requirements for motor fuel dispensing facilities and repair garages. NFPA 31 provides requirements for heating oil storage tanks. NFPA 704 provides tank labeling requirements to indicate hazards of what is being stored. All deficiencies, specific regulatory citations, and corrective actions relating to compliance with the various parts of applicable NFPA standards are included in Appendix B of this SPCC Plan.

3.13 Qualified Oil-Filled Operational Equipment [40 CFR 112.7(k)]

§112.7(k) Qualified Oil-filled Operational Equipment. The owner or operator of a facility with oil-filled operational equipment that meets the qualification criteria in paragraph (k)(1) of this sub-section may choose to implement for this qualified oil-filled operational equipment the alternate requirements as described in paragraph (k)(2) of this sub-section in lieu of general secondary containment required in paragraph (c) of this section.

> *(1) Qualification Criteria—Reportable Discharge History: The owner or operator of a facility that has had no single discharge as described in §112.1(b) from any oil-filled operational equipment exceeding 1,000 U.S. gallons or no two discharges as described in §112.1(b) from any oil-filled operational equipment each exceeding 42 U.S. gallons within any twelve month period in the three years prior to the SPCC Plan certification date, or since becoming subject to this part if the facility has been in operation for less than three years (other than oil discharges as described in §112.1(b) that are the result of natural disasters, acts of war or terrorism); and*
>
> *(2) Alternative Requirements to General Secondary Containment. If secondary containment is not provided for qualified oil-filled operational equipment pursuant to paragraph (c) of this section, the owner or operator of a facility with qualified oil-filled operational equipment must:*
>
> > *(i) Establish and document the facility procedures for inspections or a monitoring program to detect equipment failure and/or a discharge; and*
> > *(ii) Unless you have submitted a response plan under §112.20, provide in your Plan the following:*
> > *(A) An oil spill contingency plan following the provisions of part 109 of this chapter.*
> > *(B) A written commitment of manpower, equipment, and materials required to expeditiously control and remove any quantity of oil discharged that may be harmful.*

OFOE is equipment that includes an oil storage container in which the oil is present solely to support the function of the apparatus or device. Types of OFOE in use at NSA HR Headquarters include electrical equipment and elevator hydraulic reservoirs.

NSA HR Headquarters meets the qualification requirements and elects to use the alternative requirements to general secondary containment under §112.7(k).

§112.7(k)(1) Qualification

NSA HR Headquarters has had no single discharge as described in §112.1(b) from any OFOE exceeding 1,000 US gallons or no two discharges as described in §112.1(b) from any OFOE each exceeding 42 US gallons within any twelve-month period in the three years prior to the SPCC Plan certification date. The complete spill history is maintained in the Environmental Department office.

§112.7(k)(2)(i) Inspection Program

The OFOE management program is presented in Section 5.2.4 of this SPCC Plan. The OFOE inventory is included in Section 5.1.

§112.7(k)(2)(ii)(A) Oil Spill Contingency Plan

NSA HR Headquarters is not required to have an FRP. NSA HR Headquarters operations are located in very close proximity to Naval Station Norfolk, and spill response personnel, equipment, and procedures will be consistent with those described in the Consolidated Regional FRP.

§112.7(k)(2)(ii)(B) Written Commitment of Spill Response Resources

The SPCC Plan provides a written commitment of manpower, equipment, and materials required to expeditiously control and remove any quantity of oil discharged that may be harmful.

4.0 SPCC PLAN REQUIREMENTS FOR ONSHORE FACILITES (EXCLUDING PRODUCTION FACILITIES)

NSA HR Headquarters is an onshore facility and not a production facility; therefore, it must comply with the requirements in §112.8. Used cooking oil is also included in this SPCC Plan; analogous sections of §112.12 will not be repeated here.

4.1 Diked Storage Area: Restrain and Inspect Stormwater [40 CFR 112.8(b)(1) and (2)]

§112.8(b) Facility Drainage (1) Restrain drainage from diked storage areas by valves to prevent a discharge into the drainage system or facility effluent treatment system, except where facility systems are designed to control such discharge. You may empty diked areas by pumps or ejectors; however, you must manually activate these pumps or ejectors and must inspect the condition of the accumulation before starting, to ensure no oil will be discharged.

The majority of the bulk storage containers at NSA HR Headquarters are double-walled tanks constructed with integral secondary containment. For the tanks on NSA HR Headquarters that are in concrete or steel dikes, stormwater is retained in the dikes by open-and-closed type valves. There are no containment areas on NSA HR Headquarters that are constructed with pumps or ejectors. Refer to the site-specific information sheets and site maps in Section 5.2.1 and Section 5.2.2 of this SPCC Plan for descriptions of the specific drainage controls associated with tanks and portable container storage areas, respectively.

Facilities with open containment structures, including portable, temporary, or mobile flexible berms, must maintain a berm discharge log to document inspection of the accumulated rainfall prior to discharge. The Berm Discharge Log is discussed in Appendix G. Any discharges of oil into containment berms are recorded on a dedicated form.

§112.8(b)(2) Use valves of manual, open-and-closed design, for the drainage of diked areas. You may not use flapper-type drain valves to drain diked areas. If your facility drainage drains directly into a watercourse and not into an on-site wastewater treatment plant, you must inspect and may drain uncontaminated retained stormwater, as provided in paragraphs (c)(3)(ii), (iii), and (iv) of this section.

No flapper-type drain valves are utilized at this installation. Any stormwater retained in berms or other secondary containment structures is inspected for the presence of residual petroleum product prior to discharge. Refer to the berm discharge log instructions in Appendix G for draining accumulated rainfall.

4.2 Facility Drainage: Design and Equipment [40 CFR 112.8(b)(3) and (4)]

§112.8(b)(3) Design facility drainage systems from undiked areas with a potential for a discharge (such as where piping is located outside containment walls or where tank truck discharges may occur outside the loading area) to flow into ponds, lagoons, or catchment basins designed to retain oil or return it to the facility. You must not locate catchment basins in areas subject to periodic flooding.

§112.8(b)(4) If facility drainage is not engineered as in paragraph (b)(3) of this section, equip the final discharge of all ditches inside the facility with a diversion system that would, in the event of an uncontrolled discharge, retain oil in the facility.

2013 GRI page 3-7 states, “Sections 112.8(b)(3) and (b)(4) (and §112.12(b)(3) and (b)(4)) specify performance requirements for systems used to drain undiked areas with the potential for a discharge. These provisions apply only when the facility owner/operator chooses to use a

facility drainage system to meet general secondary containment requirements under §112.7(c) or a more specific containment requirement under §§112.7(h)(1), 112.8(c)(2) or 112.12(c)(2)."

For the containers included in this SPCC Plan, the Facility has chosen to meet the applicable secondary containment requirements under §112.7(c) and §112.8(c) through a combination of physical barriers and active management measures as discussed in Section 3.5 and Section 4.5 of this SPCC Plan. Therefore, as discussed in the 2013 GRI excerpt above, sections §112.8(b)(3) and §112.8(b)(4) do not apply to the containers included in this SPCC Plan.

4.3 Facility Drainage: Pump Transfer [40 CFR 112.8(b)(5)]

§112.8(b)(5) Where drainage waters are treated in more than one treatment unit and such treatment is continuous, and pump transfer is needed, provide two "lift" pumps and permanently install at least one of the pumps. Whatever techniques you use, you must engineer facility drainage systems to prevent a discharge as described in §112.1(b) in case there is an equipment failure or human error at the facility.

The requirements of §112.8(b)(5) are not applicable to the containers included in this SPCC Plan because drainage system treatment units are not used to treat drainage area stormwater.

4.4 Bulk Storage Container Construction [40 CFR 112.8(c)(1)]

§112.8(c)(1) Bulk storage containers. Not use a container for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature.

The primary tanks of the containers included in this SPCC Plan are constructed of steel. The design and construction of the containers are compatible with the characteristics of the oil product they contain and with temperature and pressure conditions. Refer to the site-specific information sheets in Section 5.2.1 of this SPCC Plan for descriptions of the tank construction materials. Any deficiencies and required corrective actions are listed in Appendix B.

4.5 Secondary Containment for Capacity of Largest Bulk Storage Container Plus Freeboard [40 CFR 112.8(c)(2)]

§112.8(c)(2) Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. You must ensure that diked areas are sufficiently impervious to contain discharged oil. Dikes, containment curbs, and pits are commonly employed for this purpose. You may also use an alternative system consisting of a drainage trench enclosure that must be arranged so that any discharge will terminate and be safely confined in a facility catchment basin or holding pond.

Methods of secondary containment intended to comply with the provisions of §112.8(c)(2) for bulk storage containers include dikes, spill pallets, and built-in secondary containment. Double-walled containers included in this SPCC Plan provide intrinsic secondary containment for 100% of the tank capacity. Because the secondary containment is not open to precipitation, this volume is sufficient to fully contain the product in the event of a leak from the primary container. All tanks with inadequate containment are listed in the Appendix B Deficiency List.

Sufficient freeboard is not defined in §112; however, in 67 FR 137, EPA suggested that freeboard should be able to contain the precipitation of a 25-year, 24-hour storm event. According to the National Oceanic and Atmospheric Administration (NOAA) rainfall intensity chart, the 25-year, 24-hour storm event at Station 44-6139 (Norfolk Weather Service Office

[WSO] Airport) is 6.82 inches. Therefore, for the purposes of this SPCC Plan, sufficient freeboard for Norfolk, Virginia, is considered to be 6.82 inches.

All areas with any type of tanks or mobile/portable petroleum containers are required to have sufficient secondary containment, including freeboard to prevent a discharge from reaching navigable waters. Information regarding fixed location storage tanks, drums, portable containers, and OFOEs is presented in Sections 5.2.1, 5.2.2, 5.2.3, and 5.2.4, respectively. Any deficiencies and required corrective actions are listed in Appendix B.

4.6 Diked Area Drainage [40 CFR 112.8(c)(3)]

§112.8(c)(3) Not allow drainage of uncontaminated rainwater from the diked area into a storm drain or discharge of an effluent into an open watercourse, lake, or pond, bypassing the facility treatment system unless you:

(i) Normally keep the bypass valve sealed closed.

(ii) Inspect the retained rainwater to ensure that its presence will not cause a discharge as described in §112.1(b).

(iii) Open the bypass valve and reseal it following drainage under responsible supervision; and

(iv) Keep adequate records of such events, for example, any records required under permits issued in accordance with §§122.41(j)(2) and 122.41(m)(3) of this chapter.

Open containment structures subject to rainfall accumulation are maintained with the drainage valve in the closed position. The berms are checked for the presence of oil prior to discharge as outlined in Appendix G. This evaluation is documented in the berm discharge log maintained at the tank site.

If free product or sheen is observed, Emergency Dispatch should be notified immediately to determine the source of the sheen (e.g., overfill or leak). The NSA HR Headquarters Environmental Protection Specialist (EPS) may be contacted for cleanup options and assistance in determining the cause of the release. The contaminants are removed by a vacuum truck and transported off-site for disposal. Rainwater collected in containment areas that does not have a sheen is released to the ground through drainage valves. If a sheen is observed, once the source of the sheen is determined, appropriate corrective measures are taken.

4.7 Corrosion Protection for Buried, Partially Buried and Bunkered Storage Tanks [40 CFR 112.8(c)(4) and (5)]

§112.8(c)(4) Protect any completely buried metallic storage tank installed on or after January 10, 1974 from corrosion by coatings or cathodic protection compatible with local soil conditions. You must regularly leak test such completely buried metallic storage tanks.

§112.8(c)(5) Not use partially buried or bunkered metallic tanks for the storage of oil, unless you protect the buried section of the tank from corrosion. You must protect partially buried and bunkered tanks from corrosion by coatings or cathodic protection compatible with local soil conditions.

NSA HR Headquarters has no partially buried or bunkered metallic storage tanks. There are two completely buried storage tanks not fully regulated by 40 CFR 280 and therefore subject to the SPCC Rule; however, these two USTs (LR-H-UST-01 and LR-H-UST-02) are nonmetallic construction not subject to corrosion. USTs that supply an emergency generator are now fully regulated by the 2015 UST regulations (40 CFR 280) and are no longer SPCC assets.

4.8 Test or Inspect Each Aboveground Container for Integrity [40 CFR 112.8(c)(6)]

§112.8(c)(6) Test or inspect each aboveground container for integrity on a regular schedule and whenever you make material repairs. You must determine, in accordance with industry standards, the appropriate qualifications for personnel performing tests and inspections, the frequency and type of testing and inspections, which take into account container size, configuration, and design (such as containers that are: shop-built, field-erected, skid-mounted, elevated, equipped with a liner, double-walled, or partially buried). Examples of these integrity tests include, but are not limited to: visual inspection, hydrostatic testing, radiographic testing, ultrasonic testing, acoustic emissions testing, or other systems of non-destructive testing. You must keep comparison records and you must also inspect the container's supports and foundations. In addition, you must frequently inspect the outside of the container for signs of deterioration, discharges, or accumulation of oil inside diked areas. Records of inspections and tests kept under usual and customary business practices satisfy the recordkeeping requirements of this paragraph.

All tanks are assigned unique identification numbers to maintain inspection records. Tanks found to have inadequate or illegible identification marking are listed as deficient in Appendix B.

All aboveground containers at NSA HR Headquarters are inspected on a monthly and annual basis in accordance with applicable industry standards as described below. Some tanks are also inspected on a daily and weekly basis in accordance with Commonwealth of Virginia regulations.

The integrity testing industry standard and schedule for all tanks at NSA HR Headquarters is presented in Appendix F.

4.8.1 Shop-Fabricated Tank Inspection Program

The industry standard for inspection and integrity testing of shop-built storage tanks in use at NSA HR Headquarters is the STI Standard for the Inspection of Aboveground Storage Tanks SP001 (current edition). Regular integrity testing under STI SP001 varies based on tank size, configuration, and condition. Tanks are determined to be STI category 1, 2, or 3 by the presence of a continuous release detection method (CRDM), a release prevention barrier (RPB), and a spill control strategy. STI SP001 provides a matrix based on tank size range and STI category to define different integrity testing regimes. STI tank category, CRDM, RPB, and spill control strategy are provided for each tank on the individual data sheets presented in Section 5.2.1 of this SPCC Plan. The integrity testing requirements for each container are presented in Appendix F.

The monthly inspection forms in use at NSA HR Headquarters have the same content as the forms in STI SP001 (5th Edition) but have been condensed into a different format. The forms are based on regional NAVFAC MIDLANT procedures and will be updated to the same content as described in Section 2.1.2.

4.8.2 Shop-Fabricated Tank Hybrid Inspection Program

The accepted industry standard for integrity testing of shop-built tanks at NSA HR Headquarters as discussed earlier is STI SP001 (current edition). The inspection forms provided in the STI SP001 current edition provide evaluation criteria for concrete-encased tanks. However, the monthly inspection forms in use at NSA HR Headquarters have the same content as the forms in STI SP001 (5th Edition) but have been condensed into a different format. These inspection forms do not provide evaluation criteria for concrete-encased tanks.

In accordance with guidance contained in an EPA Office of Emergency Management Bulk Storage Container Fact Sheet dated July 2012, a hybrid inspection program has been developed for the concrete-encased double-walled tanks at NSA HR Headquarters, which accomplishes the intent of the periodic inspection and integrity testing requirements. The amended process consists of performing STI SP001 (5th Edition) to the maximum extent practicable, with STI SP001 (5th Edition) Annual Inspection Checklist Numbers 4.1 and 4.2 omitted from the inspection program. The hybrid inspection plan is consistent with the ConVault Manufacturer's Inspection Checklist and the recommendations contained in the ConVault Manufacturer Integrity Testing open letter dated August 19, 2002. The EPA fact sheet states that an environmental equivalence determination is not required for a hybrid inspection program.

4.8.3 Field-Constructed Container Inspection Program

NSA HR Headquarters does not own or operate any field-constructed ASTs.

4.8.4 Drum and Portable Container Inspection Program

Integrity testing on 55-gallon drums and other portable containers will be conducted in accordance with STI SP001, which consists of monthly visual inspections and recertification inspections during the container service life. Portable containers at this facility consist of drums and one metal container for used cooking oil. These containers are located such that all sides are visible. This allows the facility personnel the ability to visually inspect the container, detect, and clean up any discharge before reaching navigable waters. As noted in the preamble to the SPCC rule at 67 FR 47120, these are acceptable industry practices for portable container storage and provide an effective means of verifying container integrity. Sites in which drums are not stored on pallets or other containment are listed as deficient in Appendix B. Integrity testing is documented through the CNRMA MONTHLY Inspection Checklist – Portable Containers included in Appendix C. Plastic portable containers must be recertified every seven years, and steel containers must be recertified every 12 years. In the unlikely event that any individual container remains on-site long enough to require recertification, documentation will be provided by the recertification agency and must be maintained at the NSA HR PWD Environmental Department Office for the life of that container. Alternatively, the container may be discarded in lieu of recertification.

4.9 Heating Coils [40 CFR 112.8(c)(7)]

§112.8(c)(7) Control leakage through defective internal heating coils by monitoring the steam return and exhaust lines for contamination from internal heating coils that discharge into an open watercourse, or pass the steam return or exhaust lines through a settling tank, skimmer, or other separation or retention system.

The containers included in this SPCC Plan do not contain heating coils. Therefore, the requirements under §112.8(c)(7) do not apply to the containers included in this SPCC Plan.

4.10 Overfill Prevention [40 CFR 112.8(c)(8)]

§112.8(c)(8) Engineer or update each container installation in accordance with good engineering practice to avoid discharges. You must provide at least one of the following devices:

(i) High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice.
(ii) High liquid level pump cutoff devices set to stop flow at a predetermined container content level.
(iii) Direct audible or code signal communication between the container gauger and the pumping station.

(iv) A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers.
(v) You must regularly test liquid level sensing devices to ensure proper operation.

All containers at NSA HR Headquarters were examined during preparation of this SPCC Plan. Tanks found to not have effective overfill protection as defined in §112.8(c)(8) are listed as deficient in Appendix B.

In addition to the overfill protection requirements in §112.8(c)(8), NAVFAC MIDLANT policy is to configure double-walled ASTs in accordance with the requirements of 30 NFPA Chapter 22.11.4.5. 30 NFPA Chapter 22.11.4.5 stipulates an audible or visual high level alarm at the 90% tank capacity and an automatic shutoff system such as an overfill prevention valve that activates at 95% tank capacity. Tanks found to be inconsistent with 30 NFPA Chapter 22.11.4.5 are listed as deficient in Appendix B.

4.11 Liquid Level Sensing Devices [40 CFR 112.8(c)(8)(v)]

§112.8(c)(8)(v) Engineer or update each container installation in accordance with good engineering practice to avoid discharges. You must regularly test liquid level sensing devices to ensure proper operation.

Liquid level sensing devices (e.g., level gauges and interstitial leak detectors) are examined during the monthly periodic inspection, and any deficiencies are documented on the monthly inspection checklist. The inspection checklists used at NSA HR Headquarters are included in Appendix C. Any tanks found to have defective level sensing devices during preparation of this SPCC Plan are listed as deficient in Appendix B.

4.12 Effluent Treatment Facility Observations [40 CFR 112.8(c)(9)]

§112.8(c)(9) Observe effluent treatment facilities frequently enough to detect possible system upsets that could cause a discharge as described in §112.1(b).

The containers included in this SPCC Plan are not located in drainage areas that discharge to a treatment facility. Therefore, the requirements under §112.8(c)(7) do not apply to the containers included in this SPCC Plan.

4.13 Correct Visible Discharges [40 CFR 112.8(c)(10)]

§112.8(c)(10) Promptly correct visible discharges which result in a loss of oil from the container, including but not limited to seams, gaskets, piping, pumps, valves, rivets, and bolts. You must promptly remove any accumulations of oil in diked areas.

Personnel conducting periodic tank inspections are trained to initiate corrective action when visible oil leaks from container walls, piping, pumps, valves, rivets, bolts, or other components are discovered during tank operation or inspection. Corrective actions range from minor oil seepage cleanup to submittal of an emergency work request to ensure oil is removed and the cause repaired as soon as possible to prevent a larger spill or a discharge to navigable waters or adjoining shorelines. Oil is promptly removed and disposed of according to the waste disposal method described in Section 6.5 of this SPCC Plan.

Accumulated liquids in diked areas are removed in accordance with the berm discharge procedures described in Appendix G.

4.14 Secondary Containment for Capacity of Largest Mobile or Portable Oil Storage Container Plus Freeboard [40 CFR 112.8(c)(11)]

§112.8(c)(11) Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation.

Portable container storage areas are typically located on spill pallets or other areas with sized secondary containment. Refer to the site-specific information sheets in Section 5.2.2 and Section 5.2.3 of this SPCC Plan for a description of secondary containment at each drum and portable container storage area site.

Any deficiencies, specific regulatory citations, and recommended corrective actions relating to sized secondary containment for drums and portable containers are included in Appendix B.

4.15 Corrosion Protection for Buried Piping [40 CFR 112.8(d)(1)]

§112.8(d)(1) Facility transfer operations, pumping, and facility process. Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage.

All but one UST at NSA HR Headquarters has nonmetallic buried piping. The UST with tank number NSA HQ-NH139-UST-02 has single-walled buried piping made of copper. The installation date for this UST and its underground piping is January 1, 1989. Because this date is prior to the regulatory date of August 16, 2002, it is not required to have a protective wrapping and coating.

4.16 Terminal Connections [40 CFR 112.8(d)(2)]

§112.8(d)(2) Cap or blank-flange the terminal connection at the transfer point and mark it as to origin when piping is not in service or is in standby service for an extended time.

All oil storage tanks located at NSA HR Headquarters are considered to be in active service and do not have capped or blanked off connections.

4.17 Pipe Supports [40 CFR 112.8(d)(3)]

§112.8(d)(3) Properly design pipe supports to minimize abrasion and corrosion and allow for expansion and contraction.

AST pipes are installed with adequate support to minimize the likelihood of failure resulting from metal fatigue from excessive movement, abrasion, and corrosion while allowing for expansion and contraction.

Any deficiencies, specific regulatory citations, and recommended corrective actions are included in Appendix B.

4.18 Piping, Aboveground Valves and Appurtenances [40 CFR 112.8(d)(4)]

§112.8(d)(4) Regularly inspect all aboveground valves, piping, and appurtenances. During the inspection you must assess the general condition of items, such as flange joints, expansion joints, valve glands and bodies, catch pans, pipeline supports, locking of valves, and metal surfaces. You must also conduct integrity and leak testing of buried piping at the time of installation, modification, construction, relocation, or replacement.

During the monthly and annual periodic inspection, the inspector assesses the general condition of items associated with each tank system, including, but not limited to, aboveground piping, overfill prevention valves, high-level alarms, flange joints, expansion joints, valve glands and bodies, catch pans, pipeline supports, locking of valves, and metal surfaces. The condition of each item is recorded in the applicable sections or in the Additional Comments section of the inspection forms included in Appendix C of this SPCC Plan.

4.19 Vehicle Warning [40 CFR 112.8(d)(5)]

§112.8(d)(5) Warn all vehicles entering the facility to be sure that no vehicle will endanger aboveground piping or other oil transfer operations.

After considering facility layout and EPA guidance, the PE certifying this SPCC Plan is deviating from the requirement in §112.8(d)(5) to warn all vehicles entering the facility to be sure that no vehicle will endanger aboveground piping or other oil transfer operations.

All aboveground piping connected to bulk storage containers included in this SPCC Plan are protected from the possibility of collision by routing piping away from vehicular traffic. This provides superior environmental protection compared to verbal or written warnings to drivers by physically preventing vehicular damage to piping systems. In those cases where tank and/or pipe systems are located in areas susceptible to damage from vehicles, protective measures are in place such as fencing, barriers, or curbing. Any sites with inadequate protection are included in the Deficiency List in Appendix B.

A complete discussion of the equivalent environmental protection afforded by this approach is presented in Section 3.2.1.

5.0 Facility Information

5.1 Oil Container Inventory Summary

The following is a comprehensive list of petroleum storage containers located at NSA HR Headquarters. Individual data sheets are presented for each container.

Aboveground Storage Tanks				
Tank Number	**Capacity (gallons)**	**Usage**	**Contents**	**STI Category**
NSA HQ-BallField-AST-01A (Added in Amendment 1)	250	Product Dispenser	Gasoline	1
NSA HQ-BallField-AST-01B (Added in Amendment 1)	250	Product Dispenser	Diesel	1

54,642 Gallons OFOE Capacity
261 Total Number of OFOE

Total Facility Oil Capacity SPCC Regulated	
23,331	**Gallons AST**
20,000	**Gallons UST SPCC Assets**
825	**Gallons Drum**
0	**Gallons Mobile Equipment**
685	**Gallons Portable Container**
54,642	**Gallons OFOE**
99,483	**Gallons Grand Total SPCC Regulated**

5.2 Site-Specific Information

Site-specific information sheets have been prepared following inspection of each oil storage container and each portable container storage area throughout the facility. Information presented in this section is intended to provide owners, operators, and inspectors a quick reference which indicates the types of equipment utilized and how the oil storage or transfer system complies with §112.

Additional sites not listed in this section may store petroleum products in containers less than 55 gallons.

5.2.1 Tank Systems Data Sheets and Maps

Each bulk storage container addressed in this SPCC Plan has an individual summary sheet which provides a synopsis of the technical description of the container, contents, and containment system. An individual site map is included which depicts the following for each container site:

- General Location
- Size
- Contents
- Projected discharge path in case of a container failure
- Staging area for any vehicular transfer
- Projected discharge path for releases associated with vehicular transfer
- Containment systems if other than a double-walled tank
- Surface features which potentially impact or contain the flow of released oil.

Several containers in close proximity may be designated as a single “site” and are therefore included on a single map page.

In addition, each container site also contains two companion documents. The first is a summary of the failure scenarios and associated general secondary containment compliance measures required under §112.7(b) and (c). The second is a summary of assorted compliance issues associated with each tank. As with the site maps, several containers located at one “site” may be included in a single companion document.

USTs that are fully regulated by 40 CFR 280 are not SPCC assets. Three USTs that provide gasoline storage at a fuel dispensing facility at NSA HR Headquarters are Commonwealth of Virginia regulated but exempt from SPCC requirements, other than to be shown on the SPCC facility diagram. These three USTs are marked “Exempt” on the facility diagram.

USTs that supply an emergency generator are now fully regulated by the 2015 UST regulations (40 CFR 280) and are no longer SPCC assets. Six USTs that only supply diesel to emergency power generators at NSA HR Headquarters are exempt from SPCC requirements, other than to be shown on the SPCC facility diagram. These six USTs are marked “Exempt” on the facility diagrams.

The two USTs that are not fully regulated by 40 CFR 280 and therefore are subject to the SPCC Rule provide fuel oil to a heating system.

An individual summary sheet has been included for each of the eleven USTs, and the companion document is also provided for all eleven USTs. The UST locations are shown on individual facility diagram maps in this section.

The information presented has been reviewed for compliance with §112, Virginia regulations, and industry standards. All deficiencies, specific regulatory citations, and recommended corrective actions are presented in Appendix B.

Tank Systems

General Information

Tank No.:	**NSA HQ-BallField-AST-01A**	Date Installed:	Unknown
Building No.:	BaseballField	Tank Use:	Product Dispenser
TankType:	AST	Activity/ Operator:	MWR

Tank Design Information

Capacity (gallons):	250
Contents:	Gasoline
Tank Corrosion Protection:	Painted
Tank Construction:	Double Walled Steel in Concrete
Tank Fabrication:	Shop-Fabricated

Ancillary AST Information

Release Prevention Barrier:	Elastomeric liner -
Bunkered Tank:	No
Direct ground contact:	No

Secondary Containment

Type:	Double Walled AST
Construction Material:	Plastic
Capacity:	100%
Drainage Controls:	None
Release Detection Method:	None

Piping Design Information

Aboveground Piping:	Single Walled Flexible Hose
Aboveground Piping Corrosion Protection:	N/A
Pipe Pressurization:	Pressure
Underground Piping:	None
Underground Piping Corrosion Protection:	N/A
Ancillary Equipment:	Flex Hose-Dispensers
Automatic Line Leak Detection:	N/A

Secondary Containment

Type:	Active Measures
Construction Material:	N/A
Capacity:	N/A
Drainage Controls:	N/A
Release Detection Method:	Visual Monitoring

Equipment and Spill/Overfill Prevention

Level Gauge:	Yes
High level Alarm:	None
Comm. link b/w gauger & pumper:	None
Level Gauge Linked to Computer:	No
CRDM:	Yes
Spill Control:	Secondary containment AST
STI Category:	STI-Cat 1
Spill Prevention:	AST Fill port is within spill bucket.
Auto Pump Shutoff:	Yes
Is Tank Portable:	No
Positioned to prevent spill from reaching navigable waters?	N/A, tank is not portable.

Overfill Prevention:

- ☐ Active Measures
- ☐ Communication Link b/w Gauger and Pumper (Electronic)
- ☐ Communication Link b/w Gauger and Pumper (Visual)
- ☐ Level Gauge
- ☐ Overfill/High Level Alarm
- ☐ Vent Whistle
- ☑ Overfill Prevention Valve (AST)
- ☐ Automatic Restrictor/Shutoff Device (UST)
- ☐ Not Required (UST fill event < 25 gallons/event)
- ☐ None

Potential Discharge Information

Spill Response Procedures:	Fire Department would respond should assistance be required as described in Section 6.
Worst Case Discharge:	Full Tank Capacity -
Probable Discharge Cause:	Fueling -
Probable Discharge:	<5 gal
Natural Resources at Risk:	Bousch Creek
Municipal Services at Risk:	Unnumbered storm drain system

Security

Does adequate lighting exist for spill detection during darkness:	Yes
Is Fill Port and/or Spill Bucket Secured:	Yes

Notes:

Indicates non-compliance item that must be resolved

Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1] Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2] As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Indicates issue that must be resolved to prevent noncompliance
[A] Apply required tank labels.
[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:
All entries are based solely on external visual observations unless otherwise noted
All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements
Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)
No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids
NFPA Diamond required by Code 704 for all fixed ASTs containing Oil and Hazardous Substances (OHS) liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and
Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances
Capacity marking is a primary means to protect against overfill.
"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]
1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

[A] Apply required tank labels.

[B] Tank requires vehicle protection law NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted
All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)
No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids
NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.
Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances
Capacity marking is a primary means to protect against overfill.
"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Notes:
Indicates non-compliance item that must be resolved
Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the containe must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Tank Systems

General Information

Tank No.:	**LR-H-UST-01**	Date Installed:	4/1/1994
Building No.:	H	Tank Use:	Heating System Supply
TankType:	UST	Activity/ Operator:	Navfac Mid-Atlantic, Utilities

Tank Design Information

Capacity (gallons):	10,000
Contents:	Fuel Oil
Tank Corrosion Protection:	N/A
Tank Construction:	Double Walled FRP
Tank Fabrication:	Shop-Fabricated

Ancillary AST Information

Release Prevention Barrier:	N/A UST -
Bunkered Tank:	N/A UST
Direct ground contact:	N/A UST

Secondary Containment

Type:	Double Walled UST
Construction Material:	Fiberglass
Capacity:	100%
Drainage Controls:	N/A
Release Detection Method:	Interstitial Monitoring

Piping Design Information

Aboveground Piping:	None
Aboveground Piping Corrosion Protection:	N/A
Pipe Pressurization:	Suction
Underground Piping:	Double Walled Fiberglass
Underground Piping Corrosion Protection:	N/A
Ancillary Equipment:	N/A
Automatic Line Leak Detection:	No

Secondary Containment

Type:	Double walled piping
Construction Material:	Fiberglass
Capacity:	25 gallons
Drainage Controls:	None
Release Detection Method:	Interstitial Monitoring

Equipment and Spill/Overfill Prevention

Level Gauge:	Yes
High level Alarm:	Audible & Visual
Comm. link b/w gauger & pumper:	Audible & Visual
Level Gauge Linked to Computer:	No
CRDM:	N/A
Spill Control:	N/A
STI Category:	N/A (UST)
Spill Prevention:	Spill Bucket
Auto Pump Shutoff:	No
Is Tank Portable:	No
Positioned to prevent spill from reaching navigable waters?	N/A, tank is not portable.

Overfill Prevention:

- ☐ Active Measures
- ☐ Communication Link b/w Gauger and Pumper (Electronic)
- ☐ Communication Link b/w Gauger and Pumper (Visual)
- ☐ Level Gauge
- ☑ Overfill/High Level Alarm
- ☐ Vent Whistle

Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Tank Systems

General Information

Tank No.:	**NSA HQ-MCE224-UST-08**	Date Installed:	1/1/1995
Building No.:	MCE224	Tank Use:	Product Dispenser
TankType:	UST	Activity/ Operator:	Marine Corp Exchange Auto Pride Gas Station

Tank Design Information

Capacity (gallons):	6,000
Contents:	Gasoline
Tank Corrosion Protection:	N/A
Tank Construction:	Double Walled FRP
Tank Fabrication:	Shop-Fabricated

Ancillary AST Information

Release Prevention Barrier:	N/A -
Bunkered Tank:	No
Direct ground contact:	Yes

Secondary Containment

Type:	Double Walled UST
Construction Material:	Fiberglass
Capacity:	100%
Drainage Controls:	N/A
Release Detection Method:	Automatic Tank Gauging

Piping Design Information

Aboveground Piping:	None
Aboveground Piping Corrosion Protection:	N/A
Pipe Pressurization:	Pressure
Underground Piping:	Double Walled Plastic
Underground Piping Corrosion Protection:	N/A
Ancillary Equipment:	Flex Hose-Dispensers
Automatic Line Leak Detection:	Yes

Secondary Containment

Type:	Double walled piping
Construction Material:	Plastic
Capacity:	25 gallons
Drainage Controls:	None
Release Detection Method:	Interstitial Monitoring

Equipment and Spill/Overfill Prevention

Level Gauge:	Yes (ATG)
High level Alarm:	Audible & Visual

Notes:

Indicates non-compliance item that must be resolved

Indicates issue that must be resolved to prevent noncompliance

[6] Apply required tank labels.

[8] Tank requires vehicle protection law NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the containe must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Tank Systems

General Information

Tank No.:	**NSA HQ-NH12-AST-01**	Date Installed:	Unknown
Building No.:	NH12	Tank Use:	Emergency Generator Supply
TankType:	AST	Activity/ Operator:	Atlantic Fleet Headquarters Support Activity

Tank Design Information

Capacity (gallons):	500
Contents:	Diesel
Tank Corrosion Protection:	Painted
Tank Construction:	Single Walled Steel
Tank Fabrication:	Shop-Fabricated

Ancillary AST Information

Release Prevention Barrier:	Concrete -
Bunkered Tank:	No
Direct ground contact:	No

Secondary Containment

Type:	Open Top Berm
Construction Material:	Concrete
Capacity:	649 gallons
Drainage Controls:	Manual Valve
Release Detection Method:	Visual Monitoring

Piping Design Information

Aboveground Piping:	Single Walled Steel
Aboveground Piping Corrosion Protection:	Painted
Pipe Pressurization:	Suction/Return
Underground Piping:	None
Underground Piping Corrosion Protection:	N/A
Ancillary Equipment:	N/A
Automatic Line Leak Detection:	N/A

Secondary Containment

Type:	Active Measures
Construction Material:	N/A
Capacity:	N/A
Drainage Controls:	N/A
Release Detection Method:	Visual Monitoring

Equipment and Spill/Overfill Prevention

Level Gauge:	Yes
High level Alarm:	None
Comm. link b/w gauger & pumper:	Visual
Level Gauge Linked to Computer:	No
CRDM:	Yes
Spill Control:	Secondary containment dike/berm
STI Category:	STI-Cat 1
Spill Prevention:	AST Fill port is within spill bucket.
Auto Pump Shutoff:	No
Is Tank Portable:	No
Positioned to prevent spill from reaching navigable waters?	N/A, tank is not portable.

Overfill Prevention:

- ☐ Active Measures
- ☐ Communication Link b/w Gauger and Pumper (Electronic)
- ☑ Communication Link b/w Gauger and Pumper (Visual)
- ☑ Level Gauge
- ☐ Overfill/High Level Alarm
- ☐ Vent Whistle
- ☐ Overfill Prevention Valve (AST)
- ☐ Automatic Restrictor/Shutoff Device (UST)
- ☐ Not Required (UST fill event < 25 gallons/event)
- ☐ None

Potential Discharge Information

Spill Response Procedures:	Navfac Mid-Atlantic Oil Recovery would respond should assistance be required as described in Section 6.
Worst Case Discharge:	Full Tank Capacity -
Probable Discharge Cause:	Overfill -
Probable Discharge:	<5 gal
Natural Resources at Risk:	Bousch Creek
Municipal Services at Risk:	Stormwater Outfall - 612

Security

Does adequate lighting exist for spill detection during darkness:	Yes

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Notes:
Indicates non-compliance item that must be resolved
Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)
No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids
NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.
Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances
Capacity marking is a primary means to protect against overfill.
"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program polic

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

General Information

Tank No.: **NSA HQ-NH32-AST-01**
Building No.: NH32
TankType: AST

Date Installed: 6/1/2010
Tank Use: Emergency Generator Base Tank
Activity/ Operator: Unknown

Tank Design Information

Capacity (gallons): 898
Contents: Diesel
Tank Corrosion Protection: Painted
Tank Construction: Double Walled Steel
Tank Fabrication: Shop-Fabricated

Ancillary AST Information

Release Prevention Barrier: Steel DW tank -
Bunkered Tank: No
Direct ground contact: No

Secondary Containment

Type: Double Walled AST
Construction Material: Steel
Capacity: 100%
Drainage Controls: Threaded Plug
Release Detection Method: Interstitial Monitoring

Piping Design Information

Aboveground Piping: Single Walled Flexible Hose
Aboveground Piping Corrosion Protection: N/A
Pipe Pressurization: Suction/Return
Underground Piping: None
Underground Piping Corrosion Protection: N/A
Ancillary Equipment: Flex Hose-Generators
Automatic Line Leak Detection: N/A

Secondary Containment

Type: Active Measures
Construction Material: N/A
Capacity: N/A
Drainage Controls: N/A
Release Detection Method: Visual Monitoring

Equipment and Spill/Overfill Prevention

Level Gauge: Yes
High level Alarm: None
Comm. link b/w gauger & pumper: Visual
Level Gauge Linked to Computer: No
CRDM: Yes
Spill Control: Secondary containment AST
STI Category: STI-Cat 1
Spill Prevention: Active Spill Prevention measures
Auto Pump Shutoff: No
Is Tank Portable: No
Positioned to prevent spill from reaching navigable waters? N/A, tank is not portable

Overfill Prevention:

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Notes:

Indicates non-compliance item that must be resolved

Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Potential Discharge Information

Spill Response Procedures:	Fire Department would respond should assistance be required as described in Section 6.
Worst Case Discharge:	Full Tank Capacity -
Probable Discharge Cause:	Overfill -
Probable Discharge:	<5 gal
Natural Resources at Risk:	Bousch Creek
Municipal Services at Risk:	Stormwater Outfall - 611

Security

Does adequate lighting exist for spill detection during darkness:	Yes
Is Fill Port and/or Spill Bucket Secured:	Yes

REMOVED FROM SITE

Notes:
Indicates non-compliance item that must be resolved
Indicates issue that must be resolved to prevent noncompliance
[A] Apply required tank labels.
[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:
All entries are based solely on external visual observations unless otherwise noted
All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements
Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)
No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids
NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.
Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances
Capacity marking is a primary means to protect against overfill.
"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]
1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Tank Systems

General Information

Tank No.:	**NSA HQ-NH46-AST-01**	Date Installed:	Unknown
Building No.:	NH46	Tank Use:	Emergency Generator Base Tank
TankType:	AST	Activity/ Operator:	Unknown

Tank Design Information

Capacity (gallons):	4,400
Contents:	Diesel
Tank Corrosion Protection:	Painted
Tank Construction:	Double Walled Steel
Tank Fabrication:	Shop-Fabricated

Ancillary AST Information

Release Prevention Barrier:	Steel DW tank -
Bunkered Tank:	No
Direct ground contact:	No

Secondary Containment

Type:	Double Walled AST
Construction Material:	Steel
Capacity:	100%
Drainage Controls:	Threaded Plug
Release Detection Method:	Visual Monitoring

Piping Design Information

Aboveground Piping:	Single Walled Flexible Hose
Aboveground Piping Corrosion Protection:	N/A
Pipe Pressurization:	Suction/Return
Underground Piping:	None
Underground Piping Corrosion Protection:	N/A
Ancillary Equipment:	Flex Hose-Generators
Automatic Line Leak Detection:	N/A

Secondary Containment

Type:	Active Measures
Construction Material:	N/A
Capacity:	N/A
Drainage Controls:	N/A
Release Detection Method:	Visual Monitoring

Equipment and Spill/Overfill Prevention

Level Gauge:	Yes
High level Alarm:	Audible
Comm. link b/w gauger & pumper:	Visual
Level Gauge Linked to Computer:	No
CRDM:	Yes
Spill Control:	Secondary containment AST
STI Category:	STI-Cat 1
Spill Prevention:	Active Spill Prevention measures
Auto Pump Shutoff:	No
Is Tank Portable:	No
Positioned to prevent spill from reaching navigable waters?	N/A, tank is not portable.

Overfill Prevention:

- ☐ Active Measures
- ☐ Communication Link b/w Gauger and Pumper (Electronic)
- ☑ Communication Link b/w Gauger and Pumper (Visual)
- ☑ Level Gauge
- ☑ Overfill/High Level Alarm
- ☐ Vent Whistle
- ☐ Overfill Prevention Valve (AST)
- ☐ Automatic Restrictor/Shutoff Device (UST)
- ☐ Not Required (UST fill event < 25 gallons/event)
- ☐ None

Potential Discharge Information

Spill Response Procedures:	Fire Department would respond should assistance be required as described in Section 6.
Worst Case Discharge:	Full Tank Capacity -
Probable Discharge Cause:	Overfill -
Probable Discharge:	<5 gal
Natural Resources at Risk:	Bousch Creek
Municipal Services at Risk:	Stormwater Outfall - 612

Security

Does adequate lighting exist for spill detection during darkness:	Yes
Is Fill Port and/or Spill Bucket Secured:	Yes

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

CRDM:	Yes
Spill Control:	Secondary containment AST
STI Category:	STI-Cat 1
Spill Prevention:	Direct connection to supply tank.
Auto Pump Shutoff:	Yes
Is Tank Portable:	No
Positioned to prevent spill from reaching navigable waters?	N/A, tank is not portable.

Overfill Prevention:

- ☐ Active Measures
- ☑ Communication Link b/w Gauger and Pumper (Electronic)
- ☐ Communication Link b/w Gauger and Pumper (Visual)
- ☐ Level Gauge
- ☐ Overfill/High Level Alarm
- ☐ Vent Whistle
- ☐ Overfill Prevention Valve (AST)
- ☐ Automatic Restrictor/Shutoff Device (UST)
- ☐ Not Required (UST fill event < 25 gallons/event)
- ☐ None

Potential Discharge Information

Spill Response Procedures:	Navfac Mid-Atlantic Oil Recovery would respond should assistance be required as described in Section 6.
Worst Case Discharge:	Full Tank Capacity -
Probable Discharge Cause:	Piping Failures/Breaking Lines -
Probable Discharge:	<5 gal
Natural Resources at Risk:	Bousch Creek
Municipal Services at Risk:	Stormwater Outfall - 613

Security

Does adequate lighting exist for spill detection during darkness:	Yes
Is Fill Port and/or Spill Bucket Secured:	Yes

Tank Systems

General Information

Tank No.:	**NSA HQ-NH94-AST-07**	Date Installed:	Unknown
Building No.:	NH94	Tank Use:	Emergency Generator Day Tank
TankType:	AST	Activity/ Operator:	Atlantic Fleet Headquarters Support Activity

Tank Design Information

Capacity (gallons):	500
Contents:	Diesel
Tank Corrosion Protection:	Painted
Tank Construction:	Double Walled Steel
Tank Fabrication:	Shop-Fabricated

Ancillary AST Information

Release Prevention Barrier:	Steel DW tank -
Bunkered Tank:	No
Direct ground contact:	No

Secondary Containment

Type:	Double Walled AST
Construction Material:	Steel
Capacity:	100%
Drainage Controls:	N/A
Release Detection Method:	Interstitial Monitoring

Piping Design Information

Aboveground Piping:	Single Walled Steel
Aboveground Piping Corrosion Protection:	N/A
Pipe Pressurization:	Suction/Return
Underground Piping:	None

[1]Signage Requirements
Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)
No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids
NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.
Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances
Capacity marking is a primary means to protect against overfill.
"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]
1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Signage/Markings, Overfill Protection, Secondary Containment, Corrosion Protection and Compatibility Compliance Summary

Notes:

Indicates non-compliance item that must be resolved

Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.

[B] Tank requires vehicle protection law NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Tank Systems

General Information

Tank No.:	**NSA HQ-NH94-UST-01**	Date Installed:	1/1/1988
Building No.:	NH94	Tank Use:	Emergency Generator Supply
TankType:	UST	Activity/ Operator:	Atlantic Fleet Headquarters Support Activity

Tank Design Information

Capacity (gallons):	25,000
Contents:	Diesel
Tank Corrosion Protection:	Cathodic Protection
Tank Construction:	Double Walled Steel
Tank Fabrication:	Shop-Fabricated

Ancillary AST Information

Release Prevention Barrier:	N/A -
Bunkered Tank:	N/A UST
Direct ground contact:	N/A UST

Secondary Containment

Type:	Double Walled UST
Construction Material:	Steel
Capacity:	100%
Drainage Controls:	N/A
Release Detection Method:	Interstitial Monitoring

Piping Design Information

Aboveground Piping:	None
Aboveground Piping Corrosion Protection:	N/A
Pipe Pressurization:	Pressure and Return
Underground Piping:	Double Walled Plastic
Underground Piping Corrosion Protection:	N/A
Ancillary Equipment:	N/A
Automatic Line Leak Detection:	Yes

Secondary Containment

Type:	Double walled piping
Construction Material:	Plastic
Capacity:	100%
Drainage Controls:	None
Release Detection Method:	Interstitial Monitoring and Line Leak Detectors

Equipment and Spill/Overfill Prevention

Level Gauge:	Yes (ATG)
High level Alarm:	Audible & Visual
Comm. link b/w gauger & pumper:	None
Level Gauge Linked to Computer:	No
CRDM:	Yes
Spill Control:	N/A
STI Category:	N/A (UST)
Spill Prevention:	Spill Bucket
Auto Pump Shutoff:	No
Is Tank Portable:	No
Positioned to prevent spill from reaching navigable waters?	N/A, tank is not portable.

Overfill Prevention:

- ☐ Active Measures
- ☐ Communication Link b/w Gauger and Pumper (Electronic)
- ☐ Communication Link b/w Gauger and Pumper (Visual)
- ☐ Level Gauge
- ☐ Overfill/High Level Alarm
- ☐ Vent Whistle
- ☐ Overfill Prevention Valve (AST)
- ☐ Automatic Restrictor/Shutoff Device (UST)
- ☐ Not Required (UST fill event < 25 gallons/event)
- ☑ None

Potential Discharge Information

Spill Response Procedures:	Navfac Mid-Atlantic Oil Recovery would respond should assistance be required as described in Section 6.
Worst Case Discharge:	Full Tank Capacity -
Probable Discharge Cause:	Overfill -
Probable Discharge:	<5 gal
Natural Resources at Risk:	Bousch Creek
Municipal Services at Risk:	Stormwater Outfall - 613

Security

Does adequate lighting exist for spill detection during darkness:	Yes
Is Fill Port and/or Spill Bucket Secured:	Yes

Notes:

Indicates non-compliance item that must be resolved

Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Tank Systems

General Information

Tank No.:	**NSA HQ-NH139-AST-01**	Date Installed:	Unknown
Building No.:	NH139	Tank Use:	Emergency Generator Day Tank
TankType:	AST	Activity/ Operator:	Atlantic Fleet Headquarters Support Activity

Tank Design Information

Capacity (gallons):	75
Contents:	Diesel
Tank Corrosion Protection:	Painted
Tank Construction:	Single Walled Steel
Tank Fabrication:	Shop-Fabricated

Ancillary AST Information

Release Prevention Barrier:	None -
Bunkered Tank:	No
Direct ground contact:	No

Secondary Containment

Type:	None
Construction Material:	N/A
Capacity:	N/A
Drainage Controls:	N/A
Release Detection Method:	Visual Monitoring

Piping Design Information

Aboveground Piping:	Single Walled Steel
Aboveground Piping Corrosion Protection:	None
Pipe Pressurization:	Suction/Return
Underground Piping:	None
Underground Piping Corrosion Protection:	N/A
Ancillary Equipment:	N/A
Automatic Line Leak Detection:	N/A

Secondary Containment

Type:	Active Measures
Construction Material:	N/A
Capacity:	N/A
Drainage Controls:	N/A
Release Detection Method:	Visual Monitoring

Equipment and Spill/Overfill Prevention

Level Gauge:	Yes
High level Alarm:	None
Comm. link b/w gauger & pumper:	Yes
Level Gauge Linked to Computer:	Yes
CRDM:	No
Spill Control:	None
STI Category:	STI-Cat 3
Spill Prevention:	Direct connection to supply tank
Auto Pump Shutoff:	No
Is Tank Portable:	No
Positioned to prevent spill from reaching navigable waters?	N/A, tank is not portable.

Overfill Prevention:

- ☐ Active Measures
- ☑ Communication Link b/w Gauger and Pumper (Electronic)
- ☐ Communication Link b/w Gauger and Pumper (Visual)
- ☐ Level Gauge
- ☐ Overfill/High Level Alarm
- ☐ Vent Whistle
- ☐ Overfill Prevention Valve (AST)
- ☐ Automatic Restrictor/Shutoff Device (UST)
- ☐ Not Required (UST fill event < 25 gallons/event)
- ☐ None

Potential Discharge Information

Spill Response Procedures:	Navfac Mid-Atlantic Oil Recovery would respond should assistance be required as described in Section 6.
Worst Case Discharge:	Full Tank Capacity -
Probable Discharge Cause:	Overfill -
Probable Discharge:	<5 gal
Natural Resources at Risk:	Bousch Creek
Municipal Services at Risk:	Stormwater Outfall - 611

Security

Does adequate lighting exist for spill detection during darkness:	Yes
Is Fill Port and/or Spill Bucket Secured:	Yes

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

General Information

Tank No.:	**NSA HQ-SC1-AST-01**	Date Installed:	Unknown
Building No.:	SC1	Tank Use:	Emergency Generator Base Tank
TankType:	AST	Activity/ Operator:	Joint Forces Staff College

Tank Design Information

Capacity (gallons):	382
Contents:	Diesel
Tank Corrosion Protection:	Painted
Tank Construction:	Double Walled Steel
Tank Fabrication:	Shop-Fabricated

Ancillary AST Information

Release Prevention Barrier:	Steel double bottom tank -
Bunkered Tank:	No
Direct ground contact:	No

Secondary Containment

Type:	Double Walled AST
Construction Material:	Steel
Capacity:	100%
Drainage Controls:	None
Release Detection Method:	Interstitial Monitoring

Piping Design Information

Aboveground Piping:	Single Walled Flexible Hose
Aboveground Piping Corrosion Protection:	N/A
Pipe Pressurization:	Suction/Return
Underground Piping:	None
Underground Piping Corrosion Protection:	N/A
Ancillary Equipment:	Flex Hose-Generators
Automatic Line Leak Detection:	N/A

Secondary Containment

Type:	Active Measures
Construction Material:	N/A
Capacity:	N/A
Drainage Controls:	N/A
Release Detection Method:	Visual Monitoring

Equipment and Spill/Overfill Prevention

Level Gauge:	Yes
High level Alarm:	None
Comm. link b/w gauger & pumper:	Visual
Level Gauge Linked to Computer:	No
CRDM:	Yes
Spill Control:	Secondary containment AST
STI Category:	STI-Cat 1
Spill Prevention:	Active Spill Prevention measures
Auto Pump Shutoff:	No
Is Tank Portable:	No
Positioned to prevent spill from reaching navigable waters?	N/A, tank is not portable.

