY:

Good to excellent.

APPENDIX F

Diagrams depicting solutions to two common lighting problems near sea turtle nesting beaches:
balcony or porch lighting and parking-lot lighting.

POOR

Poorly directed balcony lighting can cause problems on sea turtle nesting beaches.

BETTER

Completely shielding fixtures with a sheet of metal flashing can reduce stray light reaching the beach.

BEST

Louvered step lighting is one of the best ways to light balconies that are visible from nesting beaches.

POOR

Poorly directed parking lot lighting can cause problems on sea turtle nesting beaches.

BETTER

Fixtures with 90° cutoff angles can reduce the amount of stray light reaching the beach.

MUCH BETTER

Fully hooded floods can direct light accurately and reduce stray light even more.

BEST

Low-mounted, louvered bollard fixtures are the best way to light parking lots near nesting beaches.

Nest Mngt. Zones

 Training Area. Nests to be Relocated to a Green Zone.

Training Area. Nest Above High-tide Rack-line can be Left in Place with Self-release Cage and Posts on All 4 Sides. Nest Negatively-Inhibiting Training Routes can be Relocated West, Closer to Duneline, with Self-release Cage and Posts on All 4 Sides. If Number of Nests Negatively Inhibit Training, New Nests will be Relocated to Green Nest Mngt. Zones with Self-release Cages and Posts on All 4 Sides. No Nest-sitting.

 Training Area. Nest Above High-tide Rack-line can be Left in Place with Self-release Cage and Posts on All 4 Sides. Nest below High-tide Rack-line will be Relocated Due West of the Original Nest Site, Above the Rack-line with Self-release Cage and Posts on All 4 Sides. Nest-sitting is Authorized.

 Recreational Use Area. Nest Above High-tide Rack-line can be Left in Place with Self-release Cage and Posts on All 4 Sides. Nest below High-tide Rack-line will be Relocated Due West of the Original Nest Site, Above the Rack-line with Self-release Cage and Posts on All 4 Sides. Nest-sitting is Authorized.

Appendix L

Project Review SOP

Review each project proposed in the INRMP or by the installation or tenant of the installation (Env. Checklist Reviews, Site Approval Reviews, Site Work Induction Board Project Reviews, Work Permits, etc.) for potential concerns associated with Sea Turtles.

Federally Listed Threatened and Endangered Sea turtles utilize the beaches and nearshore environment of NASO Dam Neck Annex. These species are influenced/impacted by lights utilized at night. During the months of Apr-Sept no Bright Lights should be utilized at night to avoid conflicts with Nesting or hatching Sea Turtles at night. If light utilization is required at night at this facility, lights should be outfitted with devices to minimize eastwardly shine and direct the glow of the light downwards not outward. Lighting should be kept to a minimum and not exceed the current glow/intensity currently seen from the beach/ocean.

A lighting Assessment is to be awarded in FY15 along with a total Sea Turtle Biological Assessment (BA) for the 4 miles of NASO DNA beach front property. A programmatic USFWS Biological Opinion (BO) is anticipated to be received pending submittal of the BA. The lighting assessment will be inserted into Appendix J of this document (Sea Turtle SOP). The BO will be added to Appendix A of this document (Sea Turtle SOP). The information and materials in Appendix J and A will be utilized as appropriate to advise facilities management of existing facility modifications that need to be made and for advising requirements for future projects on the installation to maintain compliance under the endangered species act.

Training missions and recreational beach utilization during breeding season.

All individuals conducting training in the LCAC training area of the installation should receive training on sea turtle and sea turtle crawl identification. If a turtle or crawl is observed, the activity should stop, the Installation Natural Resources Manager (INRM) should be notified immediately via the Command Duty Officer, and the activity should not resume until the INRM has cleared the site for training to continue.

Nesting sea turtle surveys are conducted on all NASO DNA beaches (4 miles) each day during sea turtle nesting season (15 May - 31 Aug annually). Surveys start 1/2 hour before sunrise and typically end (if nothing is found) 1 to 2 hours later. If a sea turtle nest/crawl is found it must be cordoned off and USFWS (until Navy obtains appropriate permits) must come to collect biological data and relocate the nest if conditions dictate that relocation is warranted; otherwise the nest is caged, marked and left on site (and monitored each day until it has hatched).

These surveys allow us to clear the beaches to allow maximum training opportunities within the constraints of the law.

Daily sand smoothing activities (e.g., MWR beach clean-up) should occur immediately after the NASO Environmental Staff has completed their patrol and cleared the beach for daily use. No smoothing activities are authorized from dusk until morning turtle patrols are completed daily from 15 May - 31 Aug, unless prior coordination and authorizations have been made with the CO's designated INRM.

Fires are not authorized on the beach at Night, from May - October.

Outdoor lighting should be kept to a minimum at Night, from May-October. Use of lighting on the beach should be restricted to red-light conditions (e.g., red lenses, or white lights that have been covered with red film/tape), unless there is an emergency.

Enclosure 2. Marine Resources Stranding Database & Reporting Process

This page intentionally left blank.

Enclosure 3. Virginia Aquarium Stranding Response

This page intentionally left blank.

STRANDING REPORTING PROCESS

1. Contact the VA Aquarium Stranding Team (757-385-7575, 0830-1630 hours or 757-385-7576 for afterhours live stranding emergencies) for sea turtle, sturgeon, and marine mammal strandings. For fish strandings (such as Sharks, mass non-shark fish strandings, sturgeon, large unusual fish strandings, or any other protected fish species of concern) contact the Virginia Aquarium's Curator of Fishes, Beth Firchau, 757-434-0745.
2. Fill-out the STRANDING REPORT FORM (see below) for on-land or open water identified strandings and Return to your installation Natural Resources Manager (NRM), ASAP.
3. Notify your NRM of the Stranding(s), immediately. If the stranding involves marine mammals or sturgeon provide them the information in the stranding report form. (Michael Wright, 757-373-8531) The NRM will notify the NAVFAC MIDLANT EV22 Subject Matter Expert (SME) and NOAA POCs, as appropriate.
4. The NRM will Call OPNAVINST 3100.6H Reportable Strandings into CNO N45, Washington DC 703-695-5271 (Frank Stone), 703-342-6455 (Bob Gisiner) &/ or the NOC Battalion Watch Captain (703-692-9284); COMLANTFLT 757-836-5221 (Richard "Jene" Nissen); and NAVFAC MIDLANT Core (Jessica Bassi, 757-341-0493).
 - o The following strandings are OPNAVIST reportable events:
 - Any stranding that involves a Northern Right Whale or Beaked Whale.
 - Any stranding that involves a floating whale in open water.
 - Any discovery of a whale stranded ashore.
 - Any mass stranding (two or more animals) of whales, or dolphins that results in coverage by the local or national media.
 - Claims of unusual marine mammal behavior reported in the media, or by National Marine Fisheries Service, a private party or non-governmental entity in which naval operations, exercises or training have been implicated are reportable events.
 - Any other incident involving marine mammals, which have significant media interest and may implicate naval operations at sea are also reportable events. Examples of such marine mammal events might include manatee strandings or mass strandings (two or more) of dolphins, seals, sea lions, otters, etc.
5. If it is determined that an OPREP 3 Navy Blue report is required related to the stranding event the Natural Resources Manager will coordinate with the CDO to complete the initial report.
6. Enter Stranding Report Data into the NASO Natural Resources Access Database.

Note: Regarding Sea turtles, Marine Mammals, Sturgeon and/or other Protected Species, ONLY an individual/organization containing the appropriate Regulatory Issued Permits (e.g., USFWS, NOAA, VAST, VDGIF, VCU, etc.) is legally authorized to relocate/touch these animals. The NASO NRM has obtained a NOAA-NMFS issued permit regarding sturgeon salvage and is inquiring regarding obtaining permits regarding sea turtles with USFWS via VDGIF.

Key Contacts:

- Navy on Scene Coordinator (NOSC) = 757-341-0449(o); 757-636-4378(c)
- Regional Operations Center (ROC) = 757-322-2609(24hrs); 757-322-3093
- NASO Command Duty Officer (CDO) = 757-438-3159 (24hrs)
- NASO Natural Resources Manager (NRM) = 757-433-3461(o); 757-373- 8531(c)
- NASO Conservation Law-enforcement Officer (CLEO) = 757-433-2151(o); 757-635-5436(c)
- NASO Environmental Program Director = 757-433-3437(o)
- NAVFAC MIDLANT Core Marine Animal Media Manager = 757-341-0493(o)
- NAVFAC MIDLANT Core Natural Resources Supervisor = 757-341-0495(o)
- NAVFAC MIDLANT Core Environmental Conservation and Planning Director = 757-341-1988(o)
- NOAA Sturgeon POC = 978-282-8473(o)
- Virginia Aquarium Stranding Team (VAST) = 757-385-7575; 757-385-7576(emergency#)

Note: The ROC and the CDO should be able to assist with locating and getting equipment (if available) for emergency response. Jessica Bassi has developed the NAVFAC MIDLANT Regional Stranding Investigation Assistance Plans (RSIAP), which has received final approvals.

Note: The RSIAP indicates that the CDO will coordinate trying to obtain equipment to assist with marine animal stranding response, when needed. The need would be for large animal (e.g., whales) and mass stranding events (e.g., multiple dolphins stranding at the same time). Heavy equipment that can access and operate on a beach would be needed, primarily fork-lift type vehicles and vehicles that can dig large deep holes for burials.

Attention all boaters and beach-walkers!
Sea Turtle Cold Stunning Season is Here!

With water temperatures dropping quickly, sea turtles, which are cold-blooded reptiles, are finding themselves in trouble all over the east coast. Due to the surrounding cold waters, some of these animals may appear deceased but are actually in a coma, and require IMMEDIATE ATTENTION! If you come across any sea turtle swimming, floating or stranded on the beach, stay with it and please call the

Virginia Aquarium Stranding Response Team

757-437-6159

SEALS IN VIRGINIA

What should you do if you see a seal on the beach?

Each winter the Virginia Aquarium Stranding Response Team handles dozens of calls about seals on the beaches, docks and piers of the Virginia coast. Sightings of seals have increased dramatically in the last ten years and many of the seals we see appear to be healthy and do not need our intervention, but **they do need to be left alone!**

Wild healthy seals regularly rest on land. We call this behavior hauling out. When seals are hauled out, they need rest and should not be disturbed. If a seal is constantly disturbed and must continue going back into the water, it won't get the rest it needs to stay healthy.

Sometimes seals are in need of assistance. Sick and injured animals are candidates for recovery, rehabilitation and eventual release. The Virginia Aquarium Stranding Response Team has a permit and is trained to handle and treat seals and functions as part of the National Marine Mammal Stranding Network operated by NOAA. If a seal is obviously compromised, and it is unlikely to survive on its own, we will intervene and attempt rehabilitation. If we cannot determine whether a seal needs help, we often monitor it for 24 to 48 hours to assess its condition. We try not to intervene until we are certain an animal needs help.

If you see a seal on a beach, please call the Virginia Aquarium Stranding Response Team at **757-437-6159**. We will ask you a series of questions to help us determine whether the seal is in need of help or if it should be left alone to rest undisturbed.

Please follow the following guidelines when you encounter a seal on land:

- **Keep people and pets away from resting seals!** Keep pets on leashes and give seals a wide berth of 150 feet or more so they can rest undisturbed.
- **Do not walk between a resting seal and its access to water.** If you have to walk around a seal, walk on the land side and avoid blocking its exit route.
- **Be quiet around a resting seal!** Loud or sudden noises will disturb them.
- **Never approach closely!** Wild seals can carry diseases and parasites that you or your pet could get.
- **Never offer food to a wild seal!** Seals are wild animals and feeding them not only allows them to lose their natural fear of humans, but is also illegal under the Marine Mammal Protection Act.
- **Report seal sightings to the Virginia Aquarium Stranding Response Team! Call us at 757-437-6159, we are available every day.**
- **Enjoy the view!** Seals are beautiful wild animals. Enjoy them from a distance and respect their need to stay wild.

Enclosure 4. Section 7 Consultation on Repairs to the Shoreline Protection System at Naval Station Oceana, Dam Neck Annex, Virginia Beach (2012); Biological Opinion on the Back Bay National Wildlife Refuge Sea Turtle Management Program, Virginia Beach, Virginia (2011)

Attn: Ben McGinnis, Environmental Planning and Conservation

Re: Section 7 Consultation on Repairs to
the Shoreline Protection System at
Naval Station Oceana, Dam Neck
Annex, Virginia Beach

Dear Mr. Noble:

On November 3, 2012, the U.S. Fish and Wildlife Service (Service) delivered our response to the Biological Assessment (BA) prepared by the Navy for the referenced project and its effects on the federally listed endangered roseate tern (*Sterna dougallii dougallii*) and the federally listed threatened Atlantic piping plover (*Charadrius melodus*), loggerhead sea turtle (*Caretta caretta*), green sea turtle (*Chelonia mydas*), and seabeach amaranth (*Amaranthus punilus*) in accordance with section 7 of the Endangered Species Act of 1973 (16 U.S.C. 1531-1544, 87 Stat. 884), as amended (ESA). In our November 3, 2012 response, the Service concurred with the Navy's determination of may affect, but is not likely to adversely affect for the roseate tern and seabeach amaranth. The Service requested that the Navy address concerns regarding proposed management for loggerhead sea turtles, green sea turtles, and piping plovers.

In a letter dated April 20, 2012, the Navy requested the Service's concurrence with the determination of may affect, but is not likely to adversely affect for the loggerhead sea turtle, green sea turtle, and piping plover based on modifications made by the Navy to their Integrated Natural Resource Management Plan (INRMP). Additionally, the Navy requested the Service's concurrence with a no effect determination for nesting federally listed endangered leatherback sea turtle (*Dermochelys coriacea*), hawksbill sea turtle (*Eretmochelys imbricate*), and Kemp's ridley sea turtle (*Lepidochelys kempii*). The Service concurs with the Navy's no effect determination for these three species of sea turtle because no records of nesting attempts by these species have been documented in Virginia.

Regarding loggerhead and green sea turtles, the Navy's INRMP includes a Sea Turtle Monitoring Protocol section, which sets criteria for daily monitoring of nesting sea turtles and nests, nest protection, and nest relocations. The Navy has agreed to leave nests in situ rather than

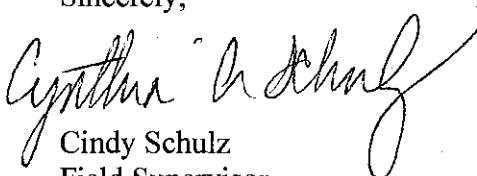

relocating nests, only moving nests when operational uses of the beach would result in the take of a nest. In such cases, the Navy will coordinate with the Service's Back Bay National Wildlife Refuge (NWR). All nest relocations by the Navy will be conducted in accordance with the methods outlined in the July 13, 2011, biological opinion issued to Back Bay NWR (copy enclosed) that provides ESA compliance for such activities at False Cape State Park, Back Bay NWR, Sandbridge Beach, Virginia Beach Resort Area, and Fort Story.

The Service does not concur with the Navy's determination of may affect, but is not likely to adversely affect for nesting loggerhead and green sea turtles, because take of turtles may occur. However, this letter amends the Loggerhead Sea Turtle Nest Monitoring and Management on Back Bay NWR biological opinion issued by the Service on July 13, 2011, to add Naval Station Oceana, Dam Neck Annex. This letter will be appended to that biological opinion and maintained as part of the decision document and administrative record. The biological opinion, this amendment, and the criteria in the INRMP together provide ESA compliance for the Navy related to monitoring of nesting sea turtles and nests, nest protection, and nest relocations for both loggerhead and green sea turtles that may occur at Naval Station Oceana, Dam Neck Annex.

The Navy has included in their INRMP guidelines for migratory bird monitoring and management. The INRMP includes protocols to ensure surveys and daily observations during sea turtle nesting periods will include monitoring for both piping plover and the federal candidate red knot (*Calidris canutus rufa*). There are no records of piping plovers nesting on beaches south of the Chesapeake Bay, where the species is considered to be an uncommon transient. Because it is unlikely that the piping plover will utilize this area and the monitoring protocols will be implemented, the Service concurs with the Navy's determination of may affect, but is not likely to adversely affect for piping plovers.

If you have any questions, please contact Mike Drummond of this office at (804) 693-6694, extension 122, or via email at mike_drummond@fws.gov.

Sincerely,

Cindy Schulz
Field Supervisor

Memorandum

To: Project Leader, Back Bay National Wildlife Refuge
(Attn: Geralyn Mireles, Wildlife Biologist)

From: Supervisor, Virginia Ecological Services *Cynthia A. Schuy*

Subject: Biological Opinion on the Back Bay National Wildlife Refuge Sea Turtle Management Program, Virginia Beach, Virginia

This document transmits the U.S. Fish and Wildlife Service's (Service) biological opinion based on our review of the subject project and its effects on the federally listed threatened loggerhead sea turtle (*Caretta caretta*) and green sea turtle (*Chelonia mydas*). The Service's Back Bay National Wildlife Refuge (BBNWR) proposes to conduct sea turtle nest management activities on BBNWR and adjacent properties along the Atlantic coast beaches extending from the Virginia/North Carolina border to the mouth of the Chesapeake Bay. This biological opinion is submitted in accordance with section 7 of the Endangered Species Act of 1973 (16 U.S.C. 1531-1544, 87 Stat. 884), as amended (ESA). Formal consultation was initiated on January 27, 2011.

This biological opinion is based on the BBNWR Comprehensive Conservation Plan (CCP) (Service 2010), emails, telephone conversations, a sea turtle management meeting, and other information provided by the Service, Virginia Department of Game and Inland Fisheries, and others. A complete administrative record of this consultation is on file in this office.

CONSULTATION HISTORY

- 08-03-10 BBNWR requested section 7 consultation on their revised CCP.
- 08-03-10 to 9-13-10 The Virginia Field Office (VAFO) and BBNWR coordinated on a management plan to review and revise sea turtle and beach management on BBNWR.
- 09-13-10 VAFO and BBNWR completed review of BBNWR CCP and completed informal consultation. BBNWR and VAFO committed to conducting a meeting and evaluation of sea turtle management prior to the 2011 sea turtle nesting season to review and revise sea turtle management and complete formal section 7 consultation, if necessary.

- 01-19-11 VAFO held a sea turtle management meeting which included BBNWR and other agencies conducting sea turtle nest management and beach management in Virginia.
- 02-02-11 VAFO received draft intra-Service section 7 consultation form on BBNWR sea turtle management.
- 02-02-11 VAFO and BBNWR reviewed and revised sea turtle nest management protocol to 06-15-11 and intra-Service consultation form.
- 06-15-11 VAFO received final revisions of the nest management protocol and intra-Service consultation from BBNWR.

BIOLOGICAL OPINION

DESCRIPTION OF THE PROPOSED ACTION

The proposed activity is to continue monitoring and managing loggerhead sea turtle nests within all sea turtle nesting areas including the beaches of BBNWR, the Virginia Beach resort area, Fort Story, the City of Sandbridge, and False Cape State Park (FCSP). These management practices will continue until the loggerhead sea turtle is no longer listed. If nests of other sea turtle species are found, including the green sea turtle, the same protocol will be followed. Activities within sea turtle nesting habitat include crawl and nest searches as well as nest relocations.

A limited number of permit holders drive vehicles on the beach at BBNWR. Permits are issued to continue traditional ingress and egress along the BBNWR beach between the permittee's residence and their full-time employment in the Norfolk-Virginia Beach area. These permits are not transferrable and will be terminated when the current permit holder is no longer able to drive, or when alternate access becomes available during the permit period. Permittee access on BBNWR beach is prohibited between 12:00 am and 5:00 am from May 1 – September 30, to reduce negative impacts on sea turtles.

Monitoring Methods -

Turtle crawl and nest searches - Morning patrols for turtle crawls and nests are conducted from about June 1 through August 31. FCSP employees patrol BBNWR and FCSP, while BBNWR staff and volunteers are responsible for the north mile of BBNWR and Sandbridge Beach. A BBNWR volunteer patrols the Fort Story and Virginia Beach resort area beaches. Personnel use ATVs for the surveys, but vehicles may be used on the beaches where permitted beach driving is allowed.

When a turtle crawl is found, BBNWR staff determine whether the crawl resulted in a nest. The presence of a "body pit" in a sea turtle crawl usually indicates the turtle attempted to lay eggs. BBNWR biologists closely examine the body pit for indented impressions and/or mounded areas that indicate the location of the female's front flippers. This dictates her position when the eggs

were deposited. If flipper impressions are found, the area directly to the rear is targeted as the most probable nest location and is carefully excavated by hand first. The fingertips are used to probe the sand for a small, soft spot, unlike the surrounding more densely packed sand. This indicates the nest location. If flipper impressions are not found, the flattened circular area at either end of the tracks is targeted. Eggs are usually a few inches below this soft, 2-3 inch opening, so extreme care is taken. The biologist gently digs by hand into the body pit to locate the egg chamber and determine if eggs are present (Service 2007). The location and date of the crawl will be recorded, whether a nest is found or not.

Nest relocation - The construction of dunes on FCSP and BBNWR beaches in the 1930s resulted in blockage of overwash and dune blowout areas which otherwise would have allowed nesting sea turtles access to higher beach elevations. Current turtle nesting is limited to lower elevation sections of the beach which are susceptible to extensive saltwater inundation, beach erosion and complete nest loss during monthly high tides, "northeaster" storms, and hurricane activity in the mid-Atlantic. Other potential threats including vehicular beach traffic and public use activity also exist on these beaches.

The following risk analysis is performed by BBNWR biologists to determine if a nest needs to be relocated. If the answer to either of the two questions below is affirmative, the nest is relocated:

- Is the nest/body pit located below the estimated mean high tide lines -- as evidenced by the wrack lines and reference to tidal conditions when personnel survey the beach?
- Is the nest in an area where there is a likelihood that vehicles will run over the nest with signage and markers installed, or that there is a likelihood that intense artificial lighting will result in hatchling disorientation?

Once nests are determined to be present, biologists wear nitrile gloves prior to handling any eggs. This minimizes potential harm to the handlers (i.e., salmonella) and to the eggs (human carried bacteria, temperature change, etc.).

Before eggs are removed, the depth from beach surface to the top of eggs is measured. Using excavated sand from the original nest, a 2 inch layer of moist sand is placed in the bottom of a cooler (Sill et al. 2000). Keeping exposed eggs shaded with an umbrella, BBNWR staff remove eggs individually from the nest, being careful not to rotate them in the process. Eggs are placed into the cooler with a 1 inch border of sand between the eggs and the sides of the cooler. The eggs are placed in the cooler in a consistent and methodical manner with note taken of the order. The number of eggs in each layer are counted and recorded. Eggs are packed in such a manner that they are not touching and with 2 inches of sand between each layer of eggs. Usually two coolers are used. After all eggs are removed, the distance from the beach surface to the bottom of the nest depth is measured (Boulon 1999, Service 2007). The length and width of the nest cavity at the widest and longest points is also measured. Once all eggs are placed in the cooler, extra sand from the nest is placed over them and into a separate container. This sand is used to surround the reburied eggs at the nursery site located on BBNWR behind the primary dune. Once all the data has been recorded, the nest cavity is refilled and the crawl brushed out with

rakes and shovels. Eggs are kept out of direct sunlight; jolting or shifting is avoided during the trip to the nursery (Mortimer 1999).

At the designated nursery site a vertical shaft large enough for the predator-proof cage is dug with a spade/shovel. The predator-proof cage is placed in the hole with the middle rib of cage at least an inch above the sand as long as bottom and top nest depths are near the original nest's depths (Service 2007). The same person who removed the eggs from the original nest transfers the eggs from the coolers to the nest cage. The eggs are not rotated or packed tightly (Jones and Musick 1988, Mortimer 1999). Eggs are placed into the nest cage in the reverse order in which they were removed from the original nest (i.e., the first egg put in the cooler will be the last one to go into the cage). The bottom and sides of the cage are filled with sand from the original nest. Dry sand is not allowed to enter the cage through the mesh while the shape and size of the original nest is recreated as closely as possible. The remainder of the relocated nest cavity is filled with the extra sand brought from the original nest. The top of the predator-proof cage is secured with three 6-inch pieces of aluminum wire, and the nest number is written on the top. For any eggs that are broken, the cause of break is recorded on a copy of the nest data sheet. The sheet is then bagged with the specimen and placed in the biology freezer at BBNWR. The Nest and Crawl Data Sheet is completed and filed at BBNWR. Digital photos of the nest and crawl are downloaded and catalogued. This information and more is included in the 2007 "Back Bay NWR Sea Turtle Nest Standard Operating Procedures."

In situ nest management - Nests that are identified and left in situ are marked with reflectors, signs identifying the site as a sea turtle nest, and flagging tape placed in the immediate vicinity of the nest (within 9.8 feet [ft]) to help prevent nests from being run over by vehicles or inadvertently disturbed. A predator guard, constructed of galvanized fence wire with a rectangular mesh size of approximately 2 inches by 4 inches is used. A trench is excavated around the nest, and the fence material is placed over the nest with flaps placed in the trenches and re-buried to prevent excavation by predators. In situ nests are monitored daily near the hatch window to determine if they are successful, and after all hatching is anticipated to be completed, the nests are excavated and the number and condition of hatched eggs, unhatched eggs, and young turtles are counted.

Action Area - The "action area" is defined as all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action. The Service has determined that the action area for this project consists of the beaches of BBNWR, FCSP, the Virginia Beach resort area, Fort Story, and Sandbridge.

STATUS OF THE SPECIES AND CRITICAL HABITAT RANGEWIDE

The loggerhead sea turtle was listed as threatened in the U.S. in 1978 (NMFS and Service 1991a) and the green sea turtle was listed as endangered in 1978 (NMFS and Service 1991b). In March 2010, the Service and NMFS published a proposed rule in the Federal Register to recognize nine distinct populations of loggerhead sea turtles worldwide. Under this proposed rule, the loggerhead sea turtle population that would be affected by the proposed actions is the north

Atlantic population and it is proposed to be listed as endangered (72 FR 12598). There is designated critical habitat outside of Virginia for the green sea turtles, but none has been designated for the loggerhead sea turtle.

Species/Critical Habitat Description and Life History – This account emphasizes loggerhead and green sea turtle nesting and breeding biology, which is the subject of this biological opinion. Additional information about the life history of these sea turtle species and their habitat use, behavior, and survival at sea can be found in other documents, including the loggerhead and green sea turtle recovery plans (National Marine Fisheries Service [NMFS] and Service 1991a, b, respectively), loggerhead and green sea turtle five-year status reviews (NMFS and Service 2007a, b, respectively), and other sources (National Research Council 1990).

The loggerhead is smaller, with a mean carapace length of 3 ft and a mean mass of 293 pounds (NMFS and Service 2008), compared to 3.35 ft and 300 pounds for the green sea turtle (National Research Council 1990). Green sea turtles nest primarily in the tropics and are rarer nesters at higher latitudes, while loggerheads have significant nesting populations outside the tropics (National Research Council 1990).

Life History and Population Dynamics - Loggerhead females are believed to reach sexual maturity at a minimum age of 30 years (Snover 2002). At the start of the breeding season, they migrate from foraging areas on the continental shelf to mating areas in the waters near their nesting beaches (Schroeder et al. 2003). Reproductive females exhibit the desire to return to their birthplace to lay their eggs (Miller et al. 2003). Females may be inseminated by multiple males (Bollmer et al. 1999). After mating, males return to their foraging areas while females remain in the waters near their natal beaches to emerge onto their nesting beaches to lay eggs. The following account of nesting biology is a synopsis of Miller et al. (2003).

Loggerhead females tend to nest on high wave energy, sandy ocean beaches. Gravid females emerge from the wash zone and crawl toward the dune line until they encounter a suitable nest site, typically on open sand at the seaward base of a dune, but sometimes in vegetation. The female clears away surface debris with the front flippers, creating a "body pit," then excavates a flask shaped nest cavity with her hind flippers. Loggerheads lay an average of 112 eggs per nest. After laying, the female covers the nest with sand using all four flippers. Once the nest covering phase is complete, she crawls back into the sea. Individual females may nest 1 to 6 times per nesting season, at intervals of 12-16 days, during the late spring to late summer. Intervals between nesting shorter than 10 days indicate that the previous nest attempt was likely aborted due to disturbance. Mature loggerheads nest every two to three years, on average (Schroeder et al. 2003). Nest incubation period (from laying to hatching) depends on temperature and ranges from 48 to 90 days at the extremes. Emergence of hatchlings from the nest cavity usually occurs within four days of hatch, but may take up to two weeks longer. Hatchling emergence from nests usually occurs at night when temperatures are lower and diurnal predators are inactive. Hatching success typically approaches 80 percent; after hatchlings leave the beaches, they typically fall prey to a variety of predators, including birds, fish, and sharks (National Research Council 1990).

Within the Northwest Atlantic, the majority of loggerhead sea turtle nesting activity occurs from April through September, with a peak in June and July (Williams-Walls et al. 1983, Dodd 1988, Weishampel et al. 2006). Nesting occurs within the Northwest Atlantic along the coasts of North America, Central America, northern South America, the Antilles, Bahamas, and Bermuda, but is concentrated in the southeastern U.S. and on the Yucatán Peninsula in Mexico on open beaches or along narrow bays having suitable sand (Sternberg 1981, Ehrhart 1989, Ehrhart et al. 2003, NMFS and Service 2008).

Sex ratio of hatchlings depends on temperature during incubation. Below 84° Fahrenheit (29° Celsius), more males are produced than females and above that temperature more females are produced (Carthy et al. 2003). Furthermore, fluctuating incubation temperatures often produce more females than stable temperatures, and temperature, hydration, and gas exchange during incubation can determine hatchling size, early swimming behavior, growth rate, and hatchling robustness (Carthy et al. 2003). Newly emerged hatchlings immediately head for the sea, most likely orienting toward the water by moving toward the brightest horizon and away from dark silhouettes (Lohmann and Lohmann 2003). Sea turtles are most negatively sensitive to blue and green light and loggerheads in particular are averse to yellow light (Witherington and Martin 1996). Once in the sea, hatchling loggerheads swim into the waves and eventually enter the open ocean, where they will spend the first 6.5 to 11.5 years of their lives primarily at the top of the water column, until finally moving to foraging areas on the continental shelf (Bolten 2003).

Green sea turtles nest in two, three, or four year intervals, and may lay as many as nine clutches within a nesting season (NMFS and Service 1991b). Clutch size varies from 75-200 eggs, and incubation ranges from about 45-75 days (NMFS and Service 1991b).

Nesting habitat - Less is known about factors that cue nest site selection than about anthropogenic disturbances that discourage nesting (Miller et al. 2003). Typical nesting areas are sandy, wide, open beaches backed by low dunes, with a flat, sandy approach from the sea (Miller et al. 2003). Nesting is nonrandom along the shoreline, but studies of the physical characteristics associated with nests versus random or non-nesting sites on the beach have produced varying results. Some factors found to determine nest selection are beach slope (3 of 3 studies), temperature (2 of 3 studies), distance to ocean (1 of 3 studies), sand type (2 of 2 studies), and moisture (1 of 3 studies), although the results were occasionally contradictory (Miller et al. 2003). Other factors examined but not found to be significant were sand compaction, erosion, pH, and salinity. Although the process of nest site selection is not well understood, a successful nest must be laid in a low salinity, high humidity, and well-ventilated substrate that is not prone to flooding or burying due to tides and storms and where temperature is optimal for development (Miller et al. 2003).

Status and Distribution – Approximately 58,000 loggerhead nests were estimated in the U.S. Atlantic in 1983 (NMFS and Service 1991a) and between 53,000 and 92,000 nests from 1989 to 1998 (Turtle Expert Working Group 2000). Within the northern subpopulation (north Florida to Virginia), studies in South Carolina and Georgia have documented a decline in number of nests

(Ehrhart et al. 2003). Based on genetic evidence, male loggerheads disperse freely among sites within the U.S. Atlantic population, while females are faithful to their natal sites (Bowen et al. 2005). Because sex ratio is determined by temperature during incubation (Miller et al. 2003), the northern part of the U.S. Atlantic population, apparently provides a disproportionate number of males to the larger population (Mrosovsky et al. 1984a, Hanson et al. 1998, Hawkes et al. 2007).

“Analyses of historic and recent abundance information by the Marine Turtle Specialist Group (MTSG) indicate that extensive population declines for the green sea turtle have occurred in all major ocean basins. The MTSG analyzed population trends at 32 index nesting sites around the world and found a 48-65 percent decline in the number of mature females nesting annually over the past 100-150 years. The two largest nesting populations of green turtles are found at Tortuguero, on the Caribbean coast of Costa Rica, and Raine Island, on the Great Barrier Reef in Australia, where an annual average of 22,500 and 18,000 females nest per season, respectively. In the U.S., green turtles nest primarily along the central and southeast coast of Florida; present estimates range from 200 - 1,100 females nesting annually” (NMFS 2008). In the southeast U.S., the majority of green turtle nesting occurs in Florida. The green turtle nesting population of Florida appears to be increasing based on 19 years (1989-2007) of index nesting data from throughout the state (http://research.myfwc.com/features/view_article.asp?id=27537).

Factors Affecting the Species – Numerous factors affect sea turtle growth, survival, and behavior while at sea from when they leave natal beaches as hatchlings until they mature and return to beaches to breed. These factors are discussed in detail in the 5-year status reviews for the two turtle species (NMFS and Service 2007a, b). The discussion herein is limited to factors affecting turtle nesting. Threats to loggerhead sea turtles on the nesting grounds are similar to those faced by green sea turtles. The following threats affect both species, though there may be some differences in susceptibility between the species.

Weather and tides - Storm events may erode beaches and destroy nests or cause nest failure due to flooding or piling of eroded sand on the nest site. Beach erosion due to wave action may also decrease the availability of suitable nesting habitat (Steinetz et al. 1998), leading to a decline in nesting rate on a particular beach. Sea level rise, often in combination with human development along beaches, is contributing to erosion, changes in beach characteristics, and more intensive management of many beaches.

Predation - Predation of eggs and young by mammals, birds, and ghost crabs may eliminate up to 100 percent of the nests and any hatchlings that emerge on beaches where predation is not managed (National Research Council 1990). This is a natural phenomenon that has always affected sea turtle populations, but due to reduced turtle population sizes, reduced turtle habitat availability, and unnatural population increases of nest predators in some areas, predation is a significant threat to remaining breeding populations and is actively controlled through predator exclusion and predator control on most beaches where turtles nest.

Human activities - Crowding of nesting beaches by pedestrians can disturb nesting females and prevent laying (NMFS and Service 2008). Furthermore, the use of flashlights and campfires may

interfere with sea-finding behavior by hatchlings. Beach driving, including pedestrian traffic and vehicle use, and beach cleaning pose a risk of injury to females and live stranded turtles, can leave ruts that trap hatchlings attempting to reach the ocean (Hosier et al. 1981, Cox et al. 1994), can disturb adult females and cause them to abort nesting attempts, and can interfere with sea-finding behavior if headlights are used at night (NMFS and Service 2008). Driving directly over incubating egg clutches can cause sand compaction, which may decrease hatching and emergence success and directly kill pre-emergent hatchlings (NMFS and Service 2007a). Artificial lighting on structures may affect turtle behavior in a similar manner (Witherington and Martin 1996). Beach cleaning can directly destroy nests. Poaching is a problem in some countries and occurs at a low level in the U.S. (NMFS and Service 2007a). An increased human presence may also lead to an increase in the presence of domestic pets that can depredate nests and an increase in litter that may attract wild predators (National Research Council 1990).

The rate of habitat loss due to erosion and escarpment formation may be increased during shoreline stabilization efforts, either through renourishment (Dolan et al. 1973) or placement of hard structures such as sea walls or pilings (Bouchard et al. 1998). Vehicle traffic may alter the beach profile leading to steeper foredunes (Anders and Leatherman 1987), which may be unsuitable for nesting. Improperly placed erosion control structures such as drift fencing can act as a barrier to nesting females. Non-native and/or invasive vegetation may be introduced in conjunction with beach development, which can overrun nesting habitat, make the substrate unsuitable for digging nest cavities, invade nests and desiccate nests, or trap hatchlings.

Reduced nesting success on constructed/augmented beaches could result due to sand compaction, escarpment formation, and changes in the beach profile. Sand compaction has been shown to negatively impact sea turtles, particularly concerning beach nourishment projects. Placement of very fine sand and/or the use of heavy machinery can cause sand compaction on nourished beaches (Nelson et al. 1987, Nelson and Dickerson 1988). Significant reductions in nesting success (i.e., false crawls occurred more frequently) have been documented on severely compacted nourished beaches (Nelson and Dickerson 1987, Nelson et al. 1987), and increased false crawls may result in increased physiological stress to nesting females. Sand compaction may also increase the length of time required to excavate nests and result in increased physiological stress (Nelson and Dickerson 1988).

ENVIRONMENTAL BASELINE

Status of the Species/Habitat Within the Action Area – Sea turtle nesting has regularly occurred within the action area since the 1970s. Since 1970, 93 nests have been recorded, ranging from 0-7 nests per year. The majority of nests have occurred on BBNWR and FCSP (49 and 28, respectively, BBNWR 2011). Up to 8 false crawls have also been recorded among all the sites within a year (2002; BBNWR 2011), and a total of 45 false crawls have been recorded.

Since monitoring began, 9 nests have been left in situ, and most of these occurred from 2003 to 2005, when BBNWR staff tested and evaluated in situ hatch success of nests. The majority of nests left in situ failed to hatch, presumably as a result of tropical storms causing prolonged

inundation and beach erosion, but at least one nest left in situ hatched successfully at a rate comparable to nests placed in the hatchery. Most nests have been relocated to a sea turtle hatchery on BBNWR, located behind the primary dune. Hatch success of the hatchery-produced young is high, generally ranging from 80 to 95 percent.

In 2010, preliminary genetic analysis of 9 sea turtle nests in Virginia was conducted in conjunction with a larger study of the population genetics of the northern recovery unit of loggerhead sea turtles. The 9 nests were laid by 4 different females, 2 of which also nested in North and South Carolina within the same year, as well as individuals that had not been recorded nesting outside of Virginia (Nairn and Shamblin 2011).

At BBNWR there is an artificial dune system that creates a narrow beach with a high primary dune. This combination creates poor quality nesting habitat due to the high probability of erosive washovers, egg exposure to saltwater and air, or entombment. Beaches in Sandbridge, Virginia Beach oceanfront, and other sites are generally larger, but are also subject to high levels of human activity, extensive illumination, and human traffic. Beaches at several sites are periodically renourished to maintain them in a condition to support public recreation.

Factors Affecting Species Environment Within the Action Area – The artificial dunes on BBNWR and FCSP result in narrow beaches that lack the upper beach zones and at high tides water is generally at or near the base of the dunes. The upper beach berm to dune transitional habitat, and all associated plants and animals, are generally lacking.

Beach driving results in ruts, compaction of sand, and disturbance of beach flora and fauna, and further contributes to the degraded condition of upper beach habitat. Vehicle operation on the beach may also reduce beach stability and result in increased levels of sand transport both on and off of the beaches of BBNWR and FCSP.

Human recreational use of the beaches, including grooming of the most heavily used recreational beaches in the City of Virginia Beach, result in highly disturbed beaches that lack natural beach contours, and may be more compacted than natural beaches. These areas also generally lack vegetation, and the beaches lie immediately in front of heavily developed hotel/resort areas. These areas are generally illuminated, and lack most characteristics of suitable sea turtle nesting beaches, with the exception of a broad beach profile that is maintained through periodic beach renourishing. Direct disturbance of sea turtles is also likely to occur on beaches that have high levels of human use or vehicle operation.

Beach renourishment may result in unsuitable beach conditions, including unnatural profiles, beach sand composition that is different from natural beaches in color, density, compaction, drainage, and other characteristics. These beaches may be suitable for sea turtle nesting, but may result in differences in nest success, hatchling gender, and hatchling fitness.

EFFECTS OF THE ACTION

Adverse Effects – The effects to sea turtles from nest relocation are not well studied, and vary depending on the specific practices involved in relocation. Because it is not practical to monitor the long-term survival or success of hatchling turtles, the specific effects of nest management action on BBNWR on hatchling turtles are not known.

Many studies indicate reduced hatch success of relocated sea turtle nests. Handling alone can result in damage to embryos by disrupting membrane attachment and result in reduced hatch success (Limpus et al. 1979, Parmenter 1980). Differences in the moisture regime, temperature regime, and gas exchange between nest sites selected by turtles and sites where nests are relocated also have the potential to affect hatch success (Ackerman 1980, McGehee 1990).

Movement of sea turtle nests to a hatchery site alters sex ratios of sea turtles compared to those that would occur in natural nests as a result of different incubation temperatures (Harvey and Slatkin 1982; Limpus et al. 1982; Mrosovsky et al. 1984a, b; Dalrymple et al. 1985; Dutton et al. 1985; Standora and Spotila 1985). The use of a hatchery site that is more far-removed from the beach likely generally results in warmer incubation temperatures than those which would occur at natural nest sites, and this would tend to increase the proportion of female hatchlings (Mrosovsky et al. 1984a, b). However, because the sex ratios that would naturally occur are expected to vary among years and sites depending on weather conditions, date that the nest is laid, nest depth, soil conditions, and other factors, it is not possible to determine how the sex ratio at the hatchery site would differ from what would occur naturally. Additionally, it is not possible to determine what biological, demographic, or genetic effects to the population may result from altered sex ratios, except that differences should be expected, and we presume that the naturally occurring sex ratios and the variation in those ratios over time, are appropriate to maintain the sea turtle populations.

As a result of the refinement of methods and implementation of a detailed protocol to excavate, transport, and re-bury turtle nests that are relocated by BBNWR personnel, hatch success rates are generally comparable to those that may occur naturally. Similarly, the identification and routine use of a carefully selected hatchery site at BBNWR has apparently reduced the adverse effects to turtle embryos and hatching success.

Emerging research on the homing abilities of sea turtles continues to indicate a strong tendency for sea turtles to return to their natal beaches to nest. However, to date, the cues that sea turtle hatchlings use to allow them to return to natal beaches are unknown. Irwin et al. (2004) have measured distorted magnetic fields within sea turtle egg enclosures similar to those used by BBNWR. Based on evidence that sea turtles navigate at sea using magnetic fields Lohmann et al. (1999) and Irwin et al. (2004) speculate that magnetic fields may be an important mechanism for imprinting on natal beaches, and distortion in magnetic fields may affect homing behavior and the ability to return to natal beaches.

Condition of hatchling turtles may be more important than hatch success in terms of the likelihood of survival and recruitment of young turtles. Hatchling size in some turtle species is related to the water balance of eggs while in the nest, with larger young generally resulting from eggs that occurred in wetter conditions (Janzen et al. 1995). While the relationship of hatchling size to nest environment during development has not been well studied in sea turtles, larger young may be more likely to survive (Janzen et al. 1995).

Manual release of hatchlings from the enclosed egg chamber used at the BBNWR hatchery may result in higher than normal susceptibility to predation. Release of hatchlings during daytime hours can result in higher predation, and release of hatchlings en masse may also increase predation vulnerability by attracting predators to the group of young being released. Under natural conditions, night-time emergence and emergence of relatively small numbers of individuals over time (particularly at more northerly latitudes) may result in reduced risk of loss of all young.

Additionally, holding hatchlings after emergence may result in expenditure of energy attempting to escape, interference with normal behaviors, and elevated levels of stress that may detrimentally affect the physiological condition of hatchlings. After release into the ocean, this may result in reduced likelihood of survival and reduced probability of reaching nursery areas.

While the risk of catastrophic loss of clutches cannot be estimated, relocating turtle nests to a common hatchery area increases the likelihood of catastrophic loss resulting from accidents, adverse environmental conditions, and disease and predation.

It is uncertain whether the effects of intensive nest management discussed above occur, and to what degree they affect hatchling survival. The types of effects may vary depending on the environmental conditions within the specific nesting season, and the specific conditions that each nest is subjected to during management activities and relocation. The combination of these factors results in highly uncertain effects to the sea turtle population. While hatch success has often been used as a proxy to assess reproductive success, the factors discussed above may reduce recruitment, affect population demography, and affect future use of turtle nesting beaches in the action area. For the purposes of this analysis and in the absence of specific information that would allow us to consider the expected magnitude and severity of effects that may result, we make the conservative assumption that all of these factors affect hatchling sea turtles to a degree that cumulatively results in significantly reduced survival and recruitment probability.

Beneficial Effects – Monitoring and in situ nest protection provides good information on the sea turtle nesting effort within the action area. Nest marking and predator protection reduce the potential for anthropogenic impacts including disruption of nests and predation that may result from artificially abundant predators. The educational component of the monitoring aids in improving beach visitor consideration of sea turtle nesting in the vicinity of recreational areas. While unknown, the controlled conditions of the turtle hatchery likely result in higher nest success rates than would occur if turtle nests were left in the wild, but it remains unclear whether the greater productivity results in improved recruitment of juvenile sea turtles.

Interrelated and Interdependent Actions - An interrelated activity is an activity that is part of the proposed action and depends on the proposed action for its justification. An interdependent activity is an activity that has no independent utility apart from the action under consultation. The Service is not aware of any such actions associated with this project.

CUMULATIVE EFFECTS

Cumulative effects include the effects of future state, tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the ESA. Cumulative effects likely to adversely impact nesting sea turtles include management of beaches by private individuals and municipalities, and use of beaches for recreational purposes. Management and use of beaches degrades the habitat quality for nesting sea turtles and minimizes the likelihood of successful nesting and hatching of young. Shoreline development adjacent to beaches, primarily along the developed Virginia Beach oceanfront and Sandbridge, results in disturbance of adult female sea turtles attempting to nest, minimizing the likelihood of successful nesting.

CONCLUSION

After reviewing the status of the loggerhead and green sea turtle, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the proposed BBNWR sea turtle nest management program is not likely to jeopardize the continued existence of the loggerhead and green sea turtles. No critical habitat has been designated for this species within the action area; therefore, none will be affected.

INCIDENTAL TAKE STATEMENT

Section 9 of the ESA and federal regulations pursuant to section 4(d) of the ESA prohibit the take of endangered and threatened species, respectively, without a special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harm is further defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns such as breeding, feeding, or sheltering. Harass is defined by the Service as intentional or negligent actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns, which include, but are not limited to, breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the ESA provided that such taking is in compliance with the terms and conditions of this incidental take statement.

The measures described below are nondiscretionary, and must be undertaken by BBNWR so that they become binding conditions of any grant or permit issued to any applicant, as appropriate, for the exemption in action 7(o)(2) to apply. BBNWR has a continuing duty to regulate the activity covered by this incidental take statement. If BBNWR (1) fails to assume and implement the terms and conditions or (2) fails to require the applicant to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to the permit or grant document, the protective coverage of section 7(o)(2) may lapse. To monitor the impact of incidental take, BBNWR must report the progress of the action and its impact on the species to the Service as specified in the incidental take statement.

AMOUNT OR EXTENT OF TAKE ANTICIPATED

The Service anticipates incidental take of all sea turtle nests that are relocated within the action area. While there is potential for some individual hatchlings to survive and recruit into the breeding population, the degree of uncertainty in the expected effects that relocation has on sea turtles requires expectation of loss of all relocated nests. Because the decision to relocate nests is dependent on the specific location, setting of the nest, and determination of BBNWR personnel, all nests that occur in any year may be relocated.

EFFECT OF THE TAKE

In the accompanying biological opinion, the Service determined that this level of anticipated take is not likely to result in jeopardy to the species or adverse modification or destruction of critical habitat.

REASONABLE AND PRUDENT MEASURES

The Service believes the following reasonable and prudent measures are necessary and appropriate to minimize take of nesting sea turtles.

- Conduct sea turtle monitoring and management to minimize anthropogenic intervention and maximize protection of nests.

TERMS AND CONDITIONS

To be exempt from the prohibitions of section 9 of the ESA, BBNWR must comply with the following terms and conditions, which implement the reasonable and prudent measures described above and outline required reporting/monitoring requirements. These terms and conditions are nondiscretionary.

The proposed action includes appropriate measures to avoid and minimize adverse effects to sea turtles, and no additional terms and conditions are needed to implement the reasonable and prudent measures.

The following relates to reporting requirements:

- Care must be taken in handling any dead specimens of proposed or listed species that are found to preserve biological material in the best possible state. In conjunction with the preservation of any dead specimens, the finder has the responsibility to ensure that evidence intrinsic to determining the cause of death of the specimen is not unnecessarily disturbed. The finding of dead specimens does not imply enforcement proceedings pursuant to the ESA. The reporting of dead specimens is required to enable the Service to determine if take is reached or exceeded and to ensure that the terms and conditions are appropriate and effective. Upon locating a dead specimen, notify the Service's Virginia Law Enforcement Office at 804-771-2883, 5721 South Laburnum Avenue, Richmond, Virginia 23231, and the Service's Virginia Field Office at 804-693-6694 at the address provided above.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the ESA directs federal agencies to utilize their authorities to further the purposes of the ESA by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to further minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

BBNWR should work with other beach owners and managers in the region to implement beach management programs for sea turtles that include efforts to minimize threats to sea turtle nesting such as artificial lighting, beach grooming, and vehicle operation on beaches.

BBNWR should develop a beach management plan that allows for overwash and natural beach processes in at least limited areas of BBNWR that will allow for sea turtle nesting. If sea turtle nest relocation continues, identify an alternate hatchery location on the beach that will allow for natural and unassisted emergence.

For the Service to be kept informed of actions minimizing or avoiding adverse effects or benefiting listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

REINITIATION NOTICE

This concludes formal consultation on the action(s) outlined in the request. As provided in 50 CFR § 402.16, reinitiation of formal consultation is required where discretionary federal agency involvement or control over the action has been retained (or is authorized by law) and if: (1) the amount or extent of incidental take is exceeded; (2) new information reveals effects of the agency action that may affect listed species or critical habitat in a manner or to an extent not considered in this opinion; (3) the action is subsequently modified in a manner that causes an effect to the listed species or critical habitat not considered in this opinion; or (4) a new species is listed or critical habitat designated that may be affected by the action. In instances where the

amount or extent of incidental take is exceeded, any operations causing such take must cease pending reinitiation.

If you have any questions, please contact Tylan Dean of this office at (804) 693-6694, extension 166, or via email at tylan_dean@fws.gov.

**Enclosure 5. Summary of the Essential Fish Habitat (EFH) and General Habitat
Perimeters for Federally Managed Species**

This page intentionally left blank.

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (EC)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
American plaice	Eggs	GOME, GB and estuaries from Passamaquoddy Bay to Saco Bay, ME and from Mass. Bay to Cape Cod Bay, MA	<12	(32)	30 - 90	All year in GOME Dec - June on GB Peaks April & May both	Surface waters	
	Larvae	GOME, GB, Southern NE and estuaries from Passamaquoddy Bay to Saco Bay, ME and from Mass Bay to Cape Cod Bay, MA	<14	(32)	30-130	Between January and August, with peaks in April and May	Surface Waters	
	Juveniles	GOME and estuaries from Passamaquoddy Bay to Saco Bay, ME and from Mass Bay to Cape Cod Bay, MA	<17	(32)	45-150		Bottom habitats with fine-grained sediments or substrate of sand or gravel	(Strong concentrations inside and around 100m isobath in Western GOME; Major Prey: echinoderms, arthropods, annelids)
	Adults	GOME, GB and estuaries from Passamaquoddy Bay to Saco Bay, ME and from Mass Bay to Cape Cod Bay, MA	<17	(34-20)	45-175		Bottom habitats with fine-grained sediments or a substrate of sand or gravel	
	Spawning Adults	GOME, GB and estuaries from Passamaquoddy Bay to Saco Bay, ME and from Mass Bay to Cape Cod Bay, MA	<14	(32)	<90	March through June	Bottom habitats of all substrate types	
Atlantic cod	Eggs	GOME, GB, eastern portion of continental shelf off southern NE and following estuaries: Englishman/ Machias Bay to Blue Hill Bay; Sheepscot R., Casco Bay, Saco Bay, Great Bay, Mass Bay, Boston Harbor, Cape Cod Bay, Buzzards Bay	<12	32 - 33 (10 - 35)	<110	Begins in fall, peaks in winter and spring	Surface Waters	
	Larvae	GOME, GB, eastern portion of continental shelf off southern NE and following estuaries: Passamaquoddy Bay to Penobscot Bay; Sheepscot R., Casco Bay, Saco Bay, Great Bay, Mass Bay, Boston Harbor, Cape Cod Bay, Buzzards Bay	<10	32 - 33	30-70	Spring	Pelagic waters	
	Juveniles	GOME, GB, eastern portion of continental shelf off southern NE and following estuaries: Passamaquoddy Bay to Saco Bay; Mass Bay, Boston Harbor, Cape Cod Bay, Buzzards Bay	<20	30 - 35	25 - 75		Bottom habitats with a substrate of cobble or gravel	HAPC - An area approximate of 300sq. nautical miles along the northern edge of GB and the Hague line containing gravel cobble substrate.
	Adults	GOME, GB, southern NE, middle Atlantic south to Delaware Bay and following estuaries: Passamaquoddy Bay to Saco Bay; Mass Bay, Boston Harbor, Cape Cod Bay, Buzzards Bay	<10	(29 - 34)	10-150		Bottom habitats with a substrate of rocks, pebbles, or gravel	(Major prey: fish crustaceans, decapods, amphipods)

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (°C)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
	Spawning Adults	GOME, GB, southern NE, middle Atlantic south to Delaware Bay and following estuaries: Englishman/ Machias Bay to Blue Hill Bay; Sheepscot R., Mass Bay, Boston Harbor, Cape Cod Bay, MA	<10	(10 - 35)	10-150	spawn during fall, winter, and early spring	Bottom habitats with a substrate of smooth sand, rocks, pebbles, or gravel	
Atlantic halibut	Eggs	GOME, GB	4 - 7	<35	<700	Between late fall and early spring, peak Nov and Dec.	Pelagic waters to the sea floor	
	Larvae	GOME, GB		30 - 35			Surface waters	
	Juveniles	GOME, GB	>2		20 - 60		Bottom habitats with a substrate of sand, gravel, or clay	
	Adults	GOME, GB	<13.6	30.4-35.3	100-700		Bottom habitats with a substrate of sand, gravel, or clay	(Major prey: crustaceans, fish, cod, squid)
	Spawning Adults	GOME, GB	<7	<35	<700	Between late fall and early spring, peaks in Nov. and Dec.	Bottom habitats with a substrate of soft mud, clay, sand, or gravel; rough or rocky bottom locations along slopes of the outer banks	
Atlantic herring	Eggs	GOME, GB and following estuaries: Englishman/ Machias Bay, Casco Bay, & Cape Cod Bay	<15	32 - 33	20 - 80	July through November	Bottom habitats with a substrate of gravel, sand, cobble, shell fragments & aquatic macrophytes. .	Eggs adhere to bottom forming extensive beds. Eggs most often found in areas of well-mixed water, with tidal currents between 1.5 and 3.0 knots (Egg beds can range from 4500 to 10,000 Km ² on GB. Eggs susceptible to suffocation from high densities and siltation)
	Larvae	GOME, GB, Southern NE and following estuaries: Passamaquoddy Bay to Cape Cod Bay, Narragansett Bay, & Hudson R./ Raritan Bay	<16	32	50 - 90	Between August and April, peaks from Sept. - Nov.	Pelagic waters	
	Juveniles	GOME, GB, Southern NE and Middle Atlantic south to Cape Hatteras and following estuaries: Passamaquoddy Bay to Cape Cod Bay; Buzzards Bay to Long Island Sound; Gardiners Bay to Delaware Bay	<10	26 - 32	15-135		Pelagic waters and bottom habitats	
	Adults	GOME, GB, southern NE and middle Atlantic south to Cape Hatteras and following estuaries: Passamaquoddy Bay to Great Bay; Mass Bay to Cape Cod Bay; Buzzards Bay to Long Island Sound; Gardiners Bay to Delaware Bay; & Chesapeake Bay	<10	>28	20-130		Pelagic waters and bottom habitats	(major prey: zooplankton)
	Spawning Adults	GOME, GB, southern NE and middle Atlantic south to Delaware Bay and Englishman/ Machias Bay Estuary	<15	32 - 33	20 - 80	July through November	Bottom habitats with a substrate of gravel, sand, cobble and shell fragments, also on aquatic macrophytes	Herring eggs are spawned in areas of well-mixed water, with tidal currents between 1.5 and 3.0 knots

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Definitions: GOME - Gulf of Maine; GB - George's Bank; HAPC - Habitat Area of Particular Concern; YOY - Young-of-Year Please note: This Table does not contain EFH info on Highly Migratory Species (sharks, tunas, billfish).

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (EC)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
Atlantic salmon	Eggs	Rivers from CT to Maine: Connecticut, Pawcatuck, Merrimack, Coheco, Saco, Androscoggin, Presumpscot, Kennebec, Sheepscot, Ducktrap, Union, Penobscot, Narraguagus, Machias, East Machias, Pleasant, St. Croix, Denny's, Passagassawaukeag Aroostook, Lamprey, Boyden, Orland Rivers, and the Turk, Hobart & Patten Streams; and the following estuaries for juveniles and adults: Passamaquoddy Bay to Muscongus Bay; Casco Bay to Wells Harbor; Mass Bay, Long Island Sound, Gardiners Bay to Great South Bay. All aquatic habitats in the watersheds of the above listed rivers, including all tributaries to the extent that they are currently or were historically accessible for salmon migration.	<10	Fresh water	30-31 cm	Between October and April	Bottom habitats with a gravel or cobble riffle (redd) above or below a pool in rivers	need clean well-oxygenated freshwater
	Larvae		<10	Fresh water		Between March and June for alevins/fry	Bottom habitats with a gravel or cobble riffle (redd) above or below a pool in rivers	
	Juveniles		<25	Fresh water to Oceanic	10- 61 cm		Bottom habitats of shallow gravel/cobble riffles interspersed with deeper riffles and pools in rivers and estuaries Water velocities between 30 - 92cm/sec	As they grow, parr transform into smolts. Atlantic salmon smolts require access downstream to the ocean. Upon entering the ocean, post-smolts become pelagic and range from Long Island Sound north to the Labrador Sea.
	Adults		<22.8	Fresh water to Oceanic			Oceanic adult Atlantic salmon are primarily pelagic and range from waters of the continental shelf off southern NE north throughout the GOME Dissolved oxygen above 5ppm for migratory pathway.	HAPC - Eleven rivers in Maine includes: St. Croix, Denny's, East Machias, Machias, Pleasant, Turk stream, Narraguagus, Penobscot, Ducktrap, Sheepscot, and Kennebec River.
	Spawning Adults		<10	Fresh water	30- 61 cm	October and November	Bottom habitats with a gravel or cobble riffle (redd) above or below a pool in rivers	Water velocity around 61cm per second
Atlantic sea scallop	Eggs	GOME, GB, southern NE and middle Atlantic south to Virginia-North Carolina border and following estuaries: Passamaquoddy Bay to Sheepscot R.; Casco Bay, Mass Bay, and Cape Cod Bay	<17			May through October Peaks in May and June in middle Atlantic area, and in Sept. and Oct. on GB and GOME	Bottom habitats	Eggs remain on sea floor until they develop into the first free-swimming larval stage.
	Larvae	GOME, GB, southern NE and middle Atlantic south to Virginia-North Carolina border and following estuaries: Passamaquoddy Bay to Sheepscot R.; Casco Bay, Mass Bay, and Cape Cod Bay	<18	16.9 - 30			Pelagic waters and bottom habitats with a substrate of gravelly sand, shell fragments, pebbles, or on various red algae, hydroids, amphipod tubes and bryozoans	
	Juveniles	GOME, GB, southern NE and middle Atlantic south to Virginia-North Carolina border and following estuaries: Passamaquoddy Bay to Sheepscot R.; Casco Bay, Great Bay, Mass Bay, and Cape Cod Bay	<15		18-110		Bottom habitats with a substrate of cobble, shells, and silt	(prey: filter feeders on phytoplankton; preferred substrates are associated with low concentrations of inorganics for optimal feeding)
	Adults	GOME, GB, southern NE and middle Atlantic south to Virginia-North Carolina border and following estuaries: Passamaquoddy Bay to Sheepscot R.; Casco Bay, Great Bay, Mass Bay, and Cape Cod Bay	<21	>16.5	18-110		Bottom habitats with a substrate of cobble, shells, coarse/gravelly sand, and sand	

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Definitions: GOME - Gulf of Maine; GB - George's Bank; HAPC - Habitat Area of Particular Concern; YOY - Young-of-Year Please note: This Table does not contain EFH info on Highly Migratory Species (sharks, tunas, billfish).