Overfill Prevention:

- ☐ Active Measures
- ☐ Communication Link b/w Gauger and Pumper (Electronic)
- ☑ Communication Link b/w Gauger and Pumper (Visual)
- ☑ Level Gauge
- ☐ Overfill/High Level Alarm
- ☐ Vent Whistle
- ☐ Overfill Prevention Valve (AST)
- ☐ Automatic Restrictor/Shutoff Device (UST)
- ☐ Not Required (UST fill event < 25 gallons/event)
- ☐ None

Potential Discharge Information

Spill Response Procedures:	Fire Department would respond should assistance be required as described in Section 6.
Worst Case Discharge:	Full Tank Capacity -
Probable Discharge Cause:	Overfill -
Probable Discharge:	<5 gal
Natural Resources at Risk:	Bousch Creek
Municipal Services at Risk:	Stormwater Outfall - 613

Security

Does adequate lighting exist for spill detection during darkness:	Yes
Is Fill Port and/or Spill Bucket Secured:	Yes

Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.
[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:
All entries are based solely on external visual observations unless otherwise noted
All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1]Signage Requirements
Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)
No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids
NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.
Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances
Capacity marking is a primary means to protect against overfill.
"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]
1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the containe must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

Notes:

Indicates non-compliance item that must be resolved

Indicates issue that must be resolved to prevent noncompliance

[A] Apply required tank labels.

[B] Tank requires vehicle protection iaw NFPA 30 Chapters 22.11.4.7 and 22.15.

Footnotes:

All entries are based solely on external visual observations unless otherwise noted

All regulatory references included in this table are to 40 CFR 112 unless otherwise noted

[1] Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2] As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

[1]Signage Requirements

Container identification number required by OPNAVINST M-5090.1 and required to develop container testing and inspection program required by 112.8(c)(6)

No Smoking sign required by OSHA Rule 29 CFR 1910.106(f)(6) on any container storing flammable or combustible liquids

NFPA Diamond required by Code 704 for all fixed ASTs containing OHS liquids. Gasoline is flammable with flash point < 100 degrees F and requires 1,3,0. Diesel is combustible with flash point > 100 and requires 1,2,0.

Contents marking required by 29 CFR 1910.1200(f)(5) for all containers that store hazardous substances

Capacity marking is a primary means to protect against overfill.

"Used Oil" label is required by 40 CFR 279 for any oil which is used, spent, or wasted. This does not apply to off-spec, discarded or reclaimed fuels.

[2]As required by 112.8(c)(8), the Owner must engineer or update each container installation in accordance with good engineering practice to avoid discharges. Owner must provide at least one of the following four devices: [112.8(c)(8)]

1. High liquid level alarms with an audible or visual signal at a constantly attended operation or surveillance station. In smaller facilities an audible air vent may suffice. [112.8(c)(8)(i)]
2. High liquid level pump cutoff device set to stop flow at a predetermined container content level. [112.8(c)(8)(ii)]
3. Direct audible or code signal communication between the container gauger and the pumping station. [112.8(c)(8)(iii)]
4. A fast response system for determining the liquid level of each bulk storage container such as digital computers, telepulse, or direct vision gauges. If you use this alternative, a person must be present to monitor gauges and the overall filling of bulk storage containers. [112.8(c)(8)(iv)]

[3] Position or locate mobile or portable oil storage containers to prevent a discharge as described in §112.1(b). Except for mobile refuelers and other non-transportation-related tank trucks, you must furnish a secondary means of containment, such as a dike or catchment basin, sufficient to contain the capacity of the largest single compartment or container with sufficient freeboard to contain precipitation. [112.8(c)(11)/112.12(c)(11)]

[4] Construct all bulk storage tank installations (except mobile refuelers and other non-transportation related tank trucks) so that you provide a secondary means of containment for the entire capacity of the largest single container and sufficient freeboard to contain precipitation. [112.8(c)(2)/112.12(c)(2)]

[5] Required in NFPA 30 Chapter 22.11.4 and NAVFAC MidAtlantic Environmental Program policy

[6] Provide buried piping that is installed or replaced on or after August 16, 2002, with a protective wrapping and coating. You must also cathodically protect such buried piping installations or otherwise satisfy the corrosion protection standards for piping in part 280 of this chapter or a State program approved under part 281 of this chapter. If a section of buried line is exposed for any reason, you must carefully inspect it for deterioration. If you find corrosion damage, you must undertake additional examination and corrective action as indicated by the magnitude of the damage. [112.8(b)(5)/112.12(b)(5)]

[7] Container may not be used for the storage of oil unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature. [112.8(c)(1)/112.12(c)(1)] To comply with this requirement, the container must be constructed to an industry standard like UL 142, UL 2085 or be part of an engineered system.

[8] In accordance with NFPA 30 Chapter 22.15, all AST must be able to withstand vehicle impact if installed in areas with potential for vehicle collisions. UL2085 protected tanks meet this requirement except in extreme cases.

5.2.2 Drum Storage Area Data Sheets and Maps

Information sheets have been prepared for drum storage areas. Information presented in this section is intended to provide owners, operators, and inspectors a quick reference which indicates the typical number of oil storage containers, the usual type of oil stored, the expected failure scenarios and associated general secondary containment compliance measures required under §112.7(b) and §112.7(c), the sized secondary containment requirements under §112.8(c), and associated drainage controls.

The information presented has been reviewed for compliance with §112 and industry standards. All deficiencies, specific regulatory citations, and recommended corrective actions are presented in Appendix B.

5.2.3. Mobile Equipment/Container Storage and Operating Area Information Sheets and Maps

Information sheets have been prepared for mobile equipment which has an internal oil storage capacity of greater than or equal to 55 gallons of non-motive power oil.

Information presented in this section is intended to provide owners, operators, and inspectors a quick reference by indicating the typical number and location of mobile equipment having 55 gallons or more of oil, the type of oil stored, the expected failure scenarios, and associated general secondary containment compliance measures required under §112.7(b) and §112.7(c). The sized secondary containment requirements under §112.8(c) are analyzed and presented for both the storage sites of the equipment when not in use and the deployment site when in operation mode. Associated drainage controls are also presented.

The information presented has been reviewed for compliance with deficiencies, specific regulatory citations, and recommended corrective actions ed in Appendix B.

5.2.3 Portable Container Storage Area Data Sheets and Maps

Information sheets have been prepared for portable container storage areas. Information presented in this section is intended to provide owners, operators, and inspectors a quick reference which indicates the typical number of oil storage containers, the usual type of oil stored, the expected failure scenarios and associated general secondary containment compliance measures required under §112.7(b) and §112.7(c), the sized secondary containment requirements under §112.8(c), and associated drainage controls.

The information presented has been reviewed for compliance with §112 and industry standards. All deficiencies, specific regulatory citations, and recommended corrective actions are presented in Appendix B.

5.2.4 Oil-Filled Operational Equipment

OFOE is equipment that includes an oil storage container in which the oil is present solely to support the function of the apparatus or device. Types of OFOE include electrical equipment such as transformers, electrical switches, and circuit breakers, as well as hydraulic systems, lubricating systems, gear boxes, machining coolant systems, heat transfer systems, certain aviation ground support maintenance equipment, and elevator hydraulic reservoirs.

OFOE at NSA HR Headquarters includes electrical transformers, circuit breakers, switches, and hydraulic elevators. Average capacity of the elevator hydraulic reservoirs is estimated to be 150 gallons. A complete inventory and selected information for OFOE in use by NSA HR Headquarters is provided in Section 5.1 of this SPCC Plan. All deficiencies, specific regulatory citations, and recommended corrective actions are presented in Appendix B.

40 CFR 112.2 specifically excludes OFOE from the definition of bulk storage container. The effect of this distinction is that OFOE is not subject to the sized secondary containment requirements of 112.8(c)(2). However, OFOE is subject to the general secondary containment requirements of 112.7 (b) and (c) which is calculated based on volume and flow rate of the most likely release of oil from the OFOE. 40 CFR 112.7 (c) requires that general secondary containment be provided for the most likely quantity of oil that would be released from OFOE unless the facility meets the qualification criteria and chooses to implement alternate requirements for qualified OFOE in lieu of general secondary containment.

NSA HR Headquarters meets the qualification criteria as defined in §112.7(k)(1) and elects to employ the alternate requirements to secondary containment for all OFOE as defined by §112.7(k)(2). The alternate requirements are: (i) establish and document the facility procedures for inspections or a monitoring program to detect equipment failure and/or a discharge; and (ii) unless you have submitted a response plan under §112.20, provide in your SPCC Plan the following: (A) An oil spill contingency plan following the provisions of part 109 of this chapter; (B) A written commitment of manpower, equipment, and materials required to expeditiously control and remove any quantity of oil discharged that may be harmful.

As part of the alternate requirements to secondary containment, OFOE must be covered by an inspection plan or monitoring program as defined by §112.7(k)(2)(i). The OFOE inspection procedure used by NSA HR Headquarters is included as Appendix H. Any discharges noted during inspections or during routine maintenance by NSA HR PWD Utilities personnel would be immediately addressed in accordance with the discharge response instructions in Section 6 of this SPCC Plan.

NSA HR Headquarters is not required to have an FRP. NSA HR Headquarters operations are located in very close proximity to Naval Station Norfolk, and spill response personnel, equipment, and procedures will be consistent with those described in the Consolidated Regional FRP. The same resources will be used at NSA HR Headquarters. A written commitment of resources required to expeditiously control and remove any quantity of oil discharged that may be harmful is provided by the Management Approval signature on page vii of this SPCC Plan.

Any OFOE owned, operated, and maintained by a public utility company at all contiguous and noncontiguous areas covered by this NSA HR Headquarters SPCC Plan is not included in this SPCC Plan. Public utility companies are responsible for any response and clean-up actions of their equipment, to include notification of federal, state, and local authorities in the event of an

incident involving their equipment. In the event of an emergency involving public utility company equipment, immediately notify the Emergency Communications Center (ECC) / Emergency Dispatch at (757) 444-3333. The ECC will notify the public utility company for response and will deploy Navy response assets for immediate response if required.

6.0 DISCHARGE RESPONSE

This section describes the response and cleanup procedures in the event of an oil discharge.

Table 2 contains basic response contacts and phone numbers.

Table 2. Emergency Contacts

Navy Emergency Contacts	**Phone Number**
Naval Station Norfolk (NSN) ECC / Emergency Dispatch	(757) 444-3333 (24 hr)
NSN Command Duty Officer	(757) 322-2366
NSA HR Command Duty Officer	(757) 438-3402
NSN Port Operations	(757) 444-1121/1756
NSN Safety Manager	(757) 433-2538
NSN Public Affairs Officer	(757) 836-1484
Navy On-Scene Coordinator (NOSC)	(757) 341-0449
NAVFAC Facility Response Team	(757) 444-7528 / 650-4147/8
NAVFAC HW Regional Spill Manager	(757) 341-0390
Technical Support Department Tank Program Manager Director	 (757) 341-0391 (Day) (757) 341-0381 (Day)
Naval Support Activity Hampton Roads Headquarters (IEPD	(757) 836-1862
NSA HR PWD Oil Recovery Office	(757) 341-0460 or (757) 341-1909 (757) 650-4148 after hours Duty Foreman
Non-Navy Emergency Contacts	**Phone Number**
National Response Center	(800) 424-8802 (24 hr)
EPA Region 3	(800) 438-2474 (215) 814-5122
USCG Sector Hampton Roads	(757) 668-5571 (24 hr)
Hampton Roads Sanitation District	(757) 460-3200 (24 hr)
Virginia Department of Environmental Quality Tidewater Regional Office	(757) 518-2000 (M-F 0830-1700)
Virginia Department of Emergency Management	1-800-468-8892 (24 hr)
Norfolk Department of Emergency Services	(757) 441-5600
Norfolk Fire Department HAZMAT Team	(757) 441-2536
Norfolk Utilities Department Emergency	(757) 823-1000 (24 hr)

Commercial response contractors are activated by contacting the NOSC at (757) 636-4378. The NOSC is called by the Command Duty Officer as warranted.

6.1 Discharge Prevention Measures

§112.7(a)(3) Describe in your Plan …

(ii) Discharge prevention measures including procedures for routine handling of products (loading, unloading, and facility transfers, etc.);

NSA HR Headquarters personnel follow written procedures for routine transfer of products as a key element of discharge prevention. These procedures are periodically reviewed and updated as needed to reflect best management practices, equipment changes, or other aspects that may contribute to spill prevention. Appendix E provides the Fuel Handling Standard Operating Procedure, which describes discharge prevention measures associated with routine product handling procedures.

6.2 Discharge or Drainage Controls

§112.7(a)(3) Describe in your Plan …

(iii) Discharge or drainage controls such as secondary containment around containers and other structures, equipment, and procedures for the control of a discharge;

Refer to the site-specific information sheets and site maps in Section 5.2.1 of this SPCC Plan for a description of the containment or diversionary structures and discharge or drainage controls at each storage tank facility. Section 5.2.2 and Section 5.2.3 contain information on secondary containment for drum storage areas and portable container storage areas, respectively. OFOE is addressed in Section 5.2.4 of this SPCC Plan.

6.3 Discharge Discovery Countermeasures

§112.7(a)(3) Describe in your Plan …

(iv) Countermeasures for discharge discovery, response, and cleanup (both the facility's capability and those that might be required of a contractor);

Immediate action must be taken to control, contain, and recover discharged product. Refer to tables with each datasheet for a summary of countermeasures for specific discharge discovery, response, and cleanup scenarios for each AST, UST, and drum and portable container storage area. See Section 6.0 for notification contact information.

6.3.1 Spill Notification Procedures

The immediate reporting of oil spill events is paramount to minimizing possible damage to the environment, health, and property. For purposes of spill notification, a spill event is defined as a discharge of oil into a berm, onto the ground, or onto the navigable waters of the United States. The initial oil spill report must not be delayed obtain in order to obtain more detailed information. Upon identification of an oil spill incident, the following actions shall be initiated unless otherwise instructed:

1. Notify the Naval Station Norfolk ECC / Emergency Dispatch at (757) 444-3333.

2. Emergency Dispatch will notify the Naval Station Norfolk Facility Response Team (FRT) to include Command Duty Officer (CDO), Environmental, Fire Department, and other responders as needed (NOSC for oil spills > 100 gallons).

3. The command / tenant responsible for the spill will send out all internal Navy correspondence as required by Navy policy.

4. Emergency Dispatch will perform the initial NRC notification as required.

5. NSA HR PWD Environmental Department will send out all other regulatory correspondence as required by state and federal regulations.

6.3.2 Information To Report

Upon discovery of a spill, the following information should be provided to the Emergency Dispatch Operator:

1. The product/material released.

2. Quantity released. Provide an estimate if exact amount is unknown and clearly convey that it is an estimate.

3. The location of the spill (building number and tank number if known) and if it has entered a waterway or storm drain or if entry is imminent.

4. The source of the spill and the root cause if known.

5. Is the source secured?

6. Is the spill contained?

7. Cleanup actions already underway.

6.3.3 Initial Spill Discovery Actions

The following are immediate actions to take before response personnel arrive if safe to do so:

1. Secure the source and all activities related to the release.

2. Warn personnel in the immediate area.

3. Turn off nearby ignition sources.

4. Contain the spill if possible with containment devices from spill kits.

5. Cover or protect nearby storm drains or divert the spill from waterways using dikes or man-made berms.

6.3.4 Spill Response Procedures

In the event of an oil spill, the following response activities will be followed:

1. Following notification to the Naval Station Norfolk ECC / Emergency Dispatch by the spill identifier, the Fire Department Initial Response Team will be dispatched to the scene to assess the spill. The Emergency Dispatch will notify the NSA HR PWD Environmental Department.

2. The Emergency Dispatch will perform any required notification to the NRC, and the NSA HR PWD Environmental Department will make other required spill notifications to state and local agencies.

3. Once on scene, the senior official of the first response unit (Fire Department) shall function as the Facility Incident Commander (FIC) until relieved by a higher qualified response person. The FIC is the Navy representative designated to coordinate and direct control and clean-up efforts at the scene of an oil spill.

4. The FIC shall assess the situation and determine what assistance, if any, is needed from NSA HR PWD or contractor spill response personnel identified in Section 6.5. The scene shall be assessed to determine if any natural resources or municipal services are at risk due to the spill. If there is a risk, the appropriate personnel will be contacted. Refer to the Important Emergency Contacts listed in Section 6.0.

5. If assistance from a commercial contractor is required, the FIC shall contact the NOSC to make the necessary arrangements. The NOSC will be notified on all petroleum spills greater than 100 gallons.

6.4 Spill Response Capability

NSA HR Headquarters has access to both NSA HR PWD (Navy) and outside spill response personnel and equipment for handling an oil spill. The NSA HR PWD Oil Recovery Team maintains a full-time staff of oil spill response personnel and equipment capable of containing and cleaning up an oil spill. Should additional assistance be required, NSA HR PWD can call upon other local naval facilities spill response equipment and personnel. Should it be necessary to obtain the services of a commercial contractor, NSA HR Headquarters maintains the ability to obtain assistance as required for oil spill recovery and cleanup.

Contacts for spill response assistance are listed below:

- Primary: NSA HR PWD:
    - NSA HR PWD Oil Recovery Team: (757) 341-0460 (0730-1600)
    - Naval Station Norfolk CDO: (757) 322-2366
    - NSA HR Headquarters CDO: (757) 438-3402

The NOSC shall provide commercial spill response contract support as needed.

Table 3. Typical Spill Response Assets Readily Available at Naval Station Norfolk

Equipment	Unit	Oil Recovery Naval Station Norfolk
Absorbent Material	Bag	100
Boom, Response	Feet	8,000
Boom, Permanent	Feet	1,500
Boat, Utility	Each	2
Boat, Boston Whaler	Each	2
Boat, Flattop, Work	Each	1
Boat, Platform	Each	4
Cleaner, Boom	Each	2
Forklift, 6000 pounds	Each	1
Generator, Diesel	Each	2
Lighting, Portable	Set	1
Mobile Van, Maintenance	Each	1
Mooring System	Each	4
Pads, Sorbent	Bundle	100
Pump, Diaphragm	Each	1
Skimmer, Rapid Response	Each	3
Skimmer, Portable Weir	Each	1
Tank, Storage	Each	7
Tank, 2000 gallon	Each	5
Tank, 10,000 gallon	Each	1
Tanker, 5000 gallon	Each	5
Tanker, Vacuum, 6000 gallon	Each	7
Tractor Truck, 15 ton	Each	2
Truck, Pump	Each	3
Truck, Stake-bed, 7 ton	Each	1
Truck, Vacuum 1800 gallon	Each	2
Truck, Vacuum 1300 gallon	Each	2
Truck, Vacuum 2500 gallon	Each	1
Truck, 1/2 ton	Each	2
Washer, high pressure	Each	2
Work Platform	Each	1

Note: Deployment time for obtaining the equipment listed above is less than 1 hour for equipment based at Naval Station Norfolk. The equipment listed above is representative of the types and quantities of oil spill response equipment maintained by NSA HR PWD Oil Recovery. To obtain an up-to-date listing of available equipment, contact the NSA HR PWD Oil Recovery office at (757) 341-0460.

6.5 Methods of Disposal of Recovered Material

§112.7(a)(3) Describe in your Plan …

(v) Methods of disposal of recovered materials in accordance with applicable legal requirements;

Recovered oil and spill materials will be disposed of in accordance with Virginia Solid Waste Management Regulations 9VAC20-80 or Virginia Hazardous Waste Management Regulations 9VAC20-60 and federal solid or hazardous waste regulations as appropriate. NSA HR PWD Hazardous Waste Program Managers and NSA HR PWD Oil Recovery personnel will determine the appropriate disposal method for recovered oil and debris.

CAUTION: DO NOT MIX NON-HAZARDOUS WASTES WITH HAZARDOUS WASTES. MINIMIZE HAZARDOUS WASTES GENERATED.

The types of waste NSA HR Headquarters may generate as a result of a spill response include:

- Hazardous and state-regulated wastes
- Fresh oil, oily wastes, and weathered oil
- Oil and water emulsions
- Oil-contaminated wastes such as:
  - Spent sorbents
  - Oil-contaminated debris and materials such as disposable personal protective equipment, rags, plastic bags or sheets, etc.
  - Oiled vegetation, soil, and sand if onshore cleanup operations occur in the response
  - Oil-contaminated wildlife carcasses
  - Waste decontamination solutions and effluents from decontamination operations
  - Non-contaminated wastes from response operations

NSA HR PWD Environmental Natural Resources personnel will coordinate disposition of contaminated wildlife and carcasses.

6.6 Post Discharge Review Procedures for NSA HR Headquarters

Each release will be evaluated by the responsible activity / tenant as well as the NSA HR Headquarters Environmental Protection Specialist, Fire Department, and XO / CO to determine the nature of the release, ensure all required notifications are made, and assess the effectiveness of response actions. When a problem is noted, corrective actions will be initiated to better prepare for or prevent any future discharge.

In accordance with 40 CFR 112.4, a report shall be submitted to the EPA Region 3 Administrator by the NSA HR PWD Spill Program Manager whenever the facility has discharged more than 1,000 gallons of oil in a single discharge, as described in §112.1(b), or discharged more than 42 gallons of oil in each of two discharges, as described in §112.1(b), occurring within any twelve month period. The report shall include the following information:

1. Facility name

2. Name of individual filing report

3. Facility location

4. Maximum storage or handling capacity of the facility and normal daily throughput

5. Corrective action and countermeasures taken, including a description of equipment repairs and replacements

6. An adequate description of the facility, including maps, flow diagrams, and topographical maps, as necessary

7. The cause of such discharge as described in §112.1(b), including a failure analysis of the system or subsystem in which the failure occurred

8. Additional preventive measures you have taken or contemplated to minimize the possibility of recurrence

9. Such other information as the Regional Administrator may reasonably require pertinent to the SPCC Plan or discharge

Appendix A: Storage Tank Management Plan

Naval Support Activity Hampton Roads Headquarters

This appendix was deleted in Amendment 1 because NSA HR HQ is covered in the Regional STMP.

Appendix B: SPCC Deficiencies

The following table lists observations of outstanding SPCC deficiencies and recommended corrective actions. Any actions corrected during the review period are not included.

Naval Support Activity Hampton Roads Headquarters SPCC Plan Deficiency List

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-BallField-AST-01A (Added in Amendment 1)	Best Management Practice	1. Tank is currently out of operation and not properly closed and may be intended for permanent closure.	1. Recommend permanently closing tank in accordance with SPCC regulations.
	40 CFR 112.8(c)(6)	2. No ID number posted on tank.	2. Properly close tank or post ID number on tank.
	NFPA Code 704	3. NFPA Hazard Diamond missing.	3. Properly close tank or install NFPA Hazard Diamond.
	NFPA 30 Chapter 27.6.4	4. Rust on tank fittings.	4. Properly close tank or remove rust and paint fittings
	NFPA 30 Chapter 27.4.3.2	5. Tank is equipped with PVC plugs in unused tank openings. Tank must be made of noncombustible materials.	5. Properly close tank or replace low melting point materials with steel plugs.
	NFPA 30 Chapter 6.5.4.2	6. Ground strap is disconnected.	6. Properly close tank or attach ground strap to tank or verify that tank is adequately grounded.
	40 CFR 112.8(c)(8)	7. Level gauge is opaque and needs to be replaced.	7. Properly close tank or replace level gauge
	NFPA 30 Chapter 22.11.4.5	8. Double-walled tanks must have an overfill alarm at 90% capacity. This tank does not have an overfill alarm.	8. Properly close tank or install overfill alarm.
	NFPA 30 Chapter 22.15	9. Tank must have vehicle protection. Bollards are not installed for the tank.	9. Properly close tank or install vehicle protection (bollards or jersey barriers). Use installation requirements in NFPA 30 4.3.7.2 as a guide.
NSA HQ-BallField-AST-01B (Added in Amendment 1)	Best Management Practice	1. Tank is currently out of operation and not properly closed and may be intended for permanent closure.	1. Recommend permanently closing tank in accordance with SPCC regulations
	40 CFR 112.8(c)(6)	2. No ID number posted on tank.	2. Properly close tank or post ID number on tank.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-BallField-AST-01B (Added in Amendment 1) (continued)	NFPA Code 704	3. NFPA Hazard Diamond missing.	3. Properly close tank or install NFPA Hazard Diamond.
	Best Management Practice	4. Capacity not labeled on tank.	4. Properly close tank or add label showing capacity of tank.
	NFPA 30 Chapter 27.6.4	5. Rust on tank fittings.	5. Properly close tank or remove rust and paint fittings
	NFPA 30 Chapter 27.4.3.2	6. Tank is equipped with PVC plugs in unused tank openings. Tank must be made of noncombustible materials.	6. Properly close tank or replace low melting point materials with steel plugs.
	NFPA 30 Chapter 6.5.4.2	7. Ground strap is disconnected.	7. Properly close tank or attach ground strap to tank or verify that tank is adequately grounded.
	40 CFR 112.8(c)(8)	8. Level gauge is opaque and needs to be replaced.	8. Properly close tank or replace level gauge.
	NFPA 30 Chapter 22.11.4.5	9. Double-walled tanks must have an overfill alarm at 90% capacity. This tank does not have an overfill alarm.	9. Properly close tank or install overfill alarm.
	NFPA 30 Chapter 22.15	10. Tank must have vehicle protection. Bollards are not installed for the tank.	10. Properly close tank or install vehicle protection (bollards or jersey barriers). Use installation requirements in NFPA 30 4.3.7.2 as a guide.
NSA HQ-BEN154-AST-01	NFPA 30 Chapter 22.15 NFPA 30A Chapter 6.5.1 (2015 editions)	1. Dispenser hose is on the ground and not protected by bollards. Hose must be secured to protect it from damage.	1. Keep dispenser hose off the ground and within protection of the bollards when not in use.
	NFPA 30 Chapter 21.8.6 (2015 Edition)	2. Concrete shell is crazed.	2. Seal cracks in concrete shell to protect secondary containment liner.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-BEN154-AST-01 (continued)	NFPA 30 Chapter 22.11.4.5 (2015 Edition)	3. Double-walled tank must have overfill alarm at 90% and automatic fuel flow shutoff mechanism at 95% capacity.	3. Existing vent whistle meets requirement for overfill alarm. Install flow restrictor on tank.
~~NSA HQ-BEN154-AST-02~~ (Removed in Amendment 1)	~~40 CFR 112.8(c)(2)~~	~~1. Single wall tank with no effective secondary containment.~~	~~1. Provide appropriate sized secondary containment and/or diversionary structure per 112.8(c)(2).~~
	~~40 CFR 112.8(c)(8)~~	~~2. Level gauge missing. No overfill prevention device provided.~~	~~2. Install direct vision level gauge or other means of overfill prevention per 112.8(c)(8).~~
	~~40 CFR 112.8(c)(10)~~	~~3. Oil residue and absorbent pad left on tank top from minor releases during filling.~~	~~3. Remove oil residue from all exterior surfaces of tank. Remove absorbent pad.~~
	~~40 CFR 112.8(c)(6)~~	~~4. Minor corrosion on tank top.~~	~~4. Treat corrosion and paint tank.~~
	~~NFPA 30 Chapter 22.7.1.1 (2015 edition)~~	~~5. No emergency vent installed on primary tank.~~	~~5. Install properly sized UL-listed emergency vent on primary tank in nozzle currently plugged.~~
NSA HQ-CA6-AST-05	NFPA 30 Chapter 6.5.4.2 (2015 edition)	1. No ground strap found.	1. Attach ground strap to tank or verify that tank is adequately grounded.
	NFPA 30 Chapter 21.6.6.3 (2015 edition)	2. Lumber stored behind and up against tank and debris on tank top surface. Area around tank shall be kept free of unnecessary combustible materials.	2. Remove lumber from behind tank and debris from tank top surface.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-CA6-AST-05 (continued)	NFPA 30 Chapter 22.11.4.5 (2015 Edition)	3. Double-walled tank must have overfill alarm at 90% and automatic fuel flow shutoff mechanism at 95% capacity.	3. Install alarm and flow restrictor on tank. Direct reading level gauge includes sender for electrical signal to remote receiver, but per manufacturer (Rochester Gauges, Inc.) gauge is not to be used for tank filling or to prevent overfill.
	NFPA 30 Chapter 22.7.1.1.1 (2015 edition)	4. No emergency vent installed on interstitial space.	4. Install properly sized UL-listed emergency vent on interstitial space.
NSA HQ-CA501-AST-01	40 CFR 112.8(c)(6)	1. Two ID numbers posted on tank.	1. Remove old sign CA-501-A from tank so inspection records can be maintained.
	NFPA Code 704	2. NFPA Hazard Diamond missing.	2. Install NFPA Hazard Diamond.
	40 CFR 112.8(c)(10)	3. Absorbent pads in spill bucket from minor releases during filling.	3. Remove absorbent pads and any fuel residue from spill bucket.
	NFPA 30 Chapter 22.15 (2015 edition)	4. Tank must have vehicle protection.	4. Install bollards in accordance with NFPA 30A 4.3.7.2 or jersey barriers to provide vehicle protection.
	NFPA 30 Chapter 22.4.2.1 (2015 edition)	5. Minimum tank separation of 36 inches not maintained for Class I and Class II liquids.	5. Relocate tank(s) to provide minimum separation of 36 inches.
	NFPA 30 Chapter 22.15 NFPA 30A Chapter 6.5.1 (2015 editions)	6. Dispenser hose is on the ground and not protected by bollards. Hose must be secured to protect it from damage.	6. Keep dispenser hose off the ground and within protection of the bollards when not in use.
	NFPA 30 Chapter 22.11.4.5 (2015 Edition)	7. Double-walled tank must have overfill alarm at 90% and automatic fuel flow shutoff mechanism at 95% capacity.	7. Existing vent whistle meets requirement for overfill alarm. Install flow restrictor on tank.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-CA501-AST-01 (continued)	NFPA 30 Chapter 21.4.3.9 (2015 Edition)	8. Pressure-vacuum vent is required. Tanks storing Class 1B liquid (gasoline) require closed normal vents, except when venting under pressure or vacuum conditions.	8. Install a pressure-vacuum vent on normal vent.
	Best Management Practice	9. Sign showing contents is damaged.	9. Replace sign showing contents.
NSA HQ-CA501-AST-02	40 CFR 112.8(c)(6)	1. Two ID numbers posted on tank.	1. Remove old sign CA-501-B from tank so inspection records can be maintained.
	40 CFR 112.8(c)(10)	2. Absorbent pad in spill bucket from minor releases during filling.	2. Remove absorbent pad and any fuel residue from spill bucket.
	NFPA 30 Chapter 22.15 (2015 edition)	3. Tank must have vehicle protection.	3. Install bollards in accordance with NFPA 30A 4.3.7.2 or jersey barriers to provide vehicle protection.
	NFPA 30 Chapter 22.4.2.1 (2015 edition)	4. Minimum tank separation of 36 inches not maintained for Class I and Class II liquids.	4. Relocate tank(s) to provide minimum separation of 36 inches.
	NFPA 30 Chapter 22.15 NFPA 30A Chapter 6.5.1 (2015 editions)	5. Dispenser hose is on the ground and not protected by bollards. Hose must be secured to protect it from damage.	5. Keep dispenser hose off the ground and within protection of the bollards when not in use.
	NFPA 30 Chapter 22.11.4.5 (2015 Edition)	6. Double-walled tank must have overfill alarm at 90% and automatic fuel flow shutoff mechanism at 95% capacity.	6. Install alarm and flow restrictor on tank.
	NFPA 30 Chapter 21.8.6 (2015 Edition)	7. Concrete shell is crazed.	7. Seal cracks in concrete shell to protect secondary containment liner. Top of concrete shell is already sealed.
NSA HQ-CA501-AST-03	40 CFR 112.8(c)(6)	1. Two ID numbers posted on tank.	1. Remove old sign CA-501-C from tank so inspection records can be maintained.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-CA501-AST-03 (continued)	40 CFR 112.8(c)(10)	2. Two oil filters left in spill bucket.	2. Remove oil filters in a timely manner from spill bucket after draining.
	NFPA 30 Chapter 22.15 (2015 edition)	3. Tank must have vehicle protection.	3. Install bollards in accordance with NFPA 30A 4.3.7.2 or jersey barriers to provide vehicle protection.
	NFPA 30 Chapter 22.7.1.1 (2015 edition)	4. No emergency vent installed on primary tank.	4. Install properly sized UL-listed emergency vent on primary tank.
	NFPA 30 Chapter 22.4.2.1.2 (2015 edition)	5. Minimum tank separation of 36 inches not maintained - applicable for used oil because within drainage path of tanks storing Class I and Class II liquids.	5. Relocate tank(s) to provide minimum separation of 36 inches.
~~LR-H-AST-04~~ (Removed in Amendment 1)	~~40 CFR 112.8(c)(2)~~	~~1. Single wall tank with no effective secondary containment.~~	~~1. Provide appropriate sized secondary containment and/or diversionary structure per 112.8(c)(2).~~
	~~40 CFR 112.8(c)(6)~~	~~2. ID label posted on tank is LRA-LR-H-AST-04.~~	~~2. Change ID label to LR-H-AST-04 so inspection records can be maintained.~~
	~~NFPA 30 Chapter 22.7.1.1 (2015 edition)~~	~~3. No emergency vent installed on primary tank.~~	~~3. Install properly sized UL-listed emergency vent on primary tank if sufficiently sized nozzle available (e.g., plugged nozzle labeled tank overflow).~~
	~~NFPA 20 Chapter 4.14.1.1 (2015 Edition)~~	~~4. Copper tubing used for tank overflow return line where labeled "Tank Vent". Copper piping is prohibited for fire pump tank application.~~	~~4. Replace copper tubing with steel piping, and remove "Tank Vent" label.~~
LR-H-AST-05 (Added in Amendment 1)	NFPA 30 Chapter 6.5.4.2	1. No ground strap was found.	1. Attach ground strap to tank or verify that tank is adequately grounded.

Tank Number	Citation	Finding	Recommended Corrective Action
LR-H-AST-05 (Added in Amendment 1) (continued)	Best Management Practice	2. 90-degree elbows of the normal vent need to slant back.	2. Install the 90-degree elbows on the normal vent that allow for it to slant back.
	NFPA 20 Chapter 11.4.1.6	3. Normal vent and emergency vent for primary tank do not terminate outside of the building as required for a Class II liquid (diesel).	3. Install metal piping such that the properly marked UL-listed normal vent and emergency vent on primary tank terminate outside of the building.
	NFPA 20 Chapter 11.4.1.6	4. Emergency vent on secondary tank is vented indoors.	4. Install metal piping such that the properly marked UL-listed emergency vent on secondary tank terminates outside of the building.
	NFPA 20 Chapter 11.4.1.2.1	5. The fuel supply tanks are required to be reserved exclusively for the fire pump diesel engine. This tank serves a fire pump diesel engine and an emergency generator.	5. Configure tank to exclusively supply the fire pump diesel engine.
	NFPA 20 Chapter 11.4.1.4.	6. Fire pump supply tanks are to be securely mounted on noncombustible supports. Tank is not located on supports.	6. Install tank on supports.
LR-H-UST-01	NFPA 30 Chapter 23.3.5 (2015 Edition)	1. Significant corrosion of metal components in sump.	1. Remove rust; consider using corrosion-resistant materials or systems in sump.
	Best Management Practice	2. Due to proximity of storm drain active measure deployment required prior to fuel transfers.	2. Require spill mat cover on storm drain prior to beginning fuel transfers; remove mat after fuel transfers are completed.
LR-H-UST-02	NFPA 30 Chapter 23.3.5 (2015 Edition)	1. Significant corrosion of metal components in sump.	1. Remove rust; consider using corrosion-resistant materials or systems in sump.

Tank Number	Citation	Finding	Recommended Corrective Action

NSA HQ-NH94-AST-08	NFPA 30 Chapter 22.7.1.1.1 (2015 edition)	1. Normal vent pipes for tank and interstice connected and routed outside building. Air and vapors from tank can enter interstice. Interstice only needs an emergency vent.	1. Replace normal vent pipe on interstice with a properly sized UL-listed emergency vent that discharges outside the building.
NSA HQ-NH94-AST-09	NFPA 30 Chapter 22.7.1.1.1 (2015 edition)	1. Normal vent pipes for tank and interstice connected and routed outside building. Air and vapors from tank can enter interstice. Interstice only needs an emergency vent.	1. Replace normal vent pipe on interstice with a properly sized UL-listed emergency vent that discharges outside the building.
NSA HQ-NH94-AST-10	NFPA 30 Chapter 27.6.4 (2015 Edition)	1. Rust on some fittings and transfer line. Corrosion protection required.	1. Remove rust and paint fittings and transfer line.
	NFPA 30 Chapter 22.11.4.5 (2015 Edition)	2. Double-walled tank must have overfill alarm at 90% and automatic fuel flow shutoff mechanism at 95% capacity.	2. Used oil is pumped from inside building to tank located outside. The Veeder-Root system inside building is programmed for overfill/high level alarm. Add an automatic flow shutoff mechanism at 95% capacity.
	NFPA 30 Chapter 22.15 (2015 edition)	3. Vehicle protection is required.	3. Install bollards in accordance with NFPA 30A 4.3.7.2 or other form of vehicle protection for tank.
NSA HQ-NH94-AST-11	NFPA 30 Chapter 27.6.4 (2015 Edition)	1. Rust on fittings, vent, and transfer line. Corrosion protection required.	1. Remove rust and paint fittings, vent, and transfer line.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-NH94-AST-11 (Continued)	NFPA 30 Chapter 22.11.4.5 (2015 Edition)	2. Double-walled tank must have overfill alarm at 90% and automatic fuel flow shutoff mechanism at 95% capacity.	2. Used oil is pumped from inside building to tank located outside. The Veeder-Root system inside building is programmed for overfill/high level alarm. Add an automatic flow shutoff mechanism at 95% capacity.
	NFPA 30 Chapter 22.15 (2015 edition)	3. Vehicle protection is required.	3. Install bollards in accordance with NFPA 30A 4.3.7.2 or other form of vehicle protection for tank.
NSA HQ-NH94-UST-01	Fully regulated under 40 CFR 280 (40 CFR 280.30)	1. No effective overfill prevention device. Overfill alarm cannot be heard or seen by fuel delivery driver.	1. Install effective overfill prevention device.
	Fully regulated under 40 CFR 280 (40 CFR 280.33)	2. Minor corrosion apparent at fill port riser tubing.	2. Evaluate corrosion condition. Consider installing a drop tube with flapper valve which would also address overfill prevention.
NSA HQ-NH94-UST-02	Fully regulated under 40 CFR 280 (40 CFR 280.30)	1. No effective overfill prevention device. Overfill alarm cannot be heard or seen by fuel delivery driver.	1. Install effective overfill prevention device.
	Fully regulated under 40 CFR 280 (40 CFR 280.33)	2. Minor corrosion apparent at fill port riser tubing.	2. Evaluate corrosion condition. Consider installing a drop tube with flapper valve which would also address overfill prevention.
NSA HQ-NH94-UST-03	Fully regulated under 40 CFR 280 (40 CFR 280.30)	1. No effective overfill prevention device. Overfill alarm cannot be heard or seen by fuel delivery driver.	1. Install effective overfill prevention device.
	Fully regulated under 40 CFR 280 (40 CFR 280.33)	2. Significant corrosion apparent at fill port riser tubing.	2. Evaluate corrosion condition. Consider installing a drop tube with flapper valve which would also address overfill prevention.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-NH95-AST-01	40 CFR 112.8(c)(2)	1. Single wall tank with no effective secondary containment.	1. Provide appropriate sized secondary containment and/or diversionary structure per 112.8(c)(2), or replace tank.
	40 CFR 112.8(c)(8)	2. Level gauge missing. No overfill prevention device provided. Level checked with stick.	2. Install at least one approved means of overfill prevention per 112.8(c)(8).
	40 CFR 112.8(c)(6)	3. Minor corrosion on tank top due to leaking battery.	3. Clean up acid leaked from battery, replace battery if necessary. Treat corrosion on tank.
	NFPA 30 Chapter 22.7.1.1 (2015 edition)	4. No emergency vent installed on primary tank.	4. Install properly sized UL-listed emergency vent on primary tank, and extend to outside.
	Best Management Practice	5. "No Smoking" sign missing from tank.	5. Add "No Smoking" sign to tank.
NSA HQ-NH139-AST-01	40 CFR 112.8(c)(6)	1. Label has new ID number of NS-NH139-AST-04; tank was repainted but does not appear to be new. Tank numbers must be reconciled.	1. Determine if tank is a replacement; if not, correct ID label so inspection records can be maintained.
	40 CFR 112.8(c)(2)	2. No secondary containment is provided. The unit is in a cinder block wall building not designed to be liquidtight.	2. Provide required secondary containment. In accordance with NFPA 30 Chapter 22.11.2.4 walls of the diked area shall be of earth, steel, concrete, or solid masonry designed to be liquidtight and to withstand a full hydrostatic head.
	NFPA 30 Chapter 21.4.3.3 (2015 edition)	3. Normal vent shall not be less than 1.25 in. nominal inside diameter.	3. Replace 1 inch vent pipe with pipe not less than 1.25 inch nominal inside diameter.
	NFPA 30 Chapter 22.7.1.1 (2015 edition)	4. No emergency vent installed on primary tank.	4. Install properly sized UL-listed emergency vent on primary tank.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-NH139-AST-01 (continued)	NFPA 30 Chapter 21.6.6.3 (2015 edition)	5. Plastic bottle of antifreeze stored next to tank. Area around tank shall be kept free of unnecessary combustible materials.	5. Remove plastic bottle from vicinity of tank.
	40 CFR 112.8(c)(10)	6. Oil residue at pipe joints.	6. Remove oil residue from pipe joints. Perform maintenance to address any continuing oil seepage.
NSA HQ-NH139-AST-02	40 CFR 112.8(c)(6)	1. Label has new ID number of NS-NH139-AST-05; tank was repainted but does not appear to be new. Tank numbers must be reconciled.	1. Determine if tank is a replacement; if not, correct ID label so inspection records can be maintained.
	40 CFR 112.8(c)(2) NFPA 30 Chapter 22.11.2.4 (2015 Edition)	2. No secondary containment is provided. The unit is in a cinder block wall building not designed to be liquidtight.	2. Provide required secondary containment. In accordance with NFPA 30 Chapter 22.11.2.4 walls of the diked area shall be of earth, steel, concrete, or solid masonry designed to be liquidtight and to withstand a full hydrostatic head.
	NFPA 30 Chapter 21.4.3.3 (2015 edition)	3. Normal vent shall not be less than 1.25 in. nominal inside diameter.	3. Replace 1 inch vent pipe with pipe not less than 1.25 inch nominal inside diameter.
	NFPA 30 Chapter 22.7.1.1 (2015 edition)	4. No emergency vent installed on primary tank.	4. Install properly sized UL-listed emergency vent on primary tank.
NSA HQ-NH139-AST-03	40 CFR 112.8(c)(2)	1. Single wall tank with no effective secondary containment.	1. Provide appropriate sized secondary containment and/or diversionary structure per 112.8(c)(2).
	40 CFR 112.8(c)(6)	2. Label has new ID number of NS-NH139-AST-06; tank does not appear to be new. Inventory and tank numbers must be reconciled; no record of NS-NH-139-AST-06.	2. Determine if tank is a replacement; if not, correct ID label so inspection records can be maintained.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-NH139-AST-03 (continued)	NFPA 30 Chapter 22.7.1.1 (2015 edition)	3. No emergency vent installed on primary tank.	3. Install properly sized UL-listed emergency vent on primary tank.
	NFPA 30 Chapter 21.6.6.3 (2015 edition)	4. Lot of boxes and other material stored in generator room. Area around tank shall be kept free of unnecessary combustible materials.	4. Remove boxes and other combustible material from generator room.
NSA HQ-NH139-UST-02	Fully regulated under 40 CFR 280	1. Sump liquid sensor device is too tall for sump and is forced to be installed at an angle where it is less effective.	1. Replace sump liquid sensor device with one that fits properly in sump.
NSA HQ-NH139-UST-03	Fully regulated under 40 CFR 280	1. Water accumulated in sump.	1. Remove water from sump. Find and eliminate cause of water intrusion.
NSA HQ-NH154-AST-01	40 CFR 112.8(c)(6)	1. Pop-up gauge indicates leak in interstitial space. Secondary containment or primary tank may be compromised. Liquid in interstice.	1. Investigate source of liquid in interstice. If liquid is fuel, remove tank from service. If liquid is water, remove the water and correct all deficiencies.
	NFPA 30 Chapter 22.7.1.1.1 (2015 edition)	2. No emergency vent installed on interstitial space.	2. Install properly sized UL-listed emergency vent on interstitial space.
	NFPA 30 Chapter 21.4.1 (2015 edition)	3. Tank is equipped with PVC plugs in unused tank openings. Tank must be noncombustible materials.	3. Replace low melting point materials with steel plugs.
	NFPA 30 Chapter 22.11.4.5 (2015 Edition)	4. Double-walled tank must have overfill alarm at 90% and automatic fuel flow shutoff mechanism at 95% capacity. Guillotine valve has been cut to allow filling with standard nozzle.	4. Existing vent whistle meets requirement for overfill alarm. Replace Guillotine valve or provide other fuel flow shutoff mechanism at 95% capacity. Follow up with tank owner/operator to ensure equipment is not purposefully damaged in the future.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-NH154-AST-01 (continued)	NFPA 30 Chapter 21.6.6.3 (2015 edition)	5. Leaves and organic debris on tank. Area around tank shall be kept free of unnecessary combustible materials.	5. Remove leaves and organic debris from around tank.
	NFPA 30 Chapter 21.4.3.2 (2015 Edition)	6. Two normal vents installed on tank.	6. Remove short normal vent, and ensure that tall normal vent with vent whistle is located on primary tank and not the interstitial space.
NSA HQ-NH200-AST-01	NFPA 30 Chapter 22.7.3.10 (2015 Edition)	1. Emergency vents not UL listed or properly labeled.	1. Install properly sized UL-listed emergency vents.
	NFPA 30 Chapter 22.11.4.5 (2015 Edition)	2. Double-walled tank must have overfill alarm at 90% and automatic fuel flow shutoff mechanism at 95% capacity.	2. Install alarm and flow restrictor on tank. Direct reading level gauge includes sender for electrical signal to remote receiver, but per manufacturer (Rochester Gauges, Inc.) gauge is not to be used for tank filling or to prevent overfill.
NSA HQ-SC1-AST-01 (Added in Amendment 1)	40 CFR 112.8(c)(8)	1. Capacity not labeled on tank.	1. Add label showing capacity of tank.
	40 CFR 112.8(c)(6), NFPA 30 Chapter 27.6.4	2. There is rust noted on the corner of the tank	2. Treat affected areas and spot paint as necessary.
	NFPA 30 Chapter 22.7.1.1	3. Emergency vent on the interstice is frozen shut.	3. Repair the emergency vent or install a properly sized UL-listed emergency vent on interstitial space.
	NFPA 30 Chapter 22.11.4.5	4. Double-walled tanks must have an overfill alarm at 90% and an automatic fuel-flow shutoff device mechanism at 95% capacity. This tank does not have an overfill alarm or an automatic fuel-flow shutoff mechanism.	4. Install overfill alarm and fuel-flow shutoff mechanism on tank.
	40 CFR 112.7(c)	5. Due to proximity of storm drain active measure deployment required prior to fuel transfers.	5. Require spill mat cover on storm drain prior to beginning fuel transfers; remove mat after fuel transfers are completed.

Tank Number	Citation	Finding	Recommended Corrective Action
NSA HQ-SDA218-AST-01	NFPA 30 Chapter 22.4.2.1 (2015 Edition)	1. Shell-to-shell separation is less than 3 ft minimum required under NFPA 30.	1. Provide adequate minimum separation distance.
	40 CFR 112.8(c)(6) and NFPA 30 Chapter 21.6.5.3 (2015 Edition)	2. Tank ID number not posted.	2. Identify tank so inspection records can be tracked.
	NFPA 30 Chapter 22.11.4.5 (2015 Edition)	3. Double-walled tank must have overfill alarm at 90% and automatic fuel flow shutoff mechanism at 95% capacity.	3. Install alarm and flow restrictor on tank.
	40 CFR 112.8(c)(6)	4. Tank is not configured to monitor the interstitial space.	4. Remove vent cap from leak detection port and configure tank to conduct leak detection.
	NFPA 30 Chapter 22.15 (2015 Edition)	5. All tanks must be able to withstand vehicle impact or have external vehicle protection when installed in areas which have the potential for vehicle collisions.	5. Install bollards in accordance with NFPA 30A 4.3.7.2 or jersey barriers to provide vehicle protection.
	NFPA 30 Chapter 22.7.1.1.2 (2015 Edition)	6. No emergency vent installed on interstitial space. Tank has a normal vent in the emergency vent nozzle.	6. Install properly sized UL-listed emergency vent on interstitial space.
	40 CFR 112.8(b)(2) and 112.8(c)(3)(iv)	7. Double-walled tanks are located in a berm. Berm has standing water which is creating a corrosive condition. Berm is drained by removal of threaded plug.	7. Configure berm with appropriate valve and maintain a log of discharge events.
NSA HQ-SDA218-AST-02	NFPA 30 Chapter 22.4.2.1 (2015 Edition)	1. Shell-to-shell separation is less than 3 ft minimum required under NFPA 30.	1. Provide adequate minimum separation distance.
	40 CFR 112.8(c)(6) and NFPA 30 Chapter 21.6.5.3 (2015 Edition)	2. Tank ID number not posted.	2. Identify tank so inspection records can be tracked.

	~~40 CFR 112.8(c)(6)~~	~~2. No ID number on tank.~~	~~2. Label tank with ID number so inspection records can be maintained. No evidence noted of monthly inspections for this tank.~~
	~~40 CFR 112.8(c)(6)~~	~~3. Significant corrosion of unit.~~	~~3. Verify requirement for this asset, and replace if required; otherwise, repair corrosion. If replaced, ensure that old tank is properly closed and removed.~~

Appendix C: Inspection Forms

No ASTs at NSA HR Headquarters regulated by the Commonwealth of Virginia have daily and weekly inspection requirements. This is due to the fact that the aggregate volume of the state-regulated tanks is less than 25,000 gallons. STI SP001 requires monthly and annual inspections for all non-portable oil storage tanks and containers greater than or equal to 55 gallons. STI SP001 requires monthly inspections of portable containers greater than or equal to 55 gallons. Portable containers, such as drums, must be inspected on a monthly basis. The inspection checklists used at NSA HR Headquarters are discussed below and are presented in this appendix.

When substantive technical changes are made to the tank inspection forms, this SPCC Plan must be amended and certified by a PE in accordance with Section 1.7.

Inspection Forms Used at NSA HR Headquarters

1. "**CNRMA MONTHLY Inspection Checklist - Portable Containers**"
   - Drums and other portable container inspections are recorded on form "CNRMA Monthly Inspection Checklist - Portable Containers."
   - Records must be maintained at container location-site for three years.

2. "**CNRMA MONTHLY Inspection Checklist for Fixed ASTs**"
   - Inspections of the following types of tanks are recorded on this form:
     - Double-walled ASTs greater than or equal to 55 gallons
     - Single-walled ASTs less than or equal to 660 gallons.
   - Records must be maintained at container location-site for three years.

     Note: These tanks also have annual inspection requirements under STI SP001. These inspections are conducted by a contract service provider and are recorded on the standard STI SP001 Annual Inspection Checklist.

3. "**CNRMA DAILY/WEEKLY/MONTHLY Inspection Checklist for Fixed Single-walled ASTs greater than 660 gallons**"
   - Inspections of single-walled ASTs greater than 660 gallons are recorded on this form which also integrates the daily and weekly inspection requirements of the Commonwealth of Virginia.
   - Records must be maintained at container location-site for five years.

     Note: These tanks also have annual inspection requirements under STI SP001. These inspections are conducted by a contract service provider and are recorded on the standard STI SP001 Annual Inspection Checklist.

4. "**NAVFAC Mid-Atlantic STI SP001 Annual Periodic Checklist**"
Annual inspections of all ASTs 55 gallons or greater are recorded on form "NAVFAC Mid-Atlantic STI SP001 Annual Periodic Checklist."

5. "**Internal Combustion Engine (ICE) PM Language for Maximo"**
Monthly inspections of all generator supply and base tanks 55 gallons or greater are recorded on form "Internal Combustion Engine (ICE) PM Language for Maximo" checklist."

Commander, Navy Region Mid-Atlantic

MONTHLY Inspection Checklist- Portable Containers

(Keep on-site for 3 years from inspection date)

Activity Name/ Building Number:		POC and phone:		
Date:	Inspector Name/signature/ last training date:			
TYPE OF STORAGE AREA (Check all that applies)		___ Drum ___Product Dispensing ___ GenSet ___Other:		
1.0 AST CONTAINMENT/STORAGE AREA		Storage Area ID:	Storage Area ID:	Storage Area ID:
		Compliant?	Compliant?	Compliant?
1.1 Are portable containers stored within a designated storage area? <STI-SP001-5-Q1.1>		Y N N/A	Y N N/A	Y N N/A
1.2 Is the containment or storage area free of debris, spills, or other fire hazards? <STI-SP001-5-Q1.2>		Y N N/A	Y N N/A	Y N N/A
1.3 For outdoor secondary containment area: is it free of accumulated rainwater? <STI-SP001-5-Q1.3>		Y N N/A	Y N N/A	Y N N/A
1.4 Is secondary containment drain valve operable and secured in a closed position? <STI-SP001-5-Q1.4>		Y N N/A	Y N N/A	Y N N/A
1.5 Are ingress/egress paths to and from storage area clear and are gates/doors operable? <STI-SP001-5-Q1.5>		Y N N/A	Y N N/A	Y N N/A
1.6 Are portable containers located entirely within secondary containment? <40CFR112.8(c)(11)>		Y N N/A	Y N N/A	Y N N/A
1.7 If portable containers are stacked, are they stacked securely, without the use of strapping material (dunnage)? <NFPA 30 9.3.9 and 9.3.9.1>		Y N N/A	Y N N/A	Y N N/A
2.0 LEAK DETECTION				
2.1 Is storage area, container(s), and surrounding area free of visible signs of leakage? <STI-SP001-5-Q2.1>		Y N N/A	Y N N/A	Y N N/A
3.0 CONTAINER				
3.1 Is portable container free of severe corrosion or noticeable holes, distortions, buckling, denting, or bulging? <40CFR112.7(c)>		Y N N/A	Y N N/A	Y N N/A
3.2 Are Drums/Container Lids/Tops closed and properly secured? <40CFR112.8(c)(11)>		Y N N/A	Y N N/A	Y N N/A
4.0 OTHER				
4.1 Are there readily accessible spill response equipment / supplies on-site? <40CFR112.7(c)>		Y N N/A	Y N N/A	Y N N/A
4.2 Are racks/shelves or platform structures secure with no sign of severe corrosion or damage?		Y N N/A	Y N N/A	Y N N/A
COMMENTS:				

Commander, Navy Region Mid-Atlantic

MONTHLY Inspection Checklist for Fixed Aboveground Storage Tanks (ASTs) *

Applies to Double Walled Tanks 55 gallons or greater and/ or Single-walled tanks less than or equal to 660 gallons

(For tanks 55 gal-660 gal, keep on-site for 3 years from inspection date. For tanks >660, keep on-site for 5 years.)

Activity Name:	Activity POC:	Phone:	Tank ID:
Date:	Inspector Name/ Signature/ & last training date:		

Inspection Area	Compliance Criteria <with Citations>	Compliance Status Yes= Compliant No= Noncompliant	Comments
1.0 TANK CONTAINMENT or AREA			
1.1 Containment Structure	Is Open-top Containment structure (berm) free of standing liquid? (If NO, follow separate Berm Discharge Log procedures. If sheen/ oil present contact Emergency Dispatch. If NO sheen or oil, discharge liquid according to procedures) <STI-SP001-5-Q1.1> and <9VAC25-91-130B(5)(a)(3)> see note -->	Yes No N/A	Note: If no berm, indicate N/A
1.2 Containment Structure	Is Open-top Containment structure (berm) free of vegetation, debris, or combustible/flammable materials? (includes wooden stairs, empty drums, etc.) <STI-SP001-5-Q1.1><9VAC25-91-130B(5)(c)(4)><NFPA30 22.11.2.8> see note -->	Yes No N/A	Note: If no berm, indicate N/A
1.3 Containment Structure	Is open Top Containment structure (berm) free of breaches, cracks, or structural deficiencies? <STI-SP001-5-Q1.1> see note -->	Yes No N/A	Note: If no berm, indicate N/A
1.4 Containment Drain Valves	Is containment drain valve operable and secured (closed)? <STI-SP001-5-Q1.3> and <9VAC25-91-130B(5)(a)(3) &(c)(3)> see note -->	Yes No N/A	Note: If no berm, indicate N/A
1.5 Pathways and Entry to Tank Area	Are pathways and entr(ies) to containment structure clear and are gates/doors operable? <STI-SP001-5-Q1.4> see note -->	Yes No N/A	Note: If no berm, indicate N/A
1.6 Tank Area	Is the tank area free of hazardous or potentially hazardous conditions? <9VAC25-91-130B(5)(a)(1)> <NAVFAC POLICY>	Yes No N/A	
1.7 Tank Area	Is the base of the tank free of high grass, weeds, and debris? <9VAC25-91-130B(5)(c)(4)> <STI-SP001-5-Q2.3>	Yes No N/A	
2.0 LEAK DETECTION			
2.1 Tank	Is tank free of visible signs of leakage AND damage? <STI-SP001-5-Q2.1> and <9VAC25-91-130B(5)(a)(4)>	Yes No** N/A	
2.2 Secondary Containment	Is tank free of visible signs of leakage into secondary containment (berm)? <STI-SP001-5-Q2.2> see note -->	Yes No** N/A	Note: If no berm, indicate N/A
2.3 Surrounding Soil	Is surrounding soil/concrete free of visible signs of leakage? <STI-SP001-5-Q2.3> and <9VAC25-91-130B(5)(a)(2)>	Yes No** N/A	
2.4 Interstice	*For double-walled tanks with a pop-up gauge:* Is interstitial space free of liquid? <STI-SP001-5-Q2.4> see note -->	Yes No** N/A	Note: Inspect only if pop-up gauge is present.
3.0 TANK and TANK EQUIPMENT			
3.1 Valves	a. Are valves, hoses, & piping free of visible signs of leaks AND damage? <STI-SP001-5-Q3.1& 3.5> <9VAC25-91-130B(5)(a)(4), (a)(5), (c)(11), & (c)(12)>	Yes No N/A	
	b. Is main tank drain valve **locked**? <STI-SP001-5-Q3.1b>	Yes No N/A	
3.2 Spill Containment Boxes on Fill Pipe	a. Is spill box free of debris, oily residue, or water? (remove debris, if applicable) <STI-SP001-5-Q3.2> see note -->	Yes No N/A	Note: If no spill box, indicate N/A
	b. Is drain valve on spill box operable & closed? <STI-SP001-5-Q3.2> see note -->	Yes No N/A	Note: If no spill box, indicate N/A

Activity Name:	Activity POC:	Phone:	Tank ID:
Date:	Inspector Name/ Signature/ & last training date:		

Inspection Area	Compliance Criteria <with Citations>	Compliance Status Yes= Compliant No= Noncompliant	Comments
3.3 Liquid Level Equipment	a. Are liquid level devices (both visual and mechanical) free of obvious physical damage? <STI-SP001-5-Q3.3a>	Yes No N/A	
	b. Is liquid level device visible to refueling operator and easily readable? <STI-SP001-5-Q3.3b>	Yes No N/A	
3.4 Overfill Equipment	a. If overfill equipment has a "test" button, audible horn, or light, activate to confirm operation. Was test confirmed as operational? (If battery powered, replace batteries as needed) <STI-SP001-5-Q3.4>	Yes No N/A	
	b. Have all overfills been prevented in the last month? <40CFR 112.4(a) & 112.8(8)>	Yes No** N/A	date of overfill:
3.5 Corrosion	Are the tank shell surface, metal containment structures, welds, seams, piping, and hose connections free of peeling areas, corrosion, or other deterioration? <STI-SP001-5-Q3.5> <9VAC25-91-130B(5)(c)(5)&(11)>	Yes No N/A	
3.6 Tanks Greater than 660 gal only	a. Is fill port secured (locked)? <9VAC25-91-130B(5)(c)(10)>	Yes No N/A	If tank <660, indicate N/A
	b. Does leak detection equipment appear to be operable and functioning as designed? <9VAC25-91-130B(5)(c)(7)>	Yes No N/A	If tank <660, indicate N/A
4.0 TANK ATTACHMENTS and Appurtenances			
4.1 Ladder and Platform Structure	Is Ladder and platform structure secure and free of corrosion or damage? <STI-SP001-5-Q4.1>	Yes No N/A	
4.2 Tanks w/ fueling dispensers (NEX & Transportation ASTs, use other form)	a. Is fueling dispenser & dispenser hardware (nozzle, hose, breakaway valve, swivel) in proper working order & free of leaks? <NFPA 30A 6.3.6 & 6.3.6.1>	Yes No N/A	If tank has no fueling dispenser, indicate N/A
	b. Is inside of dispenser cabinet free of leaks, damage, corrostion, & weathering? <NFPA 30A 6.3.6.2>	Yes No N/A	If tank has no dispenser cabinet, indicate N/A
5.0 OTHER CONDITIONS			
5.1 Other Considerations	a. Is area free of any other condition(s) that may affect safe operation or SPCC concerns such as overfills, spills or leaks? (identify concerns in comments or below and contact EPS) <STI-SP001-5-Q5.1>	Yes No N/A	
	b. Are spill response equipment/ supplies readily available? <STI-SP001-5-Q5.1>	Yes No N/A	
5.2 Signage	a. Is No Smoking and Fire Diamond signage present & visible? <STI-SP001-5-Q5.1> <NFPA 704>	Yes No N/A	
	b. Is tank clearly labeled with Tank ID, capacity, & contents? <9VAC25-91-130B(3)(d)> <40CFR112.8(c)(6)> <STI-SP001-5-Q5.1>	Yes No N/A	
Additional Comments:			

***Perform this inspection at least once monthly & also <u>within one working day</u> after a severe weather event (i.e. excessive rainfall, or wind, ice, or snow storm)**

**** If deficiencies are noted on any checklist items with an ** asterisk, immediately notify Petroleum Tank Media Manager and EPS**

DAILY/WEEKLY/MONTHLY Inspection Checklist for Fixed Aboveground Storage Tanks (AST) Greater than (>) 660 Gallons that are either Single-Walled Aboveground Storage Tanks (ASTs) OR Double Walled ASTs storing Fuel for High-Volume Motor Fuel Dispensing Facilities*
(Keep on-site for 5 years from inspection date)

*Includes NEX & Transportation dispensing facilities storing motor fuel in ASTs >660 gal

Tank Inspected (Navy ID #):			Inspection Date:	
(S) - Satisfactory; (U) - Unsatisfactory; (NA) - Not Applicable				
1.0 TANK CONTAINMENT [1.1 Containment Structure (Check containment structure for:)]				
	a. Holes or cracks in containment wall or floor;			
	b. Washout;			
	c. Liner degradation;			
	d. Corrosion;			
	e. Paint failure; and			
	f. Tank settling.			
2.0 TANK FOUNDATION AND SUPPORTS [2.1 Foundation] [2.2 Concrete Pad and Ringwall] [2.3 Supports] [2.4 Water Drainage] [2.5 Tank grounding]				
	2.1 Check tank settlement and foundation washout.			
	2.2 Check concrete pad/ring wall for cracking/spalling.			
	2.3 Check supports for corrosion, paint failure, etc.			
	2.4 Check that water drains away from tank.			
	2.5 Check tank ground strap is properly secured and is in good condition?			
3.0 CATHODIC PROTECTION [3.1 Galvanic Cathodic Protection System] [3.2 Impressed Current System]				
	3.1 Confirm system is functional, includes the wire connections for galvanic systems.			
	3.2 Inspect the operational components (power switch, meters, and alarms).			
	3.2 Record hour meter, ammeter and voltmeter readings.			
4.0 TANK SHELL, HEADS, ROOF [4.1 Coating] [4.2 Steel Condition] [4.3 Roof Slope]				
	4.1 Check for coating failure (indicate extent of failure and whether full re-coating of the tank is recommended)			
	4.2 Check steel condition for:			
	a. Dents;			
	b. Buckling;			
	c. Bulging;			
	d. Corrosion; and			
	e. Cracking.			
	4.3 Check roof slope for low points and standing water.			
5.0 TANK EQUIPMENT [5.1 Vents] [5.2 Valves] [5.3 Interstitial leak detection system] [5.4 Spill containment boxes on fill pipe] [5.5 Strainer] [5.6 Filter] [5.7 Flame arrestors] [5.8 Leak detector] [5.9 Liquid level equipment] [5.10 Overfill equipment]				
	5.1.1 Primary Tank Venting	Vent Size/Capacity:	Vent heights above grade (inches):	
	Normal:			
	Emergency:			
	a. Verify vent heights above grade are adequate.			
	b. Verify that components are moving freely.			
	c. Verify vent passways are not obstructed.			
	d. Check for safe vent discharge.			
	5.1.2 Interstice Venting	Vent Size/Capacity:	Vent heights above grade (inches):	
	Normal:			
	Emergency:			
	a. Verify vent heights above grade are adequate.			
	b. Verify that components are moving freely.			
	c. Verify vent passways are not obstructed.			
	d. Check for safe vent discharge.			

Tank Inspected (Navy ID #):		**Inspection Date:**	
	5.2.1 General Valves: Check the condition of all valves for leaks, corrosion and damage.		
	5.2.2 Anti-Siphon, Check and Gate Valves		
	a. Cycle the valve(s) open and closed.		
	b. Check for proper operation.		
	5.2.3 Pressure Regulator Valves: Check for proper operation. (Note that there may be a small, 1/4 inch drain plugs in the bottom of the valve that are not visible by looking from above only).		
	5.2.4 Expansion Relief Valves: Check that the valve is in the proper orientation. (Note that fuel must discharge back to the tank via a separate pipe or tubing.)		
	5.2.5 Solenoid Valves: Check that the valve is in the proper orientation. (Note that fuel must discharge back to the tank via a separate pipe or tubing.)		
	5.2.6 Fire and Shear Valves		
	a. Manually cycle the valve to ensure components are moving freely and that the valve handle or lever has clearance to allow valve to close completely.		
	b. Valves must not be wired in open position.		
	c. Make sure fusible element is in place and correctly positioned.		
	d. Be sure test ports are sealed with plug after testing is complete and no temporary test fixture or component remains connected to valve.		
	5.3 Interstitial Leak Detection (Check condition of equipment, including:)		
	a. The window is clean and clear in sight leak gauges.		
	b. The wire connection of electronic gauges for tightness.		
	c. Activate the test button, if applicable.		
	5.4 Spill Containment Boxes on Fill Pipe		
	a. If corrosion damage, or wear has compromised the ability of the unit to perform spill containment functions, replace the unit.		
	b. Inspect the connections to the AST for tightness, as well as the bolts, nuts, washers for condition and replace as necessary.		
	c. Drain valves must be operable and closed.		
	5.5 Strainer		
	a. Check that the strainer is clean and in good condition.		
	b. Access strainer basket and check cap and gasket seal as well as bolts.		
	5.6 Filter		
	a. Check that the filter is in good condition and is within the manufacturer's expected service life. Replace, if necessary.		
	b. Check for leaks and decreased fuel flow.		
	5.7 Flame arrestors: Follow manufacturer's instructions. Check for corrosion and blockage of air passages.		
	5.8 Leak Detector for Submersible Pump Systems: Test according to manufacturer's instructions and authority having jurisdiction (AHJ). Verify leak detectors are suited and properly installed for aboveground use.		
	5.9 Liquid Level Equipment		
	a. Has equipment been tested to ensure proper operation?		
	b. Does equipment operate as required?		
	c. Follow manufacturer's instructions?		
	5.10 Overfill Equipment		
	a. Follow manufacturer's instructions and regulatory requirements for inspection and functionality verification.		
	b. Confirm device is suited for above ground use by the manufacturer.		
	c. Check for adequate overfill prevention.		
	d. Location of Fill Port:		

Tank Inspected (Navy ID #):			Inspection Date:	
6.0 INSULATED TANKS [6.1 Insulation] [6.2 Insulation cover or jacket]				
	6.1 Check condition of insulation for:			
	a. Missing sections;			
	b. Areas of moisture;			
	c. Mold; and			
	d. Damage.			
	6.2 Check for damage to the insulation cover or jacket that will allow water intrusion			
7.0 MISCELLANEOUS				
	7.1 Electrical Wiring and Boxes: Are they in good condition?			
	7.2 Labels and Tags			
	a. Navy Tank identification markings readable and adequately secured.			
	b. Tank fuel type markings readalbe and adequately secured.			
	c. Tank capacity markings readable an adequately secured.			
	d. Tank Nameplate readable and adequately secured.			
	e. NFPA Fire Label readable and adequately secured.			
	7.3 Tank spacing between obstruction (buildings, right-of-ways, etc.)			
	Tank Sides	Obstruction Name	Spacing (feet)	
	Front Side:			
	Back Side:			
	Left Side:			
	Right Side:			
	7.4 Tank Anti-Vehicle Protection			
	a. Check for adequate anti-vehicle protection.			
	b. Type of protection:			
	7.5 Water\Liquid Presence			
	a. Check for presence of water in primary tank.			
	b. Check for the presence of liquid in the interstitial space.			
	c. Check the secondary containment for signs of breach and excessive water.			
	d. Check that the secondary containment drain valve is secured.			
	7.6 Tank Ladders and Platforms			
	a. Check the ladders and platforms for corrosion and paint failure.			
	b. Check the ladders and platforms for proper handrails, mid rails, and kick toes.			
	7.7 Low Melting Point Materials: Check for low melting materials (plastic fittings, copper lines, etc.).			
	7.8 Pipe-to-Soil Contact: Check piping to verify no direct pipe-to-soil contact.			
	7.9 Combustible Materials: Check to verify combustible materials are not within berms, against tanks, piping, etc.			
Additional Comments:				

Internal Combustion Engine (ICE) PM language for Maximo 27 Oct 2015

For questions contact Leal Boyd, NAVFAC MIDLANT Air Senior Program Manager, 757-341-0387

All ICE PM job plans must include the following language and be scheduled at least monthly

1. Perform all O&M per manufacturer recommendations
2. Do not change emission related engine settings unless manufacturer specified
3. Record date of operation: _____
4. Record engine hour meter reading BEFORE operation: _____
5. Minimize engine idle during startup; limit startup time to 30 minutes
6. Record engine START time: _____
7. Record engine STOP time: _____
8. Record engine hour meter reading AFTER operation: _____
9. Record reason for operation (maintenance, testing, emergency): _____
10. Perform visual inspection of associated tanks as described below.
11. Tank ID: _____Second Tank ID (if generator has two tanks):_____
12. Answer each question "Yes", "No", or "N/A". ("Yes" means item is compliant with tank rules, "No" indicates a non-compliant situation; If you observe a spill or leakage, liquid in secondary containment, or any safety or fire hazards, immediately notify your supervisor for immediate notification to Environmental.)
13. Is open top containment structure (berm) free of water, fuel, fuel residue, vegetation, debris, and fire hazards (combustible/flammable materials)? (Yes, No, N/A).
14. Is open top containment structure (berm) free of breaches, cracks, or structural deficiencies? (Yes, No, N/A)
15. Are open top containment structure (berm) drain valves operable and secured (closed)? (Yes, No, N/A)
16. Are pathways and entry to open top containment structure (berm) clear and gates/doors operable? (Yes, No, N/A)
17. Are the tank, piping, flexible lines, filter housings and valves free of visible signs of leakage? (Yes, No, N/A).
18. Is tank free of visible signs of leakage of fuel or water into closed secondary containment? (Check pop up leak gauge or electronic sensor.) (Yes, No, N/A).
19. Is surrounding soil/concrete free of visible signs of leakage? (Yes, No, N/A).
20. Are main tank drain valves locked (if so equipped)? (Yes, No, N/A)
21. Is the area around the fuel fill opening or inside spill containment box on fill pipe free of debris, oily residue, or water? (Yes, No, N/A)
22. Is drain valve on spill containment box on fill pipe operable and closed? (Yes, No, N/A)

23. Are liquid level devices (both visual and mechanical) easily readable and free of evident physical damage? (Yes, No, N/A)
24. If overfill equipment has a "test" button, audible horn, light, or mechanical test mechanism, activate to confirm operation. Was test confirmed as operational? (Yes, No, N/A) If battery powered, replace batteries as needed.
25. Are the tank, piping and hose connections free of corrosion, or damage? (Yes, No, N/A). .
26. Is ladder and platform structure secure and free of corrosion or damage? (Yes, No, N/A)
27. Is area free of any other conditions that should be addressed regarding continued safe operation? (Yes, No, N/A).
28. Identify issues that may affect the site spill prevention plan:_____
29. Additional Comments: _____
30. Printed Name: _____
31. Signature: _____
32. Submit completed work order to supervisor within 1 week of completion.

ANNUAL ICE PM job plans must ALSO include the following language:

33. Change oil & filter (required annually or every 500 hours, whichever comes first). Record date of oil and filter change: _____
34. Inspect/replace as necessary, air cleaner: condition ok (Y/N)? ____ if "N", date replaced: _____
35. Inspect/replace as necessary, hoses: condition ok (Y/N)? ____ if "N", date replaced: _____
36. Inspect/replace as necessary, belts: condition ok (Y/N)? ____ if "N", date replaced: _____
37. For spark ignition engines, inspect/replace as necessary, spark plugs: condition ok (Y/N)? ____ if no, date replaced: _____

Appendix D: Assumptions and Calculations

The following flow rate assumptions were used to develop the estimates required in the released scenarios required under 40 CFR 112.7 (b). The assumptions are based on industry standards and physical observation.

Flow Rate Data

Delivery truck flow rate at nozzle:	50 GPM
Delivery truck flow rate from ruptured hose:	60 GPM
Dispenser flow rate:	10 GPM
Combustion source burn rate:	1 GPM
Used oil collection suction loading rate:	10 GPM
Drum and Used Oil Tank Filling (Manual Pouring)	5 GPM

1. Overfill By Delivery Truck

Assume: a.) 6 sec response time to stop flow when overfill occurs (worst case 112.7(b))
b.) 5 sec response time to stop flow when overfill occurs (most likely 112.7(c))

Release volume=flow rate× response time

Maximum Volume (112.7(b))=50 GPM×6 sec×1 min/60 sec=**5 gallons**

Most Likely Volume (112.7(c))=50 GPM×5 sec×1 min/60 sec=**4 gallons**

2. Spillage During Delivery Hose Retrieval

Assume: a.) Hose is pressurized during retrieval
b.) 60 sec response time to stop flow when hose fails (worst case 112.7(b))
c.) 5 sec response time to stop flow when hose drips (most likely 112.7(c))

Release volume=flow rate× response time

Maximum Volume (112.7(b))=60 GPM×60 sec×1 min/60 sec=**60 gallons**

Most Likely Volume (112.7(c))=60 GPM×5 sec×1 min/60 sec=**5 gallons**

3. Transfer Out Of Tank (Fuel Dispenser)

Assume: a.) 12 sec response time for dispensing spills (worst case 112.7(b))
b.) 6 sec response time for dispensing spills (most likely 112.7(c))

Release volume=flow rate× response time

Maximum Volume (112.7(b))=10 GPM×12 sec×1 min/60 sec=**2 gallons**

Most Likely Volume (112.7(c))=10 GPM×6 sec×1 min/60 sec=**1 gallon**

4. Filling Used Oil Tank

Assume: a.) Entire volume of transfer container is spilled (worst case 112.7(b))
b.) 12 sec response time for terminating pour following spill (most likely 112.7(c))

Release volume=flow rate× response time

Maximum Volume (112.7(b))=Volume of transfer container=**5 gallons**

Most Likely Volume (112.7(c))=5 GPM×12 sec×1 min/60 sec=**1 gallon**

5. Transfer Out Of Used Oil Tank (Collection Suction Truck)

Assume: a.) 60 sec response time for securing suction following spill (worst case 112.7(b))
b.) 12 sec response time for securing suction following spill (most likely 112.7(c))

Release volume=flow rate× response time

Maximum Volume (112.7(b))=10 GPM×60 sec×1 min/60 sec=**10 gallons**

Most Likely Volume (112.7(c))=10 GPM×12 sec×1 min/60 sec=**2 gallons**

6. Spillage During Used Oil Collection Hose Retrieval

Assume: a.) Hose is essentially empty during retrieval
b.) 5 sec response time to pick up hose if it drops to ground

Release volume=flow rate× response time

Maximum Volume (112.7(b))=1 GPM×5 sec×1 min/60 sec=**<1 gallon**

Most Likely Volume (112.7(c))=1 GPM×5 sec×1 min/60 sec=**<1 gallon**

7. Transfer Out Of Tank (Small Combustion Source (Boilers and Generators))

Assume: a.) Combustion source transfer lines are typically suction feed and gravity return.
b.) Supply and return flow rate are 1 GPM.
c.) Combustion source will not operate for extended time with a hole in the suction line.

Maximum Volume (112.7(b))=**1 gallon before source cannot sustain combustion**

Most Likely Volume (112.7(c))=**1 gallon before source cannot sustain combustion**

8. Drum Filling and Emptying Releases

Assume a.) Drums are manually filled by 5-gallon containers.
b.) Total quantity of oil which could be potentially released during filling is the volume of the 5-gallon container used to fill the drum.
c.) Total quantity of oil which could be potentially released during emptying is the volume of the drum.

Since both these operations are manned and closely observed, the most likely volumes released during filling and emptying are substantially less. An engineering estimation of 1 gallon will be used for the most likely volumes released during both filling and emptying. When any sort of release occurs, the operator will immediately terminate the operation and initiate response efforts.

Filling Drum

Maximum Volume (112.7(b))=Volume of filling container=**5 gallons**
Most Likely Volume (112.7(c))=**1 gallon**

Emptying Drum

Maximum Volume (112.7(b))=Volume of Drum=**55 gallons**
Most Likely Volume (112.7(c))=**1 gallon**

Dispensing from Drum

Maximum Volume (112.7(b))=Volume of filling container=**5 gallons**
Most Likely Volume (112.7(c))=**1 gallon**

Appendix E: Standard Operating Procedures

Tank Truck Loading/Unloading Procedures

Ensure that tank car, tank truck, and vessel loading/unloading procedures meet the minimum requirements and regulations established by the Department of Transportation. Delivery personnel are required to adhere to the following procedures:

1 Prior to Product Transfer

1. All ASTs should be equipped with a functioning level gauge that is readily visible at the fill port and indicates the level of oil or quantity of oil in the tank. The level gauge shall be used in conjunction with other mechanical systems to provide overfill protection for the tank. In addition, the storage capacity, product stored, and tank identification number shall be clearly marked on the tank.

2. If no spill containment structures at the fuel transfer area are present, the truck shall be parked as close as practical to the tank to load or unload oil. The minimum length of transfer hose possible should be used to complete the connection between the truck and tank.

3. The tanker vehicle drains, valves, and outlets shall be inspected for evidence of leakage.

4. The driver must supply and implement active measures such as drip pans or absorbent pads during each transfer to minimize minor dripping and incidental fuel spillage, especially for hose disconnections and hose retrieval.

5. The loading/unloading truck and transfer lines shall be checked to ensure they are located within a containment system or on a sloped pavement that will drain to a containment system, if available.

6. If the tank is equipped with camlock connection fittings on the fillport, a compatible hose shall be used.

7. If equipped, the fillport located inside the spill bucket shall be used. Spill containment devices shall not be bypassed by filling the tank through unused tank perforations on the tank exterior.

8. All transfer hoses shall be visually checked for signs of leakage. If dripping, weeping or leakage is discovered, the driver must implement active measures to minimize incidental spillage (see Step 3 above).

9. Adequate bonding/grounding of the tanker truck shall be established before connecting to the fuel transfer point.

10. Transfer hose ends shall be kept tightly capped while moving hoses into position to minimize drips.

2 During Product Transfer

1. The driver shall ensure the transfer operation is monitored continually, either by manual or automatic means, until complete.

2. The driver will not leave the vehicle unattended during the loading/unloading process.

3. When transferring Class 1 (flammable) liquids, motors of auxiliary or portable pumps shall be shut off when making and breaking hose connections.

4. A direct line of communication between the gauge reader and the pump operator shall be maintained at all times. For one man fueling operations, visual observation of the level gauge during transfer is sufficient.

5. All transfer hose couplings shall be monitored for leakage.

6. The liquid level in the receiving tank shall be monitored to prevent overflow by level gauge or visual observation of the free surface of oil in the container.

7. The flow rate shall be reduced while topping off the tank to provide sufficient reaction time for pump shutdown without overflow of the receiving tank.

8. The receiving tank shall never be completely filled when loading; provide sufficient head space (minimum 5%) to prevent overflow due to thermal expansion.

3 Following Completion of Product Transfer

1. Securely close all vehicle internal, external, and dome-cover valves before disconnecting.

2. Close all tank and loading valves before disconnecting.

3. Make sure that all product transfer operations are complete before disconnecting any transfer hoses.

4. Ensure that transfer hoses or other connecting devices are drained, vented, blown down, or blown out with inert gas to remove the remaining product prior to moving them away from their connections.

5. Ensure that active measures (drip pans, absorbent pads, spill equipment) are in place before breaking a connection to prevent minor spills.

6. Cap the end of the transfer hose or other connecting devices before moving them to prevent uncontrolled oil leakage.

7. Disconnect grounding/bonding wires.

8. Cap associated transfer hose risers.

9. Close all transfer hose riser valves not in use.

10. Inspect tanker truck drains, valves, and outlets for evidence of leakage.

11. Remove any wheel chocks that have been used.

12. Properly dispose of any contaminated equipment used to control incidental spillage and fuel collected in drip pans during transfer operations.

To: Operators and/or owners of any AST including tenants, contractors, fueling personnel, automotive personnel, and facilities planning and Environmental personnel.

Subj: Standard Operating Procedure (SOP) for Aboveground Storage Tanks (AST)

1. PURPOSE:

Portable and fixed aboveground containers of petroleum, oil, or lubricants (POL) having a capacity greater than or equal to 55 gallons are subject to state and/or federal regulations. The purpose of this SOP is to specify these compliance requirements for each applicable POL container. This SOP reflects the requirements detailed in the facility's Spill Prevention, Control, and Countermeasures (SPCC) Plan (**Ref (a)**) and also serves to minimize releases of POL into navigable waters of the United States as required by **Ref (b)**.

2. REFERENCES:

- **Encl (7)**- Training Instructions

4. APPLICABILITY:

This SOP pertains to portable and fixed (stationary) aboveground containers of POL with a capacity equal to or greater than 55 gallons that are located within the Hampton Roads area of Virginia for longer than 30 days*. These containers include but are not limited to: aboveground storage tanks, day tanks, emergency generator base tanks, fixed and portable fire pump fuel tanks, 55-gallon drums, fixed portable emergency generators, pierside oil containers, contractor's tanks, and/or any container with a capacity of 55 gallons or more storing POL prior to use, during use, or pending disposal or future use. Tanks that are onsite for longer than 180 days are also included in the facilities Spill Prevention, Control, and Countermeasures (SPCC) Plan (**Ref (a)**) and can be found at the Installation's Environmental Office.

> *POL containers greater than or equal to 55 gallons that are stored onsite for less than 30 days are still subject to all requirements herein sans inspection requirements.

This SOP does not apply to field constructed tanks, underground storage tanks, mobile refuelers, pressure vessels, liquefied/liquid petroleum gas (such as propane or butane), motive-power fuel containers or oil-filled operational equipment (OFOE) as defined herein. Further, this SOP does not apply to SIXCON Fuel Storage mobile refueling pods or other military equipment, which are covered by other SOPs.

This SOP applies to Installation Environmental Program Directors (IEPDs), Petroleum Tank Media Managers, Environmental Protection Specialists (EPSs), tenants, contractors, fueling personnel, automotive personnel, and operators and/or owners of any AST.

5. REGULATORY DRIVERS:

Per **Ref (a)**, **Ref (b)**, **Ref (c)**, **Ref (d), Ref (e) and/or Ref (f)** all ASTs are required to have overfill/spill prevention equipment/requirements and approved secondary containment. Further, specific requirements also apply to inspections, maintenance, berm discharge protocol, notifications, training, and record-keeping.

PRINTED COPIES OF THIS DOCUMENT ARE CONSIDERED UNCONTROLLED.
IT IS THE USER'S RESP9ONSIBILITY TO VERIFY *THE PRINTED COPY AGAINST THE CURRENT CONTROLLED DOCUMENT, WHICH IS MAINTAINED ELECTRONICALLY.*

Non-compliance with federal, state, and Navy requirements can lead to regulatory Notices of Violation (NOVs), petroleum releases to the environment, substantial cleanup efforts, preventable expenses, and negative publicity.

6. DEFINITIONS:

   a. **AST**- Aboveground storage tank. For the purposes of this SOP, AST pertains to fixed containers with a capacity equal to or greater than 55 gallons.

   b. **Blind fill-** a fillport located outside of a building while the actual AST or container is located inside the building. This is required for fire pump fueling ASTs under **Ref (f)**.

   c. **High-Volume Motor Fuel Dispensing Facility**- Motor vehicle fuel dispensing facilities at Navy Exchange (NEX) and NAVFAC Transportation sites that store large volumes of motor vehicle fuel (intended for dispensing into vehicles) in ASTs >5,000 gal. Coordinate with Installation Environmental for applicable tanks.

   d. **Interstice**- In a double-walled tank, the space between the primary tank and the secondary tank, which is considered to be secondary containment for the primary tank if it fails.

   e. **Motive-power fuel containers**- Exempt from this SOP and SPCC requirements. Motive power containers are located in or on a motor vehicle and serve as petroleum storage used primarily to power the movement or propulsion of said vehicle.

   f. **Oil-filled operational equipment (OFOE)**- Exempt from this SOP but may be regulated in the facility's SPCC Plan- **Ref (a)**. OFOE includes equipment with an oil storage container (or multiple containers) in which the oil is present solely to support the function of the apparatus or the device. OFOE includes equipment such as transformers, circuit breakers, gear boxes, elevator oil reservoirs, hydraulic systems and/or reservoirs, wind turbines, and some machine tool coolant reservoirs. Emergency generator base tanks are NOT considered to be OFOE and therefore ARE included in this SOP.

   g. **Oil handling personnel**- personnel and contractors engaged in the inspection, operation, management, and maintenance of oil storage containers, the operation of equipment related to storage containers, fueling operations for equipment and vehicles, and/or emergency response personnel.

   h. **POL**- Petroleum, oil, and lubricants. Typical POL includes but is not limited to: gasoline, OTTO fuel, E-85, diesel, diesel fuel marine (DFM), biodiesel, any kind of fuel or heating oils (#2 fuel oil, #4 fuel oil, etc.), kerosene, JP-5 and other aviation fuels, cooking oil or grease, mineral oils, other vegetable-based oils, lube oil, hydraulic fluid or other synthetic oils, recovered oil, and used oil. If there are any questions regarding applicability of POL, please contact the Installation Petroleum Tank Media Manager.

   i. **Portable container/AST**- For the purposes of this SOP, this applies to portable POL containers with a capacity equal to or greater than 55 gallons. Typical portable containers include but are not limited to: portable generators, 55-gallon drums, SIXCONs, portable lube dispensers, and nonmetal cooking oil containers.

PRINTED COPIES OF THIS DOCUMENT ARE CONSIDERED UNCONTROLLED.
IT IS THE USER'S RESP9ONSIBILITY TO VERIFY *THE PRINTED COPY AGAINST THE CURRENT CONTROLLED DOCUMENT, WHICH IS MAINTAINED ELECTRONICALLY.*

j. **Primary tank**- In a double-walled tank, the innermost tank that stores and actually touches the oil product.

7. ACTIONS/ PROCEDURES FOR AST OWNERS AND OPERATORS:

In accordance with this document, tenants, owners, or operators of ASTs; contractors; or designated personnel are responsible for: maintaining secondary containment, performing required inspections, maintaining records, repairing non-compliant findings, completing required training, and providing notifications to Installation Environmental personnel (including Installation EPSs, IEPDs, and/or Petroleum Tank Media Managers) when any part of an AST system is removed, installed, relocated (moved), modified, or found to be non-compliant in any way (such as spilling or leaking).

8. GENERAL TANK REQUIREMENTS:

a. Contact the Installation EPS or Petroleum Tank Media Manager (**Encl (1)**) when facility planning includes addition, removal, or moving of fixed or portable ASTS. This includes but is not limited to: aboveground storage tanks, petroleum base tanks for fixed or emergency generators, 55-gallon drums, fire pump supply tanks, and mobile refueling equipment.

Specific installation and removal requirements apply and are defined in separate SOPs for AST Installations (**Ref (g)**) and AST Closures (**Ref (h)**). These SOPs are managed by NAVFAC MIDLANT EV11 POL Compliance and can be obtained by contacting the Installation Petroleum Tank Media Manager.

b. All ASTs must be clearly labeled per **Ref (a)** and **(d)**:

i. All labels must be legible (minimum 1.25") and visible to emergency services personnel.

ii. ASTs must be affixed with a yellow label with black characters to show tank ID, tank capacity, and tank contents;

iii. AST must be affixed with proper National Fire Protection Association (NFPA) fire diamond and No Smoking signs. Coordinate proper annotation with the Installation EPS or Petroleum Tank Media Manager.

iv. Contact the Installation Environmental Office or Petroleum Tank Media Manager (**Encl (1)**) to assign a tank ID and provide a label.

c. Tenant or holder of the Maintenance UIC (MUIC) is, at a minimum, responsible for funding repairs and upgrades and may be responsible for petroleum cleanup costs.

9. OVERFILL PREVENTION REQUIREMENTS:

a. Per **Ref (a)** and/or **(e)**, all fixed ASTs must have the following operational liquid level devices:

PRINTED COPIES OF THIS DOCUMENT ARE CONSIDERED UNCONTROLLED.
IT IS THE USER'S RESP9ONSIBILITY TO VERIFY *THE PRINTED COPY AGAINST THE CURRENT CONTROLLED DOCUMENT, WHICH IS MAINTAINED ELECTRONICALLY.*

i. Liquid level gauge such as a direct vision gauge (pop-up gauge, clock gauge, etc.), digital computer, or telepulse. This gauge must be functional and it must be legible.

ii. High liquid level audible or visual alarm (such as Automatic Tank Gauge (ATG) or air vent/whistle). This alarm must be functional and must be able to be heard over surrounding equipment and/or fueling vehicle. Visual alarms must be visible by the driver during fueling operations (e.g. vehicle in refueling area must not block visual alarm).

iii. High liquid level pump cutoff device (overfill prevention valve or liquid level switch) to stop flow at 95% full by volume, which should be clearly marked on the level gauge

b. Refueling operators at blind fills must be able to hear and/or see audible and/or visual alarms at the fillport. Liquid level devices must be visible at the fillport.

c. A person must be present during an entire refueling operation to monitor gauges and avoid overfills. Direct audible or code signal communication must be maintained between the gauger and the pumping station.

d. For tanks greater than 660 gallons, each operator shall institute safe fill, shutdown, and transfer procedures IAW **Ref (a)** that will ensure prevention of overfills during fueling operations.

e. If liquid level device is not functioning properly, owner/operator is responsible to replace or repair immediately. Immediately contact Installation EPS or Petroleum Tank Media Manager for guidance and recommendation(s) as needed (**Encl (1)**.

10. SECONDARY CONTAINMENT REQUIREMENTS:

a. Secondary containment is required by **Ref (a)** and applicable industry standards for **all** portable and fixed POL containers equal to or greater than 55 gallon capacity regardless of how much POL is actually present inside the container.

There are two types of required secondary containment, which must be approved by the signing Professional Engineer (PE) of **Ref (a)**:

i. **General** secondary containment (also called active measures):
All ASTs, including mobile refuelers, must meet "general" secondary containment requirements per 40 CFR 112.7(c) where the secondary containment must be sufficient to address a typical failure and contain the most likely quantity of oil that would be discharged. The most typical failures include overfills and drips/leaks from piping and hoses.

Examples of general secondary containment include: spill kits, sorbents, oil-dry (kitty litter), drip pans, portable berms, etc.

ii. **Sized** secondary containment (also called passive containment):
All ASTs must also have "sized" secondary containment per 40 CFR 112.8(c) where the secondary containment must be able to contain the entire

PRINTED COPIES OF THIS DOCUMENT ARE CONSIDERED UNCONTROLLED.
IT IS THE USER'S RESP9ONSIBILITY TO VERIFY *THE PRINTED COPY AGAINST THE CURRENT CONTROLLED DOCUMENT, WHICH IS MAINTAINED ELECTRONICALLY.*

POL capacity of the largest single compartment or container with sufficient freeboard for precipitation. See Berm Requirements for more information regarding freeboard.

The following are examples of acceptable sized secondary containment but are not intended to be an entire list of acceptable containment. All forms of secondary containment must be approved by the Professional Engineer that prepared the facility's SPCC Plan, **Ref (a)**:

1. An approved secondary containment spill pallet that completely holds any number of 55-gallon drums in a single layer with no overhang. If subject to precipitation, must also account for freeboard.
2. An entire building floor space or room can be used as secondary containment for many containers of POL, provided that the building or room has been designed or modified to fully contain the contents of the largest container [this determination must be made by the PE preparing the facility's SPCC Plan- **Ref (a)**]. Floor drains may only discharge to oil-containing structures such as oil-water separators or underground storage tanks with sufficient storage capacity.
3. In rare situations where tanks are manifolded, sized containment must be capable of holding the entire volume of all manifolded tanks.
4. 55-gallon drums properly stored inside of "clamshell" lockers;
5. Single-walled ASTs properly and completely situated within an intact and impervious secondary containment berm having the capacity to hold the contents of the largest single container plus sufficient freeboard if subject to precipitation (see information in Berm Requirements for additional freeboard information);
6. Double walled AST with an interstitial space that is verified on a monthly basis not to contain fuel or water;
7. Containers of POL in an indoor or outdoor Hazardous Material shed which has secondary containment space under the floor grating and has the capacity to hold the contents of the largest single POL container;

b. Mobile refuelers must meet sized secondary containment while being stored, but only require general containment (i.e. spill kit, drip pans) while transporting fuel and undergoing fueling activities.

c. Containment must be sufficient to contain a spill. Per **Ref (a)**: "The entire secondary containment system, including walls and floor (if applicable), must be capable of containing oil and must be constructed so that any discharge… will not escape the containment system before cleanup occurs". This means:

   i. Portable or "pop-up" berms must be deployed properly and may **not** be collapsed on one or more sides. They must be capable of containing oil (i.e. no rips, holes, etc.)

PRINTED COPIES OF THIS DOCUMENT ARE CONSIDERED UNCONTROLLED.
IT IS THE USER'S RESP9ONSIBILITY TO VERIFY *THE PRINTED COPY AGAINST THE CURRENT CONTROLLED DOCUMENT, WHICH IS MAINTAINED ELECTRONICALLY.*

ii. Concrete berms must have no significant cracks or crevices and must have been certified by a PE.

11. BERM and BERM DISCHARGE REQUIREMENTS:

a. If the secondary containment for an AST is an open structure (hereafter referred to as a berm) that is outdoors with no roof or enclosure to prevent precipitation from accumulating:

i. The berm must be able to contain the entire capacity of the largest single container and sufficient freeboard to contain precipitation.

1. For permanent berms: The berm capacity must be calculated to contain 100% of the capacity of the largest single tank that it holds plus "freeboard", which is determined by rainfall criterion for the geographical region. In Hampton Roads, an additional ~7" of berm depth (added to 100% capacity of the largest single tank within the berm) is required to achieve sufficient containment. See **Ref (a)** for specific depth for each facility.

2. For temporary or portable berms: This capacity is calculated to be a minimum of 110% of the largest single tank that it contains. (This deviates from permanent berms because when ~7" is applied to the height of a portable berm to achieve freeboard requirements, the sidewalls topple and berm integrity fails.)

ii. The berm must be capable of containing a worst-case discharge and free of significant cracks, holes, rips, corrosion, or any other weaknesses that could allow for the secondary containment to fail if a release were to occur.

iii. The berm must be kept free of accumulated precipitation, weeds, vegetation, debris, and combustible and/or flammable materials or other fire hazards, including wooden walkways.

iv. Berm discharge valves must be kept closed and locked at all times except during compliant discharge activities described below. Flapper valves are not allowed.

b. BERM DISCHARGE (release of accumulated precipitation) must be initiated within one (1) working day of a rainfall event to regain the full containment volume of the berm. Prior to discharge, the accumulated precipitation must be inspected by the personnel trained IAW the Training Requirements in this SOP to ensure that oil is not present (visible sheen).

i. If a sheen is present, but no measureable petroleum product,

1. Contact the Installation EPS

2. Coordinate sheen removal with EPS.

3. Coordinate with EPS to determine source of sheen and perform any corrective action.

ii. If measureable oil is present:

PRINTED COPIES OF THIS DOCUMENT ARE CONSIDERED UNCONTROLLED.
IT IS THE USER'S RESP9ONSIBILITY TO VERIFY *THE PRINTED COPY AGAINST THE CURRENT CONTROLLED DOCUMENT, WHICH IS MAINTAINED ELECTRONICALLY.*

1. Contact **Emergency Dispatch** (**Encl (1)**. Emergency dispatch will contact spill response personnel.
2. Owner/operator must follow Spill Reporting procedures as outlined in **Encl(2)**.
3. Under no circumstances should precipitation with a visible oily sheen be released from the berm.
4. If the presence of oil is persistent, coordinate with Installation EPS and Petroleum Tank Media Manager (**Encl 1**) for corrective action and/or repairs.

iii. If oil is not present: open the bypass (berm discharge) valve and drain the precipitation under responsible supervision.

iv. After berm discharge is complete, immediately secure/close the bypass (berm discharge) valve. Only manual valves are allowed. No flapper valves are allowed.

v. Record the berm discharge in the Berm Discharge Log, **Encl (3)**.

vi. The Berm Discharge Log records must be kept for 5 years per **Ref (b)**

12. INSPECTION REQUIREMENTS:

a. Per **Ref (a)**, at a minimum, all portable and fixed ASTs and containers must be visually inspected at least monthly. Per **Ref (b)** and Navy policy, ASTs that are greater than 660 gallons and are either i) single-walled, or ii) store product for high-volume motor fuel dispensing facilities (see definitions) must perform daily, weekly, and monthly inspections.

Additionally, all ASTs located outside must be inspected after any severe weather incident (snow, ice, hurricane, nor'easter, etc.) within one working day after the event or as soon as it is safe to do so. In general, all inspections must include observations of the AST, piping, appurtenances, secondary containment, and the surrounding area to ensure that leaking or spillage has not occurred and that the AST system is rust-free and in proper working order.

b. Tenants, tank owners, and/or tank operators are responsible for performing these inspections and must designate a primary and alternate individual (or group of individuals) to conduct monthly visual inspections.

c. Tank inspectors must complete training as defined in the TRAINING REQUIREMENTS section of this SOP.

d. The Installation EPS or Petroleum Tank Media Manager must provide an Information binder with all pertinent tank and inspection information, including this SOP and associated enclosures. This binder must be maintained onsite at all times or at a location disclosed to the Installation EPS **(Encl 1)**.

e. Inspections must be recorded on appropriate AST checklists provided in **Encl (4)**, **(5)**, and **(6)** and maintained in aforementioned binder. See (h) below for details.

PRINTED COPIES OF THIS DOCUMENT ARE CONSIDERED UNCONTROLLED.
IT IS THE USER'S RESP9ONSIBILITY TO VERIFY *THE PRINTED COPY AGAINST THE CURRENT CONTROLLED DOCUMENT, WHICH IS MAINTAINED ELECTRONICALLY.*

f. Inspection records for tanks that are associated with Internal Combustion Engines (ICE) may be kept with or included in the pertinent engine preventative maintenance records. Contact Installation Petroleum Tank Media Manager (**Encl 1**) to determine location and details.

g. In the event the tank is no longer needed or has been out of use for at least three months, contact Installation EPS or Petroleum Tank Media Manager for tank closure requirements. Tank inspections must continue and tank equipment must be maintained until all tank closure requirements have been performed and permanent closure has been achieved.

h. PORTABLE CONTAINERS: Each portable container or storage area with multiple containers, including secondary containment structure(s), must be inspected monthly:

   i. Utilize **Encl (4)** Monthly Inspection Checklist for Portable containers to document inspection.

   ii. Only one inspection per drum or per drum storage area is required each month.

   iii. Each portable container or group of containers must be identified as a designated Drum Storage Area:

      1. Contact Installation EPS (**Encl (1)**) to set up the Drum Storage Area.

      2. If personnel are unable to co-locate all portable containers in one area, multiple Drum Storage Areas may be designated within one building/room/warehouse.

i. FIXED ASTs: Each fixed AST, including piping and its secondary containment structure must be inspected in accordance with the following:

   i. For double walled ASTs and/or single walled ASTs 660 gallons or less, utilize **Encl (5)** Monthly Inspection Checklist for Fixed ASTs (Including Double-Walled Tanks Greater than 660 Gallons) to document the inspection.

   ii. For double-walled ASTs that are greater than 660-gallons and store product for High-Volume Motor Fuel Dispensing Facilities (see definitions):

      1.In addition to monthly inspections, daily and weekly inspections must also be conducted.

      2.Utilize **Encl (6**) Daily/Weekly/Monthly Inspection Checklist for Fixed Aboveground Storage Tanks (AST) Greater than (>) 660 Gallons that are either Single-Walled Aboveground Storage Tanks (ASTs) OR Double Walled ASTs that Store Product for High-Volume Motor Fuel Dispensing Facilities

   iii. For single-walled tanks that are greater than 660-gallons, additional state requirements apply:

      1. In addition to monthly inspections, daily and weekly inspections must also be conducted.

PRINTED COPIES OF THIS DOCUMENT ARE CONSIDERED UNCONTROLLED.
IT IS THE USER'S RESP9ONSIBILITY TO VERIFY *THE PRINTED COPY AGAINST THE CURRENT CONTROLLED DOCUMENT, WHICH IS MAINTAINED ELECTRONICALLY.*

2. Utilize **Encl (6)** Daily/Weekly/Monthly Inspection Checklist for Fixed Aboveground Storage Tanks (AST) Greater than (>) 660 Gallons that are either Single-Walled Aboveground Storage Tanks (ASTs) OR Double Walled ASTs that Store Product for High-Volume Motor Vehicle Dispensing Facilities.
3. EXCEPTIONS: Emergency generator base tanks of any size, whether single walled or double walled, are not subject to Daily and Weekly inspections, but are still subject to monthly inspections.