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (°C)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
	Spawning Adults	GOME, GB, southern NE and middle Atlantic south to Virginia-North Carolina border and following estuaries: Passamaquoddy Bay to Sheepscot R.; Casco Bay, Mass Bay, and Cape Cod Bay	<16	>16.5	18-110	May through October, peaks in May and June in middle Atlantic area, and in Sept. and Oct. on GB and in GOME	Bottom habitats with a substrate of cobble, shells, coarse/gravelly sand, and sand	
Haddock	Eggs	GB southwest to Nantucket Shoals and coastal areas of GOME and the following estuaries: Great Bay, Mass Bay, Boston Harbor, Cape Cod Bay, Buzzards Bay	<10	34 - 36	50 - 90	March to May, peak in April	Surface waters	
	Larvae	GB southwest to the middle Atlantic south to Delaware Bay and the following estuaries: Great Bay, Mass Bay, Boston Harbor, Cape Cod Bay, Buzzards Bay, and Narragansett Bay	<14	34 - 36	30 - 90	January to July, peak in April and May	Surface waters	
	Juveniles	GB, GOME, middle Atlantic south to Delaware Bay	<11	31.5 - 34	35-100		Bottom habitats with a substrate of pebble gravel	
	Adults	GB and eastern side of Nantucket Shoals, throughout GOME, *additional area of Nantucket Shoals, and Great South Channel	<7	31.5 - 35	40-150		Bottom habitats with a substrate of broken ground, pebbles, smooth hard sand, and smooth areas between rocky patches	*additional area more accurately reflects historic patterns of distribution and abundance
	Spawning Adults	GB, Nantucket Shoals, Great South Channel, throughout GOME	<6	31.5 - 34	40-150	January to June	Bottom habitats with a substrate of pebble gravel or gravelly sand	
Monkfish (Goosefish)	Eggs	GOME, GB, southern NE, middle Atlantic south to Cape Hatteras, North Carolina	<18		15- 1000	March to September	Surface waters	(eggs contained in long mucus veils that float near or at the surface)
	Larvae	GOME, GB, southern NE, middle Atlantic south to Cape Hatteras, North Carolina	15		25-1000	March to September	Pelagic waters	
	Juveniles	Outer continental shelf in the middle Atlantic, mid-shelf off southern NE, all areas of GOME	<13	29.9-36.7	25-200		Bottom habitats with substrates of a sand-shell mix, algae covered rocks, hard sand, pebbly gravel, or mud	
	Adults	Outer continental shelf in the middle Atlantic, mid-shelf off southern NE, outer perimeter of GB, all areas of GOME	<15	29.9-36.7	25-200		Bottom habitats with substrates of a sand-shell mix, algae covered rocks, hard sand, pebbly gravel, or mud	(Major prey: fish, shrimp, squid, crustaceans, mollusks)
	Spawning Adults	Outer continental shelf in the middle Atlantic, mid-shelf off southern NE, outer perimeter of GB, all areas of GOME	<13	29.9-36.7	25-200	February to August	Bottom habitats with substrates of a sand-shell mix, algae covered rocks, hard sand, pebbly gravel, or mud	
Ocean pout	Eggs	GOME, GB, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Saco Bay; Mass Bay and Cape Cod Bay	<10	32-34	<50	Late fall and winter	Bottom habitats, generally hard bottom sheltered nests, holes, or crevices where they are guarded by parents	(eggs are laid in gelatinous masses and take 2-3 months to develop)

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Definitions: GOME - Gulf of Maine; GB - George's Bank; HAPC - Habitat Area of Particular Concern; YOY - Young-of-Year Please note: This Table does not contain EFH info on Highly Migratory Species (sharks, tunas, billfish).

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (°C)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
	Larvae	GOME, GB, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Saco Bay; Mass Bay and Cape Cod Bay	<10	>25	<50	Late fall to spring	Bottom habitats in close proximity to hard bottom nesting areas	
	Juveniles	GOME, GB, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Saco Bay; Mass Bay, Boston Harbor and Cape Cod Bay	<14	>25	<80		Bottom habitats, often smooth bottom near rocks or algae	
	Adults	GOME, GB, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Saco Bay; Mass Bay, Boston Harbor and Cape Cod Bay	<15	32 - 34	<110		Bottom habitats. (Dig depressions in soft sediments which are then used by other species)	(major prey: mollusks, crustaceans, echinoderms, sand dollars)
	Spawning Adults	GOME, GB, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Saco Bay; Mass Bay, and Cape Cod Bay	<10	32 - 34	<50	Late summer to early winter, peaks in Sept. and October	Bottom habitats with a hard bottom substrate, including artificial reefs and shipwrecks	(internal fertilization)
Offshore hake	Eggs	Outer continental shelf of GB and southern NE south to Cape Hatteras, North Carolina	<20		<1250	Observed all year and primarily collected at depths from 110 - 270m	Pelagic waters	
	Larvae	Outer continental shelf of GB and southern NE south to Chesapeake Bay	<19		<1250	Observed all year and primarily collected at depths from 70 - 130m	Pelagic waters	
	Juveniles	Outer continental shelf of GB and southern NE south to Cape Hatteras, NC	<12		170- 350		Bottom habitats	
	Adults	Outer continental shelf of GB and southern NE south to Cape Hatteras, NC	<12		150 - 380		Bottom habitats	(major prey: fish - cannibalistic, shrimp, other crustaceans)
	Spawning Adults	Outer continental shelf of GB and southern NE south to the Middle Atlantic Bight	<12		330 - 550	Spawn all throughout the year	Bottom habitats	
Pollock	Eggs	GOME, GB and the following estuaries: Great Bay to Boston Harbor	<17	32 - 32.8	30-270	October to June, peaks in November to February	Pelagic waters	
	Larvae	GOME, GB and the following estuaries: Passamaquoddy Bay, Sheepscot R., Great Bay to Cape Cod Bay	<17		10-250	September to July, peaks from Dec. to February	Pelagic waters	(migrate inshore as they grow)
	Juveniles	GOME, GB and the following estuaries: Passamaquoddy Bay to Saco Bay; Great Bay to Waquoit Bay; Long Island Sound, Great South Bay	<18	29 - 32	0 - 250		Bottom habitats with aquatic vegetation or a substrate of sand, mud or rocks	(Intertidal zone may be important nursery area. Juveniles present in shallow intertidal zone at all tide stages throughout summer. Subtidal marsh creeks such as Little Egg Harbor, NJ are also seasonally important as nursery)

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Definitions: GOME - Gulf of Maine; GB - George's Bank; HAPC - Habitat Area of Particular Concern; YOY - Young-of-Year Please note: This Table does not contain EFH info on Highly Migratory Species (sharks, tunas, billfish).

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (°C)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
	Adults	GOME, GB, southern NE, and middle Atlantic south to New Jersey and the following estuaries: Passamaquoddy Bay, Damariscotta R., Mass Bay, Cape Cod Bay, Long Island Sound	<14	31 - 34	15-365		Hard bottom habitats including artificial reefs	(major prey: crustaceans, fish, mollusks)
	Spawning Adults	GOME, southern NE, and middle Atlantic south to New Jersey includes Mass Bay	<8	32 - 32.8	15-365	September to April, peaks December to February	Bottom habitats with a substrate of hard, stony, or rocky bottom includes artificial reefs	
Red hake	Eggs	GOME, GB, continental shelf off southern NE, and middle Atlantic south to Cape Hatteras	<10	< 25		May to November, peaks in June and July	Surface waters of inner continental shelf	
	Larvae	GOME, GB, continental shelf off southern NE, and middle Atlantic south to Cape Hatteras and following estuaries: Sheepscot R., Mass Bay to Cape Cod Bay; Buzzards Bay, Narragansett Bay & Hudson R./ Raritan Bay	<19	>0.5	<200	May to December, peaks in Sept. and October	Surface waters	(newly settled larvae need shelter, including live sea scallops, also use floating or mid-water objects for shelter)
	Juveniles	GOME, GB, continental shelf off southern NE, and middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Saco Bay; Great Bay, Mass Bay to Cape Cod Bay; Buzzards Bay to Conn. R.; Hudson R./ Raritan Bay, & Chesapeake Bay	<16	31 - 33	<100		Bottom habitats with substrate of shell fragments, including areas with an abundance of live scallops	
	Adults	GOME, GB, continental shelf off southern NE, and middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Saco Bay; Great Bay, Mass Bay to Cape Cod Bay; Buzzards Bay to Conn. R.; Hudson R./ Raritan, Delaware Bay, & Chesapeake Bay	<12	33 - 34	10-130		Bottom habitats in depressions with a substrate of sand and mud	(major prey: fish and crustaceans)
	Spawning Adults	GOME, southern edge of GB, continental shelf off southern NE, and middle Atlantic south to Cape Hatteras and following estuaries: Sheepscott R., Mass Bay, Cape Cod Bay, Buzzards Bay, & Narragansett Bay	<10	>25	<100	May to November, peaks in June and July	Bottom habitats in depressions with a substrate of sand and mud	
Redfish	Eggs	No EFH identification or description for this life history stage						Redfish are ovoviviparous (live bearers)
	Larvae	GOME, southern GB	<15		50-270	March to October, peak in August	Pelagic waters	
	Juveniles	GOME, southern edge of GB	<13	31 - 34	25-400		Bottom habitats with a substrate of silt, mud, or hard bottom	
	Adults	GOME, southern edge of GB	<13	31 - 34	50-350		Bottom habitats with a substrate of silt, mud, or hard bottom	
	Spawning Adults	GOME, southern edge of GB	<13	31 - 34	5 -350	April to August	Bottom habitats with a substrate of silt, mud, or hard bottom	copulation occurs between Oct-Jan. Fertilization is delayed until Feb-Apr

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Definitions: GOME - Gulf of Maine; GB - George's Bank; HAPC - Habitat Area of Particular Concern; YOY - Young-of-Year Please note: This Table does not contain EFH info on Highly Migratory Species (sharks, tunas, billfish).

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (EC)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
White hake	Eggs	GOME, GB, southern NE and the following estuaries: Great Bay to Cape Cod Bay				August to September	Surface waters	
	Larvae	GOME, southern edge of GB, southern NE to middle Atlantic and the following estuaries: Mass Bay, to Cape Cod Bay				May - mid-Atlantic area Aug. & Sept. - GOME, GB area	Pelagic waters	
	Juveniles	GOME, southern edge of GB, southern NE to middle Atlantic and the following estuaries: Passamaquoddy Bay to Great Bay; Mass Bay to Cape Cod Bay	<19		5 - 225	May-Sep - pelagic	Pelagic stage - pelagic waters; Dermersal stage - Bottom habitat with seagrass beds or substrate of mud or fine-grained sand	
	Adults	GOME, southern edge of GB, southern NE to middle Atlantic and the following estuaries: Passamaquoddy Bay to Great Bay; Mass Bay to Cape Cod Bay	<14		5 - 325		Bottom habitats with substrate of mud or fine-grained sand	(major prey: small fish, shrimp and other crustaceans)
	Spawning Adults	GOME, southern edge of GB, southern NE to middle Atlantic	<14		5 - 325	April to May - southern part of range; August - Sept.- northern part of range	Bottom habitats with substrate of mud or fine-grained sand in deep water.	
Whiting (Silver hake)	Eggs	GOME, GB, continental shelf off southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Merrimack R. to Cape Cod Bay	<20		50-150	All year, peaks June to October	Surface waters	
	Larvae	GOME, GB, continental shelf off southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Mass Bay to Cape Cod Bay	<20		50-130	All year, peaks July to September	Surface waters	
	Juveniles	GOME, GB, continental shelf off southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Casco Bay, Mass Bay to Cape Cod Bay	<21	>20	20-270		Bottom habitats of all substrate types	
	Adults	GOME, GB, continental shelf off southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Casco Bay, Mass Bay to Cape Cod Bay	<22		30-325		Bottom habitats of all substrate types	
	Spawning Adults	GOME, GB, continental shelf off southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Mass Bay and Cape Cod Bay	<13		30-325		Bottom habitats of all substrate types	
Window-pane flounder	Eggs	GOME, GB, southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Great Bay; Mass Bay to Delaware Inland Bays	<20		<70	February to November, peaks May and October in middle Atlantic July - August on GB	Surface waters	

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Definitions: GOME - Gulf of Maine; GB - George's Bank; HAPC - Habitat Area of Particular Concern; YOY - Young-of-Year Please note: This Table does not contain EFH info on Highly Migratory Species (sharks, tunas, billfish).

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (EC)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
	Larvae	GOME, GB, southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Great Bay; Mass Bay to Delaware Inland Bays	<20		<70	February to November, peaks May and October in middle Atlantic July - August on GB	Pelagic waters	
	Juveniles	GOME, GB, southern NE, middle Atlantic south to Cape Hatteras and the following estuaries: Passamaquoddy Bay to Great Bay; Mass Bay to Chesapeake Bay	<25	5.5 - 36	1 - 100		Bottom habitats with substrate of mud or fine grained sand	
	Adults	GOME, GB, southern NE, middle Atlantic south to Virginia - NC border and the following estuaries: Passamaquoddy Bay to Great Bay; Mass Bay to Chesapeake Bay	<26.8	5.5 - 36	1 - 75		Bottom habitats with substrate of mud or fine grained sand	(major prey: polychaetes, small crustaceans, mysids, small fish)
	Spawning Adults	GOME, GB, southern NE, middle Atlantic south to Virginia -NC border and the following estuaries: Passamaquoddy Bay to Great Bay; Mass Bay to Delaware Inland Bays	<21	5.5 - 36	1 - 75	February - December, peak in May in middle Atlantic	Bottom habitats with substrate of mud or fine grained sand	
Winter flounder	Eggs	GB, inshore areas of GOME, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Delaware Inland Bays	<10	10 - 30	<5	February to June, peak in April on GB	Bottom habitats with a substrate of sand, muddy sand, mud, and gravel	* On GB, eggs are generally found in water temp < 8EC, and < 90m deep.
	Larvae	GB, inshore areas of GOME, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Delaware Inland Bays	<15	4 - 30	<6	March to July, peaks in April and May on GB	Pelagic and bottom waters	* On GB, larvae are generally found in water temp < 8EC, and < 90m deep.
	Juveniles (age 1+)	GB, inshore areas of GOME, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Chincoteague Bay	<25	10 - 30	1 - 50		Bottom habitats with a substrate of mud or fine grained sand	* Young-of-year exist where water temp <28, depths 0.1 - 10m, salinities 5 - 33 (major prey: amphipods, copepods, polychaetes, bivalve siphons)
	Adults	GB, inshore areas of GOME, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Chincoteague Bay	<25	15 - 33	1 - 100		Bottom habitats including estuaries with substrate of mud, sand, gravel	(major prey: amphipods, polychaetes, bivalve siphons, crustaceans)
	Spawning Adults	GB, inshore areas of GOME, southern NE, middle Atlantic south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Delaware Inland Bays	<15	5.5 - 36	<6*	February to June	Bottom habitats including estuaries with substrate of mud, sand, gravel	*except on GB where they spawn as deep as 80m
Witch flounder	Eggs	GOME, GB, continental shelf off southern NE, middle Atlantic south to Cape Hatteras	<13	High	Deep	March to October	Surface waters	
	Larvae	GOME, GB, continental shelf off southern NE, middle Atlantic south to Cape Hatteras	<13	High	Deep	March to November, peaks in May - July	Surface waters to 250m	

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (°C)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
	Juveniles	GOME, outer continental shelf from GB south to Cape Hatteras	<13	34 - 36	50-450 to 1500m		Bottom habitats with fine-grained substrate	(the upper slope is nursery area; major prey: crustaceans, polychaetes, mollusks)
	Adults	GOME, outer continental shelf from GB south to Chesapeake Bay	<13	32 - 36	25-300		Bottom habitats with fine-grained substrate	(major prey: polychaetes, echinoderms, crustaceans, mollusks, squid)
	Spawning Adults	GOME, outer continental shelf from GB south to Chesapeake Bay	<15	32 - 36	25-360	March to November, peaks in May-August	Bottom habitats with fine-grained substrate	
Yellowtail flounder	Eggs	GB, Mass Bay, Cape Cod Bay, southern NE continental shelf south to Delaware Bay and the following estuaries: Passamaquoddy Bay to Saco Bay; Great Bay to Cape Cod Bay	<15	32.4 - 33.5	30 - 90	Mid-March to July, peaks in April to June in southern NE	Surface waters	
	Larvae	GB, Mass Bay, Cape Cod Bay, southern NE continental shelf, middle Atlantic south to Chesapeake Bay and the following estuaries: Passamaquoddy Bay to Cape Cod Bay	<17	32.4 - 33.5	10 - 90	March to April in New York bight; May to July in south NE and southeastern GB	Surface waters	(largely an oceanic nursery)
	Juveniles	GB, GOME, southern NE continental shelf south to Delaware Bay and the following estuaries: Sheepscot R., Casco Bay, Mass Bay to Cape Cod Bay	<15	32.4 - 33.5	20 - 50		Bottom habitats with substrate of sand or sand and mud	
	Adults	GB, GOME, southern NE continental shelf south to Delaware Bay and the following estuaries: Sheepscot R., Casco Bay, Mass Bay to Cape Cod Bay	<15	32.4 - 33.5	20 - 50		Bottom habitats with substrate of sand or sand and mud	(major prey: annelids, arthropods, mollusks)
	Spawning Adults	GB, GOME, southern NE continental shelf south to Delaware Bay and the following estuaries: Mass Bay to Cape Cod Bay	<17	32.4 - 33.5	10-125		Bottom habitats with substrate of sand or sand and mud	
Atlantic mackerel	Eggs	Continental Shelf from Maine through Cape Hatteras, NC also includes estuaries from Great Bay to Cape Cod Bay; Buzzards Bay to Long Island Sound; Gardiners Bay and Great South Bay	5-23	(18 - >30)	0 - 15		Pelagic waters	(peak spawning in salinities >30ppt)
	Larvae	Continental Shelf from GOME through Cape Hatteras, NC also includes estuaries from Great Bay to Cape Cod Bay; Narragansett Bay to Long Island Sound; Gardiners Bay and Great South Bay	6-22	(>30)	10-130		Pelagic waters	
	Juveniles	Continental Shelf from GOME through Cape Hatteras, NC also includes estuaries from Passamaquoddy Bay; Penobscot Bay to Saco Bay; Great Bay; Mass Bay to Cape Cod Bay; Narragansett Bay, Long Island Bay; Gardiners Bay to Hudson R./ Raritan Bay	4 - 22	(>25)	0 - 320		Pelagic waters	

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (°C)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
	Adults	Continental Shelf from GOME through Cape Hatteras, NC also includes estuaries from Passamaquoddy Bay to Saco Bay; Mass Bay to Long Island Bay; Gardiners Bay to Hudson R./ Raritan Bay	4 - 16	(>25)	0 - 380		Pelagic waters	(opportunistic feeding: can filter feed or select individual prey. Major prey: crustaceans, pelagic mollusks, polychaetes, squid, fish)
Black sea bass	Eggs	Continental Shelf and estuaries from southern NE to North Carolina, also includes Buzzards Bay			0 - 200	May to October	Water column of coastal Mid-Atlantic Bight and Buzzards Bay	
	Larvae	Pelagic waters over Continental Shelf from GOME to Cape Hatteras, NC, also includes Buzzards Bay	(11-26)	(30 - 35)	(<100)	(May - Nov, peak Jun - Jul)	Habitats for transforming (to juveniles) larvae are near coastal areas and into marine parts of estuaries between Virginia and NY. When larvae become demersal, found on structured inshore habitat such as sponge beds.	
	Juveniles	Demersal waters over Continental Shelf from GOME to Cape Hatteras, NC, also includes estuaries from Buzzards Bay to Long Island Sound; Gardiners Bay, Barnegat Bay to Chesapeake Bay; Tangier/ Pocomoke Sound and James River	>6	>18	(1 - 38)	Found in coastal areas (Apr - Dec , peak Jun - Nov) between VA and MA, but winter offshore from NJ and south; Estuaries in summer and spring	Rough bottom, shellfish and eelgrass beds, man-made structures in sandy-shelly areas, offshore clam beds and shell patches may be used during wintering	(YOY use salt marsh edges and channels; high habitat fidelity)
	Adults	Demersal waters over Continental Shelf from GOME to Cape Hatteras, NC, also includes estuaries: Buzzards Bay, Narragansett Bay, Gardiners Bay, Great South Bay, Barnegat Bay to Chesapeake Bay; Tangier/ Pocomoke Sound and James River	>6	(>20)	(20- 50)	Wintering adults (Nov. to April) offshore, south of NY to NC Inshore, estuaries from May to October	Structured habitats (natural & man-made) sand and shell substrates preferred	(spawn in coastal bays but not estuaries; change sex to males with growth; prey: benthic and near bottom inverts, small fish, squid)
Bluefish	Eggs	North of Cape Hatteras, found over Continental Shelf from Montauk Point, NY south to Cape Hatteras, South of Cape Hatteras, found over Continental Shelf through Key West, Florida	>18	>31ppt	Mid-shelf depths	April to August	Pelagic waters	*No EFH designation inshore
	Larvae	North of Cape Hatteras, found over Continental Shelf from Montauk Point, NY south to Cape Hatteras, South of Cape Hatteras, found over Continental Shelf through Key West, Florida, the slope sea and Gulf Stream between latitudes 29N and 40N; includes the following estuaries: Narragansett Bay	>18	>30ppt	>15	April to September	Pelagic waters	No EFH designation inshore for larvae

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (EC)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
	Juveniles	North of Cape Hatteras, found over Continental Shelf from Nantucket Island, MA south to Cape Hatteras, South of Cape Hatteras, found over Continental Shelf through Key West, Florida, the slope sea and Gulf Stream between latitudes 29N and 40N also includes estuaries between Penobscot Bay to Great Bay; Mass Bay to James R.; Albemarle Sound to St. Johns River, FL	(19-24)	(23 - 36) freshwater zone in Albemarle Sound		North Atlantic estuaries from June to October Mid-Atlantic estuaries from May to October South Atlantic estuaries from March to December	Pelagic waters	(use estuaries as nursery areas; can intrude into areas with salinities as low as 3 ppt)
	Adults	North of Cape Hatteras, found over Continental Shelf from Cape Cod Bay, MA south to Cape Hatteras, South of Cape Hatteras, found over Continental Shelf through Key West, Florida also includes estuaries between Penobscot Bay to Great Bay; Mass Bay to James R.; Albemarle Sound to Pamlico/ Pungo R., Bougue Sound, Cape Fear R., St. Helena Sound, Broad R., St. Johns R., & Indian R.	(14-16)	>25ppt		North Atlantic estuaries from June to October Mid-Atlantic estuaries from April to October South Atlantic estuaries from May to January	Pelagic waters	Highly migratory (major prey: fish)
Butterfish	Eggs	Over Continental shelf from GOME through Cape Hatteras, NC, also in estuaries from Mass Bay to Long Island Sound; Gardiners Bay, Great South Bay, and Chesapeake Bay	11 - 17	(25 - 33)	0-1829	(spring and summer)	Pelagic waters	
	Larvae	Over Continental shelf from GOME through Cape Hatteras, NC, also in estuaries from Boston Harbor, Waquoit Bay to Long Island Sound; Gardiners Bay to Hudson R./ Raritan Bay; Delaware Bay and Chesapeake Bay	9 - 19	(6.4 - 37)	10-1829	(summer and fall)	Pelagic waters	
	Juveniles	Over Continental shelf from GOME through Cape Hatteras, NC also in estuaries from Mass Bay, Cape Cod Bay to Delaware Inland Bays; Chesapeake Bay, York R. and James R.	3 - 28	(3 - 37)	10-365 (most <120)	(winter - shelf spring to fall - estuaries)	Pelagic waters (larger individuals found over sandy and muddy substrates)	(pelagic schooling - smaller individuals associated with floating objects including jellyfish)
	Adults	Over Continental shelf from GOME through Cape Hatteras, NC, also in estuaries from Mass Bay, Cape Cod Bay to Hudson R./ Raritan Bay; Delaware Bay and Inland Bays; York R. and James R.	3 - 28	(4 - 26)	10-365 (most <120)	(winter - shelf summer to fall - estuaries)	Pelagic waters (schools form over sandy, sandy-silt and muddy substrates)	(common in inshore areas and surf zone; prey: planktonic, thaliacians, squid, copepods)
Illex squid	Juveniles	Over Continental shelf from GOME through Cape Hatteras, NC	2 -23		0 - 182	(carried northward by Gulf Stream)	Pelagic waters	
	Adults	Over Continental shelf from GOME through Cape Hatteras, NC	4 - 19		0 -182	(late fall - offshore, spawn Dec- Mar)	Pelagic waters	(prey: fish, crustaceans, squid; die after spawning)
Loligo	Eggs***	Over Continental shelf from GOME through Cape Hatteras, NC	(>8)	(30 - 32)	(<50)	(May - spawned, hatch in Jul)	(Demersal egg masses are commonly found on sandy/mud bottom, usually attached to rocks/boulders, pilings or algae such as fucus, ulva, laminaria, porphyra)	*** EFH is not currently designated for this life stage (Eggs are demersal, enclosed in gelatinous capsule containing up to 200 eggs. Laid in masses of hundreds of capsules from different females)

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Definitions: GOME - Gulf of Maine; GB - George's Bank; HAPC - Habitat Area of Particular Concern; YOY - Young-of-Year Please note: This Table does not contain EFH info on Highly Migratory Species (sharks, tunas, billfish).

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (°C)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
	Juveniles	Over Continental shelf from GOME through Cape Hatteras, NC	4 - 27	(31 - 34)	0 - 213	spring - fall - inshore winter - offshore	Pelagic waters	(inhabit upper 10m at depth of 50 - 100m on continental shelf)
	Adults	Over Continental shelf from GOME through Cape Hatteras, NC	4 - 28		0 - 305	(Mar - Oct - inshore; winter - offshore)	Pelagic waters	(prey: fish, crustaceans)
Ocean quahog	Juveniles	Eastern edge of GB and GOME throughout the Atlantic EEZ	<18	(>25)	8-245		Throughout substrate to a depth of 3ft within federal waters, occurs progressively further offshore between Cape Cod and Cape Hatteras	(medium to fine grained sands, sandy mud, silty sand)
	Adults	Eastern edge of GB and GOME throughout the Atlantic EEZ	<18	(>25)	8 -245	(spawn May-Dec with several peaks)	Throughout substrate to a depth of 3ft within federal waters, occurs progressively further offshore between Cape Cod and Cape Hatteras	(medium to fine grained sands, sandy mud, silty sand; earliest age of maturity 7 yrs, avg 13 yrs; suspension feeders on phytoplankton)
Scup	Eggs	Southern NE to coastal Virginia includes the following estuaries: Waquoit Bay to Long Island Sound; Gardiners Bay, Hudson R./ Raritan Bay	13 - 23	>15	(<30)	May - August	Pelagic waters in estuaries	
	Larvae	Southern NE to coastal Virginia includes the following estuaries: Waquoit Bay to Long Island Sound; Gardiners Bay, Hudson R./ Raritan Bay	13 - 23	>15	(<20)	May - September	Pelagic waters in estuaries	
	Juveniles	The Continental Shelf from GOME to Cape Hatteras, NC includes the following estuaries: Mass Bay, Cape Cod Bay to Long Island Sound; Gardiners Bay to Delaware Inland Bays; & Chesapeake Bay	>7	>15	(0 - 38)	Spring and summer in estuaries and bays	Dermersal waters north of Cape Hatteras and Inshore on various sands, mud, mussel, and eelgrass bed type substrates	
	Adults	The Continental Shelf from GOME to Cape Hatteras, NC includes the following estuaries: Cape Cod Bay to Long Island Sound; Gardiners Bay to Hudson R./ Raritan Bay; Delaware Bay & Inland Bays; & Chesapeake Bay	>7	>15	(2 -185)	Wintering adults (November - April) are usually offshore, south of NY to NC	Dermersal waters north of Cape Hatteras and Inshore estuaries (various substrate types)	(spawn < 30m during inshore migration - May - Aug; prey: small benthic inverts)
Spiny Dogfish	Juveniles	GOME through Cape Hatteras, NC across the Continental Shelf; Continental Shelf waters South of Cape Hatteras, NC through Florida; also includes estuaries from Passamaquaddy Bay to Saco Bay; Mass Bay & Cape Cod Bay	3 - 28		10-390		Continental Shelf waters and estuaries	
	Adults	GOME through Cape Hatteras, NC across the Continental Shelf; Continental Shelf waters South of Cape Hatteras, NC through Florida; also includes estuaries from Passamaquaddy Bay to Saco Bay; Mass Bay & Cape Cod Bay	3 - 28	(30 - 32)	10-450		Continental Shelf waters and estuaries	(major prey: crabs, eels, small fish)

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Definitions: GOME - Gulf of Maine; GB - George's Bank; HAPC - Habitat Area of Particular Concern; YOY - Young-of-Year Please note: This Table does not contain EFH info on Highly Migratory Species (sharks, tunas, billfish).

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (EC)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
Summer flounder	Eggs	Over Continental Shelf from GOME to Cape Hatteras, NC; South of Cape Hatteras to Florida			30-70 fall; 110 winter; 9-30 spring	October to May	Pelagic waters , heaviest concentrations within 9miles of shore off NJ and NY	
	Larvae	Over Continental Shelf from GOME to Cape Hatteras, NC; South of Cape Hatteras to Florida; also includes estuaries from Waquoit Bay to Narragansett Bay; Hudson River/ Raritan Bay; Barnegat Bay, Chesapeake Bay, Rappahannock R., York R., James R., Albemarie Sound, Pamlico Sound, Neuse R. to Indian R.	(9 - 12)	(23-33) Fresh in Hudson R. Raritan Bay area	10-70	mid-Atlantic Bight from Sept. to Feb.; Southern part from Nov. to May at depths 9-30m	Pelagic waters, larvae most abundant 19 - 83km from shore; Southern areas 12 - 52 miles from shore	(high use of tidal creeks and creek mouths)
	Juveniles	Over Continental Shelf from GOME to Cape Hatteras, NC; South of Cape Hatteras to Florida; also includes estuaries from Waquoit Bay to James R.; Albemarie Sound to Indian R.	>11	10 -30 Fresh in Narrag. Bay, Albem/ Pamlico Sound, & St. Johns R.	(0.5-5) in estuary		Demersal waters, muddy substrate but prefer mostly sand; found in the lower estuaries in flats, channels, salt marsh creeks, and eelgrass beds	HAPC - All native species of macroalgae, seagrasses and freshwater and tidal macrophytes in any size bed as well as loose aggregations, within adult and juvenile EFH. (Major prey: mysid shrimp)
	Adults	Over Continental Shelf from GOME to Cape Hatteras, NC; South of Cape Hatteras to Florida; also includes estuaries from Buzzards Bay, Narragansett Bay, Conn. R. to James R.; Albemarie Sound to Broad R.; St. Johns R., & Indian R.		Fresh in Albemarie Sound, Pamlico Sound, & St. Johns R.	(0 - 25)	Inhabit shallow coastal and estuarine waters during warmer months and move offshore on outer Continental Shelf at depths of 150m in colder months	Demersal waters and estuaries	HAPC - All native species of macroalgae, seagrasses and freshwater and tidal macrophytes in any size bed as well as loose aggregations, within adult and juvenile EFH. (Major prey: fish, shrimp, squid, polychaetes)
Surf clams	Juveniles	Eastern edge of GB and the GOME throughout Atlantic EEZ	(2-30)		0 -60 , low density beyond 38		Throughout substrate to a depth of three feet within federal waters. (Burrow in med. To coarse sand and gravel substrates. Also found in silty to fine sand, not in mud)	
	Adults	Eastern edge of GB and the GOME throughout Atlantic EEZ	(2-30)		0 -60 , low density beyond 38	(spawn-summer to fall at 19 - 30 °C)	Throughout substrate to a depth of three feet within federal waters	
Tilefish	Eggs	US Canadian Boundary to VA/NC boundary (shelf break; GB to Cape Hatteras)	8 - 19	(34 - 36)	76-365	(Serial spawning March - November; peaks April - October)	Water column	
	Larvae	US Canadian Boundary to VA/NC boundary Outer continental shelf; (GB to Cape Hatteras)	8 - 19	(33 - 35)	76-365	(Feb - Oct; peaks July - Oct)	Water column	

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Definitions: GOME - Gulf of Maine; GB - George's Bank; HAPC - Habitat Area of Particular Concern; YOY - Young-of-Year Please note: This Table does not contain EFH info on Highly Migratory Species (sharks, tunas, billfish).

Summary of Essential Fish Habitat (EFH) and General Habitat Parameters for Federally Managed Species

Species	Life Stage	Geographic Area	Temp (EC)	Salinity (‰)	Depth (m)	Seasonal Occurrence	Habitat Description	Comments
	Juveniles	US Canadian Boundary to VA/NC boundary (shelf break, submarine canyon walls and flanks; GB to Cape Hatteras)	8 - 18	(33 - 36)	76-365	(All year; may leave GB in winter)	Rough bottom, small burrows, and sheltered areas. (Substrate - rocky, stiff clay, human debris)	(Tilefish are shelter-seeking and habitat limited). HAPC is substrate between the 76 and 365m isobath, from U.S. / Canadian Boundary to the Virginia / North Carolina boundary within statistical areas 616 and 537 (intersection of isobaths east of Cape May, NJ and south of Provincetown, MA)
	Adults	US Canadian Boundary to VA/NC boundary (shelf break, submarine canyon walls and flanks; GB to Cape Hatteras)	8 - 18	(33 - 36)	76-365	(All year; may leave GB in winter)	Rough bottom, small burrows, and sheltered areas. (Substrate - rocky exposed ledges, stiff clay)	HAPC is substrate between the 250 and 1200 ft isobath, from U.S. / Canadian Boundary to the Virginia / North Carolina boundary within statistical areas 616 and 537 (intersection of isobaths east of Cape May, NJ and south of Provincetown, MA) (prey: crustaceans, fish, decapods, benthic epifauna)
Red drum	Larvae	Along the Atlantic coast from Virginia through the Florida Keys	2 - 33	Low salinity	<50		Estuarine wetlands especially important Flooded saltmarshes, brackish marsh, tidal creeks, mangrove fringe, seagrasses	Red drum are euryhaline
	Juveniles	Along the Atlantic coast from Virginia through the Florida Keys	2 - 33	20 - 40	<50	Found throughout Chesapeake Bay from Sept. - Nov.	Utilize shallow backwaters of estuaries as nursery areas and remain till they move to deeper water portions of the estuary associated with river mouths, oyster bars and front beaches	Red drum are eurythermal and larger juveniles and Adults more susceptible to effects of winter cold waves than small fish
	Adults	Along the Atlantic coast from Virginia through the Florida Keys	2 - 33	20 - 40	<50	Found in Chesapeake in Spring and Fall and also along Eastern Shore of VA	Concentrate around inlets, shoals, capes along the Atlantic coast - Shallow bay bottoms or oyster reef substrate preferred. Also nearshore artificial reefs.	HAPCs for red drum include all coastal inlets, all state-designated nursery habitats of particular importance to red drum (NC - all Primary and Secondary Nursery Areas), SAV extremely important, barrier islands in NC, SC, GA, FL and passes between barrier islands into estuaries
Spanish mackerel		South Atlantic and Mid-Atlantic Bights	>20	>30			Sandy shoals of capes and offshore bars, high profile rock bottoms and barrier island ocean side waters from surf zone to shelf break but from the Gulf Stream shoreward;	All coastal inlets
Cobia		South Atlantic and Mid-Atlantic Bights	>20	>25			Sandy shoals of capes and offshore bars, high profile rock bottoms and barrier island ocean side waters from surf zone to shelf break but from the Gulf Stream shoreward; high salinity bays, estuaries, seagrass habitat.	All coastal inlets
King mackerel		South Atlantic and Mid-Atlantic Bights	>20	>30			Sandy shoals of capes and offshore bars, high profile rock bottoms and barrier island ocean side waters from surf zone to shelf break but from the Gulf Stream shoreward;	All coastal inlets
Golden crab		Chesapeake Bay to the south through the Florida Straight (and into Gulf of Mexico)			290-570	(Gulf Stream EFH because it helps to disperse golden crab larvae)	Flat foraminifera ooze, distinct mounds of dead coral, ripple habitat, dunes, black pebble habitat, low outcrop, and soft bioturbated habitat	

This table was compiled by NMFS Northeast Regional Office, Habitat Conservation Division. All information presented is part of the Regional Fishery Management Council's EFH designations except for that contained within () which is provided as important additional ecological information. Definitions: GOME - Gulf of Maine; GB - George's Bank; HAPC - Habitat Area of Particular Concern; YOY - Young-of-Year Please note: This Table does not contain EFH info on Highly Migratory Species (sharks, tunas, billfish).

Summary of Essential Fish Habitat (EFH) Designations

10 x 10 Square Coordinates:

Boundary	North	East	South	West
Coordinate	36° 50.0' N	75° 50.0' W	36° 40.0' N	76° 00.0' W

-

Square Description (i.e. habitat, landmarks, coastline markers): Waters within the Atlantic Ocean within the square affecting North Bay, Shipp's Bay, and southern Virginia Beach. These waters affect the following: Muddy Creek, Porpoise Pt., and northern Long I., and affect Virginia Beach from Rudee Inlet on the north, south past Sandbridge Beach, VA., to east of half way down Long I., just north of the Wash Flats.

Winter Skate	Figures 13 & 14	Coastal Distribution

Figure 1 Barndoor Skate EFH Juvenile (100%)

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999). **Only the shaded squares in U.S. waters represent the EFH designation.** Only bottom habitats with mud, gravel, and sand substrates that occur within the shaded areas in U.S. waters are designated as EFH. This represents 100% of the observed range of this life stage.

Figure 2 Barndoor Skate EFH Adult (100%)

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999). **Only the shaded squares in U.S. waters represent the EFH designation.** Only bottom habitats with mud, gravel, and sand substrates that occur within the shaded areas in U.S. waters are designated as EFH. This represents 100% of the observed range of this life stage.

Figure 3 Clearnose Skate EFH Juvenile (90%)

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999) and ELMR data presented in Table 5. Only habitats with soft bottom, rocky or gravelly substrates that occur within the shaded areas are designated as EFH. This represents 62% of the observed range of this life stage.

Figure 4 Clearnose Skate EFH Adult (90%)

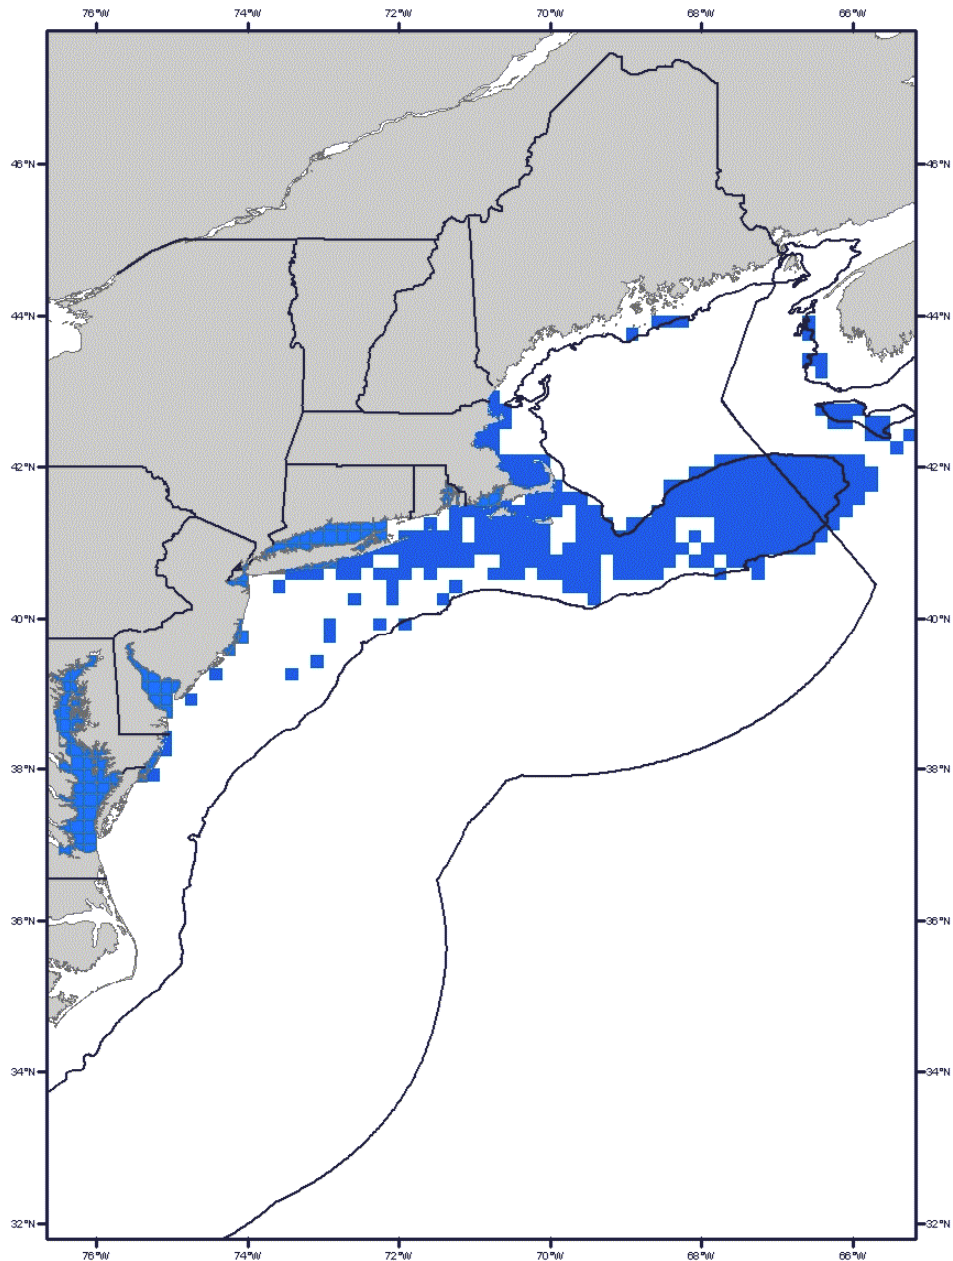

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999) and ELMR data presented in Table 5. Only habitats with soft bottom, rocky or gravelly substrates that occur within the shaded areas are designated as EFH. This represents 67% of the observed range of this life stage.

Figure 5 Little Skate EFH Juvenile (90%)

This map represents an option for the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999) and ELMR data presented in Table 5. **Only the shaded squares in U.S. waters represent the EFH designation.** Only habitats with sandy, gravelly, or mud substrates that occur within the shaded areas in U.S. waters are designated as EFH. This represents 58% of the observed range of this life stage.

Figure 6 Little Skate EFH Adult (90%)

This map represents an option for the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999) and ELMR data presented in Table 5. **Only the shaded squares in U.S. waters represent the EFH designation.** Only habitats with sandy, gravelly, or mud substrates that occur within the shaded areas in U.S. waters are designated as EFH. This represents 57% of the observed range of this life stage.

Figure 7 Rosette Skate EFH Juvenile (90%)

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999). Only habitats with a soft substrate, including sand/mud bottoms, mud with echinoid and ophiroid fragments, and shell and pteropod ooze that occur within the shaded areas are designated as EFH. This represents 63% of the observed range of this life stage.

Figure 8 Rosette Skate EFH Adult (90%)

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999). Only habitats with a soft substrate, including sand/mud bottoms, mud with echinoid and ophiroid fragments, and shell and pteropod ooze that occur within the shaded areas are designated as EFH. This represents 70% of the observed range of this life stage.

Figure 9 Smooth Skate EFH Juvenile (90%)

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999). **Only the shaded squares in U.S. waters represent the EFH designation.** Only habitats with a substrate of soft mud and also on sand, broken shells, gravel and pebbles that occur within the shaded areas in U.S. waters are designated as EFH. This represents 63% of the observed range of this life stage.

Figure 10 Smooth Skate EFH Adult (90%)

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999). **Only the shaded squares in U.S. waters represent the EFH designation.** Only habitats with a substrate of soft mud and also on sand, broken shells, gravel and pebbles that occur within the shaded areas in U.S. waters are designated as EFH. This represents 70% of the observed range of this life stage.

Figure 11 Thorny Skate EFH Juvenile (90%)

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999). **Only the shaded squares in U.S. waters represent the EFH designation.** Only habitats with a substrate of sand, gravel, broken shell, pebbles, and soft mud that occur within the shaded areas in U.S. waters are designated as EFH. This option represents 66% of the observed range of this life stage.

Figure 12 Thorny Skate EFH Adult (90%)

This map represents for the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999). **Only the shaded squares in U.S. waters represent the EFH designation.** Only habitats with a substrate of sand, gravel, broken shell, pebbles, and soft mud that occur within the shaded areas in U.S. waters are designated as EFH. This represents 66% of the observed range of this life stage.

Figure 13 Winter Skate EFH Juvenile (90%)

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999) and ELMR data presented in Table 5. **Only the shaded squares in U.S. waters represent the EFH designation.** Only habitats with a substrate of sand and gravel or mud that occur within the shaded areas in U.S. waters are designated as EFH. This represents 48% of the observed range of this life stage.

Figure 14 Winter Skate EFH Adult (90%)

This map represents the designation of EFH for this life history stage based on the areas of highest relative abundance of this species, based on the NMFS trawl survey (1963 - 1999) and ELMR data presented in Table 5. **Only the shaded squares in U.S. waters represent the EFH designation.** Only habitats with a substrate of sand and gravel or mud that occur within the shaded areas in U.S. waters would be designated as EFH. This represents 44% of the observed range of this life stage

Enclosure 6 INRMP Sea Turtle Program Biological Opinion and Biological & Lighting Assessments

United States Department of the Interior

FISH AND WILDLIFE SERVICE

Virginia Field Office
6669 Short Lane
Gloucester, VA 23061

October 21, 2016

Mr. Michael H. Jones
Director, Environmental Planning and Conservation
Navy Region Mid-Atlantic
1510 Gilbert Street
Norfolk, VA 23511- 2737

Re: Sea Turtle Management, Naval Air
Station Oceana – Dam Neck Annex
and Virginia Army National Guard –
Camp Pendleton, Virginia Beach,
VA, Project # 2016 – F-2328

Dear Mr. Jones:

This document transmits the U.S. Fish and Wildlife Service's (Service) biological opinion based on our review of the U.S. Department of the Navy's (Navy) proposed and ongoing sea turtle management at the Naval Air Station Oceana – Dam Neck Annex (NASO-DNA) and the Virginia Army National Guard's operations at Camp Pendleton (VAARNG-CP) in Virginia Beach, VA, and effects on the federally listed endangered Kemp's ridley sea turtle (*Lepidochelys kempii*) and federally listed threatened green sea turtle (*Chelonia mydas*) North Atlantic distinct population segment (DPS) and loggerhead sea turtle (*Caretta caretta*) Northwest Atlantic Ocean DPS in accordance with section 7 of the Endangered Species Act (16 U.S.C. 1531-1544, 87 Stat. 884), as amended (ESA). Your February 29, 2016 request for formal consultation was received on March 3, 2016.

This biological opinion is based on information provided in the March 3, 2016 biological assessment, the project proposal, telephone conversations, field investigations, and other sources of information. A complete administrative record of this consultation is on file in this office.

The Navy determined in its biological assessment (Navy 2016) that the proposed and ongoing actions may affect, but are not likely to adversely affect the federally listed endangered leatherback (*Dermochelys coriacea*) and hawksbill (*Eretmochelys imbricata*) sea turtles. The Service concurs with the Navy's determination because although leatherback and hawksbill sea turtles have been documented in offshore environments, no nests of either species have been

documented in the area and these species are not expected to occur there in the future. These species are not considered further in this biological opinion.

This biological opinion is valid from the date of signature through August 15, 2031.

CONSULTATION HISTORY

- 10-08-03 The Service issued NASO-DNA a non-jeopardy biological opinion for a proposed beach replenishment project.
- 05-29-08 Agreement between NASO-DNA and the Service's Back Bay National Wildlife Refuge (BBNWR) that NASO-DNA would be responsible for conducting crawl and nest patrols on NASO-DNA beaches and BBNWR was responsible for biological data collection, nest confirmation, and nest relocation on NASO-DNA beaches.
- 05-25-12 The Service issued BBNWR and NASO-DNA a non-jeopardy biological opinion for the updated BBNWR Sea Turtle Management Program.
- 10-17-14 Meeting between the Service and Naval Facilities Engineering Command (NAVFAC) Mid-Atlantic Region (MIDLANT) to discuss sea turtle management.
- 01-06-15 Service review of the NASO-DNA Integrated Natural Resources Management Plan (INRMP) that includes standard operating procedures (SOP) for sea turtle management.
- 05-29-15 National Oceanic and Atmospheric Administration review of the NASO-DNA INRMP that includes SOPs for sea turtle management.
- 06-09-15 INRMP signed into official compliance by the Navy.
- 10-08-15 Coordination of INRMP updates at the INRMP Annual Partners meeting.
- 03-03-16 The Service received the Navy's February 29, 2016 request to initiate formal consultation on the sea turtle management program.
- 04-06-16 Meeting among the Service, NASO-DNA, Joint Expeditionary Base Little Creek-Fort Story, and Virginia Department of Game and Inland Fisheries (VDGIF) to discuss sea turtle management in Virginia.
- 05-03-16 The Service provided a letter to NAVFAC acknowledging receipt of the Navy's February 29, 2016 request to initiate formal consultation.

BIOLOGICAL OPINION

DESCRIPTION OF PROPOSED ACTION

Naval Air Station Oceana - Dam Neck Annex (NASO-DNA)

NASO-DNA is an approximately 1,900-acre installation in southern Virginia Beach, VA. NASO-DNA includes approximately 4.0 miles [mi] of intertidal beach and primary and secondary coastal dune habitat along the Atlantic Ocean (Navy 2015). The beaches and dunes on NASO-DNA encompass about 164 acres of dune protection area consisting of undeveloped primary and secondary dunes and natural communities.

The proposed sea turtle patrols and nest and stranding management are defined in the SOPs for sea turtles (Navy 2015, Appendix A) included in the NASO-DNA INRMP (Navy 2015). The SOPs for sea turtle patrols, stranding notifications and actions, and nest management include:

- conducting patrols within the beach and dune areas of NASO-DNA to locate stranded sea turtles, turtle crawls, and turtle nests;
- reporting and coordinating actions for stranded sea turtles with the Virginia Aquarium Stranding Team (VAST);
- protecting and monitoring *in situ* sea turtle nests until all hatchlings have emerged;
- relocating nests to established low activity (green) zones when operational uses of the beach (e.g., red or yellow activity zones) or nest location (e.g., below the high tide line) would result in disturbance or destruction of a nest; and
- reviewing projects proposed in the INRMP or by NASO-DNA or its tenant for their potential to affect sea turtles.

Sea Turtle Patrols – The procedure for sea turtle patrols was developed to identify stranded sea turtles, sea turtle crawls, and sea turtle nests within the beach and dune areas of NASO-DNA. Nesting surveys and egg relocations will only be conducted by persons with prior experience and training in these activities and who are duly authorized to conduct such activities through a valid permit issued by the VDGIF. The patrollers will have training on patrol procedures, crawl recognition, and all-terrain vehicle (ATV) use. From 15 May to 31 August, NASO-DNA's natural resources staff and other authorized individuals will patrol the beaches daily using ATVs starting 30 minutes before sunrise. If the morning is dark, ATV headlights will be covered in red filters before use on the beach. The water's edge will be patrolled first, and then the middle beach will be patrolled. Patrolling above the high-tide line is not advised because this habitat may contain shorebird nests.

If a stranded turtle, turtle crawl, or turtle nest is sighted, procedures outlined in the following sections will be followed. If unauthorized vehicles, artificial light, or any other activity that could negatively impact sea turtle activity on the beach is found, NASO-DNA's security, conservation

law enforcement officer, and Natural Resource Manager (NRM) will be contacted. Information from the patrol will be documented in a Sea Turtle Patrol Log.

Sea Turtle Stranding – During patrols, dead or live sea turtles may be found stranded. The NASO-DNA reporting procedures, which include contacting the NRM and the VAST, will be initiated for any stranded sea turtles. Appropriate contacts will be provided in the sea turtle communication protocol and updated yearly prior to the start of the sea turtle nesting season or as needed. If appropriate, the NRM will contact the NAVFAC MIDLANT Subject Matter Expert and the National Oceanic and Atmospheric Administration Point of Contact. After helping VAST remove either dead or live stranded turtles and completing patrols, the patrollers will complete patrol logs and stranding data sheets.

Dead Stranded Turtles – If the turtle is in the surf, patrollers will move it landward so it does not wash away before the VAST arrives. Patrollers will provide the day, time, and location information on whether the turtle was moved out of the surf and the patroller's name and contact information to the VAST and the NRM. The patrollers will help the VAST with base access, data collection, and removal of the turtle.

Live Stranded Adults – Patrollers will contact the VAST and the NRM, relay the location of the stranded adult turtle, and continue to search the beach. When they finish patrolling, they will return with supplies to protect the stranded turtle. Patrollers will keep the nose and eyes of the turtle moist and its body shaded and await further instruction from the VAST. Patrollers will aid the VAST with base access, data collection, and moving the turtle.

Live Stranded Hatchlings – Patrollers will contact the NRM and the VAST, relay the location of the stranded hatchling, and place the hatchling in a cooler with moist sand until they receive further instructions.

Crawl Procedures – When a patroller finds a nesting or crawling turtle, they will extinguish their ATV headlights. Patrollers will take care not to startle the turtle and keep a safe distance away until the turtle has returned to the sea. Any turtle crawls or nests will be reported to BBNWR, the NRM, range control if found on training beaches, security, VDGIF sea turtle program manager, Command Duty Officer, Public Affairs Officer, Installation Environmental Program Director, and Public Works Officer. The patrollers and NRM will coordinate with all agencies to document the occurrence and determine appropriate actions.

After the turtle crawl has been reported, the crawl will be marked with wire flags and the surrounding area will be identified with stakes and flagging to provide a buffer around the nest. The date, time, weather, crawl measurements, and any information that can be deduced about the time of emergence and return to the ocean will be recorded. The global positioning system location will be documented and pictures taken. Flashes should not be used for nighttime photography. A permitted biologist or other approved and permitted individual (i.e., Navy, VDGIF, Service, or Virginia Aquarium representative) will determine if a false crawl, false nest,

or nest is present. If a nest is present, nest procedures will be followed. Otherwise, the patroller will complete his/her patrol.

Nest Management – The procedures discussed below are general descriptions of nest management actions at NASO-DNA. Specific procedures are found in the *Standard Operating Procedures for Sea Turtles, Naval Air Station Oceana – Dam Neck Annex* (Navy 2016, Appendix A). Only individuals having the appropriate permits (e.g., Navy, VDGIF, Service, VAST) are legally authorized to perform nest management procedures on NASO-DNA.

To locate a nest, a permitted biologist will examine any disturbed areas. Nests will be located by excavating the nest by hand. Nests will be left in place whenever possible. If a nest is relocated by a permitted biologist, it will be moved to the closest available designated location via strict protocols and prior to 9 am. Relocated nests will not be placed in organized groupings. Relocated nests will be randomly staggered along the length and width of the beach in settings that are not expected to experience daily inundation by high tides or known to routinely experience severe erosion and egg loss, predation, or subject to artificial lighting. Nest relocations in association with construction activities will cease when construction activities no longer threaten nests. For all nests, data sheets and photographs documenting the actions taken will be completed and placed in a turtle nest binder.

If a nest is found below the high tide line, the responding permit holder and NRM determine whether the nest should be relocated above the high tide line. The responding permit holder and NRM determine whether the nest should be relocated to a different area of the installation considering whether the beach is in a military training area.

NASO-DNA has identified areas of the installation where sea turtle nests or hatchlings may be impacted as a result of training that cannot be relocated (Figure 1). The majority of this training is limited to between Labor Day and Memorial Day due to the installation's close proximity to Virginia Beach. Areas designated as red zones (Figure 1) are commonly used for training that is difficult to relocate and may put sea turtle nests at risk. In the red zone, routine exercises include: training, testing and evaluation in special warfare, ordinance, overland assault, beach assault, and tactical air operations radar. Amphibious landing exercises can occur up to 4 times per month and involve 1 to 4 amphibious vehicles maneuvering onto and across the beach, foot traffic across the beach and dunes, and support personnel digging foxholes to establish a beachhead. In the red zones (Figure 1), sea turtles may be impacted by ground disturbing training activities, amphibious landing exercises, explosive ordinance disposal, physical training, security patrols, maintenance of buried communication cables, and ATV training. Training and associated activities may disturb nesting attempts or reduce hatching success. To avoid potential adverse effects, nests laid in red zones will be relocated to the nearest adjacent green zone.

Areas designated as yellow zones (Figure 1) are used for training; however, training exercises are less frequent and more flexible than training exercises conducted in red zones and nests will be left *in situ* if they can be avoided. If nests are located in areas with a likelihood of negative effects on training, NASO-DNA will contact the Service and VDGIF to discuss potential for

relocation. Relocation of nests in yellow zones will be considered on a case-by-case basis. Nests above the high tide line can be left in place, with a self-release cage and posts on all sides. Nests that negatively inhibit established training routes may be relocated west, closer to the dune line. If the number of nests negatively inhibits training, and training exercises cannot be moved to a different location the nest will be relocated to the closest green zone. Nest sitting will not occur in yellow zones.

Areas designated as green zones (Figure 1) are generally used for activities where individuals are able to avoid a marked sea turtle nest, primarily recreational use areas. Recreational use of beaches on NASO-DNA occurs seasonally, with most activity concentrated in spring and summer months. Recreational use includes swimming, beachcombing, fishing, wildlife observation, sunbathing, and other typical beach recreation. Seasonal recreational use overlaps with sea turtle nesting season and may disturb nesting attempts or reduce hatching success. A nest laid in green zones will be left *in situ*, unless located below the high tide line, in which case it will be relocated due west above the high tide to avoid inundation. NASO-DNA staff routinely patrol the beach and recreational use areas. Nests will be marked conspicuously to reduce likelihood of disturbance prior to hatching. Nest sitting is authorized in green zones.

In Situ Nest Protection and Monitoring – *In situ* nests will be surrounded by a wire predator-proof enclosure, flagging, reflectors, and signage to inform the public about the protection program. Navy (2016, Appendix D) contains detailed procedures for construction and placement of predator enclosures. Navy (2016, Appendix A) contains detailed procedures for nest monitoring and nest sitting. Nest sitting will only be authorized in green zones (Figure 1).

Nest Relocation – Nest relocation procedures are outlined in Virginia Bureau of Wildlife Resources (2015) and Navy (2016, Appendix A). Nests will be moved to the nearest approved adjacent area (Figure 1). Relocated nests will be moved to an appropriate area on NASO-DNA or VAARNG-CP. In rare circumstances when no approved areas on NASO-DNA or VAARNG-CP are available, the nest will be moved to a beach location at BBNWR. A predator enclosure cage will be placed over the relocated nest using procedures described above and outlined in Navy (2016, Appendix D). The nests will be monitored following the same procedures as for nests left *in situ*.