13. NOTIFICATION REQUIREMENTS:
    a. When a confirmed or imminent POL spill, leak, release, or overfill from any part of the AST system (including piping) has occurred, the Responsible Party and/or the party that discovers the incident must follow complete and specific protocol found in **Encl (2)**, including generating a Spill Message.
    b. In general, if POL has been released to a building, land surface, pavement, environment, or berm: **Contact Emergency Dispatch (Encl (1)).**
    c. If liquid is found in the tank interstice, **Contact Emergency Dispatch** or Installation EPS (**Encl (1)**)

14. TRAINING REQUIREMENTS:
    a. All oil handling personnel (see definitions) must complete the following training which can be completed using Environmental Compliance Assessment Training & Tracking System (ECATTS), the Navy's environmental on-line training system. Instructions for accessing ECATTS are provided in **Encl (7)**:
        i. Initial (one-time) Installation-specific SPCC training;
        ii. Annual Spill Briefing training- Follows initial training on an annual basis;
    b. All personnel that conduct AST inspections must first complete the training in (a) and complete the following training, as applicable:
        i. PORTABLE INSPECTIONS: Personnel that conduct monthly inspections of portable containers must complete applicable Inspector Training via ECATTS prior to performing inspections.
        ECATTS Instructions to take "Monthly Inspections for Portable Containers" can be found in **Encl (7).**
        ii. FIXED AST INSPECTIONS:
            1. Personnel that conduct MONTHLY inspections for single-walled tanks less than or equal to 660 gallons tanks OR double walled tanks of any size must complete applicable Inspector Training via ECATTS prior to performing inspections.
            ECATTS Instructions to take "Monthly Inspections for Fixed Aboveground Storage Tanks (Double Walled Tanks 55 gallons or

PRINTED COPIES OF THIS DOCUMENT ARE CONSIDERED UNCONTROLLED.
IT IS THE USER'S RESP9ONSIBILITY TO VERIFY *THE PRINTED COPY AGAINST THE CURRENT CONTROLLED DOCUMENT, WHICH IS MAINTAINED ELECTRONICALLY.*

greater and/ or Single-walled tanks less than or equal to 660 gallons)" can be found in **Encl (7)**

2. Personnel that conduct DAILY/WEEKLY/and MONTHLY inspections for single-walled tanks more than 660 gallons must complete applicable Inspector Training via ECATTS prior to performing inspections and every three years afterwards (at a minimum).
ECATTS Instructions to take "Daily/ Weekly/ Monthly Inspections for Fixed Single Walled Aboveground Storage Tanks Greater than 660 Gallons" can be found in **Encl (7)**

iii. Supplemental and/or hands-on training can also be provided by the Installation Petroleum Tank Media Manager (**Encl (1)**.

iv. Must keep all certificates IAW RECORDKEEPING REQUIREMENTS.

15. RECORDKEEPING REQUIREMENTS:

a. Training Certificates- Tank Operators/Inspectors are required to maintain certificate hardcopies of the below training requirements in the tank binder. Records must be made available for Installation EPS and/or Petroleum Tank Media Manager. Retain records in accordance with the following:

i. Initial Installation-specific SPCC training- minimum three years

ii. Annual Spill Briefing training- minimum three years

iii. Inspection training for tanks less than or equal to 660 gallons- minimum three (3) years

iv. Inspection training for tanks greater than 660 gallons- minimum five (5)years

v. Inspection training for portable tanks- minimum three (3) years

Training certificates for personnel that have left the command must remain on-site for the required length of time

b. Inspection Checklists- Personnel responsible for conducting AST inspections or monthly portable container inspections must maintain the following:

i. Inspection checklists must be signed by the appropriate supervisor or inspector;

ii. Hard copies of the inspection checklist must be completed in pen and ink, with month and date denoted;

PRINTED COPIES OF THIS DOCUMENT ARE CONSIDERED UNCONTROLLED.
IT IS THE USER'S RESP9ONSIBILITY TO VERIFY *THE PRINTED COPY AGAINST THE CURRENT CONTROLLED DOCUMENT, WHICH IS MAINTAINED ELECTRONICALLY.*

c. Hardcopies must be maintained onsite or at a main location for:

Inspection/ Log	Three Years	Five Years
Portable Monthly Inspection	X	
Fixed AST Monthly inspections for tanks less than 660 gallons	X	
Fixed AST Monthly inspections for tanks greater than 660 gallons		X
Berm Discharge Logs for tanks less than 660 gallons	X	
Berm Discharge Logs for tanks greater than 660 gallons		X

Appendix F: Integrity Testing Program

40 CFR 112.8 (c)(6) requires that each aboveground container be tested for integrity on a regular schedule. Integrity testing is defined in §112.8(c)(6) as any means to measure the strength (structural soundness) of the container shell, bottom, and/or floor to contain oil and may include leak testing to determine whether the container will discharge oil. A detailed discussion of the integrity testing program requirements for NSA HR Headquarters is presented in Section 4.8 of this SPCC Plan.

The following table provides specific information on scheduling of inspection and testing for each tank and piping system at NSA HR Headquarters. The table provides dates for the most recent test completion as well as the required dates for the subsequent inspection. For those tanks which fully meet integrity testing requirements through routine STI monthly and annual inspections, rather than providing a date for the next integrity test, a notation is made that STI periodic inspection is required.

Piping Integrity Testing Program (9VAC25-91-130.B.4.)

Tank Number	Capacity (gallons)	STI Category	Last Pipe Integrity Test	Pipe Integrity Test Method	Next Required Pipe Integrity Test	Level Gauge Calibration
NSA HQ-CA501-AST-01	1,000	1	N/A[A,B]	N/A[A,B]	N/A[A,B]	N/A[A,B]
NSA HQ-NH94-AST-10	1,000	1	N/A[B]	N/A[B]	N/A[B]	N/A[B]
NSA HQ-NH94-AST-11	1,000	1	N/A[B]	N/A[B]	N/A[B]	N/A[B]

[A] The pipes are flexible rubber dispenser hoses. According to Virginia DEQ dispenser hoses are not subject to 9VAC25-91-130.B.4.
[B] These tanks are not subject to 9VAC25-91-130.B.4 because the facility aggregate aboveground storage capacity subject to regulation is <25,000 gallons.

Appendix G: Berm Inspection and Drainage Instructions

EPA SPCC regulations (40 CFR 112) require the emptying of secondary containment berms for oil storage tanks after rain events under responsible supervision. For tanks with open berms (no roof or enclosure preventing rain from collecting), the berm should be drained as soon as possible following a rain event to regain the full containment volume of the berm. The berm must first be inspected for sheen or oil. If oil is present in the berm (visible sheen or oil), the oil must be removed prior to discharge. If no oil or sheen is present, berm valve must be secured immediately following the drainage event and recorded using the Berm Discharge Log included in this appendix. The NSA HR Headquarters Environmental Protection Specialist can be contacted for cleanup options and assistance in determining the cause of the release. If the presence of oil is persistent, use of the tank should be discontinued until repairs can be made. The Berm Discharge Log records must be kept for five years.

Commander, Navy Region Mid-Atlantic
Berm Discharge Log

Activity Name		POC		Phone	

List Tank ID for all tanks inspected					

Berm discharge must be initiated within **1 WORKING DAY** of a rainfall event to regain the full containment volume of the berm. The following procedure **MUST** be followed:

1) Inspect the retained rainwater to ensure that there is no presence of oil or visible sheen.
2) If measurable oil is present in the berm:
   a. Immediately contact Emergency Dispatch.
   b. Follow Spill Reporting and message protocol in accordance with Hampton Roads Naval Installation Tenant Spill Reporting and Documentation Standard Operating Procedure (**Encl (2)**)
3) If visible sheen is present oil is present in the berm:
   a. Immediately contact Installation EPS.
   b. Follow Spill Reporting and message protocol in accordance with Hampton Roads Naval Installation Tenant Spill Reporting and Documentation Standard Operating Procedure (**Encl (2)**)
4) If oil is not present:
   a. Open the bypass (berm discharge) valve and drain the rainwater under responsible supervision.
   b. Immediately secure/close the bypass (berm discharge) valve after discharge of rainwater is complete.
5) Under no circumstances should rainwater with a visible sheen be released from the containment.
6) If the presence of sheen or oil is persistent, coordinate with Installation EPS and Petroleum Tank Media Manager (**Encl (1)**) for corrective action and/or repairs.
7) Record the berm discharge in the Berm Discharge Log below.
8) Retain this Berm Discharge Log for 5 years.

Date	**Sheen/Oil Present?*** (Y/N)	**Discharge Time** (if no sheen/oil present) Begin	End	**Inspector**	**Comments** *If sheen/oil present, denote volume removed by Oil Recovery

Date	**Sheen/Oil Present? *** (Y/N)	**Discharge Time** (if no sheen/oil present) Begin	End	**Inspector**	**Comments** *If sheen/oil present, denote volume removed by Oil Recovery

Appendix H: Oil-Filled Operational Equipment

The following is the NAVFAC Mid-Atlantic Standard Operating Procedure for the inspection of OFOE. It is in use at NSA HR Headquarters.

STANDARD OPERATING PROCEDURES (SOPs) FOR OIL-FILLED OPERATIONAL EQUIPMENT (OFOE) INSPECTIONS

Background

Oil-filled operational equipment (OFOE) is equipment that includes an oil storage container in which the oil is present solely to support the function of the apparatus or device. Types of OFE include electrical equipment such as transformers, electrical switches, and circuit breakers, as well as hydraulic systems, lubricating systems, gear boxes, machining coolant systems, heat transfer systems, certain aviation ground support maintenance equipment, and elevator hydraulic reservoirs.

40 CFR 112.2 specifically excludes OFOE from the definition of bulk storage container. The effect of this distinction is that OFOE is not subject to the sized secondary containment requirements of 112.8(c)(2). However, OFOE is subject to the general secondary containment requirements of 112.7 (b) and (c). 40 CFR 112.7 (c) requires that general secondary containment be provided for the most likely quantity of oil that would be released from OFOE. The required secondary containment is calculated based on volume and flow rate of the most likely release of oil from the OFOE.

40 CFR 112.7 (k) allows the facility to implement alternate requirements in lieu of general secondary containment required in paragraph 40 CFR 112.7 (c). This exception is allowable if (a) the facility has had no single discharge from any oil-filled operational equipment exceeding 1,000 US gallons and (b) no two discharges from any oil-filled operational equipment exceeding 42 US gallons within any twelve-month period in the three years prior to the SPCC Plan certification date (Qualification Criteria). The Alternative Requirements to general secondary containment require the facility to establish and document the facility procedures for inspections or a monitoring program to detect equipment failure and/or a discharge, have an Oil Spill Contingency Plan, and have a written commitment of manpower and resources to expeditiously control and remove any released oil. It is noted that the last two requirements are met if the facility has prepared a Facility Response Plan.

Procedures for Inspections

1. This SOP applies only to Navy-owned assets. The local utilities authority will be responsible for any response and clean-up actions to include notification of federal, state, and local authorities in the event of an incident involving OFOE owned by non-Navy entities. Navy response assets may be used on these OFOEs if required.

2. NSA HR Headquarters meets the qualification criteria as defined in §112.7(k)(1) and is allowed to employ alternate requirements to secondary containment for OFOE units as defined in §112.7(k)(2). When determining the applicability of this criterion, the gallon amount(s) specified in any spills (either 1,000 or 42) refers to the amount of oil that actually reaches navigable waters or adjoining shorelines, not the total amount of oil spilled. In the event that an installation no longer meets the qualification criteria, the SPCC Coordinator or the Tank Program Manager will re-assess the secondary containment strategy.

3. Inspections on electrical equipment will take place annually in accordance with applicable codes and industry standards such as IEEE Std 62–1995 (R2005) and NFPA 70B. Other OFOE will be inspected in accordance with specific equipment requirements or annually, whichever is most frequent.

4. In the event of a release of oil from Navy-owned OFOEs, call the installation EOC for emergency dispatch.

Transformers and Electrical OFEs Owned by NSA HR Headquarters

1. NAVFAC Mid-Atlantic Utilities Department at each installation will conduct an annual visual inspection of transformers and electrical OFOE with storage capacity of 55 gallons or more on an annual basis.

2. The MAXIMO production control software program automatically generates work requests to conduct the annual inspections. Records of the inspections can be retrieved through the MAXIMO system as required.

3. Monthly electrical meter readings can also be used to satisfy the inspections required in §112.7(k)(1)(i). Any leak will be identified and reported to the NSA HR Headquarters Fire Protection Division when the OFOE is physically visited to obtain a reading. Records of meter readings are maintained by the Utilities Department.

4. Typically, significant loss of oil from transformers would result in almost immediate overheating and shutdown, thereby triggering a maintenance call to restore electric service. This would also yield an immediate observation of a release of oil and would also activate the procedures in the SOP for ASTs.

Elevators

1. It is likely that any failure of the reservoir or hydraulic lift system will result in a discharge from the automatic elevator sump pump system installed in most elevator shafts.

2. All elevator reservoirs are part of a two-phase inspection program which, in part, assesses the overall condition of the hydraulic system and reservoir. Each elevator system is subject to a mandatory monthly safety inspection and a certification inspection every six months. These formal inspection programs adequately meet the inspection requirements under §112.7(k)(2)(i).

3. The MAXIMO production control software program automatically generates work requests to conduct the required elevator inspections. Records of the inspections can be retrieved through the MAXIMO system as required.

Other Types of OFOEs

1. OFOE other than electrical equipment and elevator reservoirs are routinely inspected by the equipment operators during the course of their duties. Typically there are no records of these routine daily inspections.

2. All available records of annual inspections for any other type of OFOE will be maintained by Utilities.

CONTRACT & DO #:	N62470-16-D-9007; DO# N40085-19-F6369
BAKER PROJECT #:	174521
SUBJECT:	**Task C: Stormwater Pollution Prevention Plan**
CD ENCLOSURE:	FINAL SWPPP Report
ATTACHMENT:	Response to Comments (RTC) matrix

Please find enclosed the FINAL Stormwater Pollution Prevention Plan (SWPPP) Report for Naval Support Activity Hampton Roads (NSA-HR), completed for Naval Facilities Engineering Command Mid-Atlantic (NAVFAC) Division under Contract No. N62470-16-D-9007, Delivery Order # N40085-19-F6369. The report was finalized after addressing the two comments documented in the attached Response to Comments (RTC) matrix. The associated map book is submitted under a separate cover.

As part of this effort, a total of ten (10) sites and twenty-six (26) outfalls were inspected. A total of five sites were determined to be industrial regulated and five were determined to be non-regulated sites that receive periodic inspections due to past site activities. As always, thank you for the continued opportunity to supply engineering support and services to NAVFAC Mid-Atlantic.

EXECUTIVE SUMMARY

Michael Baker International, LLC (Baker), under contract with Naval Facilities Engineering Command (NAVFAC) Mid-Atlantic Division to provide engineering services (Contract Number N62470-16-D-9007; Delivery Order [DO] N40085-19-F6369), was tasked with the 2019 Site Compliance Evaluation (SCE), Stormwater Pollution Prevention Plan (SWPPP), SWPPP Mapping Update, and Cooling Tower and Boiler Inventory (CTBI) Plan for Naval Station Norfolk (NSN) and Naval Support Activity (NSA)- Hampton Roads (HR), Norfolk, Virginia. This document comprises the **2019 annual update to the SWPPP** for NSA-HR.

NSA-HR is currently regulated by Virginia Pollutant Discharge Elimination System (VPDES) Permit Number VA0004421 in accordance with the VPDES, Virginia State Water Control Law, and the Federal Clean Water Act (CWA). The VPDES permit sets requirements for sampling and analysis of runoff from both stormwater and non-stormwater sources and requires the development and implementation of a SWPPP to identify potential sources of pollution that may affect the water quality of stormwater discharges associated with an industrial activity. The objectives of the SWPPP are to identify the regulated industrial activities at the facility and describe the best management practices (BMPs) to implement at the activities to reduce the potential pollutants in stormwater discharges associated with industrial activity. The previous permit expired on 3 May 2016 which covers both NSN and NSA-HR. NSN is currently in the process of renewing the VPDES permit. This SWPPP has been conducted in accordance with the existing permit, effective 4 May 2011 through 3 May 2016. While NSA-HR is currently covered under VPDES Permit VA0004421 with NSN; the installation is planning to seek coverage under their own permit, but the exact timeframe for this action has yet to be determined.

A comprehensive survey was completed of the entire installation to identify activities onsite with the potential for stormwater pollution. The survey functioned as a screening mechanism and then a more detailed site investigation was completed for buildings/areas that may be regulated under the VPDES permit requirements and/or have the potential to contribute to stormwater pollution.

A total of 10 sites were inspected as part of the field work conducted between 7 November and 9 December 2019. A total of five sites were determined to be industrial regulated and five were determined to be non-regulated sites that receive periodic inspections due to past site activities. In addition, 26 outfalls were inspected and evaluated to assess coverage under the VPDES permit. Outfall 200, a non-regulated outfall, is not listed in the GIS and was therefore not evaluated. Pertinent site information was documented at all sites identified as industrial regulated, including site description, site activities, potential pollutants, method of on-site storage or disposal, existing BMPs to be maintained (in the categories of structural and nonstructural), and additional recommended BMPs, which were categorized as high-priority (mandatory), medium-priority (recommended), and low-priority (for consideration). No high-priority BMPs were identified during the 2019 comprehensive site inspections. Several low priority BMPs and two medium-priority BMP were identified during the 2019 comprehensive site inspection with recommended additional action for NSA-HR.

Activities regulated by the Virginia Department of Environmental Quality (DEQ) industrial stormwater permit are categorized by industrial sector. The sectors group facilities by the nature of industrial activity, type of materials handled, and material management practices employed and are for the most part based on a facility's Standard Industrial Classification (SIC) code. The sectors applicable to facilities at NSA-HR, regulated by VPDES Permit Number VA0004421 are identified below. Note that some sites may have multiple sectors applicable to them.

- Sector N: Scrap Recycling and Waste Recycling Facilities (1 sites)
- Sector P: Land Transportation and Warehousing Facilities (3 sites)

- Sector AD: Non-Classified Facilities (2 sites)

Additional information presented in the SWPPP includes:

- Pollution Prevention Team (PPT) members
- Additional permit requirements (including annual comprehensive site compliance evaluations, SWPPP storage and update requirements, and outfall monitoring)
- Assessment of potential pollutant sources
- Details on stormwater conditions and control measures for regulated industrial activities
- References used to populate information for the SWPPP

SWPPP Update Snapshot

1. Introduction

This section of the report provides the authorization and scope for this project, background and site overview, outline of the content of the report, summary of stormwater drainage areas, overview of regulations, and a summary of activities at NSA Hampton Roads (NSA-HR).

Authorization and Scope

Michael Baker International, LLC. (Baker), under contract with Naval Facilities Engineering Command (NAVFAC) Mid-Atlantic Division to provide engineering services (Contract Number N62470-16-D-9007; Delivery Order [DO] N40085-19-F6369), was tasked with the 2019 Site Compliance Evaluation (SCE), Stormwater Pollution Prevention Plan (SWPPP), SWPPP Mapping Update, and Cooling Tower and Boiler Inventory (CTBI) Plan for Naval Station Norfolk (NSN) and Naval Support Activity (NSA) - Hampton Roads (HR), Norfolk, Virginia. This document comprises the **2019 annual update to the SWPPP** for NSA-HR.

Background and Site Overview

NSA Hampton Roads, located in the City of Norfolk, Virginia, has the largest concentration of fleet headquarters administrative and communication facilities outside of Washington, D.C. The receiving waters for NSA Hampton Roads are Oastes Creek, the Elizabeth River, and Boush Creek. NSA Hampton Roads is bounded to the north by Naval Station Norfolk and to the east, south, and west by the City of Norfolk. Refer to **Figure 1-1** for a general location map. Additional detailed information can be found in the SWPPP Mapbook provided under separate cover.

The mission of NSA Hampton Roads is to provide consistent, operationally ready, and secure shore installation support services that allow tenant activities to dedicate their resources to warfighting, forward operations, and combat readiness. NSA-HR tenant organizations include Camp Allen, Joint Forces Staff College, United States Navy Shipboard Firefighting School, Defense Logistics Agency (DLA), a Marine Corps compound, and North Atlantic Treaty Organization Headquarters. These organizations include numerous maintenance shops, housing areas, vocational and training schools, and administrative support facilities.

The Navy currently has a joint permit that includes NSN and NSA-HR and is required to file for an individual Virginia Pollutant Discharge Elimination System (VPDES) permit due to the non-stormwater discharges at NSN that are not allowable under the general permit and other industrial stormwater discharges designated by the Virginia Department of Environmental Quality (DEQ) Director. The permit will be divided by installation in the future and NSA-HR will seek coverage under the general permit. NSA-HR has been issued VPDES Permit Number VA0004421 in accordance with the VPDES, the Virginia State Water Control Law, and the Federal Clean Water Act (CWA). The VPDES Permit Number 0004421, effective 4 May 2011 through 3 May 2016, is included as **Appendix AA**. The permit covers 248 outfalls that discharge stormwater associated with industrial activity, 52 of these are monitored through analytical sampling and 20 discharge process wastewater. These process discharges include deicing, once-through non-contact equipment cooling water, and wastewater discharges associated with the operation and maintenance of cooling towers that contain chemical additives.

The previous permit expired on 3 May 2016. NSN and NSA-HR is currently in the process of renewing the VPDES permit. This SWPPP has been conducted in accordance with the existing

permit, effective 4 May 2011 through 3 May 2016, and included in **Appendix AA**. This is anticipated to be the final SWPPP update under the existing permit before NSA-HR starts coverage under a new permit.

Content of Report

The purpose of this report is to present the updated SWPPP, which is required by VPDES Permit Number 0004421. The SWPPP contains five sections and related appendices:

- **Section 1** presents an introduction to the report, including authorization and scope, an overview of the site, a description of the report organization, summary of stormwater outfall drainage areas, background information on the regulatory requirements, and a summary of activities at NSA-HR.
- **Section 2** includes the planning and organization of the Pollution Prevention Team (PPT), whose role it is to oversee this SWPPP, as well as information on the annual inspection reports and update requirements.
- **Section 3** provides an assessment of potential pollutant sources and a summary of discharge monitoring data.
- **Section 4** describes the stormwater conditions and controls that relate to regulated industrial activities at NSA-HR.
- **Section 5** presents the references for development of this report and supporting materials.
- **Appendices** include the site-specific reference information required by the VPDES permit.
  - **Appendix A.1** Regulated Monitored Stormwater Outfalls
  - **Appendix A.2** Regulated Non-Monitored Stormwater Outfalls
  - **Appendix A.3** Non-Industrial Permitted Stormwater Outfalls
  - **Appendix A.4** Municipal Separate Storm Sewer System (MS4) Stormwater Outfalls
  - **Appendix B.1** Industrial Activities by Outfall
  - **Appendix B.2** Outfall Grouping Justification
  - **Appendix C** Dry-Weather Flow Observations
  - **Appendix D** Inventory of Outdoor Storage Areas
  - **Appendix E** Inventory of Aboveground Storage Tanks
  - **Appendix F** Inventory of Outdoor Liquid Transfer Operations
  - **Appendix G** Inventory of Aircraft Wash Rack Areas
  - **Appendix H** Inventory of Aircraft Maintenance Areas
  - **Appendix I** Inventory of Aircraft Fueling/Defueling Areas
  - **Appendix J** Inventory of Aircraft Deicing Areas
  - **Appendix K** Inventory of Vehicle Wash Rack Areas
  - **Appendix L** Inventory of Vehicle Maintenance Areas

- **Appendix M** Inventory of Vehicle/Equipment Fueling Areas
- **Appendix N** Inventory of Ship Maintenance/Repair Areas
- **Appendix O** Hazardous Waste Accumulation Storage Areas
- **Appendix P** Inventory of Scrap & Waste Recycling Facilities
- **Appendix Q** Inventory of Public Warehousing Areas
- **Appendix R** Chemical Application Areas
- **Appendix S** Quarterly Visual Monitoring
- **Appendix T** Sampling Data 2008-2019
- **Appendix U** Monitoring Requirements
- **Appendix V** Spills and Leaks
- **Appendix W** Oil/Water Separators (OWSs)
- **Appendix X** Structural BMPs Recommended for Implementation
- **Appendix Y** Non-Structural BMPs Recommended for Implementation
- **Appendix Z** Recommended Buildings for Inspections
- **Appendix AA** VPDES Permit Number VA0004421, effective 4 May 2011 through 3 May 2016

This SWPPP establishes a comprehensive program to control stormwater discharge from NSA-HR. This plan identifies and maps potential pollutant sources that could contribute to the contamination of stormwater discharge. These sources include outdoor industrial activity, process areas, materials storage areas, loading and unloading areas, liquid transfer areas, and waste disposal practices that are exposed to stormwater.

Included in Section 4 are specific best management practices (BMPs) to prevent or minimize material exposure to stormwater. Additional inspection, operation, and maintenance programs are implemented to improve the effectiveness of ongoing pollution abatement practices.

The SWPPP and appendices are supplemented by mapping that provides the location of industrial activities exposed to rainfall, material storage areas, materials loading and access areas, and existing BMPs. The report and mapping (submitted under separate cover) are provided in formats to facilitate the periodic update of the SWPPP by NAVFAC Mid-Atlantic personnel so that the document is a “living document”.

Summary of Stormwater Outfall Drainage Areas

Outfalls occurring at NSA-HR, as identified within the current VPDES permit, have been numbered according to where they discharge, as follows:

- **200-208** – discharge to the Elizabeth River
- **600-617** – discharge to Bousch Creek

Appendices A.1 and **A.2** list the outfall number, latitude, longitude, total drainage area in acres, impervious area in acres, receiving stream, permitted activities, and building and structure

numbers associated with monitored and non-monitored outfalls, respectively. Outfalls not subject to this permit are listed in **Appendix A.3**.

Prefixes used to identify the various outfalls at NSA-HR include the following:

- **NP** – outfalls not subject to VPDES Permit Number VA0004421 since "not permitted"
- **SF** – areas that drain by "sheet flow" and are therefore not covered under VPDES Permit Number VA0004421.

MS4 Regulated Outfalls

Information for outfalls covered under the MS4 permit has been added to the report in **Appendix A.4** and includes the following information for each outfall:

- Unique identifier
- Estimated MS4 acreage served
- Name of the receiving surface water and indication as to whether the receiving water is listed as impaired in the Virginia Draft 2016 303(d)/305(d) Water Quality Assessment Integrated Report
- Applicable Total Maximum Daily Load
- Associated Hydrologic Unit Code

Other than the inventory of non-permitted outfalls and MS4 outfalls identified in **Appendices A.3** and **A.4**, this SWPPP is limited to the industrial outfalls regulated by VPDES Permit Number VA0004421.

Overview of Regulations

The following sections provide an overview of the federal and state regulations that govern the regulatory compliance for industrial stormwater discharges.

Federal Regulations

Section 402(p) of the CWA requires that operators of "discharges associated with industrial activity" obtain a National Pollutant Discharge Elimination System (NPDES) permit. In 1990, the U.S. Environmental Protection Agency (EPA) developed permitting regulations under the Phase I NPDES to control stormwater discharges associated with the following eleven categories of industrial activity, as identified in Title 40 of the Code of Federal Regulations (CFR), Subsection 122.26(b)(14)(i)-(xi).

- Category One (i): Facilities subject to federal stormwater effluent discharge standards in 40 CFR Parts 405-471
- Category Two (ii): Heavy manufacturing (for example, paper mills, chemical plants, petroleum refineries, and steel mills and foundries)
- Category Three (iii): Coal and mineral mining, and oil and gas exploration and processing
- Category Four (iv): Hazardous waste treatment, storage, or disposal facilities
- Category Five (v): Landfills, land application sites, and open dumps with industrial wastes

- Category Six (vi): Metal scrapyards, salvage yards, automobile junkyards, and battery reclamation
- Category Seven (vii): Steam electric power generating plants
- Category Eight (viii): Transportation facilities that have vehicle maintenance, equipment cleaning, or airport deicing operations
- Category Nine (ix): Treatment works treating domestic sewage with a design flow of one million gallons a day or more
- Category Ten (x): Construction activities, including clearing, grading, and excavating, that result in land disturbance of equal to or greater than one acre and less than five acres
- Category Eleven (xi): Light manufacturing (e.g., food processing, printing and publishing, electronic and other electrical equipment manufacturing, and public warehousing and storage)

State Regulations

Activities regulated by the Virginia DEQ industrial stormwater permit are also categorized by industrial sector. The sectors group similar facilities by the nature of industrial activity, type of materials handled, and material management practices employed and are for the most part based on a facility's Standard Industrial Classification (SIC) code. The sectors are listed below, along with the associated, regulated SIC code:

- Sector A: Timber Products Facilities
  - SIC Codes: 2411, 2421, 2426, 2429, 2431-2439, 2441, 2448, 2449, 2451, 2452, 2491, 2493, and 2499
- Sector B: Paper and Allied Products Manufacturing Facilities
  - SIC Codes: 2611, 2621, 2631, 2652-2657, and 2671-2679
- Sector C: Chemical and Allied Products Manufacturing and Refining Facilities
  - SIC Codes: 2812-2819, 2821-2824, 2851, 2861-2869, 2873-2879, 2891-2899, and 3952
- Sector D: Asphalt Paving and Roofing Materials and Lubricant Manufacturing Facilities
  - SIC Codes: 2951, 2952, 2992, and 2999
- Sector E: Glass, Clay, Cement, Concrete, and Gypsum Product Facilities
  - SIC Codes: 3211, 3221, 3229, 3231, 3241, 3251-3259, 3261,3269, 3274, 3275, 3281, and 3291-3299
- Sector F: Primary Metals Facilities
  - SIC Codes: 3312-3317, 3321-3325, 3331-3339, 3341, 3351-3357, 3363-3369, 3398, and 3399
- Sector G: Metal Mining (Ore Mining and Dressing) Facilities
  - SIC Codes: 1011, 1021, 1031, 1041, 1044, 1061, 1081, 1094, and 1099
- Sector H: Coal Mines and Coal Mining-Related Facilities
  - SIC Codes: 1221-1241

- Sector I: Oil and Gas Extraction and Refining Facilities
  - SIC Codes: 1311, 1321, 1381-1389, and 2911
- Sector J: Mineral Mining and Dressing Facilities
  - None
- Sector K: Hazardous Waste Treatment, Storage, or Disposal Facilities
  - SIC Codes: HZ
- Sector L: Landfills, Land Application Sites, and Open Dumps
  - SIC Codes: LF
- Sector M: Automobile Salvage Yards
  - SIC Codes: 5015
- Sector N: Scrap Recycling and Waste Recycling Facilities
  - SIC Codes: 5093, and 4499
- Sector O: Steam Electric Generating Facilities
  - SIC Codes: SE
- Sector P: Land Transportation and Warehousing Facilities
  - SIC Codes: 4011, 4013, 4111-4173, 4212-4231, 4311, and 5171
- Sector Q: Water Transportation Facilities
  - SIC Codes: 4412-4499 (except 4499)
- Sector R: Ship and Boat Building and Repair Yards
  - SIC Codes: 3731, 3732
- Sector S: Air Transportation Facilities
  - SIC Codes: 4512-4581
- Sector T: Treatment Works
  - SIC Codes: TW
- Sector U: Food and Kindred Products Facilities
  - SIC Codes: 2011-2015, 2021-2026, 2032-2038, 2041-2048, 2051-2053, 2061-2068, 2074-2079, 2082-2087, 2091-2099, and 2111-2141
- Sector V: Textile Mills, Apparel, and Other Fabric Products Manufacturing
  - SIC Codes: 2211-2299, 2311-2399, and 3131-3199 (except 3111)
- Sector W: Furniture and Fixtures Facilities
  - SIC Codes: 2434, 2511-2599
- Sector X: Printing and Publishing Facilities
  - SIC Codes: 2711-2796

- Sector Y: Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries
    - SIC Codes: 3011, 3021, 3052, 3053, 3061, 3069, 3081-3089, 3931, 3942-3949, 3951-3955 (except 3952), 3961, 3965, and 3991-3999
- Sector Z: Leather Tanning and Finishing Facilities
    - SIC Codes: 3111
- Sector AA: Fabricated Metal Products Facilities
    - SIC Codes: 3411-3499, and 3911-3915
- Sector AB: Transportation Equipment, Industrial or Commercial Machinery Facilities
    - SIC Codes: 3511-3599 (except 3571-3579) and 3711-3799
- Sector AC: Electronic and Electrical Equipment and Components, Photographic and Optical Goods Facilities
    - SIC Codes: 3571-3579, 3612-3699, and 3812-3873
- Sector AD: Non-Classified Facilities / Stormwater Discharges Designated by the Board as Requiring Permits
    - Other stormwater discharges designated by the Regional Director or Board

The specific sectors applicable to facilities at NSA-HR regulated by VPDES Permit Number VA0004421 are identified below. Note that some sites may have multiple sectors applicable to them.

- Sector N: Scrap Recycling and Waste Recycling Facilities (1 site)
- Sector P: Land Transportation and Warehousing Facilities (3 sites)
- Sector AD: Non-Classified Facilities (2 sites)

Most industrial stormwater discharges are covered under general permits, as opposed to individual permits, although States and EPA can and do issue individual permits to some facilities based on site- or industry-specific concerns. NSA-HR has authorization to discharge under an individual permit (Industrial Minor), VPDES Permit Number VA0004421, which requires that a facility with regulated industrial activities develop a SWPPP. The specific requirements listed in Part I of the permit are listed below along with the corresponding section in this document that addresses the requirement.

- Part I.B.6 (page 32/89): Non-Contact Cooling Water Systems and Boiler Additives (Section 3)
- Part I.D.1.f (page 45/89): Quarterly Visual Monitoring (Section 3)
- Part I.D.1.g (page 47/89): Allowable Non-Stormwater Discharge (Section 3)
- Part I.D.1.i (page 49/89): Co-Located Industrial Activities (Section 4)
- Part I.D.1.j (page 49/89): Salt Storage (Section 3)
- Part I.D.2.b(1) (page 50/89): Pollution Prevention Team (Section 2)
- Part I.D.2.b(2) (page 51/89): Site Description (Appendices and Mapbook)
- Part I.D.2.b(3) (page 52/89): Summary of Potential Pollutant Sources (Section 3)

- Part I.D.2.b(4) (page 53/89): Spills and Leaks (Section 3 and Appendix V)
- Part I.D.2.b(5) (page 53/89): Sampling Data (Section 3 and Appendices T & U)
- Part I.D.2.b(6) (page 53/89): Stormwater Controls (Section 4)
- Part I.D.2.c (page 58/89): SWPPP Maintenance (Section 2)
- Part I.D.2.d (page 58/89): Comprehensive Site Compliance Evaluation (Section 2)
- Part I.D.2.e (page 60/89): Signature and Plan Review (Section 2)
- Part I.D.2.f (page 61/89): Maintaining an Updated SWPPP (Section 2)
- Part I.D.3 (page 62/89): Scrap Recycling and Waste Recycling Facilities (Section 4)
- Part I.D.4 (page 72/89): Various Land Transportation Facilities (Section 4)
- Part I.D.5 (page 76/89): Ship and Boat Building or Repair Yards (Section 4)
- Part I.D.6 (page 82/89): Air Transportation (Section 4)

Summary of Activities at NSA-HR

A list of the sites/buildings regulated under VPDES Permit Number VA0004421, along with their designated SIC code and associated description is summarized in **Table 1-1**.

Table 1-1
Summary of Regulated Industrial Activities and Associated SIC Codes at NSA-HR

Outfall(s)	Building	Map Sheet	2019 Sector	2019 SIC Code	Industrial Activity Description
207, 208	SDA-205	T-4, U-4, U-5	P	4225	General Warehousing and Storage
207, 208	SDA-210	T-4, U-4	N, P	5093, 4225	Scrap and Waste Materials and General Warehousing and Storage
208	SDA-204	U-4, U-5	P	4225	General Warehousing and Storage
605	MCA-612	P-9, P-10	AD	7699	Vehicle Maintenance or Land Transportation,
611, 612 [1]	NH-31A	S-8, T-8	AD	7699	Operations level vehicle maintenance and repair

[1]This table displays the outfalls as permitted under VPDES Permit No. VA000442 and does **not** reflect the updates as a result of the 2018 basin re-delineations.

All sites were determined to be in compliance with the SWPPP and permit requirements during the 2019 SCE investigation. There were no changes identified at NSA-HR during the 2019 SCE inspections.

2. Planning and Organization

This SWPPP establishes an organizational hierarchy to plan and implement stormwater control measures in accordance with existing environmental pollution prevention/contingency plans and unit-level operational activities at NSA-HR. This section outlines some of the key components to planning and organizing the implementation of these items.

Pollution Prevention Team

A PPT has been identified to oversee implementation, maintenance, and revision of the NSA-HR SWPPP. The PPT members were chosen for their ability to address a variety of topics pertaining to implementation of this SWPPP, to include:

- Inventories and inspections of hazardous material, hazardous wastes, and petroleum, oil, and lubricant (POL)
- Implementation of pollution prevention training
- Development of safety inspection procedures for hazardous materials
- Implementation of spill response and cleanup
- Development and implementation of BMPs

Members of the PPT and their roles and responsibilities include:

- Installation Water Program Manager for NSA-HR
  - Develop the SWPPP to ensure compliance with provisions of VPDES Permit Number VA0004421
  - Implement, maintain, and revise the SWPPP
  - Review, prioritize, and implement BMPs
  - Provide tenant stormwater training, as deemed necessary
- NSA-HR Environmental Protection Specialist (EPS)
  - Conduct SWPPP inspections and report any noncompliance to the Water Program Manager
  - Periodically patrol the base to ensure compliance at sites that are not routinely inspected
  - Provide input for review, prioritization, and implementation of BMPs
  - Provide and/or coordinate tenant stormwater training, as deemed necessary
  - Maintain records of periodic stormwater inspections and training
- Other members of the PPT are designated as necessary by the Installation Water Program Manager and the Installation Environmental Program Director.

PPT meetings are held as needed, with continuing discourse outside of formal meetings, to:

- Discuss operational status of regulated facilities
- Identify areas with a high pollution potential
- Evaluate and prioritize the need for BMP implementation
- Identify and assess potential new sites and new tenants for BMP implementation

Site Compliance Evaluations

The identification of potential BMPs or modifications to existing BMPs is facilitated by the use of information gathered from annual SCEs, water quality monitoring data, spill reports, interviews, and personnel suggestions. The information collected is reviewed to identify the need to implement both structural and nonstructural BMPs. BMP recommendations are categorized as low-priority (for consideration); medium-priority (recommended); or high-priority (mandatory).

The following items were evaluated in accordance with VPDES Permit Number VA0004421, Part I, Section D.2.d (1):

- Industrial materials, residue, or trash that may have or could come into contact with stormwater
- Leaks or spills from industrial equipment, drums, barrels, tanks, or any other containers that have occurred within the past three years
- Offsite tracking of industrial or waste materials or sediment where vehicles enter or exit the site
- Tracking or blowing of raw, final, or waste materials from non-exposed areas to exposed areas
- Evidence of, or the potential for, pollutants entering the drainage system
- Evidence of pollutants discharging to surface waters at all facility outfalls, and the condition of and around the outfall, including flow dissipation measures to prevent scouring
- Review of training performed, inspections completed, maintenance performed, quarterly visual examinations, and effective operation of BMPs
- Results of both visual and analytical monitoring conducted during the past year

In addition to these items identified within the permit, the following evaluations were conducted during the SCE:

- A visual inspection of equipment needed to implement the SWPPP, such as spill response equipment
- Verification of SWPPP site maps, including associated materials storage location revisions, and changes in storm drainage conveyance systems and/or drainage boundaries
- Recommendations for plan improvement to reduce pollutant loading to the stormwater drainage system
- A review of annual Discharge Monitoring Report (DMR) data to verify that existing BMPs are preventing stormwater pollutants from discharging at levels exceeding monitoring requirements

In accordance with Part I, Section D.2.d (2) (page 59 of 89), the SWPPP must be updated within 30 days unless permission for a later date is granted in writing by Virginia DEQ. If existing BMPs need to be modified or if additional BMPs are necessary, implementation shall be completed before the next anticipated storm event, if practicable, but not more than 60 days after completion of the comprehensive site evaluation, unless permission for a later date is granted in writing by Virginia DEQ.

Site-specific BMPs are presented in the SCE Report and SCE Forms (under separate cover). Structural and non-structural BMPs are identified in **Appendix X** and **Appendix Y**, respectively.

SWPPP Storage and Update Requirements

The industrial stormwater permit includes specific storage and maintenance (updating) requirements. Some of these are mentioned in other sections of this report because they apply to specific requirements such as inspections or monitoring; however, these requirements are repeated here to assist with SWPPP compliance and implementation.

In accordance with Part I, Section D.2.e (1) (page 60 of 89), the SWPPP shall be signed, dated, and retained onsite at the facility covered by the permit in accordance with Part II.B.2. The SWPPP is stored and maintained at Building NH-34 by the NSA-HR Water Program Manager. In accordance with Part I, Section D.2.e (2) (page 60 of 89), the SWPPP, annual SCE report, and other information are available to the Virginia DEQ and other regulatory agencies upon request.

In addition to any revisions required from the annual SCE, in accordance with Part I, Section D.2.f (1) (page 61 of 89), the SWPPP shall be reviewed and amended as appropriate whenever any of the following conditions apply:

- There is construction or a change in design, operation, or maintenance at the facility that has a significant effect on the discharge, or the potential for the discharge, of pollutants from the facility
- Routine inspections or compliance evaluations determine that there are deficiencies in the BMPs
- Inspections by local, state, or federal officials determine that modifications to the SWPPP are necessary
- There is a spill, leak, or other release at the facility
- There is an unauthorized discharge from the facility

In accordance with Part I, Section D.2.f (2) (page 61 of 89), SWPPP modifications shall be made within 30 calendar days after discovery, observation, or an event trigging a SWPPP modification. Implementation of new or modified BMPs (distinct from regular preventive maintenance of existing BMPs) shall be initiated before the next storm event, if possible, but no later than 60 days unless otherwise provided or approved by the Virginia DEQ. The amount of time taken to modify a BMP or implement additional BMPs shall be documented in the SWPPP.

PAGE INTENTIONALLY LEFT BLANK

3. Assessment of Potential Pollutant Sources

This section of the report describes the regulated industrial activities at NSA-HR (e.g., recycling operations, and vehicle/equipment repair, maintenance, and fueling, warehouse distribution, etc.), discharge monitoring data, spills and leaks, and identification of non-stormwater discharges.

Site Mapping

Field investigations are periodically conducted to update existing and identify new sources of stormwater pollution. These sources are presented in the SWPPP Mapbook (provided under separate cover) as a combination of symbols and shapes to designate areas where spills and leaks have occurred, industrial activities, BMPs, material storage areas, hazardous materials/waste storage, POL storage, material loading and access areas, and chemical application areas. A detailed description of the major sources that can potentially pollute stormwater is provided in the following sections.

Potential Pollutant Sources

Appendix B.1 presents a summary of industrial activities by outfall. Only outfalls associated with regulated industrial activities are included in the summary. **Appendix B.2** is the Outfall Grouping Justification representing the current industrial activities.

Pollution potential ratings are categorized as low, medium, or high potential dependent on a risk assessment of pollutant releases to navigable waterways. The definition for each risk category for pollution potential is as follows:

- **Low** – Low risk of stormwater exposure that is unlikely to result in a measurable impact. Additional BMPs are not warranted.
- **Medium** – Potential risk to stormwater runoff with possible environmental impacts. Additional BMPs may be appropriate.
- **High** – Conditions require implementation of BMPs to prevent impact to stormwater. Note that material exposed to stormwater is not necessarily an indicator of current environmental damage. Additional BMPs are warranted.

These ratings are based on the following criteria:

- Type and quantity of stored material
- Type of containment provided (if applicable)
- Type of cover provided (if applicable)
- Proximity to navigable waterways, tributaries, and associated storm drains
- Topography (mild, medium, or steep slopes)
- Presence of vegetative buffers (filtering and reduced runoff velocities)
- Soil type (infiltration and adsorption)

- Documented spills
- Evidence of spills

Identified stormwater-related inventories in **Appendices D, G, H, I, K, L, M, N, P,** and **Q** have been assigned pollution potential ratings based on the above criteria. Note that while the same terms are used, this is a separate rating system than the one described in the Site Compliance Evaluation section pertaining to BMP recommendations.

Inventory of Outdoor Material Storage Areas

Appendix D depicts an inventory of outdoor material storage areas categorized by outfall or sheet flow drainage area, location/building number, drainage map page, type of storage (open, dumpster, covered, compressed gas cylinder, etc.), materials, quantity, whether or not the storage area is covered, material containment, and the stormwater pollution potential rating.

Inventory of Outdoor Aboveground Storage Tanks

Appendix E depicts an inventory of aboveground storage tanks (ASTs) categorized by outfall or sheet flow drainage area, location/building number, map page, material/fuel stored, intended use, volume, containment area description (double-walled, open top berm, etc.), and containment volume rating. A Containment Volume/Tank Volume ≥ 1 was deemed to be adequate. Any ratio greater than one was deemed adequate, while any ratio under one was deemed not adequate.

Inventory of Outdoor Liquid Transfer Operations

Appendix F depicts an inventory of outdoor liquid transfer operations categorized by outfall or sheet flow drainage area, building number, activity location map page, type of fuel operation, materials being transferred, maximum spill quantity, and containment type description (none, double-walled, concrete, etc.).

Vehicular Operations

The following sections present the specific industrial activities related to vehicular operations that occur at NSA-HR.

Vehicle and Associated Equipment Washing

Government-owned as well as private vehicles and equipment are washed as needed at designated locations around NSA-HR. Designated wash racks at these sites are equipped with either an OWS or a diversion valve to direct flow to the sanitary sewer and prevent non-permitted discharges. **Appendix K** provides a summary of the vehicle and equipment washing areas at NSA-HR, including outfalls, location/building numbers; map page numbers; discharge areas; the type of vehicle/equipment being washed; whether or not the wash area has containment curbing, is covered, detergent is used, and has an OWS; and the pollution potential.

Vehicle Maintenance and Storage

Preventative maintenance and general repair services on automobiles, vans, trucks, forklifts, mobile refuelers, and emergency vehicles are performed at various maintenance facilities at NSA-

HR. Related activities may include fluid changes, mechanical repairs, parts cleaning and replacement, sanding, refinishing, painting, and vehicle and equipment storage. These facilities may also store used parts, such as batteries, belts, hoses, tires, and other materials. Additionally, used/waste liquid storage may be onsite, including POLs, fuel, antifreeze, cleaners, and solvents.

Most vehicle maintenance activities at NSA-HR occur indoors and therefore are usually not exposed to stormwater. Spills may occur within these buildings during repair activities as a result of leaking, ruptured, and overturned containers, or leaking vehicles and associated equipment. Therefore, these facilities have spill response procedures and spill kits readily available. **Appendix L** provides a summary of the vehicle maintenance areas that includes outfalls, location/building numbers, map page numbers, a description of activities, and pollution potential.

Vehicle Fueling

Common activities at NSA-HR include motor vehicle and equipment fueling. During these activities, fuel products are transferred from bulk fueling sites, mobile refuelers, underground storage tanks (USTs), or ASTs to the serviced vehicle or equipment. Activities associated with fueling include delivery and transfer, storage, and dispensing. Primary fuel types used at NSA-HR are gasoline, and diesel.

To prevent or reduce accidental spills and overfills, leak detection systems and overfill alarms are installed on all USTs. ASTs have liquid level gauges, overflow alarms, and are typically located within secondary containment or have an environmental equivalent.

Appendix M contains a list of vehicle/equipment fueling areas at NSA-HR including associated outfalls, location/building numbers, map page numbers, activity descriptions, and pollution potential.

Hazardous Waste Accumulation Areas

Nine areas throughout NSA-HR are designated as hazardous waste storage sites, and associated activities are managed by the NAVFAC Mid-Atlantic Waste Department. These sites are characterized as either <90 day hazardous waste accumulations areas (HWAAs) or satellite accumulation areas (SAAs), as determined by the waste generated. Typically, these hazardous waste storage sites are utilized for the storage of used/waste POLs, waste paint, fluorescent bulbs, lithium or nicad batteries, and spent solvent. Personnel responsible for management of hazardous wastes must maintain training on an annual basis.

NSN is equipped with a Treatment, Storage, and Disposal (TSD) facility, located at Buildings LP-159 and LP-24, where all hazardous wastes generated throughout installations in the Norfolk/Hampton Roads region (including wastes from NSA-HR) are stored until shipment for final disposal. **Appendix O** contains a link and a tabulated list of each Resource Conservation and Recovery Act (RCRA) permitted facility, <90 day storage area, and SAA located at NSA-HR. Standard Operation Procedures (SOPs) for HWAAs have been created and can be found on the share drive located with Environmental.

Scrap and Waste Material

The DLA Disposition Services (DLADS) for NSN and NSA-HR is located in the southwestern portion of the base in the South Depot Annex (SDA) area. These storage warehouses contain used, damaged, recyclable parts, and equipment from maintenance and other operations.

Materials are commonly segregated into material types (e.g., tires, brass, steel, electrical parts, etc.) and stored inside the SDA warehouses until DLADS excesses or auctions them.

Other scrap and waste material located throughout NSA-HR include several covered and uncovered bins for recycling metal, wood, and cardboard managed by the installation's recycling program. Metal products collected for recycling are transported to Building Z-309, the NAVFAC Integrated Solid Waste-Recycling Yard, which is an indoor/outdoor accumulation area for scrap and waste recycling. Metals are typically sorted in the outdoor accumulation area and all other materials are separated and processed indoors. BMPs for scrap and waste material processing and recycling facilities are included in Department of Defense 4160.21-M, available at http://www.dispositionservices.dla.mil/. Refer to **Appendix P** for site-specific information on scrap and waste recycling facilities including associated outfalls, location/building numbers, map page numbers, type of material being processed, and pollution potential rating.

Land Transportation and Warehousing

Appendix Q lists the locations and supporting information of public warehousing areas including outfalls, location/building number, type of warehousing, whether or not there is outdoor material storage, and the pollution potential rating. Good housekeeping practices, including minimization of exposure are observed in and around these facilities to prevent stormwater pollution.

Salt Storage

In accordance with the VPDES Permit Number VA0004421, Part I, Section D.1.j (page 49 of 89), storage piles of salt or piles containing salt used for deicing or other purposes shall be enclosed or covered to prevent exposure to precipitation. All salt storage piles shall be located on an impervious surface and all runoff from the pile, and/or runoff that comes in contact with salt, including under drain systems, shall be collected and contained within impermeable containment, maintained in storage tank(s), or disposed of through a sanitary system. In no case shall salt-contaminated stormwater be allowed to discharge to the stormwater system.

Salt is stored at NSN for use in minimizing hazardous driving conditions caused by snowy and icy roads. Limited quantities of salt are stored in manufacturer sealed bags inside Building LP-22 and large quantities of salt are stored at Building NM-59A. When heavy snow and ice occurs in the Norfolk region, salt is transferred to a concrete pad behind Building LP-22 for temporary staging while it is being applied, and it is removed after the icy conditions have concluded.

Chemical Application Areas

Fertilizers, pesticides, and herbicides are applied routinely to various locations throughout NSA-HR. Pest-control activities are performed by the appropriately licensed personnel from the Public Works Center (PWC) Pest Control staff and independent contractors. Typical pesticide application consists of fogging for mosquitoes using Vectorbac-G, as well as small, isolated use of other insecticides as needed. Fogging is performed throughout peak season during four to five weeks of summer. Herbicide is applied in various areas to control or eliminate unwanted plant growth. The 10 chemicals used as herbicides are as follows:

- Lesco 2-4-D
- Turflon
- Glyphosate

- Pramitol 25E
- Trimec Classic
- ElancoSurflan
- Weedar 64
- Devrinol 50-WP
- Bromacil
- Gallery 75

NSA-HR has one golf course: an 18-hole golf course along the southwest corner of the base (Outfall 301, which discharges to an irrigation pond). The 18-hole golf course applies agriculture-grade fertilizer and broadleaf control each November, March, May, and August. Three separate agricultural formulations are used and applied at three pounds per one hundred square feet for the fairways, and five pounds per 1,000 square feet for the greens. The herbicide Trimec Plus and insecticide Sevin are used on an as-needed basis.

A summary of chemical application areas is provided in **Appendix R**, including the chemical type, area of application, purpose of the chemical, application rates, and any related comments.