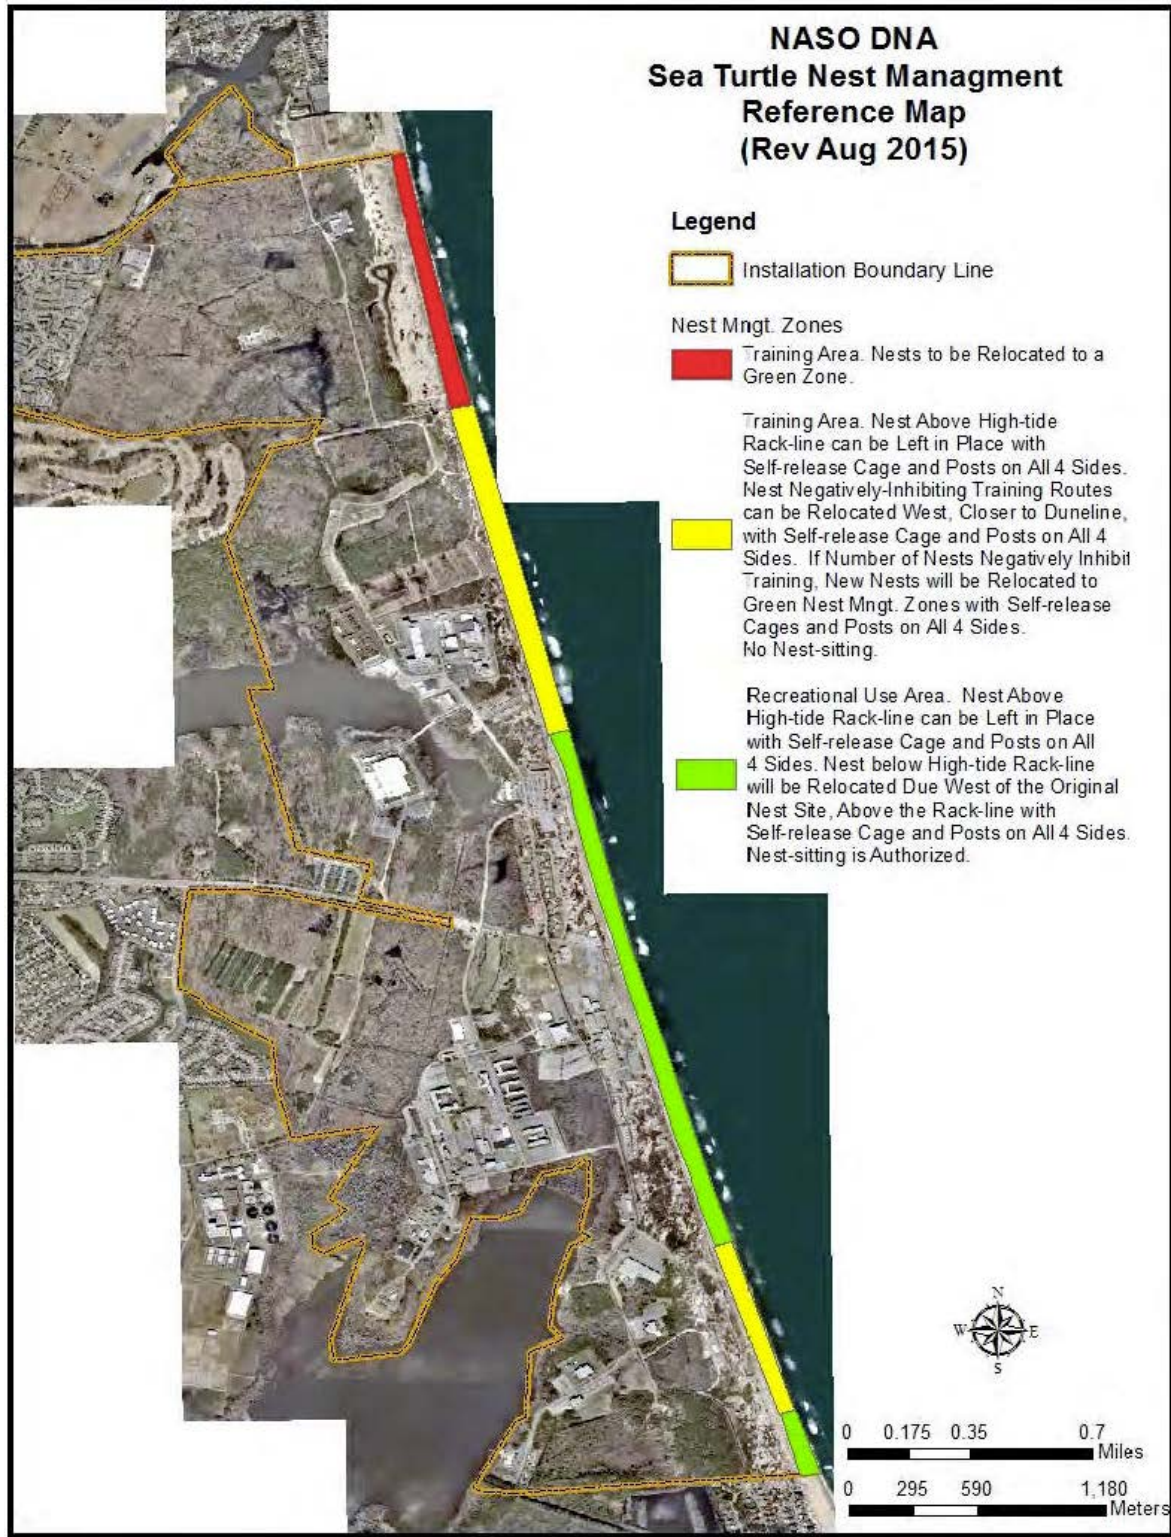

Figure 1. Naval Air Station Oceana – Dam Neck Annex sea turtle nest management map.

Virginia Army National Guard - Camp Pendleton (VAARNG-CP)

VAARNG-CP is adjacent to the northern boundary of NASO-DNA in southern Virginia Beach (Figure 2). The VAARNG-CP is situated along the Atlantic Ocean and has approximately 0.23 mi of intertidal beach and primary and secondary coastal dune habitat continuous with NASO-DNA beaches (VAARNG 2004). The VAARNG-CP beach is bounded to the north by the Croatan residential neighborhood and Croatan public beach and to the south by NASO-DNA. Through a cooperative venture with the City of Virginia Beach, approximately 1,000 ft of the northern portion of the VAARNG-CP beach is opened to the public as the Pendleton Surf Beach.

Sea Turtle Patrols – The VAARNG-CP INRMP recognizes the need for monitoring for sea turtle activity (VAARNG 2004). Currently, VAARNG-CP has a verbal agreement with NASO-DNA to conduct beach patrols. NASO-DNA beach patrols survey the VAARNG-CP beach to the property boundary for the portion of the beach leased to the City of Virginia Beach and use binoculars to survey the remaining beach. The area leased to the City of Virginia Beach is surveyed by Virginia Aquarium volunteers.

If a crawl, stranded sea turtle, or potential nest is located, the patrol will contact the NASO-DNA NRM, who in turn contacts the VAARNG-CP NRM. Notification is passed to the VAARNG-CP command staff. The VAARNG-CP NRM ensures that the Service, VDGIF, and VAST are notified as appropriate.

Nest Management – Limited training activities occur on VAARNG-CP beaches. Training includes driving vehicles such as Humvees and ATVs and can be suspended at any time to accommodate protection of sea turtles. Additional vehicular traffic can occur in an emergency situation for human safety or law enforcement activities. If a nest is located, the VAARNG-CP NRM will consult with the Service, VDGIF, and VAST to determine if the nest will be left *in situ* or relocated on VAARNG-CP, and who will be responsible for relocation. Nest management activities will be conducted in accordance with the 2015 Virginia Sea Turtle Nesting Handbook (Virginia Bureau of Wildlife Resources 2015).

In Situ Nest Protection and Monitoring – In areas with heavy foot or vehicular traffic the nest will typically be marked for avoidance. *In situ* nests will be marked with stakes, flagging, and signs that identify the site as a sea turtle nest. Stakes will be placed at each corner of the nest (36 – 40 inches from nest center) and encircled with flagging to preclude them from being run over or disturbed. A predator exclosure will be placed on the nest as described in Navy (2016, Appendix D). Nests will be monitored daily near the hatch window to determine success. A nest inventory may only be conducted 72 hours after the first sign of emergence or 70 days after the eggs were deposited (90 days for leatherbacks) whichever comes first. The nest will be excavated by permitted persons to quantify nest success.

Nest Relocation – When a nest is located below the mean high tide line, it may be moved immediately above the mean high tide line. A nest will only be moved for unusual activities, such as special military training operations by VAARNG-CP or the U.S. Navy, that pose a

serious threat to the nest. In these instances, VAARNG-CP NRM will consult with the VDGIF and Service to discuss potential mitigation measures that may include relocation. If the nest is relocated, permitted individuals will accomplish the relocation of the nest in accordance with the procedures outlined in the 2015 Virginia Sea Turtle Nesting Handbook (Virginia Bureau of Wildlife Resources 2015). Nests may be relocated to the closest adjacent suitable beach approved for relocation on VAARNG-CP or NASO-DNA. Prior to relocating any nest to the NASO-DNA green zone (Figure 1), coordination and approval must be obtained through the NASO-DNA NRM. Appendix K in the NASO-DNA Standard Operating Procedures for Sea Turtles (Navy 2016, Appendix A) lists areas approved for nest relocation. In rare circumstances when no approved areas on VAARNG-CP or NASO-DNA are available, the nest will be moved to a beach location at BBNWR. Relocated nests are marked as discussed above for *in situ* nest protection and monitoring.

Back Bay National Wildlife Refuge (BBNWR)

BBNWR has approximately 5 mi of intertidal beach and primary and secondary coastal dune habitat and is a potential relocation site for nests from NASO-DNA and VAARNG-CP. BBNWR is located south of Sandbridge, VA, and is about 8 mi south of NASO-DNA (Figure 2).

Action Area

The action area is defined as all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action. The Service has determined that the action area for this project includes the beach and dune areas at NASO-DNA, VAARNGCP, and BBNWR. The action area at NASO-DNA is bounded by VAARNG-CP to the north and the community of Sandbridge, VA, to the south. The action area within NASO-DNA includes approximately 4 continuous mi of intertidal beach and primary and secondary coastal dune along the Atlantic Ocean, which total about 164 acres. The action area at VAARNG-CP is bounded to the north by the Croatan residential neighborhood and the Croatan public beach and to the south by NASO-DNA. The action area within VAARNG-CP has approximately 0.23 mi of intertidal beach and primary and secondary coastal dune habitat that is continuous with NASO-DNA beaches and includes the Pendleton Surf Beach. The action area at BBNWR is bounded to the north by Sandbridge beach and to the south by False Cape State Park. The action area within BBNWR has approximately 5 mi of intertidal beach and primary and secondary coastal dune habitat.

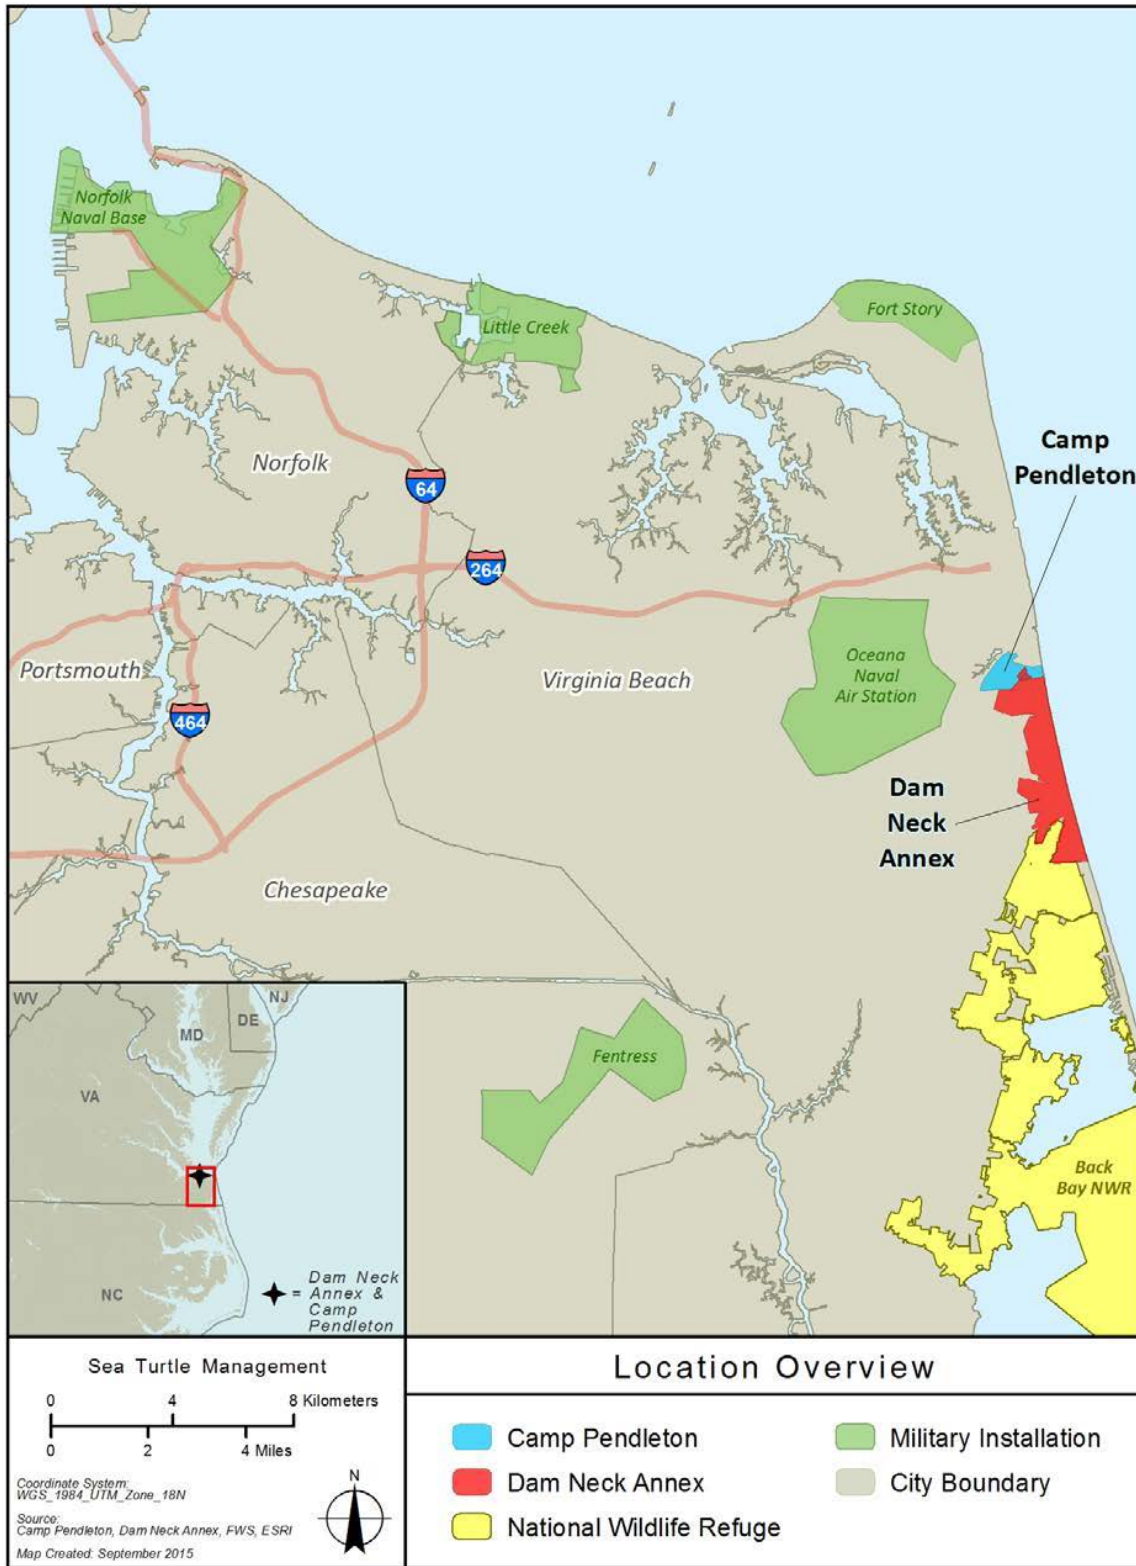

Figure 2. Location of Naval Air Station Oceana – Dam Neck Annex and Virginia Army National Guard – Camp Pendleton.

STATUS OF THE SPECIES AND CRITICAL HABITAT RANGEWIDE

Kemp's Ridley Sea Turtle – The species description, life history, population dynamics, status and distribution, and critical habitat description, if applicable are at: Lazell 1980; Morreale et al. 1982, 2007; Lutcavage and Musick 1985; Henwood and Ogren 1987; Ogren 1989; Collard 1990; Meylan et al. 1990; Manzella et al. 1991; Service and National Marine Fisheries Service (NMFS) 1992; Marquez-Millan 1994; Keinath et al. 1994; Renaud 1995; Weber 1995; Godfrey 1996; Musick and Limpus 1997; Landry and Costa 1999; Turtle Expert Working Group 2000; Coyne et al. 2000; Foote and Mueller 2002; Gulko and Eckert 2004; Morreale and Standora 2005; Renaud and Williams 2005; Seney and Musick 2005; Heppell et al. 2005; Schmid and Barichivich 2006; Frey et al. 2007; NMFS and Service 2011; NMFS et al. 2011; Witherington et al. 2012; Galloway et al. 2013; and Barco and Swingle 2014. No critical habitat has been designated for this species.

Green Sea Turtle North Atlantic Distinct Population Segment – The species description, life history, population dynamics, status and distribution, and critical habitat description, if applicable are at: Dolan et al. 1973; Parmenter 1980; Hosier et al. 1981; Morreale et al. 1982; Peterson et al. 1985; Carr 1987; Anders and Leatherman 1987; Hirth and Samson 1987; Nelson et al. 1987; Nelson and Dickerson 1987, 1988; Schwartz 1989; National Research Council 1990; NMFS and Service 1991, 2007, 2008, 2015; Cox et al. 1994; Epperly et al. 1995a, b; Meylan et al. 1995; Witherington and Martin 1996, 2003; Hirth 1997; Musick and Limpus 1997; Lutcavage et al. 1997; Bouchard et al. 1998; Mortimer 1999; Bjorndal et al. 2000; Broderick et al. 2001; Holloway-Adkins and Provanca 2005; Witherington et al. 2006, 2012; Hiram and Ehrhart 2007; McClellan and Read 2009; and Pintus et al. 2009. No critical habitat has been designated for this species in this area (81 FR 20057-20090).

Loggerhead Sea Turtle Northwest Atlantic Ocean Distinct Population Segment – The species description, life history, population dynamics, status and distribution, and critical habitat description, if applicable are at: Graham 1973; Dolan et al. 1973; Schwartz 1978; Limpus et al. 1979, 1985; Mrosovsky 1980, 1988; Hosier et al. 1981; Carr 1982; Bradner 1983; Mrosovsky et al. 1984; Lutcavage and Musick 1985; Anders and Leatherman 1987; Nelson and Dickerson 1987, 1988; Nelson et al. 1987; Dodd 1988; Musick 1988; Christens 1990; McGehee 1990; National Research Council 1990; NMFS and Service 1991, 2007, 2008; Witherington 1991; Burke et al. 1991; Shoop and Kenney 1992; Cox et al. 1994; Georges et al. 1994; Epperly et al. 1995c; Addison 1996; Witherington and Martin 1996, 2003; Bouchard et al. 1998; Hanson et al. 1998; Steinetz et al. 1998; Bollmer et al. 1999; Turtle Expert Working Group 2000, 2009; Prescott 2000; Wood and Bjorndal 2000; Webster and Cook 2001; Godley et al. 2001; Comer 2002; Snover 2002; Witzell 2002; Mitchell et al. 2002; Avens et al. 2003; Bolten 2003; Lohmann and Lohmann 2003; Carthy et al. 2003; Ehrhart et al. 2003; Hopkins-Murphy et al. 2003; Miller et al. 2003, Schroeder et al. 2003; Bowen et al. 2005; Roberts et al. 2005; Abella et al. 2007; Hawkes et al. 2007, 2011; McClellan and Read 2007; Bimbi 2009; McElroy 2009; Tuttle and Rostal 2010; Service 2011b, 2014; LeBlanc et al. 2012; Griffin et al. 2013; NMFS 2014; Barco and Swingle 2014; Fisher et al. 2014; and Mansfield et al. 2014. Critical habitat has

been designated for this species but not in the terrestrial environment in Virginia (79 FR 39756-39854).

ENVIRONMENTAL BASELINE

Status of the Kemp's Ridley Sea Turtle Within the Action Area – Kemp's ridleys have been recorded off the coast of southeastern Virginia throughout the year. In Virginia, the average strandings per year for Kemp's ridley is 39, with a peak in June and fall (Barco and Swingle 2014). Strandings have been recorded in or near NASO-DNA and VAARNG-CP during spring, summer, and fall. Two Kemp's ridley nests have been recorded in Virginia. One nest was recorded at NASO-DNA in June 2012, which was the first documented nest in Virginia. The nest was left *in situ* and a total of 71 hatchlings emerged in mid-August (VDGIF 2015). The second nest was located and left *in situ* at False Cape State Park near the North Carolina/Virginia border in July 2014 (VDGIF 2015). No Kemp's ridley nests or false crawls have been documented at VAARNG-CP or BBNWR. We anticipate Kemp's ridley turtles may nest on NASO-DNA, VAARNG-CP, or BBNWR in the future.

Status of the Green Sea Turtle Within the Action Area – Green turtles are present in waters off Virginia's coast throughout the year. Strandings have been recorded in the action area during summer and fall and just south of the region during winter. The first green sea turtle nest in Virginia was documented in 2005 at BBNWR (Service 2005). No nests or false crawls have been recorded on NASO-DNA or VAARNG-CP beaches; however, 1 green turtle nest was recorded on Sandbridge Beach, just south of the action area, in August 2005 and was subsequently moved to BBNWR (VDGIF 2015). Based on this previous nesting record in southeastern Virginia, scattered green turtle nesting in nearby North Carolina, and the nesting of other turtle species in the action area, green turtles may nest on NASO-DNA in the future. Habitat for nesting sea turtles at VAARNG-CP is effected by the high concentrations of people using the beach during the nesting season, the relatively short beach (0.23 mi), and proximity to the heavily populated Virginia Beach.

Status of the Loggerhead Sea Turtle Within the Action Area – Loggerheads have been recorded in and near NASO-DNA and VAARNG-CP throughout the year. A total of 128 and 8 strandings have been recorded at NASO-DNA and VAARNG-CP, respectively, particularly during spring, summer, and fall. Three loggerhead false crawls have been documented on NASO-DNA, 2 in 2012 and 1 in 2014. Two loggerhead nests have been documented on NASO-DNA in July 1992 and July 2002. Both nests were relocated to BBNWR (Navy 2016). A loggerhead nest was located on Pendleton Surf Beach in the VAARNG-CP action area in August 2015 (VDGIF 2015). This nest was relocated above the high tide line to prevent tidal inundation; however, the nest was washed out during Hurricane Joaquin in October 2015 (Navy 2016). Previous to 2015, no nests or false crawls had been documented at VAARNG-CP. There have been 78 loggerhead nests at BBNWR between 1970 and 2015; 4 nests in 2010; 6 nests in 2012; 2 nests in 2013; 1 nest in 2014; and 4 nests in 2015.

Factors Affecting the Species Environment Within the Action Area – Sea turtles at NASO-DNA and VAARNG-CP are affected by a suite of existing actions associated with the mission of the installations to provide education and training to sailors in specified combat systems operation and maintenance, to provide specialized skills training, to provide training systems support to operational and systems commands, as well as other functions and tasks. Training, testing, and evaluation facilities operated at NASO-DNA include a helicopter pad, weapons compound, and Beach and Dune Training Areas. The Marine Air Control Squadron operates a compound and radar tower in the northeastern portion of the installation. An explosives test facility is located adjacent to the northern beach. Other training activities on the northern beach include: training, testing and evaluation in special warfare, ordnance, overland assault, beach assault, and tactical air operations radar. Amphibious landing exercises can occur up to 4 times per month and involve 1 to 4 amphibious vehicles maneuvering onto and across the beach, foot traffic across the beach and dunes, and support personnel digging foxholes to establish a beachhead. Training and associated activities may disturb nesting attempts or reduce hatching success. Beach driving during training results in ruts, compaction of sand, and disturbance of beach flora and fauna, and may degrade the condition of upper beach habitat. Vehicle operation on the beach may also reduce beach stability and result in increased levels of sand transport both on and off of the beaches of NASO-DNA.

The facilities and land of VAARNG-CP are used to support training for various military and government agencies. The majority of training is limited to between Labor Day and Memorial Day due to the installation's close proximity to Virginia Beach. Training includes weapons firing certification, classroom training, field artillery drivers training, and construction equipment drivers training. Weapons firing certification is limited to small caliber weapons and is located immediately behind the dunes. No training activities occur on VAARNG-CP beaches. Sea turtles are potentially impacted by ground disturbing training activities, explosive ordnance disposal, physical training, security patrols, maintenance of buried communication cables, and ATV training. Training and associated activities may disturb nesting attempts or reduce hatching success.

Recreational use of beaches on NASO-DNA and VAARNG-CP occurs seasonally, with most activity concentrated in spring and summer months. Recreational use includes swimming, beachcombing, fishing, wildlife observation, sunbathing, and other typical beach recreation. NASO-DNA staff post signage and implement closures to aid in protecting sensitive resources and routinely patrol the beach and recreational use areas. Seasonal recreational use overlaps with sea turtle nesting season and may disturb nesting attempts or reduce hatching success. As a result of the refinement of methods and implementation of a detailed protocol to excavate, transport, and re-bury nests relocated by NASO-DNA and VAARNG-CP personnel, hatch success rates are generally comparable to those that may occur naturally and are likely to vary from approximately 70% to 90% of total eggs (Limpus 1979, Jones and Musick 1988).

The artificial dunes on BBNWR result in narrow beaches that lack upper beach zones and at high tides water is generally at or near the base of the dunes. Recreational use of beaches occurs seasonally, with most activity concentrated in spring and summer months. Recreational use

includes beach driving, beachcombing, fishing, and wildlife observation. BBNWR routinely patrol the beach and recreational use areas for sea turtle crawls and nests and post signage and implement closures to protect nests. Seasonal recreational use overlaps with loggerhead nesting season and may disturb nesting attempts or reduce hatching success. Beach driving results in ruts, compaction of sand, and disturbance of beach flora and fauna, and further contributes to the degraded condition of upper beach habitat. Vehicle operation on the beach may also reduce beach stability and result in increased levels of sand transport both on and off of the beaches of BBNWR.

Climate change effects on the Kemp's ridley sea turtle are summarized from the species recovery plan (NMFS et al. 2011). "In the case of sea turtles, where many other habitat modifications are documented (e.g., beach development, loss of foraging habitat), the prospects for accentuated synergistic impacts on survival of the species may be even more important in the long-term. Such potential problems have been discussed for some time (Myers 1992). In these species, where temperature determines the sex of the developing embryo, even a few degrees change in beach temperatures over the next decade will cause a strong shift toward more female hatchlings being produced. Data suggest that a female bias may be present in the Kemp's ridley population and would be advantageous to the short-term recovery of this endangered sea turtle, but manipulation of natural sex ratios may have long-term, unknown positive or negative consequences. Another serious impact from global climate change is sea level rise. In areas of development, nesting beaches have no possibility for natural barrier island migration landward as sea levels rise. In the case of the Kemp's ridley where most of the critical nesting beaches are undeveloped, beaches may shift landward and still be available for nesting. Impacts from climate change, especially due to global warming, are likely to become more apparent in future years (IPCC 2007)."

Climate change effects on the green sea turtle are summarized from Service's final rule to list 11 DPSs of the green sea turtle as endangered or threatened (81 FR 20058-20090). "Species with high fecundity and low juvenile survival, such as sea turtles, are the most vulnerable to climate change and elevated levels of environmental variability (Cavallo et al., 2015; Halley et al., in review). Temperature changes and sea level rise are likely to change ocean currents and the movements of hatchlings, surface-pelagic juveniles, and adults (Hamann et al., 2007; Hawkes et al., 2009; Poloczanska et al., 2009; Cavallo et al., 2015). Nesting beaches are likely to be impacted by climate change. Sea level rise is likely to reduce the availability and increase the erosion rates of nesting beaches, particularly on low-lying, narrow coastal and island beaches (Fish et al., 2005; Baker et al., 2006; Jones et al., 2007; Fuentes et al., 2009; Hawkes et al., 2009; Anasta'cio et al., 2014; Pike et al., 2015). On undeveloped and unarmored beaches with no landward infrastructure, a typical beach profile may maintain its configuration but will be translated landward and upward (Bruun, 1962); however, along developed coastlines, and especially in areas where erosion control structures have been constructed to limit shoreline movement, sea level rise is likely to cause severe effects on nesting females and their eggs (Hawkes et al., 2009; Poloczanska et al., 2009). Increased storm frequency and intensity are likely to result in altered nesting beaches and decreased egg and hatchling success (Pike and Stiner, 2007; Van Houtan and Bass, 2007; Hawkes et al., 2009; Fuentes et al., 2011a; Dewald

and Pike, 2014; Brost et al., 2015). Increasing air and sea surface temperatures are strongly correlated to sand temperatures (Fuentes et al., 2009; Santos et al., 2015a), which could lead to embryonic mortality at 35 °C (Ackerman, 1997) and the loss of male hatchlings at 30.3 °C (Godfrey and Mrosovsky, 2006; Fuentes et al., 2010b; 2011b).”

“Adaptation by natural selection occurs when individuals with one heritable trait survive and reproduce (passing that trait onto their offspring) at a higher rate than individuals with other heritable traits. It occurs over many generations, and one green turtle generation is approximately 30 years (Seminoff et al., 2015). As climate change progresses (i.e., temperatures increase, ocean acidification increases, sea level rises, and storms increase in frequency and intensity), sea turtles that nest on lowlying beaches with inhospitable sand temperatures will produce less viable offspring than previously and as compared to those nesting at higher elevations and on beaches with sand temperatures conducive to embryonic development. This adaptation scenario will have a net effect of reducing the overall abundance of sea turtle populations in the future (e.g., reduced production at the low-lying beaches and constant production at the higher elevation beaches). The capacity for green turtles to quickly adapt is questionable because they are long-lived and late maturing, and the species has previously evolved in a climate that changed at a much slower rate than projections suggest for the next 100 years (Hamann et al., 2007; Hawkes et al., 2009; Poloczanska et al., 2009). Slow evolutionary rates (Awise et al., 1992) and smaller population sizes (as a result of previous declines and relative to preexploitation populations; McClenachan et al., 2006) may further limit the species’ ability to adapt (Hawkes et al., 2009). Therefore, adaptation by natural selection for green turtles is likely to be limited and may not match the rate of climate change impacts within the foreseeable future. We agree that in response to climate change, green turtles may alter their behavior; for example, nesting females may use beaches with higher elevation or cooler sands (Santos et al., 2015). However, the likelihood of altered behavior is difficult to estimate because green turtles exhibit high nesting site fidelity at some locations (Carr and Carr, 1972; Dizon and Balazs, 1982; Mortimer and Portier, 1989; Marquez, 1990; Bowen et al., 1992) and low nesting site fidelity at others (Basintal 2002; Abe et al., 2003). Dizon and Balazs (1982) state, “It is imperative for the well-being of the population that no alterations in the habitat be made since once imprinted the green turtle is unlikely to switch its breeding habitat.” Santos et al. (2015a) conclude that no environmental condition may be important enough to deter a faithful nester. In addition, alternative nesting sites may not be available. Furthermore, coastal squeeze, where coastal development prevents the landward migration of beaches, may prevent the use of higher elevation areas (Fish et al., 2008; Mazaris et al., 2009), even on continental beaches. Alternative beaches may not provide the optimal substrate for nesting (Fuentes et al., 2010a).”

Climate change effects on the loggerhead sea turtle are summarized from Service’s final critical habitat designation for the loggerhead sea turtle Northwest Atlantic Ocean DPS (79 FR 39756-39854). “Climate change has the potential to impact loggerhead sea turtles in the Northwest Atlantic, affecting nesting habitat availability, temperature dependent sex ratios, timing of the nesting season, and increased erosion from frequent intense storm events (Bender et al. 2010, p. 458; Weishampel et al. 2004, p. 1426; Hawkes et al. 2009, pp. 139–141; Reese et al. 2013, pp. 269– 271). The decline in loggerhead nesting in Florida from 1998 to 2007, as well as the recent

increase, appears to be tied to climatic conditions (Van Houtan and Halley 2011, p. 3). Although rapid changes in sea level are predicted, estimated timeframes and resulting water levels vary due to the uncertainty about global temperature projections and the rate of ice sheets melting and slipping into the ocean (Bindoff et al. 2007, pp. 409, 421; Witt et al. 2009, p. 901). Potential impacts of climate change to the Northwest Atlantic Ocean loggerhead DPS include beach erosion from rising sea levels, repeated inundation of nests, skewed hatchling sex ratios from rising incubation temperatures, and abrupt disruption of ocean currents used for natural dispersal during the complex life cycle (Fish et al. 2005, pp. 489–490; Fish et al. 2008, p. 336; Hawkes et al. 2009, pp. 139–141; Poloczanska et al. 2009, pp. 164–175). Thus, climate change impacts could have profound long-term impacts on loggerhead nesting populations in the Northwest Atlantic Ocean, but it is not possible to project the impacts at this point in time.”

EFFECTS OF THE ACTION

Direct and Indirect Effects – Direct effects are the direct or immediate effects of the project on the species, its habitat, or designated critical habitat. Indirect effects are defined as those that are caused by the proposed action and are later in time, but still are reasonably certain to occur (50 CFR 402.02).

Sea Turtle Patrols – Patrols are unlikely to disturb nesting sea turtles as they are conducted during morning hours, after a majority of sea turtles have initiated nesting. Protocols for patrols further reduce the likelihood of adverse effects to nesting or stranded sea turtles by limiting the speed of ATVs, training drivers to recognize the presence of stranded sea turtles or nest crawls, covering ATV lights, and implementing general best practices (e.g., communication protocols, avoiding distress to the animal, implementing area closures when needed). ATV use on the beaches may compact beach sand; however, ATVs are lighter than most vehicles and patrollers are trained to limit the likelihood of sand compaction due to ATV use. Therefore, sea turtles are not expected to be adversely affected by patrols.

Sea Turtle Stranding – Stranded sea turtles may suffer from illness, cold stunning, injury, or death. These effects are not a result of assistance (medical attention and transportation) provided to stranded turtles. While stranded turtles are being held or transported, standard protocols will limit the likelihood of further injury or death as a result of the stranding program. Sea turtles are not expected to be adversely affected as a result of the stranding program.

Crawl Procedures – When a patroller finds a nesting or crawling turtle, they will extinguish their ATV headlights, take care not to startle the turtle, and keep a safe distance away until the turtle has returned to the sea. If a nest is present, nest procedures will be followed. Sea turtles are not expected to be adversely affected as a result of crawl procedures.

Nest Management – Only individuals having the appropriate permits will perform nest management procedures. Because Service permits issued to these individuals/entities have already undergone section 7 consultation, effects to turtles from nest locating, nest relocation, and nest monitoring conducted by permittees will not be analyzed in this biological opinion.

In the red zone on NASO-DNA (Figure 1) training and associated activities may disturb nesting attempts or reduce hatching success and all nests will be relocated to the nearest adjacent green zone. Noise from training exercises conducted at night during nesting season may disturb nesting females. Noise can discourage nesting females from using particular sections of beach; however, training exercises are limited in scope and undisturbed beaches are available within other areas of NASO-DNA for nesting. Disturbance is likely to result in sea turtle nests being laid nearby in more protected areas, rather than an overall decrease in the number of nest attempts per year. If nests are not identified during patrols, training exercises may crush eggs within the nest; or crush, entrap, or disturb hatchlings attempting to leave the nest. Due to routine patrols and identification of stranded sea turtles, crawls, and nests within the beach and dune areas of NASO-DNA, the likelihood of unidentified nests being located within red zone training areas is low.

Relocation of sea turtle nests can be an effective conservation method for sea turtle populations where clutches would otherwise be lost and where populations require intervention (Pintus et al. 2009). However, nest relocation should only be conducted as a last resort because relocation may cause negative impacts to eggs and hatchlings through reduced hatch and emergence success (Wyneken et al. 1988, Mortimer 1999, NMFS and Service 2008, Sieg et al. 2011). Handling sea turtle eggs can injure or kill embryos as a result of disrupting membrane attachment (Limpus et al. 1979, Parmenter 1980, Eckert and Eckert 1990, Pintus et al. 2009, Sieg et al. 2011, Revuelta et al. 2014).

Relocated nests may have different moisture levels, gas exchange, thermal conditions, sand grain size, density, compaction, organic content, or color, which can lead to adverse effects on embryonic development and hatchling success, particularly sex ratios and survival of hatchlings (Ackerman 1980, Parmenter 1980, Miller and Limpus 1983, Spotila et al. 1983, McGehee 1990, Mortimer 1990, Georges et al. 1994, Crain et al. 1995, Ackerman 1997, Carthy et al. 2003, Fisher et al. 2014, Revuelta et al. 2014). Relocating nests into sands deficient in oxygen or moisture can result in mortality, morbidity, and reduced behavioral competence of hatchlings. Water availability is known to influence the incubation environment of the embryos and hatchlings of turtles with flexible-shelled eggs, which has been shown to affect nitrogen excretion (Packard et al. 1984), mobilization of calcium (Packard and Packard 1986), mobilization of yolk nutrients (Packard et al. 1985), hatchling size (Packard et al. 1981, McGehee 1990), energy reserves in the yolk at hatching (Packard et al. 1988), and locomotory ability of hatchlings (Miller et al. 1987). In a 1994 Florida study comparing loggerhead hatching and emerging success of relocated nests with nests left in their original location, Moody (1998) found that hatching success was lower in relocated nests at 9 of 12 beaches evaluated. In addition, emerging success was lower in relocated nests at 10 of 12 beaches surveyed in 1993 and 1994. If established protocols are followed successfully, nest relocation should result in a loss of no more than 10% of an average clutch (128 eggs).

It is uncertain whether the effects of intensive nest management discussed above will occur and to what degree they affect hatchling survival. The types of effects may vary depending on the environmental conditions within the specific nesting season, and the specific conditions that each

nest is subjected to during management activities and relocation. While hatch success has been used as a proxy to assess reproductive success, the factors discussed above may reduce recruitment, affect population demography, and affect future turtle use of nesting beaches in the action area. For the purposes of this analysis and in the absence of specific information that would allow us to consider the expected magnitude and severity of effects that may result, we make the conservative assumption that all of these factors affect hatchling sea turtles to a degree that cumulatively results in reduced survival and recruitment probability.

In the yellow zones on NASO-DNA (Figure 1) relocation of nests will be considered on a case-by-case basis. If a nest inhibits training, the nest will be relocated west, closer to the dune line. If there are multiple nests inhibiting training, they will be relocated to the closest green zone. Effects to nests in yellow zones will be similar to effects discussed above for nests in the red zone; however, the frequency, intensity, and duration of effects are likely to be less as training is less frequent and nests may be left *in situ*. If nests are not identified during patrols, training exercises may crush eggs within the nest; or crush, entrap, or disturb hatchlings attempting to leave the nest. Due to routine patrols and identification of stranded sea turtles, crawls, and nests within the beach and dune areas of NASO-DNA, the likelihood of unidentified nests being located within yellow zone training areas is low.

In the green zone on NASO-DNA and on VAARNG-CP nests will be left *in situ*, unless located below the high tide line, in which case the nest will be relocated west above the high tide to avoid inundation. Recreational use of these areas may result in trash on the ground, which could attract predators and increase the carrying capacity of the predators due to increased food availability. The increased numbers of predators may increase losses of turtle eggs and nests. However, use of these sites for recreation is generally light and not continuous and routine, and use of predator proof sea turtle enclosures will limit the ability of predators to disturb nests. Additionally, patrols to identify stranded sea turtles, crawls, and nests within the beach and dune areas of both locations and marking of nests will minimize the likelihood of these effects.

BBNWR is a potential relocation site for nests from NASO-DNA and VAARNG-CP. Impacts to sea turtles nests from relocation will be consistent with those discussed above. Nests will be preferentially relocated to green areas within NASO-DNA; however, in rare circumstances when suitable relocation sites are not available at NASO-DNA or VAARNG-CP, nests may be relocated to BBNWR. If established protocols are followed successfully, nest relocation should result in a loss of no more than 10% of an average clutch (128 eggs).

Interrelated and Interdependent Actions – An interrelated activity is an activity that is part of the proposed action and depends on the proposed action for its justification. An interdependent activity is an activity that has no independent utility apart from the action under consultation. The Service is not aware of activities interrelated to or interdependent with the proposed action at this time.

Beneficial Actions – Monitoring and *in situ* nest protection provide information on the sea turtle nesting within the action area. Routine patrols to identify stranded sea turtles, crawls, and nests

minimize impacts to nesting turtles and nests from training and recreational activities. Nest marking and predator protection reduce the potential for anthropogenic impacts including disruption of nests and predation.

CUMULATIVE EFFECTS

Cumulative effects include the effects of future State, tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the ESA. The Service is not aware of any future State, tribal, local, or private actions within the action area at this time.

CONCLUSION

The proposed and ongoing sea turtle management is anticipated to benefit stranded and nesting sea turtles and sea turtle nests vs. conducting training and recreational activities at NASO-DNA and VAARNG-CP without such a program in place. Effects to Kemp's ridley, green, and loggerhead sea turtle nests and nestlings/hatchlings as a result of operational and recreational activities are expected to be avoided and minimized as a result of monitoring for turtle crawls and marking of nests. The proposed and ongoing sea turtle management is expected to result in a reduction in either sea turtle reproductive output or success. However, these reductions are less than what would be expected if this program was not implemented.

After reviewing the status of the Kemp's ridley sea turtle, green sea turtle North Atlantic DPS, and loggerhead sea turtle Northwest Atlantic Ocean DPS; the environmental baseline for the action area; the effects of the proposed action; and the cumulative effects, it is the Service's biological opinion that proposed and ongoing sea turtle management at NASO-DNA and VAARNG-CP, as proposed, are not likely to jeopardize the continued existence of the Kemp's ridley sea turtle, green sea turtle North Atlantic DPS, and loggerhead sea turtle Northwest Atlantic Ocean DPS. No critical habitat has been designated for the Kemp's ridley sea turtle; therefore, none will be affected. No critical habitat has been designated for the green sea turtle North Atlantic DPS in this area; therefore, none will be affected. Critical habitat for the loggerhead sea turtle Northwest Atlantic Ocean DPS has been designated but not in the terrestrial environment in Virginia; therefore, none will be affected.

INCIDENTAL TAKE STATEMENT

Section 9 of the ESA and Federal regulation pursuant to section 4(d) of the ESA prohibit the take of endangered and threatened species, respectively, without a special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harm is further defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns such as breeding, feeding, or sheltering. Harass is defined by the Service as intentional or negligent actions that create the likelihood of injury to listed

species to such an extent as to significantly disrupt normal behavior patterns, which include, but are not limited to, breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the ESA provided that such taking is in compliance with the terms and conditions of this incidental take statement.

The measures described below are nondiscretionary, and must be undertaken by the Navy so that they become binding conditions of any grant or permit issued to any applicant/contractor, as appropriate, for the exemption in section 7(o)(2) to apply. The Navy has a continuing duty to regulate the activity covered by this incidental take statement. If the Navy (1) fails to assume and implement the terms and conditions or (2) fails to require any applicant/contractor to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to the permit or grant document, the protective coverage of section 7(o)(2) may lapse. To monitor the impact of incidental take, the Navy must report the progress of the action and its impact on the species to the Service as specified in the incidental take statement [50 CFR 402.14(i)(3)].

AMOUNT AND EXTENT OF TAKE

During military operations, direct mortality of the developing embryos in nests within the red zone may occur for nests that are not found and relocated. The exact number of these missed nests is not known. However, in 2 separate monitoring programs, where hand digging was performed to confirm the presence of nests and thus reduce the chance of missing nests through misinterpretation, trained observers missed about 6 to 8% of the nests because of natural elements (Martin 1992, Ernest and Martin 1993). In another study, Schroeder (1994) found that under the best conditions, about 7% of nests can be misidentified as false crawls by highly experienced sea turtle nest surveyors.

The Service anticipates incidental take of sea turtles will be difficult to detect for the following reasons: (1) sea turtles nest primarily at night and all nests are not found because [a] natural factors, such as rainfall, wind, and tides may obscure crawls and [b] human-caused factors, such as pedestrian and vehicular traffic, may obscure crawls, and result in nests being destroyed because they were missed during a nesting survey and egg relocation program; (2) total number of hatchlings per missed nest is unknown; (3) reduction in percent hatching and emerging success per relocated nest vs a natural nest is unknown; (4) an unknown number of females may avoid the red zone beach and nest in a less than optimal area; and (5) lights may misdirect an unknown number of hatchlings and result in death.

However, the following level of take of these species can be anticipated by the disturbance of suitable sea turtle nesting beach habitat because turtles nest within the military operation area (red zone) and military operations will likely occur in the red zone during a portion of the nesting season. Incidental take is anticipated for 1 mile of sea turtle nesting beach habitat (0.75 miles in the red zone at NASO-DNA and 0.25 miles at VAARNG-CP) as a result of the proposed military

operations. The take is expected to be in the form of: (1) destruction of all nests that may be constructed and eggs that may be deposited and missed by a nest survey and egg relocation program within the red zone; (2) reduced hatching success due to egg mortality during relocation and adverse conditions at the relocation site; (3) harassment in the form of disturbing or interfering with female turtles attempting to nest during military operations; (4) misdirection of nesting and hatchling turtles during military operations.

EFFECT OF THE TAKE

In the accompanying biological opinion, the Service determined that this level of anticipated take is not likely to result in jeopardy to the species or destruction or adverse modification of critical habitat.

REASONABLE AND PRUDENT MEASURES

The Service believes that all reasonable and prudent measures necessary and appropriate to minimize take of Kemp's ridley, green, and loggerhead sea turtles have been incorporated into the proposed action.

TERMS AND CONDITIONS

To be exempt from the prohibitions of section 9 of the ESA, the Navy must comply with the following terms and conditions, which implement the reasonable and prudent measures described above and outline required reporting/monitoring requirements. These terms and conditions are nondiscretionary.

1. Provide an annual report summarizing sea turtle survey and monitoring efforts, location and status of all sea turtle occurrences recorded, and any additional relevant information (nesting success, hatching success, emergence success, disorientations, and lighting surveys). Reports should be provided to the Service in digital format, at the email address provided below, by December 31 of each year.
2. Care must be taken handling any dead specimens of proposed or listed species that are found to preserve biological material in the best possible state. In conjunction with the preservation of any dead specimens, the finder has the responsibility to ensure that evidence intrinsic to determining the cause of death of the specimen is not unnecessarily disturbed. The finding of dead specimens does not imply enforcement proceedings pursuant to the ESA. The reporting of dead specimens is required to enable the Service to determine if take is reached or exceeded and to ensure that the terms and conditions are appropriate and effective. Upon locating a dead specimen, notify the Service's Virginia Law Enforcement Office at 804-771-2883, 7721 South Laburnum Avenue, Richmond, Virginia 23231, and the Service's Virginia Field Office at 804-693-6694 at the address provided on the letterhead above.

The Service believes that no more than 1 mile of nesting beach habitat will be incidentally taken as a result of the proposed action over the 15-year term of the biological opinion. The reasonable and prudent measures, with their implementing terms and conditions, are designed to minimize the impact of incidental take that might otherwise result from the proposed action. If, during the course of the action, this level of incidental take is exceeded, such incidental take represents new information requiring reinitiation of consultation and review of the reasonable and prudent measures provided. The Federal agency must immediately provide an explanation of the causes of the taking and review with the Service the need for possible modification of the reasonable and prudent measures.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the ESA directs federal agencies to utilize their authorities to further the purposes of the ESA by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to further minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

- Collect data on characteristics of beaches where sea turtles nest and provide this information to the Service and VDGIF. Coordinate with other interested parties to develop protocols for data collection and analysis throughout Virginia to improve understanding of sea turtle habitat characteristics.

For the Service to be kept informed of actions minimizing or avoiding adverse effects or benefitting listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

REINITIATION NOTICE

This concludes formal consultation on the actions outlined in the request. As provided in 50 CFR 402.16, reinitiation of formal consultation is required where discretionary Federal agency involvement or control over the action has been retained (or is authorized by law) and if: (1) the amount or extent of incidental take is exceeded; (2) new information reveals effects of the agency action that may affect listed species or critical habitat in a manner or to an extent not considered in this opinion; (3) the agency action is subsequently modified in a manner that causes an effect to the listed species or critical habitat not considered in this opinion; or (4) a new species is listed or critical habitat designated that may be affected by the action. In instances where the amount or extent of incidental take is exceeded, any operations causing such take must cease pending reinitiation.

Mr. Jones

1.0 INTRODUCTION

1.1 PURPOSE AND NEED

The purpose of this Biological Assessment (BA) is to address the effect of sea turtle nest and stranding management and relocation at Naval Air Station Oceana - Dam Neck Annex (NASO-DNA) and Virginia Army National Guard - Camp Pendleton (VAARNG-CP) on federally listed species and designated critical habitat under the jurisdiction of the United States Fish and Wildlife Service (USFWS). The United States (US) Navy proposes to implement a nesting sea turtle management strategy to comply with legal mandates in Section 7 of the Endangered Species Act (ESA) of 1973 as amended (16 US Code [USC] 1531 et seq) in accordance with 32 Code of Federal Regulations Part 190 – Department of Defense (DOD) Natural Resources Management Program; 16 USC §670a et seq. – Sikes Act, as amended; DOD Instruction (DODI) 4715.03 – Natural Resources Conservation Program; DOD Manual 4715.03 – Integrated Natural Resources Management Plan (INRMP) Implementation Manual; Chief of Naval Operations Operating Instruction 5090.1D – Environmental Readiness Program; and Chief of Naval Operations Operating Manual OPNAV M-5090.1.

The proposed action involves nesting and stranded sea turtle management at NASO-DNA and VAARNG-CP in Virginia Beach, Virginia. These actions have the potential to impact the following ESA-listed species in the Action Area: loggerhead sea turtle (*Caretta caretta*), green sea turtle (*Chelonia mydas*), leatherback sea turtle (*Dermochelys coriacea*), hawksbill sea turtle (*Eretmochelys imbricata*), and Kemp's ridley sea turtle (*Lepidochelys kempii*). No critical habitat for these sea turtle species has been designated in or near the Action Areas.

The purpose of the proposed action is to ensure consistency with the installations' military mission and to support "no net loss" in military mission capability for the installation lands, while providing for the conservation and rehabilitation and the sustainable multipurpose use of natural resources on the installations. The nesting sea turtle management plan at NASO-DNA and VAARNG-CP is a component of the separate INRMPs for these two contiguous properties. NASO-DNA and VAARNG-CP are not jointly operated; however, a partnership exists between the two installations in regards to sea turtle management. In accordance with DOD policy on natural resources conservation programs, the INRMP must work to guarantee DOD's continued access to its land, air, and water resources for realistic military training and testing and to sustain the long-term ecological integrity of natural resources and the ecosystem services they provide (DODI 4715.03). The INRMP must also ensure the natural resources conservation program and military operations are integrated and consistent with Navy policy on stewardship and all legal requirements concerning natural resources.

1.2 OBJECTIVES

This BA provides the information necessary for compliance with Section 7 of the ESA. Section 7 assures that, through consultation (or conferencing for proposed species) with the appropriate federal agency, federal actions do not jeopardize the continued existence of any threatened, endangered, or proposed species or result in the destruction or adverse modification of critical habitat. The objective of this BA is to determine how the turtle management actions may affect threatened and endangered (T&E) species and ensure that management decisions and actions associated with the implementation of the proposed actions do not place any T&E species in jeopardy of extinction.

1.3 CONSULTATION HISTORY

1.3.1 Naval Air Station Oceana - Dam Neck Annex

Early coordination and pre-consultation with the USFWS was conducted during meetings and phone conversations. The following is a list of relevant consultations and meetings between NASO-DNA and the USFWS, Gloucester, Virginia Field Office specifically for sea turtle management:

1. USFWS and NASO-DNA. Biological Opinion issued on the effects of a proposed beach replenishment project at NASO-DNA on loggerhead turtles (*Carretta carreta*). 8 October 2003
2. USFWS Back Bay National Wildlife Refuge (BBNWR) and NASO-DNA. Relocation of Sea Turtle Nests from Naval Air Station (NAS) Oceana, Dam Neck Annex to Back Bay National Wildlife Refuge. Agreement between BBNWR and NASO-DDNA that the Navy was responsible for conducting crawl and nest patrols on NASO-DNA beaches and the BBNWR was responsible for biological data collection, nest confirmation, and nest relocation. 29 May 2008.
3. USFWS, BBNWR, NASO-DNA. Biological Opinion issued on the updated Back Bay National Wildlife Refuge Sea Turtle Management Program (2011) and updated to include NASO DNA. 25 May 2012.
4. Meeting between USFWS and Naval Facilities Engineering Command (NAVFAC) Mid-Atlantic Region (MIDLANT). The USFWS notified NAVFAC MIDLANT at this time of the changes to sea turtle management strategy in the state of Virginia. 17 October 2014.
5. USFWS, NOAA, and NASO-DNA. Review of the NASO-DNA INRMP that includes Standard Operating Procedures (SOP) for sea turtle management. USFWS reviewed and signed 1 January 2015; NOAA reviewed and signed 29 May 2015; INRMP signed into official compliance by the Navy on 9 June 2015.
6. USFWS and NASO-DNA. Coordination of INRMP updates at the INRMP Annual Partners meeting, 8 October 2015.

1.3.2 *Virginia Army National Guard - Camp Pendleton*

No consultations exist between VAARNG-CP and the USFWS regarding sea turtle management. In the event that crawls or nests are discovered on VAARNG-CP, the installation Natural Resource Manager (NRM) would notify the USFWS, Virginia Department of Game and Inland Fisheries (VDGIF), and the Virginia Aquarium Stranding Team (VAST) as appropriate. The NRM will consult with these agencies to determine the appropriate actions and who will be responsible for nest management if the nest is left *in situ*. Nest management activities would be done in accordance with the 2015 Virginia Sea Turtle Nesting Handbook (Virginia Bureau of Wildlife Resources 2015).

2.0 DESCRIPTION OF THE ACTION AREA AND PROPOSED ACTION

2.1 ACTION AREA

The Action Area includes the beach and dune areas of two military bases in the tidewater area of southeastern Virginia in the southeastern portion of the City of Virginia Beach: NASO-DNA and VAARNG-CP (Figure 1).

2.1.1 *Naval Air Station Oceana - Dam Neck Annex*

NASO-DNA is an approximately 769-hectare (ha) (1,900-acre [ac]) installation in southern Virginia Beach, Virginia. The Action Area at NASO-DNA includes approximately 6.4 kilometers (km) (4.0 continuous miles [mi]) of intertidal beach and primary and secondary coastal dune habitat along the Atlantic Ocean. (DON 2015) (Figures 2 and 3). The beaches and dunes on NASO-DNA encompass about 77 ha (164 ac) of dune protection area consisting of undeveloped primary and secondary dunes and natural communities. The Action Area at NASO-DNA is bounded by VAARNG-CP in the north and the community of Sandbridge, Virginia, to the south.

2.1.2 *Virginia Army National Guard - Camp Pendleton*

VAARNG-CP is adjacent to the northern boundary of NASO-DNA in southern Virginia Beach. The VAARNG-CP portion of the Action Area is situated along the Atlantic Ocean and has approximately 0.37 km (0.23 mi) of intertidal beach and primary and secondary coastal dune habitat that is continuous with NASO-DNA beaches (VAARNG 2004) (Figure 4). The VAARNG-CP beach is bounded to the north by the Croatan residential neighborhood and a public beach and to the south by NASO-DNA. Through a cooperative venture with the City of Virginia Beach, approximately 300 m (1000 ft) of the northern portion of the VAARNG-CP beach is opened to the public as a surf beach (Croatan - Pendleton Surf Beach) when the VAARNG-CP firing range is not being actively used.

2.2 PROPOSED ACTION

2.2.1 *Naval Air Station Oceana - Dam Neck Annex*

The proposed actions for sea turtle patrols and nest and stranding management are defined in the Standard Operating Procedures (SOPs) for Sea Turtles (Appendix A) included in the NASO-DNA INRMP (Department of the Navy [DON] 2015a). The SOPs for sea turtle patrols, stranding notifications and actions, and nest management at NASO-DNA include:

- conducting patrols within the Action Area to locate stranded sea turtles, turtle crawls, and turtle nests;
- reporting and coordinating actions for stranded sea turtles with VAST;
- protecting and monitoring *in situ* sea turtle nests within the Action Area until all hatchlings have emerged;
- relocating nests when operational uses of the beach within the Action Area or its location on the beach (e.g., below the high tide line, within public use areas) would result in the disturbance or destruction of a nest; and
- reviewing projects proposed in the INRMP or by the installation or tenant of the installation for their potential to affect sea turtles.

2.2.1.1 Sea Turtle Patrols

The procedure for sea turtle patrols has been created to identify any stranded sea turtles, sea turtle crawls, and sea turtle nests within the Action Area. The patrollers would have training sessions on the patrol procedures as well as crawl recognition training and all-terrain vehicle (ATV) training. From 15 May to 31 August, the base's natural resources staff and other authorized individuals would patrol the beaches starting 30 minutes before sunrise. If the morning is dark, headlights would be covered in red filters before use on the beach. Patrollers would first check along the water's edge and then survey the middle beach. Patrolling above the high-tide line is not advised because this habitat may contain piping plover nests. If a stranded turtle, turtle crawl, or turtle nest is sighted, patrollers would follow the procedures outlined in the following sections. If unauthorized vehicles, artificial light, or any other activity that could negatively impact sea turtle activity on the beach is found, patrollers would contact base security, the installation's conservation law enforcement officer (or "Game Warden"), and the installation's NRM. Patrollers would document information from the patrol in a Sea Turtle Patrol Log.

2.2.1.2 Sea Turtle Stranding

During patrols, sea turtles may be found stranded on the beach either dead or alive. The in-house reporting procedures, which includes contacting the NRM and the VAST, will be initiated for any turtles found on the beach. If appropriate, the NRM would contact the NAVFAC MIDLANT EV22 Subject Matter Expert and the National Oceanic and Atmospheric Administration (NOAA) Point of Contact. If the turtle is in the surf, patrollers would drag it up the beach so that it does not wash away before the VAST arrives at the site. Patrollers would provide the day, time, base, location, information on whether the turtle was dragged out of the surf, their own name, and contact information to the VAST and the NRM. The patrollers would also help the VAST with base access, data collection, and removal of the turtle.

If the patrollers locate a living stranded adult or hatchling turtle, the NRM and the VAST are notified immediately. If patrollers find a hatchling, they would contact the NRM and the VAST, relay the location at which the hatchling was found, and then place the hatchling in a cooler with moist sand until they receive further instructions. If the patrollers find an injured or uninjured adult turtle, they would contact the VAST and the NRM, relay the location at which the adult turtle was found, and then continue to search the beach. When they finish patrolling, they would return with supplies to protect the turtle. In order to protect a stranded turtle that is injured, patrollers would keep the nose and eyes of the turtle moist and its body shaded and then await further instruction from the VAST. Patrollers would aid the VAST with base access, data collection, and moving the turtle. After helping VAST remove either dead or living stranded turtles and completing patrols, the patrollers would complete and turn in patrol logs and stranding data sheets.

2.2.1.3 Crawl Procedures

A crawl can be identified by the impressions left in the sand by a sea turtle's flipper when the turtle is exiting or entering the ocean. A nest area is identified by the body cavity a turtle creates as it digs a hole, deposits and buries its eggs, and turns away from the dunes to reenter the ocean. The nest usually contains both a mound and a flattened area.

When a patroller comes across a nesting or crawling turtle, they would extinguish their ATV headlights and park a safe distance away. Patrollers would take care not to startle the turtle and keep a safe distance away until the turtle has returned to the sea. Any turtle crawls or nests would be reported to the BBNWR, the NRM, range control if found on training beaches, security, VDGIF sea turtle program manager, Command Duty Officer, Public Affairs Officer, Installation Environmental Program Director, and Public Works Officer. The patrollers and NRM will coordinate with all agencies to document the occurrence and determine the appropriate actions.

After the turtle crawl has been reported, the crawl would be marked with wire flags and the surrounding area would be blocked off. The date, time, weather, crawl measurements, and any information that can be deduced about the time of emergence and return to the ocean would be recorded. The global

positioning system (GPS) location would be documented, and pictures would be taken. Flashes should not be used for nighttime photography. A permitted biologist or other approved and permitted individual (i.e., Navy, state, USFWS, or Virginia Aquarium representative) will then determine if a false crawl, false nest, or nest is present. If a nest is discovered, nest procedures would be followed. Otherwise, the patroller would complete the rest of his/her patrol.

2.2.1.4 Nest Management

The procedures discussed below are general descriptions of the management actions that would occur at NASO-DNA for sea turtle management. Specific procedures are found in the *Standard Operating Procedures for Sea Turtles, Naval Air Station Oceana – Dam Neck Annex* (Appendix A). Only individuals having the appropriate Regulatory Issued Permit (e.g., Navy, state, USFWS, VAST) are legally authorized to perform nest management procedures on NASO-DNA.