Discharge Monitoring Report Data

In accordance with VPDES Permit Number VA0004421, Part I, Section D.2.b (5) (page 53 of 89), the SWPPP shall include a summary of existing stormwater discharge sampling data taken at the facility, including any data collected during the previous permit term. Sampling data collected during the previous and current permit term is summarized in **Appendix T**. Sampling requirements presented in **Appendix U** are consistent with the current compliance reporting required under VPDES Permit Number VA0004421. Copies of all data used to create eDMRs are kept on file at the NSA-HR Environmental office. **Appendices T** and **U** present the required testing parameters, frequency of required analyses, and minimum and maximum limit values for each parameter. If multiple samples were obtained during a single sampling period, the results from each sampling event are reported under the monitoring period when the samples were obtained.

Visual Examination and Analytical Monitoring

In accordance with the VPDES Permit Number VA0004421, NSA-HR is authorized to discharge stormwater associated with industrial activities from point sources. There are several activities at NSA-HR that are classified as regulated industrial activities. The outfalls corresponding to these regulated industrial activities, or similarly grouped representative outfalls, require analytical and visual monitoring. The regulated industrial activities at NSA-HR are listed below by the categories of regulated sectors and associated SIC codes:

- Sector AD: Designated by Director, Repair Shops and Related Services (SIC Code 7699)
- Sector N: Scrap Recycling and Waste Recycling (SIC Code 5093)
- Sector P: Land Transportation and Warehousing, General Warehousing, and Storage (SIC Code 4225)

Visual Examination

Part 1, Section D.1.f of VPDES Permit Number VA0004421 outlines the requirements for quarterly visual examinations of stormwater quality. Visual examinations of stormwater discharges associated with regulated industrial outfalls must be conducted and documented on a quarterly basis. Visual examination reports are maintained with the SWPPP and are referenced in **Appendix S**.

Whenever practicable, the visual examination should be made during daylight hours (e.g., normal working hours). If no storm event resulted in runoff from the facility during a monitoring quarter, the permittee is excused from visual monitoring for that quarter provided that documentation is included with the monitoring records indicating that no runoff occurred.

In accordance with Part 1, Section D.1.f (2) of VPDES Permit Number VA0004421 (page 45 of 89), visual examinations must be made of grab samples taken during the first hour the runoff or snowmelt begins discharging from the facility. No analytical tests are required to be performed on the samples. If the collection of a grab sample during the first hour is impractical, a grab sample can be taken during the first three hours of the discharge, and documented with a description of why a grab sample during the first hour was not available. The examination must document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of stormwater pollution. The examination must be conducted in a well-lit area. All samples (except snowmelt samples) must be collected from the discharge resulting from a storm event that results in an actual discharge from the site from a "measurable storm event" that occurs at least 72 hours from the previously measurable storm event.

In accordance with Part 1, Section D.1.f (3) of VPDES Permit Number VA0004421 (page 46 of 89), the visual examination reports must be maintained onsite with the SWPPP. The report must include the following information: the outfall location, the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the stormwater discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of stormwater pollution), and probable sources of any observed stormwater contamination.

Analytical Monitoring

Part I of VPDES Permit Number VA0004421 specifies the sampling and analytical monitoring program for stormwater discharges at NSA-HR. The monitoring parameters for each outfall identified within Part I, Section A of the permit may include any combination of the following parameters: flow, pH, temperature, cyanide, total Kjeldahl nitrogen, total organic carbon, total petroleum hydrocarbons, total recoverable silver, total recoverable aluminum, total recoverable arsenic, total recoverable cadmium, total recoverable chromium, total recoverable copper, total recoverable iron, total recoverable mercury, total recoverable lead, total recoverable selenium, total recoverable zinc, total suspended solids, dissolved copper, and dissolved zinc. In addition, wastewater process discharge samples may be analyzed for the following parameters: total phosphorus, hardness, ammonia-N, total residual chlorine, and effluent toxicity testing.

In accordance with Part I, Section D.1.e of VPDES Permit Number VA0004421 (page 44 of 89), when a facility has two or more outfalls that discharge substantially identical effluents, based on similarities of the industrial activities, significant materials, size of drainage areas, and stormwater management practices occurring within the drainage areas of the outfalls, the effluent of one such

outfall grouping may be tested as a representative outfall. The Navy has developed a representative outfall determination that has been approved by Virginia DEQ. This outfall grouping and explanation is located in **Appendix B.2** and the outfall associated with NSA-HR are highlighted in yellow. Historical and current monitoring records for these grouped outfalls are maintained by PWD NSN Environmental.

Appendix U lists the activity associated with each outfall, monitoring requirements, and the sampling frequency set by the permit.

Significant Leaks and Spills

In accordance with VPDES Permit Number VA0004421, Part I, Section D.2.b (4) (page 53 of 89), the SWPPP must identify areas where potential spills and leaks that may contribute pollutants to stormwater discharges can occur and their corresponding outfalls. The plan shall include a list of significant spills and leaks of toxic or hazardous pollutants that actually occurred at exposed areas or drained to a stormwater conveyance within the last three years. The list shall be updated if significant spills or leaks occur in exposed areas of the facility during the term of the permit. Significant spills and leaks include releases of oil or hazardous substances in excess of reportable quantities. As facility policy, releases of oil or hazardous substances that are not in excess of reporting requirements are reported internally to the NSA-HR Environmental Public Works Department.

Potential spills and leaks that may occur at NSA-HR include fuel, oil, paint, antifreeze, sewage, or other chemical spills related to liquid transfer operations, or material handling operations. A separate comprehensive program, which includes training and reporting, has been established to help mitigate and correct direct discharges. The United States Navy (USN) has implemented a policy that all spills and accidental releases must be reported internally. PWD NSA HAMPTON ROADS Environmental enters all spill events in an electronic regional spill log, tabbed out by installation, that documents all spill events in reverse chronological order, dating back to January 2008. The date, location, and description of each spill or leak are documented. These detailed spill reports provide environmental managers with useful information concerning sites where repetitive incidents occur so that these can be investigated and eliminated.

Appendix V presents a tabulated list of spill inventory data at NSA-HR. It should be noted that NSA-HR also documents all spills and leaks in accordance with the Spill Prevention, Control, and Countermeasure (SPCC) regulations, and not all of the identified/documented spills and leaks may have occurred at exposed areas or drained to potential stormwater conveyances.

Identification of Non-Stormwater Discharges

Allowable Non-Stormwater Discharges

Non-stormwater discharges are not authorized unless specifically permitted under Part I, Section D.1.g (page 47 of 89) of VPDES Permit Number VA0004421. Only specified non-stormwater discharges are authorized by the permit if they are identified within the SWPPP, the location of the discharge is identified, and appropriate BMPs are in place for each source. The following non-stormwater discharges are explicitly identified within the permit:

- Discharges from firefighting activities

- Fire hydrant flushing
- Potable water including water line flushing
- Uncontaminated air conditioning or compressor condensate
- Irrigation drainage
- Landscape watering provided all pesticides, herbicides, and fertilizer have been applied in accordance with manufacturer's instructions
- Pavement wash waters where no detergents are used and no spills or leaks of toxic or hazardous materials have occurred (unless all spilled material has been removed)
- Routine external building wash down which does not use detergents
- Uncontaminated ground water or spring water
- Foundation or footing drains where flows are not contaminated with process materials
- Incidental windblown mist from cooling towers that collects on rooftops or adjacent portions of the facility, but NOT intentional discharges from the cooling tower (e.g., "piped" cooling tower blowdown or drains). If cooling tower windblown mist is included as one of the allowable non-stormwater discharges from the facility, the discharge must be evaluated for the presence of chemicals used in the cooling tower and included in the SWPPP. An inventory of cooling towers including related discharges and chemicals is identified in the CTBI report presented under a separate cover.
- Discharges from swimming pools in accordance with the provisions identified in Part 1, Section D.1.g (1)(l) (page 47 of 89) of VPDES Permit Number VA0004421

A summary of allowable non-stormwater discharges, including whether they are present at NSA-HR, pollution potential, location, and applicable BMPs is presented in **Table 3-1**.

Table 3-1
Summary of Allowable Non-Stormwater Discharges

Type of Discharge	Present at NSA-HR	Pollution Potential	Location	Appropriate BMPs
Discharges from firefighting activities	Yes	Low	Throughout	Firefighting activities should be performed in a manner to minimize discharge to the stormwater system, if possible. BMPs during an emergency may include: avoid directing firefighting effluents to erodible surfaces, if possible, avoid directing runoff to the stormwater system, if possible, apply fire-fighting flows so that runoff will flow over vegetated areas, and using drain blockers or inlet covers where applicable. Additional controls may be necessary in the event of a hazardous material release. Non-emergency, training, and simulated activities shall be conducted only in approved locations with appropriate runoff controls, if possible.
Fire hydrant flushing	Yes	Low	242 fire hydrant locations identified in the SWPPP Mapbook	Fire hydrant flushing activities are documented by NAVFAC Utilities as part of an active preventive maintenance program
Potable water including water line flushing	Yes	Low	Throughout (24 loops on base)	Water line flushing is documented by PWC
Uncontaminated air conditioning or compressor condensate	Yes	Low	Throughout	None
Irrigation drainage	No	N/A	N/A	N/A
Landscape watering provided all pesticides, herbicides, and fertilizer have been applied in accordance with manufacturer's instructions	Yes	Low	Throughout	NSA-HR has a Pesticide Discharge Management Plan (PDMP) which identifies the relevant BMPs for these activities
Pavement wash waters where no detergents are used and no spills or leaks of toxic or hazardous materials have occurred (unless all spilled material has been removed)	Yes	Low	Throughout	Procedures are in place to prohibit the use of detergents and all spills or leaks of toxic/hazardous materials are cleaned up

Table 3-1 Summary of Allowable Non-Stormwater Discharges				
Type of Discharge	**Present at NSA-HR**	**Pollution Potential**	**Location**	**Appropriate BMPs**
Routine external building wash down which does not use detergents	Yes	Low	Throughout	Procedures are in place to prohibit the use of detergents
Uncontaminated ground water or spring water	No	N/A	N/A	N/A
Foundation or footing drains where flows are not contaminated with process materials	Yes	Low	Throughout	None
Incidental windblown mist from cooling towers that collects on rooftops or adjacent portions of the facility	Yes	Low	Throughout	Cooling towers are monitored to assess pollution potential and an annual inventory of cooling towers is performed
Discharges from swimming pools	No	N/A	N/A	N/A

Illicit Discharge Survey

Field investigations began in June 1997 to establish a baseline of non-stormwater discharge locations into the storm drainage system. Full facility Illicit Discharge Surveys (IDSs) are conducted at least once per each permit cycle. The last IDS was conducted in December 2014. As a part of an IDS, all outfalls, catch basins, drop inlets, and other stormwater infrastructure are observed during a period of dry weather for flows. In addition, buildings are also observed to identify potential illicit discharge points to the storm drainage system. **Appendix C** contains an inventory of dry weather flow observations from the previous IDSs.

Non-stormwater or illicit discharges are flows into the storm sewer system that are not related to runoff from rainfall or snowmelt. Examples of non-stormwater discharges include cross connections with the sanitary sewer, fuel spills, contaminated groundwater infiltration, and dumping of hazardous materials. Non-stormwater discharges are not authorized unless explicitly identified in Part I, Section D.1.g (page 47 of 89) of VPDES Permit Number VA0004421.

Cooling Towers and Boilers

Cooling towers are a stormwater concern when chemical additives, such as micro-biocides and pH balancers are used for regular operations and maintenance activities. Cooling towers and boilers have the potential to repeatedly discharge wastewaters when they are in operation. Accordingly, VPDES Permit Number VA0004421, Part I, Section B.6 (page 32 of 89) has provisions for all non-contact cooling water units, boiler systems, or heating, ventilation, and air conditioning (HVAC) systems that use chemical additives, other than those on file with Virginia DEQ, to identify the chemical additives and schedule of usage.

In addition to identification of the chemicals and schedule of usage, there are provisions for characterization of the wastewater discharge identified within VPDES Number VA0004421, Part I, Section B.6.d (page 33 of 89). A representative grab sample of the wastewater shall be collected to adequately characterize the wastewater from select units with a conveyance to

surface waters. This wastewater characterization is conducted annually as required by permit, presented under a separate cover, submitted to the Virginia DEQ Tidewater Regional Office, maintained on file at the NAVFAC Mid-Atlantic Environmental Office, and included in **Appendix T** of this report.

NSA-HR conducts an annual evaluation of cooling towers and boilers. Field investigations include visual inspections of the cooling towers and boilers to determine ultimate discharge disposition and potential conveyances to the stormwater system. The 2019 CTBI identified 14 cooling towers, with two identified as draining to the storm system. The 2019 CTBI identified 88 boiler units, 87 noted as in-service and three noted as out-of-service with 11 identified as draining to the storm system. A summary of the chemicals used on the cooling tower and boiler units is presented as an appendix to the CTBI Report. The CTBI Report is presented under a separate cover and annual reports are submitted to the Virginia DEQ Tidewater Regional Office and maintained on file at the NAVFAC Mid-Atlantic Environmental Office.

PAGE INTENTIONALLY LEFT BLANK

4. NSA-HR Stormwater Conditions and Controls

Regardless of the activity-specific measures and controls, all sectors include existing structural and nonstructural BMPs to ensure the protection of NSA-HR waters from adverse water quality impacts resulting from chemical spills and/or contaminated stormwater runoff. Site-specific management practices may be recommended for locations requiring additional control measures, and are identified in the SCE report provided under separate cover. The following sections present a general description of existing structural and nonstructural BMPs at NSA-HR. In addition, this section presents sector-specific recommendations based on the VPDES permit.

Existing Structural BMPs

Current existing and recommended structural BMPs are identified within the NSA-HR SCE. **Appendix X** describes particular structural BMPs recommended for implementation. The following are structural BMPs that may be implemented at NSA-HR:

- Secondary containment is used to minimize stormwater contamination for ASTs and other bulk material storage.
- Roofing structures are used to reduce exposure of materials. Storing materials under or within roofed structures reduces the potential for stormwater contamination via runoff. In addition, these structures can reduce storage drum corrosion and ultraviolet deterioration of plastic containment and storage structures.
- Riprap is used to minimize erosion where there is potential for rapid flow in drainage systems.
- OWSs are used to prevent petroleum-type, phase-separated pollutant discharges to the sanitary and storm sewer systems. An inventory of the OWSs is listed in **Appendix W,** including outfall, location/building number, device number, map page number, process being used, and to where the OWS discharges.
- Spill control valves are used to control stormwater releases and prevent potential discharge of pollutants. These valves are primarily located at containment berms and fuel transfer areas.
- Modular storage buildings, conex boxes, and hazardous materials lockers are structures that provide cover and containment for materials, minimizing exposure of stormwater to the materials stored. They also reduce the rate of drum and package deterioration, thus decreasing the potential for spills and leaks to the environment.
- “No Dumping” placards have been installed on storm drains throughout NSA-HR.
- Roof runoff treatment barrels function to remove heavy metal pollutants. This site-specific technology reduces potential copper and zinc concentrations in stormwater discharge.

Existing Nonstructural BMPs

The existing environmental management plans establish a coordinated program of non-structural control measures for the management of hazardous materials/hazardous waste/POLs and other

materials exposed to stormwater, operation and maintenance of pollution abatement equipment, and spill response cleanup. **Appendix Y** describes the non-structural BMPs recommended for implementation and include the associated outfall, location/building number, map page number, associated industrial activity, current compliance, and a list of recommendations.

Baseline Best Management Practices

In addition to structural and nonstructural BMPs, NSA-HR implements the following baseline BMPs as identified in Part I, Section D.2.b.6 (b) of VPDES Permit Number VA0004421 (page 54 of 89), as applicable.

- Good housekeeping measures require maintaining areas that may contribute pollutants to stormwater discharges by making sure they stay in a clean and orderly state. Particular attention is paid to areas with raw material stockpiles, material handling areas, storage areas, liquid storage tanks, and loading/unloading areas.
- Eliminating and minimizing exposure, as practicable, ensures industrial materials and activities are located inside or protected by a storm-resistant covering to prevent exposure to runoff.
- The preventative maintenance program involves inspection and maintenance of stormwater management devices. The NSA-HR EPS inspects and tests the facility equipment and systems to uncover any conditions that could cause breakdowns or failures that result in discharges of pollutants to surface waters.
- Spill Prevention and Response Procedures, upon detection of a spill at NSA-HR, procedures for reporting and cleanup of fuel and oil spills are located in the NSA-HR Spill Reporting and Documentation SOP. Immediate notification must be sent to the Emergency Communications Center (ECC) at (757) 444-3333. The appropriate stakeholders are then notified of the spill situation and they provide direction of the oil recovery cleanup services depending on the extent of impact.
- Routine facility inspections ensure that elements of the SWPPP are operating as planned. NSA-HR EPSs are tasked with routine inspections of industrial facilities with at least one inspection conducted during a period when stormwater discharge is occurring. In addition, some facilities may have to be inspected more frequently in accordance with the permit requirements. Tenants may perform these more frequent routine facility inspections. All inspections are maintained in the facility's online Environmental Management System (EMS) with a records of inspection maintained within three-ring binders. All deficiencies found during routine inspections should be corrected within 30 days unless written permission has been authorized by the Virginia DEQ. **Appendix Z** contains the list of buildings that require routine inspections to include the building number, associated outfall, map page number, and industry activity at the site.
- Employee training for stormwater pollution prevention is provided through the web-based training system, Environmental Compliance Assessment Training and Tracking System (ECATTS), which addresses the following topics: SWPPP requirements as they relate to individual personnel job functions, BMPs, spill prevention and response procedures for spills, leaks, or breaks in structural control, and proper material/scrap inspection, handling, and storage procedures. Annual stormwater employee training is required for all employees who work in areas where industrial materials or activities are exposed to storm water and for all employees who are responsible for implementing activities identified in

this SWPPP. Training records are administered and maintained by the NSA-HR Public Works Environmental office.

- Sediment and erosion control, no areas at NSA-HR exhibit a high potential for significant erosion due to the very low differences in elevation across the facility. No additional erosion control measures are implemented unless construction/demolition activities are taking place.
- Management of runoff, including stormwater runoff management practices (i.e., permanent structural BMPs) that are typically used to divert, infiltrate, reuse, or otherwise reduce pollutants in stormwater discharges from the site.

Sector-Specific Measures and Controls

The following sections provide the sector-specific measures and controls as presented in VPDES Permit Number VA0004421.

Measures and Controls for Scrap Recycling and Waste Recycling Facilities (Sector N)

Part I, Section D.3 (page 62 of 89) of VPDES Permit Number VA0004421 identifies the permit requirements for stormwater discharges associated with industrial activity for scrap recycling and waste recycling facilities that are engaged in the processing, reclaiming, and wholesale distribution of scrap and waste materials, such as ferrous and nonferrous metals, paper, plastic, cardboard, and glass; activities that are identified as SIC Code 5093; as well as facilities that are engaged in reclaiming and recycling liquid wastes such as used oil, antifreeze, mineral spirits, and industrial solvents.

One site is currently identified as Sector N, SIC 5093 and includes SDA-210.

Site Map

The site mapping, per Part I, Section D.3.e (1) (a) (page 63 of 89), requires the location of the following activities to be identified: scrap and waste material storage, outdoor scrap and waste processing equipment, and containment areas for turnings exposed to cutting fluids. Site mapping is presented in the NSA-HR Mapbook provided under a separate cover. In addition, the NSA-HR Mapbook provides outfall delineation and storm drainage manhole and drop inlet locations. Field investigations are conducted periodically to update existing and identify new locations.

Stormwater Controls

A comprehensive list of the stormwater controls related to scrap and waste recycling facilities at NSA-HR is presented in the following sections. The list includes both structural and non-structural BMPs utilized to prevent the contamination of stormwater from related industrial activities.

Inbound Recyclable and Waste Material Control Program

NSA-HR has an active recycling program the processes various materials including: glass, plastic, cardboard, metals, paper, and other goods.

A recyclable and waste material inspection program is required to minimize the likelihood of receiving materials that may be significant pollutant sources to stormwater discharges. Expectations of the NSA-HR's inbound recyclable and waste material control program include the following BMP options:

- Provide information/education flyers, brochures, and pamphlets to suppliers of scrap and recyclable waste materials on draining and properly disposing of residual fluids prior to delivery to the facility (e.g., from vehicles and equipment engines, radiators, and transmissions, oil-filled transformers, and individual containers or drums), and on removal of mercury switches prior to delivery to the facility
- Establish procedures to minimize the potential of any residual fluids from coming in contact with precipitation/runoff
- Establish procedures for accepting scrap lead-acid batteries, including requirements for handling storage and disposal or recycling of batteries
- Provide training targeted to those personnel engaged in the inspection and acceptance of inbound recyclable materials
- Establish procedures to ensure that liquid waste, including used oil, are stored in materially-compatible and non-leaking containers and are properly disposed or recycled in accordance with RCRA, federal, state, and local requirements

Outdoor Scrap and Waste Material Stockpiles/Storage

Appropriate measures and controls are utilized to minimize contact of stormwater runoff with exposed scrap and waste material stockpiles and storage areas, where practicable, at NSA-HR. These practices also work to minimize the extent of stormwater contamination for these areas:

- Utilize permanent or semi-permanent covers
- Divert run-on and runoff away from storage areas using dikes, berms, containment trenches, culverts, and/or surface grading
- Vegetative swales and strips or sediment traps to facilitate settling or filtering of pollutants
- Media filtration such as catch basin and sand filters
- Silt fencing
- OWSs, sumps, and dry absorbents in stockpile areas that have potential sources of residual fluids (e.g., oil or fuel)

Covered or Indoor Storage of Scrap and Waste Material Stockpiles

The following measures and controls are utilized to minimize residual liquids and accumulated particulate matter, originating from scrap and recyclable waste materials stored indoors or under cover, from coming in to contact with stormwater runoff. BMP options include:

- Provide good housekeeping measures, including the use of dry absorbents or wet vacuum cleanup methods to collect, handle, store, and dispose or recycle residual liquids originating from recyclable containers
- Prohibit the practice of allowing tipping floors or other processing areas from discharging to the stormwater drainage system
- Disconnect or seal off all existing floor drains connected to the stormwater sewer system

Scrap and Recyclable Waste Processing Areas

Measures and controls are provided for areas where scrap and waste processing equipment are located to minimize exposure of precipitation and runoff from the scrap processing equipment. Some scrap and recyclable waste processing equipment, including shredding facilities, generate visible amounts of particulate residue. Good housekeeping and preventative maintenance measures should be implemented to minimize contact of precipitation and runoff with residual fluid and accumulated particulate matter. The following BMP options include:

- Establish a schedule of periodic inspections of equipment for leaks, spills, malfunctioning parts, or worn/corroded equipment
- Implement preventative maintenance to maintain and/or repair processing equipment
- Remove all mercury switches from vehicle hood and trunk lighting units as well as anti-lock brake system units containing mercury switches
- Utilize dry absorbents or other cleanup practices to collect and dispose of or recycle spilled fluid
- Install low-level alarms or similar protection devices on unattended hydraulic reservoirs (over 150-gallon capacity) or provide adequate secondary containment
- Divert run-on and runoff away from scrap processing areas using diversion dikes, berms, culverts, containment trenches, elevated concrete pads, and/or surface grading
- Install OWSs, sumps, or similar devices in scrap processing areas that are potential sources of residual fluids, including grease
- Mount permanent or semi-permanent covers
- Install retention and detention basins or ponds, vegetative swales and strips, or sediment traps to facilitate settling or filtering of pollutants in runoff from scrap processing areas
- Install media filtration such as catch basins or sand filters

Inbound Recyclable Material Control

In accordance with VPDES Permit Number VA0004421, Part I, Section D.3.e (1) (d) i (page 70 of 89), industrial facilities that perform recycling of source-separated materials should provide an inbound materials inspection program to minimize the likelihood of receiving non-recyclable materials that may be a significant source of pollutants in surface runoff. The inspection program should include the following:

- Information and education measures to inform suppliers of recyclable materials about the types of materials that are acceptable and those that are not recyclable
- Description of training measures for drivers responsible for pickup of recyclable materials
- Required rejection of non-recyclable wastes or household hazardous waste at the source
- Procedures for handling and disposing of non-recyclable materials

Outdoor Storage of Source Separated Materials

In accordance with VPDES Permit Number VA0004421, Part I, Section D.3.e (1) (d) ii (page 71 of 89), facilities conducting a related industrial activity must minimize the exposure of recyclable materials to surface runoff and precipitation. This includes good housekeeping measures to

prevent accumulation of particulate matter and fluids in high-traffic areas, as well as the following options:

- Provide totally enclosed drop-off containers for the public
- Install a sump pump with each containment pit and discharge collected fluids to a sanitary sewer
- Provide dikes and curbs for secondary containment
- Divert surface runoff away from outside material storage areas
- Provide covers over containment bins, dumpsters, and roll-off boxes
- Store the equivalent of one day's volume of recyclable materials indoors

Indoor Storage and Material Processing

In accordance with VPDES Permit Number VA0004421, Part I, Section D.3.e (1) (d) iii (page 71 of 89), industrial facilities conducting a related industrial activity must minimize the release of pollutants from indoor storage and processing areas. This is achieved by using the following BMPs:

- Schedule routine good housekeeping measures for all storage and processing areas
- Prohibit the practice of allowing tipping floor wash waters from draining to any portion of the storm sewer system
- Provide employee training on pollution prevention practices through ECATTS online training program

Vehicle and Equipment Maintenance

In accordance with VPDES Permit Number VA0004421, Part I, Section D.3.e (1) (d) iv (page 72 of 89), industrial facilities must provide BMPs for all outside areas where vehicle and equipment maintenance is performed relating to source separated recycling. These BMPs include the following options:

- Prohibit vehicle and equipment wash water from discharging to the storm sewer system
- Minimize or eliminate outdoor maintenance areas wherever possible
- Establish spill prevention and cleanup procedures in fueling areas
- Avoid topping off fuel tanks
- Divert runoff from fueling areas
- Store lubricants and hydraulic fluids indoors
- Provide employee training on proper handling and storage of hydraulic fluids and lubricants through the ECATTS online training program

Measures and Controls for Various Transportation and Warehousing Facilities (Sector P)

Part I, Section D.4 (page 72 of 89) of VPDES Permit Number VA0004421 identifies the permit requirements for stormwater discharges associated with industrial activity from facilities that are

engaged in land transportation and warehousing activities. The requirements listed under this section apply to stormwater discharges from the facilities on NSA-HR identified by SIC Codes 40, 41, 42, 43, and 5171, and having vehicle and equipment maintenance shops and/or equipment cleaning operations. Also covered under this section are facilities found under SIC Codes 4221 through 4225 that do not have vehicle and equipment maintenance shops and/or equipment cleaning operations, but have areas where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to stormwater.

The discharge of vehicle and equipment wash waters, including tank cleaning operations, is not authorized by VPDES Permit Number VA0004421. Such discharges are discharged to the sanitary sewer system in accordance with the Hampton Roads Sanitation District (HRSD) industrial pretreatment requirements. Vehicle and equipment wash waters not accepted by HRSD are characterized and properly disposed of through the waste program.

A total of three sites are currently identified as Sector P, including the following buildings: SDA-204, SDA-205, and SDA-210.

Site Map

In accordance with VPDES Permit Number VA0004421, Part I, Section D.4.e (1) (a) (page 73 of 89), the site mapping provides a visual indication of fueling stations, vehicle/equipment maintenance and cleaning areas, storage areas for vehicles/equipment with actual or potential fluid leaks, loading/unloading areas, TSD areas, liquid storage tanks, and processing areas. Field investigations are conducted periodically to update existing and identify new locations. Site mapping is presented in the NSA-HR Mapbook provided under a separate cover.

Non-Stormwater Discharges

In accordance with VPDES Permit Number VA0004421, Part I, Section D.4.d (page 73 of 89), NSA-HR has notified HRSD of facilities that discharge vehicle and equipment wash waters to the sanitary sewer system. These facilities are inventoried in the pretreatment device management plan.

Inspection Program

In accordance with VPDES Permit Number VA0004421, Part I, Section D.4.e (2) (b) (page 76 of 89), the facilities covered under this industry are inspected quarterly. Inspections include a review of storage areas for vehicles and equipment awaiting maintenance, fueling areas, vehicle and equipment maintenance areas (both indoors and outdoors), material storage areas, vehicle and equipment cleaning areas, and loading and unloading areas.

Employee Training

In accordance with VPDES Permit Number VA0004421, Part I, Section D.4.e (2) (c) (page 76 of 89), employee training is provided by annual use of the web-based ECATTS training system and addresses the following topics:

- Used oils
- Spent solvent management

- Fueling procedures
- Good housekeeping practices
- Proper painting procedures
- Used battery management

Stormwater Controls

A comprehensive list of the stormwater controls related to motor vehicle and rail transportation services at NSA-HR is presented. In accordance with VPDES Permit Number VA0004421, Part I, Section D.4.e (1) (b) (page 73 of 89), the potential pollutant sources that may contribute to the contamination of stormwater discharges may include bulk petroleum storage, vehicle and equipment maintenance, vehicle and equipment washing, hazardous waste storage, outdoor material storage, dirt/gravel parking areas for vehicles awaiting maintenance, and fueling areas.

Good Housekeeping: Vehicle and Equipment Storage Areas

- Confine storage of vehicles and equipment awaiting maintenance to designated areas
- Store vehicles and equipment indoors where practicable
- Utilize drip pans, berms, dikes, absorbent materials, roofs, or covered storage areas to minimize contamination of the stormwater runoff from these areas
- Clean pavement surface to remove oil and grease

Good Housekeeping: Fueling Areas

- Provide cover over the fueling area
- Utilize spill and overflow protection and cleanup equipment
- Minimize run-on/runoff of stormwater to the fueling area
- Utilize dry cleanup methods
- Treat and/or recycle collected stormwater runoff where practicable

Good Housekeeping: Material Storage Areas

- Storage vessels must be maintained in good condition with proper labeling
- Provide indoor storage for materials where practicable
- Install berms or dikes to minimize run-on/runoff of stormwater to these areas
- Use dry cleanup methods
- Treat and/or recycle collected stormwater runoff where practicable

Good Housekeeping: Vehicle and Equipment Cleaning Areas

- Perform cleaning operations indoors were practicable
- Provide cover over the cleaning operation
- Ensure all wash waters drain to the appropriate collection system

- Treat and/or recycle the collected stormwater runoff were practicable

Good Housekeeping: Vehicle and Equipment Maintenance Areas

- Perform maintenance activities indoors were practicable
- Utilize drip pans under vehicles
- Maintain an organized inventory of materials used in the shop
- Thoroughly drain all parts of fluids prior to disposal
- Prohibit wet cleanup practices that would result in the discharge of pollutants to the stormwater drainage system
- Utilize dry cleanup methods
- Treat and/or recycle the collected stormwater runoff where practicable
- Minimize the run-on/runoff of stormwater to the maintenance areas

Appendix R
Chemical Application Areas

This page intentionally left blank.

APPENDIX R

CHEMICAL APPLICATION AREAS

Chemical	Area of Application	Purpose	Application Rates	Comments
Lesco 2-4-D	Parking Lots	Herbicide	1 lb. per 1,000 S.F.	As needed for weed control.
Turflon	Fence Lines	Herbicide	2 pints per 1,000 S.F.	As needed for weed control.
Roundup (Gyphosate)	Parking Lots	Herbicide	2½ oz. per 1 gallon of water per 1,000 S.F.	As needed for weed control.
Simizine	Lawns Throughout NSA Hampton Roads	Herbicide	Under investigation	As needed for weed control.
Bromacil	Various	Herbicide	Under investigation	As needed for weed control.
Pramitol 25E	Storage Areas	Herbicide	2 pints per 1,000 S.F.	As needed for weed control.
Lime Pelletized	Lawns Throughout NSA Hampton Roads	Fertilizer	8 lbs. per 1,000 S.F.	As needed for lawn repair.
Trimec Classic	Lawns Throughout NSA Hampton Roads	Herbicide	2½ pints per 1,000 S.F.	As needed for weed control.
Trimec Plus	Golf Course	Herbicide	3 oz. per 1 gallon of water per 1,000 S.F.	As needed for broadleaf and grass control.
Country Club	Lawns Throughout NSA Hampton Roads	Fertilizer & Herbicide	1 lb. per 12,000 S.F.	Applied 2 times a year.
Elanco Surflan	Ornamental Beds	Herbicide	3 oz. per 1,000 S.F.	As needed for weed control.
Insecticide VII	Golf Course	Pesticide	Under investigation	As needed for grub control.
Fly Tec Bait	Outside Galley and Dumpsters	Pesticide	3 ounces per area	As needed for fly control.
Gopha-Rid	Ammunition Bunkers	Rodenticide	0.5 ounces per burrow	As needed for gopher control.
Karmel (Karmex)	Fence Lines	Herbicide	8 lbs. per acre	Applied twice a year.
Malathion 57%	Ornamental Plants	Insecticide	1/10% mixture	Applied 6 to 8 times a year.
Ornamec	Ornamental Plants	Herbicide	1% mixture	As needed for weed control.
Orthene Ornamental	Ornamental Plants	Insecticide	1/2% mixture	As needed for insect control.
Permanone	Throughout NSA Hampton Roads	Insecticide	3/4 ounces per minute	As needed for mosquito control.
Purge Jet Freeze	Throughout NSA Hampton Roads	Insecticide	4 ounces per nest	As needed for wasp and hornet control.
Monsanto Round-Up	Parking Lots	Herbicide	1/2% mixture	As needed for weed control.
Snail and Slug Bait	Throughout NSA Hampton Roads	Pesticide	1/2 lb per year	As needed for snail and slug control.
Spike Treflan	Electrical Substations	Herbicide	100 lbs per acre	Applied twice a year.
Surflan	Ornamental Beds	Herbicide	1% mixture	As needed for weed control.
Vectobac G	Marsh Areas and Golf Course	Insecticide	2,000 lbs per year	As needed for mosquito larva control.
Weedar 64	Fence Lines and Parking Lots	Herbicide	1/2% mixture	As needed for weed control.
Scotts Fertilizer 32	Lawns Throughout NSA Hampton Roads	Fertilizer	51.88 lbs per 12,000 S.F.	As needed for fertilization during March, May, August, and November.
Scotts Fertilizer 18	Lawns Throughout NSA Hampton Roads	Fertilizer	50 lbs per 12,000 S.F.	As needed for fertilization during March, May, August, and November.

APPENDIX R

CHEMICAL APPLICATION AREAS

Chemical	Area of Application	Purpose	Application Rates	Comments
Devrinol 50-WP	Lawns Throughout NSA Hampton Roads	Herbicide	2-4 lbs per acre	As needed for weed control.
Gallery 75	Lawns Throughout NSA Hampton Roads	Herbicide	1/2 oz per 1,000 S.F.	As needed for weed control.
LESCO 2 4 D	Parking Lots	Herbicide	1 lb per 1,000 S.F.	As needed for weed control.
Turflon	Fence Lines	Herbicide	2 pints per 1,000 S.F.	As needed for weed control.

Expiration Date: May 03, 2016

AUTHORIZATION TO DISCHARGE UNDER THE

VIRGINIA POLLUTANT DISCHARGE ELIMINATION SYSTEM

AND

THE VIRGINIA STATE WATER CONTROL LAW

In compliance with the provisions of the Clean Water Act as amended and pursuant to the State Water Control Law and regulations adopted pursuant thereto, the following owner is authorized to discharge in accordance with the information submitted with the permit application, and with this cover page, and Parts I and II of this permit, as set forth herein.

Owner: Department of the U.S. Navy
Commander, Naval Region Mid-Atlantic

Facility Name: US - Naval Station Norfolk
City: Norfolk
County: N/A
Facility Location: 9900 Hampton Blvd at Gate 2
Norfolk, Virginia 23511-2737

The owner is authorized to discharge to the following receiving stream:

Stream: SEE ATTACHMENT I

River Basin:

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall: 001 and 01A (once-through non-contact cooling water discharge, U.S. Navy's Lambert's Point Deperming Station; SIC Code 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS				MONITORING REQUIREMENTS [a]	
	Monthly Average	Weekly Average	Minimum	Maximum	Frequency	Sample Type
Flow (MGD)	NA	NA	NA	NL	1/Year	Estimate
pH (S.U.)	NA	NA	6.0	9.0	1/Year	Grab
Temperature (°C)	NA	NA	NA	NL	1/Year	I.S.
Total Recoverable Copper (ug/l) [a]	NA	NA	NA	NL	1/Year	Grab
Total Recoverable Zinc (ug/l) [a]	NA	NA	NA	NL	1/Year	Grab

NA = Not Applicable.

NL = No limitation, however, reporting is required.

I.S. = Immersion Stabilization

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfalls: 002, 004, 006-010, 012, 013, 015, 018-021, 025-028, 030, 032, 035-038, 040-053, 056, 057, 060, 062-065, 070-072, 077, 079, 080, 081, 087, 101, 102, 118, 119, 121, 122, 124-131, 134, 136-138, 140-143, 145-147, 151-158, 200-204, 300-328, 330, 337, 340-342, 346-355, 409, 414-416, 600-604, 606-610, and 612-617 (storm water runoff not associated with regulated industrial activities; storm water runoff from a small municipal separate storm sewer system [MS4] as defined by the U.S. Environmental Protection Agency [40CFR122.32]; outfalls 134, 610 and 613 with active HVAC discharges; outfalls 326, and 614 with vehicle washrack discharges; SIC code 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

THESE OUTFALLS SHALL CONTAIN STORM WATER RUNOFF NOT ASSOCIATED WITH A REGULATED INDUSTRIAL ACTIVITY AND WHERE NO CHEMICAL OR VISUAL MONITORING OF STORM WATER RUNOFF ARE REQUIRED.

THIS DESIGNATION DOES NOT RELEIVE THE PERMITTEE FROM THE RESPONSIBILITY OF FILING FOR, OBTAINING, AND COMPLYING WITH THE TERMS AND CONDITIONS OF ANY PERMIT OR ALLOWANCES AFFORDED UNDER THE SMALL MS4 PERMIT REQUIRED BY 40 CFR 122.32 THAT HAS BEEN, OR MAY BE, ISSUED TO THIS FACILITY.

OTHER THAN DE-MINIMUS QUANTITIES OF STEAM CONDENSATE AND KNOWN DISCHARGES OF WASTEWATERS FROM PROPERLY OPERATED AND MAINTAINED HEATING, VENTILATION, AND AIR CONDITIONING (HVAC) SYSTEMS, THERE SHALL BE NO DISCHARGE(S) OF PROCESS WASTEWATER(S), INCLUDING WASTEWATERS FROM VESSEL, VEHICLE, EQUIPMENT, AND AIRCRAFT MAINTENANCE ACTIVITIES, FROM THESE OUTFALLS.

FOR CERTAIN OUTFALLS NOTED ABOVE THAT CONVEY EQUIPMENT COOLING WASTEWATER DISCHARGES ASSOCIATED WITH ACTIVE AND OPERATING HVAC SYSTEMS, SEPARATE WASTEWATER MONITORING AND REPORTING REQUIREMENTS AND CONDITIONS MAY BE REQUIRED ELSEWHERE IN THIS PERMIT.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 003 (storm water runoff from multiple regulated industrial activities; active HVAC discharge; SIC codes 4225, 4449, 5171, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab
Total Recoverable Aluminum (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Iron (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Zinc (ug/l) [c]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 005, 017, 031, 033, 076, 089, 091, 103, 104, 113, 139, 205, 206, 208, and 400 (storm water runoff from regulated industrial activities; general warehousing and storage; outfalls 031 and 113 with active HVAC discharges; outfall 400 with vehicle washrack; outfall 112 with aircraft washrack; SIC codes 4222, 4225, 4226, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. See Parts I.D.1.e. and I.D.1.f.(4) for additional information and allowances regarding substantially identical effluents. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 011, 014, 022, 105, and 110 (storm water runoff from regulated industrial activities; boat building and repairing; SIC codes 3732, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Copper (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Zinc (ug/l) [c]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. See Parts I.D.1.e. and I.D.1.f.(4) for additional information and allowances regarding substantially identical effluents. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 016, 023, 039, 083 and 112 (storm water runoff from multiple regulated industrial activities; outfall 016 with active HVAC discharge; SIC codes 3731, 3732, 4225, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. See Parts I.D.1.e. and I.D.1.f.(4) for additional information and allowances regarding substantially identical effluents. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 024 (storm water runoff from multiple regulated industrial activities; bermed petroleum storage [402]; SIC codes 4961, 5171, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 029 and 207 (storm water runoff from multiple regulated industrial activities; outfall 029 with active HVAC discharges; SIC codes 4225, 5093, 7699, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l) [c] [d]	NA	NL	1/Year	Grab
Total Recoverable Aluminum (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Cadmium (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Chromium (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Copper (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Iron (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Lead (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Zinc (ug/l) [c]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. See Parts I.D.1.e. and I.D.1.f.(4) for additional information and allowances regarding substantially identical effluents. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 029 and 207 (storm water runoff from multiple regulated industrial activities; outfall 029 with active HVAC discharges; SIC codes 4225, 5093, 7699, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 034 (storm water runoff from multiple regulated industrial activities; vehicle washrack discharges; SIC codes 4225, 5171, 7699, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 054 (storm water runoff from regulated industrial activity; Q-72 Wharf Builder's Barge Repair Center; SIC codes 3732, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/3 Months	Estimate
pH - Precipitation Event (S.U.)	6.0	9.0	1/3 Months	Grab
Total Suspended Solids (mg/l) [b]	NA	60	1/3 Months	Grab
Dissolved Copper (ug/l) [b]	NA	NL	1/3 Months	Grab
Dissolved Zinc (ug/l) [b]	NA	NL	1/3 Months	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/3 Months = In accordance with the following schedule: 1st quarter (January 1 - March 31); 2nd quarter (April 1 - June 30); 3rd quarter (July 1 - September 30); 4th quarter (October 1 - December 31).

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 055 (storm water runoff from multiple regulated industrial activities; SIC codes 3731, 3732, 5093 as oil recovery, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab
Total Recoverable Copper (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Zinc (ug/l) [c]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required; NA = Not Applicable
1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 058 and 094 (storm water runoff from multiple regulated industrial activities; outfall 058 with active HVAC and equipment and heavy vehicle washrack discharges; SIC codes 4225, 4499, 7699, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab
Total Recoverable Aluminum (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Iron (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Zinc (ug/l) [c]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. See Parts I.D.1.e. and I.D.1.f.(4) for additional information and allowances regarding substantially identical effluents. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 059, 605, and 611 (storm water runoff from regulated industrial activities; repair shops and related services, not elsewhere classified; outfalls 605 and 611 with vehicle washrack discharges; SIC codes 7699, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

THESE OUTFALLS SHALL CONTAIN ONLY STORM WATER RUNOFF ASSOCIATED WITH A REGULATED INDUSTRIAL ACTIVITY WHERE NO CHEMICAL MONITORING IS REQUIRED. THERE SHALL BE NO DISCHARGE OF PROCESS WASTEWATER FROM THESE OUTFALLS.

SEE PART I.D. FOR STORM WATER MANAGEMENT REQUIREMENTS THAT MAY APPLY TO THESE DISCHARGES FROM A REGULATED INDUSTRIAL ACTIVITY. QUARTERLY VISUAL MONITORING WILL BE REQUIRED OF THIS GROUPING OF OUTFALLS CONSISTENT WITH THE REQUIREMENTS OF PART I.D.1.f.(1). SEE PART I.D.1.f.(4) FOR ADDITIONAL INFORMATION AND ALLOWANCES REGARDING SUBSTANTIALLY IDENTICAL EFFLUENTS. STORM WATER SAMPLING FOR THESE OUTFALLS SHALL NOT BE SUBJECT TO THE SPRCIFIED STORM EVENT MONITORING REQUIREMENTS (72 HOURS SEPARATION; STORM EVENT DURATION; RAINFALL MEASUREMENTS. ALL OTHER REQUIREMENTS SPECIFIED UNDER PART I.D.2. SHALL APPLY.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 061 and 074 (storm water runoff from regulated industrial activities; marina operations; SIC codes 4493, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Aluminum (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Iron (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Zinc (ug/l) [c]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. See Parts I.D.1.e. and I.D.1.f.(4) for additional information and allowances regarding substantially identical effluents. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 066 and 067 (storm water runoff from multiple regulated industrial activities; outfall 067 with active HVAC and heavy truck washrack discharges; SIC codes 4961, 5171, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. See Parts I.D.1.e. and I.D.1.f.(4) for additional information and allowances regarding substantially identical effluents. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 068, 069, 073, 082, 100, 116, 117, 120, 132, 133, 144, 329, 331, 343, 344, 345, 418, 425, 426, and 427 (storm water runoff from regulated industrial activities; airports, flying fields without anti-icing/deicing; outfall 069 and 133 with active HVAC discharges; outfalls 120, 132, 133, and 425 with aircraft washrack discharges; SIC codes 4581, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

THESE OUTFALLS SHALL CONTAIN ONLY STORM WATER RUNOFF ASSOCIATED WITH A REGULATED INDUSTRIAL ACTIVITY WHERE NO CHEMICAL OR VISUAL MONITORING ARE REQUIRED. THERE SHALL BE NO DISCHARGE OF PROCESS WASTEWATER FROM THESE OUTFALLS.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 075, 078, and 332 (storm water runoff from multiple regulated industrial activities; outfall 078 with active HVAC discharge; outfalls 075 and 078 with aircraft washrack discharges; SIC codes 4225, 4226, 4581, and 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. See Parts I.D.1.e. and I.D.1.f.(4) for additional information and allowances regarding substantially identical effluents. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 114 (storm water runoff from multiple regulated industrial activities; heavy truck washrack discharges; SIC codes 3724, 4225, 4961, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 115 (storm water runoff from multiple regulated industrial activities; active HVAC discharge [Bldg. V-61]; Bousch Creek Culvert; SIC codes 3724, 4225, 4226, 4581, 5171, HZ, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

THIS OUTFALL SHALL CONTAIN STORM WATER RUNOFF ASSOCIATED WITH A REGULATED INDUSTRIAL ACTIVITIES AND WHERE NO CHEMICAL OR VISUAL MONITORING OF STORM WATER RUNOFF ARE REQUIRED.

OTHER THAN DE-MINIMUS QUANTITIES OF STEAM CONDENSATE AND KNOWN DISCHARGES OF WASTEWATERS FROM PROPERLY OPERATED AND MAINTAINED HEATING, VENTILATION, AND AIR CONDITIONING (HVAC) SYSTEMS, THERE SHALL BE NO DISCHARGE(S) OF PROCESS WASTEWATER(S) FROM THESE OUTFALLS.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 123 (storm water runoff from multiple regulated industrial activities; equipment washrack discharge; SIC codes 3724, 4581, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

THIS OUTFALL SHALL CONTAIN ONLY STORM WATER RUNOFF ASSOCIATED WITH A REGULATED INDUSTRIAL ACTIVITY WHERE NO CHEMICAL OR VISUAL MONITORING ARE REQUIRED. THERE SHALL BE NO DISCHARGE OF PROCESS WASTEWATER FROM THIS OUTFALL.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 135, 422, 423, 424 (storm water runoff from multiple regulated industrial activities; outfall 135 with active HVAC discharge and aircraft washrack discharge; SIC codes 3724, 4225, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. See Parts I.D.1.e. and I.D.1.f.(4) for additional information and allowances regarding substantially identical effluents. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 149 (storm water runoff from multiple regulated industrial activities; jet engine test pad; SIC codes 3724, 4225, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/3 Months	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/3 Months	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/3 Months	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	NL	1/3 Months	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/3 Months = In accordance with the following schedule: 1st quarter (January 1 - March 31); 2nd quarter (April 1 - June 30); 3rd quarter (July 1 - September 30); 4th quarter (October 1 - December 31).

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 333 (storm water runoff from regulated industrial activity; airports, flying fields with potential for anti-icing/deicing; SIC codes 4581, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

THIS OUTFALL SHALL CONTAIN ONLY STORM WATER RUNOFF ASSOCIATED WITH A REGULATED INDUSTRIAL ACTIVITY WHERE NO CHEMICAL OR VISUAL MONITORING ARE REQUIRED. THERE SHALL BE NO DISCHARGE OF PROCESS WASTEWATER FROM THIS OUTFALL.

SEE PART I.B.9.d.(4) FOR ADDITIONAL REPORTING REQUIREMENTS FOR THIS OUTFALL.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 334, 335, 336, 338, 339 (storm water runoff from regulated industrial activity; airports, flying fields with potential for anti-icing/deicing activities during winter season; outfall 338 with active HVAC discharge; SIC code 4581, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

THESE OUTFALLS SHALL CONTAIN ONLY STORM WATER RUNOFF ASSOCIATED WITH A REGULATED INDUSTRIAL ACTIVITY WHERE NO CHEMICAL MONITORING IS REQUIRED. THERE SHALL BE NO DISCHARGE OF PROCESS WASTEWATER FROM THESE OUTFALLS.

SEE PART I.B.9.D. OF THIS PERMIT FOR ADITIONAL INFORMATION REGARDING INDUSTRIAL ACTIVITIES AT THESE LOCATIONS.

SEE PART I.D. FOR STORM WATER MANAGEMENT REQUIREMENTS THAT MAY APPLY TO THESE DISCHARGES FROM A REGULATED INDUSTRIAL ACTIVITY. QUARTERLY VISUAL MONITORING WILL BE REQUIRED OF THIS GROUPING OF OUTFALLS CONSISTENT WITH THE REQUIREMENTS OF PART I.D.1.f.(1). SEE PART I.D.1.f.(4) FOR ADDITIONAL INFORMATION AND ALLOWANCES REGARDING SUBSTANTIALLY IDENTICAL EFFLUENTS. STORM WATER SAMPLING FOR THESE OUTFALLS SHALL NOT BE SUBJECT TO THE SPRCIFIED STORM EVENT MONITORING REQUIREMENTS (72 HOURS SEPARATION; STORM EVENT DURATION; RAINFALL MEASUREMENTS). ALL OTHER REQUIREMENTS SPECIFIED UNDER PART I.D.2. SHALL APPLY.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 401, 404, (storm water runoff from regulated industrial activity; petroleum bulk stations and terminals where limitations apply; SIC codes 5171, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow (MGD)	NA	NL	1/Year	Estimate [b]
pH (S.U.)	6.0	9.0	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l [c] [d]	NA	30	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 402, 407, 410, 411, 412, 413, 417, 419, 420 (storm water runoff from regulated industrial activity; petroleum bulk stations and terminals where limitations are not applied; SIC codes 5171, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS	
	Minimum	Maximum	Frequency	Sample Type

THESE OUTFALLS SHALL CONTAIN ONLY STORM WATER RUNOFF ASSOCIATED WITH A REGULATED INDUSTRIAL ACTIVITY WHERE NO CHEMICAL MONITORING IS REQUIRED. THERE SHALL BE NO DISCHARGE OF PROCESS WASTEWATER FROM THESE OUTFALLS.

SEE PART I.D. FOR STORM WATER MANAGEMENT REQUIREMENTS THAT MAY APPLY TO THESE DISCHARGES FROM A REGULATED INDUSTRIAL ACTIVITY. QUARTERLY VISUAL MONITORING WILL BE REQUIRED OF THIS GROUPING OF OUTFALLS CONSISTENT WITH THE REQUIREMENTS OF PART I.D.1.f.(1). SEE PART I.D.1.f.(4) FOR ADDITIONAL INFORMATION AND ALLOWANCES REGARDING SUBSTANTIALLY IDENTICAL EFFLUENTS. STORM WATER SAMPLING FOR THIS OUTFALL SHALL NOT BE SUBJECT TO THE SPRCIFIED STORM EVENT MONITORING REQUIREMENTS (72 HOURS SEPARATION; STORM EVENT DURATION; RAINFALL MEASUREMENTS. ALL OTHER REQUIREMENTS SPECIFIED UNDER PART I.D.2. SHALL APPLY.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 408, and 421 (storm water runoff from multiple regulated industrial activities; outfall 408 with active HVAC and vehicle washrack discharges; SIC codes 4212, 4225, 4226, 7699, HZ, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

EFFLUENT CHARACTERISTICS	DISCHARGE LIMITATIONS		MONITORING REQUIREMENTS [a]	
	Minimum	Maximum	Frequency	Sample Type
Flow - Precipitation Event (MG)	NA	NL	1/Year	Estimate [b]
pH - Precipitation Event (S.U.)	NL	NL	1/Year	Grab
Total Suspended Solids (mg/l) [c]	NA	NL	1/Year	Grab
Total Petroleum Hydrocarbons (mg/l) [c] [d]	NA	NL	1/Year	Grab
Total Organic Carbon (mg/l) [c]	NA	NL	1/Year	Grab
Total Kjeldahl Nitrogen (mg/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Arsenic (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Cadmium (ug/l) [c]	NA	NL	1/Year	Grab
Total Cyanide (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Lead (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Mercury (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Selenium (ug/l) [c]	NA	NL	1/Year	Grab
Total Recoverable Silver (ug/l) [c]	NA	NL	1/Year	Grab

NL = No limit, however, reporting is required
NA = Not Applicable

1/Year = Between January 1 and December 31.