Nest Procedures

In order to locate a nest, a permitted biologist will examine any disturbed areas, such as mounds or depressions, found along flipper tracks. If a flipper impression can be found, the area opposite the impression is the probable nest location. If no impression is found, the biologist will check for flattened circular areas along and at the end of the turtle tracks indicating the probable nest location. The biologist will examine potential nests closely for front flipper impressions to determine how a turtle was positioned when it laid its eggs. A properly trained and permitted person would excavate to locate the nest by hand so that the eggs are less likely to be damaged. Eggs would be found a few inches below a soft layer of sand.

If a nest is found, the responding permit holder and base NRM must determine whether the nest should be relocated considering the following factors: how high the nest is located on the beach (the nest location relative to the high tide line), the width of the beach, whether the area is at a high risk of erosion, and whether the nest is located on a sloughing escarpment where it could be buried. The social environment of the beach, such as the amount of public use of the beach and whether the beach is in a military training area, would also be taken into account. Lastly, upcoming weather conditions (e.g., hurricanes) would be considered. If a nest is not relocated, it would be protected using the procedures described in the next section. If a nest is relocated, it would be moved to the closest available safe location via strict protocols. In either case, data sheets and photographs documenting the actions taken to relocate the turtle nest would be completed and placed in a turtle nest binder.

In Situ Nest Protection and Monitoring

If a nest is left *in situ*, it would be surrounded by a wire predator-proof enclosure, flagging, reflectors, and informational signage to inform the public about the protection program. Predator-proof enclosures are 36 in. wide, 36 in. length, 24 in. high cages constructed from 2 in. by 4 in. mesh fencing, each side also has a 6 in. flange (Figure 5). Enclosures are centered exactly over the egg chamber and the flanges are anchored with stakes and covered with sand. Appendix D contains detailed procedures for the construction and placement of predator enclosures. The nest would be checked every morning and afternoon for unauthorized disturbances or disturbances from predators. The person checking would also determine if the turtles have started hatching. In locations where nest sitting is approved, 10 days before the turtles are expected to hatch, nest sitting would begin every night from 8 P.M. to 5 A.M. Nest sitting would only be authorized in the approved (green) zones (Figure 6). Nest sitters would notify the Navy and BBNWR if the turtles begin to hatch, record the emergence time, prepare their path into the surf, count the number of hatchlings, and protect them from predators; however, nest sitters would not assist hatchlings in making the journey to the ocean. *In situ* nests located in training areas will be allowed to hatch “naturally” without nest sitters. After 2 to 3 weeks, when all the turtles have hatched, the nest would be excavated to collect data. Dead hatchlings and infertile eggs would be frozen in the BBNWR biology freezer. Data sheets would be completed and placed in a turtle nest binder.

Figure 5. Example of a predator-proof sea turtle egg chamber enclosure

Nest Relocation

Relocating a nest involves two steps: removing the nest from one location and forming a new nest in another location. Both steps require great care and attention to improve the chances for hatchling survival.

Before removing eggs, responders would measure the depth from the beach surface to the top of the eggs. Using sand from the original nest, the bottom of a cooler would be lined with 2 inches (in.) of sand with a 1-in. border of sand placed between cooler sides. As a responder removes eggs from the nest, they would keep them shaded under an umbrella and be careful not to rotate them. The responders would record the order of the eggs being placed into the cooler and the number of eggs in each layer. Eggs will be packed in a manner so that they are not touching with 2 in. of sand from the nest placed between each layer. The distance from the beach surface to the bottom of the nest and the nest temperature would then be measured and recorded. Extra sand from the bottom of the nest would be placed on top of the eggs in the cooler and also collected in a separate container used to surround the reburied eggs at the relocation site. Responders would then rake over tracks and fill the cavity from the nest excavation. During transportation, responders would avoid jolting or shifting the eggs, keep the eggs out of direct sunlight, and maintain them at a moderate temperature.

Nests would be moved to the nearest oceanfront nursery site or approved adjacent area (Figure 6). If none, the nest would be moved to a nursery site at BBNWR. At the new site, responders would dig a hole with the same dimensions as the original nest. The bottom and sides of the hole would be filled with sand from the original nest. The same person who removed the eggs would transfer them to the new nest without rotating them. The eggs will be placed in the reverse order from the original nest because the first egg placed in the cooler will be the last egg taken out. Responders would record if and how any eggs break during the relocation.

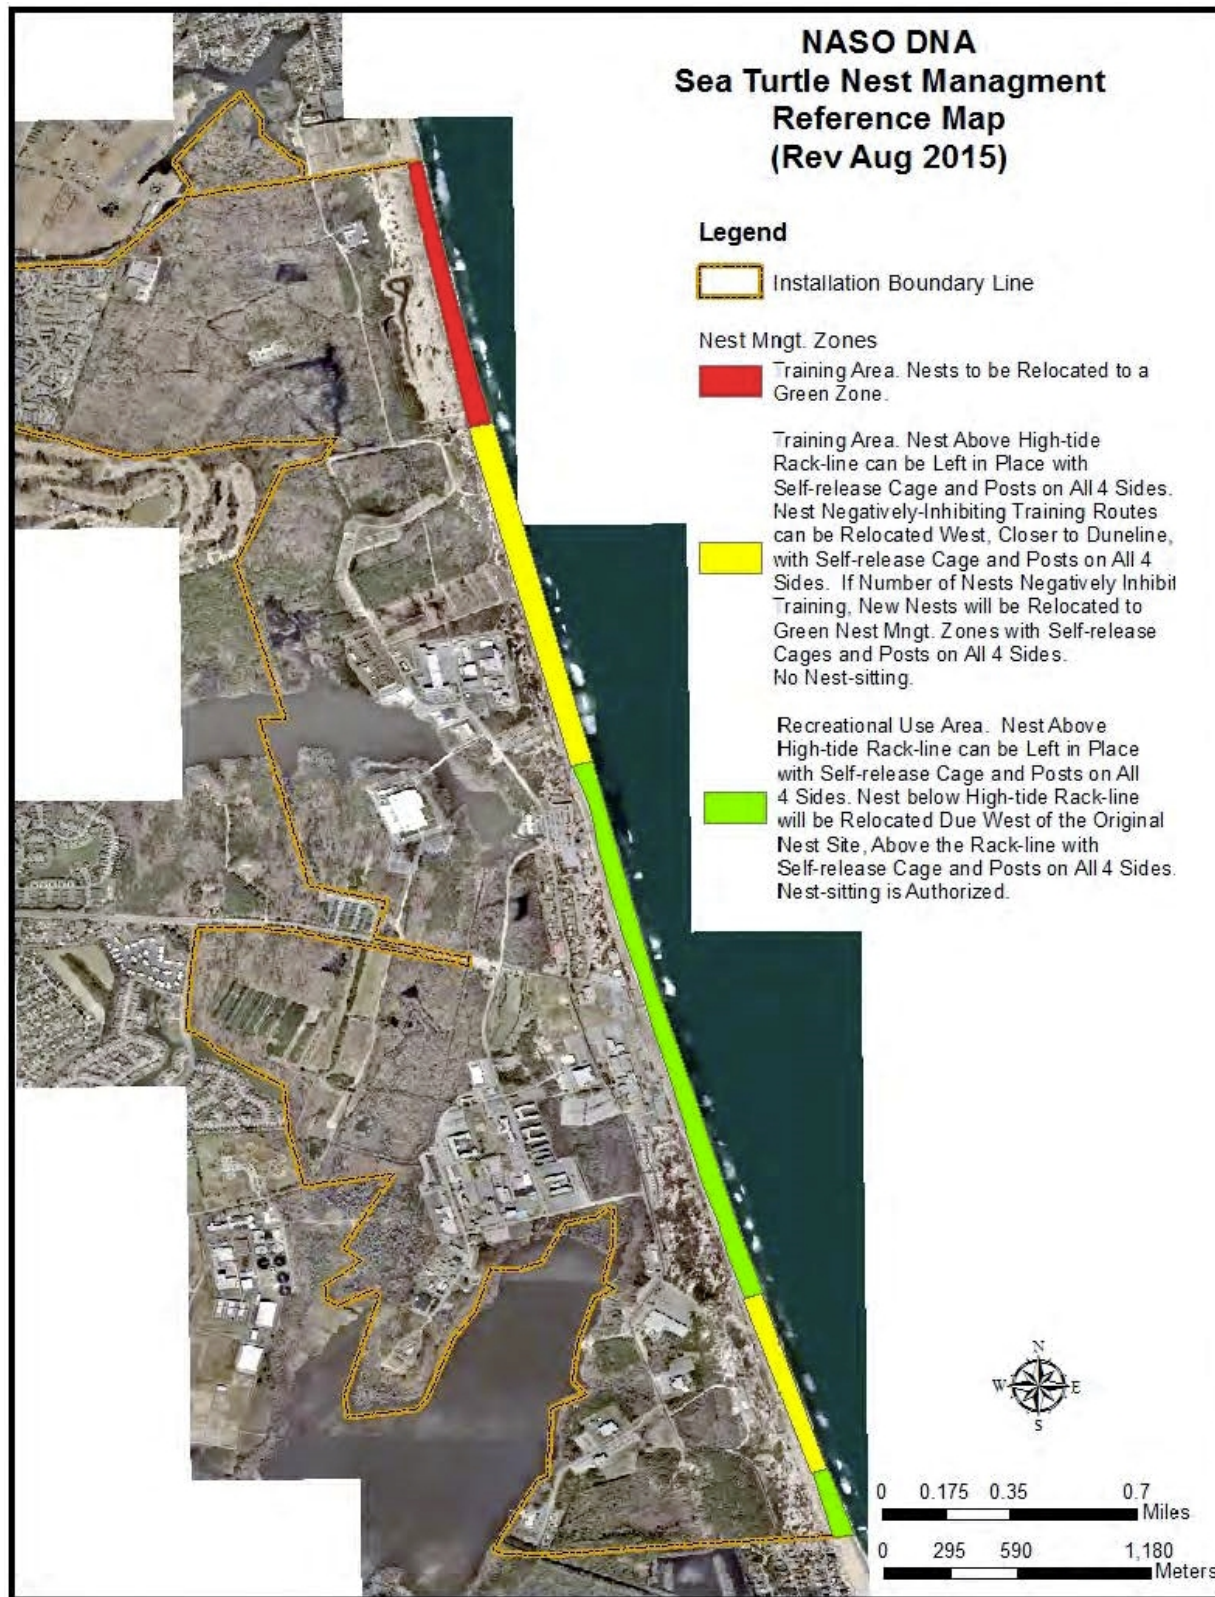

Figure 6. Naval Air Station Oceana – Dam Neck Annex Sea Turtle Nest Management Map

After the new nest has been built, a predator enclosure cage would be placed over the nest using the procedures described above and outlined in Appendix D. This cage will allow hatchlings to escape without human help. The nest number would be placed on top of the cage. If the nest is not located on a nursery site, information about the nest will be posted 1-2 feet (ft) away from the predator exclusion cage on all four sides. If the nest is located within a nursery site, the entire site would be cordoned off and information posted for the site as a whole. Responders would rake all footprints from the beach to the dunes to avoid attracting attention to the nests. The data sheets about the nest relocation would be placed in a turtle nest binder along with photos of the relocation process. The nests would then be monitored following the same procedures given for nests left *in situ*.

2.2.2 Virginia Army National Guard - Camp Pendleton

2.2.2.1 Sea Turtle Patrols

The VAARNG-CP INRMP recognizes the need for monitoring for sea turtle activity on the beach (VAARNG 2004). Currently, VAARNG-CP has a verbal agreement with NASO-DNA to conduct beach patrols and lighting surveys. NASO-DNA beach patrols survey the VAARNG-CP beach to the leased property boundary and use binoculars to survey the remaining beach.

In the event that a crawl, stranded sea turtle, or potential nest is located, the patrol will contact the NASO-DNA NRM, who in turn contacts the VAARNG-CP NRM. Notification is passed up to the VAARNG-CP command staff. The VAARNG NRM ensures that the USFWS, VDGIF, and the VAST are notified as appropriate.

2.2.2.2 Nest Management

In the event a nest is located, the VAARNG-CP NRM will consult with USFWS, VDGIF, and the VAST to determine the appropriate actions, if the nest will be left *in situ* or relocated on VAARNG-CP, and who will be responsible for relocation if necessary. Nest management activities would be conducted in accordance with the 2015 Virginia Sea Turtle Nesting Handbook (Virginia Bureau of Wildlife Resources 2015).

In Situ Nest Protection and Monitoring

Nests left *in situ* will be marked with stakes, flagging, and signs that identify the site as a sea turtle nest. Stakes should be placed at each corner of the nest (36 – 40 in. from nest center) and encircled with flagging to preclude them from being run over or disturbed. A predator enclosure (see Figure 5) will be placed on the nest as described in Appendix D. Nests will be monitored daily near the hatch window in order to determine their success. At the end of the hatching window, when all anticipated hatching is expected to be completed, the nest will be excavated by permitted persons to quantify the success of the nest.

Nest Relocation

Nest relocation is considered as a last resort in instances where the nest is located below the mean high tide line. In areas with heavy foot or vehicular traffic the nests would typically be marked for avoidance. For human activities, a nest should only be moved for unusual, but lawfully conducted activities that pose a serious threat. In these instances, VAARNG-CP NRM will consult with the VDGIF and USFWS to discuss potential mitigation measures that may include relocation. If the nest is to be relocated, permitted individuals will accomplish the relocation of the nest in accordance with the procedures outlined in the 2015 Virginia Sea Turtle Nesting Handbook. Nests may be relocated to the closest adjacent suitable beach and approved for relocation on VAARNG-CP, Croatan Beach, or NASO-DNA. Prior to relocating any nest within the NASO-DNA Green Zone (see Figure 5), coordination and approval must be obtained through the DNA-NASO NRM. Appendix K in the NASO-DNA Standard Operating Procedures for Sea Turtles (Appendix A) lists the areas approved for nest relocation.

All attempts should be made to relocate the nest within 6 hours after eggs are laid to reduce the potential for movement-induced mortality. Care will be taken to ensure eggs are not rotated during handling and movement. Nests are excavated by hand without the use of digging tools. During nest excavation and handling, the eggs should remain shaded. Once located, eggs are placed in a rigid container(s) with 2-3 in. of moist sand from the nest in the bottom. Once all the eggs have been collected they should be covered with 2-3 in. of moist sand from the nest.

Nests should be relocated to areas above the high tide line that are relatively free of vegetation in order to preclude roots encroaching into nest chambers. At the new site, responders would dig a hole with a rounded bottom with the same dimensions and depth as the original nest. The eggs will be placed in the new nest while maintaining each egg's original orientation. The new nest should be covered with moist sand excavated from the new egg chamber to the upper level of the surrounding moist sand. Dry sand should not be allowed to enter the nest chamber. Once the nest chamber is buried, the sand is gently patted by hand and covered with dry sand. Nests are marked as discussed in above for *in situ* nest protection and monitoring.

2.2.3 Back Bay National Wildlife Refuge

BBNWR is a potential nest relocation site for sea turtle nests found in the Action Areas. BBNWR is located south of Sandbridge, Virginia, and is about 12.9 km (8 mi) south of NASO-DNA (see Figure 1). The refuge contains over 3,683 ha (9,100 ac) of barrier islands that border the Atlantic Ocean and Back Bay with beach, dune, woodland, marsh, and farm field habitats (USFWS 2011).

2.3 BEST MANAGEMENT PRACTICES AND MITIGATION MEASURES

The proposed action provides a nesting sea turtle management strategy for the Action Area that includes measures that would be implemented by the Navy to avoid, reduce, and offset potential adverse direct effects to the leatherback, loggerhead, Kemp's ridley, green, and hawksbill sea turtles. The proposed action includes regular patrols of the Action Area to identify the presence of sea turtles on land, to document the occurrence, and to protect and monitor turtles and turtle nests and coordinate with the BBNWR biologists or other permitted biologists to move nests if deemed necessary. The Navy would implement these best management practices and protective measures during all compliance activities. In addition to active beach patrols, the Navy has conducted lighting surveys in areas near the beach and dunes to identify the light sources reaching the beach (Appendix B). Common recommendations for mitigating effects of light visible on the beach include:

- removing or turning off unnecessary light sources causing light pollution on the beach;
- minimizing lighting from outdoor sources by realigning, modifying, repositioning, or shielding fixtures to keep light from reaching the beach;
- minimizing lighting from indoor sources by turning off unnecessary lights, repositioning fixtures, and using tinting or opaque curtains or blinds;
- replacing certain fixtures with others that produce less light pollution;
- reducing the wattage or changing the type of bulb to a type that is less disruptive to sea turtles; and
- creating natural light screens to block light from reaching the beach.

This page intentionally left blank

3.0 LISTED SPECIES AND CRITICAL HABITAT IN THE ACTION AREA

3.1 SPECIES CONSIDERED

The following ESA-listed sea turtle species are known to occur in Virginia’s waters, including the Chesapeake Bay: the leatherback, loggerhead, Kemp’s ridley, green, and hawksbill turtles (Table 1). Based on known distributions and habitat associations, these five species may occur in the Action Area and may be affected by the proposed actions. The loggerhead and green turtles are listed as threatened under the ESA, while the leatherback, hawksbill, and Kemp’s ridley turtles are designated as endangered. Critical habitat has not been designated in Virginia for any species of sea turtle; therefore, no critical habitat is located in or near the Action Area.

Table 1. Federally listed sea turtle species

	Scientific Name	ESA Status
Order Testudines, Suborder Cryptodira		
Family Cheloniidae		
Loggerhead turtle ¹	<i>Caretta caretta</i>	Threatened ¹
Green turtle ²	<i>Chelonia mydas</i>	Threatened ²
Hawksbill turtle	<i>Eretmochelys imbricata</i>	Endangered
Kemp’s ridley turtle	<i>Lepidochelys kempii</i>	Endangered
Family Dermochelyidae		
Leatherback turtle	<i>Dermochelys coriacea</i>	Endangered

¹Four distinct population segments (DPSs) of the loggerhead turtle are designated as threatened, while five DPSs are designated as endangered under the ESA. The Northwest Atlantic Ocean DPS, which occurs in Virginia, is designated as threatened.

²Although this species as a whole is listed as threatened, the Florida and Mexican Pacific nesting stocks of the green turtle are listed as endangered. The nesting area for green turtles encountered at sea cannot be determined; therefore, a conservative management approach is to assume that green turtles in the offshore environment may be from the endangered populations.

Sea turtles occur throughout Virginia’s coastal waters, in the entire main-stem Chesapeake Bay, and 8 to 16 km (5 to 10 mi) up the tributaries. Some individual turtles may travel beyond the 5-mi tributary limit into fresher waters (Lutcavage and Musick 1985; Byles 1988; Musick 1988; Mansfield 2006; DON 2009). Sea turtles occur in Virginia waters from May through October or early November although a few strandings have been recorded as early as April and as late as December (Byles 1988; Keinath 1993; Coles 1999). Sea turtle occurrence in the Chesapeake Bay is based on seasonal temperature fluctuations (Byles 1988; Musick 1988; Keinath 1993; Coles 1999; Mansfield 2006). Based on aerial and stranding data, turtles migrate into the Bay during the spring when sea surface temperatures (SSTs) warm to approximately 18 degrees Celsius (°C; 64 degrees Fahrenheit [°F]) (Lutcavage and Musick 1985; Keinath et al. 1987; Byles 1988; Musick 1988; Keinath 1993; Coles 1999). Southern migrations to winter habitats south of Cape Hatteras, North Carolina, are typically triggered when SSTs drop below 20°C (68°F) in the fall (Mansfield et al. 2009).

Most of the sea turtles found in the Chesapeake Bay are either immature loggerhead or Kemp’s ridley turtles utilizing the bay as a seasonal foraging ground (Lutcavage and Musick 1985; Musick 1988). The Bay is considered an important developmental habitat for juvenile loggerhead turtles (Musick and Limpus 1997; Mansfield et al. 2009). Leatherback and green turtles occur less frequently, and hawksbill turtles are considered extremely rare in Virginia waters. Only three hawksbills have been recorded in the Bay (Keinath et al. 1991; Virginia Institute of Marine Science [VIMS] 2008; Barco and Swingle 2014).

Sea turtle nesting habitat in Virginia includes beaches along the Atlantic side of the Eastern Shore and beaches south of the Chesapeake Bay mouth from the Virginia Beach oceanfront to the Virginia/North Carolina border. Nesting occurs during the spring and summer months, particularly June, July, and August (VDGIF data). The loggerhead is the only turtle species that nests regularly on Virginia beaches; approximately 5 to 15 nests are reported annually along the ocean-facing beaches (Barco and Swingle

2014). Based on VDGIF nesting data between 2000 and 2014, the dates of the earliest and latest reported loggerhead nest in Virginia were 15 May 2006 and 2 September 2013, respectively. Only two Kemp's ridley nests have been recorded in Virginia: one on Dam Neck Naval Base in June 2012 and one on False Cape State Park near the North Carolina/Virginia border in July 2014 (R. Boettcher, VDGIF, unpublished data). One green turtle nest was recorded in southeastern Virginia in August 2005 (R. Boettcher, VDGIF, unpublished data).

Although the majority of stranding records in Virginia are of juvenile loggerhead and Kemp's ridley turtles, leatherback, green, and hawksbill turtles have also stranded here based on the comprehensive database of sea turtle strandings dating to 1991 (Barco and Swingle 2014). Between 2001 and 2013, over 2,800 loggerhead turtles and 500 Kemp's ridley turtles stranded in Virginia (Barco and Swingle 2014). Most of the turtles stranded on Virginia beaches were moderately to severely decomposed individuals; therefore, evidence of illness or human-induced mortality is difficult to impossible to determine. Potential causes of death include propeller strikes, ingested fishing gear, cold stunning, and net entanglement (Mansfield et al. 2002b; Mansfield et al. 2002a; Mansfield 2006). Virginia's turtles have also been known to interact with some fishing gear and commercial vessels such as pound nets, pot gears, larger mesh gillnets, longline and trawling gear, and hopper dredges (Mansfield 2006). In Virginia, sea turtles are susceptible to mortality from the Virginia pound net fishery (Lutcavage and Musick 1985). Offshore the mid-Atlantic coast, loggerheads and leatherbacks are caught as bycatch in the pelagic longline fishery (Garrison and Richards 2004). Loggerheads, in particular, appear to be affected by vessels in Virginia waters and rarely survive the trauma from propeller strikes (Barco and Swingle 2014).

Both natural and anthropogenic stressors continue to affect sea turtles and their nesting and marine habitats throughout their ranges. General human-related threats common to sea turtles in estuarine and marine environments include fisheries by-catch, illegal harvesting, vessel strikes, construction and development, marine debris ingestion or entanglement, noise pollution, power generation activities (e.g., intake into the cooling systems of power plants), oil and gas activities, military activities, and environmental contamination (Lutcavage et al. 1997; National Marine Fisheries Service [NMFS] and USFWS 2008; Hamann et al. 2010; NMFS et al. 2011; NMFS and USFWS 2013a; NMFS and USFWS 2013b).

Anthropogenic stressors to sea turtles in the terrestrial nesting environment include beach cleaning, beach nourishment, shoreline armoring, coastal development and construction, recreational beach equipment, debris, beach driving, artificial lighting, nest relocation, and military activities (Witherington and Martin 2003; Turtle Expert Working Group [TEWG] 2007; NMFS and USFWS 2008; Hamann et al. 2010; NMFS et al. 2011; NMFS and USFWS 2013a; NMFS and USFWS 2013b). Many of these stressors may directly impact hatchling or adult turtles on beaches or indirectly affect them via the loss or degradation of nesting habitat. In addition, the illegal harvesting of sea turtles and their eggs continues to threaten sea turtle species, particularly in regions outside the US (Dow et al. 2007). Of all the anthropogenic activities that cause sea turtle mortality, shrimp trawling is thought to be the most detrimental to the recovery of sea turtle populations (NMFS and USFWS 2008).

Climate change is also considered an anthropogenic factor that affects sea turtle habitat and biology through increased temperatures, sea level rise, ocean acidification, changes in precipitation and circulation patterns, and increased cyclonic activity (Poloczanska et al. 2009; Hamann et al. 2010; NMFS and USFWS 2013b). Sea level rise threatens all nesting beaches, particularly since portions of the southeast US and Caribbean are known to be highly vulnerable to sea level rise (Melillo et al. 2014). Sea turtles are particularly vulnerable to climate change because of their sensitivity to environmental temperatures (Hawkes et al. 2009; Fossette et al. 2012). Rising water temperatures will lead to shifts in the range and abundance of algae, plankton, and fish which could affect sea turtle prey distribution and abundance (NMFS and USFWS 2013b). In addition, rising air temperatures may skew natural sex ratios of embryos (NMFS and USFWS 2013b). Although some sea turtles species and populations, such as northwest Atlantic leatherbacks, may be more resilient to climate change than others, non-climate-related threats, including fisheries bycatch and coastal development, will influence the resilience of sea turtles to climate change (Fuentes et al. 2013).

Natural stressors that directly affect sea turtles include disease and predation, particularly predation on eggs and hatchlings (Eckert et al. 2012). Tsunamis can cause encroachment and erosion of nesting habitat and increased debris in the marine habitat (NMFS and USFWS 2013b).

3.2 SPECIES ACCOUNTS

3.2.1 *Leatherback Sea Turtle (Dermochelys coriacea)*

3.2.1.1 Description

The leatherback turtle is the largest living sea turtle; adults average between 200 and 700 kilograms (kg) (440 and 1,543 pounds [lb]) with carapace lengths ranging from 119 to 176 centimeters (cm) (47 to 69 in.) (NMFS and USFWS 1992). The leatherback's carapace lacks the outer layer of horny scutes possessed by all other sea turtle species and is composed of a flexible layer of dermal bones underlying tough, oily connective tissue and smooth skin. The body is barrel-shaped and tapered to the rear with seven longitudinal dorsal ridges, and it is almost completely black with variable spotting. All adults possess a unique pink spot on the dorsal surface of their head. Scientists use this marking to identify specific individuals (McDonald and Dutton 1996).

3.2.1.2 Status

Leatherback turtles are listed as endangered under the ESA (35 Federal Register [FR] 6069). Critical habitat for Atlantic leatherbacks is designated in the Caribbean at Sandy Point, St. Croix, US Virgin Islands (USVI) (NMFS 1979). The most recent abundance estimates for adult leatherbacks range from 34,000 to 94,000 individuals in North Atlantic waters (NMFS and USFWS 2007; TEWG 2007). Based on the latest assessment of the Atlantic leatherback population, leatherbacks are significantly increasing at most nesting beaches in the Atlantic (TEWG 2007). In Florida, where leatherback nesting was once considered rare, the number of nests has been increasing by approximately 10 percent per year since 1979 (Stewart et al. 2011). Determining the definitive causes of these observed increases is difficult although researchers suggest that improved nest monitoring and protection and variable ocean climates may be contributing to these population changes (Stewart et al. 2011). Populations nesting in Culebra, Puerto Rico, and St. Croix, USVI, also appear to be increasing due to heightened protection and monitoring of the nesting habitat over the past 20 years (Hillis-Starr et al. 1998; Fleming 2001; Thompson et al. 2001; Dutton et al. 2005).

3.2.1.3 Threats

Both natural and anthropogenic stressors continue to affect leatherbacks and their nesting and marine habitats (NMFS and USFWS 2013b). Natural stressors that directly affect leatherbacks include disease and predation, particularly predation on eggs and hatchlings (Eckert et al. 2012). Tsunamis can cause encroachment and erosion of nesting habitat and increased debris in the marine habitat (NMFS and USFWS 2013b). Anthropogenic threats to leatherback turtles are generally related to fisheries interactions, marine debris ingestion, poaching, and boat strikes (TEWG 2007). Climate change is also considered an anthropogenic factor that will affect leatherback habitat and biology (NMFS and USFWS 2013b). Rising water temperatures will lead to shifts in the range and abundance of algae, plankton, and fish which could affect leatherback prey distribution and abundance (NMFS and USFWS 2013b). In addition, rising air temperatures may skew natural sex ratios of embryos, and sea level rise may lead to loss of nesting habitat (NMFS and USFWS 2013b). According to Fuentes et al. (2013), the northwest Atlantic leatherbacks may be the most resilient sea turtle management unit to climate change. They may be able to mitigate the effects of long-term climate change due to their migratory nature, relatively weak fidelity to nesting beaches, individual nesting preferences, and spatial nesting strategies (e.g., tendency to place some nests in the cooler wash-over zone of beaches) (Dutton et al. 1999; Kamel and Mrosovsky 2004); however, non-climate-related threats, such as fisheries bycatch and coastal development, will influence the resilience of sea turtles to climate change (Fuentes et al. 2013).

3.2.1.4 Habitat Associations

Late juvenile and adult leatherback turtles are known to range from mid-ocean to continental shelf and nearshore waters (Schroeder and Thompson 1987; Shoop and Kenney 1992; Grant and Ferrell 1993; Dodge et al. 2014). Juvenile and adult foraging habitats include both coastal feeding areas in temperate waters and offshore feeding areas in tropical waters (Eckert and Abreu-Grobois 2001). Adults may also feed in cold waters at high latitudes (James et al. 2006a). Leatherbacks foraging in the western North Atlantic prefer waters from 16 to 18°C (60.8 to 64.4°F) (Thompson et al. 2001; James et al. 2006b); their lower thermal limit is in SSTs between 10 and 12°C (50.0 and 53.6°F) (Witt et al. 2007). Leatherback nesting beach habitat is generally associated with deep water, strong waves, and oceanic currents, but shallow waters near mud banks are also utilized for nesting (TEWG 2007).

3.2.1.5 Distribution

A regular, seasonal occurrence of leatherbacks is known along the northeast US Atlantic coast. In the late winter and early spring, leatherbacks are distributed primarily in tropical latitudes (Stewart and Johnson 2006); survey data show that around this time of year, individuals begin to move north along the North American Atlantic coast. By February and March, the majority of leatherbacks found in US Atlantic waters are distributed off northeast Florida. This movement continues through April and May when leatherbacks begin to occur in large numbers off the coasts of Georgia and the Carolinas (NMFS 1995; NMFS 2000). Leatherbacks become more numerous off the mid-Atlantic and southern New England coasts in late spring and early summer, and by late summer and early fall, they may be found in the waters off eastern Canada (Cetacean and Turtle Assessment Program [CETAP] 1982; Shoop and Kenney 1992; Thompson et al. 2001; Dodge et al. 2014).

Leatherback nesting occurs on isolated mainland beaches in tropical and temperate oceans (NMFS and USFWS 1992) and to a lesser degree on some islands, such as the Greater and Lesser Antilles. In the US, the densest nesting is on the Atlantic coast of Florida (Stewart and Johnson 2006). Sporadic nesting occurs in Georgia, South Carolina, and North Carolina (Rabon et al. 2003).

Leatherbacks occur off Virginia year round; peak occurrence is during the spring and summer (April through September) based on sighting and stranding data (Barco and Swingle 2014) (Figure 5). Between 2001 and 2013, a total of 92 leatherbacks stranded in Virginia (Barco and Swingle 2014). Leatherbacks typically strand on Virginia's ocean-facing beaches but also occasionally in the mid-Chesapeake Bay (Figure 7). Leatherback strandings in the Chesapeake Bay area peak during the months of May and July (Barnard et al. 1989), which suggests peak abundances during this time of year although few leatherbacks are observed in the Chesapeake Bay during any given year. Live leatherbacks have been reported in the upper Chesapeake Bay and in the Severn River in the Mobjack Bay system (Musick 1988; Keinath and Musick 1990).

Occurrence in the Naval Air Station Oceana - Dam Neck Annex Action Area

Leatherback turtles have been recorded in or near the NASO-DNA Action Area throughout the year except during winter (Figure 7). Several strandings have been recorded in the Action Area during spring, summer, and fall (Figure 7). Sightings have been recorded just off the coast of southeast Virginia during summer and fall (Figure 7). Although no leatherback nests or false crawls have been documented in the Action Area, leatherback nesting may occur along the beaches of this installation. Sporadic nesting of leatherbacks occurs just south of Virginia along the coast of North Carolina (Rabon et al. 2003), and other turtle species have nested on NASO-DNA beaches (see loggerhead and Kemp's ridley turtle sections).

Occurrence in the Virginia Army National Guard - Camp Pendleton Action Area

Leatherback turtles have been recorded in or near the VAARNG-CP Action Area throughout the year except during winter (Figure 7). Strandings have been recorded in or near the Action Area during spring, summer, and fall (Figure 7). Sightings have been recorded just off the coast of southeast Virginia during

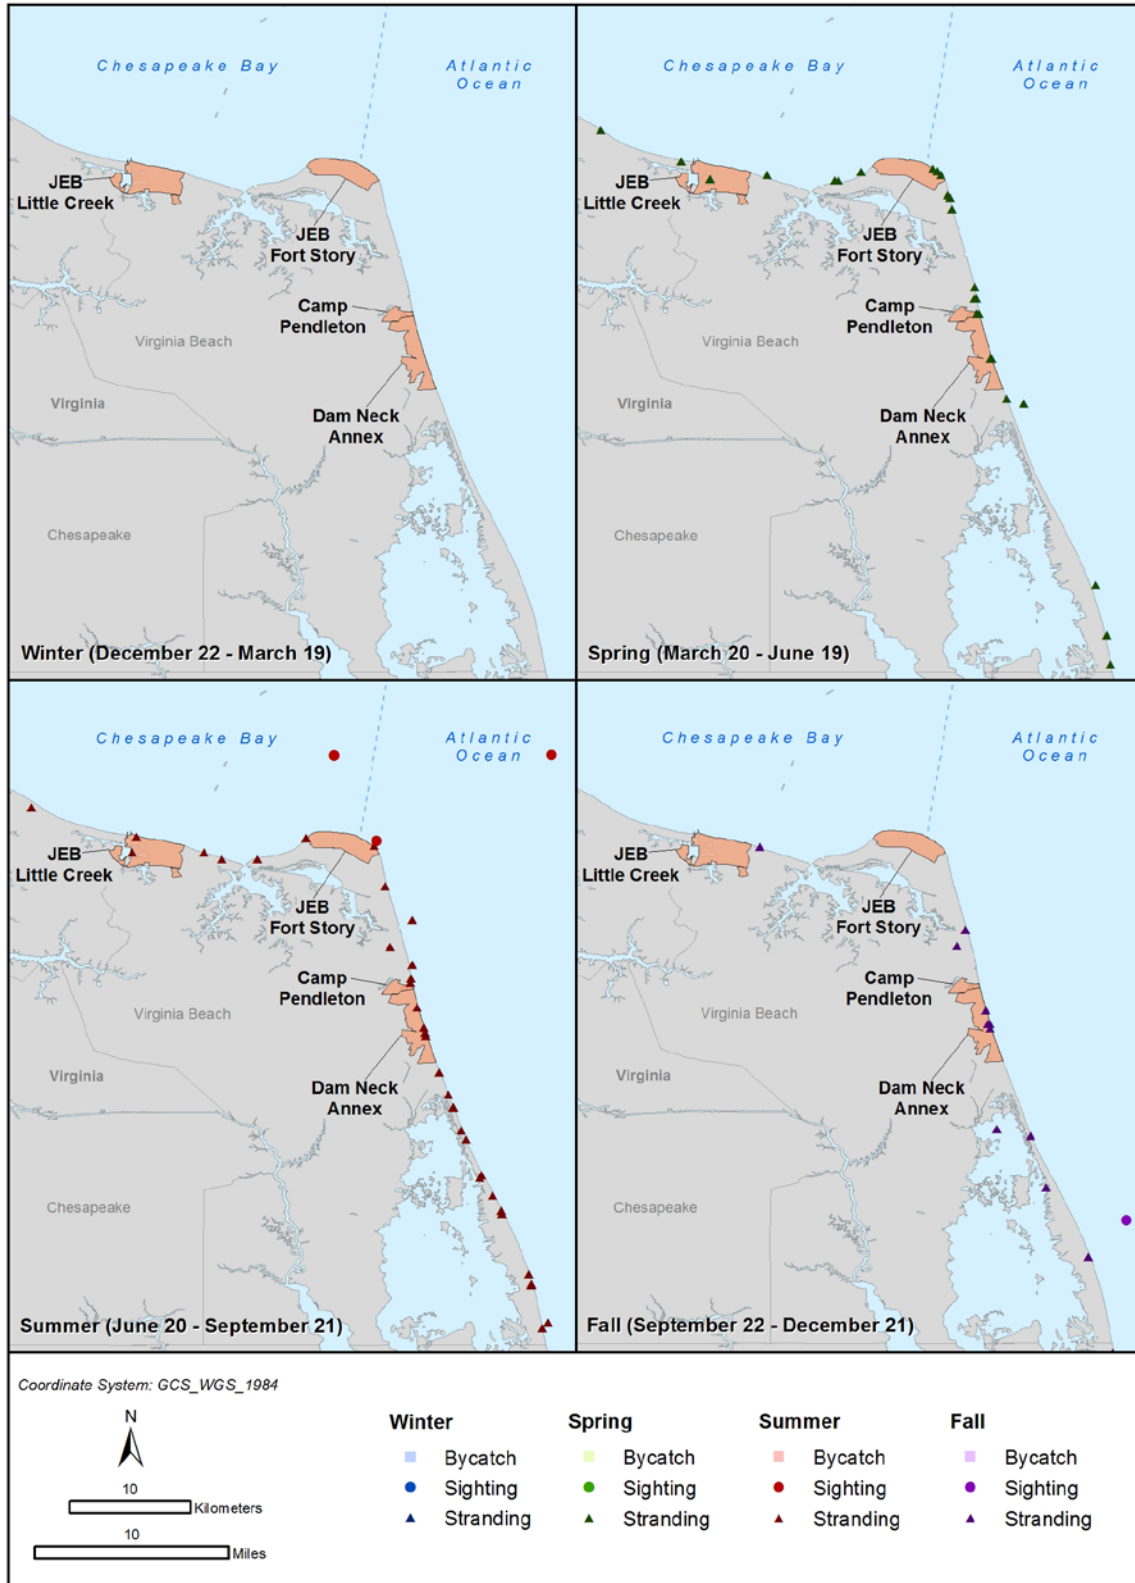

Figure 7. Sighting, stranding, and incidental fisheries bycatch records of the leatherback turtle near the Action Area. Source data: Refer to Appendix C.

summer and fall (Figure 7). No leatherback nests or false crawls have been documented in the Action Area or elsewhere in Virginia although sporadic nesting does occur just south of Virginia along the coast of North Carolina (Rabon et al. 2003). This installation may not provide suitable habitat for nesting turtles due to the crowds of people who frequent the beaches during the nesting season and the fact that the beachfront is relatively short (366 m [1,200 ft]) and immediately adjacent to heavily populated Virginia Beach. Suitable nest sites have been suggested to be within the sheltered foredune area (VAARNG 2004); however, the dune vegetation's roots in this area could inundate nests and damage, entrap, and suffocate the eggs and hatchlings (M. Wright, NASO-DNA NRM, personal communication).

3.2.2 *Loggerhead Sea Turtle (Caretta caretta)*

3.2.2.1 Description

The loggerhead turtle is a large, hard-shelled sea turtle named for its proportionately large head and powerful jaws. Adult loggerheads weigh between 100 and 150 kg (220 and 331 lb) with average carapace lengths ranging from 90 to 95 cm (35 to 37 in) (Dodd 1988; NMFS and USFWS 1991b). Adult loggerheads usually possess a reddish-brown carapace with scutes that are bordered with yellow (NMFS and USFWS 1991b).

3.2.2.2 Status

The loggerhead sea turtle comprises nine distinct population segments (DPSs). The Northwest Atlantic Ocean DPS occurs in Virginia and is designated as threatened under the ESA (USFWS and NMFS 2011). Five recovery units (nesting subpopulations) are identified in the Northwest Atlantic: (1) Northern - Florida/Georgia border to southern Virginia; (2) Peninsular Florida – Florida/Georgia border south through Pinellas County, Florida (excluding Key West); (3) Dry Tortugas – islands west of Key West, Florida; (4) Northern Gulf of Mexico - Franklin County, Florida west through Texas; and (5) Greater Caribbean – Mexico through French Guiana, The Bahamas, and Lesser/Greater Antilles (NMFS and USFWS 2008; USFWS and NMFS 2011). The Peninsular Florida population represents approximately 87 percent of all nesting effort in the Northwest Atlantic Ocean DPS (Ehrhart et al. 2003). Although overall nesting has been significantly declining in the Northwest Atlantic Ocean DPS, nesting data from 2008 through 2010 show a more positive trend (USFWS and NMFS 2011).

The loggerhead is the most abundant sea turtle occurring in US waters. The most recent preliminary abundance estimate of loggerheads in US continental shelf waters was approximately 588,000 individuals and was generated from aerial survey data recorded between Cape Canaveral, Florida, and the mouth of the Gulf of St. Lawrence in 2010 (Northeast Fisheries Science Center [NEFSC] and Southeast Fisheries Science Center [SEFSC] 2011). The most recent estimate of adult females in the Northwest Atlantic Ocean DPS is 30,000 (USFWS and NMFS 2011). Regional estimates of loggerhead abundance in coastal ocean waters of Virginia were recently generated from aerial surveys conducted in 2011 and 2012 from the Convention on the International Regulations for Preventing Collision at Sea line to approximately 50 km (31 mi) offshore between Ship Shoal Inlet and the Virginia/North Carolina border (Barco and Swingle 2014). Loggerhead abundance was 26,674 in the spring (May/June); 19,004 in the summer (July/August); and 5,443 in the fall (September/October); however, this fall estimate was based on only one survey and is likely an underestimation (Barco and Swingle 2014).

Critical habitat for the Northwest Atlantic Ocean DPS was recently designated for terrestrial and marine areas in the Atlantic and Gulf of Mexico (NMFS 2014; USFWS 2014). The USFWS-designated terrestrial critical habitat areas include 88 nesting beaches in North Carolina, South Carolina, Georgia, Florida, Alabama, and Mississippi (USFWS 2014). These critical habitat areas include a total of 38 units encompassing 393.7 km (244.6 mi) of the Atlantic Ocean shoreline designated for the Northern Recovery Unit: 8 units in North Carolina, 22 in South Carolina, and 8 in Georgia. These units comprise approximately 86 percent of the documented nesting within the recovery unit (USFWS 2014). Although the extreme northern nesting range of this DPS is important to the conservation and recovery of loggerhead turtles, no areas in Virginia and Delaware were designated as critical habitat due to the low number of nests in these states (USFWS 2014).

The NOAA-designated marine critical habitat for the Northwest Atlantic Ocean DPS includes some nearshore reproductive areas directly offshore of nesting beaches from North Carolina through Mississippi, winter habitat in North Carolina, breeding habitat in Florida, constricted migratory corridors in North Carolina and Florida, and *Sargassum* habitat in the western Gulf of Mexico and in US waters within the Gulf Stream in the Atlantic Ocean (NMFS 2014). The nearshore reproductive areas are adjacent to high-density nesting beaches used by hatchlings egressing to the open-water environment and by nesting females transiting between the beach and open water during the nesting season and extend 1.6 km (1.0 mi) offshore. The winter habitat in North Carolina includes warm-water habitats between Cape Hatteras and Cape Fear near the western edge of the Gulf Stream (between the 20- and 100-m isobaths) that are used by a high concentration of juveniles and adults during the winter months. The constricted migratory corridor off North Carolina consists of waters between 36°N and Cape Lookout from the edge of the Outer Banks barrier islands to the 200-m isobath. This corridor overlaps with the northern portion of winter habitat off North Carolina and serves as a migratory pathway for loggerheads transiting to neritic foraging areas in the north and back to winter, foraging, and/or nesting areas in the south. The majority of loggerheads pass through this migratory corridor in the spring (April to June) and fall (September to November), but loggerheads are also present in this area from April through November (NMFS 2014).

3.2.2.3 Threats

Loggerhead turtles face the same general natural and anthropogenic threats of other sea turtles as mentioned previously. The primary threats to the Northwest Atlantic population extend throughout the terrestrial and marine habitats and include bottom trawl, pelagic longline, demersal longline, and demersal large mesh gillnet fisheries; legal and illegal harvesting; vessel strikes; beach armoring; beach erosion; marine debris; oil pollution; light pollution; and predation by native and exotic species (NMFS and USFWS 2008).

3.2.2.4 Habitat Associations

Loggerheads occur worldwide in habitats ranging from coastal estuaries, bays, and lagoons to pelagic waters (Dodd 1988). Neonate loggerheads are oceanic and rarely occupy continental shelf waters. Neonates recently tagged in the western North Atlantic moved throughout the Gulf Stream and into the Sargasso Sea, probably to take advantage of *Sargassum* habitats which provide a thermal environment that supports growth (Mansfield et al. 2014). Older, larger juveniles are oceanic but also utilize neritic environments (Witzell 2002; McClellan and Read 2007; TEWG 2009). Late juveniles and adult loggerheads most often occur on the continental shelf and along the shelf break of the US Atlantic and Gulf coasts as well as in coastal estuaries and bays (CETAP 1982; Shoop and Kenney 1992). Subadult and adult loggerhead turtles tend to inhabit deeper offshore feeding areas along the western Atlantic coast from mid-Florida to New Jersey and most likely forage on benthic prey (Hopkins-Murphy et al. 2003; Roberts et al. 2005; Hawkes et al. 2007).

Typical loggerhead nesting beaches tend to be sandy, wide, open beaches backed by low dunes and fronted by a flat, sandy approach from the ocean (Miller et al. 2003). Loggerheads typically nest on beaches close to reef formations and adjacent to warm temperature currents (Dodd 1988; TEWG 2000). Nesting beaches often face the open ocean or are situated along narrow bays (NMFS and USFWS 1991b). Nest site selection tends to depend more on beach slope and width than temperature, moisture, or salinity (Wood and Bjorndal 2000).

3.2.2.5 Distribution

In the US North Atlantic, loggerhead turtles commonly occur in shelf waters as far north as the New York Bight (CETAP 1982; Shoop and Kenney 1992). Loggerhead distribution along the US Atlantic coast is strongly seasonal and is dictated primarily by SSTs. Loggerheads are associated with SSTs between 13 and 28°C (55.5 and 82.4°F) (Mrosovsky 1980); they tend to become lethargic in SSTs below 15°C (59°F) and may become incapacitated ("cold-stunned") at temperatures below 10°C (50°F) (Schwartz 1978; Mrosovsky 1980). Loggerheads occur north of Cape Hatteras primarily in late spring through early fall

(May and October) with a peak occurrence in June; however, sightings are recorded in mid-Atlantic and northeast waters throughout the year (CETAP 1982; Lutcavage and Musick 1985; Shoop and Kenney 1992; DON 2008a; DON 2008b). During the summer, loggerheads may be found regularly in shelf waters from Delaware Bay to Hudson Canyon, including Long Island Sound and Cape Cod Bay (Burke et al. 1991; Shoop and Kenney 1992; Prescott 2000; University of Delaware Sea Grant 2000). As SSTs decrease in the winter, most individuals move south of Cape Hatteras to overwinter (Epperly et al. 1995c; Mitchell et al. 2002; Hawkes et al. 2011). From November to April, loggerheads are primarily found off the coast of southern North Carolina in the South Atlantic Bight (Griffin et al. 2013); however, stranding and sighting data indicate that not all loggerheads leave mid-Atlantic and New England waters during the winter (Burke et al. 1991) (Figure 8).

Loggerhead nesting beaches are distributed throughout warm, temperate, and subtropical regions (between 40°N and 40°S) with some scattered nesting in the tropics (The SWOT Team 2007). Loggerheads are the only marine turtles that nest predominantly outside of the tropics (Ehrhart et al. 2003). Along the US east coast, loggerheads regularly nest from southeastern Florida to Virginia, and occasional nests have been recorded in Maryland, Delaware, and New Jersey (Graham 1973; Brandner 1983; Musick 1988; NMFS and USFWS 1991b; USFWS 2014). Adult loggerheads exhibit strong site fidelity to nesting beaches and typically return to their natal beaches or nearby areas to nest (Addison 1996; Comer 2002). Intra-seasonal nesting patterns for females vary; some females may nest only once a season while others may nest several times (Webster and Cook 2001). Although nesting has been recorded in May and September, most loggerhead nesting in Virginia occurs in June, July, and August (VDGIF data) (Figure 9). Between 2010 and 2015, annual loggerhead nests in Virginia ranged from 2 to 16 (VDGIF data; Navy data).

Occurrence in the Naval Air Station Oceana - Dam Neck Annex Action Area

Loggerhead turtles have been recorded in and near the NASO-DNA Action Area throughout the year (Figure 8). A total of 128 strandings have been recorded in the Action Area, particularly during spring, summer, and fall (Figure 8). Three loggerhead false crawls have been documented on NASO-DNA: 14 July 2002, 12 August 2002, and 26 June 2014 (Figure 9). A total of two loggerhead nests were recorded on NASO-DNA beaches in July 1992 and July 2002 (Figure 9). Both nests were relocated to a protected hatchery site within the BBNWR (VDGIF data; M. Wright, NASO-DNA-NRM, personal communication).

Occurrence in the Virginia Army National Guard - Camp Pendleton Action Area

Loggerhead turtles have been recorded in and near the VAARNG-CP Action Area throughout the year (Figure 8). Numerous strandings have been recorded along the southeast Virginia coastline; eight of these strandings were in the Action Area (Figure 8). A loggerhead nest was confirmed on Croatan - Pendleton Surf Beach in the VAARNG-CP Action Area in August 2015 (R. Boettcher, VDGIF, unpublished data) (Figure 9). Although this nest was relocated to prevent the highest seasonal tides from washing over and inundating the nest, it was washed out as a result of high surf during Hurricane Joaquin on 2 October 2015 (S. Rose, Virginia Aquarium and Marine Science Foundation, personal communication). Until 2015, no nests or false crawls had been recorded on VAARNG-CP beaches. This installation may not provide suitable habitat for nesting turtles due to the crowds of people who frequent the beaches during the nesting season and the fact that the beachfront is relatively short (366 m [1,200 ft]) and immediately adjacent to heavily populated Virginia Beach. Suitable nest sites have been suggested to be within the sheltered foredune area (VAARNG 2004); however, the dune vegetation's roots in this area would inundate nests and damage, entrap, and suffocate the eggs and hatchlings (M. Wright, NASO-DNA NRM, personal communication).

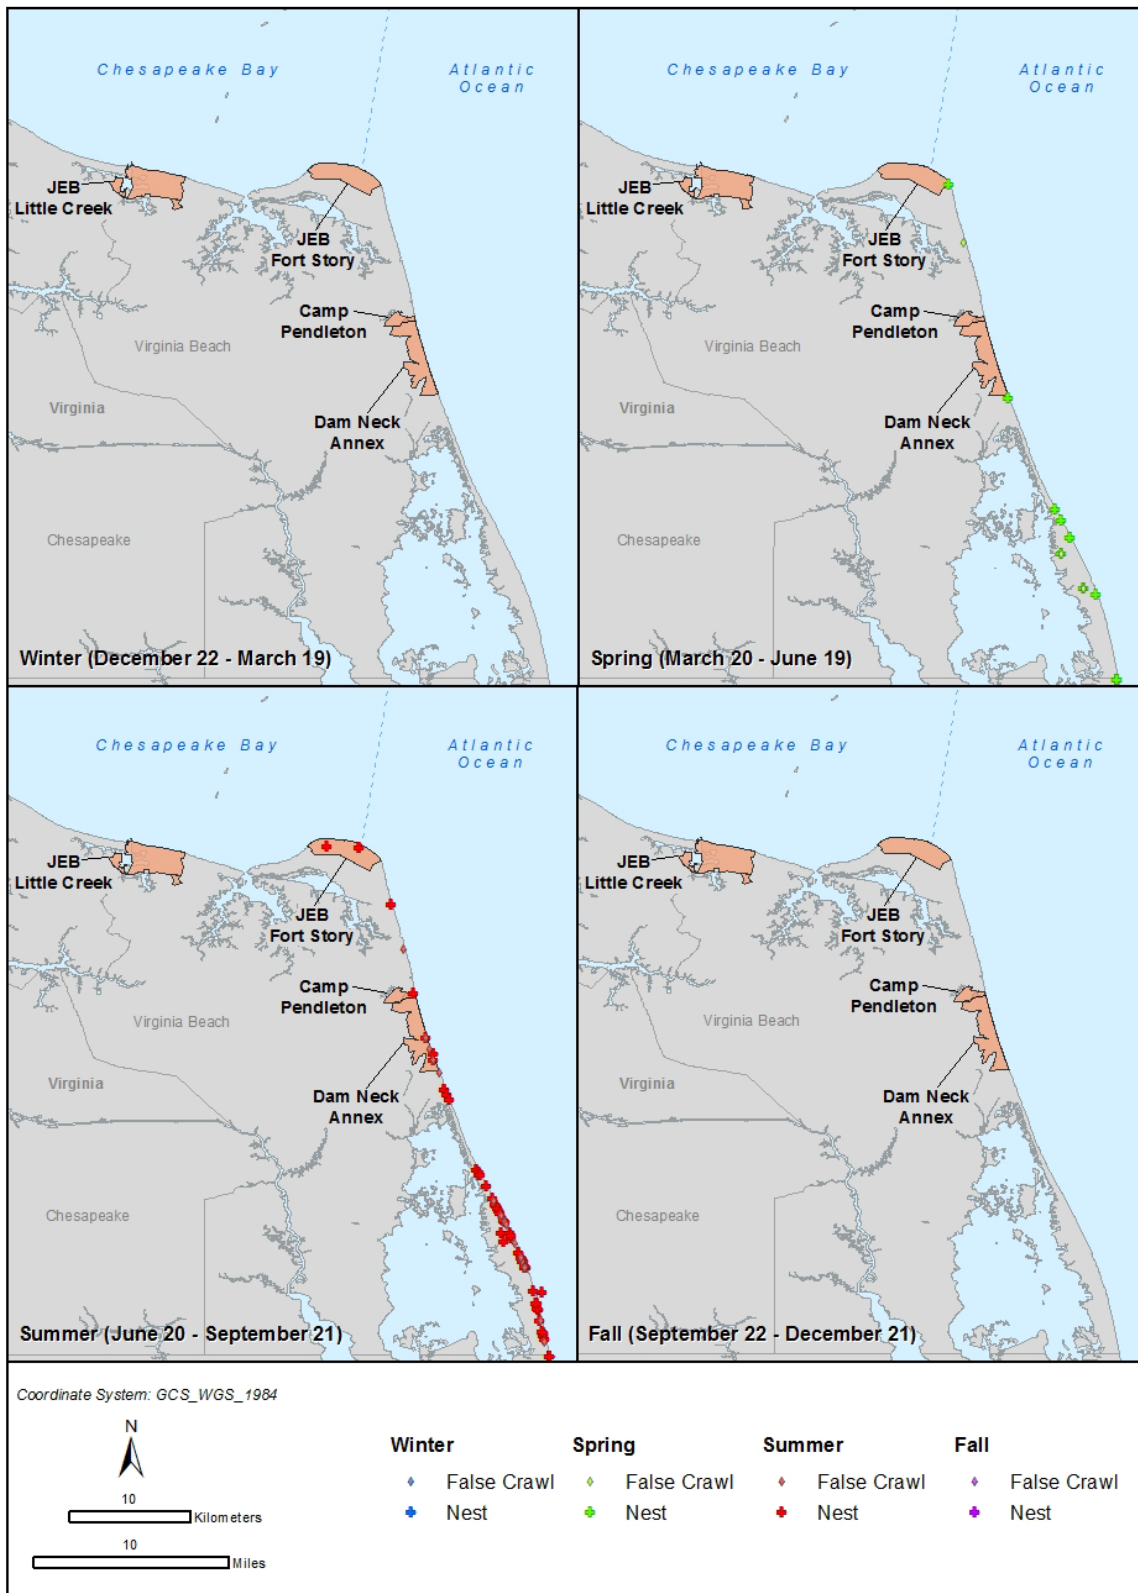

Figure 9. False crawl and nesting records of the loggerhead turtle near the Action Area. Source data: Refer to Appendix C.

3.2.3 *Green Sea Turtle (Chelonia mydas)*

3.2.3.1 Description

Named for the color of their fat, green turtles are the largest of the hard-shelled sea turtles. Adult green turtles commonly weigh over 100 kg (220 lb) and are greater than 100 cm (39 in.) in length (NMFS and USFWS 1991a). Hatchlings have distinct countershading: black on the dorsal surface and mostly cream white on the ventral surface (Witherington et al. 2006). Adult carapaces range in color from solid black to gray, yellow, green, and brown in starburst or irregular patterns; the plastron is a much lighter yellow to white (NMFS and USFWS 1991a). Green turtles in the Atlantic exhibit a slower growth rate than Pacific green turtles (Bjorndal et al. 2000).

3.2.3.2 Status

The green turtle is currently designated as threatened under the ESA with the Florida and Mexican Pacific coast nesting populations listed as endangered. The nesting area for green turtles encountered at sea cannot be determined; therefore, a current conservative management approach is to assume that green turtles in the offshore environment may be from the endangered populations. The NMFS and USFWS recently proposed to remove the current range-wide listing for the green turtle and list 11 DPSs under the ESA (NMFS and USFWS 2015). Based on this proposed rule, eight DPSs would be listed as threatened, and the remaining three DPSs would be designated as endangered. If this ruling is approved, the green turtles occurring in Virginia would be considered part of the threatened North Atlantic DPS (NMFS and USFWS 2015). Recent population estimates for green turtles in the western North Atlantic are not available. Over the past 5 years (2010-2014), the number of green turtle nests in Florida averaged 16,064 annually (Florida Fish & Wildlife Conservation Commission-Fish & Wildlife Research Institute 2015). The only designated critical habitat for this species is in Puerto Rico (NMFS 1998).

3.2.3.3 Threats

Threats to green turtles in the North Atlantic include destruction or modification of habitat; overutilization for commercial, recreational, scientific, or educational purposes; disease; predation; incidental bycatch in fishing gear; dredging; vessel strikes; climate change and natural disasters; contaminants; and marine debris (Hirama 2007; McClellan and Read 2009; NMFS and USFWS 2015). Green turtle nesting habitat is specifically threatened by coastal development, coastal armoring, beachfront lighting, erosion, sand extraction, and vehicle and pedestrian traffic on nesting beaches (Lutcavage et al. 1997; Witherington and Martin 2003; Witherington et al. 2006).

3.2.3.4 Habitat Associations

Post-hatchling and early-juvenile green turtles reside in convergence zones in the open ocean (Carr 1987; Witherington et al. 2012). Once green turtles reach a carapace length of 20 to 25 cm (8 to 10 in), they migrate to shallow, nearshore areas (<50 m [164 ft] in depth) where they spend the majority of their lives as late juveniles and adults. The optimal developmental habitats for late juveniles and foraging adults are warm, shallow waters (3 to 5 m [10 to 16 ft] in depth) with an abundance of subaquatic vegetation and also areas in close proximity to nearshore reefs or rocky areas (Holloway-Adkins and Provanca 2005; Witherington et al. 2006). Green turtles primarily nest on sandy oceanic beaches of mainland shorelines, barrier islands, volcanic islands, and atolls (Witherington et al. 2006). Nesting habitat at Tortuguero Beach, Costa Rica, the largest remaining green turtle rookery in the Atlantic, is associated with more heavily vegetated portions of the beach (Hirth and Samson 1987). In Florida, green turtles seem to prefer nesting on barrier-island beaches that are susceptible to high wave energy and have coarse sands, steep slopes, and prominent foredunes. These beaches also have minimal artificial lighting (Witherington et al. 2006).

3.2.3.5 Distribution

Along the US east coast, green turtles are found as far north as Massachusetts (NMFS and USFWS 1991a). Juvenile green turtles utilize estuarine waters as far north as Long Island Sound, Chesapeake Bay, and North Carolina sounds as summer developmental habitat (Epperly et al. 1995a; Epperly et al. 1995b; Musick and Limpus 1997). As adults, green turtles are restricted to more southern latitudes (Epperly et al. 1995b) and are only occasionally found north of Florida. During nonbreeding periods, adults and juvenile distributions may overlap in coastal feeding areas (Hirth 1997).

Green turtles nest on both island and continental beaches between 30°N and 30°S (Witherington et al. 2006). The major Atlantic nesting colonies are located at Ascension Island (in the South Atlantic Ocean), Aves Island (in the Caribbean Sea, west of Guadeloupe), and on the beaches of Costa Rica and Suriname (NMFS and USFWS 1991a). Although Florida is near the northern extent of the green turtle's Atlantic nesting range, it hosts a significant proportion of green turtle nesting (Witherington et al. 2006). Approximately 99 percent of the green turtle nesting in Florida occurs on the Atlantic coast with Brevard through Broward Counties hosting the greatest nesting activity (Meylan et al. 1995; Witherington et al. 2006). Scattered nesting have been recorded in Georgia and the Carolinas (Peterson et al. 1985; Schwartz 1989; NMFS and USFWS 1991a). Green turtle nesting in North Carolina has been documented at Onslow Beach, Caswell Beach, Bald Head Island, and near Cape Hatteras (Schwartz 1989). The first ever green turtle nest in Virginia was documented in 2005 at BBNWR (USFWS 2005; R. Boettcher, VDGIF, unpublished data).

Occurrence in the Naval Air Station Oceana - Dam Neck Annex Action Area

Green turtles have been recorded in Virginia throughout the year (Figure 10). Strandings have been recorded in the Action Area during summer and fall and just south of this region during winter (Figure 10). No nests or false crawls have been recorded on NASO-DNA beaches (Figure 11); however, one green turtle nest was recorded on Sandbridge Beach just south of this Action Area in August 2005 and was subsequently moved to BBNWR (VDGIF data) (Figure 11). Green turtles may nest on NASO-DNA beaches based on this previous nesting record in southeastern Virginia, scattered green turtle nesting in nearby North Carolina, and the nesting of other turtle species in this Action Area (Schwartz 1989).

Occurrence in the Virginia Army National Guard - Camp Pendleton Action Area

Green turtles have been recorded in Virginia throughout the year (Figure 10). Strandings have been recorded in or near the Action Area during summer and fall (Figure 10). No green turtle nests or false crawls have been recorded on VAARNG-CP beaches (Figure 11). This installation may not provide suitable habitat for nesting turtles due to the crowds of people who frequent the beaches during the nesting season and the fact that the beachfront is relatively short (366 m [1,200 ft]) and immediately adjacent to heavily populated Virginia Beach. Suitable nest sites have been suggested to be within the sheltered foredune area (VAARNG 2004); however, the dune vegetation's roots in this area would inundate nests and damage, entrap, and suffocate the eggs and hatchlings (M. Wright, NASO-DNA NRM, personal communication).

3.2.4 *Hawksbill Sea Turtle (*Eretmochelys imbricata*)*

3.2.4.1 Description

The hawksbill turtle is a small- to medium-sized sea turtle. Adults typically weigh around 80 kg (176 lb) with carapace lengths ranging from 65 to 90 cm (26 to 35 in) (Witzell 1983; NMFS and USFWS 1993). The carapace is often brown or amber with irregularly radiating streaks of yellow, orange, black, and reddish-brown. Hawksbills are distinguished from other sea turtles by their hawk-like beaks, posteriorly overlapping carapace scutes, and two pairs of claws on their flippers (NMFS and USFWS 1993).

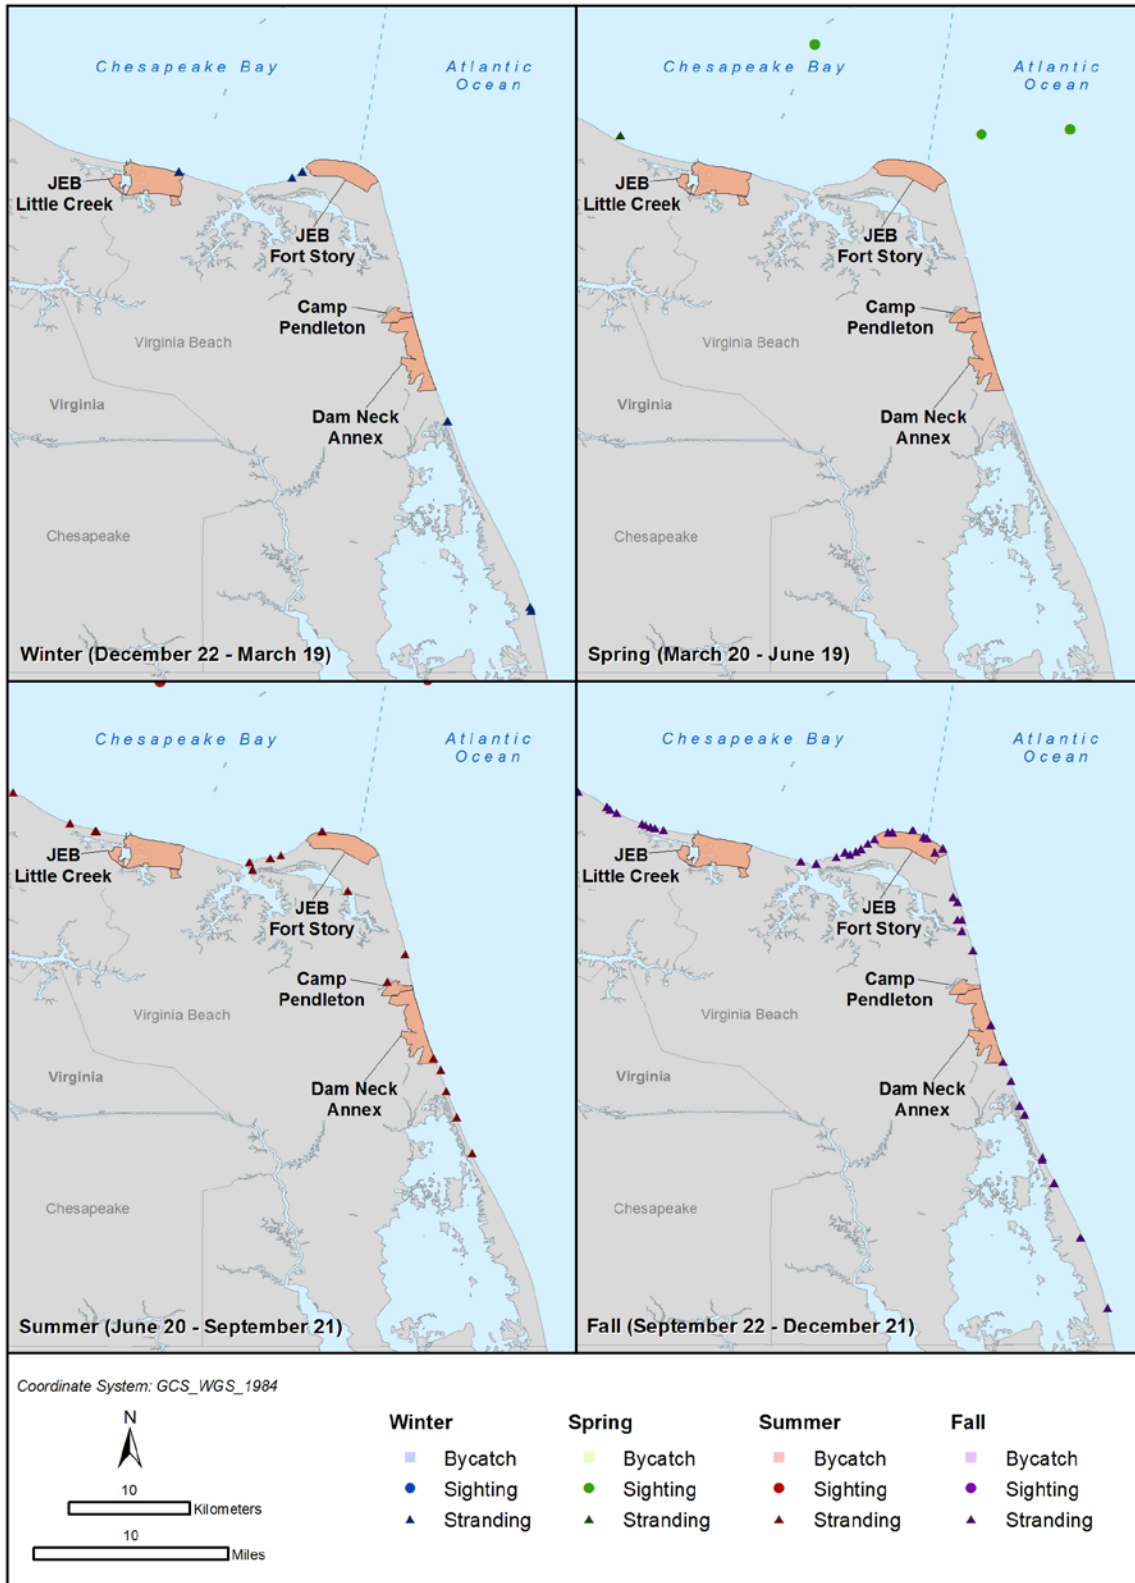

Figure 10. Sighting, stranding, and incidental fisheries bycatch records of the green turtle near the Action Area. Source data: Refer to Appendix C.

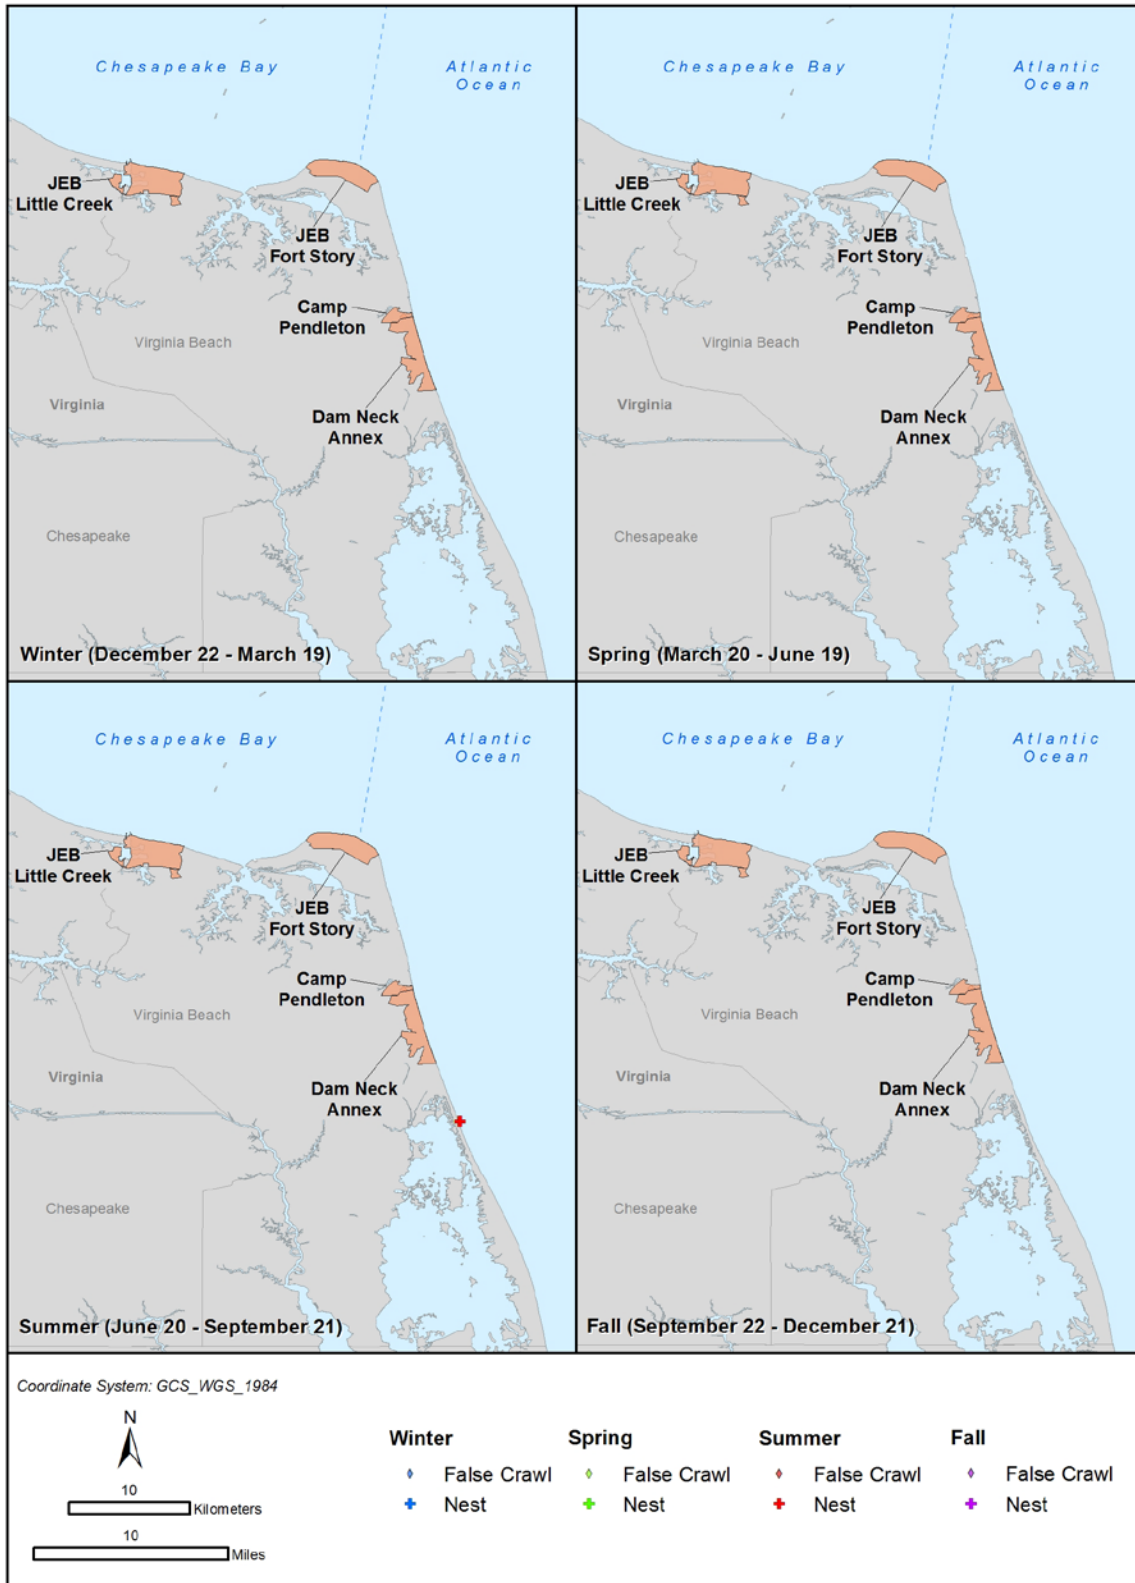

Figure 11. Nests and false crawls of the green turtle near the Action Area. Source data: Refer to Appendix C.

3.2.4.2 Status

The hawksbill turtle is designated as endangered under the ESA. This species is second only to the Kemp's ridley in terms of endangerment (NMFS and USFWS 1993; Bass 1994). The most recent estimate of hawksbill abundance in the Atlantic Ocean was 3,626 to 6,108 nesting females per season based on historical and recent estimates of nesting colonies from around the Atlantic Basin (NMFS and USFWS

2013a). Critical habitat for this species is designated on Mona and Monito Islands in Puerto Rico (NMFS 1998). One of the two most important nesting populations in the US is located on Mona Island and is increasing. The other important US nesting population is on Buck Island Reef National Monument in the USVI and is also increasing (NMFS and USFWS 2013a).

3.2.4.3 Threats

Impacts to hawksbill nesting and marine habitats are increasing and include construction, beach armoring and renourishment, artificial lighting, and sand extraction (NMFS and USFWS 2013a). Throughout the Western Atlantic and Caribbean, hawksbill nesting and foraging habitat has been lost to beach development, sand mining, lights, and pollution (Mortimer and Donnelly 2008). Because hawksbills prefer to nest under vegetation (Horrocks and Scott 1991; Kamel and Delcroix 2009), they are particularly impacted by beachfront development and clearing of dune vegetation (Mortimer and Donnelly 2008). In addition to impacts from coastal development, anthropogenic threats to hawksbill turtles include poaching, the tortoiseshell trade, degradation of coral reefs, ingestion and entanglement in marine debris, oil spills, other contaminants, and incidental capture in commercial and artisanal fisheries. Climate change and associated factors like sea level rise are emerging and are major threats to the conservation and recovery of hawksbills. Warmer sea temperatures are expected to impact coral reefs, which serve as important foraging habitats for hawksbill turtles. Sea level rise threatens nesting beaches (Mortimer and Donnelly 2008; NMFS and USFWS 2013a). Vessel strikes are also a threat to hawksbills, particularly in the southeast US (NMFS and USFWS 2013a).

3.2.4.4 Habitat Associations

As post-hatchlings and small juveniles, hawksbill turtles inhabit oceanic waters where they are sometimes associated with driftlines and floating patches of *Sargassum* (Parker 1995; Witherington et al. 2012). The developmental habitats for juvenile benthic-stage hawksbills are the same as the primary feeding grounds for adults; they include tropical, nearshore waters associated with coral reefs, hard bottoms, cliff-wall habitats with soft corals and invertebrates, or estuaries with mangroves (Musick and Limpus 1997; Diez et al. 2003). Coral reefs are optimal habitat for juveniles, subadults, and adults (NMFS and USFWS 1993; Diez et al. 2003). Late juveniles generally reside on shallow reefs less than 18 m (59 ft) deep; however, as they mature into adults, hawksbills move to deeper habitats and may forage to depths greater than 90 m (295 ft). Benthic-stage hawksbills are seldom found in waters beyond the continental or insular shelf unless they are transiting between distant foraging or nesting grounds (NMFS and USFWS 1993). Although hawksbills exhibit a wide tolerance for nesting substrate type, they prefer to nest under vegetation on beaches with low wave energy and steep slopes (Horrocks and Scott 1991; Kamel and Delcroix 2009).

3.2.4.5 Distribution

In the western Atlantic Ocean, this species is found throughout the Gulf of Mexico, the Greater and Lesser Antilles, and southern Florida, as well as along the mainland of Central America south to Brazil (NMFS and USFWS 1993). The hawksbill is rare north of Florida (Lee and Palmer 1981; Keinath et al. 1991; Parker 1995; Plotkin 1995; USFWS 2001). Small hawksbills have stranded as far north as Cape Cod, Massachusetts (NMFS 2006).

The largest nesting aggregation in the Caribbean occurs along the Yucatán Peninsula, Mexico (NMFS and USFWS 1993). Other small, yet important, nesting assemblages are found in Belize, Nicaragua,

Panama, Venezuela, Cuba, Antigua, and the Grenadines (NMFS and USFWS 1993). Within the continental US, hawksbill nesting is rare and is restricted to beaches in southern Florida and the Florida Keys (Dodd 1995). Nesting has been documented at Jupiter Island, Biscayne National Monument, and the Canaveral National Seashore on the eastern Florida coast (Lund 1985).

Hawksbill turtles are considered extralimital to the Chesapeake Bay area (DON 2009). The first verified account of a hawksbill turtle in the Bay occurred in November 1991, when a commercial fisherman caught a juvenile hawksbill at the mouth of the James River; the turtle was later released in Florida (Keinath et al. 1991). Since then, two additional hawksbill sea turtles have been reported in the Chesapeake Bay: one in December 2000 and one in November 2004 (VIMS 2008). These individuals were also juveniles and were both cold-stunned. Another hawksbill stranded along the coast of Virginia north of the mouth of the Chesapeake Bay (Barco and Swingle 2014) (Figure 12).

Occurrence in the Naval Air Station Oceana - Dam Neck Annex Action Area

Hawksbill turtles have stranded on ocean-facing beaches in southeastern Virginia (Figure 12); however, this species has not been documented in the Action Area. Hawksbill turtles typically nest in tropical areas and are not known to nest in Virginia; therefore, hawksbills are not expected to nest on NASO-DNA beaches.

Occurrence in the Virginia Army National Guard - Camp Pendleton Action Area

Hawksbill turtles have stranded on ocean-facing beaches in southeastern Virginia (Figure 12); however, this species has not been documented in the Action Area. Due to the rare occurrence of this species this far north (DON 2009) and the potential unsuitable habitat of VAARNG-CP beaches (VAARNG 2004), hawksbill turtles are not expected to nest in the VAARNG-CP Action Area.

3.2.5 Kemp's Ridley Sea Turtle (*Lepidochelys kempii*)

3.2.5.1 Description

The Kemp's ridley is the smallest sea turtle species, reaching approximately 60 to 70 cm (24 to 28 in.) straight carapace length and weighing around 45 kg (99 lb) (USFWS and NMFS 1992; Gulko and Eckert 2004). The carapace is round to somewhat heart-shaped and changes from the gray-black color of hatchlings to a pale olive-gray color of adults (Marquez-M. 1994).

3.2.5.2 Status

The Kemp's ridley turtle is designated as endangered under the ESA (35 FR 18319). Once considered the most endangered sea turtle species, the Kemp's ridley turtle has experienced a consistent increase in nesting numbers since the lowest recorded nest count of 702 nests in 1985 (Heppell et al. 2005). From 2005 through 2010, approximately 5,500 females were estimated to be nesting at all monitored beaches in the Gulf of Mexico. In 2011 and 2012, the preliminary estimates of nests observed at the primary nesting beaches in Mexico were 19,368 and 20,197, respectively (Gallaway et al. 2013). Based on a predicted annual growth rate of 12 to 16 percent, this population may grow to 10,000 nesting females in Mexico by 2015 (Heppell et al. 2005). No critical habitat has been designated for this species.

3.2.5.3 Threats

The decline of this species is primarily due to human activities, particularly the direct harvest of adults and eggs and incidental capture in commercial fishing operations. The resurgence in nesting numbers over the last few decades is largely due to efforts to protect females and hatchlings on nesting beaches and reductions in fisheries-related mortality resulting from the use of Turtle Excluder Devices in the US and Mexican trawl fisheries (Heppell et al. 2005). In the northeast US, cold-stunning events are common for this species; 1,084 immature Kemp's ridleys were cold-stunned between 1994 and 2006 (NMFS et al. 2011). Additional threats to Kemp's ridley turtles include construction, beach nourishment, predation,

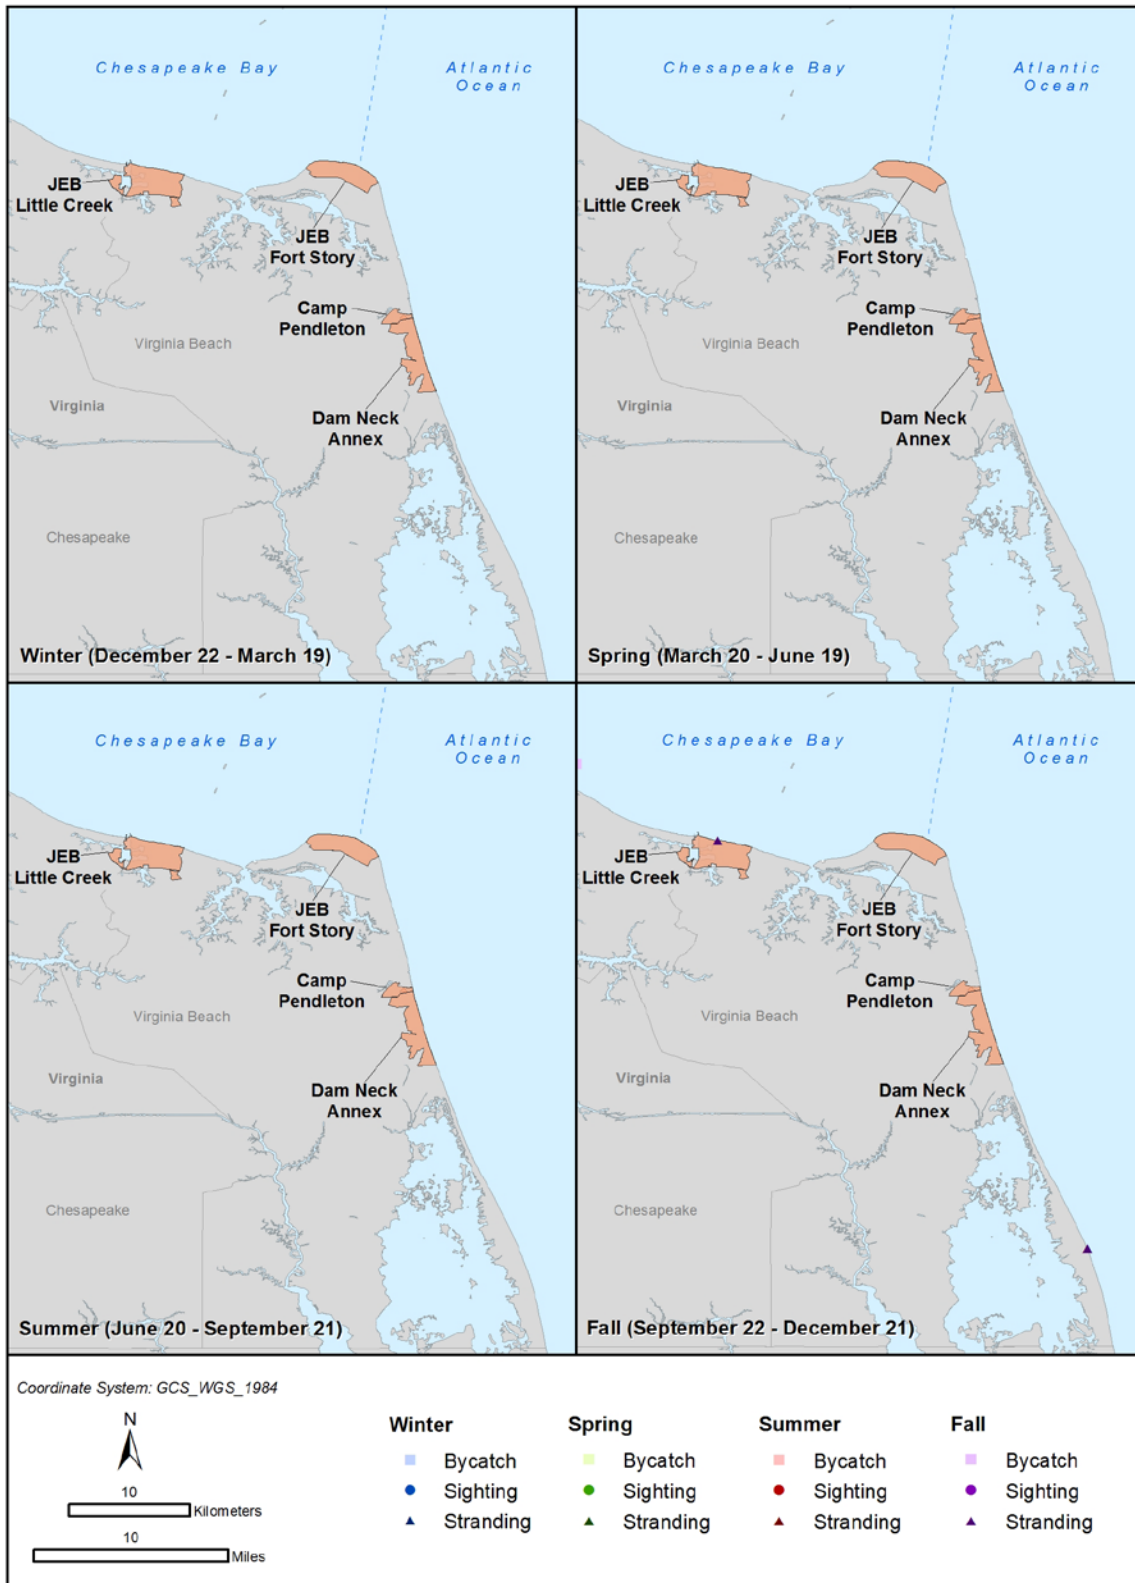

Figure 12. Sighting, stranding, and incidental fisheries bycatch records of the hawksbill turtle near the Action Area. Source data: Refer to Appendix C.

artificial lighting, diseases, climate change, vessel strikes, dredging, and pollution (NMFS et al. 2011; Gallaway et al. 2013). Because the Gulf of Mexico is an area of high-density offshore oil exploration and extraction, chronic, low-level spills and occasional massive spills, such as the Deepwater Horizon oil spill incident in 2010, may impact Kemp's ridley turtles at sea and on nesting beaches in the Gulf. Although short-term impacts were minimized via coordinated response efforts, the long-term effects of this 2010 disaster on Kemp's ridley turtle are not yet known (NMFS et al. 2011).

3.2.5.4 Habitat Associations

Kemp's ridley turtles inhabit open-ocean and *Sargassum* habitats of the North Atlantic Ocean as post-hatchlings and small juveniles (Manzella et al. 1991; Witherington et al. 2012). Large juveniles and adults move to benthic, nearshore feeding grounds along the US Atlantic and Gulf coasts (Morreale and Standora 2005). Habitats frequently utilized include warm-temperate to subtropical sounds, bays, estuaries, tidal passes, shipping channels, and beachfront waters where their preferred prey occurs (Lutcavage and Musick 1985; Landry and Costa 1999; Seney and Musick 2005). Their most suitable habitats are less than 10 m (33 ft) deep with SSTs between 22 and 32°C (72 and 90°F) (Coyne et al. 2000). Seagrass beds, mud bottom, and live bottom are important developmental habitats (Schmid and Barichivich 2006). Post-nesting Kemp's ridleys travel along coastal corridors generally shallower than 50 m (164 ft) (Morreale et al. 2007). Nesting habitat is typically sandy ocean beaches. The beach at Rancho Nuevo, Mexico, where a majority of nests are laid, is formed by low dunes and isolated on the land side by shallow coastal lagoons with several narrow cuts that open during the rainy season forming estuaries or temporary sand bars (Marquez-M. 1994). Kemp's ridleys typically nest just beyond the high-tide line in front of the first dune, on the windward slope, or on top of the dune (Marquez-M. 1994).

3.2.5.5 Distribution

The Kemp's ridley range is restricted to the North Atlantic Ocean (Marquez-M. 1994). Oceanic transport of hatchling Kemp's ridleys is controlled primarily by hydrography in the Gulf of Mexico (Collard 1990). Upon leaving the nesting beach of Rancho Nuevo, hatchling Kemp's ridleys enter the Mexican Current and are swept eastward into the northern Gulf of Mexico (Musick and Limpus 1997). Many juveniles are retained in the northern Gulf until they migrate inshore to demersal habitat. Others may be carried south from the northern Gulf into the Loop Current where they are swept into the Florida Current and, subsequently, the Gulf Stream (Musick and Limpus 1997). Once they reach a size of approximately 20 to 30 cm (8 to 12 in.) or at least two years of age, they actively migrate to neritic developmental habitats along the US Atlantic Coast (Musick and Limpus 1997). Adults are largely confined to the Gulf of Mexico with moderate numbers along the eastern US coast as far north as Nova Scotia (Lazell 1980; Morreale et al. 1992).

Kemp's ridleys occur in waters off North Carolina from April through October and in Virginia in May through November (Morreale and Standora 2005). Some juveniles may migrate as far north as New York and New England, arriving in these areas around June and leaving to travel south in early October (Morreale and Standora 2005). During the winter, they migrate south to warmer waters off Florida (Marquez-M. 1994). They typically migrate within the nearshore waters along the mid-Atlantic coast (Morreale and Standora 2005; Morreale et al. 2007); juveniles and adults often travel inshore of the 18-m isobath (Renaud and Williams 2005). Individuals are known to overwinter south of Cape Hatteras although the majority of Kemp's ridley turtles stay in Florida near Cape Canaveral during the winter (Henwood and Ogren 1987). Individuals that overwinter off southern North Carolina may subsequently move into warmer waters (e.g., Gulf Stream or areas off South Carolina) during mid-winter (Renaud 1995; Morreale and Standora 2005). For example, an individual tagged in Beaufort, North Carolina, in 1989 remained in Onslow Bay during the winter and moved into the Gulf Stream when temperatures cooled close to shore in January 1990 (Renaud 1995). Kemp's ridleys utilize the Chesapeake Bay and coastal Virginia waters, in particular, as summer developmental habitat (Lutcavage and Musick 1985). Individuals may prefer the shallow seagrass habitats in the Chesapeake Bay and adjacent waters due to the presence of their preferred prey, the blue crab, in this region (Lutcavage and Musick 1985; Keinath et al. 1994). The Kemp's ridley turtle is the second most common sea turtle species that strands in Virginia;

they average 39 strandings per year with a peak in June and in the fall (Barco and Swingle 2014) (Figure 13).

Nesting occurs primarily on a single nesting beach at Rancho Nuevo on the eastern coast of Mexico (USFWS and NMFS 1992) with a few additional nests in Texas, Florida, South Carolina, and North Carolina (Meylan et al. 1990; Weber 1995; Godfrey 1996; Foote and Mueller 2002). Kemp's ridley nesting in Virginia is extremely rare. Only two Kemp's ridley nests have been recorded in Virginia: one on Dam Neck Naval Base in June 2012 and one on False Cape State Park near the North Carolina/Virginia border in July 2014 (R. Boettcher, VDGIF, unpublished data) (Figure 14).

Occurrence in the Naval Air Station Oceana - Dam Neck Annex Action Area

Kemp's ridley turtles have been recorded in southeastern Virginia throughout the year (Figure 13). Strandings have been recorded in or near the NASO-DNA Action Area during spring, summer, and fall (Figure 13). One Kemp's ridley nest was recorded in the Action Area on 15 June 2012 (Figure 14). This was the first documented Kemp's ridley nest in Virginia. The nest was left *in situ*, and a total of 71 hatchlings emerged in mid-August (VDGIF data).

Occurrence in the Virginia Army National Guard - Camp Pendleton Action Area

Kemp's ridley turtles have been recorded in southeastern Virginia throughout the year (Figure 13). Strandings have been recorded in or near the VAARNG-CP Action Area during spring, summer, and fall (Figure 13). No Kemp's ridley turtle nests or false crawls have been recorded in the Action Area (Figure 14).

4.0 ENVIRONMENTAL BASELINE OF AFFECTED AREA

4.1 NAVAL AIR STATION OCEANA - DAM NECK ANNEX

The facilities, including the Action Area, at NASO-DNA are used to support the mission of the Installation to provide quality education and training to sailors in specified combat systems operation and maintenance, to provide specialized skills training, to provide training systems support to operational and systems commands, and to perform other functions and tasks as directed by higher authority (DON 2015a). These facilities are also used by command tenants of the installation as well as commands stationed at other installations. Training, testing, and evaluation facilities operated at NASO-DNA include a helicopter pad, weapons compound, and Beach and Dune Training Areas. The Marine Air Control Squadron (MACS)-24 operate a compound and radar tower in the northeastern portion of the installation. Also, an explosives test facility is located adjacent to the northern beach. Other training activities that occur on the northern beach include training, testing and evaluation in special warfare, ordnance, overland assault, beach assault, and tactical air operations radar. Amphibious landing exercises using Landing Craft Air Cushions (LCACs) and other amphibious vehicles can occur up to four times per month and involve one to four amphibious vehicles maneuvering onto and across the beach, foot traffic across the beach and dunes, and support personnel digging foxholes to establish a beachhead.

The Action Area consists of the beach and dune areas of the installation. The beaches on NASO-DNA are divided into three nest management zones depending on their use, training or recreation, and the intensity that occurs on training beaches (see Figure 6). Red zones, which include the Beach and Dune Training Areas, have ground disturbing training activities such as LCACs, explosive ordnance disposal, and ATV training and have restricted access at all times (DON 2015a). Red zones occupy approximately the northern quarter of NASO-DNA with the exception of a portion of the northern-most area of the beach which has a spillover of recreational uses from VAARNG-CP.

The yellow zones are firing range safety fans that have restricted access and are closed during small-arms firing training at ranges located inland from the dunes. Green zones are recreational beaches used by military personnel and families and have minimal access restrictions.

Beach and dune environments are important to the unique training environment at NASO-DNA and remain an ongoing natural resources challenge that has been addressed by various shoreline stabilization projects (DON 2015a). Training exercises can result in accelerated beach and dune erosion and the loss of significant ecological communities (DON 2015a). Other periodic disturbances include physical training occurring early in the morning and during daylight hours three to four times per week; daily security patrols; trash pickup at recreational beaches each morning from April to November; daily (from May to September) swimming, surfing, beachcombing, kayaking, fishing, and volleyball at recreational and fishing beaches; and the maintenance of buried communication cables at the south end of the beach every few years (DON 2015a).

4.1.1 Previous Sea Turtle Management Actions

NASO-DNA has undertaken actions in the past for the management of sea turtles. In 2003, NASO-DNA requested formal consultation on a beach replenishment project at NASO-DNA and the potential effects on the loggerhead turtle. The USFWS issued the final Biological Opinion on 8 October 2003 that the action, as proposed, was not likely to jeopardize the continued existence of the loggerhead turtle. In 2008, NASO-DNA and BBNWR entered into a nest relocation agreement that in which BBNWR staff would determine if a nest is present and relocate the nest if necessary. The USFWS issued a Biological Opinion in 2011 on the BBNWR Sea Turtle Management Program, including nest relocations from other areas within Virginia Beach, and determined that the program was not likely to jeopardize the continued existence of the loggerhead or green sea turtles (USFWS 2011). On 25 May 2012, the Biological Opinion was amended to include NASO-DNA.

4.1.2 *Lighting Survey*

Artificial illumination on or near the beaches of NASO-DNA can deter adult females from emerging from the water, affect nest site selection, disrupt the seaward orientation of adult females after nesting, and disrupt the seaward orientation of hatchlings after emergence from the nest (Witherington and Bjorndal 1991; Witherington 1992; Witherington and Martin 2003; Tuxbury and Salmon 2005; Brei et al. 2014; Rivas et al. 2015). Lighting surveys, following the USFWS protocols and guidelines recommended in the Florida Marine Research Institute's technical report (Witherington and Martin 2003), were conducted on NASO-DNA from April to October 2015 to identify artificial lighting sources that emit light that is visible from the beaches of this installation (DON 2015). The lighting survey report from these surveys can be found in Appendix B.

4.1.2.1 Methodology

Lighting surveys included both daytime and nighttime surveys that were conducted within the pre-nesting season, the nesting season, and the post-nesting/hatching season (DON 2015b). Daytime surveys allowed the surveyors to familiarize themselves with the areas to be surveyed at night and to identify the likely sources of light to be investigated at night. Nighttime surveys were conducted to document light sources that are visible on NASO-DNA beaches with the potential to impact sea turtles and to classify them as either direct or indirect light sources. The pre-nesting season survey collected the baseline data of light sources with a direct, indirect, or potential to impact sea turtles. The remaining surveys conducted during the nesting season and the post-nesting/hatching season documented any changes or additions to light sources not identified during the pre-nesting or other follow-up surveys.

Prior to the first surveys, desktop analyses were conducted to identify potential light sources on the installation and to create a map for use during surveys. The map was used by the surveyors to orient themselves while on the beach and assist in locating light sources. Daytime surveys occurred on 1 and 3 April 2015 along the beach face and behind the rear dunes. If allowed, photographs of potential light sources were taken for referral purposes and for inclusion into reports.

The pre-nesting season nighttime surveys were conducted on 14 and 15 April 2015. These surveys occurred within 2 to 14 days following a full moon and were started after 2100 as specified in the USFWS protocols. Nighttime surveys consisted of at least two surveyors walking the beach at night above the water line in the swash zone. Both direct and indirect light sources were identified. Identification included the classification of the type of light source and GPS coordinates or map location of the actual light source. Survey forms were completed to document building number, parking area, or other identifiers of the location on the installation. The number of lights, type, color, and potential for disruption (as reviewed in Witherington and Martin [2003]) were also recorded.

Nesting season surveys were conducted on 5 and 12 June 2015 to document any changes or additions to light sources, particularly as a result of new construction and from the change in beach length from the beach replenishment that was completed in April. These dates complied with the phase of the moon and time specified in the USFWS protocols. Maps generated from the pre-nesting nighttime survey data were used to identify new and changed impacts. The beach was surveyed first and then followed by the survey behind the dunes to locate light sources identified from the beach. All light sources that were identified were documented.

The post-nesting/hatching season survey had to be accomplished on two separate dates. On 11 September 2015, the southern two-thirds of the NASO-DNA beach were surveyed. The remaining northern portion of the beach was surveyed on 10 October 2015. Both survey dates were within the survey window specified in protocols and were started after 2100.

4.1.2.2 Results

NASO-DNA has artificial lighting that reaches the beach both directly and indirectly. A total of 236 direct, indirect, and other light sources that were not on during surveys but are expected to have an impact were

identified during surveys on NASO-DNA. Most of the artificial light sources identified (101 light sources) have a direct impact on the beach. An additional 54 light sources were identified as indirect sources because they either constituted a glow that could be seen above the dunes or illuminated structures, such as building walls, which were visible from the beach. A total of 81 light sources were categorized as either "Direct-if on" or "Indirect-if on". Those classified as "Direct-if on" were not on at the time of nighttime surveys, but the fixtures could be seen from the beach. Those classified as "Indirect-if on" were not on during the nighttime surveys and were classified due to factors such as: their height and proximity to the beach, they were located near similar light sources that were classified as indirect, or it was apparent that they would likely illuminate structures that were visible from the beach. The majority of light sources identified on NASO-DNA are on elevated fixtures such as street, parking lot, and sports field lights. These sources rise above the dunes and scatter light over a wide area. Other sources included wall-mounted area and flood lights located on upper levels of buildings and areas of concentrated light sources that created localized sky glow. Seventy-six lights identified at NASO-DNA have high-pressure sodium lamps considered to be highly disruptive to sea turtles (Witherington and Martin 2003). An additional 61 lights were identified as having white, broad-spectrum lamps considered to be extremely disruptive. General recommendations from the lighting survey report (DON 2015b) are included in this BA in Section 2.3 above and specific recommendations are included in the survey report (Appendix B).

4.2 VIRGINIA ARMY NATIONAL GUARD - CAMP PENDLETON

The facilities and land of VAARNG-CP are used to support training for the VAARNG, Virginia Air National Guard, out-of-state National Guard units, and other government agencies. The majority of training is limited to those months between Labor Day and Memorial Day due to the installation's close proximity to Virginia Beach, a popular tourist location in the summer months. Training that occurs on VAARNG-CP includes weapons firing certification, classroom training, field artillery drivers training and, for the Air Guard units, construction equipment drivers training. Weapons firing certification is limited to small caliber weapons (e.g., 5.56-mm, 9-mm, .38-caliber, and 12-gauge shotgun). The weapons firing certification range is located immediately behind the dunes. No training activities occur on VAARNG-CP beaches.

The beach at VAARNG-CP is open for use by active duty, Guard and Reserve, and retired military personnel for recreational use such as swimming, beachcombing, and fishing. From Memorial Day to Labor Day, the City of Virginia Beach leases 600 ft of the beach and an adjacent parking area from Camp Pendleton for use by surfers who are restricted from using the public beaches of the main resort areas north of the installation. Other periodic disturbances include daily security patrols and trash pickup each morning between Memorial Day and Labor Day.

Manipulation of the beach and dunes at VAARNG-CP likely occurred during construction of the adjacent firing range (VAARNG 2004). Damage to dune vegetation has been widespread from pedestrian and vehicular traffic at the northern and southern limits of the installation beach. The VAARNG-CP INRMP proposes dune vegetation replanting to stabilize the dune system in those areas where vegetation has been removed (VAARNG 2004).

4.2.1 *Lighting Survey*

Artificial illumination on or near the beaches of VAARNG-CP can deter adult females from emerging from the water, affect nest site selection, disrupt the seaward orientation of adult females after nesting, and disrupt the seaward orientation of hatchlings after emergence from the nest (Witherington and Bjorndal 1991; Witherington 1992; Witherington and Martin 2003; Tuxbury and Salmon 2005; Brei et al. 2014; Rivas et al. 2015). Lighting surveys, following the USFWS and guidelines recommended in the Florida Marine Research Institute's technical report (Witherington and Martin 2003), were conducted on VAARNG-CP to identify artificial lighting sources that emit light that is visible from the beach of this installation (DON 2015b). The lighting survey report from these surveys can be found in Appendix B.

4.2.1.1 Methodology

Lighting surveys included both daytime and nighttime surveys that were conducted within the pre-nesting season, the nesting season, and the post-nesting/hatching season. (DON 2015b). Initial pre-nesting season surveys were accomplished to document light sources that are visible on VAARNG-CP beaches with the potential to impact sea turtles and classify them as either direct or indirect light sources. The remaining surveys conducted during the nesting season and the post-nesting/hatching season to document any changes or additions to light sources not identified during previous surveys. All nighttime surveys were conducted within 2 to 14 days following a full moon and was started after 2100 hours as specified in the USFWS protocols.

Prior to the first surveys, desktop analyses were conducted to identify potential light sources on the installation and create a map for use during surveys. The map was used by the surveyors to orient themselves while on the beach and assist in locating light sources. The daytime survey occurred 3 April 2015. The purpose for the daytime survey was to allow surveyors to identify potential light sources that would be reexamined during nighttime surveys. These surveys occurred both along the beach face and behind the rear dunes. If allowed, photographs of potential light sources were taken for referral purposes and for inclusion into reports.

The pre-nesting season nighttime surveys was conducted on 15 April 2015. The nighttime survey consisted of at least two surveyors walking the beach at night above the water line in the swash zone. Both direct and indirect light sources were identified. Identification included the classification of the type of light source and GPS coordinates or map location of the actual light source. Survey forms were completed to document building number, parking area, or other identifiers of the location on the installation. The number of lights, type, color, and potential disruption (as reviewed in Witherington and Martin [2003]) were also included in the survey forms.

The post-nesting/hatching season survey was accomplished on 10 October 2015 starting at 0030 hours. The beach survey began on the northern portion of VAARNG-CP beach leased to the City of Virginia Beach and was completed at the installation boundary with NASO-DNA. Surveyors used maps generated from previous surveys to identify any changes that may have occurred from previous surveys. Any lights that were identified from beach surveys were located and characterized by observed impact, type of fixture, type of light, and specific location of the light source.

4.2.1.2 Results

Three light sources on VAARNG-CP are visible from the beach, one direct and two indirect. The direct light source consisted of a small, solar-powered LED flood lamp mounted on one of the fence post that illuminates a small US flag mounted on an adjacent post and the indirect sources are two wall-mounted area lights that illuminate the top wall and roof peak of the restroom facility on the parking lot leased to the City of Virginia Beach. The other light sources visible from VAARNG-CP beaches included the off-base residential areas on the northern edge of the base and the top of the radar dome located in the MACS-24 compound on NASO-DNA. General recommendations from the lighting survey report (DON 2015b) are included in this BA in Section 2.3 above and specific recommendations are included in the survey report (Appendix B).

5.0 EFFECTS OF THE ACTION

5.1 NEST RELOCATION

Nest relocation is a management technique used to protect nests that may be destroyed by environmental factors, such as erosion or repeated tidal inundation, or permitted human activities, such as military training activities, recreational uses, and beach nourishment during the nesting season. The relocation of eggs can be an effective conservation method for sea turtle populations where clutches would otherwise be lost and where populations require intervention (Pintus et al. 2009); however, nest relocation should only be conducted as a last resort when the nest is presumably doomed and only in cases where *in situ* protection is not possible because relocation may cause negative impacts to eggs and hatchlings (Wyneken et al. 1988; Mortimer 1999; NMFS and USFWS 2008; Sieg et al. 2011). While it has been reported in the southeastern US that no significant differences were detected between the hatch and emergence success of *in situ* and relocated loggerhead clutches (Bimbi 2009; McElroy 2009), other studies suggest relocated sea turtle nests had significantly lower hatch and emergence success than *in situ* nests (Eckert and Eckert 1990; Herrera 2006; Pintus et al. 2009; Sieg et al. 2011; Revuelta et al. 2014). Nest relocations can result in movement-induced mortality of embryos and adverse changes to embryonic development and hatching success due to changes in the egg chamber environment. The proposed nest relocation has the potential to affect sea turtles in the Action Area. The potential direct and indirect effects of nest relocations on sea turtles are discussed below.

5.1.1 *Movement-induced Mortality*

Nest relocating that is unnecessary or improperly executed can result in movement-induced mortality of embryos (Limpus et al. 1979). The manipulation of eggs during extraction, transport, and relocation of clutches exposes the eggs to rotational or vibrational movements which can negatively affect embryonic development and directly damage the eggs. Egg mortality increases with more severe handling and longer intervals between oviposition and movement (Miller and Limpus 1983). The embryonic membranes of older eggs are easily torn if the eggs are rotated or jarred (Mortimer 1999). Traditional protocols for nest relocation suggest that eggs should be moved within 12 hours of deposition (Limpus et al. 1979; Mortimer 1999); however, more recent studies of translocated loggerhead turtle nests indicate that careful (avoiding egg rotation) delayed translocation up to 96 hours after the eggs are laid does not negatively affect hatching success, incubation period, or hatchling size and mass (Abella et al. 2007). Movement-induced mortality may also be reduced via short-term cold exposure which slows or suspends development in turtles; cooling the eggs to 10 to 14°C (50 to 57°F) immediately following laying has been shown to prevent movement-induced mortality of loggerhead turtle embryos during the first 72 hours of incubation (Miller and Limpus 1983).

5.1.2 *Adverse Changes to Embryonic Development and Hatching Success*

Embryonic development and hatching success are influenced by the environmental conditions of the nest. Even though strict measures may be taken to develop suitable relocated nests, man-made nests may be of poorer quality compared to natural turtle nests and are likely to have different features than those chosen by the nesting female (Pintus et al. 2009). Compared to natural nests, relocated nests may have different substrate characteristics, such as grain size, density, compaction, organic content, and color, which may alter the nest environment leading to adverse effects on embryonic development and hatching success, particularly hatchling fitness and the natural sex ratios of embryos (Crain et al. 1995; Fisher et al. 2014; Revuelta et al. 2014). Embryos are vulnerable to extremes in three main environmental factors: moisture (including substrate humidity and salinity), gas exchange, and temperature (Ackerman 1980; Miller and Limpus 1983; Mortimer 1990; Georges et al. 1994; Ackerman 1997; Carthy et al. 2003).

Nests relocated into sand that is deficient in oxygen or moisture can lead to embryo mortality and the reduced behavioral competence of hatchlings. Eggs absorb water vapor from the surrounding sand soon after oviposition and increase in weight. Maintaining this initial mass is critical; eggs cannot survive to hatching if they lose more than 40 percent of this initial mass (Miller et al. 2003). Weight changes in the eggs are influenced by the hydrologic conditions of the beach, including salt and organic material and

substrate (Ackerman 1997). Optimum moisture levels are necessary for healthy embryo development and hatching success. Embryos exposed to wet conditions during development have longer incubation periods and grow to larger hatchling size than those exposed to drier conditions; however, high moisture levels can destroy entire clutches (McGehee 1990). The rate and growth of embryos is also related to the respiratory gas exchange between the eggs and the surrounding beach (Ackerman 1980). Gas diffusion is influenced by the water content and particle size of the sand (Ackerman 1980; Miller et al. 2003). Oxygen demand is higher near the end of incubation than during early developmental stages; therefore, inundation of the nest near the end of incubation could destroy the entire clutch (Miller et al. 2003). Maximum growth and hatching success occur when the respiratory environment of the clutch is similar to the oxygen levels of a natural nest. In addition, females build their nests in a way that equalizes gas exchange for all the eggs in the clutch; therefore, nest relocation must include measures to recreate as closely as possible the environment of the original nest (Ackerman 1980).

In addition to changes in the oxygen and moisture content, relocated nests may have different thermal conditions than *in situ* nests (Bimbi 2009; Pintus et al. 2009; Tuttle and Rostal 2010). This change in the overall temperature regime of the nest can cause skewed sex ratios (Morreale et al. 1982; Godfrey et al. 1997; Pintus et al. 2009; Sieg et al. 2011). Differences in sand type and shading of turtle nests affect the thermal environment of the embryos. In addition, changes in metabolic heating of the clutch can affect sex ratios (Broderick et al. 2001; Sieg et al. 2011). Metabolic heating is the difference between the sand temperature and the egg clutch incubation temperature due to metabolizing embryos and is influenced by clutch size, position in the nest, and number of live versus decomposing embryos (Broderick et al. 2001).

Incubation temperature has significant developmental effects on sea turtles, including affecting sexual differentiation and also affecting traits, such as locomotor abilities, that influence survival (Fisher et al. 2014). Sexual differentiation of sea turtle embryos is determined by egg incubation temperature, usually during the middle third of development (Limpus et al. 1985). Within fluctuating beach temperatures, the sex is determined by the proportion of development at a temperature and not by the duration of exposure to the temperature (Georges et al. 1994). The pivotal temperature varies between populations within a species (Limpus et al. 1985). In loggerhead turtles, the pivotal temperature is around 29°C (84°F) (Mrosovsky 1988; Wibbels 2003). According to LeBlanc et al. (2012), temperatures at or below 26°C (79°F) produce 100 percent males, temperatures at or above 30.5°C (86.9°F) produce 100 percent females, and temperatures falling between this range produce mixed sex ratios. Temperature also affects success of the clutch with high incubation temperatures causing an increase in embryonic mortality (Ackerman 1997; Broderick et al. 2001; Godley et al. 2001). Turtle embryos generally survive mean incubation temperatures up to 35°C (95°F), but leatherback and olive ridley (*Lepidochelys olivacea*) turtle embryos may be less tolerant of high incubation temperatures than green and loggerhead turtle embryos (Howard et al. 2014).

Hatchling sex ratios are important because they represent the pools from which future sex ratios will arise (TEWG 2009); therefore, any shifts in hatchling sex ratios can affect future generations of turtles if changes are extreme enough to impact productivity (TEWG 2009). The potential effects of clutch relocation at a population level are unknown but could be profound, particularly if fewer males are produced (Pintus et al. 2009). The largest US nesting subpopulation of loggerheads in Florida is known to produce mostly female hatchlings (TEWG 2009); however, beaches north of Florida seem to be important for the production and recruitment of male turtles into the overall western North Atlantic population (LeBlanc et al. 2012). For example, even during the warmest nesting seasons, more males were produced from nests in Georgia than nests farther south of this region (LeBlanc et al. 2012). Proper conservation techniques in this region should be implemented to facilitate the necessary recruitment of male loggerhead turtles into the overall western North Atlantic population (LeBlanc et al. 2012).

5.2 CUMULATIVE EFFECTS

Cumulative effects are those effects to ESA-listed species of future state, local, and/or private actions that are reasonably certain to occur on or near the Action Area. Future federal actions that are not related to the proposed action are not considered because they require separate Section 7 consultation.

5.2.1 Naval Air Station Oceana - Dam Neck Annex

Cumulative effects of actions likely to impact sea turtles on or near the Action Area include continued development of beaches adjacent to NASO-DNA and vessel interactions. Continued coastal development and the chronic pollution associated with development threaten sea turtles worldwide. Coastal development and urbanized coastal areas introduce threats to sea turtles and their habitats such as direct mortality, destruction of nesting beaches, light pollution, alteration of nearshore habitat, sedimentation, eutrophication, and the introduction of heavy metals and other contaminants (Horrocks and Scott 1991; Lutcavage et al. 1997; Witherington and Martin 2003; Witherington et al. 2006; Mortimer and Donnelly 2008; Kamel and Delcroix 2009; NMFS et al. 2011; Gallaway et al. 2013). All of these threats have the potential to affect sea turtles in the vicinity of NASO-DNA. In areas of high human population with a high volume of recreational and commercial boat traffic and active coastal ports, such as the Virginia Beach area, propeller strikes and vessel collisions pose a significant threat to sea turtles (NMFS 2009).

5.2.2 Virginia Army National Guard - Camp Pendleton

Cumulative effects of actions likely to impact sea turtles on or near the Action Area include continued development of beaches adjacent to VAARNG-CP and vessel interactions. Continued coastal development and the chronic pollution associated with development threaten sea turtles worldwide. Coastal development and urbanized coastal areas introduce threats to sea turtles and their habitats such as direct mortality, destruction of nesting beaches, light pollution, alteration of nearshore habitat, sedimentation, eutrophication, and the introduction of heavy metals and other contaminants (Horrocks and Scott 1991; Lutcavage et al. 1997; Witherington and Martin 2003; Witherington et al. 2006; Mortimer and Donnelly 2008; Kamel and Delcroix 2009; NMFS et al. 2011; Gallaway et al. 2013). All of these threats have the potential to affect sea turtles in the vicinity of VAARNG-CP. In areas of high human population with a high volume of recreational and commercial boat traffic, such as the Virginia Beach area, propeller strikes and vessel collisions pose a significant threat to sea turtles (NMFS 2009).

6.0 DETERMINATION OF EFFECTS

6.1 NAVAL AIR STATION OCEANA - DAM NECK ANNEX

A determination of may affect but not likely to adversely affect has been made for the leatherback and hawksbill sea turtles from the implementation of the NASO-DNA Sea Turtle Management Program. As discussed in Sections 3.2.1.5 and 3.2.4.5, leatherback and hawksbill sea turtles have been recorded in the waters off of NASO-DNA, but no nests of either species have been documented on Virginia beaches. Leatherback sea turtles primarily nest on isolated mainland beaches in tropical and temperate oceans (NMFS and USFWS 1992) and to a lesser degree on some islands, such as the Greater and Lesser Antilles. The densest nesting on the US Atlantic coast occurs in Florida (Stewart and Johnson 2006) with sporadic nesting in Georgia, South Carolina, and North Carolina (Rabon et al. 2003). Reports of hawksbill sea turtles in the waters off the Virginia coast are rare with only four recorded sightings since 1991 (see Section 3.2.4.5). Hawksbill sea turtles nest in the Caribbean along the Yucatán Peninsula, Mexico; smaller nesting assemblages are found in Belize, Nicaragua, Panama, Venezuela, Cuba, Antigua, and the Grenadines (NMFS and USFWS 1993). While hawksbill sea turtles are found in Virginia waters and strandings have been documented on Virginia beaches, nesting along the continental US is restricted to southern Florida and the Florida Keys (Dodd 1995).

Based on the known potential impacts of nest relocation and the previous confirmed records of nests on Virginia beaches, it is determined that the proposed action may affect and is likely to adversely affect the loggerhead, green, and Kemp's ridley sea turtles. All three of these species have previously nested on Virginia beaches, and both loggerhead and Kemp's ridley turtles have nested on NASO-DNA beaches. A total of two loggerhead nests were recorded on NASO-DNA in 1992 and 2002, and one Kemp's ridley nest was recorded at NASO-DNA in 2012. Although the conservation measures to be implemented (see Section 2.2) do include the monitoring of nesting sea turtles and nests, nest protection, and careful protocols for nest relocations to increase the potential for successful nesting and hatching of sea turtles over that of not taking any management actions, relocation of turtle nests does pose the potential for nest failure and may cause incidental takes of these turtle species. Based on this determination, NASO-DNA requests initiation of formal consultation pursuant to Section 7 of the ESA.

6.2 VIRGINIA ARMY NATIONAL GUARD - CAMP PENDLETON

As discussed in Section 2.1.2, VAARNG-CP has a verbal agreement in which NASO-DNA would conduct beach patrols. NASO-DNA beach patrols survey the VAARNG-CP beach to the leased property boundary and use binoculars to survey the remaining beach. In the event that a crawl or potential nest is located, the patrol will contact the NASO-DNA NRM who, in turn, contacts the VAARNG-CP NRM. Notification is passed up to the VAARNG-CP command staff. The VAARNG NRM also ensures that the USFWS, VDGIF, and the VAST are notified as appropriate. The VAARNG-CP NRM will consult with these agencies to determine the appropriate actions and who will be responsible for relocation and to where the nest would be moved or for nest management if the nest is left *in situ* or relocated on VAARNG-CP. Nest management and relocation activities would be done in accordance with the 2015 Virginia Sea Turtle Nesting Handbook (Virginia Bureau of Wildlife Resources 2015).

A determination of may affect but not likely to adversely affect has been made for the leatherback and hawksbill sea turtles from sea turtle management actions on VAARNG-CP. As discussed in Sections 3.2.1.5 and 3.2.4.5, leatherback and hawksbill sea turtles have been recorded in the waters off of VAARNG-CP, but no nests of either species have been documented on Virginia beaches. Leatherback sea turtles primarily nest on isolated mainland beaches in tropical and temperate oceans (NMFS and USFWS 1992) and to a lesser degree on some islands, such as the Greater and Lesser Antilles. Reports of hawksbill sea turtles in the waters off the Virginia coast are rare with only four recorded sightings since 1991 (see Section 3.2.4.5). Hawksbill sea turtles nest in the Caribbean along the Yucatán Peninsula, Mexico; smaller nesting assemblages are found in Belize, Nicaragua, Panama, Venezuela, Cuba, Antigua, and the Grenadines (NMFS and USFWS 1993).