Upon issuance of the permit, Discharge Monitoring Reports (DMRs) shall be submitted to the regional office at the frequency required by the permit regardless of whether an actual discharge occurs. In the event that there is no discharge for the monitoring period, then "no discharge" shall be reported on the DMR.

[a] See Part I.D. for additional storm water sampling and reporting requirements. See Parts I.D.1.e. and I.D.1.f.(4) for additional information and allowances regarding substantially identical effluents. Storm event sampling for this outfall shall not be subject to the specified storm event monitoring requirements (72 hours separation; storm event duration; rainfall measurements). All other requirements specified under Part I.D.2. shall apply.

[b] Estimate of the total volume of the discharge during the storm event.

[c] See Parts I.B.3. and I.B.4. for quantification levels and reporting requirements, respectively.

PART I

A. LIMITATIONS AND MONITORING REQUIREMENTS

1. During the period beginning with the permit's effective date and lasting until the permit's expiration date, the permittee is authorized to discharge from outfall(s): 408, and 421 (storm water runoff from multiple regulated industrial activities; outfall 408 with active HVAC and vehicle washrack discharges; SIC codes 4212, 4225, 4226, 7699, HZ, 9711).

Such discharges shall be limited and monitored by the permittee as specified below:

[d] Total Petroleum Hydrocarbons (TPH) is the sum of individual gasoline range organics (TPH-GRO) and diesel range organics (TPH-DRO) to be measured by EPA SW 846 Method 8015C (2007) for gasoline and diesel range organics, or by EPA SW 846 Methods 8260B (1996) and 8270D (2007). If the combination of Methods 8260B and 8270D is used, the laboratory must report the total of gasoline range organics, diesel range organics, and polynuclear aromatic hydrocarbons.

2. There shall be no discharge of floating solids or visible foam in other than trace amounts.

This report is required by your VPDES permit and by law. (See, e.g., the Code of Virginia of 1950 §62.1-44.5 and 9 VAC 25-31-50.) Failure to report or failure to report truthfully can result in civil penalties of $32,500 per violation, per day and felony prosecutions which can carry a 15 year term.

DISCHARGE MONITORING REPORT (DMR) - GENERAL INSTRUCTIONS

1. Complete this form in permanent ink or indelible pencil. The use of 'correction fluid/tape' is not allowed.
2. Be sure to enter the dates for the first and last day of the period covered by the report on the form in the space marked "Monitoring Period".
3. For those parameters where the "permit requirement" spaces have a requirement or limitation, provide data in the "reported" spaces in accordance with your permit.
4. Enter the average and maximum quantities and units in the "reported" spaces in the columns marked "Quantity or Loading".
   KG/DAY = Concentration (mg/L) x Flow (MGD) x 3.785 G/D (Grams/Day) = Concentration (mg/L) x Flow (MGD) x 3785
5. Enter maximum, minimum, and/or average concentrations and units in the "reported" spaces in the columns marked "Quality or Concentration".
6. For all parameters enter the number of samples which do not comply with the maximum and/or minimum permit requirements in the "reported" space in the column marked "No. Ex." (Number of Exceedances). If none, enter "0". Do NOT include monthly average violations in this field. Include any Maximum 7-Day Average and Maximum Weekly Average violations in this field. Permittees with continuous pH, or temperature monitoring requirements should consult the permit for what constitutes an exceedance and report accordingly.
7. You are required to sample (at a minimum) according to the Sample Frequencies and Sample Types specified in your permit.
8. Enter the actual frequency of analysis for each parameter (number of times per day, week, month, etc.) in the "reported" space in the column marked "Frequency of Analysis".
9. Enter the actual type of sample (Grab, 8HC, 24HC, etc) collected for each parameter in the "reported" space in the column marked "Sample Type".
10. Enter additional required data or comments in the space marked "additional permit requirements or comments". If additional required data or comments are appended to the DMR, reference appended correspondence in this field.
11. Record the number of bypasses during the month, the total flow in million gallons (MG) and BOD5 in kilograms (KG) in the proper columns in the section marked "Bypasses and Overflows".
12. The operator in responsible charge of the facility should review the form and sign in the space provided. If the plant is required to have a licensed operator or if the operator in responsible charge of the facility is a licensed operator, the operator's signature and certificate number must be reported in the spaces provided.
13. The principal executive officer then reviews the form and must sign in the space provided and provide a telephone number where he/she can be reached. Every page of the DMR must have an original signature.
14. Send the completed form(s) with original signatures to your Department of Environmental Quality Regional Office by the 10th of each month unless otherwise specified in the permit.
15. You are required to retain a copy of the report for your records.
16. Where violations of permit requirements are reported, attach a brief explanation in accordance with the permit requirements decribing causes and corrective actions taken. Reference each seperate violation by date.
17. If you have any questions, contact the Department of Environmental Quality Regional Office listed on the DMR.

B. OTHER REQUIREMENTS OR SPECIAL CONDITIONS

1. Permit Reopeners

a. Water Quality Standards Reopener

Should effluent monitoring indicate the need for any water quality based limitation, this permit may be modified or, alternatively, revoked and reissued to incorporate appropriate limitations.

b. Nutrient Enriched Waters Reopener

This permit may be modified or, alternatively, revoked and reissued to include new or alternative nutrient limitations and/or monitoring requirements should the State Water Control Board adopt nutrient standards for the waterbody receiving the discharge or if a future water quality regulation or statute requires new or alternative nutrient control.

c. Total Maximum Daily Load (TMDL) Reopener

This permit shall be modified or, alternatively, revoked and reissued if any approved wasteload allocation procedure, pursuant to Section 303(d) of the Clean Water Act, imposes wasteload allocations, limits or conditions on the facility that are not consistent with the permit requirements.

2. Notification Levels

The permittee shall notify the Department as soon as they know or have reason to believe:

a. That any activity has occurred or will occur which would result in the discharge, on a routine or frequent basis, of any toxic pollutant which is not limited in this permit, if that discharge will exceed the highest of the following notification levels:

(1) One hundred micrograms per liter (100 ug/l);
(2) Two hundred micrograms per liter (200 ug/l) for acrolein and acrylonitrile; five hundred micrograms per liter (500 ug/l) for 2,4-dinitrophenol and for 2-methyl-4,6-dinitrophenol; and one milligram per liter (1 mg/l) for antimony;
(3) Five (5) times the maximum concentration value reported for that pollutant in the permit application; or
(4) The level established by the State Water Control Board.

b. That any activity has occurred or will occur which would result in any discharge, on a non-routine or infrequent basis, of a toxic pollutant which is not limited in this permit, if that discharge will exceed the highest of the following notification levels:

(1) Five hundred micrograms per liter (500 ug/l);
(2) One milligram per liter (1 mg/l) for antimony;
(3) Ten (10) times the maximum concentration value reported for that pollutant in the permit application.
(4) The level established by the State Water Control Board.

3. Quantification Levels Under Part I.A.

a. The maximum quantification levels (QL) shall be as follows:

Effluent Characteristic	Quantification Level
Chlorine	0.1 mg/l
Total Phosphorus	0.1 mg/l
Ammonia-N	0.2 mg/l
Total Kjeldahl Nitrogen	0.5 mg/l
Hardness	1.0 mg/l
Total Suspended Solids	1.0 mg/l
Total Petroleum Hydrocarbons	1.0 mg/l
Aluminum	1.0 mg/l
Iron	1.0 mg/l
Total Organic Carbon	10.0 mg/l
Arsenic	27.6 ug/l
Cadmium	16.0 ug/l
Chromium	50.0 ug/l
Copper	6.5 ug/l
Cyanide	1.0 ug/l
Lead	96.0 ug/l
Mercury	0.7 ug/l
Selenium	120.0 ug/l
Silver	0.8 ug/l
Zinc	36.0 ug/l

b. The permittee may use any approved method which has a QL equal to or lower than the (QL) listed in Part I.B.3.a. above. The QL is defined as the lowest concentration used to calibrate a measurement system in accordance with the procedures published for the method.

4. Compliance Reporting Under Part I.A.

a. Compliance with the daily maximum limitations and/or reporting requirements for the parameters listed in Part I.B.3.a. shall be determined as follows: All data below the quantification level (QL) listed in Part I.B.3.a. above shall be treated as zero. All data equal to or above the QL shall be treated as reported. An arithmetic average of the values shall be calculated using all reported data, including the defined zeros, collected

collected for each day during the reporting month. The maximum value of these daily averages thus determined shall be reported on the DMR as the Daily Maximum. If all data are below the QL, then the average shall be reported as <QL.

b. Any single datum required shall be reported as "<QL" if it is less than the QL listed in Part I.B.3.a. above. Otherwise, the numerical value shall be reported.

c. Where possible, all limit values on the Part I.A. limits page(s) are expressed in two significant figures. As a result, single, trailing zeros occurring after any single digit are significant. Effluent limits of 10 or greater are rounded to two significant whole numbers, with the exception that loading limits are expressed as whole numbers.

d. The permittee shall report at least the same number of significant figures as the permit limit for a given parameter. Regardless of the rounding convention used (i.e., 5 always rounding up or to the nearest even number) by the permittee, the permittee shall use the convention consistently, and shall ensure that consulting laboratories employed by the permittee use the same convention.

5. Materials Handling and Storage

Any and all product, materials, industrial wastes, and/or other wastes resulting from the purchase, sale, mining, extraction, transport, preparation and/or storage of raw or intermediate materials, final product, by-product or wastes, shall be handled, disposed of and/or stored in such a manner so as not to permit a discharge of such product, materials, industrial wastes and/or other wastes to State waters, except as expressly authorized.

6. Non-Contact Cooling Water Systems and Boiler Additives

a. If at any time during the life of this permit, the permittee decides to treat any non-contact cooling water unit(s), boiler system(s), or heating, ventilation, and cooling (HVAC) systems with chemical additives [other than those additives currently in use and on file with the DEQ Tidewater Regional Office], the following requirements shall be satisfied.

At least thirty (30) days prior to implementing any chemical addition to the cooling water and/or boiler equipment, the permittee shall **notify the DEQ Tidewater Regional Office, in writing**, of the following:

(1) The chemical additives to be employed and their purpose. Provide to the staff for review, a Material Safety Data Sheet (MSDS) for each proposed additive;

(2) Schedule of additive usage, including the identification of wastewater treatment and/or retention to be provided during the use of additives.

(3) The permittee shall neither use tributyltin and any chemical additives containing tributyltin, nor use Hexavalent chromium-based water treatment chemicals in the cooling water systems.

b. Should the addition of treatment chemicals significantly alter the characteristics of the effluent from the cooling water and/or boiler unit(s) or their usage becomes persistent or continuous, this permit shall be modified or, alternatively, revoked and reissued to include appropriate limitations or conditions.

c. The permittee shall properly operate and maintain all cooling water systems that are active and discharging a chemically treated wastewater to surface waters. The permittee, or a designated representative, shall inspect cooling towers at least once per year to ensure that they are properly operated and maintained. The results of these annual inspections shall be incorporated into the facility's storm water pollution prevention plan along with information pertaining to the designated outfalls that direct these wastewaters to surface water(s).

d. The permittee shall characterize selected wastewater discharges from HVAC cooling water systems, identified in the table below, during the term of the permit.

(1) The permittee shall obtain a grab sample of the cooling water discharges at a representative point at each building's location in accordance with the schedule in the table below. The sampling of wastewaters shall occur prior to their commingling with storm water runoff or other wastewaters that may be present in associated conveyances leading to surface waters.

CY SCHEDULE	UNIT IDENTIFIER	HVAC DISCHARGE LOCATION	FINAL OUTFALL
CY 2011	C-34	Building SP-250	134
	C-08	Building U-132	408
CY 2012	C-16	Building CEP-200	016
	C-62	Building SC-1	613
CY 2013	C-29	Building Z-133	029
	C-31	Building W-143	031
	C-15	Building V-61	115
CY 2014	C-67	Building N-25A	067
	C-69	Building N-30	069
	C-61	Building NH-95	613
CY 2015	C-58	Building N-25	058
	C-78	Building LF-18	078
	C-13	Building V-53	113

(2) Sampling shall be in accordance with Parts I.B.6.d.(3) and I.B.6.d.(4) below. Attachment A, is the reporting form for submission of the resulting chemical test data. Attachment C shall be used for submission of results from whole effluent toxicity testing. Attachments A and C shall be submitted as discrete content to the annual report required by Part I.B.6.e. of this condition.

(3) Chemical Monitoring

(a) The constituents listed below shall be characterized for each HVAC cooling water unit discharge noted in the table above, for the stipulated monitoring period:

Constituent	Reported as
Flow	MGD
pH	Standard Units
Temperature	Degrees Celsius
Ammonia-Nitrogen	mg/l
Total Residual Chlorine	mg/l
Hardness	mg/l (as CaCO3)
Total Phosphorus	mg/l
Total Recoverable Silver	ug/l
Total Recoverable Copper	ug/l
Total Recoverable Zinc	ug/l
Whole Effluent Toxicity Testing (WET)	LC_{50} / TUa

(b) The permittee may use any approved method which has a QL equal to or lower than the (QL) listed in Part I.B.3.a. of this permit.

(4) Whole Effluent Toxicity Monitoring

Whole effluent toxicity monitoring of the discharges, identified in the table in Part I.B.6.d.(1), shall be performed once per permit term in accordance with the schedule in the table.

(a) Toxicity samples shall be taken at the same time and location as the monitoring required in Part I.B.6.d. Acute toxicity tests shall be conducted with the species Americamysis bahia and Cyprinodon variegatus using 48-hour static acute tests. All toxicity test conditions and reporting requirements under Part I.C. of this permit shall be followed. The permittee shall report the results and supply one complete copy of the toxicity test report with the DMR. A complete report must contain a copy of all laboratory benchsheets, certificates of analysis, all chains of custody, and Attachment C.

CERTIFICATION:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment for knowing violations. See 18 U.S.C. §1001 and 33 U.S.C. §1319. (Penalties under these statutes may include fines up to $10,000 and or maximum imprisonment of between 6 months and 5 years.)

_____

Signature, printed name and title of Principal Officer or Authorized Agent / Date

All data from discharges sampled during the specific calendar year shall be submitted with the annual report required by Part I.B.6.e. of this permit.

(b) If any of the discharges from the cooling water systems are found to be toxic (LC_{50} = 100%, TU_a 1.0), the permittee shall evaluate conditions that may have resulted in this finding and identify the cause(s) of toxicity if able.

e. The permittee shall prepare and submit an annual report addressing all boiler and cooling tower water discharges, and cooling tower blow-down discharges associated with heating, ventilation and air conditioning (HVAC) equipment where the discharges have the reasonable potential to enter surface waters. The report shall provide the following information:

(1) the location(s) and size(s) of all boilers and HVAC equipment with a potential to discharge wastewater to surface waters;

(2) the affected outfall(s) under this permit;

(3) the volume(s) of wastewater(s) discharged during the preceding calendar year;

(4) the volume(s) and type(s) of treatment chemical(s) used and their purpose, the timing of the treatment and the status of the HVAC equipment (active, inactive, installed, removed, planned, etc.);

(5) the report shall provide, as discrete content, the results of wastewater characterization required by Parts I.B.6.d.(3) and (4); and

(6) the report shall also discuss any investigations or actions taken, planned, or scheduled to reclaim HVAC wastewaters in lieu of discharge to surface waters for beneficial reuse including but not limited to landscape irrigation, boiler feed water, equipment/ vehicle/aircraft washwaters, or other similar uses.

First Annual Report Due: **No later than February 10, 2012, and annually thereafter for the term of the permit**

7. Vessels of the Armed Forces - Discharges Allowed by the Uniform National Discharge Standards (UNDS), and Other Requirements

a. Authorized Non-Storm Water Discharges from Vessels

In addition to those point source vessel discharges authorized by the UNDS, the regulation and monitoring of underwater ship husbandry does not need to be included in

this permit. Section 325 of the National Defense Authorization Act for Fiscal Year (FY) 1996 amended Section 312 of the Clean Water Act by adding a section on UNDS for Vessels of the Armed Forces. Phase I of the UNDS rulemaking was completed in FY 1999, with Environmental Protection Agency (USEPA) and the Department of Defense (DoD) jointly identifying 25 specific liquid discharges that require shipboard marine pollution control devices (MPCDS). Phase II of UNDS continues with DoD and the USEPA developing new or enhanced performance standards for all identified UNDS discharges, including underwater ship husbandry, during the term of this permit.

b. Tributyltin (TBT) Exclusion

The removal and/or application (hereafter referred to as use) of hull coatings or other hull features or materials on vessels which contain any amount of the biocide tributyltin or related compounds are prohibited at this permitted facility unless specifically allowed by the UNDS referenced in Part I.B.7.a., above. Should the permittee consider using materials that contain TBT during the term of this permit, the permit must be modified or, alternatively, revoked and reissued to incorporate a numeric limitation which addresses the State's water quality standards for tributyltin, prior to its use.

c. Non-Storm Water Discharges Associated with Vessel Maintenance and Repair Activities

(1) This permit does not authorize any non-storm water discharges from shore-side activities that may be generated at those locations associated with Standard Industrial Classification (SIC) codes 3731, 3732, and SIC Major Group code 44, which result directly from the repair or maintenance of support vessels (e.g., barges, floats, camels, etc.) or other mission essential water craft located at this facility, on a permanent or temporary basis. See Parts I.D.1.i., I.D.5.d, and I.D.5.e.(2)(a)i., for additional information and requirements in this regard.

(2) For the purposes of this permit, non-storm water discharges include process wastewaters associated with vessel repair or maintenance. Process wastewaters related to vessel maintenance or hull work shall be any water used on a vessel's hull for any purpose regardless of application pressure, including but not limited to the activities of removing marine salts, sediments, marine growth and paint, or other hull cleaning activities using water such as preparing hull areas for inspection or work (e.g., cutting, welding, grinding, etc.).

d. When and where it is necessary to rinse Naval Station Norfolk service craft or other mission essential water-borne vehicles/platforms following operational deployment in marine waters, all suitable and appropriate best management practices (BMP) should be employed to reduce, or minimize to the extent practicable, the release of solids, biocides, or other potentially deleterious materials to storm water conveyance systems or surface waters. Management practices to consider include:

(1) limit hull rinsing activities to those hulls and vessel features that are not coated with anti-foulant systems formulated with toxic biocides (tributyltin, cuprous oxide, etc.) and the washing does not disturb or remove biological growth or blistered, poorly adhered hull coatings;

(2) whenever possible, limit hull rinsing activities to locations where a designated wash-rack exists and the discharge of wastewaters at that location are collected for disposal or diverted to the sanitary sewer system, in lieu of direct discharge to surface waters;

(3) in the absence of designated washracks, limit hull rinsing activities to areas with impervious surfaces where runoff of process wastewaters can be confined for collection and approved disposal in lieu of a discharge to surface waters via on-site drainage structures, and;

(4) identify all locations where service craft and other mission essential water-borne vehicles/platforms, not in a repair status, are rinsed in the Storm Water Pollution Prevention Plan (SWPPP), in addition to describing management practices to be imposed and maintained during these activities.

e. Should the permittee consider it necessary to generate a defined process wastewater (Part I.B.7.c.(2)) that will result in a point source discharge to surface waters, this permit must be modified or, alternatively, revoked and reissued to incorporate appropriate effluent limitations, monitoring requirements and necessary permit conditions.

8. Vehicle and Equipment Maintenance

a. This permit does not authorize any discharges of non-storm water discharges that may be generated at those locations associated with Standard Industrial Classification (SIC) codes 40, 41, 42, 43, and 5171 that have vehicle and equipment maintenance shops (vehicle and equipment rehabilitation, mechanical repairs, painting, fueling and lubrication) and/or equipment cleaning operations. See Parts I.D.4. and I.D.4.d. for additional information and requirements in this regard.

b. For the purposes of this permit, non-storm water discharges include process wastewaters associated with vehicle or equipment repair or maintenance. Process wastewaters related to vehicle and equipment maintenance shall be any water used on a vehicle or piece of equipment for any purpose, including but not limited to the removal of dirt and debris, greases, oils, marine salts and paints, or other cleaning activities using water including the wash down of impervious surfaces at the location where vehicle and equipment maintenance are performed.

c. Identify all locations where mobile canteens, heavy trucks and other industrially related heavy equipment are maintained, serviced, and repaired in the Storm Water Pollution Prevention Plan (SWPPP), in addition to describing management practices to be imposed and maintained during these activities. See Part I.D.4. for additional information.

9. Aircraft Maintenance and Cold Weather Activities

a. Non-Storm Water Discharges

For the purpose of this permit, the following discharges are not "authorized" non-storm water discharges under this permit, and if present, may require additional controls, limitations, or prohibitions:

(1) aircraft, ground vehicle, runway and equipment washwaters; and

(2) dry weather discharges of deicing/anti-icing chemicals.

b. Identify all locations where private, contracted, and government owned and operated rotary and fixed wing aircraft, and other airfield support equipment are maintained, serviced, and repaired in the Storm Water Pollution Prevention Plan (SWPPP). In addition, describe management practices, to be imposed and maintained during these activities. See Part I.D.6. for additional information.

c. For all washracks associated with aircraft maintenance, that have a potential to release contaminated runoff to surface waters, the permittee shall develop and maintain current a system of sufficiently detailed log books and records that document the following actions by tenant aircraft-type Commands:

(1) identifies the date and time of aircraft washing;

(2) identifies the date and time of diversion valve positioning/realignment to ensure process wastewaters are routed to the sanitary sewer, the date and time

the valves were restored, and the identity of the tenant activity representative(s) performing these actions;

(3) identifies per location the type of cleaners, soaps, or chemical solutions that may be used during aircraft washing/maintenance;

(4) identifies the date when automatic and manual diversion valves were inspected, calibrated, maintained, and if necessary, repaired and returned to service;

(5) identifies the date when oil/water separators or other treatment equipment associated with aircraft maintenance activities are inspected, maintained, and if necessary, repaired and returned to service; and

(6) identifies the date(s) and time(s) when water program representatives of Norfolk Naval Station have inspected the contents of all washracks logs and records to confirm compliance with this permit condition and the requirements of Parts I.D. and I.D.6. of this permit.

(7) Once developed, these logbooks and records shall be maintained at a central location at each tenant aircraft maintenance activity and must be readily accessible to Naval Station Norfolk environmental staff for inspection, review, and confirmation of compliance with Naval Station Norfolk Instructions, Directives, guidance, and this permit. These logbooks and records shall also be made readily available to Department staff upon request, to confirm compliance with the terms and conditions of this permit.

d. Aircraft Cold Weather Activities - Outfalls 333, 334, 335, 336, 338, and 339

(1) The expected season for anti-icing and deicing activities is during the months of December, January, February and March. For the purpose of this section, the term "deicing" is defined as the process to remove frost, snow, or ice from aircraft surfaces and "anti-icing" is the process that prevents the accumulation of frost, snow, or ice, primarily on surfaces of fixed-wing aircraft.

(2) The permittee shall develop a log-book system that provides the date and beginning and ending times for each anti-icing and deicing event, an estimate of propylene glycol or other chemical solutions applied, the mix-ratio used, and an estimate of spent chemical solutions recovered from impervious surfaces surrounding the application site, or sites. Should recovery of chemical solutions not occur, this must

be noted in the log along with any reasons for not recovering the spent solutions. If spent propylene glycol or other chemical solutions are lost to storm water structures or conveyances for any reason, an estimate of volume lost and actions taken to recover the spent solutions shall also be documented in the log. Once developed and deployed, this log book shall be maintained at a central location and made available to Department staff upon request.

(3) Although the permittee will not be required to collect samples of runoff from these activities during the term of the permit for chemical analyses or whole effluent toxicity testing, a best management practices (BMP) compliance form shall be prepared and submitted for each anti-icing/deicing event performed during the months identified in Part I.B.9.d.(1), above. Attachment B constitutes the BMP compliance reporting form.

(4) The permittee shall prepare and submit an annual report that summarizes the information collected and maintained in paragraph (2) above. This report shall be signed and certified as per Part II.K. of this permit. The annual reports shall contain a completed Attachment B for each anti-icing/deicing event performed during the reporting period. **The first report for the first seasonal period December 2011 and January through March 2012, shall be submitted by not later than April 10, 2012, and annually thereafter for the term of the permit for subsequent reporting periods.**

(3) Should the Department's review of the annual reports determine that treatment chemical recovery rates are insufficient, or if loss of treatment chemicals to the storm water conveyance system(s) is directly associated with documented environmental impacts (discoloration of surface waters, stressed or dead animals or plants, other noticeable effects, etc.), then this permit may be modified or, alternatively, revoked and reissued to incorporate appropriate effluent monitoring requirements at outfalls 333, 334, 335, 336, 338 and 339.

ATTACHMENT B
ANTI-ICING, DEICING SAMPLING EVENT BMP COMPLIANCE REPORT

This form shall be completed for each anti-icing or deicing event during the calendar year (CY) reporting period identified below. A separate sheet shall be prepared for each such event performed during the stipulated reporting period.

C. TOXICS MANAGEMENT PROGRAM (TMP)

1. Biological Monitoring - Outfalls 024, 054, and 091

a. In accordance with the schedule in Part I.C.2. below, the permittee shall conduct annual acute toxicity tests for outfalls 024, 054,and 091 for the duration of the permit. The permittee shall collect a grab sample of final effluent in accordance with the sampling methodology in Parts I.A., I.D.1.a. and I.D.1.b. of this permit. The grab samples for toxicity testing shall be taken at the same time as the monitoring for the outfalls in Part I.A. of this permit. The acute test to use is:

48-Hour Static Acute test using Americamysis bahia

These acute tests shall be performed with a minimum of 5 dilutions, derived geometrically, for the calculation of a valid LC_{50}. Express the results as TU_a (Acute Toxic Units) by dividing 100/ LC_{50} for reporting.

Test procedures and reporting shall be in accordance with the WET testing methods cited in 40 CFR 136.3.

b. The permittee may provide additional samples to address data variability during the period of initial data generation. These data shall be reported and may be included in the evaluation of the effluent toxicity. Test procedures and reporting shall be in accordance with the WET testing methods cited in 40 CFR 136.3.

c. The permittee may show a demonstrated absence of toxicity and request a waiver from sampling requirements for outfall 091 listed above. The following conditions are required to receive a waiver:

(1) A LC_{50} of 100% effluent equivalent to 1.0 TU_a must be met for two consecutive monitoring periods.

(2) Samples must be taken at the same time as the other Part I.A. monitoring for each outfall.

(3) A waiver request is to be submitted to and approved by the appropriate DEQ regional office. The waiver request must include a summary of the data and a certification that, based on current potential pollutant sources and BMPs used, future discharges from the outfall requesting the waiver are reasonable expected to be the same or cleaner for the remaining monitoring periods. The waiver must be signed and certified in accordance with Part II.K. of the permit.

2. Reporting Schedule

The permittee shall report the results and supply one complete copy of the toxicity test reports to the Tidewater Regional Office in accordance with the schedule below. A complete report must contain a copy of all laboratory benchsheets, certificates of analysis, all chains of custody, and Attachment C. All data shall be submitted by the 10th of the month following sampling.

(a)	Conduct first annual TMP test for outfalls 024, 054 and 091 using Americamysis bahia (A.b.)	By December 31, 2012
(b)	Submit results of all biological tests	By the 10th of the month following sampling but no later than January 10, 2013
(c)	Conduct second annual TMP tests for outfalls 024, 054 and 091 using A.b.	By December 31, 2013
(d)	Submit results of the biological test	By the 10th of the month following sampling but no later than January 10, 2014
(e)	Conduct third annual TMP tests for the required outfalls listed above using A.b.	By December 31, 2014
(f)	Submit results of all biological tests	By the 10th of the month following sampling but no later than January 10, 2015
(g)	Conduct fourth annual TMP tests for the required outfalls listed above using A.b.	By December 31, 2015
(h)	Submit results of the biological test	By the 10th of the month following sampling but no later than January 2016

_____

Signature, printed name and title of Principal Officer or Authorized Agent / Date

D. STORM WATER MANAGEMENT CONDITIONS

1. General Storm Water Special Conditions

a. Sample Type

For all storm water monitoring required in Part I.A. or other applicable sections of this permit, a minimum of one grab sample shall be taken. Unless otherwise specified, all such samples shall be collected from the discharge resulting from a storm event that occurs at least 72 hours from the previously measurable storm event (a "measurable storm event" is defined as a storm event that results in an actual discharge from the site). The required 72-hour storm event interval is waived where the permittee documents that less than a 72-hour interval is representative for local storm events during the season when sampling is being conducted. The grab sample shall be taken during the first hour of the discharge. If the collection of a grab sample during the first hour is impracticable, a grab sample can be taken during the first three hours of the discharge, and the permittee shall document with the SWP3 a description of why a grab sample during the first hour was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable, the permittee must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

b. Sampling Methodology for Specific Outfalls

Due to the nature of the effluent discharged at these outfalls (potentially contaminated storm water associated with a regulated industrial activity), the following shall be required when obtaining samples required by Part I.A. of this permit:

(1) At the time of sampling, the permittee shall ensure that the effects of tidal influences are kept to an absolute minimum. This can be achieved by:

(a) Sampling at low tide; and/or

(b) Sampling at a representative point which has been demonstrated to be free of tidal influences

(2) In the event that sampling of an outfall is not possible due to the absence of effluent flow during a particular testing period, the permittee shall provide written notification to the DEQ's Tidewater Regional Office with the DMR for the month following the period in which samples were to be collected.

c. Recording of Results

For each measurement or sample taken pursuant to the storm event monitoring requirements of this permit, the permittee shall record and report with the Discharge Monitoring Reports (DMRs) the following information:

(1) The date and duration (in hours) of the storm event(s) sampled;

(2) The rainfall total (in inches) of the storm event which generated the sampled discharge; and

(3) The duration between the storm event sampled and the end of the previous measurable storm event.

In addition, the permittee shall maintain a monthly log documenting the amount of rainfall received at this facility on a daily basis. A summarization of this information shall also be submitted with the DMRs.

d. Sampling Waiver

When a permittee is unable to collect storm water samples required in Part I.A. or other applicable sections of this permit within a specified sampling period due to adverse climatic conditions, the permittee shall collect a substitute sample from a separate qualifying event in the next period and submit these data along with the data for the routine sample in that period. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

e. Representative Discharges

When a facility has two or more outfalls that discharge substantially identical effluents, based on similarities of the industrial activities, significant materials, size of drainage areas, and storm water management practices occurring within the drainage areas of the outfalls, the permittee may test the effluent of one of such outfalls and report that the quantitative data also apply to the substantially identical outfall(s) provided that:

(1) the representative outfall determination has been approved by DEQ prior to data submittal; and,

(2) the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents.

f. Quarterly Visual Examination of Storm Water Quality

(1) Commensurate with initiation of annual Part I.A. monitoring for storm water discharges associated with industrial activity, beginning not later than January 1, 2012, and continuing for the term of the permit, the permittee must perform and document a quarterly visual examination of a storm water discharge from each outfall, except discharges exempted below and those exempted in Part I.A. of this permit. The examination(s) must be made at least once in each of the following three-month periods: January through March, April through June, July through September, and October through December. Whenever practicable, the visual examination should be made during daylight hours (e.g., normal working hours). If no storm event resulted in runoff from the facility during a monitoring quarter, the permittee is excused from visual monitoring for that quarter provided that documentation is included with the monitoring records indicating that no runoff occurred. The documentation must be signed and certified in accordance with Part II.K. of this permit.

(2) Visual examinations must be made of grab samples taken during the first hour of when the runoff or snowmelt begins discharging from the facility. If the collection of a grab sample during the first hour is impracticable, a grab sample can be taken during the first three hours of the discharge, and the permittee shall document with the SWP3 a description of why a grab sample during the first hour was impracticable. The examination must document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The examination must be conducted in a well-lit area. No analytical tests are required to be performed on the samples. All samples (except snowmelt samples) must be collected from the discharge resulting from a storm event that results in an actual discharge from the site (defined as a "measurable storm event"), and that occurs at least 72 hours from the previously measurable storm event. The 72-hour storm interval is waived if the permittee is able to document that less than a 72-hour interval is representative for local storm events during the sampling period. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term. If no qualifying storm event resulted in runoff during daylight hours from the facility during a monitoring quarter, the permittee is excused from visual monitoring for that quarter provided that

documentation is included with the monitoring records indicating that no qualifying storm event occurred during daylight hours that resulted in storm water runoff during that quarter. The documentation must be signed and certified in accordance with Part II.K. of this permit.

(3) The visual examination reports must be maintained on-site with the Storm Water Pollution Prevention Plan (SWPPP). The report must include the outfall location, the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(4) If the facility has two or more outfalls that discharge substantially identical effluents, based on similarities of the industrial activities, significant materials, size of drainage areas, and storm water management practices occurring within the drainage areas of the outfalls, the permittee may conduct visual monitoring on the effluent of just one of the outfalls and report that the observations also apply to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (i.e., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)) shall be provided in the plan.

(5) When the permittee is unable to conduct the visual examination due to adverse climatic conditions, the permittee must document the reason for not performing the visual examination and retain this documentation onsite with the records of the visual examinations. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

g. Allowable Non-Storm Water Discharges

(1) The following non-storm water discharges are authorized by this permit provided the non-storm water component of the discharge is in compliance with g.(2) below:

(a) Discharges from fire fighting activities;

(b) Fire hydrant flushings;

(c) Potable water including water line flushings;

(d) Uncontaminated air conditioning or compressor condensate;

(e) Irrigation drainage;

(f) Landscape watering provided all pesticides, herbicides, and fertilizer have been applied in accordance with manufacturer's instructions;

(g) Pavement wash waters where no detergents are used and no spills or leaks of toxic or hazardous materials have occurred (unless all spilled material has been removed);

(h) Routine external building wash down which does not use detergents;

(i) Uncontaminated ground water or spring water;

(j) Foundation or footing drains where flows are not contaminated with process materials;

(k) Incidental windblown mist from cooling towers that collects on rooftops or adjacent portions of the facility, but NOT intentional discharges from the cooling tower (e.g., "piped" cooling tower blowdown or drains); and

(l) Discharges from swimming pools subject to the following conditions:

i. Total residual chlorine (TRC) concentration shall be non-detect at maximum quantification level (QL) of 0.1 mg/l TRC, the pH of the discharge is between the range of 6.5 to 8.5 standard units (SU), total suspended solids is below 60 mg/l, and the water is not murky upon release;

ii. The wastewater complies with the applicable water quality standards and is known to be free of algaecides such as copper or silver;

iii. Discharges should be released to vegetated areas without flow to storm water systems or streams;

iv. Discharge the water in a manner that will prevent nuisance conditions. Nuisance conditions occur when water is ponded for a prolonged period; and

v. Discharges to storm water conveyances shall only be used when all other options are unavailable (sanitary sewer system, landscape irrigation, release to vegetated areas without flows to streams, collection for beneficial reuse, etc.).

(2) Except for flows from fire fighting activities, the Storm Water Pollution Prevention Plan must include:

(a) Identification of each allowable non-storm water source;

(b) The location where the non-storm water is likely to be discharged; and

(c) Descriptions of appropriate BMPs for each source.

(3) If mist blown from cooling towers is included as one of the allowable non-storm water discharges from the facility, the permittee must specifically evaluate the discharge for the presence of chemicals used in the cooling tower. The evaluation shall be included in the SWPPP.

h. Releases of Hazardous Substances or Oil in Excess of Reportable Quantities

The discharge of hazardous substances or oil in the storm water discharge(s) from the facility shall be prevented or minimized in accordance with the storm water pollution prevention plan for the facility. This permit does not authorize the discharge of hazardous substances or oil resulting from an on-site spill. This permit does not relieve the permittee of the reporting requirements of 40 CFR 110, 40 CFR 117 and 40 CFR 302 or §62.1-44.34:19 of the Code of Virginia. Where a release containing a hazardous substance or oil in an amount equal to or in excess of a reportable quantity established under either 40 CFR 110, 40 CFR 117 or 40 CFR 302 occurs during a 24-hour period:

(1) The permittee is required to notify the Department in accordance with the requirements of Part II.G. of this permit as soon as he or she has knowledge of the discharge;

(2) Where a release enters an adjacent Municipal Separate Storm Sewer System (MS4; e.g., City of Norfolk), the permittee shall also notify the owner of the MS4; and

(3) The SWPPP required by this permit must be reviewed to identify measures to prevent the reoccurrence of such releases and to respond to such releases, and the plan must be modified where appropriate.

i. Co-Located Industrial Activities

(1) If the facility has industrial activities occurring on-site which are described by any of the activities identified in the application submitted for reissuance of this permit, those industrial activities are considered to be co-located industrial activities. Storm water discharges from co-located industrial activities are authorized by this permit, provided that the permittee complies with any and all additional pollution prevention plan and monitoring requirements set forth in Parts I.A. and I.D. of this permit, applicable to that particular co-located industrial activity. The permittee shall determine which additional pollution prevention plan and monitoring requirements are applicable to the co-located industrial activity by examining the narrative descriptions of each coverage section.

(2) Sector-specific monitoring requirements and limitations are applied discharge by discharge at facilities with co-located activities. Where storm water from the co-located activities are commingled, the monitoring requirements and limitations are additive. Where more than one numeric limitation for a specific parameter applies to a discharge, compliance with the more restrictive limitation is required. Where monitoring requirements for a monitoring period overlap, the permittee may use a single sample to satisfy both monitoring requirements.

j. Additional Requirements for Salt Storage

Storage piles of salt or piles containing salt used for deicing or other commercial or industrial purposes shall be enclosed or covered to prevent exposure to precipitation. The permittee shall implement appropriate measures (e.g., good housekeeping, diversions, containment) to minimize exposure resulting from adding to or removing materials from the pile. All salt storage piles shall be located on an impervious surface. All runoff from the pile, and/or runoff that comes in contact with salt, including under drain systems, shall be collected and contained within a bermed basin lined with concrete or other impermeable materials., or within an underground storage tank(s), or within an above ground storage tank(s), or disposed of through a sanitary sewer (with the permission of the treatment facility).

A combination of any or all of these methods may be used. In no case shall salt contaminated storm water be allowed to discharge directly to the ground or to state waters.

2. Storm Water Pollution Prevention Plan (SWPPP)

The storm water pollution prevention plan requirements of this permit may be fulfilled, in part, by incorporating by reference other plans or documents such as a spill prevention control and countermeasure (SPCC) plan developed for the facility under Section 311 of the Clean Water Act, or best management practices (BMP) programs otherwise required for the facility, provided that the incorporated plan meets or exceeds the plan requirements of Part I.D.2.b. (Contents of the Plan). All plans incorporated by reference into the storm water pollution prevention plan become enforceable under this permit. If a plan incorporated by reference does not contain all of the required elements of the SWPPP of Part I.D.2.b. the permittee shall develop the missing SWPPP elements and include them in the required plan.

a. Deadlines for Plan Preparation and Compliance

(1) A SWPPP for the facility was required to be developed and implemented under the previous permit. The existing storm water pollution prevention plan shall be reviewed and modified, as appropriate, to conform to the requirements of this section. Permittees shall implement the provisions of the storm water pollution prevention plan as a condition of this permit.

(2) Measures That Require Construction

In cases where construction is necessary to implement measures required by the plan, the plan shall contain a schedule that provides compliance with the plan as expeditiously as practicable, but no later than 3 years after the effective date of this permit. Where a construction compliance schedule is included in the plan, the schedule shall include appropriate nonstructural and/or temporary controls to be implemented in the affected portion(s) of the facility prior to completion of the permanent control measure.

b. Contents of the Plan

The contents of the SWPPP shall comply with the requirements listed below and those in Parts I.D.3., I.D.4., I.D.5., I.D.6. and I.D.7. The plan shall include, at a minimum, the following items:

(1) Pollution Prevention Team

The plan shall identify the staff individuals by name or title that comprise the facility's storm water pollution prevention team. The pollution prevention

team is responsible for assisting the facility or compliance manager in developing, implementing, maintaining, revising, and ensuring compliance with the facility's SWPPP. Specific responsibilities of each staff individual on the team shall be identified and listed.

(2) Site Description

The plan shall include the following:

(a) Activities at the Facility

A description of the nature of the industrial activities at the facility.

(b) General Location Map

A general location map (e.g., USGS quadrangle or other map) with enough detail to identify the location of the facility and the receiving waters within one mile of the facility.

(c) Site Map

A site map identifying the following:

i. The size of the property (in acres);

ii. The location and extent of significant structures and impervious surfaces (roofs, paved areas and other impervious areas);

iii. Locations of all storm water conveyances including ditches, pipes, swales, and inlets, and the directions of storm water flow (use arrows to show which ways storm water will flow);

iv. Locations of all existing structural and source control BMPs;

v. Locations of all surface water bodies, including wetlands;

vi. Locations of potential pollutant sources identified under Part I.D.2.b.(3);

vii. Locations where significant spills or leaks identified under Part I.D.2.b.(4) have occurred;

viii. Locations of the following activities where such activities are exposed to precipitation: fueling stations; vehicle and equipment maintenance and/or cleaning areas; loading/unloading areas; locations used for the treatment, storage or disposal of wastes; liquid storage tanks; processing and storage areas; access

roads, rail cars and tracks; transfer areas for substances in bulk; and machinery;

ix. Locations of storm water outfalls and an approximate outline of the area draining to each outfall, and location of municipal storm sewer systems, if the storm water from the facility discharges to them;

x. Location and description of all non-storm water discharges;

xi. Location of any storage piles containing salt used for deicing or other commercial or industrial purposes; and

xii. Locations and sources of runon to the site from adjacent property where the runon contains significant quantities of pollutants. The permittee shall include an evaluation with the SWPPP of how the quality of the storm water running onto the facility impacts the facility's storm water discharges.

(d) Receiving Waters and Wetlands

The name of all surface waters receiving discharges from the site, including intermittent streams, dry sloughs, and arroyos. Provide a description of wetland sites that may receive discharges from the facility. If the facility discharges into or through a municipal separate storm sewer system (MS4), identify the MS4 operator, and the receiving water to which the MS4 discharges.

(3) Summary of Potential Pollutant Sources

The plan shall identify each separate area at the facility where industrial materials or activities are exposed to storm water. Industrial materials or activities include, but are not limited to: material handling equipment or activities, industrial machinery, raw materials, industrial production and processes, intermediate products, byproducts, final products, and waste products. Material handling activities include, but are not limited to: the storage, loading and unloading, transportation, disposal, or conveyance of any raw material, intermediate product, final product or waste product. For each separate area identified, the description shall include:

(a) Activities in Area

A list of the activities (e.g., material storage, equipment fueling and cleaning, cutting steel beams); and

(b) Pollutants

A list of the associated pollutant(s) or pollutant constituents (e.g., crankcase oil zinc, sulfuric acid, cleaning solvents, etc.) for each activity. The pollutant list shall include all significant materials handled, treated, stored or disposed that have been exposed to storm water in the three years prior to the date this SWPPP was prepared or amended. The list shall include any hazardous substances or oil at the facility.

(4) Spills and Leaks

The SWPPP shall clearly identify areas where potential spills and leaks that can contribute pollutants to storm water discharges can occur and their corresponding outfalls. The plan shall include a list of significant spills and leaks of toxic or hazardous pollutants that actually occurred at exposed areas, or that drained to a storm water conveyance during the three-year period prior to the date this SWPPP was prepared or amended. The list shall be updated if significant spills or leaks occur in exposed areas of the facility during the term of the permit. Significant spills and leaks include releases of oil or hazardous substances in excess of reportable quantities, and may also include releases of oil or hazardous substances that are not in excess of reporting requirements.

(5) Sampling Data

The plan shall include a summary of existing storm water discharge sampling data taken at the facility. The summary shall include, at a minimum, any data collected during the previous permit term.

(6) Storm Water Controls

(a) BMPs shall be implemented for all the areas identified in Part I.D.2.b.(3) to prevent or control pollutants in storm water discharges from the facility. All reasonable steps shall be taken to control or address the quality of discharges from the site that may not originate at the facility. The SWPPP shall describe the type, location and implementation of all BMPs for each area where industrial materials or

activities are exposed to storm water. Selection of BMPs shall take into consideration:

i. That preventing storm water from coming into contact with polluting materials is generally more effective, and less costly, than trying to remove pollutants from storm water;

ii. BMPs generally shall be used in combination with each other for most effective water quality protection;

iii. Assessing the type and quantity of pollutants, including their potential to impact receiving water quality, is critical to designing effective control measures;

iv. That minimizing impervious areas at the facility can reduce runoff and improve groundwater recharge and stream base flows in local streams (however, care must be taken to avoid groundwater contamination);

v. Flow attenuation by use of open vegetated swales and natural depressions can reduce in-stream impacts of erosive flows;

vi. Conservation or restoration of riparian buffers will help protect streams from storm water runoff and improve water quality; and

vii. Treatment interceptors (e.g., swirl separators and sand filters) may be appropriate in some instances to minimize the discharge of pollutants.

(b) Control Measures

The permittee shall implement the following types of BMPs to prevent and control pollutants in the storm water discharges from the facility unless it can be demonstrated and documented that such controls are not relevant to the discharges (e.g., there are no storage piles containing salt).

i. Good Housekeeping

The permittee shall keep clean all exposed areas of the facility that are potential sources of pollutants to storm water discharges. Typical problem areas include areas around trash containers, storage areas, loading docks, and vehicle fueling

and maintenance areas. The plan shall include a schedule for regular pickup and disposal of waste materials, along with routine inspections for leaks and conditions of drums, tanks and containers. The introduction of raw, final or waste materials to exposed areas of the facility shall be minimized to the maximum extent practicable. The generation of dust, along with off-site vehicle tracking of raw, final or waste materials, or sediments, shall be minimized to the maximum extent practicable.

ii. Eliminating and Minimizing Exposure

To the extent practicable, industrial materials and activities shall be located inside, or protected by a storm-resistant covering to prevent exposure to rain, snow, snowmelt, and runoff. Note: Eliminating exposure at all industrial areas may make the facility eligible for the "Conditional Exclusion" for No Exposure" provision of 9 VAC 25-31-120 E, thereby eliminating the need to have a permit.

iii. Preventive Maintenance

The permittee shall have a preventive maintenance program that includes regular inspection, testing, maintenance and repairing of all industrial equipment and systems to avoid breakdowns or failures that could result in leaks, spill and other releases. This program is in addition to the specific BMP maintenance required under Part I.D.2.c. (Maintenance of BMPs).

iv. Spill Prevention and Response Procedures
The plan shall describe the procedures that will be followed for preventing and responding to spills and leaks.

- Preventive measures include barriers between material storage and traffic areas, secondary containment provisions, and procedures for material storage and handling.
- Response procedures shall include notification of appropriate facility personnel, emergency agencies, and regulatory agencies, and procedures

for stopping, containing and cleaning up spills. Measures for cleaning up hazardous material spills or leaks shall be consistent with applicable RCRA regulations at 40 CFR Part 264 and 40 CFR Part 265. Employees who may cause, detect or respond to a spill or leak shall be trained in these procedures and have necessary spill response equipment available. If possible, one of these individuals shall be a member of the Pollution Prevention Team.

- Contact information for individuals and agencies that must be notified in the event of a spill shall be included in the SWPPP, and in other locations where it will be readily available.

v. Routine Facility Inspections

- Facility personnel who possess the knowledge and skills to assess conditions and activities that could impact storm water quality at the facility, and who can also evaluate the effectiveness of BMPs shall regularly inspect all areas of the facility where industrial materials or activities are exposed to storm water. These inspections are in addition to, or as part of, the comprehensive site evaluation required under Part I.D.2.d. At least one member of the Pollution Prevention Team shall participate in the routine facility inspections.

- The inspection frequency shall be specified in the plan based upon a consideration of the level of industrial activity at the facility, but shall be a minimum of quarterly unless more frequent intervals are specified elsewhere in the permit or written approval is received from the Department for less frequent intervals. At least once each calendar year, the routine facility inspection must be conducted during a period when a storm water discharge is occurring.

- Any deficiencies with implementation of the SWPPP that are found shall be corrected as soon as practicable, but not later than within 30 days of the inspection, unless permission for a later date is granted in writing by the Director. The results of the inspections shall be documented in the SWPPP, along with the date(s) and description(s) of any corrective actions that were taken in response to any deficiencies or opportunities for improvement that were identified.

vi. Employee Training

The permittee shall implement a storm water employee training program for the facility. The SWPPP shall include a schedule for all types of necessary training, and shall document all training sessions and the employees who received the training. Training shall be provided for all employees who work in areas where industrial materials or activities are exposed to storm water, and for employees who are responsible for implementing activities identified in the SWPPP (e.g., inspectors, maintenance personnel, etc.). The training shall cover the components and goals of the SWPPP, and include such topics as spill response, good housekeeping, material management practices, BMP operation and maintenance, etc. The SWPPP shall include a summary of any training performed.

vii. Sediment and Erosion Control

The plan shall identify areas at the facility that, due to topography, land disturbance (e.g., construction, landscaping, site grading), or other factors, have a potential for soil erosion. The permittee shall identify and implement structural, vegetative, and/or stabilization BMPs to prevent or control on-site and off-site erosion and sedimentation. Flow velocity dissipation devices shall be placed at discharge locations and along the length of any outfall channel if the flows would otherwise create erosive conditions.

viii. Management of Runoff

The plan shall describe the storm water runoff management practices (i.e., permanent structural BMPs) for the facility. These types of BMPs are typically used to divert, infiltrate, reuse, or otherwise reduce pollutants in storm water discharges from the site.

Structural BMPs may require a separate permit under § 404 of the CWA and the Virginia Water Protection Permit Program Regulation (9 VAC 25-210) before installation begins.

c. Maintenance

All BMPs identified in the SWPPP shall be maintained in effective operating condition. Storm water BMPs identified in the SWPPP shall be observed during active operation (i.e., during a storm water runoff event) to ensure that they are functioning correctly. Where discharge locations are inaccessible, nearby downstream locations shall be observed. The observations shall be documented in the SWPPP.

The SWPPP shall include a description of procedures and a regular schedule for preventive maintenance of all BMPs, and shall include a description of the back-up practices that are in place should a runoff event occur while a BMP is off-line. The effectiveness of nonstructural BMPs shall also be maintained by appropriate means (e.g., spill response supplies available and personnel trained, etc.). If site inspections required by Part I.D.2.b.(6)(b)(v) or Part I.D.2.d. identify BMPs that are not operating effectively, repairs or maintenance shall be performed before the next anticipated storm event. If maintenance prior to the next anticipated storm event is not possible, maintenance shall be scheduled and accomplished as soon as practicable. In the interim, back-up measures shall be employed and documented in the SWPPP until repairs or maintenance is complete. Documentation shall be kept with the SWPPP of maintenance and repairs of BMPs, including the date(s) of regular maintenance, date(s) of discovery of areas in need of repair or replacement, and for repairs, date(s) that the BMP(s) returned to full function, and the justification for any extended maintenance or repair schedules.

d. Comprehensive Site Compliance Evaluation

The permittee shall conduct comprehensive site compliance evaluations at least once a year. The evaluations shall be done by qualified personnel who possess the knowledge and skills to assess conditions and activities that could

impact storm water quality at the facility, and who can also evaluate the effectiveness of BMPs. The personnel conducting the evaluations may be either facility employees or outside constituents hired by the facility.

(1) Scope of the Compliance Evaluation

Evaluations shall include all areas where industrial materials or activities are exposed to storm water, as identified in Part I.D.2.b.(3). The personnel shall evaluate:

(a) Industrial materials, residue or trash that may have or could come into contact with storm water;

(b) Leaks or spills from industrial equipment, drums, barrels, tanks or other containers that have occurred within the past three years;

(c) Off-site tracking of industrial or waste materials or sediment where vehicles enter or exit the site;

(d) Tracking or blowing of raw, final, or waste materials from areas of no exposure to exposed areas;

(e) Evidence of, or the potential for, pollutants entering the drainage system;

(f) Evidence of pollutants discharging to surface waters at all facility outfalls, and the condition of and around the outfall, including flow dissipation measures to prevent scouring;

(g) Review of training performed, inspections completed, maintenance performed, quarterly visual examinations, and effective operation of BMPs;

(h) Results of both visual and any analytical monitoring done during the past year shall be taken into consideration during the evaluation.

(2) Based on the results of the evaluation, the SWPPP shall be modified as necessary (e.g., show additional controls on the map required by Part I.D.2.b.(2)(c); revise the description of controls required by Part I.D.2.b.(6) to include additional or modified BMPs designed to correct problems identified). Revisions to the SWPPP shall be completed within 30 days following the evaluation, unless permission for a later date is granted in writing by the Director. If existing BMPs need to be modified or if additional BMPs are necessary, implementation shall be completed before the next anticipated storm event, if practicable, but not more than 60 days after

completion of the comprehensive site evaluation, unless permission for a later date is granted in writing by the Department;

(3) Compliance Evaluation Report

A report shall be written summarizing the scope of the evaluation, name(s) of personnel making the evaluation, the date of the evaluation, and all observations relating to the implementation of the SWPPP, including elements stipulated in Part I.D.2. d.(1) (a) through (f) above. Observations shall include such things as: the location(s) of discharges of pollutants from the site; location(s) of previously unidentified sources of pollutants; location(s) of BMPs that need to be maintained or repaired; location(s) of failed BMPs that need replacement; and location(s) where additional BMPs are needed. The report shall identify any incidents of noncompliance that were observed. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the SWPPP and this permit. The report shall be signed in accordance with Part II.K. and maintained with the SWPPP.

(4) Where compliance evaluation schedules overlap with routine inspections required under Part I.D.2. b.(6)(b)v., the annual compliance evaluation may be used as one of the routine inspections.

e. Signature and Plan Review

(1) Signature/Location

The SWPPP shall be signed in accordance with Part II.K., dated, and retained on-site at the facility covered by this permit in accordance with Part II.B.2. All other changes to the SWPPP, and other permit compliance documentation, must be signed and dated by the person preparing the change or documentation.

(2) Availability

The permittee shall make the SWPPP, annual site compliance evaluation report, and other information available to the Department upon request.

(3) Required Modifications

The Director may notify the permittee at any time that the SWPPP, BMPs, or other components of the facility's storm water program do not meet one or more of the requirements of this permit. The notification shall identify specific provisions of the permit that are not being met, and may include required modifications to the storm water program,

additional monitoring requirements, and special reporting requirements. The permittee shall make any required changes to the SWPPP within 60 days of receipt of such notification, unless permission for a later date is granted in writing by the Director, and shall submit a written certification to the Director that the requested changes have been made.

f. Maintaining an Updated SWPPP.

(1) The permittee shall review and amend the SWPPP as appropriate whenever:

(a) There is construction or a change in design, operation, or maintenance at the facility that has a significant effect on the discharge, or the potential for the discharge, of pollutants from the facility;

(b) Routine inspections or compliance evaluations determine that there are deficiencies in the BMPs;

(c) Inspections by local, state, or federal officials determine that modifications to the SWPPP are necessary;

(d) There is a spill, leak or other release at the facility; or

(e) There is an unauthorized discharge from the facility.

(2) SWPPP modifications shall be made within 30 calendar days after discovery, observation or event requiring a SWPPP modification. Implementation of new or modified BMPs (distinct from regular preventive maintenance of existing BMPs described in Part I.D.2. b.(6)(b)(iii)) shall be initiated before the next storm event if possible, but no later than 60 days after discovery, or as otherwise provided or approved by the Director. The amount of time taken to modify a BMP or implement additional BMPs shall be documented in the SWPPP.

(3) If the SWPPP modification is based on a release or unauthorized discharge, include a description and date of the release, the circumstances leading to the release, actions taken in response to the release, and measures to prevent the recurrence of such releases. Unauthorized releases and discharges are subject to the reporting requirements of Part II.G. of this permit.

3. Scrap Recycling and Waste Recycling Facilities

a. Discharges Covered Under This Section

The requirements listed under this section apply to storm water discharges associated with industrial activity from facilities that are engaged in the processing, reclaiming and wholesale distribution of scrap and waste materials such as ferrous and nonferrous metals, paper, plastic, cardboard, glass, animal hides (these types of activities are typically identified as SIC Code 5093), and facilities that are engaged in reclaiming and recycling liquid wastes such as used oil, antifreeze, mineral spirits, and industrial solvents (also identified as SIC Code 5093). Separate permit requirements have been established for recycling facilities that only receive source-separated recyclable materials primarily from non-industrial and residential sources (also identified as SIC Code 5093) (e.g., common consumer products including paper, newspaper, glass, cardboard, plastic containers, aluminum and tin cans). This includes recycling facilities commonly referred to as material recovery facilities (MRF).

b. Effluent Limitations

None applicable.

c. Analytical Monitoring

Non-source-separated facilities only: TSS, Al, Cu, Cd, Cr, Fe, Pb, Zn (SIC 5093);

d. Non-Storm Water Discharges

Discharges from turnings containment areas are not "authorized" non-storm water discharges under this section, and if present, may require additional controls and/or limitations.

e. Pollution Prevention Plan Requirements

In addition to the requirements of Part I.D.2., all facilities are required to comply with the general SWPPP requirement in this section. This part identifies the SWPPP requirements for specific types of recycling facilities. The permittee shall implement and describe in the SWPPP a program to address those items that apply. Included are lists of BMP options that, along with any functional equivalents, shall be considered for implementation. Selection or de-selection of a particular BMP or approach is up to the best professional judgment of the permittee, as long as the objective of the requirement is met.

(1) Site Description

(a) Site Map

The site map shall identify the locations where any of the following activities or sources may be exposed to precipitation/surface runoff: scrap and waste material storage, outdoor scrap and waste processing equipment, and containment areas for turnings exposed to cutting fluids.

(b) Scrap Recycling and Waste Recycling Facilities (Non-Source-Separated, Non-Liquid Recyclable Materials)

The following SWPPP special conditions have been established for facilities that receive, process and do wholesale distribution of non-liquid recyclable wastes (e.g., ferrous and nonferrous metals, plastics, glass, cardboard and paper). These facilities may receive both non-recyclable and recyclable materials. This section is not intended for those facilities that only accept recyclable materials primarily from non-industrial and residential sources.

i. Inbound Recyclable and Waste Material Control Program

The plan shall include a recyclable and waste material inspection program to minimize the likelihood of receiving materials that may be significant pollutant sources to storm water discharges. BMP options:

- Provide information/education flyers, brochures and pamphlets to suppliers of scrap and recyclable waste materials on draining and properly disposing of residual fluids prior to delivery to the facility (e.g., from vehicles and equipment engines, radiators, and transmissions, oil-filled transformers, and individual containers or drums), and on removal of mercury switches prior to delivery to the facility;
- Establish procedures to minimize the potential of any residual fluids from coming in contact with precipitation/ runoff.
- Establish procedures for accepting scrap lead-acid batteries. Additional requirements for the

handling, storage and disposal or recycling of batteries are contained in the scrap lead-acid battery program provisions in subpart (b)iv. below;

- Provide training targeted for those personnel engaged in the inspection and acceptance of inbound recyclable materials;
- Establish procedures to ensure that liquid wastes, including used oil, are stored in materially compatible and non-leaking containers and disposed or recycled in accordance with all requirements under the Resource Recovery and Conservation Act (RCRA), and other state or local requirements.

ii. Scrap and Waste Material Stockpiles/ Storage (Outdoor)

The plan shall describe measures and controls to minimize contact of storm water runoff with stockpiled materials, processed materials and non-recyclable wastes. BMP options:

- Permanent or semi-permanent covers;
- The use of sediment traps, vegetated swales and strips, catch basin filters and sand filters to facilitate settling or filtering of pollutants;
- Diversion of runoff away from storage areas via dikes, berms, containment trenches, culverts and surface grading;
- Silt fencing;
- Oil/water separators, sumps and dry adsorbents for areas where potential sources of residual fluids are stockpiled (e.g., automotive engine storage areas).

iii. Stockpiling of Turnings Exposed to Cutting Fluids (Outdoor Storage)

The plan shall implement measures necessary to minimize contact of surface runoff with residual cutting fluids. BMP options (use singularly/in combination):

- Storage of all turnings exposed to cutting fluids under some form of permanent or semi-permanent cover. Storm water discharges from these areas are permitted provided the runoff is first treated by an oil/water separator or its equivalent. Procedures to collect, handle, and dispose or recycle residual fluids that may be present shall be identified in the plan;

- Establish dedicated containment areas for all turnings that have been exposed to cutting fluids. Storm water runoff from these areas can be discharged provided: 1) the containment areas are constructed of either concrete, asphalt or other equivalent type of impermeable material; 2) there is a barrier around the perimeter of the containment areas to prevent contact with storm water run-on (e.g., berms, curbing, elevated pads, etc.); 3) there is a drainage collection system for runoff generated from containment areas; 4) there is a schedule to maintain the oil/water separator (or its equivalent); and 5) procedures are identified for the proper disposal or recycling of collected residual fluids.

iv. Scrap and Waste Material Stockpiles/ Storage (Covered or Indoor Storage)

The plan shall address measures and controls to minimize contact of residual liquids and particulate matter from materials stored indoors or under cover from coming in contact with surface runoff. BMP options:

- Good housekeeping measures, including the use of dry absorbent or wet vacuum clean up methods, to contain or dispose/recycle residual liquids originating from recyclable containers, or mercury spill kits from storage of mercury switches;

- Prohibiting the practice of allowing wash water from tipping floors or other processing areas from

discharging to the storm sewer system;

- Disconnecting or sealing off all floor drains connected to the storm sewer system.

v. Scrap and Recyclable Waste Processing Areas.

The plan shall include measures and controls to minimize surface runoff from coming in contact with scrap processing equipment. In the case of processing equipment that generate visible amounts of particulate residue (e.g., shredding facilities), the plan shall describe measures to minimize the contact of residual fluids and accumulated particulate matter with runoff (i.e., through good housekeeping, preventive maintenance, etc.). BMP options:

- A schedule of regular inspections of equipment for leaks, spills, malfunctioning, worn or corroded parts or equipment;
- A preventive maintenance program for processing equipment;
- Removal of mercury switches from the hood and trunk lighting units, and removal of anti-lock brake system units containing mercury switches;
- Use of dry-absorbents or other cleanup practices to collect and to dispose/recycle spilled/leaking fluids, or use of mercury spill kits for spills from storage of mercury switches;
- Installation of low-level alarms or other equivalent protection devices on unattended hydraulic reservoirs over 150 gallons in capacity. Alternatively, provide secondary containment with sufficient volume to contain the entire volume of the reservoir;
- Containment or diversion structures such as dikes, berms, culverts, trenches, elevated concrete pads, and grading to minimize contact of storm water runoff with outdoor processing equipment or stored materials;

- Oil/water separators or sumps;
- Permanent or semi-permanent covers in processing areas where there are residual fluids and grease;
- Retention and detention basins or ponds, sediment traps, vegetated swales or strips, to facilitate pollutant settling/ filtration;
- Catch basin filters or sand filters.

vi. Scrap Lead-Acid Battery Program

The plan shall address measures and controls for the proper handling, storage and disposal of scrap lead-acid batteries. BMP options:

- Segregate scrap lead-acid batteries from other scrap materials;
- A description of procedures and/or measures for the proper handling, storage and disposal of cracked or broken batteries;
- A description of measures to collect and dispose of leaking lead-acid battery fluid;
- A description of measures to minimize and, whenever possible, eliminate exposure of scrap lead-acid batteries to precipitation or runoff;
- A description of employee training for the management of scrap batteries.

vii. Spill Prevention and Response Procedures

The SWPPP shall include measures to minimize storm water contamination at loading/unloading areas, and from equipment or container failures. BMP options:

- Description of spill prevention and response measures to address areas that are potential sources of fluid leaks or spills;
- Immediate containment and clean up of spills/leaks. If malfunctioning equipment is responsible for the spill/leak, repairs shall also be conducted as soon as possible;

- Cleanup procedures shall be identified in the plan, including the use of dry absorbents. Where dry absorbent cleanup methods are used, an adequate supply of dry absorbent material shall be maintained on-site. Used absorbent material shall be disposed of properly;
- Drums containing liquids, especially oil and lubricants, shall be stored: indoors; in a bermed area; in over-pack containers or spill pallets; or in similar containment devices;
- Overfill prevention devices shall be installed on all fuel pumps or tanks;
- Drip pans or equivalent measures shall be placed under any leaking piece of stationary equipment until the leak is repaired. The drip pans shall be inspected for leaks and potential overflow and all liquids properly disposed of in accordance with RCRA requirements;
- An alarm and/or pump shut off system shall be installed on outdoor equipment with hydraulic reservoirs exceeding 150 gallons in order to prevent draining the tank contents in the event of a line break. Alternatively, the equipment may have a secondary containment system capable of containing the contents of the hydraulic reservoir plus adequate freeboard for precipitation. A mercury spill kit shall be used for any release of mercury from switches, anti-lock brake systems, and switch storage areas.

viii. Inspection Program

All designated areas of the facility and equipment identified in the plan shall be inspected at least monthly.

ix. Supplier Notification Program

The plan shall include a program to notify major suppliers which scrap materials will not be accepted at the facility or are only accepted under certain conditions.

(c) Waste Recycling Facilities (Liquid Recyclable Materials)

i. Waste Material Storage (Indoor)

The plan shall include measures and controls to minimize/eliminate contact between residual liquids from waste materials stored indoors and surface runoff. The plan may refer to applicable portions of other existing plans such as SPCC plans required under 40 CFR Part 112. BMP options:

- Procedures for material handling (including labeling and marking);
- A sufficient supply of dry-absorbent materials or a wet vacuum system to collect spilled or leaked materials (note: spilled or leaking mercury should never be vacuumed);
- An appropriate containment structure, such as trenches, curbing, gutters or other equivalent measures; and
- A drainage system, including appurtenances (e.g., pumps or ejectors, or manually operated valves), to handle discharges from diked or bermed areas. Drainage shall be discharged to an appropriate treatment facility, sanitary sewer system, or otherwise disposed of properly. Discharges from these areas may require coverage under a separate VPDES permit or industrial user permit under the pretreatment program.

ii. Waste Material Storage (Outdoor)

The plan shall describe measures and controls to minimize contact between stored residual liquids and precipitation or runoff. The plan may refer to applicable portions of other existing plans such as SPCC plans required under 40 CFR Part 112. Discharges of precipitation from containment areas containing used oil shall also be in accordance with applicable sections of 40 CFR Part 112. BMP options:

- Appropriate containment structures (e.g., dikes, berms, curbing, pits)

to store the volume of the largest single tank, with sufficient extra capacity for precipitation;

- Drainage control and other diversionary structures;
- For storage tanks, provide corrosion protection and/or leak detection systems; and
- Dry-absorbent materials or a wet vacuum system to collect spills.

iii Truck and Rail Car Waste Transfer Areas.

The plan shall describe measures and controls to minimize pollutants in discharges from truck and rail car loading/unloading areas. The plan shall also address measures to clean up minor spills/leaks resulting from the transfer of liquid wastes. BMP options:

- Containment and diversionary structures to minimize contact with precipitation or runoff; and
- Use of dry cleanup methods, wet vacuuming, roof coverings, or runoff controls.

iv. Inspections

Inspections shall be made monthly and shall also include all areas where waste is generated, received, stored, treated or disposed that are exposed to either precipitation or storm water runoff.

(d) Recycling Facilities (Source-Separated Materials)

The following SWPPP special conditions have been established for facilities that receive only source-separated recyclable materials primarily from non-industrial and residential sources.

i. Inbound Recyclable Material Control

The plan shall include an inbound materials inspection program to minimize the likelihood of receiving non-recyclable materials (e.g., hazardous materials) that may be a significant source of pollutants in surface runoff. BMP options:

- Provide information and education measures to inform suppliers of

recyclable materials on the types of materials that are acceptable and those that are not acceptable;

- A description of training measures for drivers responsible for pickup of recyclable materials;
- Clearly mark public drop-off containers regarding which materials can be accepted;
- Rejecting non-recyclable wastes or household hazardous wastes at the source; and
- Establish procedures for the handling and disposal of non-recyclable materials.

ii. Outdoor Storage

The plan shall include procedures to minimize the exposure of recyclable materials to surface runoff and precipitation. The plan shall include good housekeeping measures to prevent the accumulation of particulate matter and fluids, particularly in high traffic areas. BMP options:

- Provide totally-enclosed drop-off containers for the public;
- Install a sump/pump with each containment pit, and discharge collected fluids to a sanitary sewer system;
- Provide dikes and curbs for secondary containment (e.g., around bales of recyclable waste paper);
- Divert surface runoff away from outside material storage areas;
- Provide covers over containment bins, dumpsters, roll-off boxes; and
- Store the equivalent one day's volume of recyclable materials indoors.

iii. Indoor Storage and Material Processing.

The plan shall include measures to minimize the release of pollutants from indoor storage and processing areas. BMP options:

- Schedule routine good housekeeping measures for all storage and processing areas;
- Prohibit a practice of allowing tipping floor washwaters from draining to any portion of the storm sewer system; and
- Provide employee training on pollution prevention practices.

iv. Vehicle and Equipment Maintenance

The plan shall also provide for BMPs in those areas where vehicle and equipment maintenance is occurring outdoors. BMP options:

- Prohibit vehicle and equipment wash water from discharging to the storm sewer system;
- Minimize or eliminate outdoor maintenance areas, wherever possible;
- Establish spill prevention and clean-up procedures in fueling areas;
- Avoid topping off fuel tanks;
- Divert runoff from fueling areas;
- Store lubricants and hydraulic fluids indoors; and
- Provide employee training on proper, handling, storage of hydraulic fluids and lubricants.

4. Land Transportation and Warehousing

a. Discharges Covered Under This Section

The requirements listed under this section apply to storm water discharges associated with industrial activity from ground transportation facilities and rail transportation facilities (generally identified by SIC Codes 40, 41, 42, 43, and 5171), that have vehicle and equipment maintenance shops (vehicle and equipment rehabilitation, mechanical repairs, painting, fueling and lubrication) and/or equipment cleaning operations. Also covered under this section are facilities found under SIC Codes 4221 through 4225 (public warehousing and storage) that do not have vehicle and equipment maintenance shops and/or equipment cleaning operations.

b. Effluent Limitations

Not Applicable.

c. Analytical Monitoring

SIC Codes 4011, 4013, 4111-4173, 4212-4231, 4311, and 5171 - TPH, TSS

d. Non-Storm Water Discharges

Discharges of vehicle/equipment/surface wash water, including tank-cleaning operations are not "authorized" non-storm water discharges under this section, and if present, may require additional controls or limitations.

e. Pollution Prevention Plan Requirements

In addition to the requirements of Part I.D.2., the SWPPP shall include, at a minimum, the following items:

(1) Site Description

(a) Site Map

The site map shall identify the locations of any of the following activities and indicate whether the activities may be exposed to precipitation/surface runoff:

i. Fueling stations;

ii. Vehicle/equipment maintenance or cleaning areas;

iii. Storage areas for vehicle/equipment with actual or potential fluid leaks;

iv. Loading/unloading areas;

v. Areas where treatment, storage or disposal of wastes occur;

vi. Liquid storage tanks; and

vii. Processing areas; and storage areas.

(b) Summary of Potential Pollutant Source

The plan shall describe and assess the potential for the following to contribute pollutants to storm water discharges: on-site waste storage or disposal; dirt/gravel parking areas for vehicles awaiting maintenance; and fueling areas.

(2) Storm Water Controls

(a) Good Housekeeping

i. Vehicle and Equipment Storage Areas

The storage of vehicles and equipment awaiting maintenance with actual or potential fluid leaks shall be confined to designated areas (delineated on the site map). The permittee shall consider the following measures (or their equivalents):

- The use of drip pans under vehicles and equipment;
- Indoor storage of vehicles and equipment;
- Installation of berms or dikes;
- Use of absorbents;
- Roofing or covering storage areas; and
- Cleaning pavement surface to remove oil and grease.

ii. Fueling Areas

The permittee shall describe and implement measures that prevent or minimize contamination of the storm water runoff from fueling areas. The permittee shall consider the following measures (or their equivalents):

- Covering the fueling area;
- Using spill/overflow protection and cleanup equipment;
- Minimizing storm water run-on/runoff to the fueling area;
- Using dry cleanup methods; and
- Treating and/or recycling collected storm water runoff.

iii. Material Storage Areas

Storage vessels of all materials (e.g., for used oil/oil filters, spent solvents, paint wastes, hydraulic fluids) shall be maintained in good condition, so as to prevent contamination of storm water, and plainly labeled (e.g., "used oil," "spent solvents," etc.). The permittee shall consider the following measures (or their equivalents):

- Indoor storage of the materials;
- Installation of berms/dikes around the areas, minimizing runoff of storm water to the areas;
- Using dry cleanup methods; and
- Treating and/or recycling the collected storm water runoff.

iv. Vehicle and Equipment Cleaning Areas

The permittee shall describe and implement measures that prevent or minimize contamination of storm water runoff from all areas used for vehicle/equipment cleaning. The permittee shall consider the following measures (or their equivalents):

- Performing all cleaning operations indoors; covering the cleaning operation;
- Ensuring that all washwaters drain to a proper collection system (i.e., not the storm water drainage system unless VPDES permitted); and
- Treating and/or recycling the collected storm water runoff.

v. Vehicle and Equipment Maintenance Areas

The permittee shall describe and implement measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle/equipment maintenance. The permittee shall consider the following measures or equivalents:

- Performing maintenance activities indoors; using drip pans;
- Keeping an organized inventory of materials used in the shop;
- Draining all parts of fluids prior to disposal;
- Prohibiting wet clean up practices where the practices would result in the discharge of pollutants to storm water drainage systems;
- Using dry cleanup methods;
- Treating and/or recycling collected storm water runoff; and
- Minimizing run-on/runoff of storm water to maintenance areas.

vi. Locomotive Sanding (Loading Sand for Traction) Areas

The plan shall describe measures that prevent or minimize contamination of the storm water runoff from areas used for locomotive sanding.

The permittee shall consider the following measures (or their equivalents):

- Covering sanding areas;
- Minimizing storm water run-on/runoff; or
- Appropriate sediment removal practices to minimize the off-site transport of sanding material by storm water.

(b) Routine Facility Inspections

The following areas/activities shall be included in all inspections:

i. Storage area for vehicles/equipment awaiting maintenance;

ii. Fueling areas;

iii. Indoor and outdoor vehicle/equipment maintenance areas;

iv. Material storage areas;

v. Vehicle/equipment cleaning areas; and

vi. Loading/unloading areas.

(c) Employee Training

Employee training shall take place, at a minimum, annually (once per calendar year). Employee training shall address the following, as applicable:

i. Used oil/spent solvent management;

ii. Fueling procedures;

iii. General good housekeeping practices;

iv. Proper painting procedures; and

v. Used battery management.

5. Water Transportation, Ship and Boat Building or Repair Yards, and Tenants and Contractors Performing Similar Activities

a. Discharges covered under this section

The requirements listed under this section apply to storm water discharges associated with industrial activity from water transportation facilities (generally identified by SIC Major Group 44), that have vehicle (vessel) maintenance shops and/or equipment cleaning operations. The water transportation industry includes facilities engaged in foreign or domestic transport of freight or passengers in deep sea or inland waters; marine cargo

handling operations; ferry operations; towing and tugboat services; and marinas.

In addition, the requirements listed under this section also apply to storm water discharges associated with industrial activity from facilities engaged in ship building and repairing and boat building and repairing (SIC Code 373). According to the U.S. Coast Guard, a vessel 65 feet or greater in length is referred to as a ship and a vessel smaller than 65 feet is a boat.

The term "yard", as used in this section, refers to any shore-side location(s) at Naval Station Norfolk where vessels, boats, barges, or other similar water-borne craft are stored, maintained, repaired, and/or fabricated.

b. Effluent Limitations

Not applicable.

c. Analytical Monitoring

(1) SIC Codes 4412-4499 - Al, Fe, Zn

(2) SIC codes 3731, 3732 - TSS

d. Non-Storm Water Discharges

Consistent with the requirements of Part I.B.7.c., The following discharges are not "authorized" non-storm water discharges under this section, and if present, may require additional controls and/or limitations:

(1) Bilge and ballast water;

(2) Sanitary wastes;

(3) Pressure wash water; and

(4) Cooling water originating from vessels.

e. Pollution Prevention Plan Requirements

In addition to the requirements of Part I.D.2., the SWPPP shall include, at a minimum, the following items:

(1) Site Description.

(a) Site Map

The site map shall identify the locations where any of the following activities may be exposed to precipitation/surface runoff:

i. Fueling;

ii. Engine maintenance/repair;

iii. Vessel maintenance/repair;

iv. Pressure washing;

v. Painting;

vi. Sanding;

vii. Blasting;

viii. Welding;

ix. Metal fabrication;

x. Loading/unloading areas;

xi. Locations used for the treatment, storage or disposal of wastes;

xii. Liquid storage tanks;

xiii. Liquid storage areas (e.g., paint, solvents, resins); and

xiv. Material storage areas (e.g., blasting media, aluminum, steel, scrap iron).

(b) Summary of Potential Pollutant Sources

The plan shall describe the following additional sources and activities that have potential pollutants associated with them:

i. Outdoor manufacturing or processing activities (i.e., welding, metal fabricating); and

ii. Significant dust or particulate generating processes (e.g., abrasive blasting, sanding, painting).

(2) Storm Water Controls

(a) Good Housekeeping Measures

i. Pressure Washing Area

If pressure washing is used to remove marine growth from vessels, the discharge water must be permitted as a process wastewater by a separate VPDES permit. The SWPPP shall describe: the measures to collect or contain the discharge from the pressure washing area(s); the method for the removal of the visible solids; the methods of disposal of the collected solids; and where the discharge will be released.

ii. Blasting and Painting Areas

The permittee shall describe and implement measures to prevent spent abrasives, paint chips and overspray from discharging into the receiving waterbody or the storm sewer system. To prevent the discharge of contaminants, the permittee shall consider containing all blasting/painting

activities, or using other methods, such as hanging plastic barriers or tarpaulins during blasting or painting operations to contain debris. The plan shall include a schedule for regularly cleaning storm systems to remove deposits of abrasive blasting debris and paint chips. The plan shall include any standard operating practices with regard to blasting and painting activities, such as the prohibition of uncontained blasting/painting over open water or the prohibition of blasting/painting during windy conditions that can render containment ineffective.

iii. Material Storage Areas

All containerized materials (e.g., fuels, paints, solvents, waste oil, antifreeze, batteries) shall be plainly labeled and stored in a protected, secure location away from drains. The permittee shall describe and implement measures to prevent or minimize the contamination of precipitation/surface runoff from the storage areas. The plan shall specify which materials are stored indoors and consider containment or enclosure for materials that are stored outdoors. The permittee shall consider implementing an inventory control plan to limit the presence of potentially hazardous materials on-site. Where abrasive blasting is performed, the plan shall specifically include a discussion on the storage and disposal of spent abrasive materials generated at the facility.

iv. Engine Maintenance and Repair Areas

The permittee shall describe and implement measures to prevent or minimize contamination of precipitation/surface runoff from all areas used for engine maintenance and repair. The permittee shall consider the following measures (or their equivalent):

- Performing all maintenance activities indoors; maintaining an organized inventory of materials used in the shop; draining all parts of fluids prior to disposal;

- Prohibiting the practice of hosing down the shop floor;
- Using dry cleanup methods; and
- Treating and/or recycling storm water runoff collected from the maintenance area.

v. Material Handling Areas

The permittee shall describe and implement measures to prevent or minimize contamination of precipitation/surface runoff from material handling operations and areas (e.g., fueling, paint and solvent mixing, disposal of process wastewater streams from vessels). The permittee shall consider the following measures (or their equivalents):

- Covering fueling areas; using spill/overflow protection; mixing paints and solvents in a designated area (preferably indoors or under a shed); and
- Minimizing run-on of storm water to material handling areas.

vi. Dry-dock Activities

The industrial operations of, and process wastewater discharges from, floating drydocks, graving drydocks, conventional and Crandall marine railways are not authorized activities under this permit. Should the permittee desire to site and operate any of those vessel hauling, repair, and maintenance systems at Naval Station Norfolk, this permit shall be modified or, alternatively, revoked and reissued to incorporate appropriate limitations and effluent monitoring requirements.

vii. General Yard Area

The plan shall include a schedule for routine yard maintenance and cleanup. Scrap metal, wood, plastic, miscellaneous trash, paper, glass, industrial scrap, insulation, welding rods, packaging, etc., shall be routinely removed from the general yard area.

(b) Preventative Maintenance

As part of the facility's preventive maintenance program, storm water management devices shall be inspected and maintained in a timely manner (e.g., oil/water separators and sediment traps cleaned to ensure that spent abrasives, paint chips and solids are intercepted and retained prior to entering the storm drainage system). Facility equipment and systems shall also be inspected and tested to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters.

(c) Routine Facility Inspections

The following areas shall be included in all monthly inspections:

i. Pressure washing area;

ii. Blasting, sanding, and painting areas;

iii. Material storage areas;

iv. Engine maintenance and repair areas;

v. Material handling areas; and

vi. General yard area.

(d) Employee Training

Training shall address, at a minimum, the following activities (as applicable):

i. Used oil management;

ii. Spent solvent management;

iii. Disposal of spent abrasives;

iv. Disposal of vessel wastewaters;

v. Spill prevention and control;

vi. Fueling procedures;

vii. General good housekeeping practices;

viii. Painting and blasting procedures; and

ix. Used battery management.

(e) Comprehensive Site Compliance Evaluation

The permittee shall conduct regularly scheduled evaluations at least once a year and address those areas contributing to a storm water discharge associated with industrial activity (e.g., pressure washing area, blasting/sanding areas, painting areas, material storage areas, engine maintenance/repair areas, and material handling areas. These sources shall be

inspected for evidence of, or the potential for, pollutants entering the drainage system.

6. Air Transportation.

a. Discharges Covered Under This Section

The requirements listed under this section apply to storm water discharges associated with industrial activity from air transportation facilities including airports, airport terminal services, air transportation (scheduled and nonscheduled), flying fields, air courier services, and establishments engaged in operating and maintaining airports, and servicing, repairing or maintaining aircraft (generally classified under SIC Code 45), which have vehicle maintenance shops, material handling facilities, equipment cleaning operations or airport and/or aircraft deicing/anti-icing operations. For the purpose of this section, the term "deicing" is defined as the process to remove frost, snow, or ice and "anti-icing" is the process which prevents the accumulation of frost, snow, or ice. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, or deicing/ anti-icing operations are addressed under this section.

b. Effluent Limitations

Not applicable.

c. Analytical Monitoring.

Facilities at airports that use 100,000 gallons of glycol-based deicing/anti-icing chemicals and/or 100 tons of urea on an average annual basis, monitor only those outfalls from the airport facility that collect runoff from areas where deicing/anti-icing activities occur (SIC 45): pH, TSS, BOD_5, COD, and TKN.

d. Non-Storm Water Discharges

The following discharges are not "authorized" non-storm water discharges under this section, and if present, may require additional controls and/or limitations:

(1) Aircraft, ground vehicle, runway and equipment washwaters; and

(2) Dry weather discharges of deicing/anti-icing chemicals.

e. Releases of Reportable Quantities of Hazardous Substances and Oil

If an airport authority is the sole permittee, then the sum total of all spills at the airport shall be assessed against the reportable quantity. If the airport authority is a co-permittee with other deicing/anti-icing operators

at the airport, such as numerous different airlines, the assessed amount shall be the summation of spills by each co-permittee. If separate, distinct individual permittees exist at the airport, then the amount spilled by each separate permittee shall be the assessed amount for the reportable quantity determination.

f. Pollution Prevention Plan Requirements

SWPPPs developed for areas of the facility occupied by tenants of the airport shall be integrated with the plan for the entire airport. For the purposes of this permit, tenants of the airport facility include airline passenger or cargo companies, fixed based operators and other parties who have contracts with the airport authority to conduct business operations on airport property and whose operations result in storm water discharges associated with industrial activity. In addition to the requirements of Part I.D.2., the SWPPP shall include, at a minimum, the following items:

(1) Site Description

(a) Site Map

The site map shall identify the location of the following activities and indicate any of the activities that may be exposed to precipitation/surface runoff:

i. Aircraft and runway deicing/anti-icing operations;

ii. Fueling stations;

iii. Aircraft, ground vehicle and equipment maintenance/cleaning areas; and

iv. Storage areas for aircraft, ground vehicles and equipment awaiting maintenance.

(b) Summary of Potential Pollutant Sources

The plan shall include a narrative description of the potential pollutant sources from the following activities:

i. Aircraft, runway, ground vehicle and equipment maintenance and cleaning; and

ii. Aircraft and runway deicing/anti-icing operations (including apron and centralized aircraft deicing/anti-icing stations, runways, taxiways and ramps). Facilities which conduct deicing/anti-icing operations shall maintain a record of the types (including the Material Safety Data Sheets (MSDS)) and monthly quantities of deicing/anti-icing chemicals

used, either as measured amounts, or in the absence of metering, as estimated amounts. This includes all deicing/anti-icing chemicals, not just glycols and urea (e.g., potassium acetate). Tenants and fixed-base operators who conduct deicing/anti-icing operations shall provide the above information to the airport authority for inclusion in the storm water pollution prevention plan for the entire facility.

The SWPPP shall define the average seasonal timeframe (e.g., December-February, October-March, etc.) during which deicing activities typically occur at the facility. Implementation of BMPs, facility inspections and monitoring shall be conducted with particular emphasis throughout the defined deicing season.

(2) Storm Water Controls

(a) Good Housekeeping

i. Aircraft, Ground Vehicle and Equipment Maintenance Areas

The permittee shall describe and implement measures that prevent or minimize the contamination of storm water runoff from all areas used for aircraft, ground vehicle and equipment maintenance (including the maintenance conducted on the terminal apron and in dedicated hangars). The following practices (or their equivalents) shall be considered:

- Performing maintenance activities indoors;
- Maintaining an organized inventory of materials used in the maintenance areas; draining all parts of fluids prior to disposal;
- Preventing the practice of hosing down the apron or hangar floor;
- Using dry cleanup methods; and
- Collecting the storm water runoff from the maintenance area and providing treatment or recycling.

ii. Aircraft, Ground Vehicle and Equipment Cleaning Areas

Permittees shall ensure that cleaning of equipment is conducted in designated areas only and clearly identify these areas on the ground and delineate them on the site map. The permittee shall describe and implement measures that prevent or minimize the contamination of the storm water runoff from cleaning areas.

iii. Aircraft, Ground Vehicle and Equipment Storage Areas

The storage of aircraft, ground vehicles and equipment awaiting maintenance shall be confined to designated areas (delineated on the site map). The following BMPs (or their equivalents) shall be considered:

- Indoor storage of aircraft and ground vehicles;
- The use of drip pans for the collection of fluid leaks; and
- Perimeter drains, dikes or berms surrounding storage areas.

iv. Material Storage Areas

Storage vessels of all materials (e.g., used oils, hydraulic fluids, spent solvents, and waste aircraft fuel) shall be maintained in good condition, so as to prevent or minimize contamination of storm water, and plainly labeled (e.g., "used oil," "Contaminated Jet A," etc.). The permittee shall describe and implement measures that prevent or minimize contamination of precipitation/runoff from storage areas. The following BMPs or their equivalents shall be considered:

- Indoor storage of materials;
- Centralized storage areas for waste materials; and
- Installation of berms/dikes around storage areas.

v. Airport Fuel System and Fueling Areas

The permittee shall describe and implement measures that prevent or minimize the discharge of fuels to the storm sewer/surface waters resulting from fuel

servicing activities or other operations conducted in support of the airport fuel system. The following BMPs (or their equivalents) shall be considered:

- Implementing spill and overflow practices (e.g., placing absorptive materials beneath aircraft during fueling operations);
- Using dry cleanup methods; and
- Collecting the storm water runoff.

(3) Source Reduction

Owners who conduct deicing/anti-icing operations shall consider alternatives to the use of urea and glycol-based deicing/anti-icing chemicals to reduce the aggregate amount of deicing/anti-icing chemicals used and/or lessen the environmental impact. Chemical options to replace ethylene glycol, propylene glycol and urea include: potassium acetate; magnesium acetate; calcium acetate; anhydrous sodium acetate.

(a) Runway Deicing Operations

Owners shall evaluate present application rates to ensure against excessive over application by analyzing application rates and adjusting as necessary, consistent with considerations of flight safety. Also the following BMP options shall be considered (or their equivalents):

i. Metered application of chemicals;

ii. Pre-wetting dry chemical constituents prior to application;

iii. Installation of runway ice detection systems; and

iv. Implementing anti-icing operations as a preventive measure against ice buildup.

(b) Aircraft Deicing/Anti-Icing Operations

Owners shall determine whether excessive application of deicing/anti-icing chemicals occurs, and adjust as necessary, consistent with considerations of flight safety. This evaluation shall be carried out by the personnel most familiar with the particular aircraft and flight operations in question (versus an outside entity such as the airport authority). The use of alternative deicing/anti-icing agents as well as containment measures for all applied chemicals

shall be considered. Also, the following BMP options (or their equivalents) shall be considered for reducing deicing fluid use:

i. Forced-air deicing systems;

ii. Computer-controlled fixed-gantry systems;

iii. Infrared technology;

iv. Hot water;

v. Varying glycol content to air temperature;

vi. Enclosed-basket deicing trucks;

vii. Mechanical methods;

viii. Solar radiation;

ix. Hangar storage;

x. Aircraft covers; and

xi. Thermal blankets for MD-80s/DC-9s.

The use of ice-detection systems and airport traffic flow strategies and departure slot allocation systems shall also be considered.

(c) Management of Runoff

Where deicing/anti-icing operations occur, owners shall describe and implement a program to control or manage contaminated runoff to reduce the amount of pollutants being discharged from the site. The plan shall describe the controls used for collecting or containing contaminated melt water from collection areas used for disposal of contaminated snow. The following BMPs (or their equivalents) shall be considered:

i. Establishing a dedicated deicing facility with a runoff collection/recovery system;

ii. Using vacuum/collection trucks;

iii. Storing contaminated storm water/deicing fluids in tanks and releasing controlled amounts to a publicly owned treatment works;

iv. Collecting contaminated runoff in a wet pond for natural decomposition (be aware of attracting wildlife that may be hazardous to flight operations); and

v. Directing runoff into vegetative swales or other infiltration measures.

The plan shall consider the recovery of deicing/anti-icing materials when these materials are applied during non-precipitation events (e.g., covering storm sewer inlets, using booms, installing absorptive interceptors in the drains, etc.) to prevent these materials from later becoming a source of storm water contamination. Used deicing fluid shall be recycled whenever possible.

(d) Routine Facility Inspections

The inspection frequency shall be specified in the plan. At a minimum, inspections shall be conducted once per month during deicing/anti-icing season (e.g., October through April for most airports). If deicing occurs before or after this period, the inspections shall be expanded to include all months during which deicing chemicals may be used. Also, if significantly or deleteriously large quantities of deicing chemicals are being spilled or discharged, or if water quality impacts have been reported, the inspection frequency shall be increased to weekly until such time as the chemical spills/discharges or impacts are reduced to acceptable levels. The Director may specifically require increased inspections and the SWPPP to be reevaluated as necessary.

(e) Comprehensive Site Compliance Evaluation.

The annual site compliance evaluations shall be conducted by qualified facility personnel during periods of actual deicing operations, if possible. If not practicable during active deicing or if the weather is too inclement, the evaluations shall be conducted when deicing operations are likely to occur and the materials and equipment for deicing are in place.

7. Transportation Equipment, Industrial or Commercial Machinery

a. Discharges Covered Under This Section

The requirements listed under this section apply to storm water discharges associated with industrial activity from transportation equipment, industrial or commercial machinery manufacturing facilities (commonly described by SIC Major Group 35 [except SIC Code 357], and SIC Major Group 37 [except SIC Code 373]).

b. Effluent Limitations

Not applicable.

c. Analytical Monitoring

Not applicable

d. Pollution Prevention Plan Requirements

In addition to the requirements of Part I.D.2., the SWPPP shall include, at a minimum, the following items:

(1) Site Description

(a) Site Map

The site map shall identify where any of the following may be exposed to precipitation/ surface runoff: vents and stacks from metal processing and similar operations.

(2) Storm Water Controls

(a) Non-Storm Water Discharges

For facilities that discharge wastewater, other than solely domestic wastewater, to the sanitary sewer system, the permittee shall notify the operator of the sanitary sewer and associated treatment works of its discharge. In such cases, a copy of a notification letter shall be attached to the plan. Any specific permit conditions shall be considered in the plan.

CONDITIONS APPLICABLE TO ALL VPDES PERMITS

A. Monitoring

1. Samples and measurements taken as required by this permit shall be representative of the monitored activity.

2. Monitoring shall be conducted according to procedures approved under Title 40 Code of Federal Regulations Part 136 or alternative methods approved by the U.S. Environmental Protection Agency, unless other procedures have been specified in this permit.

3. The permittee shall periodically calibrate and perform maintenance procedures on all monitoring and analytical instrumentation at intervals that will insure accuracy of measurements.

B. Records

1. Records of monitoring information shall include:

   a. The date, exact place, and time of sampling or measurements;

   b. The individual(s) who performed the sampling or measurements;

   c. The date(s) and time(s) analyses were performed;

   d. The individual(s) who performed the analyses;

   e. The analytical techniques or methods used; and

   f. The results of such analyses.

2. Except for records of monitoring information required by this permit related to the permittee's sewage sludge use and disposal activities, which shall be retained for a period of at least five years, the permittee shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this permit, and records of all data used to complete the application for this permit, for a period of at least 3 years from the date of the sample, measurement, report or application. This period of retention shall be extended automatically during the course of any unresolved litigation regarding the regulated activity or regarding control standards applicable to the permittee, or as requested by the Board.

C. Reporting Monitoring Results

1. The permittee shall submit the results of the monitoring required by this permit not later than the 10th day of the month after monitoring takes place, unless another reporting schedule is specified elsewhere in this permit. Monitoring results shall be submitted to:

Department of Environmental Quality
Tidewater Regional Office
5636 Southern Boulevard
Virginia Beach, VA 23462

2. Monitoring results shall be reported on a Discharge Monitoring Report (DMR) or on forms provided, approved or specified by the Department.

3. If the permittee monitors any pollutant specifically addressed by this permit more frequently than required by this permit using test procedures approved under Title 40 of the Code of Federal Regulations Part 136 or using other test procedures approved by the U.S. Environmental Protection Agency or using procedures specified in this permit, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or reporting form specified by the Department.

4. Calculations for all limitations which require averaging of measurements shall utilize an arithmetic mean unless otherwise specified in this permit.

D. Duty to Provide Information

The permittee shall furnish to the Department, within a reasonable time, any information which the Board may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit or to determine compliance with this permit. The Board may require the permittee to furnish, upon request, such plans, specifications, and other pertinent information as may be necessary to determine the effect of the wastes from his discharge on the quality of state waters, or such other information as may be necessary to accomplish the purposes of the State Water Control Law. The permittee shall also furnish to the Department upon request, copies of records required to be kept by this permit.

E. Compliance Schedule Reports

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit shall be submitted no later than 14 days following each schedule date.

F. Unauthorized Discharges

Except in compliance with this permit, or another permit issued by the Board, it shall be unlawful for any person to:

1. Discharge into state waters sewage, industrial wastes, other wastes, or any noxious or deleterious substances; or

2. Otherwise alter the physical, chemical or biological properties of such state waters and make them detrimental to the public health, or to animal or aquatic life, or to the use of such waters for domestic or industrial consumption, or for recreation, or for other uses.

G. Reports of Unauthorized Discharges

Any permittee who discharges or causes or allows a discharge of sewage, industrial waste, other wastes or any noxious or deleterious substance into or upon state waters in violation of Part II F; or who discharges or causes or allows a discharge that may reasonably be expected to enter state waters in violation of Part II F, shall notify the Department of the discharge immediately upon discovery of the discharge, but in no case later than 24 hours after said discovery. A written report of the unauthorized discharge shall be submitted to the Department, within five days of discovery of the discharge. The written report shall contain:

1. A description of the nature and location of the discharge;
2. The cause of the discharge;
3. The date on which the discharge occurred;
4. The length of time that the discharge continued;
5. The volume of the discharge;
6. If the discharge is continuing, how long it is expected to continue;
7. If the discharge is continuing, what the expected total volume of the discharge will be; and
8. Any steps planned or taken to reduce, eliminate and prevent a recurrence of the present discharge or any future discharges not authorized by this permit.

Discharges reportable to the Department under the immediate reporting requirements of other regulations are exempted from this requirement.

H. Reports of Unusual or Extraordinary Discharges

If any unusual or extraordinary discharge including a bypass or upset should occur from a treatment works and the discharge enters or could be expected to enter state waters, the permittee shall promptly notify, in no case later than 24 hours, the Department by telephone after the discovery of the discharge. This notification shall provide all available details of the incident, including any adverse affects on aquatic life and the known number of fish killed. The permittee shall reduce the report to writing and shall submit it to the Department within five days of discovery of the discharge in accordance with Part II I 2. Unusual and extraordinary discharges include but are not limited to any discharge resulting from:

1. Unusual spillage of materials resulting directly or indirectly from processing operations;
2. Breakdown of processing or accessory equipment;
3. Failure or taking out of service some or all of the treatment works; and
4. Flooding or other acts of nature.

I. Reports of Noncompliance

The permittee shall report any noncompliance which may adversely affect state waters or may endanger public health.

1. An oral report shall be provided within 24 hours from the time the permittee becomes aware of the circumstances. The following shall be included as information which shall be reported within 24 hours under this paragraph:

   a. Any unanticipated bypass; and

   b. Any upset which causes a discharge to surface waters.

2. A written report shall be submitted within 5 days and shall contain:

   a. A description of the noncompliance and its cause;

   b. The period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and

   c. Steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

   The Board may waive the written report on a case-by-case basis for reports of noncompliance under Part II I if the oral report has been received within 24 hours and no adverse impact on state waters has been reported.

3. The permittee shall report all instances of noncompliance not reported under Parts II I 1 or 2, in writing, at the time the next monitoring reports are submitted. The reports shall contain the information listed in Part II I 2.

NOTE: The immediate (within 24 hours) reports required in Parts II G, H and I may be made to the Department's Regional Office at (757) 518-2000 (voice), and online via http://www.deq.virginia.gov/prep/h2rpt.html . For reports outside normal working hours, leave a message and this shall fulfill the immediate reporting requirement. For emergencies, the Virginia Department of Emergency Services maintains a 24 hour telephone service at 1-800-468-8892.

J. Notice of Planned Changes

1. The permittee shall give notice to the Department as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required only when:

   a. The permittee plans alteration or addition to any building, structure, facility, or installation from which there is or may be a discharge of pollutants, the construction of which commenced:

      (1) After promulgation of standards of performance under Section 306 of Clean Water Act which are applicable to such source; or

(2) After proposal of standards of performance in accordance with Section 306 of Clean Water Act which are applicable to such source, but only if the standards are promulgated in accordance with Section 306 within 120 days of their proposal;

b. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations nor to notification requirements specified elsewhere in this permit; or

c. The alteration or addition results in a significant change in the permittee's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan.

2. The permittee shall give advance notice to the Department of any planned changes in the permitted facility or activity which may result in noncompliance with permit requirements.

K. Signatory Requirements

1. Applications. All permit applications shall be signed as follows:

a. For a corporation: by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;

b. For a partnership or sole proprietorship: by a general partner or the proprietor, respectively; or

c. For a municipality, state, federal, or other public agency: By either a principal executive officer or ranking elected official. For purposes of this section, a

principal executive officer of a public agency includes: (i) The chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency.

2. Reports, etc. All reports required by permits, and other information requested by the Board shall be signed by a person described in Part II K 1, or by a duly authorized representative of that person. A person is a duly authorized representative only if:

   a. The authorization is made in writing by a person described in Part II K 1;

   b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.); and

   c. The written authorization is submitted to the Department.

3. Changes to Authorization. If an authorization under Part II K 2 is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Part II K 2 shall be submitted to the Department prior to or together with any reports, or information to be signed by an authorized representative.

4. Certification. Any person signing a document under Parts II K 1 or 2 shall make the following certification:

   "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

L. Duty to Comply

The permittee shall comply with all conditions of this permit. Any permit noncompliance constitutes a violation of the State Water Control Law and the Clean Water Act, except that noncompliance with certain provisions of this permit may constitute a violation of the State Water Control Law but not the Clean Water Act. Permit

noncompliance is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application.

The permittee shall comply with effluent standards or prohibitions established under Section 307(a) of the Clean Water Act for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the Clean Water Act within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if this permit has not yet been modified to incorporate the requirement.

M. Duty to Reapply

If the permittee wishes to continue an activity regulated by this permit after the expiration date of this permit, the permittee shall apply for and obtain a new permit. All permittees with a currently effective permit shall submit a new application at least 180 days before the expiration date of the existing permit, unless permission for a later date has been granted by the Board. The Board shall not grant permission for applications to be submitted later than the expiration date of the existing permit.

N. Effect of a Permit

This permit does not convey any property rights in either real or personal property or any exclusive privileges, nor does it authorize any injury to private property or invasion of personal rights, or any infringement of federal, state or local law or regulations.

O. State Law

Nothing in this permit shall be construed to preclude the institution of any legal action under, or relieve the permittee from any responsibilities, liabilities, or penalties established pursuant to any other state law or regulation or under authority preserved by Section 510 of the Clean Water Act. Except as provided in permit conditions on "bypassing" (Part II U), and "upset" (Part II V) nothing in this permit shall be construed to relieve the permittee from civil and criminal penalties for noncompliance.

P. Oil and Hazardous Substance Liability

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties to which the permittee is or may be subject under Sections 62.1-44.34:14 through 62.1-44.34:23 of the State Water Control Law.

Q. Proper Operation and Maintenance

The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit. Proper operation and maintenance also includes effective plant performance, adequate funding, adequate staffing, and adequate laboratory and process controls, including appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary

facilities or similar systems which are installed by the permittee only when the operation is necessary to achieve compliance with the conditions of this permit.

R. Disposal of Solids or Sludges

Solids, sludges or other pollutants removed in the course of treatment or management of pollutants shall be disposed of in a manner so as to prevent any pollutant from such materials from entering state waters.

S. Duty to Mitigate

The permittee shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this permit which has a reasonable likelihood of adversely affecting human health or the environment.

T. Need to Halt or Reduce Activity not a Defense

It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

U. Bypass

1. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. The permittee may allow any bypass to occur which does not cause effluent limitations to be exceeded, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions of Parts II U 2 and U 3.

2. Notice

   a. Anticipated bypass. If the permittee knows in advance of the need for a bypass, prior notice shall be submitted, if possible at least ten days before the date of the bypass.

   b. Unanticipated bypass. The permittee shall submit notice of an unanticipated bypass as required in Part II I.