Based on the known potential impacts of nest relocation and the previous confirmed records of nests on Virginia beaches, it is determined that the proposed action may affect and is likely to adversely affect the loggerhead, green, and Kemp's ridley sea turtles. All three of these species are documented as having previously nested on Virginia beaches. A loggerhead nest was confirmed on a VAARNG-CP beach in August 2015 (R. Boettcher, VDGIF, unpublished data) and loggerhead and Kemp's ridley turtles have nested on adjacent NASO-DNA beaches. Although the conservation measures to be implemented (see Section 2.1) do include the monitoring of nesting sea turtles and nests, nest protection, and careful protocols for nest relocations to increase the potential for successful nesting and hatching of sea turtles over that of not taking any management actions, relocation of turtle nests does pose the potential for nest failure and may cause incidental takes of these turtle species. Based on this determination, VAARNG-CP requests initiation of formal consultation pursuant to Section 7 of the ESA.

VMSM = Virginia Marine Science Museum (now know as the Virginia Aquarium & Marine Science Center)

Introduction

This document provides the standard operating procedures (SOP) associated with managing Naval Air Station Oceana's (NASO) sea turtle program.

There are 5 species of sea turtles known off of the coast of NASO and NASO Dam Neck Annex (DNA), in southeastern Virginia: Green (*Chelonia mydas*); Hawksbill (*Eretmochelys imbricata*); Kemp's ridley (*Lepidochelys kempii*); Leatherback (*Dermochelys coriacea*); and Loggerhead (*Caretta caretta*). Of these 5 species 3 are known to have successfully nested along the coast of southeastern Virginia: Loggerhead, Kemp's ridley, and Green. Both the Loggerhead and the Kemp's ridley have been documented as nesting on NASO DNA. Leatherback sea turtles are known to have nested in North Carolina, but have yet to be documented nesting in Virginia. All 5 species of turtles have been documented as strandings in southeastern Virginia.

The NASO shoreline does not have typical suitable nesting habitat, but could have random stranding occurrences, particularly associated with tidal wash-up during storm events. The NASO DNA coastline (~4 miles) provides suitable nesting habitat and annually reports sea turtle strandings.

NASO and United States Fish & Wildlife Service (USFWS) Back Bay National Wildlife Refuge (BBNWR) work cooperatively to manage the sea turtle program at NASO DNA. The guiding documents associated with this cooperative working partnership are the Endangered Species Act (ESA), the NASO DNA Integrated Natural Resources Management Plan (INRMP) mandated by the Sikes Act (available upon request), the BBNWR Biological Opinion as amended on 25 May 2012 (Appendix A), and the 2008 NASO & BBNWR nest relocation agreement (Appendix B).

NASO staff and authorized associates perform daily sea turtle patrols to locate nests, crawls, and strandings at NASO DNA and Virginia Army National Guard-Camp Pendleton (VAARNG-CP) during the sea turtle nesting season. For nests located on NASO DNA, NASO and BBNWR biologists collaboratively determine if a nest should be left in place (in situ) or relocated. Relocated nests are buried on the closest adjacent land suitable site available to the originating nest location or to an established beach front nursery site on NASO DNA or BBNWR. The nests are protected by a predator enclosure that allows for unattended hatching and release of hatchlings. Nests are checked daily and are more closely monitored when the estimated hatching date approaches.

Nests located on VAARNG-CP property are collaboratively managed between BBNWR and VAARNG-CP biologists. NASO staff will notify both BBNWR and VAARNG-CP biologists if a crawl is located on their property.

All observed turtle strandings on NASO DNA and VAARNG-CP will be reported to the VA Aquarium Stranding Team (VAST).

Lighting assessments starting in 2015 are planned to be completed every 5 years (appendix J) to identify and address on installation lighting concerns associated with sea turtles.

Projects, training, and other activities on NASO DNA are reviewed to determine potential impacts to sea turtles and guidance is provided to minimize and or avoid identified concerns (appendix L)

Turtle Patrols

General Information

Morning patrols for nesting sea turtle crawls and nests, as well as for marine mammal and sea turtle strandings are conducted from 15 May through 31 Aug on NASO DNA and VAANG-CP. NASO Natural Resources staff and other authorized individuals conduct the patrols.

Patrollers attend a training session on turtle patrol procedures and crawl recognition (Appendix C). In addition to the patrol procedures training, ATV safety training presented by a Navy designated safety trainer is required for all volunteers, interns, and staff who will be operating an ATV or utility vehicle (refresher training required every 5 years). Patrols are done by ATV, or other four/all-wheel drive vehicle as approved by the installation Natural Resources Manager (NRM).

Appendix D provides a map of the NASO DNA patrol area. Due to Military Mission requirements the North end of NASO DNA is patrolled 1st (north of the building 127 beach access).

Patrollers arrive on site no-later-than 30 minutes prior to sunrise as identified by the Sunrise/Sunset table (Appendix E). If patrols start before daylight, headlights of vehicles will be covered with red filters before proceeding onto the beach. Patrollers first scout the beach along the water's edge looking for turtle crawls and strandings. Patrollers then return along the middle beach looking for crawls and high tide line strandings. Due to the narrow beaches and potential for nesting Piping plover, patrollers do not patrol above high tide line. If a stranded sea turtle or a crawl is sighted, procedures outlined in crawl and nest procedures section of this SOP are followed.

While on patrol, patrollers concurrently scout for and identify any unauthorized vehicles, temporary artificial lighting or other beach activities that may interfere with turtles. If such items are identified patrollers should notify base security, the conservation law-enforcement officer/"Game Warden" (CLEO), and the installation NRM. Security or the CLEO will escort any unauthorized vehicles, with headlights turned off, from the beach and will address any other concerns as appropriate referring to the appropriate Executive Order 11989, ESA, the Coastal Zone Management Act, or other regulatory document as appropriate.

At the completion of each patrol, the patroller records patrol information in the Sea Turtle Patrol Log (Appendix F). BBNWR employees respond as soon as possible to nest/crawl reports made by or relayed to BBNWR staff, volunteers, visitors, and partnering agencies.

Equipment and Supplies

- All-Terrain-Vehicle (ATV)
 - The patroller is responsible for wearing appropriate personal protective equipment (PPE). PPE includes but is not limited to: eye protection, safety vest, helmet, gloves, hearing protection, closed toed shoes, long shirt, long pants, and scarf under the helmet (for personal hygiene when sharing helmets). **A helmet must be worn ANY time an ATV is operated.**
 - Before patrol begins individuals should inspect the ATV and ensure:
 - ATV has adequate fuel, oil, and brake fluid levels. If not then those fluids should be filled appropriately.
 - ATV has adequate tire pressure for patrolling on the beach, if not adjust tire pressure accordingly.
 - ATV's nuts, bolts, toolbox, wiring, etc. are adequately secured.
 - ATV lights and gauges are working appropriately.
 - ATV lights if on beach before daylight are covered with red film/lens.
 - After patrol is completed individuals should inspect the ATV and ensure:
 - ATV is rinsed off daily after exiting the beach to minimize damage to the equipment from salt and sand.
 - ATV is refueled after each usage, if fuel gauge drops below ½ full.
 - ATV did not become damaged during patrol and all equipment/controls are in full working order.
 - ATV is stored and locked in the Natural Resources ATV storage shed behind Building 127.
 - ATV issues are documented on the patrol log and reported to the Natural Resources Manager.
- Turtle Patrol Log Book
 - Includes:
 - Data Sheets
 - Access & Notification Procedures (Contact List)
 - Copy of appropriate SOPs
 - Crawl and Turtle Identification Guide
 - Patrol Calendar
 - Brochures
- ATV Toolbox
 - Ensure before leaving on patrol that all required supplies/equipment are present and replace used items once patrol is completed)
 - Pens & Pencils
 - Latex gloves
 - Goggles
 - Hearing Protection
 - Helmet
 - Safety Vest
 - Tire gauge
 - Bright colored wire flag markers to flag off nest
 - Bags for trash and other various uses
 - First aid kit

- Paper towels
- Large hook to drag dead stranding to high beach
- “Do Not Cross” tape and pink tape to flag off turtle crawl/nest
- Digital camera
 - Check Battery Status after each patrol. If Low swap battery out with charged battery kept by Natural Resources Manager.
- GPS unit with extra batteries
- Binoculars
- Fluorescent orange spray paint (used for remarking previously spray painted turtles whose paint has degraded to a point where it is or will quickly become hard to identify that that turtle has already been reported and recorded)
- Storage Shed
 - ATV
 - Fuel (kept in appropriately marked Navy Authorized Storage Container)
 - Oil (kept in appropriately marked Navy Authorized Storage Container)
 - Restocking Supplies for ATV Toolbox
 - Response Equipment (Signs, Cages, Posts, Post-hole Pounder, Auger, Wire, Fencing, ATV Loading Ramp, Spot-light with Red-cap, live stranding Cooler, towels, live stranding shade tent/umbrella, Shovels, Rakes, Nuts & Bolts, foldable chairs, etc.).

Sea Turtle Strandings

All stranded turtles on NASO DNA and VAANG-CP are reported to the VA Aquarium Stranding Team (VAST), formerly the Virginia Marine Science Museum (VMSM), at 757-385-7575 (during business hours 0830-1630) or at 757-385-7576 (during afterhours for live stranding emergencies) .

Notifications regarding strandings found elsewhere in Virginia Beach, VA are referred to BBNWR and VAST.

Notifications regarding strandings found in North Carolina are referred to the North Carolina Aquarium’s Network for Endangered Sea Turtles (NEST) team at 252-441-8622.

See Appendix G for details regarding all marine animal stranding reporting procedures.

Dead Strandings

The procedures for dead strandings found on NASO, NASO DNA and VAARNG-CP are as follows:

- 1) If turtle is already spray painted, the turtle is not reported.
- 2) If spray paint is not seen on turtle, report turtle to the VAST at 757-385-7575 and the NRM at 757-433-3461. Ensure you relay day, time of finding, base name, location (preferably GPS point and physical location description), your name and contact information. If sea turtle is in the surf drag it up onto the beach so that it does not wash away before VAST arrives on the scene. Be sure to document on

the datasheets and notify VAST that the turtle was originally located in the surf and dragged up onto the beach.

- 3) Assist, as needed, the VAST with access to the stranding.
- 4) Assist, as needed/as able, the VAST with data collection and removal of the stranding.
- 5) Complete Turtle patrol log & appropriate other datasheets, include location description, GPS location, and note if pictures were taken (pictures should be taken and sent to the installation NRM). All other data will be obtained and recorded by the responding VAST personnel on a standard National Marine Fisheries Service (NMFS) sea turtle stranding form.

Live Strandings

The procedures for live strandings found on NASO, NASO DNA and VAARNG-CP are as follows:

- 1) If it is a hatchling, VAST and installation NRM is contacted. The turtle is kept in a moist dark environment until further instructions are given.
- 2) If the turtle is injured, VAST and installation NRM is contacted. The turtle's nose and eyes are kept moist and the body kept shaded, while the patroller awaits further instructions.
- 3) If the turtle is uninjured determine if it is a stranding or a nesting attempt. If it is a nesting attempt follow procedures in crawl and nest procedures section of this SOP. If it is a stranding, VAST and installation NRM should immediately be contacted. The patroller awaits further instructions.
- 4) If the turtle is in the water, no attempt is made to catch it. If the turtle appears to be in distress, VAST and installation NRM is contacted. As much information as possible is collected and recorded on the appropriate logs and is reported to VAST.
- 5) Assist, as needed, the VAST with access to the stranding.
- 6) Assist, as needed/as able, the VAST with data collection and removal of the stranding.
- 7) Complete Turtle patrol log & other appropriate datasheets, include location description, GPS location, and note if pictures were taken (pictures should be taken and sent to the installation NRM). All other data will be obtained and recorded by the responding VAST personnel on a standard NMFS sea turtle stranding form.

Note: If a live stranding is found while conducting nesting sea turtle patrol, immediately call in the stranding to VAST and the installation NRM with all appropriate information. After notifying VAST and installation NRM, continue and complete the nesting turtle patrol. After completing the turtle patrol collect live stranding supplies from the storage shed and proceed back to the turtle to provide the turtle appropriate protection until VAST can arrive on the scene. If the turtle is a hatchling, you should collect it on the spot and place it in the hatchling cooler with moist sand (no standing water) and continue on your patrol, be sure to let VAST know where to meet you to pickup the hatchling. [If

another natural resources staff member is available, they can be called in to assist with either completing the patrol or taking care of the live stranding situation.]

Crawl and Nest Procedures

General Information

A crawl is the entry and/or exit flipper and drag markings/impressions left in the sand from a sea turtle exiting and entering back into the Ocean, crawling up and off of the beach. The crawl area includes the entry, and exit crawl and any nesting area.

The nesting area is the disturbed area (“body cavity”) created by the turtle as she digs a hole, deposits and buries eggs, and turns away from the dunes towards the ocean for reentry. Usually there is mounded sand, as well as a flattened area. Sometimes sand disturbance from turning looks like a nesting area. In this case, hard sand usually with unbroken layers of dark sand can be found underneath the softer, disturbed sand. A crawl without any evidence of an attempt to dig a hole is termed a “false crawl.” A crawl that contains a nesting area that does not contain eggs is termed a “false nest.”

When a nesting or crawling turtle is encountered, usually spotted by a crawl observed in the ATV path, patrollers/responders immediately extinguish the headlights and park the ATV at a safe distance from the turtle. Patrollers should take extreme care to not startle turtle(s) and to stop anyone else from entering into the turtle nesting/crawling area. Patrollers should keep a good distance away from the turtle until the turtle has either engaged in egg laying or is returning to the surf. Patrollers cordon off the area from access, record the time the turtle was first spotted, GPS the nest location, determine whether the individual is carrying tags and record any tagging information or identifying characteristics, and take pictures from a distance (only if no flash is required or a picture can be taken utilizing an infrared lens, **NO WHITE LIGHT FLASHES**).

Patrollers report the nesting activity immediately to BBNWR and the installation NRM, and then continue all other required notifications. Other notifications may include but are not limited to range control, security, VA Department of Game and Inland Fisheries (VDGIF) sea turtle program manager, Command Duty Officer, Public Affairs Officer, Installation Environmental Program Director, Public Works Officer, etc.

When a sea turtle crawl is found, BBNWR employees will respond as quickly as possible following notification. All crawl and nest sightings are recorded on the Nest and Crawl Data Sheet (Appendix H).

Once appropriate notifications have been made, area marked, and immediate need data collected the patroller should complete the remainder of the patrol to determine if any other potential nesting activity occurred on base. If the turtle is in the process of digging a body cavity, she will most likely attempt to nest. Once active egg laying begins, to save time place a marker (survey flag) at least one foot behind the cavity to indicate the position of the nest, before continuing patrol. If additional nesting activity is identified, the same process should be followed as for the original nest. The patroller should request

additional support to aide in protecting crawls and nests until BBNWR staff can get on site to obtain appropriate biological data. **No one is allowed to enter into the nest/crawl area until authorization has been given by USFWS or the installation NRM.**

BBNWR, in support of an agreement with the Virginia Aquarium (formerly the Virginia Marine Science Museum), retains four hatchlings from the first successful loggerhead sea turtle nest they manage. These hatchlings are transferred to the Virginia Aquarium and used in an exhibit for about one year. After that time, they are transported by boat to the Gulf Stream and released.

BBNWR, in support of an agreement with Warnell School of Forestry and Natural Resources at the University of Georgia, collects a single egg from nests. These eggs are used as part of the “Genetic Mark-Recapture of the Northern Recovery Unit (GA, SC, NC [and VA]) and Mitochondrial Genomics for Characterizing Genetic Structure of Loggerhead Turtles” project/study. **The project duration is from 01 June 2010 to 31 May 2013.** Detailed information regarding this project is available upon request.

Crawl Procedures

BBNWR and Virginia Department of Game and Inland Fisheries (VDGIF) will be notified if a crawl is found on property.

BBNWR employees will respond immediately to reports of crawls and/or nests.

BBNWR Procedures are as follows:

- 1) Upon notification of a crawl, BBNWR staff will collect required equipment and supplies to respond to the site. Equipment will be utilized for biological data collection, protecting the nest and if required relocating the nest.
- 2) The perimeter of the entire nesting area (including incoming and outgoing tracks) is marked with wire flags. *(may be completed in advance by Navy staff)*
- 3) If necessary, the area is cordoned off with flagging to keep the public off of the tracks and possible nesting area. *(may be completed in advance by Navy staff)*
- 4) The data required in Section I, II, and III of data sheet is collected (Appendix H). This includes the date, weather conditions, names of observers, and crawl measurements. Track width measurements are taken from the lower, wetter portions of the beach where flipper impressions are more noticeable. Time of emergence from the ocean and return is estimated based on tide marking and tide tables.
- 5) A GPS location for the nest area is obtained.
- 6) The crawl is photographed. A small dry-erase board noting the date, crawl number, location, and so forth is included in every photo.
- 7) BBNWR biologist will make a determination if the site is a false crawl, false nest, or if a nest is present. BBNWR biologist will examine any nest body cavities by carefully digging out any body cavities to determine if eggs are present. (See Nest Procedures Section of this SOP for additional details.)
 - a. The BBNWR biologist will closely examine any circular, indented or mounded areas within the nesting area for front flipper impressions to

determine how the turtle was positioned when she laid the clutch of eggs before stepping near or inside it.

- b. If flipper impressions are found, the area directly opposite them will be targeted as the most probable nest location and will be excavated first.
- c. If impressions are not found, the flattened circular area at the end of the tracks will be targeted, followed by other flattened areas.
- d. The nest will be carefully excavated by hand to ensure eggs (if present) are not damaged. The observer will usually find a small, soft section of sand, unlike the surrounding harder sands. Eggs are usually a few inches below this soft, 2"-3" opening, so extreme care must be taken.

Nest Procedures

The BBNWR biologist and installation NRM will jointly make a determination regarding the status of the nest [nest relocation or left in place (In Situ)].

Appendix K depicts the Sea Turtle Nest Management Zones for NASO DNA.

VDGIF will be notified of any nest relocation or excavation efforts.

This determination is made by examining many factors associated with the nest location, such as: height on the beach (preferably close to the toe of the dunes), above average high tide line (regular inundation by water will result in embryonic mortality); width of the beach; amount of public use; located in a military training area; area susceptible to erosion; and sloughing escarpment (susceptible to being buried too deep). If the nest is at risk from several wash-overs during high tide, and/or the beach has a lot of public use the nest will be relocated. If the nest is located well above the high tide line, and in an area with a low amount of public use, then the nest will be left in situ, unless there are other extenuating circumstances. If, for any reason, the BBNWR Biologist or installation NRM determines that the nest will be in danger of destruction if left in place, the nest will be relocated to a safer location on the closest available suitable adjacent land.

In Situ Nests

Nests located in undisturbed, wide, high, beach areas adjacent to the toe of the dunes, will be left in situ. Each nest will be protected from predators by a wire predator enclosure.

The nest will be surrounded by informational signs, wire, flagging, and reflectors to educate the public, deter human disturbance and alert permittees driving on the beach.

The nest will be checked daily to ensure no unauthorized disturbance of the nest has been made, to determine if hatching has commenced, and to document any signs of predatory disturbance and plant or pest invasion. No later than ten days before the estimated hatch date, nest sitting/monitoring procedures will be implemented (Appendix I). Nest sitting is the process where individuals watch over the nest nightly until the nest has been confirmed via excavation that no further hatching will occur from that particular nest.

Individuals conducting nest sitting are called nest sitters. The nest sitters help protect emerging sea turtle hatchlings from predators as the turtles make their way to the ocean.

Two to three weeks after the hatchlings have emerged and no more signs of hatching are present, the nest will be excavated and data will be collected. In situ nests threatened by hurricanes or storms with expected beach erosion may be relocated to the next approved most suitable adjacent ocean front beach property.

BBNWR procedures are as follows:

- 1) Once eggs have been determined present and the nest identified to stay in place, the depth from beach surface is measured (using a board placed level with the sand surface, over the nest), to the top of eggs, with a tape measure.
- 2) The nest is then covered back up ensuring sand is placed back over the eggs in the same order as removed (moist sand first).
- 3) Eggs are left in place to naturally hatch out.
- 4) Once all data has been recorded, the tracks will be raked over.
- 5) The nest will be excavated two to three weeks after the majority of hatchlings have emerged. Hatchlings may continue to emerge for two weeks after initial emergence. Data on remaining unhatched eggs including developmental stage will be recorded. Dead hatchlings and infertile eggs will be frozen in the BBNWR biology freezer.

Relocated Nests

Excavating Nests

If it is determined necessary to move a nest, it will be relocated to either a suitable ocean front beach nursery site on NASO DNA or to the nearest approved suitable adjacent land to the originating nest location. If conditions change at NASO DNA and there are no suitable nest relocation sites available on the installation or on immediately adjacent land owner property nests will be relocated to a designated nursery site at BBNWR.

- 1) The BBNWR biologist will closely examine any circular, indented or mounded areas within the nesting area for front flipper impressions to determine how the turtle was positioned when she laid the clutch of eggs before stepping near or inside it.
- 2) If flipper impressions are found, the area directly opposite them will be targeted as the most probable nest location and will be excavated first.
- 3) If impressions are not found, the flattened circular area at the end of the tracks will be targeted, followed by other flattened areas.
- 4) The nest will be carefully excavated by hand to ensure eggs (if present) are not damaged. The observer will usually find a small, soft section of sand, unlike the surrounding harder sands. Eggs are usually a few inches below this soft, 2"-3" opening, so extreme care must be taken
- 5) Before the eggs are removed, the depth from beach surface is measured (using a board placed level with the sand surface, over the nest), to the top of eggs, with a tape measure.
- 6) Using excavated sand from the original nest, a 2" layer of sand will be placed in the bottom of a cooler.
- 7) Keeping exposed eggs shaded with an umbrella, the BBNWR biologist will remove them individually from the nest being careful not to rotate the eggs. They will be placed into the cooler with a 1" border of sand between the eggs and cooler. The eggs will be placed in the cooler in a methodical and consistent manner with note taken of the order. The number of eggs in each layer will be counted and recorded. Eggs will be packed in such a manner that they are not

- touching and with two inches of sand between each layer of eggs. With large nests, a second cooler will be needed.
- 8) After all eggs are removed, the "bottom nest depth," (the depth from board level with sand surface, to bottom of empty nest) is measured. The length and width of the nest cavity at the widest and longest points is also measured.
 - 9) Once all eggs are placed in the cooler, extra sand from the nest is placed over them, and also into a separate container. This sand will be used to surround the reburied eggs at the nursery site.
 - 10) Once all data has been recorded, the tracks will be raked over and the nest cavity refilled
 - 11) Eggs will be kept at a moderate temperature, out of direct sunlight, and jolting or shifting will be avoided during the trip to the nursery.

Items Needed for Nest Response/Relocation

BBNWR equipment for nest response/relocations (Navy equipment is identified under the Equipment and Supplies section of this SOP):

- Coolers (3)
- Aluminum wire (40 feet)
- In-situ predator exclosure
- Relocation predator exclosure
- Shovels (3)
- Umbrellas (2)
- Measuring tape (40 meter)
- Post hole diggers (2)
- Dry erase board and markers (2)
- Rake
- Digital camera and extra batteries
- Extra hand-held radio and cellular phone
- Pen and notepad
- Nest and Crawl data sheet
- Black indelible marker (to mark nest # on cage)
- Wire flags
- BBNWR Sea turtle nest box
- BBNWR Sea turtle patrol box

Nest Relocation

BBNWR procedures:

- 1) At the designated relocation site a hole is dug with a shovel that will allow the reconstruction of the original nest dimensions with sand from the originating nest.
- 2) The bottom and sides of reconstructed nest cavity will be filled with sand from original nest and compacted firmly. Dry sand will be prevented from entering the cage while the shape and size of the original nest is recreated as closely as possible. The remainder of the relocated nest cavity is filled with the extra sand brought from the original nest.
- 3) The same person who removed the eggs from the original nest will transfer the eggs from the cooler(s) to the nest-cage. **THE EGGS WILL NOT BE ROTATED**

- or packed tightly. Eggs will be placed into the nest-cage in the reverse order in which they were removed from the original nest. For example, the first egg put in the cooler will be the last one to go into the cage.
- 4) For any eggs that are broken how the break occurred is recorded, and a copy of the nest data sheet is included in the freezer with the specimens.
 - 5) Once the nest is in place and fully buried a trench will be dug around the nest cavity in which to place and secure the predator enclosure cage. This is the same cage utilized for in situ nests. The cage allows hatchlings to hatch and be released without human assistance. The nest number will be affixed to the top of the cage.
 - 6) Once predator enclosure is in place, for nests not located in a nursery site a large post with sea turtle information and protection notices will be placed on all 4 sides of the nest, approximately 1-2 feet away from the cage. If a nursery site is established the nursery site will be posted and cordoned off, as such each individual nest will not receive posts and signs.
 - 7) The Nest and Crawl Data Sheet is completed and placed in the turtle nest binder in the office with photos of the nest and crawl.
 - 8) Once data collection is completed, all foot prints/tracks leading from the beach into the dunes are smoothed out with grass rakes and/or boards to reduce the chance of curious members of the public following the tracks from the beach to the nest.

Nest Monitoring

After an appropriate length of incubation (40 days for Kemps Ridley and 50 days for Loggerhead and Green sea turtle nests), **nests will be monitored** via 2 daytime nest checks and overnight “nest sitting,” in approved zones (figure 1). Day time checks will be made once in the morning and once in the afternoon. Nest sitting will occur from 8PM to 5AM. Day and night checks are looking to initially identify a cone shaped depressions in the center of the nest and for evidence of prior/undocumented emergence. The time a depression is first seen is recorded on the Hatching Data Sheet, as well as on the original Nest Data Sheet.

The majority of nests hatch out at night. Nest sitters prepare the path to the surf, count the hatchlings and protect the hatchlings from predators such as gulls, raccoons, ghost crabs and foxes.

See Appendix I for detailed Standard Operating Procedures for Nest Monitoring.

Release of Hatchlings and Nest Excavation

When hatchlings begin emerging, Navy and BBNWR personnel will be contacted immediately. Hatchlings from in situ nests will be counted and observed.

The emergence time will be recorded on the Hatching Data Sheet.

The hatchlings will be allowed to crawl to the ocean on their own. It is very important that the hatchlings make this journey without assistance. Observers will frighten off any potential predators, if necessary.

The nest will be excavated two to three weeks after the majority of hatchlings have emerged. Hatchlings may continue to emerge for two weeks. The final judgment lies with Refuge Biologist. Data on remaining unhatched eggs including developmental stage will be recorded. Dead hatchlings and infertile eggs will be frozen in the biology freezer located in the brick building.

See Appendix I for detailed SOP for nest monitoring and hatchling release procedures.

FISH AND WILDLIFE SERVICE

Ecological Services
6669 Short Lane
Gloucester, Virginia 23061

MAY 25 2012

Mr. W. David Noble
Director, Environmental Planning and Conservation
Department of the Navy
Navy Region Mid-Atlantic
1510 Gilbert Street
Norfolk, Virginia 23511-2737

Attn: Ben McGinnis, Environmental Planning and Conservation

Re: Section 7 Consultation on Repairs to
the Shoreline Protection System at
Naval Station Oceana, Dam Neck
Annex, Virginia Beach

Dear Mr. Noble:

On November 3, 2012, the U.S. Fish and Wildlife Service (Service) delivered our response to the Biological Assessment (BA) prepared by the Navy for the referenced project and its effects on the federally listed endangered roseate tern (*Sterna dougallii dougallii*) and the federally listed threatened Atlantic piping plover (*Charadrius melodus*), loggerhead sea turtle (*Caretta caretta*), green sea turtle (*Chelonia mydas*), and seabeach amaranth (*Amaranthus punilus*) in accordance with section 7 of the Endangered Species Act of 1973 (16 U.S.C. 1531-1544, 87 Stat. 884), as amended (ESA). In our November 3, 2012 response, the Service concurred with the Navy's determination of may affect, but is not likely to adversely affect for the roseate tern and seabeach amaranth. The Service requested that the Navy address concerns regarding proposed management for loggerhead sea turtles, green sea turtles, and piping plovers.

In a letter dated April 20, 2012, the Navy requested the Service's concurrence with the determination of may affect, but is not likely to adversely affect for the loggerhead sea turtle, green sea turtle, and piping plover based on modifications made by the Navy to their Integrated Natural Resource Management Plan (INRMP). Additionally, the Navy requested the Service's concurrence with a no effect determination for nesting federally listed endangered leatherback sea turtle (*Dermochelys coriacea*), hawksbill sea turtle (*Eretmochelys imbricate*), and Kemp's ridley sea turtle (*Lepidochelys kempii*). The Service concurs with the Navy's no effect determination for these three species of sea turtle because no records of nesting attempts by these species have been documented in Virginia.

Regarding loggerhead and green sea turtles, the Navy's INRMP includes a Sea Turtle Monitoring Protocol section, which sets criteria for daily monitoring of nesting sea turtles and nests, nest protection, and nest relocations. The Navy has agreed to leave nests in situ rather than

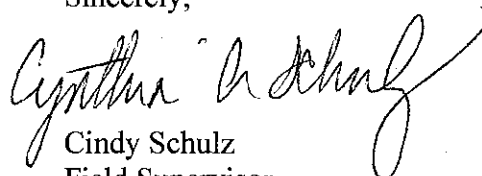

relocating nests, only moving nests when operational uses of the beach would result in the take of a nest. In such cases, the Navy will coordinate with the Service's Back Bay National Wildlife Refuge (NWR). All nest relocations by the Navy will be conducted in accordance with the methods outlined in the July 13, 2011, biological opinion issued to Back Bay NWR (copy enclosed) that provides ESA compliance for such activities at False Cape State Park, Back Bay NWR, Sandbridge Beach, Virginia Beach Resort Area, and Fort Story.

The Service does not concur with the Navy's determination of may affect, but is not likely to adversely affect for nesting loggerhead and green sea turtles, because take of turtles may occur. However, this letter amends the Loggerhead Sea Turtle Nest Monitoring and Management on Back Bay NWR biological opinion issued by the Service on July 13, 2011, to add Naval Station Oceana, Dam Neck Annex. This letter will be appended to that biological opinion and maintained as part of the decision document and administrative record. The biological opinion, this amendment, and the criteria in the INRMP together provide ESA compliance for the Navy related to monitoring of nesting sea turtles and nests, nest protection, and nest relocations for both loggerhead and green sea turtles that may occur at Naval Station Oceana, Dam Neck Annex.

The Navy has included in their INRMP guidelines for migratory bird monitoring and management. The INRMP includes protocols to ensure surveys and daily observations during sea turtle nesting periods will include monitoring for both piping plover and the federal candidate red knot (*Calidris canutus rufa*). There are no records of piping plovers nesting on beaches south of the Chesapeake Bay, where the species is considered to be an uncommon transient. Because it is unlikely that the piping plover will utilize this area and the monitoring protocols will be implemented, the Service concurs with the Navy's determination of may affect, but is not likely to adversely affect for piping plovers.

If you have any questions, please contact Mike Drummond of this office at (804) 693-6694, extension 122, or via email at mike_drummond@fws.gov.

Sincerely,

Cindy Schulz
Field Supervisor

Memorandum

To: Project Leader, Back Bay National Wildlife Refuge
(Attn: Geralyn Mireles, Wildlife Biologist)

From: Supervisor, Virginia Ecological Services *Cynthia A. Schuy*

Subject: Biological Opinion on the Back Bay National Wildlife Refuge Sea Turtle Management Program, Virginia Beach, Virginia

This document transmits the U.S. Fish and Wildlife Service's (Service) biological opinion based on our review of the subject project and its effects on the federally listed threatened loggerhead sea turtle (*Caretta caretta*) and green sea turtle (*Chelonia mydas*). The Service's Back Bay National Wildlife Refuge (BBNWR) proposes to conduct sea turtle nest management activities on BBNWR and adjacent properties along the Atlantic coast beaches extending from the Virginia/North Carolina border to the mouth of the Chesapeake Bay. This biological opinion is submitted in accordance with section 7 of the Endangered Species Act of 1973 (16 U.S.C. 1531-1544, 87 Stat. 884), as amended (ESA). Formal consultation was initiated on January 27, 2011.

This biological opinion is based on the BBNWR Comprehensive Conservation Plan (CCP) (Service 2010), emails, telephone conversations, a sea turtle management meeting, and other information provided by the Service, Virginia Department of Game and Inland Fisheries, and others. A complete administrative record of this consultation is on file in this office.

CONSULTATION HISTORY

- 08-03-10 BBNWR requested section 7 consultation on their revised CCP.
- 08-03-10 to 9-13-10 The Virginia Field Office (VAFO) and BBNWR coordinated on a management plan to review and revise sea turtle and beach management on BBNWR.
- 09-13-10 VAFO and BBNWR completed review of BBNWR CCP and completed informal consultation. BBNWR and VAFO committed to conducting a meeting and evaluation of sea turtle management prior to the 2011 sea turtle nesting season to review and revise sea turtle management and complete formal section 7 consultation, if necessary.

- 01-19-11 VAFO held a sea turtle management meeting which included BBNWR and other agencies conducting sea turtle nest management and beach management in Virginia.
- 02-02-11 VAFO received draft intra-Service section 7 consultation form on BBNWR sea turtle management.
- 02-02-11 VAFO and BBNWR reviewed and revised sea turtle nest management protocol to 06-15-11 and intra-Service consultation form.
- 06-15-11 VAFO received final revisions of the nest management protocol and intra-Service consultation from BBNWR.

BIOLOGICAL OPINION

DESCRIPTION OF THE PROPOSED ACTION

The proposed activity is to continue monitoring and managing loggerhead sea turtle nests within all sea turtle nesting areas including the beaches of BBNWR, the Virginia Beach resort area, Fort Story, the City of Sandbridge, and False Cape State Park (FCSP). These management practices will continue until the loggerhead sea turtle is no longer listed. If nests of other sea turtle species are found, including the green sea turtle, the same protocol will be followed. Activities within sea turtle nesting habitat include crawl and nest searches as well as nest relocations.

A limited number of permit holders drive vehicles on the beach at BBNWR. Permits are issued to continue traditional ingress and egress along the BBNWR beach between the permittee's residence and their full-time employment in the Norfolk-Virginia Beach area. These permits are not transferrable and will be terminated when the current permit holder is no longer able to drive, or when alternate access becomes available during the permit period. Permittee access on BBNWR beach is prohibited between 12:00 am and 5:00 am from May 1 – September 30, to reduce negative impacts on sea turtles.

Monitoring Methods -

Turtle crawl and nest searches - Morning patrols for turtle crawls and nests are conducted from about June 1 through August 31. FCSP employees patrol BBNWR and FCSP, while BBNWR staff and volunteers are responsible for the north mile of BBNWR and Sandbridge Beach. A BBNWR volunteer patrols the Fort Story and Virginia Beach resort area beaches. Personnel use ATVs for the surveys, but vehicles may be used on the beaches where permitted beach driving is allowed.

When a turtle crawl is found, BBNWR staff determine whether the crawl resulted in a nest. The presence of a "body pit" in a sea turtle crawl usually indicates the turtle attempted to lay eggs. BBNWR biologists closely examine the body pit for indented impressions and/or mounded areas that indicate the location of the female's front flippers. This dictates her position when the eggs

were deposited. If flipper impressions are found, the area directly to the rear is targeted as the most probable nest location and is carefully excavated by hand first. The fingertips are used to probe the sand for a small, soft spot, unlike the surrounding more densely packed sand. This indicates the nest location. If flipper impressions are not found, the flattened circular area at either end of the tracks is targeted. Eggs are usually a few inches below this soft, 2-3 inch opening, so extreme care is taken. The biologist gently digs by hand into the body pit to locate the egg chamber and determine if eggs are present (Service 2007). The location and date of the crawl will be recorded, whether a nest is found or not.

Nest relocation - The construction of dunes on FCSP and BBNWR beaches in the 1930s resulted in blockage of overwash and dune blowout areas which otherwise would have allowed nesting sea turtles access to higher beach elevations. Current turtle nesting is limited to lower elevation sections of the beach which are susceptible to extensive saltwater inundation, beach erosion and complete nest loss during monthly high tides, "northeaster" storms, and hurricane activity in the mid-Atlantic. Other potential threats including vehicular beach traffic and public use activity also exist on these beaches.

The following risk analysis is performed by BBNWR biologists to determine if a nest needs to be relocated. If the answer to either of the two questions below is affirmative, the nest is relocated:

- Is the nest/body pit located below the estimated mean high tide lines -- as evidenced by the wrack lines and reference to tidal conditions when personnel survey the beach?
- Is the nest in an area where there is a likelihood that vehicles will run over the nest with signage and markers installed, or that there is a likelihood that intense artificial lighting will result in hatchling disorientation?

Once nests are determined to be present, biologists wear nitrile gloves prior to handling any eggs. This minimizes potential harm to the handlers (i.e., salmonella) and to the eggs (human carried bacteria, temperature change, etc.).

Before eggs are removed, the depth from beach surface to the top of eggs is measured. Using excavated sand from the original nest, a 2 inch layer of moist sand is placed in the bottom of a cooler (Sill et al. 2000). Keeping exposed eggs shaded with an umbrella, BBNWR staff remove eggs individually from the nest, being careful not to rotate them in the process. Eggs are placed into the cooler with a 1 inch border of sand between the eggs and the sides of the cooler. The eggs are placed in the cooler in a consistent and methodical manner with note taken of the order. The number of eggs in each layer are counted and recorded. Eggs are packed in such a manner that they are not touching and with 2 inches of sand between each layer of eggs. Usually two coolers are used. After all eggs are removed, the distance from the beach surface to the bottom of the nest depth is measured (Boulon 1999, Service 2007). The length and width of the nest cavity at the widest and longest points is also measured. Once all eggs are placed in the cooler, extra sand from the nest is placed over them and into a separate container. This sand is used to surround the reburied eggs at the nursery site located on BBNWR behind the primary dune. Once all the data has been recorded, the nest cavity is refilled and the crawl brushed out with

rakes and shovels. Eggs are kept out of direct sunlight; jolting or shifting is avoided during the trip to the nursery (Mortimer 1999).

At the designated nursery site a vertical shaft large enough for the predator-proof cage is dug with a spade/shovel. The predator-proof cage is placed in the hole with the middle rib of cage at least an inch above the sand as long as bottom and top nest depths are near the original nest's depths (Service 2007). The same person who removed the eggs from the original nest transfers the eggs from the coolers to the nest cage. The eggs are not rotated or packed tightly (Jones and Musick 1988, Mortimer 1999). Eggs are placed into the nest cage in the reverse order in which they were removed from the original nest (i.e., the first egg put in the cooler will be the last one to go into the cage). The bottom and sides of the cage are filled with sand from the original nest. Dry sand is not allowed to enter the cage through the mesh while the shape and size of the original nest is recreated as closely as possible. The remainder of the relocated nest cavity is filled with the extra sand brought from the original nest. The top of the predator-proof cage is secured with three 6-inch pieces of aluminum wire, and the nest number is written on the top. For any eggs that are broken, the cause of break is recorded on a copy of the nest data sheet. The sheet is then bagged with the specimen and placed in the biology freezer at BBNWR. The Nest and Crawl Data Sheet is completed and filed at BBNWR. Digital photos of the nest and crawl are downloaded and catalogued. This information and more is included in the 2007 "Back Bay NWR Sea Turtle Nest Standard Operating Procedures."

In situ nest management - Nests that are identified and left in situ are marked with reflectors, signs identifying the site as a sea turtle nest, and flagging tape placed in the immediate vicinity of the nest (within 9.8 feet [ft]) to help prevent nests from being run over by vehicles or inadvertently disturbed. A predator guard, constructed of galvanized fence wire with a rectangular mesh size of approximately 2 inches by 4 inches is used. A trench is excavated around the nest, and the fence material is placed over the nest with flaps placed in the trenches and re-buried to prevent excavation by predators. In situ nests are monitored daily near the hatch window to determine if they are successful, and after all hatching is anticipated to be completed, the nests are excavated and the number and condition of hatched eggs, unhatched eggs, and young turtles are counted.

Action Area - The "action area" is defined as all areas to be affected directly or indirectly by the federal action and not merely the immediate area involved in the action. The Service has determined that the action area for this project consists of the beaches of BBNWR, FCSP, the Virginia Beach resort area, Fort Story, and Sandbridge.

STATUS OF THE SPECIES AND CRITICAL HABITAT RANGEWIDE

The loggerhead sea turtle was listed as threatened in the U.S. in 1978 (NMFS and Service 1991a) and the green sea turtle was listed as endangered in 1978 (NMFS and Service 1991b). In March 2010, the Service and NMFS published a proposed rule in the Federal Register to recognize nine distinct populations of loggerhead sea turtles worldwide. Under this proposed rule, the loggerhead sea turtle population that would be affected by the proposed actions is the north

Atlantic population and it is proposed to be listed as endangered (72 FR 12598). There is designated critical habitat outside of Virginia for the green sea turtles, but none has been designated for the loggerhead sea turtle.

Species/Critical Habitat Description and Life History – This account emphasizes loggerhead and green sea turtle nesting and breeding biology, which is the subject of this biological opinion. Additional information about the life history of these sea turtle species and their habitat use, behavior, and survival at sea can be found in other documents, including the loggerhead and green sea turtle recovery plans (National Marine Fisheries Service [NMFS] and Service 1991a, b, respectively), loggerhead and green sea turtle five-year status reviews (NMFS and Service 2007a, b, respectively), and other sources (National Research Council 1990).

The loggerhead is smaller, with a mean carapace length of 3 ft and a mean mass of 293 pounds (NMFS and Service 2008), compared to 3.35 ft and 300 pounds for the green sea turtle (National Research Council 1990). Green sea turtles nest primarily in the tropics and are rarer nesters at higher latitudes, while loggerheads have significant nesting populations outside the tropics (National Research Council 1990).

Life History and Population Dynamics - Loggerhead females are believed to reach sexual maturity at a minimum age of 30 years (Snover 2002). At the start of the breeding season, they migrate from foraging areas on the continental shelf to mating areas in the waters near their nesting beaches (Schroeder et al. 2003). Reproductive females exhibit the desire to return to their birthplace to lay their eggs (Miller et al. 2003). Females may be inseminated by multiple males (Bollmer et al. 1999). After mating, males return to their foraging areas while females remain in the waters near their natal beaches to emerge onto their nesting beaches to lay eggs. The following account of nesting biology is a synopsis of Miller et al. (2003).

Loggerhead females tend to nest on high wave energy, sandy ocean beaches. Gravid females emerge from the wash zone and crawl toward the dune line until they encounter a suitable nest site, typically on open sand at the seaward base of a dune, but sometimes in vegetation. The female clears away surface debris with the front flippers, creating a "body pit," then excavates a flask shaped nest cavity with her hind flippers. Loggerheads lay an average of 112 eggs per nest. After laying, the female covers the nest with sand using all four flippers. Once the nest covering phase is complete, she crawls back into the sea. Individual females may nest 1 to 6 times per nesting season, at intervals of 12-16 days, during the late spring to late summer. Intervals between nesting shorter than 10 days indicate that the previous nest attempt was likely aborted due to disturbance. Mature loggerheads nest every two to three years, on average (Schroeder et al. 2003). Nest incubation period (from laying to hatching) depends on temperature and ranges from 48 to 90 days at the extremes. Emergence of hatchlings from the nest cavity usually occurs within four days of hatch, but may take up to two weeks longer. Hatchling emergence from nests usually occurs at night when temperatures are lower and diurnal predators are inactive. Hatching success typically approaches 80 percent; after hatchlings leave the beaches, they typically fall prey to a variety of predators, including birds, fish, and sharks (National Research Council 1990).

Within the Northwest Atlantic, the majority of loggerhead sea turtle nesting activity occurs from April through September, with a peak in June and July (Williams-Walls et al. 1983, Dodd 1988, Weishampel et al. 2006). Nesting occurs within the Northwest Atlantic along the coasts of North America, Central America, northern South America, the Antilles, Bahamas, and Bermuda, but is concentrated in the southeastern U.S. and on the Yucatán Peninsula in Mexico on open beaches or along narrow bays having suitable sand (Sternberg 1981, Ehrhart 1989, Ehrhart et al. 2003, NMFS and Service 2008).

Sex ratio of hatchlings depends on temperature during incubation. Below 84° Fahrenheit (29° Celsius), more males are produced than females and above that temperature more females are produced (Carthy et al. 2003). Furthermore, fluctuating incubation temperatures often produce more females than stable temperatures, and temperature, hydration, and gas exchange during incubation can determine hatchling size, early swimming behavior, growth rate, and hatchling robustness (Carthy et al. 2003). Newly emerged hatchlings immediately head for the sea, most likely orienting toward the water by moving toward the brightest horizon and away from dark silhouettes (Lohmann and Lohmann 2003). Sea turtles are most negatively sensitive to blue and green light and loggerheads in particular are averse to yellow light (Witherington and Martin 1996). Once in the sea, hatchling loggerheads swim into the waves and eventually enter the open ocean, where they will spend the first 6.5 to 11.5 years of their lives primarily at the top of the water column, until finally moving to foraging areas on the continental shelf (Bolten 2003).

Green sea turtles nest in two, three, or four year intervals, and may lay as many as nine clutches within a nesting season (NMFS and Service 1991b). Clutch size varies from 75-200 eggs, and incubation ranges from about 45-75 days (NMFS and Service 1991b).

Nesting habitat - Less is known about factors that cue nest site selection than about anthropogenic disturbances that discourage nesting (Miller et al. 2003). Typical nesting areas are sandy, wide, open beaches backed by low dunes, with a flat, sandy approach from the sea (Miller et al. 2003). Nesting is nonrandom along the shoreline, but studies of the physical characteristics associated with nests versus random or non-nesting sites on the beach have produced varying results. Some factors found to determine nest selection are beach slope (3 of 3 studies), temperature (2 of 3 studies), distance to ocean (1 of 3 studies), sand type (2 of 2 studies), and moisture (1 of 3 studies), although the results were occasionally contradictory (Miller et al. 2003). Other factors examined but not found to be significant were sand compaction, erosion, pH, and salinity. Although the process of nest site selection is not well understood, a successful nest must be laid in a low salinity, high humidity, and well-ventilated substrate that is not prone to flooding or burying due to tides and storms and where temperature is optimal for development (Miller et al. 2003).

Status and Distribution – Approximately 58,000 loggerhead nests were estimated in the U.S. Atlantic in 1983 (NMFS and Service 1991a) and between 53,000 and 92,000 nests from 1989 to 1998 (Turtle Expert Working Group 2000). Within the northern subpopulation (north Florida to Virginia), studies in South Carolina and Georgia have documented a decline in number of nests

(Ehrhart et al. 2003). Based on genetic evidence, male loggerheads disperse freely among sites within the U.S. Atlantic population, while females are faithful to their natal sites (Bowen et al. 2005). Because sex ratio is determined by temperature during incubation (Miller et al. 2003), the northern part of the U.S. Atlantic population, apparently provides a disproportionate number of males to the larger population (Mrosovsky et al. 1984a, Hanson et al. 1998, Hawkes et al. 2007).

“Analyses of historic and recent abundance information by the Marine Turtle Specialist Group (MTSG) indicate that extensive population declines for the green sea turtle have occurred in all major ocean basins. The MTSG analyzed population trends at 32 index nesting sites around the world and found a 48-65 percent decline in the number of mature females nesting annually over the past 100-150 years. The two largest nesting populations of green turtles are found at Tortuguero, on the Caribbean coast of Costa Rica, and Raine Island, on the Great Barrier Reef in Australia, where an annual average of 22,500 and 18,000 females nest per season, respectively. In the U.S., green turtles nest primarily along the central and southeast coast of Florida; present estimates range from 200 - 1,100 females nesting annually” (NMFS 2008). In the southeast U.S., the majority of green turtle nesting occurs in Florida. The green turtle nesting population of Florida appears to be increasing based on 19 years (1989-2007) of index nesting data from throughout the state (http://research.myfwc.com/features/view_article.asp?id=27537).

Factors Affecting the Species – Numerous factors affect sea turtle growth, survival, and behavior while at sea from when they leave natal beaches as hatchlings until they mature and return to beaches to breed. These factors are discussed in detail in the 5-year status reviews for the two turtle species (NMFS and Service 2007a, b). The discussion herein is limited to factors affecting turtle nesting. Threats to loggerhead sea turtles on the nesting grounds are similar to those faced by green sea turtles. The following threats affect both species, though there may be some differences in susceptibility between the species.

Weather and tides - Storm events may erode beaches and destroy nests or cause nest failure due to flooding or piling of eroded sand on the nest site. Beach erosion due to wave action may also decrease the availability of suitable nesting habitat (Steinetz et al. 1998), leading to a decline in nesting rate on a particular beach. Sea level rise, often in combination with human development along beaches, is contributing to erosion, changes in beach characteristics, and more intensive management of many beaches.

Predation - Predation of eggs and young by mammals, birds, and ghost crabs may eliminate up to 100 percent of the nests and any hatchlings that emerge on beaches where predation is not managed (National Research Council 1990). This is a natural phenomenon that has always affected sea turtle populations, but due to reduced turtle population sizes, reduced turtle habitat availability, and unnatural population increases of nest predators in some areas, predation is a significant threat to remaining breeding populations and is actively controlled through predator exclusion and predator control on most beaches where turtles nest.

Human activities - Crowding of nesting beaches by pedestrians can disturb nesting females and prevent laying (NMFS and Service 2008). Furthermore, the use of flashlights and campfires may

interfere with sea-finding behavior by hatchlings. Beach driving, including pedestrian traffic and vehicle use, and beach cleaning pose a risk of injury to females and live stranded turtles, can leave ruts that trap hatchlings attempting to reach the ocean (Hosier et al. 1981, Cox et al. 1994), can disturb adult females and cause them to abort nesting attempts, and can interfere with sea-finding behavior if headlights are used at night (NMFS and Service 2008). Driving directly over incubating egg clutches can cause sand compaction, which may decrease hatching and emergence success and directly kill pre-emergent hatchlings (NMFS and Service 2007a). Artificial lighting on structures may affect turtle behavior in a similar manner (Witherington and Martin 1996). Beach cleaning can directly destroy nests. Poaching is a problem in some countries and occurs at a low level in the U.S. (NMFS and Service 2007a). An increased human presence may also lead to an increase in the presence of domestic pets that can depredate nests and an increase in litter that may attract wild predators (National Research Council 1990).

The rate of habitat loss due to erosion and escarpment formation may be increased during shoreline stabilization efforts, either through renourishment (Dolan et al. 1973) or placement of hard structures such as sea walls or pilings (Bouchard et al. 1998). Vehicle traffic may alter the beach profile leading to steeper foredunes (Anders and Leatherman 1987), which may be unsuitable for nesting. Improperly placed erosion control structures such as drift fencing can act as a barrier to nesting females. Non-native and/or invasive vegetation may be introduced in conjunction with beach development, which can overrun nesting habitat, make the substrate unsuitable for digging nest cavities, invade nests and desiccate nests, or trap hatchlings.

Reduced nesting success on constructed/augmented beaches could result due to sand compaction, escarpment formation, and changes in the beach profile. Sand compaction has been shown to negatively impact sea turtles, particularly concerning beach nourishment projects. Placement of very fine sand and/or the use of heavy machinery can cause sand compaction on nourished beaches (Nelson et al. 1987, Nelson and Dickerson 1988). Significant reductions in nesting success (i.e., false crawls occurred more frequently) have been documented on severely compacted nourished beaches (Nelson and Dickerson 1987, Nelson et al. 1987), and increased false crawls may result in increased physiological stress to nesting females. Sand compaction may also increase the length of time required to excavate nests and result in increased physiological stress (Nelson and Dickerson 1988).

ENVIRONMENTAL BASELINE

Status of the Species/Habitat Within the Action Area – Sea turtle nesting has regularly occurred within the action area since the 1970s. Since 1970, 93 nests have been recorded, ranging from 0-7 nests per year. The majority of nests have occurred on BBNWR and FCSP (49 and 28, respectively, BBNWR 2011). Up to 8 false crawls have also been recorded among all the sites within a year (2002; BBNWR 2011), and a total of 45 false crawls have been recorded.

Since monitoring began, 9 nests have been left in situ, and most of these occurred from 2003 to 2005, when BBNWR staff tested and evaluated in situ hatch success of nests. The majority of nests left in situ failed to hatch, presumably as a result of tropical storms causing prolonged

inundation and beach erosion, but at least one nest left in situ hatched successfully at a rate comparable to nests placed in the hatchery. Most nests have been relocated to a sea turtle hatchery on BBNWR, located behind the primary dune. Hatch success of the hatchery-produced young is high, generally ranging from 80 to 95 percent.

In 2010, preliminary genetic analysis of 9 sea turtle nests in Virginia was conducted in conjunction with a larger study of the population genetics of the northern recovery unit of loggerhead sea turtles. The 9 nests were laid by 4 different females, 2 of which also nested in North and South Carolina within the same year, as well as individuals that had not been recorded nesting outside of Virginia (Nairn and Shamblin 2011).

At BBNWR there is an artificial dune system that creates a narrow beach with a high primary dune. This combination creates poor quality nesting habitat due to the high probability of erosive washovers, egg exposure to saltwater and air, or entombment. Beaches in Sandbridge, Virginia Beach oceanfront, and other sites are generally larger, but are also subject to high levels of human activity, extensive illumination, and human traffic. Beaches at several sites are periodically renourished to maintain them in a condition to support public recreation.

Factors Affecting Species Environment Within the Action Area – The artificial dunes on BBNWR and FCSP result in narrow beaches that lack the upper beach zones and at high tides water is generally at or near the base of the dunes. The upper beach berm to dune transitional habitat, and all associated plants and animals, are generally lacking.

Beach driving results in ruts, compaction of sand, and disturbance of beach flora and fauna, and further contributes to the degraded condition of upper beach habitat. Vehicle operation on the beach may also reduce beach stability and result in increased levels of sand transport both on and off of the beaches of BBNWR and FCSP.

Human recreational use of the beaches, including grooming of the most heavily used recreational beaches in the City of Virginia Beach, result in highly disturbed beaches that lack natural beach contours, and may be more compacted than natural beaches. These areas also generally lack vegetation, and the beaches lie immediately in front of heavily developed hotel/resort areas. These areas are generally illuminated, and lack most characteristics of suitable sea turtle nesting beaches, with the exception of a broad beach profile that is maintained through periodic beach renourishing. Direct disturbance of sea turtles is also likely to occur on beaches that have high levels of human use or vehicle operation.

Beach renourishment may result in unsuitable beach conditions, including unnatural profiles, beach sand composition that is different from natural beaches in color, density, compaction, drainage, and other characteristics. These beaches may be suitable for sea turtle nesting, but may result in differences in nest success, hatchling gender, and hatchling fitness.

EFFECTS OF THE ACTION

Adverse Effects – The effects to sea turtles from nest relocation are not well studied, and vary depending on the specific practices involved in relocation. Because it is not practical to monitor the long-term survival or success of hatchling turtles, the specific effects of nest management action on BBNWR on hatchling turtles are not known.

Many studies indicate reduced hatch success of relocated sea turtle nests. Handling alone can result in damage to embryos by disrupting membrane attachment and result in reduced hatch success (Limpus et al. 1979, Parmenter 1980). Differences in the moisture regime, temperature regime, and gas exchange between nest sites selected by turtles and sites where nests are relocated also have the potential to affect hatch success (Ackerman 1980, McGehee 1990).

Movement of sea turtle nests to a hatchery site alters sex ratios of sea turtles compared to those that would occur in natural nests as a result of different incubation temperatures (Harvey and Slatkin 1982; Limpus et al. 1982; Mrosovsky et al. 1984a, b; Dalrymple et al. 1985; Dutton et al. 1985; Standora and Spotila 1985). The use of a hatchery site that is more far-removed from the beach likely generally results in warmer incubation temperatures than those which would occur at natural nest sites, and this would tend to increase the proportion of female hatchlings (Mrosovsky et al. 1984a, b). However, because the sex ratios that would naturally occur are expected to vary among years and sites depending on weather conditions, date that the nest is laid, nest depth, soil conditions, and other factors, it is not possible to determine how the sex ratio at the hatchery site would differ from what would occur naturally. Additionally, it is not possible to determine what biological, demographic, or genetic effects to the population may result from altered sex ratios, except that differences should be expected, and we presume that the naturally occurring sex ratios and the variation in those ratios over time, are appropriate to maintain the sea turtle populations.

As a result of the refinement of methods and implementation of a detailed protocol to excavate, transport, and re-bury turtle nests that are relocated by BBNWR personnel, hatch success rates are generally comparable to those that may occur naturally. Similarly, the identification and routine use of a carefully selected hatchery site at BBNWR has apparently reduced the adverse effects to turtle embryos and hatching success.

Emerging research on the homing abilities of sea turtles continues to indicate a strong tendency for sea turtles to return to their natal beaches to nest. However, to date, the cues that sea turtle hatchlings use to allow them to return to natal beaches are unknown. Irwin et al. (2004) have measured distorted magnetic fields within sea turtle egg enclosures similar to those used by BBNWR. Based on evidence that sea turtles navigate at sea using magnetic fields Lohmann et al. (1999) and Irwin et al. (2004) speculate that magnetic fields may be an important mechanism for imprinting on natal beaches, and distortion in magnetic fields may affect homing behavior and the ability to return to natal beaches.

Condition of hatchling turtles may be more important than hatch success in terms of the likelihood of survival and recruitment of young turtles. Hatchling size in some turtle species is related to the water balance of eggs while in the nest, with larger young generally resulting from eggs that occurred in wetter conditions (Janzen et al. 1995). While the relationship of hatchling size to nest environment during development has not been well studied in sea turtles, larger young may be more likely to survive (Janzen et al. 1995).

Manual release of hatchlings from the enclosed egg chamber used at the BBNWR hatchery may result in higher than normal susceptibility to predation. Release of hatchlings during daytime hours can result in higher predation, and release of hatchlings en masse may also increase predation vulnerability by attracting predators to the group of young being released. Under natural conditions, night-time emergence and emergence of relatively small numbers of individuals over time (particularly at more northerly latitudes) may result in reduced risk of loss of all young.

Additionally, holding hatchlings after emergence may result in expenditure of energy attempting to escape, interference with normal behaviors, and elevated levels of stress that may detrimentally affect the physiological condition of hatchlings. After release into the ocean, this may result in reduced likelihood of survival and reduced probability of reaching nursery areas.

While the risk of catastrophic loss of clutches cannot be estimated, relocating turtle nests to a common hatchery area increases the likelihood of catastrophic loss resulting from accidents, adverse environmental conditions, and disease and predation.

It is uncertain whether the effects of intensive nest management discussed above occur, and to what degree they affect hatchling survival. The types of effects may vary depending on the environmental conditions within the specific nesting season, and the specific conditions that each nest is subjected to during management activities and relocation. The combination of these factors results in highly uncertain effects to the sea turtle population. While hatch success has often been used as a proxy to assess reproductive success, the factors discussed above may reduce recruitment, affect population demography, and affect future use of turtle nesting beaches in the action area. For the purposes of this analysis and in the absence of specific information that would allow us to consider the expected magnitude and severity of effects that may result, we make the conservative assumption that all of these factors affect hatchling sea turtles to a degree that cumulatively results in significantly reduced survival and recruitment probability.

Beneficial Effects – Monitoring and in situ nest protection provides good information on the sea turtle nesting effort within the action area. Nest marking and predator protection reduce the potential for anthropogenic impacts including disruption of nests and predation that may result from artificially abundant predators. The educational component of the monitoring aids in improving beach visitor consideration of sea turtle nesting in the vicinity of recreational areas. While unknown, the controlled conditions of the turtle hatchery likely result in higher nest success rates than would occur if turtle nests were left in the wild, but it remains unclear whether the greater productivity results in improved recruitment of juvenile sea turtles.

Interrelated and Interdependent Actions - An interrelated activity is an activity that is part of the proposed action and depends on the proposed action for its justification. An interdependent activity is an activity that has no independent utility apart from the action under consultation. The Service is not aware of any such actions associated with this project.

CUMULATIVE EFFECTS

Cumulative effects include the effects of future state, tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the ESA. Cumulative effects likely to adversely impact nesting sea turtles include management of beaches by private individuals and municipalities, and use of beaches for recreational purposes. Management and use of beaches degrades the habitat quality for nesting sea turtles and minimizes the likelihood of successful nesting and hatching of young. Shoreline development adjacent to beaches, primarily along the developed Virginia Beach oceanfront and Sandbridge, results in disturbance of adult female sea turtles attempting to nest, minimizing the likelihood of successful nesting.

CONCLUSION

After reviewing the status of the loggerhead and green sea turtle, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the proposed BBNWR sea turtle nest management program is not likely to jeopardize the continued existence of the loggerhead and green sea turtles. No critical habitat has been designated for this species within the action area; therefore, none will be affected.

INCIDENTAL TAKE STATEMENT

Section 9 of the ESA and federal regulations pursuant to section 4(d) of the ESA prohibit the take of endangered and threatened species, respectively, without a special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harm is further defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns such as breeding, feeding, or sheltering. Harass is defined by the Service as intentional or negligent actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns, which include, but are not limited to, breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the ESA provided that such taking is in compliance with the terms and conditions of this incidental take statement.

The measures described below are nondiscretionary, and must be undertaken by BBNWR so that they become binding conditions of any grant or permit issued to any applicant, as appropriate, for the exemption in action 7(o)(2) to apply. BBNWR has a continuing duty to regulate the activity covered by this incidental take statement. If BBNWR (1) fails to assume and implement the terms and conditions or (2) fails to require the applicant to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to the permit or grant document, the protective coverage of section 7(o)(2) may lapse. To monitor the impact of incidental take, BBNWR must report the progress of the action and its impact on the species to the Service as specified in the incidental take statement.

AMOUNT OR EXTENT OF TAKE ANTICIPATED

The Service anticipates incidental take of all sea turtle nests that are relocated within the action area. While there is potential for some individual hatchlings to survive and recruit into the breeding population, the degree of uncertainty in the expected effects that relocation has on sea turtles requires expectation of loss of all relocated nests. Because the decision to relocate nests is dependent on the specific location, setting of the nest, and determination of BBNWR personnel, all nests that occur in any year may be relocated.

EFFECT OF THE TAKE

In the accompanying biological opinion, the Service determined that this level of anticipated take is not likely to result in jeopardy to the species or adverse modification or destruction of critical habitat.

REASONABLE AND PRUDENT MEASURES

The Service believes the following reasonable and prudent measures are necessary and appropriate to minimize take of nesting sea turtles.

- Conduct sea turtle monitoring and management to minimize anthropogenic intervention and maximize protection of nests.

TERMS AND CONDITIONS

To be exempt from the prohibitions of section 9 of the ESA, BBNWR must comply with the following terms and conditions, which implement the reasonable and prudent measures described above and outline required reporting/monitoring requirements. These terms and conditions are nondiscretionary.

The proposed action includes appropriate measures to avoid and minimize adverse effects to sea turtles, and no additional terms and conditions are needed to implement the reasonable and prudent measures.

The following relates to reporting requirements:

- Care must be taken in handling any dead specimens of proposed or listed species that are found to preserve biological material in the best possible state. In conjunction with the preservation of any dead specimens, the finder has the responsibility to ensure that evidence intrinsic to determining the cause of death of the specimen is not unnecessarily disturbed. The finding of dead specimens does not imply enforcement proceedings pursuant to the ESA. The reporting of dead specimens is required to enable the Service to determine if take is reached or exceeded and to ensure that the terms and conditions are appropriate and effective. Upon locating a dead specimen, notify the Service's Virginia Law Enforcement Office at 804-771-2883, 5721 South Laburnum Avenue, Richmond, Virginia 23231, and the Service's Virginia Field Office at 804-693-6694 at the address provided above.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the ESA directs federal agencies to utilize their authorities to further the purposes of the ESA by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to further minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information.

BBNWR should work with other beach owners and managers in the region to implement beach management programs for sea turtles that include efforts to minimize threats to sea turtle nesting such as artificial lighting, beach grooming, and vehicle operation on beaches.

BBNWR should develop a beach management plan that allows for overwash and natural beach processes in at least limited areas of BBNWR that will allow for sea turtle nesting. If sea turtle nest relocation continues, identify an alternate hatchery location on the beach that will allow for natural and unassisted emergence.

For the Service to be kept informed of actions minimizing or avoiding adverse effects or benefiting listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

REINITIATION NOTICE

This concludes formal consultation on the action(s) outlined in the request. As provided in 50 CFR § 402.16, reinitiation of formal consultation is required where discretionary federal agency involvement or control over the action has been retained (or is authorized by law) and if: (1) the amount or extent of incidental take is exceeded; (2) new information reveals effects of the agency action that may affect listed species or critical habitat in a manner or to an extent not considered in this opinion; (3) the action is subsequently modified in a manner that causes an effect to the listed species or critical habitat not considered in this opinion; or (4) a new species is listed or critical habitat designated that may be affected by the action. In instances where the

amount or extent of incidental take is exceeded, any operations causing such take must cease pending reinitiation.

If you have any questions, please contact Tylan Dean of this office at (804) 693-6694, extension 166, or via email at tylan_dean@fws.gov.

NASO & BBNWR Nest Relocation Agreement

DEPARTMENT OF THE NAVY

NAVAL AIR STATION OCEANA
1750 TOMCAT BOULEVARD
VIRGINIA BEACH, VIRGINIA 23460-2191

IN REPLY REFER TO:

5090

Ser 00/202

May 29, 2008

Mr. Jared Brandwein
Refuge Manager
U.S. Fish and Wildlife Service
Back Bay National Wildlife Refuge
4005 Sandpiper Road
Virginia Beach, VA 23456-4325

SUBJECT: RELOCATION OF SEA TURTLE NESTS FROM NAVAL AIR STATION
(NAS) OCEANA, DAM NECK ANNEX TO BACK BAY NATIONAL
WILDLIFE REFUGE

Dear Mr. Brandwein:

The Navy requests the assistance of the U.S. Fish and Wildlife Service (USFWS) Back Bay National Wildlife Refuge (BBNWR) staff, as an authorized agency for the relocation of endangered species nests, in the relocation of sea-turtle nests found on NAS Oceana, Dam Neck Annex.

Per the NAS Oceana, Dam Neck Annex Integrated Natural Resources Management Plan (INRMP) signed by the U.S. Navy, USFWS, Virginia Department of Game and Inland Fisheries, Navy Natural Resources personnel or trained authorized volunteers will conduct patrols of NAS Oceana, Dam Neck Annex beaches in an attempt to locate endangered loggerhead sea turtle (*Caretta caretta*) nests. The patrol covers approximately four miles and is located north of Sandbridge, and south of Camp Pendleton State Military Reservation. Patrols are to begin May 15, 2008, and end August 31, 2008, of each year.

Loggerhead sea turtles have nested on site. The frequency of nesting is sporadic and infrequent. It has been almost eight years since the last recorded nest was identified on NAS Oceana, Dam Neck Annex.

The high tide line on the majority of the beaches laps at the toe of the dune line. Beaches are also utilized for recreation and military training. These three factors combined lead the Navy Natural Resources Specialist to determine that the beaches are unsuitable for successful nest hatching on-site.

Pending concurrence with the USFWS BBNWR staff, the Navy Natural Resources Specialist recommends that in the event of a sea-turtle crawl on NAS Oceana, Dam Neck Annex, the Navy patroller immediately notify USFWS BBNWR staff of the crawl. The Navy patroller or other Navy representative would then coordinate access for the USFWS BBNWR staff onto NAS Oceana, Dam Neck Annex. USFWS BBNWR staff would then determine if a nest is present and facilitate the relocation. Navy Natural Resources staff will remain onsite to assist as needed.

Subject: Sea Turtle Nest Relocation from Oceana/Dam Neck Base
Date: Friday, June 06, 2008 11:44:14

Hi Mike,
Got the (your) official request from CO Captain Hunter of Oceana Naval Air Station to have us move sea turtle nests from the Dam Neck Naval Base beach to the nursery at Back Bay NWR. Do you need a response from us on this? Or not? Please let me know.
Thanks!

Subject: Re: Sea-turtle Nest Relocation

Hi Mike,
Likewise, it was nice talking sea-turtle stuff again.
Sure. Our (FWS) policy is that we be contacted about all sea turtle nests in the Virginia Beach area (even the Virginia Aquarium doesn't have authority to relocate sea turtle nests). So, please do contact me or Erica Locher if a nest turns up on Dam Neck Naval Base. Thanks for asking, and looking forward to continuing work with you.

Subject
Sea-turtle Nest Relocation

Hi John:

As always it was a pleasure chatting with you today regarding sea-turtle patrols and nesting.

We are drafting a formal letter per your request; however, this may take a week or so before it is ready for official submission.

In the interim and in the event that we do have a crawl, would it still be okay for us to contact your staff regarding potential nest relocations?

R,

Mike

Training Materials

Natural Resources: Personnel Training (*Sea-Turtle Nesting & Marine Species Strandings*)

Michael Wright
Natural Resource Specialist
PWD NAS Oceana

Natural Resources Mission

- **Implement and maintain a balanced and integrated program for the management of natural resources on Navy-owned lands in support of the installation mission.**
- **Ensure military readiness and sustainability while complying with natural resources protection laws.**
- **Conserve and manage natural resources entrusted to Navy care.**

Today's Topics

- **Endangered Species, Sea Turtle Nest Surveys**
- **Marine Species Stranding Patrols & Reporting**

Sea Turtle Patrols/Nesting Activity Surveys

- **Dates: 15 May – 31 August**
- **Start Time: 30min prior to sunrise, NLT 0600**
- **Location: NASO DNA & VAANG-CP Beaches**
- **Procedures:**
 - **Turtle Patrol Log Manual**
 - **ATV**
 - Preventative Maintenance
 - Safety (Operation & PPE)
 - **Beach Patrol**
 - **Contacts**

Sea Turtle Patrols/Nesting Activity Surveys

- **Perform a figure 8**

- **Patrol Begins at the Middle of DNA. Continuing North 1st to cover firing range beaches 1st.**

- If Firing Ranges are active do not go past the firing range warning signs, see attached photo(s).

- **Patrol Shoreline First**

- **Patrol Middle Beach Second**

NASO DNA Sea Turtle Patrol Reference Map (Rev May 2013)

If firing range red flags or lights are flying stop at the 1st tower with these flags or lights and wait for the guard to say or give you the thumbs up to proceed up/down the firing range beach. Active ranges should cease fire to allow you thru and there should not be an extended wait time (5 minutes max). If you have difficulties give Michael Wright a call on her cell phone.

Note: You should be clearing these beaches 1st, you should be completed with the Firing Range, MACS24, and VAANG beaches NLT 0700, unless you locate a crawl.

Ideally, unless something major happens you should be done with your entire patrol by 0730.

0.5

Miles

-  Storage Shed
-  Vehicle Beach Access
-  ATV Beach Access
-  Walkover Beach Access
-  Range Restricted Beach Access
-  Alternate Route

No Alt. Route
as of May 2014

South End of Patrol Area (Sandbridge/Dam Neck Annex border)

North End of Patrol Area (VAANG-CP/Croatan Beach border)

Firing Range Warning Signage

- **Read Sea Turtle Standard Operating Procedures (SOP) Manual and all associated Appendices.**
 - **Sign Signature Page Acknowledging Receipt and Review of the Sea-turtle SOP. Signature page to remain on file at the installation Natural Resource Office, Building 820.**
 - **Note: Face to Face/Classroom training, goes over the SOP and Appendices, but one should read the SOP to ensure they understand the full details.**
 - **If there are any questions, contact the installation Natural Resources Manager.**

• **Identification of Crawls & Sea Turtles:**

- **Attached Photos were provided by the installation Natural Resources Program or from Michael Wright's personal photos.**
- **Photocopies of the sea turtle sections of the following book/guide are utilized in this training presentation to help explain how to identify sea turtles species: "Guide to Marine Mammals and Turtles of the U.S. Atlantic and Gulf of Mexico," published in 1999, authored by Kate Wynne and Malia Schwartz. Copies of the book have been purchased and are available for use.**

Examples of Loggerhead Sea Turtle Crawls

Crawl with Nesting Pit (normal tracks)

False Crawl (Crawl w/no Nest)

Crawl with Nesting Pit (X-cross tracks)

Example of Uncovered Loggerhead Sea-Turtle Nest

Note: Eggs look like white ping-pong balls. Nest typically contains anywhere from 60 to 120+ eggs. A turtle can nest multiple times in a season.

Example of Hatched Loggerhead Sea Turtles ("Hatchlings")

Note: These photos are of hatchlings from a nest just south of NASO Dam Neck Annex (NASO DNA) on the north end of Back Bay National Wildlife Refuge near the community of Sandbridge adjacent and directly south of NASO DNA.

Hatchlings fit in the palm of an average sized human hand. They typically hatch after dark and just before sun-rise and are guided by the light of the moon towards the water. City lights typically interfere with this process and misguide the hatchlings exhausting them and leaving them vulnerable to predation.

During early morning patrols keep an eye out for hatchlings starting in July, in the possible but unlikely event that a nest/crawl was missed during daily patrols.

15June2012 Kemps Ridley Sea Turtle Nesting NASO Dam Neck Annex

Unlike the Green or Loggerhead Turtles, which rarely lay nests during the afternoon daylight hours, it is not uncommon for Kemps Ridley's to lay nests during the day. This turtle was on the beach from ~1430-1530.

Adult Female Turtle Laying Nest:

Adult Turtle Crawl:

Notice the difference in the width of the tracks and the body cavity between the Loggerhead and the Kemps Ridley crawls. Kemps Ridleys (up to ~100 lbs.) are the smallest and Loggerheads (up to ~300 lbs) are the largest sea turtles currently nesting on our beaches.

Adult Turtle Flipper Prints & Closer view of Crawl Prints:

Nest Left In-Situ with Predator Guard/Cage and Signage:

Nests left on site (in-situ), not relocated, are protect with a predator guard to keep out predators such as foxes and racoons during egg incubation. The predator guard is designed to allow the turtles to hatch and work their way to the ocean without being held captive in the cage. Nests relocated to dunal nursery sites have enclosed cages.

In-situ nest are clearly marked and posted to provided general information, to clearly indicate that disturbance of the nest is prohibited and is a violation of Federal Law, and minimize the potential for vehicles to drive over and crush the nest.

Unlike all the other animals in this book, sea turtles are reptiles—taxonomically distant and distinct from marine mammals. They have dry, scaly skin, which is relatively impermeable to water; are ectothermic; and like many reptiles, lay eggs. The most distinguishing characteristic of sea turtles is their shell, a defining trait they share with all turtles. From terrestrial ancestors, marine turtles evolved secondarily to a marine existence. This resulted in a strongly tapered, streamlined shell and powerful, rigid, paddlelike forelimbs that “fly” through the water with amazing speed, without compromising the ability to move on land—an incapable confine for animals that must come ashore to lay their eggs.

Strong swimmers, sea turtles are capable of making deep, repetitive dives to search for food and can remain submerged for long periods of time, such as when resting on the ocean bottom. In fact, sea turtles spend little time at the water surface—often just long enough to take a breath of air—though some sea turtles, such as the leatherback and loggerhead, can be found basking at the water

surface. Basking in the sun may aid in maintaining a body temperature higher than that of the surrounding water, allowing for survival in colder Atlantic waters.

Life History

Sea turtles migrate, sometimes long distances, from foraging grounds to shallow-water nesting grounds to mate, nest, and lay their eggs. The female emerges from the water and digs a flask-shaped nest in the sand with her hind flippers, then lays 50 to 170 (depending on the species) ping-pong ball-shaped eggs. After covering the nest with sand, she returns to the water. She will nest several times in one season. After the nesting season, she migrates back to the foraging grounds. In most species of sea turtles, mature females do not nest every year, remaining instead at the foraging grounds in off years.

Following an 8-to-10-week incubation, the eggs hatch, and the hatchlings dig their way out of the nest, usually emerging at night. They make their way to the water, orienting them-

selves to the brightest horizon (hatchlings disoriented by brightly lit beaches become more vulnerable to hazards such as predation and dessication). Once in the water, they swim rapidly—“swimming frenzy”—until they reach the open ocean, where many species spend the “lost years” living and feeding in floating sargassum. They “reappear” as juveniles in feeding grounds shared with adults or, in some cases, migrate to developmental feeding grounds. But some species, such as the leatherback, spend their entire lives in a pelagic existence, coming inshore only to mate and nest.

Courtesy of CEE

Conservation

Probably the single greatest threat to sea turtle survival in U.S. Atlantic waters is entanglement in active and discarded fishing gear. Sea turtles that become entangled and cannot reach the surface to breathe become increasingly anoxic (oxygen depleted) and comatose. Not all turtles in this condition are dead. Although they are inactive and their heart rate is negligible, recent research shows that they may be able to recover.

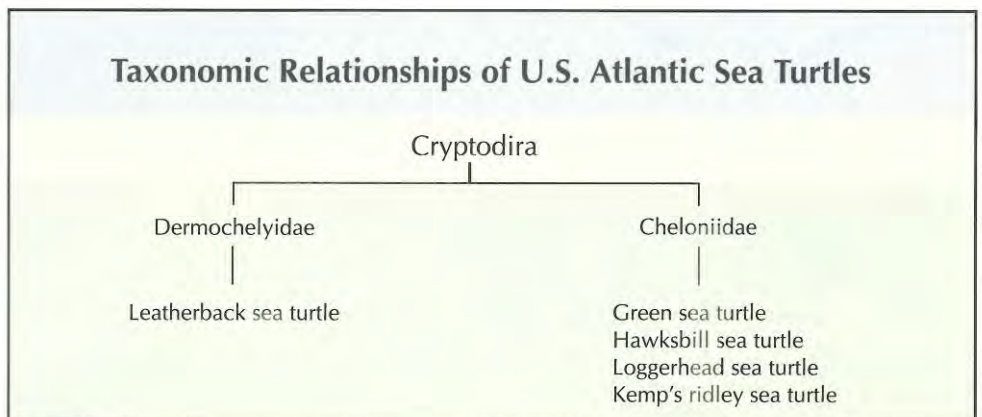

You can help sea turtles found in this condition: Place the turtle in the shade, carapace-up, and keep it moist with seawater until flipper activity resumes. Recovery may take more than 2 hours. Remember: Regulations require that you return the turtle to the water.

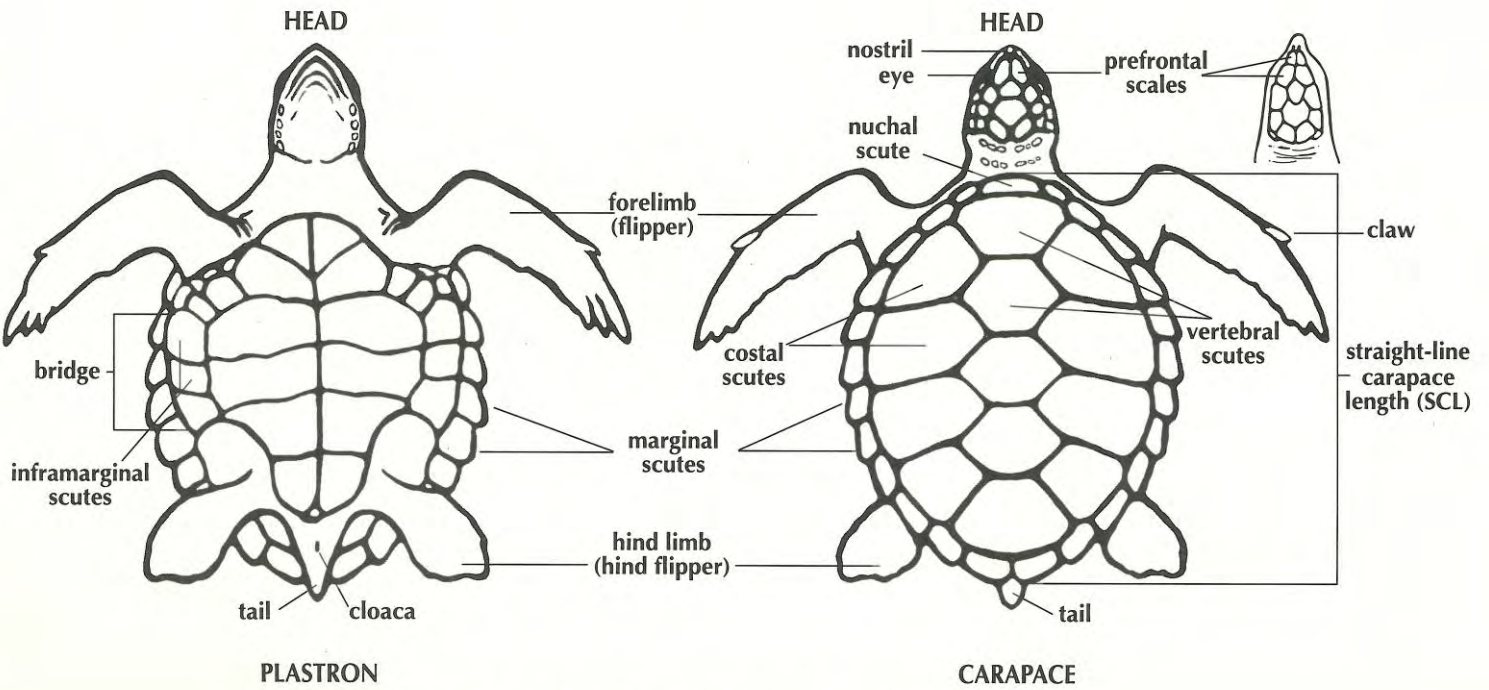

Dermochelyidae

Carapace and plastron lack horny shell scutes, being covered instead by leathery skin. Underlying bones of the shell are almost completely lost, their place taken by a mosaic of thousands of tiny bones imbedded below the leathery skin. Forelimbs are smooth, broad, and paddlelike and lack claws. This family is represented by a single living species, *Dermochelys coriacea*, the leatherback sea turtle.

Cheloniidae

Family composed of the “hard-shelled” sea turtles. Shell is covered with horny scutes, variable in number, but usually including 5 vertebral scutes, 4 or 5 pairs of costal scutes, and 3 or 4 pairs of inframarginal scutes. Carapace is oval to heart-shaped. Forelimbs are covered with scales, are paddlelike, with elongated digits and 1 to 2 claws on each forelimb.

Note: Sex of sea turtles is difficult to determine through external morphology.

HAWKSBILL SEA TURTLE

KEMP'S RIDLEY SEA TURTLE

GREEN SEA TURTLE

LEATHERBACK SEA TURTLE

LOGGERHEAD SEA TURTLE

SIZE: Adult shell to 1.8 m SCL (6 ft), 727 kg to 1 ton.

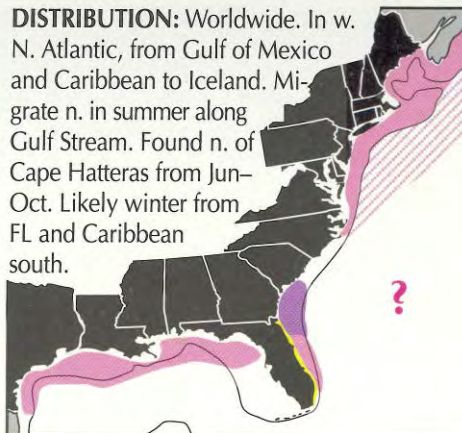

BODY/SHELL: Largest living turtle. **Lacks shell scutes, head and body scales.** Covered by **leathery skin.** Carapace divided longitudinally by 7 ridges; hingeless plastron divided by 5 ridges; head short, blunt, with **2 cusps projecting from upper jaw.** Limbs **clawless.**

COLOR: **Only black marine turtle in Atlantic,** but often spotted with white or pinkish blue on undersides of head, limbs, body.

BEHAVIOR: Solitary at sea, but adults may congregate off nesting beaches or while feeding on jellyfish. Relatively fast swimmers (>10 knots), breach occasionally. Spend majority of time feeding or basking near or at water surface. Most dives <200 m (660 ft), <20 min; but can dive to 1,300 m (4,290 ft).

DISTRIBUTION: Worldwide. In w. N. Atlantic, from Gulf of Mexico and Caribbean to Iceland. Migrate n. in summer along Gulf Stream. Found n. of Cape Hatteras from Jun–Oct. Likely winter from FL and Caribbean south.

HABITAT: Highly pelagic, migratory. Occasionally enter shallow waters of bays and estuaries.

DIET: Primarily jellyfish.

LIFE HISTORY: Courtship and mating thought to occur off nesting beaches. In w. Atlantic, nesting occurs Apr–Nov on e. coast of FL, Caribbean, and s; rarely in TX, GA, SC, NC. Mature females may oviposit >6 times per year, laying 50–170 eggs per clutch. Incubation lasts 53–74 days. Little is known about hatchling, juvenile movements.

STATUS AND HUMAN INTERACTIONS: Endangered. Principal threats in U.S. Atlantic are entanglement in fixed fishing gear, boat collisions, debris ingestion. Threats to eggs and hatchlings include nesting beach alteration and artificial lighting.

Right photo: The leatherback lacks a bony shell. Instead, the shell is covered by a thin, black, leathery skin raised in 7 ridges.

The two cusps on the upper jaw of a leatherback assist in grasping slippery jellyfish prey. ▼

Larry Wood/MCJB

Scott Kraus/NEA

NOTE: Mortality of marine turtles found entangled/entrapped can be reduced: Place turtle carapace-up; keep moist and in shade until flipper activity resumes.

SIZE: Avg adult shell 1 m SCL (3.3 ft); avg weight 150 kg.

BODY/SHELL: Largest hard-shelled sea turtle. **Carapace smooth**, heart-shaped or oval, covered with horny scutes, with **4 pairs costals**, **nuchal scute not touching first costal**. **Head relatively small, rounded, with 1 pair prefrontals**. One claw on each forelimb.

COLOR: Carapace and head olive to brown, some with mottled, radiating, or wavy pattern on scutes; plastron yellowish white. Hatchlings black above, white below.

BEHAVIOR: Can migrate great distances from nesting beaches to foraging grounds.

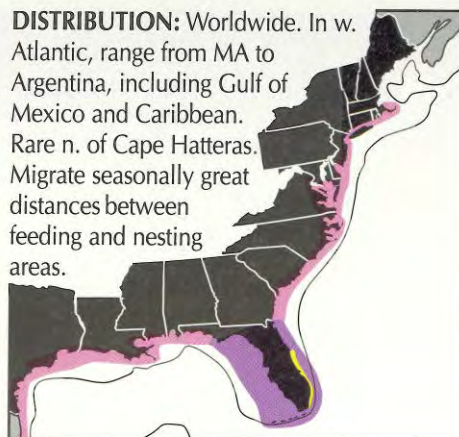

HABITAT: Pelagic as hatchlings (to 0.25 m SCL), then move to benthic feeding grounds; juveniles and adults congregate in relatively shallow, protected waters containing seagrass, macroalgae "pastures;" also coral reefs, worm reefs, rocky bottoms.

CAN BE CONFUSED WITH:

Greens can be distinguished by their smooth carapace and only 1 pair of prefrontal scales between the eyes. Note that carapace color is highly variable. ▶

DIET: Pelagic-stage hatchlings and juveniles eat molluscs, jellyfish, crustaceans. Diet shifts to seagrasses, macroalgae as juveniles mature and move inshore.

LIFE HISTORY: Mating occurs off nesting beaches close to shore. Mature females nest Mar–Oct (peak May–Jun). U.S. nesting occurs on tropical beaches in FL, Puerto Rico, U.S. Virgin Islands. Females oviposit avg 2–3 times per season, laying 100–150 eggs per clutch. Incubation lasts 45–60 days.

STATUS AND HUMAN INTERACTIONS: Breeding population endangered in FL; threatened elsewhere. Historically exploited for eggs, meat. In U.S. Atlantic, degradation of nesting and feeding habitats, boat collisions, fishing gear entanglement, and disease are serious problems.

Tom Doty/CETAP

NOTE: Mortality of marine turtles found entangled/entrapped can be reduced: Place turtle carapace-up; keep moist and in shade until flipper activity resumes.

SIZE: Avg adult shell 0.92 m SCL (3 ft), can reach 1.2 m; avg adult weight 115 kg.

BODY/SHELL: Carapace covered with horny scutes, with **5 pairs costals, nuchal scute touches first costal; 3 pairs inframarginals present on bridge.** Head large, broad, with 2 pairs prefrontals; jaws powerful for crushing prey. Two claws on each forelimb.

COLOR: Carapace and head yellow-orange to reddish brown, often covered by barnacles, fouling organisms; plastron yellowish to light brown. Hatchlings light brown to almost black.

BEHAVIOR: Hatchlings engage in "swimming frenzy" for about 20 hrs after hatching, carrying them offshore. May live in sargassum rafts until reach approx 0.45 m SCL. Juveniles, adults tend to congregate at same nearshore feeding grounds each year. Loggerheads may hibernate in winter.

HABITAT: Pelagic as hatchlings, then migrate to nearshore waters. Adults, juveniles inhabit subtropical continental shelf and coastal waters (bays, lagoons, river mouths).

Loggerhead Sea Turtle

CAN BE CONFUSED WITH:

Kemp's Ridley Sea Turtle

Hawksbill Sea Turtle

Green Sea Turtle

DISTRIBUTION: Worldwide. In w. Atlantic, from Newfoundland to Argentina, including Gulf of Mexico and Caribbean. Migrate n. over continental shelf in summer; found n. of Cape Hatteras May–Oct. Retreat s. in winter.

DIET: Primarily benthic feeders on crustaceans, molluscs.

LIFE HISTORY: Sexes thought to migrate together from foraging sites to nesting beaches, where mating occurs in surface waters. Nest Apr–Sep (peak Jun–Jul) on temperate beaches from s. NJ to FL; major U.S. nesting area is e. FL. Mature females may oviposit 3–6 times per season, laying 95–150 eggs per clutch. Incubation lasts 49–71 days.

STATUS AND HUMAN INTERACTIONS: Threatened. In U.S. Atlantic, greatest known mortality is entanglement in towed or fixed fishing gear. Boat collisions are also a serious problem. Threats to eggs, hatchlings include nesting beach degradation (development, erosion control, etc.) and artificial lighting.

Tom Dohy/CETAP

NOTE: Mortality of marine turtles found entangled/entrapped can be reduced: Place turtle carapace-up; keep moist and in shade until flipper activity resumes.

SIZE: Avg adult shell 0.66–0.86 m SCL (2.2–2.8 ft); avg weight 82 kg.

BODY/SHELL: Carapace shield-shaped, covered with **thick, horny, overlapping scutes, with 4 pairs costals, nuchal scute not touching first costal.** Head narrow with 2 pairs prefrontals, **beak-like snout.** Two claws on each forelimb.

COLOR: Carapace pattern “tortoiseshell,” with radiating brown, black, amber streaks; head scales dark brown with yellow margins; plastron yellow.

BEHAVIOR: Migrate between feeding and nesting grounds. Adults, large juveniles capable of making deep dives (>100 m) to forage on deep-water sponges.

HABITAT: Pelagic as hatchlings and juveniles (to 0.25 m SCL), then move to feeding grounds in rocky or coral reef waters in the tropics, subtropics. Pelagic and benthic habitats poorly understood. Juveniles favor shallow waters, adults may forage in deeper waters.

Hawksbill Sea Turtle

CAN BE CONFUSED WITH:

Green Sea Turtle

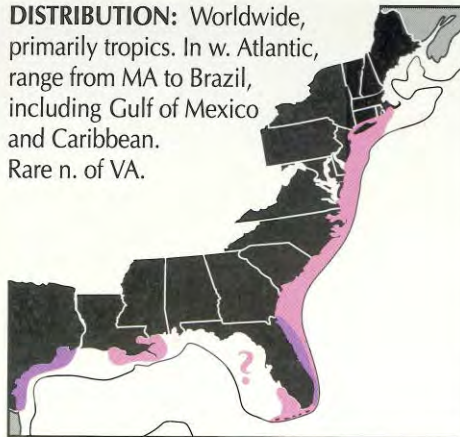

Loggerhead Sea Turtle

Kemp's Ridley Sea Turtle

DISTRIBUTION: Worldwide, primarily tropics. In w. Atlantic, range from MA to Brazil, including Gulf of Mexico and Caribbean. Rare n. of VA.

DIET: Primarily sponges and benthic invertebrates.

LIFE HISTORY: Nesting occurs year-round. In w. Atlantic, nest on beaches in Caribbean, C. and S. America. Rare nesting in FL. Mature females oviposit avg 4–6 times per season, laying 140–160 eggs per clutch. Incubation lasts 47–77 days.

STATUS AND HUMAN INTERACTIONS: Endangered. Highly exploited worldwide for tortoiseshell, and more recently, whole stuffed turtles. In U.S. Atlantic and Caribbean, degradation of coral reefs and nesting beaches remains a serious problem.

Rob Nawojchik/MA

NOTE: Mortality of marine turtles found entangled/entrapped can be reduced: Place turtle carapace-up; keep moist and in shade until flipper activity resumes.

The bird-like “beak” of the hawksbill aids in feeding from crevices and hard surfaces, such as coral reefs.

SIZE: Smallest sea turtle; adult shell 0.58–0.80 m SCL (1.9–2.6 ft); weight 40–50 kg.

BODY/SHELL: Carapace heart-shaped, covered with horny scutes, with **5 costals, nuchal scute touches first costal; 4 inframarginals with pores present on bridge.** Head broad, but pointed, with 2 pairs prefrontals; jaws powerful and strongly ridged. One claw on each forelimb.

COLOR: Carapace light olive to gray; head and limbs gray; plastron white. Hatchlings dark gray to black.

BEHAVIOR: Adults found at feeding grounds primarily in the Gulf of Mexico. Juveniles feed in nearshore waters along the East Coast and Gulf; migrate s. for winter. Some remain too long, are caught in cold water, become cold-stunned, and die.

HABITAT: Pelagic as hatchlings (to 0.20 m SCL), then enter nearshore waters, primarily those with seagrass beds or mud bottoms favored by crabs. Adults, juveniles utilize similar inshore coastal waters.

Kemp's Ridley Sea Turtle

CAN BE CONFUSED WITH:

Loggerhead Sea Turtle

Hawksbill Sea Turtle

Green Sea Turtle

The smallest sea turtle, Kemp's ridley can be distinguished by a heart-shaped carapace and a large, broad head.

DISTRIBUTION: Atlantic, primarily w. N. Atlantic. Range: Nova Scotia to Mexico. Adults and juveniles found year-round in Gulf of Mexico; many juveniles migrate n. along the East Coast in summer, then retreat s. in fall.

DIET: Primarily crabs but also shrimp, molluscs.

LIFE HISTORY: Both sexes migrate to waters off nesting beaches to mate. Ridleys are unique: Females may nest in mass aggregations called "arribadas" (Spanish for "arrival"); they nest during the day; and 99% of all nesting occurs on several beaches near Rancho Nuevo, Mexico. Some single nesting occurs on beaches in Mexico, TX, FL, SC, NC. Nest Apr–Aug (peak Apr–Jun) and oviposit avg 3 times per season, laying avg 103 eggs per clutch. Incubation lasts 48–65 days.

STATUS AND HUMAN INTERACTIONS: Endangered. Egg collection, taking of nesting females, and entanglement in towed fishing gear have decimated the species. Mexican and U.S. law now prohibits taking of eggs and turtles. Entanglement in trawls remains the primary source of mortality despite TED regulations.

NOTE: Mortality of marine turtles found entangled/entrapped can be reduced: Place turtle carapace-up; keep moist and in shade until flipper activity resumes.

Appendix F

Sea Turtle Patrol Log

Appendix G

Stranding Reporting Procedures and Datasheet

STRANDING REPORTING PROCESS

1. Contact the VA Aquarium Stranding Team (757-385-7575, 0830-1630 hours or 757-385-7576 for afterhours live stranding emergencies) for sea turtle, sturgeon, and marine mammal strandings. For fish strandings (such as Sharks, mass non-shark fish strandings, sturgeon, large unusual fish strandings, or any other protected fish species of concern) contact the Virginia Aquarium's Curator of Fishes, Beth Firchau, 757-434-0745.
2. Fill-out the STRANDING REPORT FORM (see below) for on-land or open water identified strandings and Return to your installation Natural Resources Manager (NRM), ASAP.
3. Notify your NRM of the Stranding(s), immediately. If the stranding involves marine mammals or sturgeon provide them the information in the stranding report form. (Michael Wright, 757-373-8531) The NRM will notify the NAVFAC MIDLANT EV22 Subject Matter Expert (SME) and NOAA POCs, as appropriate.
4. The NRM will Call OPNAVINST 3100.6H Reportable Strandings into CNO N45, Washington DC 703-695-5271 (Frank Stone), 703-342-6455 (Bob Gisiner) &/ or the NOC Battalion Watch Captain (703-692-9284); COMLANTFLT 757-836-5221 (Richard "Jene" Nissen); and NAVFAC MIDLANT Core (Jessica Bassi, 757-341-0493).
 - o The following strandings are OPNAVIST reportable events:
 - Any stranding that involves a Northern Right Whale or Beaked Whale.
 - Any stranding that involves a floating whale in open water.
 - Any discovery of a whale stranded ashore.
 - Any mass stranding (two or more animals) of whales, or dolphins that results in coverage by the local or national media.
 - Claims of unusual marine mammal behavior reported in the media, or by National Marine Fisheries Service, a private party or non-governmental entity in which naval operations, exercises or training have been implicated are reportable events.
 - Any other incident involving marine mammals, which have significant media interest and may implicate naval operations at sea are also reportable events. Examples of such marine mammal events might include manatee strandings or mass strandings (two or more) of dolphins, seals, sea lions, otters, etc.
5. If it is determined that an OPREP 3 Navy Blue report is required related to the stranding event the Natural Resources Manager will coordinate with the CDO to complete the initial report.
6. Enter Stranding Report Data into the NASO Natural Resources Access Database.

Note: Regarding Sea turtles, Marine Mammals, Sturgeon and/or other Protected Species, ONLY an individual/organization containing the appropriate Regulatory Issued Permits (e.g., USFWS, NOAA, VAST, VDGIF, VCU, etc.) is legally authorized to relocate/touch these animals. The NASO NRM has obtained a NOAA-NMFS issued permit regarding sturgeon salvage and is inquiring regarding obtaining permits regarding sea turtles with USFWS via VDGIF.

Key Contacts:

- Navy on Scene Coordinator (NOSC) = 757-341-0449(o); 757-636-4378(c)
- Regional Operations Center (ROC) = 757-322-2609(24hrs); 757-322-3093
- NASO Command Duty Officer (CDO) = 757-438-3159 (24hrs)
- NASO Natural Resources Manager (NRM) = 757-433-3461(o); 757-373- 8531(c)
- NASO Conservation Law-enforcement Officer (CLEO) = 757-433-2151(o); 757-635-5436(c)
- NASO Environmental Program Director = 757-433-3437(o)
- NAVFAC MIDLANT Core Marine Animal Media Manager = 757-341-0493(o)
- NAVFAC MIDLANT Core Natural Resources Supervisor = 757-341-0495(o)
- NAVFAC MIDLANT Core Environmental Conservation and Planning Director = 757-341-1988(o)
- NOAA Sturgeon POC = 978-282-8473(o)
- Virginia Aquarium Stranding Team (VAST) = 757-385-7575; 757-385-7576(emergency#)

Note: The ROC and the CDO should be able to assist with locating and getting equipment (if available) for emergency response. Jessica Bassi has developed the NAVFAC MIDLANT Regional Stranding Investigation Assistance Plans (RSIAP), which has received final approvals.

Note: The RSIAP indicates that the CDO will coordinate trying to obtain equipment to assist with marine animal stranding response, when needed. The need would be for large animal (e.g., whales) and mass stranding events (e.g., multiple dolphins stranding at the same time). Heavy equipment that can access and operate on a beach would be needed, primarily fork-lift type vehicles and vehicles that can dig large deep holes for burials.

- MACS-24 has provided emergency assistance previously.
 - Sgt. Leonard Oleson 757-492-6465 x229
 - GySgt Eric Orth 757-492-3878/3891
 - Maj Woodworth 757-492-6465 x234
- NSWDG may be able to assist (CLEO, Lawrence McGrogan may have additional POCs)
 - Keith Crutchfield 757-862-9006(o); 757-619-1145(c)
 - John Puvogel 757-862-9004(o)
 - Ken O'Malley 757-862-9002(o)
 - Sally Torgler 757-862-9001(o)
- VAANG Camp Pendleton CO has indicated that they have a battalion that could assist us upon request with equipment needs
 - SSG Reynaldo Abeng 757-493-3123(o); 757-2024268(c)
 - SFC Randy Carter 434-294-2100(c)
 - LTC Elena M. Scarbrough 757-493-3128(o); 434-480-7465(bb)

STRANDING REPORT FORM

1. Date of incident: _____
2. Time of incident(local vice zulu time): _____
3. Type of incident (turtle, dolphin, whale, seal, shark, sturgeon, other):
-

4. Location of incident(include lat/long; base or property name; and geographical location, floating in Atlantic Ocean nearshore, laying on beach in surf, laying on beach in rack line, laying on beach between the dune and the rack line, etc.) :
_____ / _____

5. Identity of person who discovered event (e.g. military, civilian, other government personnel):

6. Identity of person preparing this report (name, command, job position):

7. Time strandings commenced: _____

8. Time of last stranding: _____

9. Stranded Marine Animal Condition:

Species	Total #	Alive	Dead	Severely Decayed	Necropsy Completed (Yes, No, In Process)

10. Who performed or will be performing the necropsy.

11. Date & Time VA Aquarium Stranding Team was notified:

12. Date & Time VA Aquarium Stranding Team Responded on site:

13. Were Photos Taken, If so by whom, attach photos to report (send digital copies to the installation Natural Resources Manager):

14. Additional Notes:

15. Below Space Left Open for Additional Notes or Drawings:

REGIONAL STRANDING
INVESTIGATION ASSISTANCE PLAN

BETWEEN

NORTHEAST REGION, NATIONAL MARINE FISHERIES SERVICE OF THE
NATIONAL OCEANIC AND ATMOSPHERIC ADMINISTRATION
DEPARTMENT OF COMMERCE
AND
MID-ATLANTIC REGION, UNITED STATES NAVY
DEPARTMENT OF DEFENSE

I. PURPOSE

The purpose of this Regional Stranding Investigation Assistance Plan (RSIAP or Plan) is to implement the National Memorandum of Understanding (MOU) (Attachment 1). The MOU establishes a framework consistent with federal fiscal law requirements whereby the Navy may assist the National Marine Fisheries Service (NMFS) with the Phase 1 and 2 investigations (See attachment (2) for definition of Phase 1 and 2, USE and MTEs) of uncommon stranding events (USE) during major training exercises (MTE) in specific geographical locations through the provision of in-kind services as specified later in this document. This Plan is intended to act as an instrument to more effectively respond to USEs during MTEs, subject to fiscal and procurement law requirements, and consistent with resource availability, military security, logistical feasibility, and operational or installation commitments. Additionally, this RSIAP ensures the optimum efficiency and maximum benefit to the United States by establishing a framework for cooperation and coordination between NMFS Northeast Region and Mid-Atlantic Region, U.S. Navy (the Parties) on marine mammal health and stranding responsibilities. This Plan is necessary and essential to further the mission of the Parties in that it will serve as an umbrella agreement that sets forth the general terms and conditions under which the Parties may seek cooperative programs and activities.

II. BACKGROUND

a. Through a National Coordinator and six regional coordinators, NMFS oversees, coordinates, and authorizes marine mammal stranding responses, associated activities and training to personnel. To respond to strandings, volunteer stranding networks have been established in all coastal states and are authorized through Letters of Authority from the NMFS regional offices.

b. Pursuant to the Atlantic Fleet Active Sonar Training (AFAST), Southern California Range Complex (SOCAL), Hawaii Range Complex (HRC), Mariana Islands Range Complex (MIRC), and Gulf of Alaska (GOA) Marine Mammal Protection Act (MMPA) Final Rules, the National MOU was created to establish a framework whereby the Navy can assist NMFS with Phase 1 and Phase 2 Investigations of USEs during MTEs. The National MOU requires completion of

RSIAPs for these areas to further identify regional assets that might be requested by NMFS during a USE. In addition, the National MOU requires each RSIAP to identify high priority species based on the USE species identified below:

(1) Uncommon Stranding Event (USE) – A stranding event that takes place during a major training exercise (MTE) and involves any one of the following:

(i) Two or more individuals of any cetacean species (not including mother/calf pairs), unless of species of concern listed in the next subparagraph found dead or live on shore within a 2-day period and occurring within 30 miles of one another.

(ii) A single individual or mother/calf pair of any of the following marine mammals of concern: beaked whale of any species, dwarf or pygmy sperm whales, melon-headed whales, pilot whales, right whales, humpback whales, sperm whales, blue whales, fin whales, or sei whales.

(iii) A group of 2 or more cetaceans of any species exhibiting indicators of distress.

III. AUTHORITIES

a. NMFS and Navy regions are authorized to enter into RSIAPs pursuant to the Marine Mammal Protection Act, 16 U.S.C. § 1361 et seq., and other authorities, as described in the National MOU (See paragraphs 3 & 5.e. of MOU).

b. The Economy Act, 31 U.S.C. § 1535, which provides that an agency may place an order with a major organizational unit within the same agency or another agency for goods or services if:

(A) Amounts are available;

(B) The ordering agency decides the order is in the best interest of the United States Government;

(C) The agency to fill the order is able to provide or get by contract the ordered goods or services; and

(D) The agency decides ordered goods or services cannot be provided by contract as conveniently or cheaply by a commercial enterprise (payments must be made on the basis of the actual cost of goods or services provided)

IV. SCOPE

a. INSTALLATIONS AND POCs FOR EACH INSTALLATION.

This Regional Stranding Investigation Assistance Plan is intended to address an agreement between Navy Region MIDLANT and NMFS Northeast Region. Navy installations covered by this agreement include the following:

1.

Cheatham
Annex,

Yorktown, VA

POC: Trevor Manning (IEPD), telephone 757-887-4086, e-mail;
trevor.manning@navy.mil and (PWO) LT Trevor Bingham, telephone 757-887-4636,
email; trevor.bingham@navy.mil

2. Naval Weapons Station (NWS) Yorktown, Yorktown, VA
POC: Trevor Manning (IEPD), telephone 757-887-4086, e-mail;
trevor.manning@navy.mil and (PWO) LT Trevor Bingham, telephone 757-887-4636,
email; trevor.bingham@navy.mil

3. Naval Station Norfolk, Norfolk, VA
POC: Sharon Bauman (IEPD), telephone 757-341-0523, email; Sharon.bauman@navy.mil and (Port Ops) LCDR Morris Oxendine, telephone 757-442-0942, email; morris.oxendine@navy.mil

4. Norfolk Naval Shipyard, Portsmouth, VA
POC: Valerie Walker (IEPD), telephone 757 396-8270, email; valerie.walker@navy.mil.

5. Craney Island Fuel Depot, Portsmouth, VA
POC: Caren Hendrickson, telephone 757-445-3113, email;
caren.hendrickson@navy.mil.

6. St. Julian's Creek Annex, Portsmouth, VA
POC: Valerie Walker (IEPD), telephone 757-396-8270, email;
Valerie.walker@navy.mil

7. Joint Expeditionary Base Little Creek-Fort Story

POC: Sharon Waligora (IEPD), telephone 757-462-5350, email;
Sharon.waligora@navy.mil

Little Creek:

Fort Story:

8. Dam Neck Annex, Virginia Beach, VA
POC's: Michael Wright (NRS), telephone 4757-433-3461, cell 757-373-8531, email; Michael.wright@navy.mil and Conservation Law Enforcement Officer (CLEO), telephone 757-433-2151, Cell 757-635-5436

9. Naval Weapons Station (NWS) Earle, Earle, NJ

POC: Eric Helms, telephone 732-866-2540, email; eric.helms@navy.mil and LCDR Matthew Tolhurst (PWO), telephone 732-866-2317, email: matthew.tolhurst@navy.mil

10. Naval Submarine Base New London, Groton, CT

POC: Michael Brown (IEPD), telephone 860-694-3976, email; michael.brown13@navy.mil

11. Naval Station Newport, Newport, RI

POC: Shannon Kam, (NRS), telephone 401 841-6377, email; shannon.kam@navy.mil

12. Portsmouth Naval Shipyard, Kittery, ME

POC: Ian Trefry (NRM), telephone 207-438-4362, email: ian.trefry@navy.mil and Lisa Joy (IEPD), telephone 207-438-4707, email: lisa.joy@navy.mil.

13. Naval Computer and Telecommunications (NCTAMS) Cutler, Cutler, ME
POC: Ian Trefry (NRM), telephone 207-438-4362, email: ian.trefry@navy.mil and Clifford
"Mark" Staggs (EPS), telephone 207-259-8282, email: clifford.staggs@navy.mil

V. GOALS AND OBJECTIVES

a. The Fleets and NMFS have developed a Stranding Protocol and Communication Plan that includes a flowchart with points of contact if a USE occurs. This is a related but separate requirement that remains unaffected by this document. This Plan is being developed to provide a consistent process for Navy support for Marine Mammal Stranding Investigations and Assistance when there is a USE during a MTE. This process may enable scientists to obtain better data on mechanisms involved in a marine mammal stranding.

b. Subject to the limitations in paragraph VI of this Plan, the Parties agree to cooperate on stranding response and investigations through the use of U.S. Navy and NMFS in-kind services when available. In-kind services by installation may include:

1. Cheatham Annex

- GROUND VEHICLES: Three front end loaders, 3 backhoes, 1 rubber tire excavator, 1 track excavator, and 2 skid steer loaders.
- PERSONNEL: Five equipment operators, as well as escorts to locations of stranding occurrences on the installation.

2. Naval Weapons Station Yorktown

- Same resources as Cheatham Annex.

3. Naval Station Norfolk (NSN)

- PERSONNEL: Operators for equipment listed below.
- BOATS: NSN can provide 1 small service boat.
- GROUND VEHICLES: NSN has four 6K forklifts and 2 pickup trucks.
- ACCESS TO BASE: The IEPD contact will provide Security with the information of who will be responding (agency and/or individual, and an example of a badge, if possible) and security will ensure they obtain access.

4. Norfolk Naval Shipyard (NNSY)

- BOATS: NNSY has limited small boat support through Port Operations.
- ACCESS TO BASE: Base access protocol is to contact the security office. The security POC is Glenn Hawthorne, Security Director, phone 757-396-5131.

5. Craney Island Fuel Depot

- ACCESS TO BASE: Coordinate with installation POC Caren Hendrickson.

6. St. Julian's Creek Annex

- BOATS: NNSY has limited small boat support through Port Operations.
- ACCESS TO BASE: Base access protocol is to contact the security office. The security POC is Glenn Hawthorne, Security Director, phone 757-396-5131.

7. Joint Expeditionary Base Little Creek-Fort Story

- No resources identified at this time.

8. Dam Neck Annex

- The Command Duty Office (CDO) will assist with locating and obtaining equipment. The CDO is manned 24 hours a day and can be reached by telephone at 757-433-2366.

9. NWS Earle

- ACCESS TO BASE: Temporary access can be coordinated on a case by case basis in accordance with the needs of the stranding response.
- BOATS: Vessels and operators are available for sighting animals in the vicinity of the Earle piers. Other small vessels may be available.
- GROUND VEHICLES: Cranes, backhoes, and frontend loaders are available. Personnel transport vehicles are available as well as dump trucks and flatbed trucks.
- PERSONNEL: Heavy equipment operators are available and security personnel are available on a case by case basis.
- OTHER SERVICES AND EQUIPMENT: Lifting straps, chains, and cargo nets available. The installation has a waste disposal contract if dumpsters need to be requested.

10. Subase New London

- GROUND VEHICLES: New London can offer 1 tractor trailer and flat bed truck and one landing craft mechanized (LCM) boat.
- ACCESS TO BASE: Contact Michael Brown, IEPD, for installation access.

11. Naval Station Newport

- Naval Station Newport has a current memorandum of agreement (MOA) with the NMFS NERO (Attachment 2). All protocols specified in the MOU will be adhered to and this MOA provides the following information:
- ACCESS TO BASE: The NMFS will be granted base access to perform necropsies at the Stillwater Basin boat ramp and parking lot, contingent upon ramp operations, and the beaches as a backup necropsy site. NMFS will be allowed to bring a vessel into the installation's restricted waters provided it stays 100 feet from any Navy or Coast Guard vessel. Security must be notified 3 days in advance of NMFS intentions to come onto the installation, except in emergency situations. Installation and/or security POCs will assist NFMS in obtaining the necessary camera and equipment passes.

12. Portsmouth Naval Shipyard

- ACCESS TO BASE: There is a landing site at Jamaica Island Beach and a temporary response set up location can be available at Jamaica Island.
- Anti-Terrorism Office (ATO) may be able to provide tug boat assistance provided mission requirements are not compromised. The Facility Response Team (FRT) has several small vessels available for nearshore operations.
- GROUND VEHICLES: Bob Landry (Transportation), phone 207-438-5557 may be able to secure an excavator, skid-steer, rubber tire crane, flat bed trucks, and/or passenger vans (for personnel transport).
- PERSONNEL: Heavy equipment operators, public relations coordination, enforcement, labor.
- OTHER SERVICES AND EQUIPMENT: Lifting straps, chains, shackles, and life jackets.

13. NCTAMS Cutler

- ACCESS TO BASE: There are landing sites at Davis Beach, Little Holly Cove, and Little Machias Bay Coastline. A temporary response set up location can be available at the old Coast Guard Landing Area, Davis Beach, and Little Holly Cove.
- PERSONNEL: Enforcement and general labor.

c. The Parties agree to share data (as clearance procedures allow) relevant to projects and activities conducted under this plan pursuant to the Atlantic Fleet Active Sonar Training (AFAST), Southern California Range Complex (SOCAL), Hawaii Range Complex (HRC), Mariana Islands Range Complex (MIRC), and Gulf of Alaska (GOA) Marine Mammal Protection Act (MMPA) Final Rules.

d. The Parties recognize that NMFS possesses limited marine mammal stranding response and investigation resources and may not be in a position to fully implement all of the tests and procedures listed as part of Phase 1 and Phase 2 Investigations. If NMFS identifies that specific tests, procedures, or analyses are needed to complete Phase 1 and Phase 2 Investigations, NMFS may request assistance from the Navy to do so. NMFS and the Navy may enter into additional implementing agreements to authorize the Navy to transfer funds to NMFS consistent with federal fiscal law, to support the implementation of the necessary investigational procedures/tests/analyses.

e. As soon as practical, upon completion of a project or activity year, NMFS agrees to provide an accounting of each project's expenditures for projects or activities with applicable statutes, regulations, and policies.

f. The Parties will meet annually in March to discuss the implementation and progress of the prior year(s) projects and activities, provide contact updates, and submit a report documenting data collected supported by this MOU. A template will be developed for submitting the annual report. The plan will be reviewed during the annual meeting for operation and effect.

g. NMFS will work with Navy POCs to ensure Navy personnel providing assistance have knowledge and expertise consistent with NMFS' stranding response protocols, procedures and guidelines.

VI. LIMITATIONS

This RSIAP is meant to serve as a regional framework for cooperation between the U.S. Navy and NMFS for assistance and response related to USEs during MTEs. Actions or activities agreed to in this Plan may not exceed the agreement between the Navy and NMFS in the National MOU. Nothing in this Plan obligates either Party to expend appropriations, provide in-kind services or equipment, or enter into any contract or other obligation. Projects or activities conducted under this Plan must comply with all applicable statutes and regulations, including those statutes and regulations applicable to procurement and the Economy Act, further, the projects or activities are contingent upon resource availability and logistic feasibility and must not negatively affect Navy operational or installation commitments or military security.

MAY 29 2015

Dear Mr. Wright:

By this letter you are hereby designated to act as the primary contact and Co-Investigator for the DoD Partners in Flight Rep. (VA), Naval Air Station Oceana, Public Works Department, Environmental Program Division, for the Greater Atlantic Regional Fisheries Office under Endangered Species Act scientific research Permit No. 17273 to maximize the use of dead Atlantic (*Acipenser oxyrinchus oxyrinchus*) and shortnose (*Acipenser brevirostrum*) sturgeon parts for research and educational purposes. The Naval Air Station Oceana is acting as a Cooperating Facility under Permit No. 17273. Sturgeon samples may be obtained from individuals authorized to collect them in the course of salvage activities or any U.S. facility authorized to hold captive sturgeon. Sturgeon parts and samples may be used to support law enforcement actions, research studies, and outreach education. This authorization shall be subject to the following conditions:

1. A copy of this permit shall be in your possession during the proposed work.
2. Please read the permit and note the research conditions relating to activities authorized under the permit and detailed reporting requirements.
3. This letter authorizes you to utilize whole sturgeon or parts and pieces resulting from sturgeon salvage incidents for research and education purposes as well as respond to sturgeon salvage incidents.
4. This authorization is in force until August 9, 2018. This permit expires on the date indicated and is non-renewable. This permit may be extended by the Director, NMFS Office of Protected Resources, pursuant to applicable regulations and the requirements of the ESA.

Sincerely,

Jessica A. Pruden
Principal Investigator

Permit No. 17273
Expiration Date: August 9, 2018
Reports Due: November 9th, annually

PERMIT TO TAKE/COLLECT, RECEIVE/POSSESS, AND IMPORT/EXPORT PROTECTED SPECIES¹ PARTS FOR SCIENTIFIC PURPOSES

I. Authorization

This permit is issued to NOAA Fisheries Northeast Region, Protected Resources Division (hereinafter "Permit Holder"), One Blackburn Drive, Gloucester, MA 01930, [Responsible Party: Mary Colligan], pursuant to the provisions of the Endangered Species Act of 1973 (ESA; 16 U.S.C. 1531 *et seq.*); the regulations governing the taking, importing, and exporting of endangered and threatened species (50 CFR Parts 222-226).

II. Abstract

The objective of the permitted activity, as described in the application, is to maximize the use of dead Atlantic (*Acipenser oxyrinchus oxyrinchus*) and shortnose (*A. brevirostrum*) sturgeon parts for research and educational purposes. Sturgeon samples may be obtained from individuals authorized to collect them in the course of scientific research, salvage activities, any U.S. facility authorized to hold captive sturgeon, or taken during other authorized activities. Sturgeon parts and samples may be used to support law enforcement actions, research studies (primarily genetics), and outreach education.

III. Terms and Conditions

The activities authorized herein must occur by the means, in the areas, and for the purposes set forth in the permit application, and as limited by the Terms and Conditions specified in this permit, including all attachments and appendices. Any permit noncompliance constitutes a violation and is grounds for permit modification, suspension, or revocation, and for enforcement action.

A. Duration of Permit

1. Personnel listed in Condition C.1 of this permit (hereinafter "Researchers") may conduct activities authorized by this permit through August 9, 2018. This permit expires on the date indicated and is non-renewable. This permit may be extended by the Director, NMFS Office of Protected Resources, pursuant to applicable regulations and the requirements of the ESA.

¹ "Protected species" include species listed as threatened or endangered under the ESA, and marine mammals.

2. Researchers must suspend all permitted activities occurring in the field in the event harassment, serious injury, or mortality² of protected species occurs during specimen collection in the field, or if authorized take³ or receipt/import/export of specimens is exceeded. The Permit Holder must submit a written incident report as described in Condition E.2. The Permits Division may grant authorization to resume permitted activities based on review of the incident report and in consideration of the Terms and Conditions of this permit.

B. Number and Kind(s) of Protected Species, Location(s) and Manner of Taking

1. The table below outlines the number of animals, by species, and the number of parts/specimens authorized to be taken/collected, and the locations and time periods in which these activities may occur.

Table 1: Activities authorized under Permit No. 17273, annually. Specimens may be salvaged from U.S. East coast rivers from Maine to Florida. Sturgeon parts/carcasses of any Distinct Population Segment (i.e., range-wide) may be collected.

SPECIES	PRODUCTION /ORIGIN	LIFESTAGE/ SEX	EXPECTED TAKE	TAKE ACTION	DETAILS
Sturgeon, shortnose	Wild	All	100	Import/export/ receive only	collection, receipt, and transport of dead animals
Sturgeon, shortnose	Captive	All	350	Import/export/ receive only	take action = receipt and transport only
Sturgeon, Atlantic	Wild	All	100	Import/export/ receive only	collection, receipt, and transport of dead animals
Sturgeon, Atlantic	Captive	All	75	Import/export/ receive only	take action = receipt and transport only

² This permit does not allow for unintentional harassment, serious injury, or mortality caused by the presence or actions of researchers in the field when collecting specimens from dead marine mammals. This includes, but is not limited to, harassment, injury, or death of animals attempting to avoid researchers (e.g., a pinniped stampede).

³ By regulation, a take under the MMPA includes the collection of dead animals, or parts thereof.

2. This permit does not authorize the harassment of any protected species.
3. In the case of an unusual mortality event, takes may be increased up to 1,000 animals with written approval from the Director, Office of Protected Resources.
4. Researchers must comply with all provisions specified in Appendix 1 of this permit for biological samples taken/collected, received/possessed, or imported/exported under authority of this permit.
5. Researchers working under this permit may collect visual images (*i.e.*, any form of still photographs, film, video, or other footage) as needed to document the permitted activities, provided the collection of such images in the field does not result in harassment of protected species.
 - a. The Permit Holder may use these images in printed materials (including commercial or scientific publications) and presentations provided the images are accompanied by a statement indicating that the activity depicted was conducted pursuant to Permit No. 17273. This statement must accompany the images in all subsequent uses or sales.
 - b. Annual reports required pursuant to Condition E.3 must note such incidental scientific, educational, or commercial uses of the images.
6. Upon written request from the Permit Holder, approval for photography, filming, or audio recording activities not essential to achieving the objectives of the permitted activities in the field, including allowing personnel not essential to the research (*e.g.* a documentary film crew) to be present, may be granted by the Chief, Permits Division.
 - a. Where such non-essential photography, filming, or recording activities are authorized they must not influence the conduct of permitted activities in any way or result in takes of protected species.
 - b. Personnel authorized to accompany the Researchers during permitted activities for the purpose of non-essential photography, filming, or recording activities are not allowed to participate in the permitted activities.
 - c. The Permit Holder and Researchers cannot require or accept compensation in return for allowing non-essential personnel to accompany Researchers to conduct non-essential photography, filming, or recording activities.

C. Qualifications, Responsibilities, and Designation of Personnel

1. At the discretion of the Permit Holder, the following Researchers may participate in the conduct of the permitted activities in accordance with their qualifications and the limitations specified herein:
 - a. Principal Investigator – Jessica Pruden;
 - b. Co-Investigators – See Appendix 3;
 - c. Research Assistants – any personnel identified by the Permit Holder or Principal Investigator and qualified to act pursuant to Conditions C.2, C.3, and C.4 of this permit.
2. Individuals conducting permitted activities must possess qualifications commensurate with their roles and responsibilities. The roles and responsibilities of personnel operating under this permit are as follows:
 - a. The Permit Holder is ultimately responsible for all activities of any individual who is operating under the authority of this permit. Where the Permit Holder is an institution/facility, the Responsible Party is the person at the institution/facility who is responsible for the supervision of the Principal Investigator.
 - b. The Principal Investigator (PI) is the individual primarily responsible for the taking, import, export and any related activities conducted under the permit. The PI must be on site during any activities conducted under this permit unless a Co-Investigator named in Condition C.1 is present to act in place of the PI.
 - c. Co-Investigators (CIs) are individuals who are qualified to conduct activities authorized by the permit without the on-site supervision of the PI. CIs assume the role and responsibility of the PI in the PI's absence.
 - d. Research Assistants (RAs) are individuals who work under the direct and on-site supervision of the PI or a CI. RAs cannot conduct permitted activities in the absence of the PI or a CI.
3. Personnel involved in permitted activities in the field must be reasonable in number and essential to conduct of the permitted activities. Essential personnel are limited to:
 - a. Individuals who perform a function directly supportive of and necessary to the permitted activity;

- b. Individuals included as backup for those personnel essential to the conduct of the permitted activity; and
 - c. Individuals included for training purposes.
4. Persons who require state or Federal licenses to conduct activities authorized under the permit must be duly licensed when undertaking such activities.
5. The Permit Holder or PI may designate additional CIs provided that a copy of the letter designating the individual, and a copy of the individual's curriculum vitae, is provided to the Permits Division via the online permits system (APPS: <https://apps.nmfs.noaa.gov>) on the day of designation and confirmed by mail. The Permit Holder cannot require or receive any direct or indirect compensation in return for requesting authorization for such person to act as a PI, CI, or RA under the permit.

D. Possession of Permit

1. This permit cannot be transferred or assigned to any other person.
2. The Permit Holder and all other persons operating under the authority of this permit must possess a copy of this permit: when engaged in a permitted activity; when a protected species part is in transit incidental to a permitted activity; and during any other time when any protected species part taken under such permit is in the possession of such persons.
3. A duplicate copy of this permit must be attached to the container, package, enclosure, or other means of containment in which a protected species part is placed for purposes of storage, transit, supervision, or care.

E. Reports

1. The Permit Holder must submit annual, final, and incident reports, and any papers or publications resulting from the research authorized herein to the Chief, Permits Division, Office of Protected Resources, NMFS, 1315 East-West Highway, Room 13705, Silver Spring, MD 20910; phone (301) 427-8401; fax (301) 713-0376. The Permit Holder must submit annual, final, and incident reports, and any papers or publications resulting from the research authorized herein to the Permits Division. Reports may be submitted:
 - through the online system at <https://apps.nmfs.noaa.gov>;
 - by email attachment to the permit analyst for this permit; or
 - by hard copy mailed or faxed to the Chief, Permits Division, at the address listed above.

2. Written incident reports related to harassment, serious injury, or mortality events or to exceeding authorized take or receipt/import/export collection takes, must be submitted to the Chief, Permits Division within two weeks of the incident. The incident report must include a complete description of the events and identification of steps that will be taken to reduce the potential for additional incidents.
3. An annual report must be submitted to the Chief, Permits Division by November 9th for each year the permit is valid (August 9th – August 8th of each year). The annual report describing activities conducted during the previous permit year must follow the format in Appendix 2.
4. A final report must be submitted to the Chief, Permits Division within 180 days after expiration of the permit (February 9, 2019), or, if the research concludes prior to permit expiration, within 180 days of completion of the research. The final report must follow the format in Appendix 2.
5. Research results must be published or otherwise made available to the scientific community in a reasonable period of time.

F. Coordination

1. To the maximum extent practical, the Permit Holder must coordinate collection activities in the field with activities of other Permit Holders conducting the same or similar studies on the same species, in the same locations, or at the same times of year to avoid disturbance of animals.

G. Observers and Inspections

1. NMFS may review activities conducted pursuant to this permit. At the request of NMFS, the Permit Holder must cooperate with any such review by:
 - a. Allowing any employee of NOAA or any other person designated by the Director, NMFS Office of Protected Resources to observe permitted activities; and
 - b. Providing any documents or other information relating to the permitted activities.

H. Modification, Suspension, and Revocation

1. All permits are subject to suspension, revocation, modification, and denial in accordance with the provisions of subpart D [Permit Sanctions and Denials] of 15 CFR part 904.

2. The Director, NMFS Office of Protected Resources may modify, suspend, or revoke this permit in whole or in part:
 - a. In order to make the permit consistent with any change made after the date of permit issuance with respect to any applicable regulation prescribed under section 4 of the ESA;
 - b. In any case in which a violation of the terms and conditions of the permit is found;
 - c. In response to a written request⁴ from the Permit Holder;
 - d. If NMFS determines that the application or other information pertaining to the permitted activities (including, but not limited to, reports pursuant to Section E of this permit and information provided to NOAA personnel pursuant to Section G of this permit) includes false information; and
 - c. If NMFS determines that the authorized activities will operate to the disadvantage of threatened or endangered species or are otherwise no longer consistent with the purposes and policy in section 2 of the ESA.
3. Issuance of this permit does not guarantee or imply that NMFS will issue or approve subsequent permits or amendments for the same or similar activities requested by the Permit Holder, including those of a continuing nature.

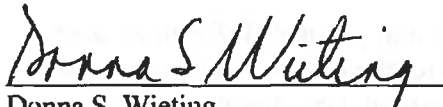

I. Penalties and Permit Sanctions

1. Any person who violates any provision of this permit, the ESA, or the regulations at 50 CFR parts 222-226 is subject to civil and criminal penalties, permit sanctions, and forfeiture as authorized under the ESA, and 15 CFR part 904.
2. NMFS shall be the sole arbiter of whether a given activity is within the scope and bounds of the authorization granted in this permit. The Permit Holder must contact the NMFS Permits Division for verification before conducting the activity if they are unsure whether an activity is within the scope of the permit. Failure to verify, where NMFS subsequently determines that an activity was outside the scope of the permit, may be used as evidence of a violation of the permit, the ESA, and applicable regulations in any enforcement actions.

⁴ The Permit Holder may request changes to the permit related to: the objectives or purposes of the permitted activities; the species or number of animals taken; and the location, time, or manner of taking/collecting, possessing, importing and exporting protected species. Such requests must be submitted in writing to the Chief, Permits Division in the format specified in the application instructions.

J. Acceptance of Permit

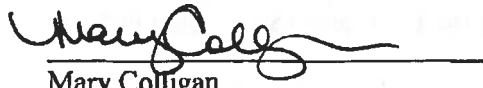

1. In signing this permit, the Permit Holder:
 - a. Agrees to abide by all terms and conditions set forth in the permit, all restrictions and relevant regulations under 50 CFR Parts 222-226, and all restrictions and requirements under the ESA;
 - b. Acknowledges that the authority to conduct certain activities specified in the permit is conditional and subject to authorization by the NMFS Office Director; and
 - c. Acknowledges that this permit does not relieve the Permit Holder of the responsibility to obtain any other permits, or comply with any other Federal, State, local, or international laws or regulations.

Appendix 1

Disposition of Biological Samples

1. All biological samples collected or received under the authority of this permit must be maintained according to accepted curatorial standards. The Terms and Conditions of this permit shall remain in effect as long as the biological samples authorized hereunder are maintained under the authority and responsibility of the Permit Holder.
2. Unless other disposition is specified in the permit application, the Permit Holder may retain biological samples not consumed in analysis or otherwise disposed of during or after research or enhancement activities authorized by this permit if the specimens are maintained in a properly curated collection and made available for research or enhancement purposes at the request of the Office Director. Remaining samples may be archived for analysis by the Permit Holder not described in the permit application provided that the project descriptions are provided to the Permits, Conservation and Education Division for inclusion in the permit file. NMFS encourages Researchers to transport any remaining samples to the National Ocean Service (NOS), Marine Forensics Laboratory, 219 Fort Johnson Road, Charleston, South Carolina 29412, phone (843)762-8547, fax (843)762-8700.
3. The Responsible Party [Mary Colligan, Assistant Regional Administrator; One Blackburn Drive; Gloucester, MA 01930; phone (978) 281-9116] must be contacted prior to, and where necessary, approve and authorize the transfer of biological samples to persons not listed in the permit application. Researchers may transfer parts collected or received under this permit for scientific research, curation, or educational purposes to recipients authorized as Co-Investigators by the Responsible Party.
4. Under no circumstances may any endangered species parts collected or obtained under the authority of this permit be bought or sold. Recipients of any biological samples taken under the authority of this permit must adhere to the conditions of this permit.
5. The Permit Holder must maintain a record of all biological specimens obtained under this permit. This record must include the number and type of specimens; a description of each animal from which specimen materials were taken including, species, age, size, weight, sex, reproductive condition; date and location of acquisition; preservative; and circumstances causing death or nature of specimen collection. Where samples are received from facilities (*i.e.*, power plants) documentation regarding the original legal take must also be maintained by the Permit Holder.
6. No animals may be intentionally killed for the purpose of providing specimens under this permit, and no remuneration, either financial or in-kind, can be offered for the taking of animals from the wild. This does not preclude legitimate logistical collection and transportation expenses.

Appendix 2: Protected Species Parts Permit Report Form

Reports may be submitted

- through the online system at <https://apps.nmfs.noaa.gov>
- by email attachment to the permit analyst for this permit
- by hard copy mailed or faxed to the Chief, Permits Division, Office of Protected Resources, NMFS, 1315 East-West Highway, Room 13705, Silver Spring, MD 20910; phone (301)427-8401; fax (301)713-0376.

The following is only an EXAMPLE of the report form. If you do not intend to submit your report online, please contact your permit analyst for an electronic report form to fill out and return.

Date: _____ **Reporting Period:** _____

Permit Number: _____ **Permit Holder's Name:** _____

Contact Name: _____ **Contact Email:** _____

Contact Phone #: _____
(Contact = person submitting report)

Part I: Take Table. Enter information on the actual number of animals from which parts were collected, received, or imported/exported during this reporting period according to the table in your permit. Note: You must complete a table that looks like the Permit Table (Take Table 1 of your permit), with an additional column for you to enter the "actual number of animals taken" in the last permit year. You must contact your permit analyst for an electronic version of this table or use the on-line report system.

Also provide the information in the following table (Table 2). You must contact your permit analyst for an electronic version of this additional table and provide it as an attachment to your report.

Date	Type of activity (e.g., receipt or import)	Species (common and scientific name)	Description of and number of parts (e.g., 2 teeth)	Description of animal from which part was taken (age, size, sex, reproductive condition)	Sample origination (e.g., subsistence hunt); and date and location of collection	Country of origin and authorizing government agency (include NMFS permit number if applicable)	Disposition of part ⁵

⁵ Indicate whether part was consumed in analysis, is curated (if so, how), or was transferred. For transfers to other researchers, include the sample ID, person and location to which the part was transferred, description of secondary use, and how the person was authorized to receive the part from you.

Part II: Narrative. Provide responses to the following, as applicable:

1. Describe any problems or unforeseen events encountered during the permitted activities and any steps taken or proposed to resolve such problems.
2. Describe what measures were taken to minimize incidental effects of permitted activities on animals in the wild, such as disturbance to nearby animals, and the effectiveness of these measures, as applicable.
3. Describe steps taken to coordinate the permitted activities with other permit holders.
4. Summarize any preliminary findings. Did you accomplish the goals of your permitted activities?
5. List titles of reports, publications, etc. resulting from this reporting period. Attach copies of any final documents as available. If these documents are not yet available, indicate when you anticipate that they will be completed and submitted. When reports and publications are available, send to the Chief, Permits Division, and include the permit number in subject line.
6. Note the number and type of non-permitted species harassed or otherwise taken, and the observed effects of such taking.
7. Note any incidental (non-research related) use of photographs, film, or other images (e.g., on websites, in commercial publications or documentaries).
8. Indicate any additional findings, results, or information you would like to report or comment on.
9. Copies of the following must be submitted with this report:
 - a. Foreign collection and export authorizations; and
 - b. Foreign CITES export permits and stamped wildlife declaration forms, and Form 3-177 for each import.

Guidance for Co-Investigators

Thank you for your interest in being a Co-Investigator on permit (File No. 17273) to collect, necropsy, sample, and salvage dead shortnose and Atlantic sturgeon, etc., as specified in the permit and permit application for the purposes of education and scientific research.

During the review of the application we were advised to develop guidance for the many Co-Investigators named on the application. Also, we were asked to name which type of Co-Investigator each of you might be. We divided Co-Investigator activities into the following three categories: Response, Research and Education. Accordingly, this document serves as guidance for all Co-Investigators broken down by type of anticipated activity. See Attachment A to determine which categories you fall under.

I. Response:

Co-Investigators responding to reports of dead shortnose and Atlantic sturgeon are generally natural resource managers, researchers from the various states or Federal services, or researchers from Universities. Dead sturgeon are likely to be found washed ashore or, in some cases, floating. Since dead sturgeon may be located in sensitive areas such as protected islands, wildlife management areas, National refuges, state parks and historical sites, etc., you are urged to work with local officials to gain access to these areas. Be aware and mindful of any sensitive habitats/protected resources you may encounter as you attempt to investigate and/or retrieve a sturgeon carcass. You are advised to seek permission before entering these areas and to obtain additional permits as necessary.

Please be aware that your activities may disrupt other wild animals, including protected species such as other fishes, waterfowl, seabirds and marine mammals. This permit does not allow the harassment of any protected species other than shortnose and Atlantic sturgeon; please be sure to conduct research in such a manner that disturbance of any non-target species does not occur. Information on keeping a safe distance from protected marine wildlife can be found at: <http://www.nmfs.noaa.gov/pr/education/viewing.htm>. Additional guidance for working around wildlife may be obtained at: http://www.watchablewildlife.org/publications/marine_wildlife_viewing_guidelines.htm. Lastly, in some cases, the area may be too sensitive to enter and the Co-Investigator should refrain from responding (i.e., should not disturb nesting piping plovers to access a sturgeon carcass).

All Co-Investigators responding to a dead sturgeon are required to fill out a sturgeon salvage form (Attachment B) or provide data to NMFS for insertion in the form, for each sturgeon carcass you collect/obtain and submit it within 30 days to the appropriate regional contact:

Greater Atlantic Regional Fisheries Office

Jessica Pruden, Shortnose Sturgeon Recovery Coordinator

Phone: 978-282-8482

Fax: 978-281-9394

E-Mail Jessica.Pruden@noaa.gov

Lynn Lankshear

Atlantic Sturgeon Recovery Coordinator

Phone: 978-282-8473

Fax: 978-281-9394

E-Mail Lynn.Lankshear@noaa.gov

Southeast Region

Kelly Shotts, Atlantic and Shortnose Sturgeon Recovery Coordinators

Phone: 727-551-5603

Fax: 727-824-5309

E-Mail Kelly.Shotts@noaa.gov

Please find and review Attachment B, the sturgeon salvage form, as you read the following instructions for filling out form. This is a working document; we appreciate your help in field testing the form and hope you will provide comments for improving it. Comments should be sent to Jessica Pruden (contact information given above). Instructions are based on blocks in the salvage form as pictured below.

- Record investigator's (responding Co-Investigator) contact information.

INVESTIGATORS'S CONTACT INFORMATION	
Name: First _____	Last _____
Agency Affiliation _____	Email _____
Address _____	

Area code/Phone number _____	

- Call appropriate NMFS regional contact identified above to obtain a unique identifier and record it in the top block.
- Record the date sturgeon carcass was first reported to investigator.
- Record the date sturgeon carcass was collected/examined by investigator.

UNIQUE IDENTIFIER (Assigned by NMFS)

DATE REPORTED:

Month Day Year 20

DATE EXAMINED:

Month Day Year 20

- Identify to species (if possible).

SPECIES: (check one)

shortnose sturgeon

Atlantic sturgeon

Unidentified *Acipenser* species

Check "Unidentified" if uncertain. See reverse side of this form for aid in identification.

- Record location where carcass was found.

LOCATION FOUND: <input type="checkbox"/> Offshore (Atlantic or Gulf beach) <input type="checkbox"/> Inshore (bay, river, sound, inlet, etc)	
River/Body of Water _____	City _____ State _____
Descriptive location (be specific) _____	

Latitude _____ N (Dec. Degrees)	Longitude _____ W (Dec. Degrees)

- Determine stage of decomposition at the time of examination. Record carcass condition.
 - Fresh dead = Normal appearance, usually with little scavenger damage; fresh smell (edible); minimal drying and wrinkling of skin, eyes and mucous membranes; eyes clear; carcass not bloated, muscles firm, viscera intact and well-defined; body intact and easily moved.
 - Moderately decomposed = Carcass intact, bloating evident, possible scavenger damage; mild odor; mucous membranes dry, eyes sunken or missing; muscles soft and poorly defined; viscera soft, friable but still intact; body fragile but can usually be moved intact.
 - Severely decomposed = Carcass may be intact, but collapsed; often severe scavenger damage; strong odor; muscles nearly liquefied and easily torn; viscera often identifiable but friable, easily torn, and difficult to dissect; body fragile and comes apart if moved.
 - Dried carcass = Skin may be draped over skeletal remains; any remaining tissues are desiccated.
 - Skeletal, scutes & cartilage = Only pieces of carcass can be found and identified.

CARCASS CONDITION at time examined: (check one) <input type="checkbox"/> 1 = Fresh dead <input type="checkbox"/> 2 = Moderately decomposed <input type="checkbox"/> 3 = Severely decomposed <input type="checkbox"/> 4 = Dried carcass <input type="checkbox"/> 5 = Skeletal, scutes & cartilage
--

Record sex and how this was determined.

SEX: <input type="checkbox"/> Undetermined <input type="checkbox"/> Female <input type="checkbox"/> Male How was sex determined? <input type="checkbox"/> Necropsy <input type="checkbox"/> Eggs/milt present when pressed <input type="checkbox"/> Borescope
--

- Examine externally and record signs of external injury etc (see back of form).

Describe any wounds / abnormalities (note tar or oil, gear or debris entanglement, propeller damage, etc.). Please note if no wounds / abnormalities are found.

- Record length and weight measurements and circle the unit of measurement used. Also indicate if the length and weight measurements were actual or estimates. (i.e., some length measurements of severely decomposed carcasses are estimates because carcass may not be intact).

MEASUREMENTS:	<i>Circle unit</i>
Fork length	_____ cm / in
Total length	_____ cm / in
Length <input type="checkbox"/> actual <input type="checkbox"/> estimate	
Mouth width (inside lips, see reverse side)	_____ cm / in
Interorbital width (see reverse side)	_____ cm / in
Weight <input type="checkbox"/> actual <input type="checkbox"/> estimate	_____ kg / lb

- Examine the fish externally for tags and scan for internal tags. Record any tag information.
- Note: All tag information recorded on this form will be shared with the US Fish and Wildlife Cooperative Sturgeon Tagging Database (NMFS will share tag information with staff at the MD Fishery Resource Office using salvage forms submitted by Co-Investigators).
<http://www.fws.gov/northeast/marylandfisheries/mfrofactsheet.htm>

TAGS PRESENT? Examine for external tags including fin clips? <input type="checkbox"/> Yes <input type="checkbox"/> No		Scanned for PIT tags? <input type="checkbox"/> Yes <input type="checkbox"/> No
Tag #	Tag Type	Location of tag on carcass
_____	_____	_____
_____	_____	_____

- Take photo/video and record where the images will be maintained.

PHOTODOCUMENTATION: Photos/vids taken? <input type="checkbox"/> Yes <input type="checkbox"/> No Disposition of Photos/Video: _____ _____ _____

- If possible/appropriate, necropsy carcass. Record the date the fish was necropsied and the name of the person who conducted the necropsy.
- Record any observations during necropsy and submit this information with the salvage form.

Carcass Necropsied? <input type="checkbox"/> Yes <input type="checkbox"/> No Date Necropsied: _____ Necropsy Lead: _____

- If possible/appropriate, sample carcass. Record what samples were collected, how they were preserved and where they were sent/archived. Please be aware that sturgeon parts and tissues may only be sent to persons/labs that are listed as a CI on this permit.
- All responders are required to sample shortnose and Atlantic sturgeon carcasses for genetic tissue. The tissue sampling and shipment must be coordinated with Julie Carter. Julie Carter will send sampling instructions, chain of custody form and vials for the tissue samples (see also Attachment C for sampling instructions):
 - Julie Carter
 NOS Marine Forensic Branch
 219 Fort Johnson Road
 Charleston, SC 29412
 phone: 843-762-8547
 fax: 843-762-8700
 Email: Julie.Carter@noaa.gov
- Permanently label all samples with a unique identifier assigned by NOAA fisheries. [Call appropriate NMFS regional contact identified above to obtain number – See top right block on salvage form].

SAMPLES COLLECTED? <input type="checkbox"/> Yes <input type="checkbox"/> No		
Sample	How preserved	Disposition (person, affiliation, use)
_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____

- Record the final disposition of the majority of the remains.

<p>CARCASS DISPOSITION: (check one or more)</p> <p><input type="checkbox"/> 1 = Left where found</p> <p><input type="checkbox"/> 2 = Buried</p> <p><input type="checkbox"/> 3 = Collected for necropsy/salvage</p> <p><input type="checkbox"/> 4 = Frozen for later examination</p> <p><input type="checkbox"/> 5 = Other (describe)</p> <p>_____</p>
--

- Record any additional comments at the bottom of the front page.

Comments:

- Submit Completed forms to appropriate NMFS regional contact identified above within 30 days of the date the carcass was reported.

Submit completed forms (within 30 days of date of investigation) to: Greater Atlantic Regional Fisheries Office
Contacts – Shortnose Sturgeon Recovery Coordinator (Jessica Pruden, Jessica.Pruden@noaa.gov, 978-282-8482) or Atlantic Sturgeon Recovery Coordinator (Lynn Lankshear, Lynn.Lankshear@noaa.gov, 978-282-8473); **Southeast Region Contacts**- Shortnose and Atlantic Sturgeon Recovery Coordinator (Kelly Shotts, Kelly.Shotts@noaa.gov, 727-551-5603).

Safety:

- Shortnose and Atlantic sturgeon carcasses will be in various stages of decomposition and may harbor diseases, parasites etc. Practice common sense in examining and sampling dead shortnose sturgeon. Wear protective clothing including gloves and a mask. Wash yourself and your gear thoroughly after handling a dead sturgeon.
- Maintain appropriate training, licenses and certificates and use caution in the operation of motorized vehicles (boats, trucks, cars, etc.).
- Safely transfer specimens to authorized researchers, educators, laboratories, etc., following Material Safety Data Sheet (M.S.D.S) protocol for shipment and handling. Please be aware that shortnose sturgeon parts and tissues may only be sent to persons/labs that are listed as a CI on this permit.
- Safely dispose of unused portions of shortnose sturgeon carcasses

Data Access Policy for shortnose sturgeon salvage form

Upon written request, information submitted to National Marine Fisheries Service (NOAA Fisheries) on this form will be released to a requestor provided that the requestor credits the collector of the information and NOAA Fisheries. NOAA Fisheries will notify the collector that these data have been requested and the intent of their use.

II. Research:

Those Co-Investigators interested in research activities may receive sturgeon specimens from responders as they become available. There are many researchers who are also interested in response and in this case will directly use the specimens they collect themselves under the permit.

Anticipated uses for scientific research: morphology; genetics; histopathology; contaminants; age, growth and maturity analyses; cryopreservation of sperm; food habits; parasitology; examination for potential human impacts (oil spill, ship strike, bycatch in fisheries, dredging, blasting, impingement/entrainment etc.) and investigation of unusual mortality events/fish kills.

Researcher responsibilities include the following:

1. Credit contributing responders (i.e. those Co-Investigators that provided the data or specimens) and NOAA Fisheries. Any research published as a result of work performed on samples or information received under this permit must acknowledge the cooperating Co-Investigators, NOAA Fisheries, and the permit number in any publications or other reports resulting from the use of the transferred material/data
2. Share copies of any resultant publications/unpublished reports with Co-Investigators by submitting these reports to the appropriate NMFS regional contact.

Additional research needs may be identified during the 5-year term of the permit. Contact the appropriate NMFS regional contact to relay your research interests. Please be aware that responders are acting on a voluntary basis and there are generally relatively few sturgeon carcasses reported dead each year (~10) so it may take some time to meet your needs.

III. Education:

Many Co-Investigators that are responders and researchers also have an interest in obtaining and maintaining specimens for outreach and education. The permit will authorize the retention and maintenance of sturgeon (whole and parts) for education. The anticipated educational uses follow:

Educational uses: taxidermy; collection of hard parts such as individual scutes, bones and entire cartilaginous skeleton; clear and stain of small fish; casts of sturgeon carcasses, plastomer reproductions, dissection (necropsy) and development of sampling and necropsy procedures and manuals.

Educator responsibilities include the following:

1. As appropriate, credit contributing responders, NOAA Fisheries, and cite the permit number in resultant publications/outreach materials.
2. Share copies of any resultant publications/outreach materials with Co-Investigators by submitting them to the appropriate NMFS regional contact.

Additional educational needs may be identified during the 5-year term of the permit. Contact the appropriate NMFS regional contact to relay your education or outreach interests. Please be aware that responders are acting on a voluntary basis and there are generally relatively few sturgeon carcasses reported dead each year (~10) so it may take some time to meet your needs.

IV: Instructions for Transfer and Shipment of Specimens

Transfer:

Because shortnose and Atlantic sturgeon are listed species under the Endangered Species Act, transfer of specimens must be carefully documented and the persons/labs receiving

specimens must be authorized to have them. Therefore, once specimens are salvaged from a dead sturgeon, they may only be transferred to other Co-Investigators or cooperating diagnostic labs listed on this permit, No 17273 (see Attachment A). Transfer of specimens to Co- Investigators/cooperators must be documented on the “SAMPLES COLLECTED” block of the Sturgeon Salvage Form. All samples must be labeled with the Unique Identifier recorded in the top right block of the salvage form.

Any further transfer of specimens among Co-Investigators/cooperating diagnostic labs (i.e. beyond what was recorded on the salvage form) may be permissible on a case by case basis. You must contact the appropriate NMFS regional contact to arrange for the transfer. NMFS must report annually all sturgeon salvaged and collected under this permit and the disposition of all samples and subsamples.

Shipment:

Follow Material Safety Data Sheet (M.S.D.S) protocol for safe shipment and handling. Double check that all specimens are labeled with the Unique Identifier recorded in the top right block of the Sturgeon Salvage Form.

Include the following documentation with each shipment:

- Copy of Sturgeon Salvage Form
- Copy of the NMFS research permit authorizing the collection of the sample(s)
- Chain of Custody Form (as requested or appropriate)

Place the samples in leak-proof containers/bags; place the documentation on top of the samples. Seal the samples and documents together in the shipping container and send to authorized Co-Investigator(s)/cooperating diagnostic lab(s).

V. Adding Co-Investigators to the permit:

The permit, if issued, is expected to be valid for five years from the date of issuance. Qualified Co-Investigators or Cooperating Diagnostic Labs may be added to this permit on a case by case basis through an authorization provided by the Responsible Party of the permit. Interested persons should contact Jessica Pruden for more information:

Appendix 3a:

Certification, Identification and Chain of Custody Form for Submitting Sturgeon Genetic Tissue Samples.^{1, 2}

(A) CERTIFICATION OF SPECIES (Collector)

I, _____, hereby certify that I have positively identified the
 Full Name
 fish or fishes sampled in this shipment as: shortnose sturgeon; Atlantic sturgeon; other unknown
 based on my knowledge and experience as a _____,
 Position Job Title
 Signature: _____ Date Identified: _____
 Address: _____
 Phone Number: _____

(B) SAMPLE IDENTIFICATION

Species Identification: shortnose sturgeon; Atlantic sturgeon; unknown
 Unique ID No: _____; Tissue Type: _____; Preservative: _____;
 Location: (River: _____; River-km: _____; Lat/Long: _____);
 River Location Description: _____;
 Total Length (TL) of Specimen (mm): _____ Weight of Specimen (g): _____; Sex (if known) _____

Specific comments on take: _____

Check here if multiple samples are submitted and use *Field Collection Report* (Appendix 3b) with the data fields listed in this section.

(C) EVIDENCE OF CHAIN OF CUSTODY

1.	_____	_____	_____	_____
	Release Signature	NMFS Permit No.	Method of Transfer	Date
	_____	_____	_____	_____
	Receipt Signature	NMFS Permit No.		Date
2.	_____	_____	_____	_____
	Release Signature	NMFS Permit No.	Method of Transfer	Date
	_____	_____	_____	_____
	Receipt Signature	NMFS Permit No.		Date
3.	_____	_____	_____	_____
	Release Signature	NMFS Permit No.	Method of Transfer	Date
	_____	_____	_____	_____
	Receipt Signature	NMFS Permit No.		Date

¹ Instructions on next page.

² If multiple samples are shipped, attach summary sheet in Appendix 3b.

Instructions: Collecting, Certifying, Identifying & Shipping Tissue Samples Collected from Sturgeon.

1. **Species Certification:**

For each shipment a “*Certification of Species Identification*” (Section A) must be provided. This form documents the collector has identified the fish or fishes sampled in the shipment as either a shortnose or Atlantic sturgeon. If there is any doubt about the identity of a sample, then mark unknown and include comments on the take.

2. **Sample Identification:**

Assign a unique number identifying each individual fish captured and subsequently sampled. This number must be recorded in Section B and on the collection vial for each sample taken. Record tissue type; preservative used; date of capture; location of capture (river & description, lat/long, river km, and nearest city); length of specimen; weight; and sex, if known. Check the box provided if you are submitting multiple samples, and provide a hard-copy and/or email a copy of the sample spreadsheet with information for each of the data fields listed above.

3. **Tissue Sampling Instructions:**

a. Cleanliness of Samples: Cross contamination should be avoided. For each fish, use a clean cutting tool, syringe, etc. for collecting and handling samples.

b. Preserving & Packaging Samples:

- i. Label vial with fish’s unique ID number.
- ii. Place a 1-2 cm² section of pelvic fin clip in vial with preservative (95% absolute ETOH (un-denatured), recommended).
- iii. Seal individual vials or containers with leak proof positive measure (e.g., tape).
- iv. Package vials and absorbent within a double sealed container (e.g., zip lock baggie).
- v. Label air package properly identifying ETOH warning label (**See Appendix 3c**).

c. Shipping Instructions:

When shipping samples, place separately Appendix 3a, 3b and 3c (Sample ID and Chain of Custody Forms and Shipping Training Form) in container and seal the shipping box to maintain the chain of custody. (**Note:** A copy of the ESA permit authorizing the collection of the sample(s) must also accompany the sample(s)).

Important Notice: You must be certified before shipping tissue samples preserved with 95% ETOH in “excepted quantities” (A Class 3 Hazardous Material Due to Flammable Nature). See **Appendix 3c: “NMFS Guidelines for Air-Shipments of Excepted Quantities of Ethanol Solutions”** to comply with the DOT/IATA federal regulations.

4. **Chain of Custody Instructions:**

The “*Chain of Custody*” (Section C) should be maintained for each shipment of tissue samples and must accompany the sample(s) at all times. To maintain the chain of custody, when sample(s) are transferred, the sample(s) and the documentation should be packaged and sealed together to ensure that no tampering has occurred. All subsequent handlers breaking the seal must also sign and document the chain of custody section.

5. **Contact Information:**

A. NMFS, Office of Protected Resources:

i. Primary Contact: (Greater Atlantic Regional Fisheries Office) Shortnose Sturgeon Recovery Coordinator (Jessica Pruden, jessica.pruden@noaa.gov, 978/282-8482); Atlantic Sturgeon Recovery Coordinator (Lynn Lankshear, lynn.lankshear@noaa.gov, 978/282-8473)

ii. Primary Contact: (Southeast) Shortnose Sturgeon and Atlantic Sturgeon Recovery Coordinator (Kelly Shotts, kelly.shotts@noaa.gov, 727/551-5603)

i. Secondary Contact: Malcolm Mohead (malcolm.mohead@noaa.gov) Phone: 301/713-2289

ii. Secondary Contact: Jennifer Skidmore (jennifer.skidmore@noaa.gov) Phone: 301/713-2289

B. NOS Archive:

i. Primary Contact: Julie Carter (julie.carter@noaa.gov) Phone: 843/762-8547

Appendix 3b Summary Sheet for Genetic Tissue Samples Collected^{1,2}

Date	Species	Unique ID No.	Genetic Tissue Type	Preservative	Location: (River)	Location (River-km)	Location (Lat/Long)	Total Length (mm)	Weight (g)	Sex	Comments

1. Please coordinate with NMFS to receive a file copy of this appendix in spreadsheet format and include file on disk with shipment.
2. If multiple samples are shipped, attach this form to supplement Appendix 3a.

Appendix 3c

NMFS Guidelines for Air-Shipment of "Excepted Quantities" of Ethanol Solutions

These guidelines have been adapted with permission from the University of New Hampshire-Office of Environmental Health & Safety; our appreciation is to Andy Glode for providing reference materials upon which this guide was created.

The U.S. Department of Transportation (DOT: 49 CFR 173.4) and the International Air Transport Association (IATA: 2007 Dangerous Goods Regulations, Sec. 2.7) regulate shipments of ethanol (ETOH) in *excepted quantities*. As a result, specific procedures must be followed as well as certifying proper training of individuals prior to packaging and shipping specimens preserved in ETOH. These guidelines will inform proper shipping and also satisfy certifying requirements. Failure to meet such requirements could result in regulatory fines and/or imprisonment.

Therefore, prior to submitting ETOH preserved samples and appropriate documentation (*e.g.*, a FedEx Airbill) to a carrier, please read, initial and sign this document, affirming you have understood the requirements as outlined. Please include this document in the shipping package and retain a copy for your records.

- 1) Packages and documents submitted to a carrier must not contain any materials other than those described in this document (*i.e.* containers holding ethanol-preserved specimens and related absorbent and packaging materials). Also, laboratory or sampling equipment, *unrelated documents*, or other goods must be packaged and shipped in separate boxes. (Note: ETOH solutions are not permitted to be transported in checked baggage, carry-on baggage, or airmail.) **I understand (____)**
- 2) Please read the manufacturer's Material Safety Data Sheet (MSDS) for ETOH recognizing ETOH (55 - 100%) is classed as hazardous flammable material (NFPA Rating = 3). Note also, its vapor is capable of traveling a considerable distance to an ignition source causing "flashback." Properly packaging and labeling shipments of ethanol solutions will minimize the chance of leakage, and would also communicate the potential hazard to transport workers in the event of a leak. **I understand (____)**
 - a) **Quantity Limits:** Small quantities (inner container less than 30 ml, with a maximum net quantity of 500 ml for the entire package) of ETOH can be shipped with "Excepted Quantities" labels without completion of a Dangerous Goods Declaration. (*e.g.*, If shipping vials having a maximum volume of 10 ml each, you may put up to 50 vials in one box.) **I understand (____)**
 - b) **Package Components:**
 - i. **Inner (primary) packaging (*e.g.*, vial, tube, jar, etc.):** Do not completely fill inner packaging; allow 10% head-space for liquid expansion. Liquids must not completely fill inner packaging at a temperature of 55°C (130°F). Closures of inner packaging (*e.g.*, vials with tops) must be held securely in place with tape or other positive means. **I understand (____)**
 - ii. **Intermediate (secondary) packaging (*e.g.* Ziplock or other plastic bag):** Place inner container(s) (*e.g.*, vials with ETOH) into a high-quality plastic bag. Then add an absorbent material capable of absorbing any spillage without reacting with the ethanol. Seal the first bag tightly and then tape the locking seals. Next, seal the inner bag within a second bag for added safety. **I understand (____)**
 - iii. **Outer packaging (*e.g.*, cardboard box):** Ethanol solutions may not be shipped in envelopes, Tyvek® sleeves, or other non-rigid mailers. The dimensions of the outer box must be at least 100 mm (~4 inches) on two sides. Any space between the inner packing containers placed in the outer packaging should be eliminated with additional filler. **I understand (____)**
 - c) **Package Labels:**
 - i. **Dangerous Goods in Excepted Quantities Label (Figure 1):** The label must display a "3" as the ethanol hazard class number using a black marker. You may obtain self-adhesive labels from NMFS, or else, order online. **I understand (____)**
 - ii. **Name and Address:** The outer container must display the name and address of the shipper and consignee. When using shipping boxes, completely remove or black out all unnecessary labels or marks. **I understand (____)**

Figure 1. Dangerous Goods in Excepted Quantities label

Appendix 3c (continued)

d) **Package Tests:**

A representative example of packaging used for excepted quantities of ethanol solutions must pass a drop test and compressive load test without any breakage or leakage of any inner packaging and without any significant reduction in package effectiveness. Perform the following tests on a representative example of your packaging and keep a record of the results.

i. **Drop Test:** Drop a representative package from a height of 1.8 m (5.9 feet) directly onto a solid unyielding surface:

Test Results

- a. One drop flat on the base; (_____)
- b. One drop flat on top; (_____)
- c. One drop flat on the longest side; (_____)
- d. One drop flat on the shortest side; and (_____)
- e. One drop on a corner. (_____)

ii. **Compressive Load Test:** Apply a force to the top surface of a representative package for a duration of 24 hours, equivalent to the total weight of identical packages if stacked to a height of 3 meters. (_____)

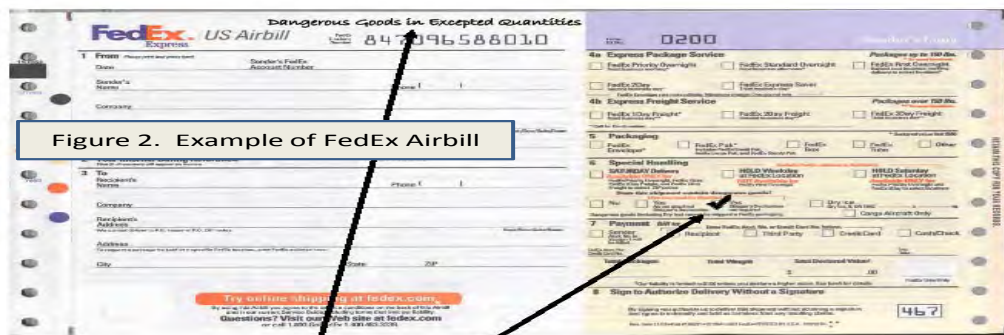

e) **Package Documentation:**

Proper documentation is required for all shipments of hazardous materials. Incorrect documentation is the most common cause for package refusal. If using documentation for couriers other than FedEx, UPS and DHL, please contact NMFS for assistance.

i. **FedEx:** For domestic shipments with FedEx Express, fill out the standard US Airbill. Fill out the form completely including the following information:

- a. In Section 6, Special Handling, check the box “Yes, Shipper’s Declaration not required.”
- b. On the top of the form above the FedEx tracking number, include the statement, “**Dangerous Goods in Excepted Quantities**” See example in **Figure 2**. I understand (_____)

ii. **DHL:** The “*Nature and Quantity of Goods*” box of the air waybill must include “**Dangerous Goods in Excepted Quantities.**” I understand (_____)

Include this statement and check this box.

By signing this document, I affirm I understand the hazards associated with ethanol and the shipping requirements for ethanol solutions, as outlined in this guide. I also understand I am required to include a copy of this document in the package and that it should be appended to an ESA permit (if listed samples are shipped).

Comments:

Distinguishing Characteristics of Atlantic and Shortnose Sturgeon (version 01-30-2014)

Characteristic	Atlantic Sturgeon, <i>Acipenser oxyrinchus</i>	Shortnose Sturgeon, <i>Acipenser brevirostrum</i>
Maximum length	> 9 feet/ 274 cm	4 feet/ 122 cm
Mouth	Football shaped and small. Width inside lips < 55% of bony interorbital width	Wide and oval in shape. Width inside lips > 62% of bony interorbital width
*Pre-anal plates	Paired plates posterior to the rectum & anterior to the anal fin.	1-3 pre-anal plates almost always occurring as median structures (occurring singly)
Plates along the anal fin	Rhombic, bony plates found along the lateral base of the anal fin (see diagram below)	No plates along the base of anal fin
Habitat/Range	Anadromous; spawn in freshwater but primarily lead a marine existence	Freshwater amphidromous; found primarily in fresh water but does make some coastal migrations

* From Vecsei and Peterson, 2004

Describe any wounds / abnormalities (note tar or oil, gear or debris entanglement, propeller damage, etc.). Please note if no wounds / abnormalities are found.

Data Access Policy: Upon written request, information submitted to National Marine Fisheries Service (NOAA Fisheries) on this form will be released to the requestor provided that the requestor credit the collector of the information and NOAA Fisheries. NOAA Fisheries will notify the collector that these data have been requested and the intent of their use.

Submit completed forms (within 30 days of date of investigation) to: Greater Atlantic Regional Fisheries Office
Contacts – Shortnose Sturgeon Recovery Coordinator (Jessica Pruden, Jessica.Pruden@noaa.gov, 978-282-8482) or Atlantic Sturgeon Recovery Coordinator (Lynn Lankshear, Lynn.Lankshear@noaa.gov, 978-282-8473); **Southeast Region Contact**- Shortnose and Atlantic Sturgeon Recovery Coordinator (Kelly Shotts, Kelly.Shotts@noaa.gov, 727-551-5603).

NOAA Marine Biotoxins Program – Analytical Response Team

Sampling Protocol for Algal Identification and Toxin Analysis

Supplies

- * Bucket
- * Plastic bottles (100 ml and 1 liter)
- * Plankton net (10 µm nylon mesh) if available
- * Lugol's iodine fixative
or
- * glutaraldehyde fixative

Lugol's iodine: - dissolve 10 g potassium iodide (KI) in 100 ml distilled water
 - add 5 g crystalline iodine (I₂)
 - add 10 ml glacial acetic acid

Protocol

1. Look for discolored water patches (record observations). *There may not be discolored water in association with some toxic algal events.* Record temperature, salinity, and dissolved oxygen if possible.
2. For qualitative analysis, collect sample with a plankton net, if available, using vertical tow (bottom to surface). Transfer ~100 ml of concentrated sample to a 100 ml plastic bottle. Add preservative: Lugol's to make a tea color (1-2 ml) or glutaraldehyde to make 2% final concentration (2 ml).
3. For quantitative analysis, collect surface water samples using bucket.
 - a. Transfer water into two 1 L bottles (rinsed soda bottles are acceptable) for toxin analysis. Wrap bottles with wet paper towels. Store in a cool, dark place (do not freeze). Ship overnight if possible in styrofoam cooler containing wet paper towels and refrigerated blue ice packs (keep these from actually touching the bottle).
 - b. Transfer ~100ml sub-sample to 100 ml plastic bottles. Add preservative: Lugol's to make a tea color (1-2 ml) or glutaraldehyde to make 2% final concentration (2 ml). Store in cool, dark place until shipping.

Sampling Protocol for Toxin Analysis in Animals

Supplies

- * Normal sized samples: 50-mL plastic centrifuge tubes or other plastic tubes
- * Large samples: sealable/ziplock plastic bags or bottles

** Prior to collection, obtain required permits or licenses in order to comply with state and/or federal regulations for shellfish or protected species (marine mammals, sea turtles).

Invertebrates, (clams, oysters, mussels, scallops, crustaceans)

Generally collect entire animal. Freeze whole or shucked – 100 g meat/tissue. Samples can be stored in ziplock bags on ice until they can be frozen. Freeze (-20°C) and ship on dry ice.

Collection of shellfish is most easily accomplished by the use of available harvesting methods (rakes, dredges, etc.)

Prey Fish

If possible, the species should be identified before freezing. Small fish should be collected and frozen, then shipped whole. For large species, stomach contents (whole stomach), liver and flesh should be sampled and stored separately. Minimum of 50 g flesh should be obtained. All tissues can be stored frozen (-20°C) in ziplock bags until shipment on dry ice.

Mammals

(also see Geraci, J.R. and Lounsbury, V.J. 2005. Marine Mammals Ashore: A Field Guide for Strandings. National Aquarium, Baltimore, MD, 372 pp. for detailed necropsy sampling procedures). Limit sampling to code 1 or 2 animals (see above reference for definition), as changes in toxin structure and tissue matrix may occur in degraded tissue samples.

The most useful tissues/fluids for confirming biotoxin exposure are generally feces, urine and stomach contents. However, samples from additional tissues (gastric fluid, liver, kidney, lung, brain, serum) are important for metabolism and body burden studies. All samples should be immediately placed in a cooler on ice and frozen (-20°C) as soon as possible after collection. Samples should be shipped on dry ice to the laboratory for analysis. Prior to shipping samples, please contact receiving laboratory to ensure proper receipt of the samples.

All samples must be labeled with animal ID, date, species in indelible ink. Additionally, a small tag containing sample information inserted inside the sample container may be useful in some cases. Additional details, including location (latitude/longitude or closest landmark), animal length, weight, condition code, sex, and additional relevant information must be recorded on a sample log and a hard copy must accompany samples. In addition, also send a digital version to your contact at the laboratory. See the attached sample information sheet as an example.

Urine - Collect a minimum of 0.5 ml urine, more if available (5-10 ml). Store frozen (-20°C) in capped plastic centrifuge tubes.

Feces – Collect a minimum of 5 g (preferably 50 g). Store frozen (-20°C) in capped plastic centrifuge tubes or other container suitable for freezer storage.

Intestinal contents - Collect a minimum of 5 g (preferably 50 g). Store frozen (-20°C) in capped plastic centrifuge tubes or other container suitable for freezer storage. Indicate which portion of the intestine was sampled (e.g. upper, mid-, lower intestine)

Stomach contents – Collect a minimum of 5 g (preferably 50 g) of solid or semi-solid contents if available. Store frozen (-20°C) in capped plastic centrifuge tubes or other container suitable for freezer storage. If stomach fluid only is available, collect at least 5ml in a plastic tube or vial.

Gastric fluid, liver, kidney, lung, spleen, brain – collect 100 g (or mL) if possible. Store frozen (-20°C) in separate ziploc bags.

Serum – obtain serum by centrifugation (1500-3000 x g; 5 minutes) of whole, heparinized blood. The top layer is the serum. Collect >0.5 ml of serum and store frozen (-20°C) in a plastic tube.

Whole blood -Heparinized whole blood can be spotted directly onto blood collection cards and stored at room temperature in the presence of dessicant pouches. Blood cards with detailed instructions can be obtained from your contact at the Marine Biotoxins Program laboratory.

Birds

Collect as above for mammals, substituting cloacal contents for feces and urine, and with the addition of gizzard contents.

Marine Mammal Stranding Response Agreement

Between

Northeast Region
National Marine Fisheries Service
National Oceanic and Atmospheric Administration
Department of Commerce

AND

Virginia Aquarium & Marine Science Center
Stranding Response Program

Articles III, IV, V, and VI are reserved and issued at the discretion of the NMFS Regional Administrator.

Table of Contents

Article I: General Provisions.....	3
Article II: Purpose and General Responsibilities.....	5
Article III: Dead Animal Response.....	11
Article IV: Live Animal Response: First Response.....	14
Article V: Live Animal Response: Rehabilitation and Final Disposition.....	18
Article VI: Northeast Region Good Standing Agreement.....	23
Article VII: Northeast Region Communication Agreement.....	25
Article VIII: Participant’s Authorized Personnel.....	28
Article IX: Rights of States and Local Governments.....	29
Article X: Effective Dates, Renewal, and Application Procedures.....	30
Article XI: Review, Modification, and Termination.....	31

Article I: General Provisions

A. Authority

1. This Marine Mammal Stranding Response Agreement (hereinafter Agreement) is entered into between the Department of Commerce, National Oceanic and Atmospheric Administration (NOAA), National Marine Fisheries Service (NMFS) Northeast Region, and the Stranding Network Participant Virginia Aquarium & Marine Science Center Stranding Response Program (Participant), under the authority of section 112(c) and section 403 of the Marine Mammal Protection Act of 1972 (MMPA), as amended. **This Agreement supersedes all pre-existing Stranding Agreements between these parties. An organizational representative with signatory authority (e.g. Executive Director, President, CEO) must sign this Agreement on behalf of the Stranding Network Organization.**
2. NMFS has been delegated authority by the Department of Commerce to administer the MMPA. To assist in the implementation and administration of the MMPA, the Stranding Network has been established to respond to stranded marine mammals within NMFS' Northeast Region of the United States. The Northeast Region consists of the following coastal states and territories: Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania, New Jersey, Delaware, Maryland and Virginia.

B. Scope

1. Under the MMPA, NMFS is responsible for mammals of the **Order Cetacea** and the **Order Pinnipedia** other than walruses (hereinafter marine mammals).
2. The geographic response area assigned to Participant consists of the following: coastal and tidal waters of Virginia, including the Virginia portion of Chesapeake Bay and its tributaries. The Participant may assist in stranding response within the Region outside of their assigned response area, if requested by NMFS or by another Participant. Outside the Northeast Region, the Participant may assist with stranding response upon request from the appropriate NMFS Regional Stranding Coordinator(s).

C. Limitations

1. This Agreement creates an authorization for the Participant to take marine mammals, which would be otherwise prohibited by the MMPA. This taking authorization only applies to the Participant and its authorized personnel (see Article VI) for activities that are consistent with this Agreement.
2. In particular, this Agreement does not authorize:

- a. The taking of any marine mammal species listed as endangered or threatened under the Endangered Species Act of 1973 (ESA), as amended. Authorization to take ESA listed species is provided under an MMPA/ESA Permit No. 932-1489-09, as amended, issued to the NMFS National Marine Mammal Health and Stranding Response Program Coordinator and **requires authorization and direction from the NMFS Regional Stranding Coordinator in the event of a stranding involving a threatened or endangered marine mammal.**
- b. The sale or offer of sale of any marine mammal or marine mammal parts including cells, gametes, or cell cultures.

D. Definitions

All terms used in the Agreement shall be interpreted to have the meaning specified in the MMPA section 3 and section 409 and NMFS implementing regulations 50 CFR 216.3 unless the context or specific language requires otherwise. For ease of reference, those definitions, as well as additional terms and definitions for this Agreement, are provided in Attachment A.

Article II: Purpose and General Responsibilities

A. Purpose of Agreement. NMFS and the Participant enter into this Agreement for the following purposes:

1. To provide for rapid response and investigation of stranded marine mammals (Order Cetacea and Order Pinnipedia) within the Northeast Region in accordance with the purposes and policies of the MMPA.
2. To implement Title IV (Marine Mammal Health and Stranding Response Program) of the MMPA:
 - a. to facilitate the collection and dissemination of reference data on the health of marine mammals and health trends of marine mammal populations in the wild;
 - b. to correlate the health of marine mammals and marine mammal populations in the wild with available data on physical, chemical, and biological environmental parameters; and
 - c. to detect and coordinate effective responses to Marine Mammal Unusual Mortality Events (UMEs).
3. To specify the activities during which the Participant may take stranded marine mammals (Order Cetacea and Order Pinnipedia) or marine mammal parts for the primary purpose of ensuring the appropriate response, rehabilitation, disposition, and utilization of stranded marine mammals or marine mammal parts under MMPA sections 109(h), 112(c), and 403 and the Agreement.
4. To define the nature and extent of services that the Participant will provide NMFS under this Agreement and NMFS' responsibilities to the Participant.
5. To specify the requirements for the preparation and maintenance and reporting of records containing scientific data obtained from dead and live stranded marine mammals or parts from dead stranded marine mammals.
6. To provide for the timely exchange of information for use by both parties and other network members in furthering the objectives of the MMPA under this Agreement.

B. Joint Responsibilities

NMFS and the Participant will work cooperatively to:

1. Implement Title IV of the MMPA;

2. Effectively respond to and investigate the causes and impacts of UMEs;
3. Collect the appropriate data for determination of serious injuries and mortalities due to human interactions;
4. Collect reference data on marine mammal health and diseases;
5. Collect data on the frequency and causes of strandings; and
6. Interpret findings and identify health trends and diseases of concern to include emerging, reportable, and zoonotic diseases.

C. NMFS Responsibilities

NMFS Shall:

1. Provide the Participant with notice of any changes to laws, regulations, policies and/or guidelines applicable to or promulgated by NMFS that may apply to the Participant's activities. This includes criteria for issuance, renewal and termination of stranding agreements. Notwithstanding this provision, it is the responsibility of the Participant to comply with all laws, regulations, policies and/or guidelines that apply to the Participant's activities.
2. Conduct periodic compliance reviews of Stranding Agreements as stated in Article IX.
3. Provide guidance and assistance regarding investigation of marine mammal unusual mortality events including financial and physical resources (example: NOAA laboratory assistance) and financial resources when available and authorized (in accordance with section 405 of the MMPA – UME National Contingency Fund) and in coordination with the Working Group on Marine Mammal Unusual Mortality Events.
4. Alert the Participant when NMFS has been notified that there are diseases of concern that are emerging, reportable, and/or zoonotic within the Northeast Region.
5. Pursuant to criteria established under the MMPA section 407, provide access to the National Marine Mammal Health and Stranding Response Program Database, as developed, and access to marine mammal tissues in the National Marine Mammal Tissue Bank following NMFS data and tissue access procedures and policies.
6. As needed and as resources are available, provide specialized marine mammal stranding response equipment and investigation training on a local, regional or national basis.

7. Pursuant to MMPA section 402, collect and update periodically and make available to stranding network participants and other qualified scientists, existing information on:
 - a. procedures and practices for rescuing and rehabilitating stranded marine mammals;
 - b. species by species criteria used by the stranding network participants, for determining at what point a marine mammal undergoing rescue and rehabilitation is returnable to the wild based on its ability to survive in the wild and risk to the wild population of marine mammals;
 - c. procedures and practices for collecting, preserving, labeling, and transporting marine mammal tissues for physical, chemical, and biological analyses;
 - d. relevant scientific literature on marine mammal health, disease, and rehabilitation;
 - e. compilation and analyses of strandings by region to monitor species, numbers, conditions, and causes of illness and death in stranded marine mammals; and
 - f. other life history and reference level data, including marine mammal tissue analyses that would allow comparison of the causes of illness and death in stranded marine mammals with physical, chemical, and biological environmental parameters.
8. Identify a Northeast Region Marine Mammal Stranding Response Program Coordinator who will serve as the Participant's primary point of contact for notification, coordination, reporting, response and rehabilitation activities as specified throughout this Agreement. The NMFS Regional Administrator will serve as the Participant's primary point of contact for administration of the Agreement, as well as dispositions and other management activities as specified throughout the Agreement. **The NMFS Regional Administrator's designated point of contact for this Agreement is the NMFS Northeast Region Marine Mammal Stranding Coordinator, Northeast Regional Office, Protected Resources Division.** (see Attachment B for contact information).
9. In certain circumstances such as large scale events (e.g. mass stranding, unusual mortality events, live right whale stranding), NMFS may establish a formal Incident Command System (ICS) for response, including the identification of an Incident Commander. Events such as oil spills, NMFS will follow direction from United States Coast Guard (USCG). Opportunities for ICS training can be accessed through the Federal Emergency Management Agency (see <http://www.training.fema.gov/EMIWeb/IS/is100.asp>), USCG, or NMFS. If necessary, guidance will be provided by NMFS on a case-by-case basis.

10. Relay reports of stranded marine mammals (live or dead) within the Participant's geographic range to the Participant and inquire whether the Participant has the capability to respond. If the Participant cannot respond, the Stranding Coordinator may make requests to other regional Stranding Participants to respond.
11. Coordinate regional activities to maximize geographic coverage while facilitating appropriate division of responsibilities among regional Participants according to institutional abilities and authorities.
12. Respond to the Participant's completed requests for authorizations such as requests for parts authorizations, parts transfers, and release determinations.
13. Provide information regarding availability of Prescott Grants and any other relevant NMFS funding opportunities.
14. For emergency stranding events (live or dead), provide and maintain a 24-hour stranding hotline number: 1-866-755-NOAA (6622).

D. Participant Responsibilities

The Participant shall:

1. Comply with laws, regulations, policies and/or guidelines applicable to or promulgated by NMFS that apply to activities under this Agreement; or any Federal, state or municipal laws that pertain to stranding network operations (e.g., municipal water management laws).
2. Cooperate with other members of the Northeast Region Stranding Network and the National Marine Mammal Stranding Program as well as Federal, state, and local officials and employees in matters supporting the purposes of this Agreement.
3. Be subject to the direction of a designated employee (e.g., NMFS Marine Mammal Stranding Coordinator or NMFS Special Agent) representing the NMFS Northeast Regional Administrator or Office of Law Enforcement with respect to the taking of a stranded marine mammal.
4. Manage any and all expenses that the Participant incurs associated with the activities authorized by this Agreement. NMFS does not have funds to reimburse volunteers for expenses incurred in responding to stranding events. However under the marine mammal UME process, funding may be available for costs associated with specific analyses and additional requests in accordance with section 405 of the MMPA UME National Contingency Fund and in coordination with the Working Group on Marine Mammal Unusual Mortality Events. Additionally, competitive funding opportunities for Stranding Network Participants may be available through the Prescott Stranding Assistance Grant Program (see

<http://www.nmfs.noaa.gov/pr/health/prescott/>). Non-competitive funds to supplement equipment and training needs may become available on a year by year basis. NMFS will provide notification of the availability of these funds.

5. Promote human and public safety by taking precautions against injury or disease to any network personnel, volunteers, and the general public when working with live or dead marine mammals.
6. Notify immediately the NMFS Stranding Coordinator upon learning of any diseases of concern (e.g., emerging, reportable, and/or zoonotic diseases) that are detected and/or confirmed that could be a potential hazard for public health or animal health (NMFS will provide guidance on reportable diseases as it becomes available);
7. Transfer of marine mammal parts (50 CFR 216.22 and 216.37):
 - a. Non-diagnostic parts, tissues, cells, gametes, or cell cultures to be used for scientific research, species enhancement, or education shall be transferred only to persons or labs that have received prior written authorization from the NMFS MMPA/ESA scientific research permit or a Regional Parts Authorization Letter. A unique field number assigned by NMFS (e.g., NMFS Registration Number) or the Participant must be marked on or affixed to the marine mammal part or container.
 - b. Diagnostic parts, tissue samples, fluid specimens, parts, or cells may be transferred to labs within the United States for diagnostic use without any additional authorizations.
8. Work cooperatively with the NMFS and the USCG in a hazardous waste spill (i.e., oil spills) ICS if implemented.
9. Notify the NMFS Regional Administrator in writing within 30 days of any changes in its Designee organizations, key personnel (see Attachment A), capabilities, and/or geographic area of response.
10. If requested, the Participant shall coordinate with NMFS to develop and implement a media plan relating to stranding events.
11. Photo documenting (still or video) for other than diagnostic or identification purposes (such as dorsal fin identification, documentation of lesions, scars, etc.) must not interfere or influence the conduct of the stranding responders and response in any way or cause additional harassment to marine mammals.
12. If requested by the NMFS Regional Stranding Coordinator, the Participant will provide copies of any photographs, films, and/or videotapes documenting any stranding, particularly for those strandings when human interactions are