3. Prohibition of Bypass

   a. Bypass is prohibited, and the Board may take enforcement action against a permittee for bypass, unless:

      (1) Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;

      (2) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; and

(3) The permittee submitted notices as required under Part II U 2.

b. The Board may approve an anticipated bypass, after considering its adverse effects, if the Board determines that it will meet the three conditions listed above in Part II U 3 a.

V. Upset

1. An upset constitutes an affirmative defense to an action brought for noncompliance with technology based permit effluent limitations if the requirements of Part II V 2 are met. A determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is not a final administrative action subject to judicial review.

2. A permittee who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:

a. An upset occurred and that the permittee can identify the cause(s) of the upset;

b. The permitted facility was at the time being properly operated;

c. The permittee submitted notice of the upset as required in Part II I; and

d. The permittee complied with any remedial measures required under Part II S.

In any enforcement proceeding the permittee seeking to establish the occurrence of an upset has the burden of proof.

W. Inspection and Entry

The permittee shall allow the Director, or an authorized representative, upon presentation of credentials and other documents as may be required by law, to:

1. Enter upon the permittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this permit;

2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this permit;

3. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this permit; and

4. Sample or monitor at reasonable times, for the purposes of assuring permit compliance or as otherwise authorized by the Clean Water Act and the State Water Control Law, any substances or parameters at any location.

For purposes of this section, the time for inspection shall be deemed reasonable during regular business hours, and whenever the facility is discharging. Nothing contained herein shall make an inspection unreasonable during an emergency.

X. Permit Actions

Permits may be modified, revoked and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

Y. Transfer of Permits

1. Permits are not transferable to any person except after notice to the Department. Except as provided in Part II Y 2, a permit may be transferred by the permittee to a new owner or operator only if the permit has been modified or revoked and reissued, or a minor modification made, to identify the new permittee and incorporate such other requirements as may be necessary under the State Water Control Law and the Clean Water Act.

2. As an alternative to transfers under Part II Y 1, this permit may be automatically transferred to a new permittee if:

   a. The current permittee notifies the Department at least 30 days in advance of the proposed transfer of the title to the facility or property;

   b. The notice includes a written agreement between the existing and new permittees containing a specific date for transfer of permit responsibility, coverage, and liability between them; and

   c. The Board does not notify the existing permittee and the proposed new permittee of its intent to modify or revoke and reissue the permit. If this notice is not received, the transfer is effective on the date specified in the agreement mentioned in Part II Y 2 b.

Z. Severability

The provisions of this permit are severable, and if any provision of this permit or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit, shall not be affected thereby.

NAVSUPPACT HAMPTON ROADS INSTRUCTION 5090.4

From: Commanding Officer, Naval Support Activity Hampton Roads

Subj: FISHING PROGRAM

Ref: (a) 32 C.F.R. Section 190
(b) DODINST 4715.3
(c) OPNAVINST 5090.1(Series)
(d) Installation Natural Resource Management Plan
(e) P.L. 105-85 (Sikes Act Improvement Amendments of 1997)
(f) E.O. 12962
(g) Virginia Freshwater and Saltwater Fishing Regulations

Encl: (1) Installation Fishing Areas
(2) Example Permit
(3) Installation Waiver

1. Purpose. This instruction sets forth the authority, responsibilities, procedures, and policies for fishing on board Naval Support Activity (NAVSUPPACT) Hampton Roads Portsmouth Annex (PA) and Northwest Annex (NWA) at the locations in enclosure (1).

2. Policy

a. References (a) through (g) allow for recreational fisheries management on military installations, consistent with military requirements.

b. Violations of reference (g) or this instruction may result in suspension or revocation of NWA and/or PA fishing privileges. Department of Defense (DoD) law enforcement and/or Environmental Division personnel are authorized by the Commanding Officer (CO) to suspend a fishing permit until adjudication by the Legal Officer.

3. Definitions

a. Fishing. Refers to the harvest or attempted harvest of finfish species for sport or self-consumption.

FOR OFFICIAL USE ONLY - PRIVACY SENSITIVE
Any misuse or unauthorized disclosure may result in both civil and criminal penalties

b. Catch and Release. Practice within recreational fishing intended as a technique of conservation. After capture, the fish are unhooked and returned to the water.

c. Tidal Waters (Saltwater). Tidal waters include the shorelines of the Elizabeth River along the seawall at PA.

4. Responsibilities

a. Environmental Division. The Environmental Division, part of the Public Works Department, has a Natural Resources (NR) branch responsible for the management of fish and wildlife resources, including management and approval of fishing locations; and enforcement of federal, state, and local fish and wildlife laws and regulations.

b. Public Safety Department. Law Enforcement Division personnel will provide assistance and support to NR staff and Conservation Officers with state law enforcement issues upon request and where applicable. Installation security officers have the power to apprehend and arrest violators for violations occurring at places over which the Navy has law enforcement jurisdiction.

c. Anglers

1. All personnel who exercise their privilege to fish onboard PA and NWA are responsible for complying with this instruction and abide by all Federal and State statutes and regulations incorporated herein by reference, and directives of NR staff.

2. Rec Access. Each user must set up an account within Rec Access at nwa.recaccess.com. After registering, users will be given a Rec Access ID Number ("RAID #") which will be unique to each individual angler. Accounts previously created are still valid.

d. Base Personnel. Military and civilian personnel who observe or acquire credible information concerning violations of fish and wildlife laws and regulations, and this instruction, shall report information to the installation NR Manager.

5. Regulations and Procedures

a. Authorized Personnel. For reasons of safety and security, and pending changes in Force Protection Condition (FPCON) constraints, the following persons are authorized to

fish on PA and NWA with proper credentials (Common Access Card (CAC), military/civilian retiree, and/or dependent identification card) must be carried at all times and presented to security personnel, NR staff, or their representatives when requested. The authorized personnel include:

(1) Active duty military personnel, with current DoD CAC

(2) Retired military personnel, with DD Form 2 (Retired)

(3) Dependents of active duty/retired military personnel, with current DD Form 1173

(4) Active and retired federal civil service employees, with a current CAC/retiree CAC

If allowable under existing FPCON, authorized patrons may be accompanied by two guests. All guests must adhere to applicable fish and wildlife laws and regulations, and this instruction. Sponsors are responsible for their guests and must accompany them at all times.

b. Permit. An installation permit is required in order to fish on NWA and PA; all patrons over the age of 18 and guests are required to purchase an installation fishing permit. Permits are available through the online Rec Access website at nwa.recaccess.com. The permit provides fishing access to PA and NWA only. Possession of an installation permit does not authorize access to the installation, convey, or bestow any other rights or privileges in enclosure (2).

c. Installation Waiver. Enclosure (3) is the acceptance of responsibility in the event an injury occurs while fishing on the installation and required prior to purchasing/signature of a permit.

d. License. All patrons and guests must comply with Virginia State fishing regulations and licensing requirements. Dependents and guests under the age of 12 must be directly supervised by an adult 18 years or older who holds a valid fishing license.

e. Fishing Regulations. Reference (g) outlines state specific rules and regulations. Violators will be held accountable.

(1) Hook and line, and rod and reel are the only lawful methods of take.

(2) Cast nets and trot lines are prohibited.

(3) It is prohibited to use life fish as bait or release any species of fish into managed ponds at NWA, except fish caught from the respective pond.

(4) NWA is catch and release only.

(5) Only natural bait (e.g., crickets, shrimp, worms, cut bait) and artificial bait may be used. Minnows are prohibited at NWA.

(6) Consumption of alcoholic beverages is prohibited during any fishing activity or event to which this instruction applies.

(7) Launching boats from NAVSUPPACT Hampton Roads properties is not permitted.

(8) Littering on station is prohibited. All refuse shall be placed in a designated trash container or carried out. This includes all refuse generated from fishing activities (monofilament line, hooks, etc.).

(9) CO, Officer in Charge, or NR Managers may close specific fishing areas at any time. Such announcements will be posted online or at the NR Office. Personnel may not use water bodies in areas not listed in enclosure (1) of this instruction without specific authorization by the NR Manager.

6. Rates. Fees for fishing permits are at the discretion of the NR program and may change year to year depending on program requirements

7. Public Safety Department. Law Enforcement Division personnel will provide assistance and support to NR staff and Conservation Officers with state law enforcement issues upon request and where applicable. Installation security officers have the power to apprehend and arrest violators for violations occurring at places over which the Navy has law enforcement jurisdiction.

8. Records Management. Records created, as a result of this instruction, regardless of media and format, must be managed per Secretary of the Navy Manual 5210.1 of January 2012

9. Review and Effective Date. Per OPNAVINST 5215.17A, the Environmental Department will review this instruction annually on the anniversary of its effective date to ensure applicability, currency, and consistency with the Federal, DoD, SECNAV, and Navy policy and statutory authority using OPNAV 5215/40 Review of Instruction. This instruction will automatically expire 5 years after effective date unless reissued or canceled prior to the 5-year anniversary date, or an extension has been granted.

(4) Example Hunter's and Parking Permit
(5) Health and Safety Information

1. Purpose. This instruction sets forth the authority, responsibilities, procedures, and policies for hunting and trapping onboard Naval Support Activity (NAVSUPPACT) Hampton Roads Northwest Annex (NWA).

2. Policy

a. Hunting and trapping at NAVSUPPACT Hampton Roads NWA is authorized and controlled by the installation Commanding Officer (CO) through locally published NAVSUPPACT Hampton Roads NWA instructions and references (a) through (h).

b. Violations of applicable federal and state hunting and trapping regulations and wildlife conservation statutes may result in criminal prosecution in the United States District Court and/or under the Uniform Code of Military Justice, as well as suspension or revocation of NAVSUPPACT Hampton Roads NWA hunting and trapping privileges. Department of Defense (DoD) law enforcement and/or Environmental Division personnel are

FOR OFFICIAL USE ONLY - PRIVACY SENSITIVE
Any misuse or unauthorized disclosure may result in both civil and criminal penalties

authorized by the CO to suspend a hunter or trappers' permit until adjudication.

3. Responsibilities

a. Environmental Division. The Environmental Division, part of the Public Works Department, has a Natural Resources (NR) branch responsible for the management of fish and wildlife resources, including control of game harvesting, management, and approval of hunting locations; and enforcement of federal, state, and local laws and regulations.

b. Public Safety Department. Law Enforcement Division personnel will provide assistance and support to NR staff and Conservation Officers with state law enforcement issues upon request and where applicable. Installation security officers have the power to apprehend and arrest violators for violations occurring at places over which the Navy has law enforcement jurisdiction.

c. Hunters/Trappers

(1) All personnel who exercise their privilege to hunt and/or trap onboard NAVSUPPACT Hampton Roads NWA are responsible for complying with this instruction, Installation specific regulations listed in Enclosure (1), and all federal and state statutes and regulations, including but not limited to References (e) and (f).

(2) Recreation Access. Used to administer the sale and check in/out component of the natural resources hunting and trapping program. Each user must set up an account within Rec Access at nwa.recaccess.com. After registering, users will be given a Recreation (Rec) Access ID Number (RAID #) which will be unique to each individual. Accounts previously created are still valid.

d. Sportsman Quality Management Board. The Sportsman Quality Management Board is a group of approved and waivered volunteers that support the installations natural resources hunting and trapping program. Volunteers are managed by the NR Manager and help support the installation program through maintaining trails, tree stands, and assisting with harvested game.

e. Base Personnel. Military and civilian personnel who observe or acquire credible information concerning violations of fish and wildlife laws and regulations, and this instruction, shall report information to the installation Natural Resource Manager.

4. Regulations/Procedures

a. Authorized Personnel. For reasons of safety and security, and pending changes in Force Protection Condition (FPCON) constraints, the following persons are authorized to hunt or trap on NAVSUPPACT Hampton Roads NWA. Proper credentials (Common Access Card (CAC), military/civilian retiree, and/or dependent identification card) must be carried at all times and presented to NAVSUPPACT Hampton Roads NWA security personnel, NR staff, or their representatives when requested. Authorized personnel include:

(1) Active duty military personnel, with current DoD CAC

(2) Retired military personnel, with DD Form 2 (Retired)

(3) Dependents of active duty/retired military personnel, with current DD Form 1173

(4) Active and retired federal civil service employees, with a current CAC/retiree CAC

If allowable under existing FPCON, authorized patrons may be accompanied by one guest. All guests must adhere to applicable federal and state statutes and regulations, and this instruction. Sponsors are responsible for their guests and must accompany them at all times, including sitting on the same stand.

b. Permits/Licenses. Installation permits are required in order to hunt/trap on NAVSUPPACT Hampton Roads NWA; all patrons and guests must purchase an installation hunting/trapping permit. Permits are available through the online Rec Access website at nwa.recaccess.com. The permits provide hunting/trapping access to NAVSUPPACT Hampton Roads NWA only, are valid continuously from 1 August to 31 July, and must be carried at all times. Possession of an installation permit does not authorize access to the installation, convey, or bestow any other rights or privileges. In order to obtain a permit, hunters/trappers must complete items 1-3 prior to purchasing a permit and items 4-6 to validate the permit for hunting:

(1) Installation Waiver. Enclosure (2) is the acceptance of responsibility in the event an injury occurs while hunting/trapping on the installation. Validation of Installation Waiver will be added to each user's account following completion. Required prior to purchasing permit

(2) Hunter Safety Card/Certificate. All hunters must have attended a hunter safety course from any state prior to hunting on NAVSUPPACT Hampton Roads NWA. Validation of Hunter Safety Card or Certificate will be added to each user's account following completion. Required prior to purchasing a permit. See Enclosure (3) for example hunter and parking permit.

(3) Indoctrination Brief. All persons wishing to hunt on NAVSUPPACT Hampton Roads NWA are required to watch and/or attend, an Indoctrination brief available on Rec Access and/or in person by the NR Manager. This brief will help hunters familiarize themselves with base regulations, hunting areas, and all procedures not covered herein. Required prior to purchasing a permit.

(4) Weapons Registration. Weapons registration is required annually per reference (d), enclosure (3) prior to transporting a firearm on the installation. Proof of completion shall be provided to the NR Manager prior to validating a permit.

(5) Weapons Qualifications. Hunters must qualify with bow, muzzleloader, and/or shotgun at least every three years. Validation of weapons qualification will be added to each user's account following completion.

(6) License. A valid Virginia/North Carolina hunting and/or trapping license is required for each person for the state in which they plan to hunt or trap game species on NAVSUPPACT Hampton Roads NWA.

c. Hunting/Trapping Regulations. See Enclosure (1) for installation specific rules and regulations.

d. Health/Safety. See Enclosure (4) for health and safety information.

5. Rates. Fees for NAVSUPPACT Hampton Roads NWA hunting and trapping permits are at the discretion of the NR program and may change year to year depending on program requirements.

6. Records Management. Records created, as a result of this instruction, regardless of media and format, must be managed per reference (g).

7. Review and Effective Date. Per OPNAVINST 5215.17A, the Environmental Department will review this instruction annually on the anniversary of its effective date to ensure applicability, currency, and consistency with the Federal, DoD, SECNAV, and Navy policy and statutory authority using OPNAV 5215/40 Review of Instruction. This instruction will automatically expire five years after effective date unless reissued or canceled prior to the five year anniversary date, or an extension has been granted.

J. P. KLINE

Distribution: (NAVSUPPACTHRINST 5216.1V)
Lists I through IV

Northwest Annex Hunting and Trapping Regulations

1. General Regulations. All local, state, and Federal laws and regulations apply to installation property, unless specifically modified by this rules and regulations product.

2. Enforcement. The Natural Resource Manager, his/her agents, Public Safety Department, and State Wildlife Law Enforcement officers are authorized to conduct inspections of hunters/trappers for the purpose of checking bag limits, type of game, means used to take game, and for any other wildlife conservation restrictions.

3. Weapons

   a. Per this instruction, all firearms, including bows and crossbows, intended for use on NWA must be registered through Security. Registered firearms are permitted for hunting during hunting activities on NWA ONLY. Firearms are not permitted on any other installation under NSA Hampton Roads. Enclosure (3) of this instruction is available and should be filled out and submitted to the Natural Resource Manager.

   b. Approved firearms on NWA include bow, crossbow, muzzleloader, and shotgun.

      i. Shotgun must be 20 gauge or larger and are authorized for buckshot (#1, 0, 00, 000) or slugs for deer; turkey hunting requires #2 to #6 shot.
      ii. Muzzleloader must be .45 caliber or larger. Smokeless powder is not authorized on NWA.

   c. Pistols and rifles, with the exception of muzzleloaders, are not permitted on board NWA.

   d. Loaded firearms are prohibited while walking to and from a tree stand and while climbing.

   e. Firearms must remain unloaded with safety on and trigger lock installed while transporting in a vehicle farthest point away from ammo.

4. Blaze Orange Requirements

a. A solid blaze colored (blaze orange or blaze pink) hat or solid blaze colored upper body clothing that is visible from 360 degrees while walking to and from a tree stand or hunting area is required at all times.

b. Display at least 100 square inches of solid blaze colored material at shoulder level within body reach and visible from 360 degrees during general firearms season. Turkey hunting and bow hunting during bow hunting season only are exempt.

c. Hunting from an enclosed ground blind (pop-up, chair, box, etc.) that conceals view shall display at least 100 square inches of solid blaze colored material, visible from 360 degrees attached to or immediately above the blind. This blaze color is in addition to any worn on the hunter's person during open firearms season.

5. Deer Hunting

a. Seasons. NWA hunting seasons follow state rules and regulations provided in references (d) and (e); however, hunting is only permitted on Monday, Tuesday, Thursday, and Saturday.

b. Bag Limits. Daily/Season bag limits for the Installation follow state rules and regulations as described in reference (d) and (e) for each season.

c. Deer Management Assistance Program (DMAP). Yearly, NWA applies for DMAP and may receive doe tags for hunters to use in place of their personal tag in Virginia only. Hunters are still required to check harvested game in through the VDGIF. Tags will be available at the Game Check Station until they are all used. DMAP tags must be used before using your own tag when harvesting does in Virginia.

d. Check-in/Out

i. Hunters are required to check in and out for hunting. Hunters may log in to Rec Access via their smartphone, tablet, or personal computer at nwa.recaccess.com to check in or out of a tree stand/area. Hunters may also check in using the tablet available at the Game Check Station, BLDG 295. Hunters are required to check for special notices and area closures, which will be posted online and on the bulletin board at the Game Check Station, BLDG 295.

ii. Check-in is permitted one and a half (1.5) hours prior to a hunter's arrival on NWA and check out no later than one and a half (1.5) hours after sunset. Under no circumstances may a hunter leave the installation while checked in to hunt. The earliest you can check in is 1.5 hours before sunrise. Failure to conform to these requirements will result in a violation.

iii. Hunters may hunt in only one hunting stand or bow hunting area at a time and may not enter other stands/bow hunting areas at any time unless tracking a wounded animal.

iv. Dependent hunters under 16 years of age must be accompanied by, and be under the positive supervision of, an adult 21 years of age or older who has completed all requirements to hunt on NWA. Positive supervision means:

1. within clear and full view of the adult sponsor;
2. within such a distance that clear, verbal communication can be maintained; and,
3. in such a position as to be influenced by the adult sponsor, if necessary.

e. Hunting Areas/Stands. Figure 1 identifies authorized hunting stands and bow hunting areas. Maps are available online at nwa.recaccess.com or at the Game

f. Check Station. The CO/OIC or Natural Resource Manager may secure tree stands/areas at any time during special events, training exercises, or for safety concerns.

i. Any stand or blind established for the purpose of hunting shall not have exclusive use rights.

ii. Hunters are permitted to climb or attach a temporary stand within 50 yards of designated, permanent tree stand locations.

iii. Numbered tree stands identify Virginia stands and letters identify North Carolina stands.

iv. Bow hunting only areas include the Supply Woods Areas (00, 01, and 02), Barracks Woods, and Coast Guard Woods. You must be hunting from an elevated stand in Coast Guard Woods. Hunters must stay within the parameters identified for each area.

v. Hunters may not place a tree stand or ground blind in a hunting area more than 45 days prior to the opening day of the deer-hunting season. Additionally, all hunters must remove all portable tree stands and ground blinds within 45 days of the last day of the deer-hunting season. The Natural Resources program may confiscate portable stands found within hunting areas outside of authorized dates.

vi. Anyone caught stealing, damaging, or defacing a tree stand, or who interferes with or disrupts the lawful taking of wildlife by another person, will be prosecuted to the maximum extent possible.

vii. Hunters are permitted to clear limbs no greater than 2" in diameter to create shooting lanes. Felling trees of any size is prohibited and will result in a violation.

viii. Use of a safety belt or harness is mandatory when hunting from any ladder or climbing tree stand. Stand-alone platform stands are exempt from this requirement.

ix. Hunters are permitted to use bicycles on trails to access tree stands or areas. No motorized vehicles are permitted.

g. Harvested Game

i. All hunters are required to notch their tag per state regulations prior to moving the animal from the spot of kill per reference (d) and (e). This includes use of a DMAP tag in Virginia. DMAP tags must be notched and in your possession at all times while deer is in your possession.

ii. All deer harvested on NWA shall be processed through the Game Check Station, BLDG 295 by a Sportsman Quality Management Board Volunteer, NR Manager, or other personnel as assigned prior to butchering or removing from base during the hunting season. If there is no one present at the Game Check Station, please contact the Hunter Hotline at 757-421-8256 only for checking in harvested game. Deer harvest data collected is submitted to the game department for analysis. If someone is not available to assist, hunters are responsible for data collection per instructions at the game check station.

iii. Deer may be field dressed at the location of kill or at the Game Check Station (Building 295) during the hunting season. All hunters must ensure cleanliness of the Game Check Station and be respectful of base personnel and residents while transporting game across the installation.

h. Special Authority Hunts. When determined to be necessary for game management, to protect human health and safety, or to provide hunt opportunities for persons with disabilities, special hunts may occur

(deer drives, wounded warrior hunts, etc.). Certain permit requirements may be authorized and approved to allow additional hunters access. Scheduling and oversight of special authority hunts will be the responsibility of the installation Natural Resources Manager.

6. Spring Turkey Hunting

a. Seasons. NWA spring turkey hunting season follows state rules and regulations provided in references (d) and (e); however, hunting is only permitted on lottery drawn hunt days and per installation Natural Resources Manager.

b. Bag Limits. One turkey per day per person.

c. Lottery. Hunters interested in Spring Turkey season must possess a validated installation hunting permit in order to enter the lottery. The lottery will be run via Rec Access.

d. Turkey Hunting Areas. Areas available subject to change per the Natural Resources Manager. Firearms restrictions are still relevant. Bow only areas must use bow and firearms are permitted in other areas.

e. Day of Hunt. The hunting day will be from 30 minutes before sunrise until 1200 or as otherwise directed.

f. Harvested Game. All harvested turkeys shall be reported to the Natural Resources Manager.

g. Authorized Hunters. Each hunter may bring one guest depending on FPCON requirements at the time. Guest must meet all the requirements as the sponsor. Authorized hunters must have purchased an installation hunting permit prior to entering the lottery.

7. Trapping. All areas open to hunting are open to trapping. Trapping seasons, legal traps, and methods are announced annually in references (d) and (e). Trappers are directed

to contact the Natural Resource Manager for specific details and regulations pertaining to trapping on NWA.

8. Wounded Game. Hunters must make every reasonable effort to retrieve wounded game. Hunter's/hunt captains are encouraged to assist others in tracking and recovering wounded game. Hunter's may not pursue wounded game into an adjacent hunting area until first checking in from his/her assigned area and checking out a new area, unless the hunter is in pursuit of a recently wounded animal and following an active and obvious blood trail. Hunters must cease tracking efforts one and a half (1.5) hours after sunset and come back the next day.

9. Scouting

   a. Scouting is defined as looking for game, game trails, or signs; preparing for hunting by searching out hunting locations or placing stands. Firearms may not be carried into the field when signed out for scouting.

   b. Unless closed for operational or security reasons, all hunting areas are open for scouting prior to the first day of hunting season on Wednesday, Friday and Sunday during the season. Hunters interested in scouting shall use the Rec Access website and check out using the Scouting Permit.

10. Parking

   a. Parking permit for the hunting season will be provided following the purchase of a hunting/trapping permit.

   b. Parking permit must be displayed on the dashboard of your vehicle while parked in designated hunter-parking areas ONLY.

   c. Vehicles are restricted to paved roads only. Off-road vehicular use and driving on dirt/grassy farm roads are prohibited. Do not block any roadways, firebreaks, or gates. Penalties/parking tickets may be warranted.

11. Spotlighting. It is unlawful for any person to cast the rays of an artificial light on any NWA field or wooded area at any time. This restriction does not apply to law enforcement personnel exercising official duties; Environmental Division representatives conducting official population studies; or hunters who are attempting to locate wounded or dead deer.

12. Baiting. Attracting wildlife by baiting is NOT permitted on the installation.

13. Wanton Waste. Animals may not be deliberately killed and left in the field. Hunters should make every effort possible to retrieve lost or crippled game. All game killed and found by the hunter will be applied to a hunter's bag limit, regardless of condition. Cases of wanton waste will be prosecuted to the maximum extent possible. Hunters are encouraged to utilize as much of all harvested animals as possible.

14. Other Wildlife. Protected wildlife such as songbirds, hawks, owls, eagles, gulls, herons, egrets, snakes, etc. shall not be hunted or trapped at any time. Killing, capturing, or harassing other non-game species is prohibited. There shall be no open season on any wildlife except for feral swine and coyotes. Report any harvest or sighting of feral swine or coyote to the NR Manager immediately.

15. Permit Suspension/Revocation Policy

a. Violations of state and/or federal game laws will be prosecuted in the U.S. District Court. Violation of NWA policies and regulations will be processed through the Legal Officer. Penalties listed are the maximum that may be awarded for the given infraction. Appeal of punishment imposed by the Legal Officer will be forwarded to the CO, via the Executive Officer.

b. Second and subsequent offenses will be considered if they have occurred within the past 5 years. These punishments are for routine incidents. Should an incident be aggravated or the perpetrator be

uncooperative or unwilling to abide by the terms of a punishment, more severe punishments may be awarded (e.g., a 1st or 2nd offense may merit indefinite suspension of hunting privileges). Penalties may carry over into the following season. A hunter will not get credit for time served after the hunting season ends.

c. Violations and corresponding punishments at the discretion of the NR Manager are as follows:

VIOLATION	**PUNISHMENT**
Check-in/out (failing to sign-in/out, leaving while signed in, checking in earlier than 1.5 hours, not where signed out to, illegal parking)	1st Offense: up to 1 month suspension 2nd Offense: up to 3 month suspension 3rd Offense: up to 1 year suspension 4th Offense: indefinite suspension
Unauthorized "mercy killing"	1st Offense: up to 3 month suspense 2nd Offense: up to 1 year suspension 3rd Offense: indefinite suspension
Violation of NWA season or bag limit, but within State's season or bag limit	1st Offense: up to 3 month suspense and game forefeiture. 2nd Offense: up to 1 year suspension and game forefeiture 3rd Offense: indefinite suspension and game forefeiture
Incorrect firearm/ammo	1st Offense: up to 6 month suspension 2nd Offense: up to 1 year suspension 3rd Offense: indefinite suspension
Littering	1st Offense: warning 2nd Offense: up to 6 month suspension 3rd Offense: 1 year suspension
Failure to wear safety clothing or to use safety belt in tree stand	1st Offense: warning 2nd Offense: up to 6 month suspension

	3rd Offense: up to 1 year suspension
Building/using unapproved blind or stand	1st Offense: up to 6 month suspension 2nd Offense: up to 1 year suspension 3rd Offense: indefinite suspension
Unapproved release of animals onboard NWA	1st Offense: up to 6 month suspension 2nd Offense: up to 1 year suspension 3rd Offense: indefinite suspension
Violation of State's season or bag limit (daily or season, wrong sex/age or species)	1st Offense: up to 1 year suspension and game forefeiture. 2nd Offense: indefinite suspension and game forefeiture
Defacing Property	1st Offense: up to 1 year suspension 2nd Offense: indefinite suspension
No License and/or Base Access Permit	1st Offense: up to 1 year suspension 2nd Offense: indefinite suspension
Unescorted junior hunter	1st Offense: up to 1 year suspension 2nd Offense: indefinite suspension
Failure to check deer at Game Check Station BLDG 295	1st Offense: up to 1 year suspension 2nd Offense: indefinite suspension
"Spotlight" hunting	1st Offense: up to 1 year suspension 2nd Offense: indefinite suspension
Wanton Waste	1st Offense: up to 1 year suspension 2nd Offense: indefinite suspension

Failure to comply with EV Division special announcements	1st Offense: up to 1 year suspension 2nd Offense: indefinite suspension

QUALIFICATION TO POSSESS FIREARMS OR AMMUNITION

PRIVACY ACT STATEMENT

AUTHORITY: 18 U.S.C. 922(g)(9); E.O. 9397.

PRINCIPLE PURPOSE(S): To obtain information to determine if you have been convicted of a crime of domestic violence which would disqualify you from shipping, transporting, possessing or receiving either Government-issued or private firearms or ammunition and to determine if reassignment, reclassification, detailor other administrative action is warranted. Your Social Security Number is solicited solely for purposes of verifying your identity.

ROUTINE USE(S): To the Department of Justice so that such information can be included in the National Instant Criminal Background Check System which may be used by firearm licensees (importers, manufacturers or dealers) to determine whether individuals are qualified to receive or possess firearms and ammunition.

DISCLOSURE: Mandatory for all personnel who are required to certify. Failure to provide the information may result in (1) (military only) the imposition of criminal or administrative penalties for failing to obey a lawful order, and (2) (civilian only) the imposition of administrative penalties, to include removal from Federal service. However, neither your answers nor information or evidence gained by reason of your answers can be used against you in any criminal prosecution for a violation of Title 18, United States Code, Section 922(g)(9), including (military only) prosecutions under the Uniform Code of Military Justice, based on a violation of Section 922(g)(9), for conduct which occurred prior to the completion of this form.
The answers you furnish and any information resulting therefrom, however, may be used against you in a criminal or administrative proceedings if you knowingly and willfully provide false statements or information.

SECTION I – INSTRUCTIONS

An amendment to the Gun Control Act of 1968 (18 U.S.C. 922) makes it a felony for anyone who has been convicted of a misdemeanor crime of domestic violence to ship, transport, possess, or receive firearms or ammunition. It is also a felony for any person to sell or otherwise dispose of a firearm to any person so convicted.

The Department of Defense has, by policy, expanded the prohibitions contained in Title 18 Section 922(g)(9) to those military or civilian personnel who have felony convictions for crimes of domestic violence. Convictions of crimes of domestic violence do not include summary court-martial convictions, the imposition of nonjudicial punishment (Article 15, UCMJ), or deferred prosecutions (or similar alternative dispositions) in civilian courts. Furthermore, a person shall not be considered as having committed a "crime of domestic violence" for purposes of the firearms restriction of the Gun Control Act unless all of the following elements are present:

(1) the person was convicted of a crime;

(2) the offense has as its factual basis the use or attempted use of physical force, or threatened use of a deadly weapon;

(3) the convicted offender was at the time of the offense:
(a) a current or former spouse, parent or guardian of the victim,
(b) a person with whom the victim shared a child in common,
(c) a person who was cohabiting with or has cohabited with the victim as a spouse, parent, or guardian, or (d) a person who was similarly situated to a spouse, parent, or guardian of the victim;

(4) the convicted offender was represented by counsel, or knowingly and intelligently waived the right to counsel;

(5) if entitled to have the case tried by jury, the case was actually tried by jury or the person knowingly and intelligently waived the right to have the case tried by jury;

(6) the conviction has not been expunged or set aside, or the convicted offender has not been pardoned for the offense or had civil rights restored, unless the pardon, expungement, or restoration of civil rights provides that the person may not ship, transport, possess or receive firearms.

SECTION II – QUALIFICATION INQUIRY (Complete and return to your commander or immediate supervisor within 10 days of receipt)

1. HAVE YOU EVER BEEN CONVICTED OF A CRIME OF DOMESTIC VIOLENCE AS DESCRIBED ABOVE: (Initial and date)

YES		NO		I DON'T KNOW (Provide explanation on reverse)

2. IF YOU ANSWERED "YES" TO THE FIRST QUESTION, PROVIDE THE FOLLOWING INFORMATION WITH RESPECT TO THE CONVICTION:

a. COURT/JURISDICTION	b. DOCKET/CASE NUMBER
c. STATUTE/CHARGE	d. DATE SENTENCED (YYYYMMDD)

3. CERTIFICATION I hereby certify that, to the best of my information and belief, all of the information provided by me is true, correct, complete, and made in good faith. I understand that false or fraudulent information provided herein may be grounds for criminal and/or administrative proceedings, to include (if civilian) adverse action, up to and including removal, and (if military) disciplinary action under the Uniform Code of Military Justice. I further understand that I have a continuing obligation to inform my Commander or Supervisor should I be convicted of a crime of domestic violence in the future.

Health and Safety

Lyme disease (LD): A tick-borne bacterial disease that is becoming a significant health problem in Virginia. The primary vector for LD in the east coast states is the deer tick, but all ticks are potential vectors. LD bacterium can be transmitted at any time during the tick's active life cycle, which involves the following stages: larva, nymph, and adult. Small mammals, particularly mice, are the common hosts of the larval and nymphal stages, whereas deer are the primary hosts for adults. Larvae and nymphs are of particular concern because of their small size. Thorough tick checks should be made after being in an area inhabited by ticks.

Symptoms commonly associated with the early stages of the disease include flu-like symptoms such as a headache, chills, fatigue, fever, and sore, aching muscles and joints. A large red rash, usually characteristic of LD, can appear within 3 to 32 days after an infected tick bites a person. The rash most often appears around the bite but can occur elsewhere on the body. However, sportsmen should be aware that not all individuals will develop a rash. If any of the above symptoms develop, consult your physician immediately.

Rabies: May be prevalent in the area. Sportsmen should consult their physician for advice on pre-exposure vaccines. If you are bit and suspect rabies, please consult your physician immediately.

West Nile Virus: Has been confirmed in the State of Virginia from year to year. Symptoms of West Nile Virus often include fever, headache, tiredness, and body aches. These symptoms usually only persist for a few days. To reduce the possible exposure to West Nile Virus, apply insect repellant contain permethrin; do not spray permethrin directly on the skin. Wear long pants and long sleeved shirts weather permitting. Remove and prevent any standing water around your house and yard, including empting and refilling bird baths and pet's water bowl once or twice per week.

Venomous Snakes: Are present on the installation. Canebrake Rattlesnake, Copperhead, and Cottonmouths have all been observed

and present high risk when encountered and bitten. Consult medical help immediately upon being bit by any of these species. **Black Bear**: Are present on the installation. If a bear is encountered make lots of noise, make yourself look big and back away slowly. Take bear spray in the woods with you as a deterrent. Report bear/human conflicts to the NR manager as soon as possible.

Due to the risks of contracting wildlife diseases, hunters are advised to wear rubber gloves while field dressing deer and other game animals.

COMNAVREG MIDLANT INSTRUCTION 11015.3

Subj: NATURAL RESOURCES MANAGEMENT FOR FISH AND WILDLIFE, FERAL ANIMALS, INVASIVE SPECIES, AND CERTAIN PESTS

Ref: (a) E.O. 13112
(b) NAVFAC P-73, Vol. II
(c) OPNAVINST 5090.1 (Series)
(d) 18 U.S. Code § 42
(e) 16 U.S. Code §§ 703-704
(f) 16 U.S. Code §§ 668-668c
(g) 16 U.S. Code § 1361, *et seq.*
(h) 50 C.F.R. pt. 10
(i) 50 C.F.R. pt. 21
(j) SECNAVINST 6401.1 (Series)
(k) NASOCEANAINST 3750.2 (Series)

1. Purpose. To prescribe procedures and assign responsibility for management and control of fish and wildlife, feral animals, invasive species, and certain pests within Commander, Navy Region, Mid-Atlantic (COMNAVREG MIDLANT) Area of Responsibility (AOR). This includes the areas of Naval Weapons Station (WPNSTA), Yorktown (including Cheatham Annex); Naval Air Station (NAS), Oceana (including Naval Auxiliary Landing Field [NALF] Fentress, Camp Pendleton, and Dam Neck Annex); Naval Station (NAVSTA), Norfolk (including St. Julien's Creek Annex and St. Helena Annex); Naval Support Activity (NAVSUPPACT), Norfolk (including Northwest Annex); Naval Amphibious Base (NAVPHIBASE), Little Creek; Fleet and Industrial Supply Center (FISC), Norfolk (Craney Island Fuel Depot and Yorktown Fuel Terminal); and Norfolk Naval Shipyard (NAVSHIPYD Norfolk), Portsmouth, VA (only New Gosport Annex, Scott Center Annex, and South Gate Annex).

2. Policy

a. Per references (a) through (c), the Navy is authorized to take measures to control invasive species.

b. References (d) through (g), the Lacey, Migratory Bird Treaty, Eagle Protection, and Marine Mammal Protection Acts, respectively, protect designated wildlife and control activity involving protected wildlife parts. Violations of these statutes may result in criminal prosecution. Regulations contained in references (h) and (i) implement reference (e) and list species protected by Federal law. Reference (j) describes government responsibility for preventing injury and diseases from animals.

3. Definitions

a. Per reference (a), an "invasive species" is a species that is non-native (or alien to the ecosystem under consideration), and whose introduction causes, or is likely to cause harm to economic, environmental, or human health.

b. Per reference (e), "take" means to pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to pursue, hunt, shoot, wound, kill, trap, capture, or collect.

c. Per reference (c), "pest" refers to any organism (except for microorganisms that cause human or animal diseases) that adversely affects the well-being of humans or animals, attacks real property, supplies, equipment or vegetation, or is otherwise undesirable.

d. Per reference (j), "feral" refers to wild animals and unowned dogs, cats, or other domestic animals.

4. Responsibilities

a. Regional Engineer. The Commanding Officer, Navy Public Works Center/Regional Engineer (PWC/RE), Norfolk, as the Regional Environmental Program Manager, is responsible for management and control of, and for providing services pertaining to, fish and wildlife, feral animals, invasive species, and pests. On behalf of COMNAVREG MIDLANT, the Regional Engineer obtains natural resources permits required by Federal law to carry out this program. Regional Engineer authority, in natural resources matters, may be sub-delegated to a properly trained Regional Natural Resources Program Manager, under the supervision of the Regional Environmental Group Head.

(1) Environmental Services Desk. The PWC/RE Environmental Group provides pest management services through the Environmental Services Department. In addition, the Environmental Services Department responds to routine service calls for removal of non-migratory birds and control of feral animals. These services may be requested through the Environmental Services Desk at (757) 444-7528 during working hours and (757) 444-3477 after hours. Requests for services involving animals, such as sea turtles, marine mammals, game animals and migratory birds or raptors, not under the purview of the Environmental Services Department, will be referred by Service Desk personnel to Natural Resources Managers.

(2) Natural Resources Specialists. Under the direction of the Regional Natural Resources Program Manager, installation Natural Resource Specialists use integrated management practices and procedures to manage fish and wildlife and control certain feral, nuisance and invasive species. Per reference (k), Natural Resources personnel also develop and execute depredation and

dispersal procedures for Bird Animal/Aircraft Strike Hazard (BASH) purposes, and personally supervise these activities when lethal methods are required. Natural Resources Managers, and all other PWC/RE personnel involved in lethal control activities, must be properly trained and duly certified for all weapons employed in accordance with applicable regulations. These personnel are located in Storefront Compliance Departments of the Regional Environmental Group. Natural Resources personnel will also identify bird and/or other animal remains associated with aircraft mishaps in accordance with reference (k).

(3) Conservation Officers. Under the direction of Natural Resources Managers, Conservation Officers enforce fish and wildlife and other natural resources laws and regulations. They may conduct field inspections and employ approved control methods for certain species. Control measures include, but are not limited to, live trapping, relocation, and lethal methods. Conservation Officers also perform wildlife forensic investigations and respond to wildlife damage complaints.

(4) Regional Natural Resources Managers. Regional natural resources managers shall:

(a) Provide direction to natural resources managers and game wardens regarding the management of fish and wildlife and the control of feral animals, invasive species, and pests.

(b) Ensure appropriate approval and procedures are in place to properly issue, store, carry, and use firearms.

(c) Ensure the natural resource manager and game warden weapons qualifications cards are certified and remain current.

(d) Coordinate with local and regional security for required range time, qualifications, and DoD training as needed.

b. NAVSHIPYD Norfolk. Pest control services for NAVSHIPYD Norfolk are currently provided through government contract; these services may be requested through LANTNAVFACENGCOM at (757) 396-5121, extension 200.

c. Security Officers. Security Officers respond to emergency wildlife complaints and requests for services. Security Officers are an after-hours emergency contact point for Natural Resources Managers, Conservation Officers, and pest management personnel. Within existing resources and according to established training priorities, Security Officers also assist Natural Resources personnel in obtaining required weapons qualifications.

d. Airfield Facilities Division Officer. All bird/animal strikes should be investigated and reported in accordance with reference (k). Animal remains will be collected by the Airfield Facilities Division Officer and placed in appropriate BASH freezers located in Building 102 at NAS Oceana and LP-167 at Chambers Field, NAVSTA Norfolk.

e. Aviation Squadrons. All bird strikes must be reported in accordance with reference (k). Airfield Facilities or Natural Resources should be immediately contacted following any strike to ensure bird/animal remains are collected and identified.

5. Review. The Regional Natural Resources Program Manager is responsible for review and update of this instruction.

Subj: POLICY LETTER PREVENTING FERAL CAT AND DOG POPULATIONS ON NAVY PROPERTY

Ref: (a) SECNAVINST 6401-1A, of 16 Aug 94, Veterinary Health Services
(b) AFPMB TIM #37, Guidelines for Reducing Feral/Stray Cat Populations on Military Installations in the United States
(c) OPNAVINST 6250.4B, dtd 27 Aug. 1998, Pest Management Programs
(d) Executive Order 13112 of 3 Feb 1999, Invasive Species

1. This letter clarifies the application of reference (a) regarding the prevention of free roaming (also called wild, feral or stray) cat and dog populations on Navy installations. The objective is to prevent injury or disease to Navy personnel, and eliminate adverse impacts on native wildlife. It requires Navy commands to institute pro-active pet management procedures in order to prevent establishment of free roaming cat and dog populations. Free roaming cats and dogs pose a potential public health threat to personnel on Navy installations, and they pose a threat to wildlife including endangered species and migratory birds.

2. Existing policy at Paragraph 4-2c(4) of reference (a) states "Dogs, cats, and other privately-owned or stray animals will not be permitted to run at large on military reservations." Consistent with this policy, Navy commands must ensure the humane capture and removal of free roaming cats and dogs. Consistent with this requirement, Trap/Neuter/Release (TNR) programs will no longer be established on Navy land. All existing TNR programs on Navy land must be terminated no later than 1 January 2003.

3. Responsible pet ownership is a key factor in eliminating free roaming cat and dog populations. In consultation with supporting Army Veterinary Office, installations shall implement appropriate pet management measures to preclude establishment

Subj: POLICY LETTER PREVENTING FERAL CAT AND DOG POPULATIONS ON NAVY PROPERTY

of feral cat/dog populations, including, but not limited to the following:

Require installation residents to keep and feed pet animals indoors or under close supervision when outdoors (such as on leash and collar or other physical control device - cage, fenced yard etc.).

Encourage neutering or spaying of cats and dogs before they reach reproductive age (exceptions to this policy can be made on a case by case basis as determined by the Installation Commander).

Require routine vaccinations of cats and dogs for rabies and other diseases as required by federal, state and local laws and ordnances. A current vaccination record is required at time of registration of pets.

Require microchipping registration (or other system of pet identification approved by supporting veterinary office) of all pet cats and dogs brought onto installations. Installation residents must register cats and dogs and have pets wear registration or identification tags at all times.

Prohibit the feeding of feral animals on the installation.

Provide educational materials to pet owners regarding installation regulations and general pet management.

Enforce prohibition of abandonment of animals on installations.

Comply with all humane and animal control regulations at the federal, state and local level (and their equivalents in host nation countries).

Navy installations in Europe that do not have a supporting veterinary office contact 100th Medical Detachment (VA HQ) (011) 49-622-177-2868; for all other locations that do not have a supporting veterinary office the POC is the VETCOM HQ, Commander (210) 221-6522.

Subj: POLICY LETTER PREVENTING FERAL CAT AND DOG POPULATIONS ON NAVY PROPERTY

4. Effective prevention, management and elimination of feral cat and dog populations requires close coordination and cooperation between natural resources, pest management, security, veterinary, and housing personnel to develop and implement an effective and humane program. Reference (b) provides information for preventing free roaming cat populations on military installations. General pest management guidelines are detailed in reference (c). Every effort should be made to work with other federal, state and local agencies to support reference (a) and reference (d) by eliminating free roaming cat and dog populations on Navy land. Navy commands should work with local animal control agencies to determine the best approach for the ultimate disposition of the captured animals. Every effort should be made, if practical, to find homes for adoptable feral cats and dogs.

5. My point of contact on this issue is Mr. Joe Cook, CNO N456M, at (703) 602-5335, or DSN 332-5335.

Enclosure 6. Pollinator-Friendly Management

This page intentionally left blank.

Pollinator Friendly Pesticide Applicator Best Management Practices

October 2014

Background

Pollinators, such as bees, bats, birds, and butterflies, are essential to the majority of the flowering plants in our environment and to the production of more than 130 different food crops. Pollinators are highly sensitive to many pesticides, especially insecticides. Your help as pest management personnel is critical to the continued safety of our food supply and environment. Proper pesticide use avoids harm to pollinators and their food sources, water, and habitats.

Use an integrated pest management (IPM) approach:

- Monitor and assess pest populations to determine if levels warrant control.
- Select the best combination of pest control options that minimizes risks to pollinators.

Read and Follow the Pesticide Label

On pesticide labels, look under the "Environmental Hazards" and "Directions for Use" headings for important information on protecting pollinators. Some labels warn against use of the product on blooming crops by stating, "Do not apply to blooming crops or weeds if bees are visiting in the treatment area." Some labels limit at-bloom applications to times when bees are not actively visiting, such as late evening. Apply the product in a manner consistent with the label directions.

Be Alert to Bloom

Presence of bloom is the key factor in pollinator exposure to pesticides. Honey bees and other pollinators are most at risk of poisoning when bee-toxic pesticides are applied to weeds or other vegetation that is blooming. Avoid applying any bee-toxic pesticides on blooming plants that attract bees. Keep pesticide drift from nearby blooming weeds that are attracting bees.

Timing of Pesticide Application

The time of pesticide application is very important. Apply pesticides that are toxic to bees in the evening when most honeybees have stopped foraging and returned to their hives. This allows the maximum time for the pesticide to decompose before the bees come into contact with it the next day.

Avoid Residual Toxicity

Use insecticides with short residuals. Do not apply insecticides having a long residual to blooming crops.

Check the Weather

Environmental conditions affect pesticide persistence. Daytime applications at low temperatures may cause some classes of pesticides to remain toxic much longer than during warm weather. Cloud cover also may prolong toxicity due to lower levels of ultraviolet light which breaks down many pesticides. Do not apply bee-toxic pesticides with extended residual toxicity on nights when dew is forecast. Dew may re-wet pesticides and increase bee exposure. Environmental conditions also affect bee activity. When high daytime temperatures encourage bees to begin foraging earlier or continue later than usual, adjust application times of bee-toxic pesticides accordingly. Experience shows that when bee-toxic pesticides are applied before or during cold nights, followed by warm summer days, the incidence of bee kills greatly increases.

Use Less Hazardous Pesticides

Neonicotinoid pesticides (i.e. pesticides with the active ingredient clothianidin, dinotefuron, imidacloprid, and thiamethoxam) may potentially cause adverse effects to pollinators. The EPA is taking steps to change these pesticide labels so they better protect bees by being clearer and more precise in their directions for pesticide application.

Use of neonicotinoid pesticides should be avoided in areas where pollinators may be present. Also avoid using them on any flowering plants. Use on flowering plants may result in exposure to bees even if applied when the plant is not flowering because they are taken up systemically and have a long residual.

Use the Least Hazardous Pesticide Formulation

Granular formulations are the least hazardous when bees are present because they are the least likely to drift. Dust and microencapsulated formulations are most hazardous to bees because they are similar in size to pollen and tend to stick to bee hairs. Dusts almost always drift more than other formulations. Emulsifiable concentrate formulations are usually less hazardous to bees than wettable powders because the powders remain toxic in the field longer. Spray formulations are usually safer to bees than dusts, but there are differences among spray types. Generally, water soluble formulations are safer than emulsifiable formulations, and fine sprays are less dangerous than coarse sprays. Sprays of undiluted pesticides may be more dangerous than diluted sprays.

Minimize Drift

Honey bees will visit the blooms of crops and/or weeds near target crops and be unintentionally impacted there by drift and pesticide residues. Keep the product on the intended area and apply pesticides with equipment that has been calibrated for the particular application. When appropriate, use ground applications instead of aerial applications to reduce risk of drift out of the target area.

Communicate with Beekeepers

Cooperation and communication among applicators and beekeepers greatly increases the likelihood of success in protecting pollinators and their habitats. Take the initiative to establish good relations and communication with commercial and local beekeepers. Notify beekeepers of future pesticide applications planned in the area so that they may attempt to protect their bees.

Learn about Local Regulations/Programs

Check for specific local ordinances pertaining to pollinators, especially beehive locations or designated preserves (if applicable). Some regions require that commercial beehive operations register the location where hives are being kept. Many states have regulations intended to reduce the hazard of insecticide applications to bees.

1.0 INTRODUCTION

The U.S. Department of the Navy (Navy), Naval Facilities Engineering Command (NAVFAC) Mid-Atlantic prepared this nuisance wildlife management plan for Naval Support Activity Hampton Roads Northwest Annex (NSAHR NWA) (Figure 1). The term nuisance wildlife includes species that adversely affect the well-being of domestic animals, other wildlife, property, or human health and safety. The Virginia Administrative Code (Title 4VAC15-20-160) lists the house mouse (*Mus musculus*), Norway rat (*Rattus norvegicus*), black rat (*Rattus rattus*), coyote (*Canis latrans*), feral hog (*Sus scrofa*), nutria (*Myocastor coypus*), woodchuck (*Marmota monax*), European starling (*Sturnus vulgaris*), English sparrow (*Passer domesticus*), and pigeon (*Columba livia*) as nuisance species. All of these species are known to or have the potential to occur on NSAHR NWA. This plan is designed to address nuisance wildlife on NSAHR NWA and is designated as Version 1 to indicate that it is a living document to be updated as required to address changing conditions and new information as it becomes available.

Although all of these species occur or have the potential to occur at NSAHR NWA, coordination with installation personnel and local experts identified the coyote and nutria as the primary nuisance wildlife species of interest/concern at the time of this plan. Of the listed nuisance wildlife species, the occurrence of coyote and nutria was considered to have the greatest potential for adverse effects on NSAHR NWA. As a result of this determination, field surveys were initiated to gain baseline information on the occurrence of these two species and their potential habitats. The results of those surveys (Navy 2014a) are used herein to develop the guidance and recommendation for monitoring and control.

1.1 PURPOSE

The purpose of this management plan is to prevent nuisance wildlife from adversely affecting the military mission and operations on NSAHR NWA. This plan identifies and focuses management efforts and provides management guidelines for control of nuisance wildlife. This plan is recommended for implementation under the overarching guidance of NSAHR NWA's Integrated Natural Resources Management Plan (INRMP) (Navy 2014b).

1.2 GOALS AND OBJECTIVES

To effectively implement this management plan and evaluate its success, measurable goals and objectives must be identified. The goals include (1) informing installation personnel of the nuisance wildlife conditions and (2) minimizing nuisance wildlife concerns on NSAHR NWA. The objectives include (1) disseminating information on the occurrence and abundance of nuisance wildlife and (2) implementing management actions to prevent nuisance wildlife from becoming a threat to NSAHR NWA military mission and operations. Measures of success include the dissemination of fact sheets on nuisance wildlife and the number of nuisance complaints received. Implementation of this plan requires the cooperation of the installation commander and key persons within the chain of command affecting natural resources management.

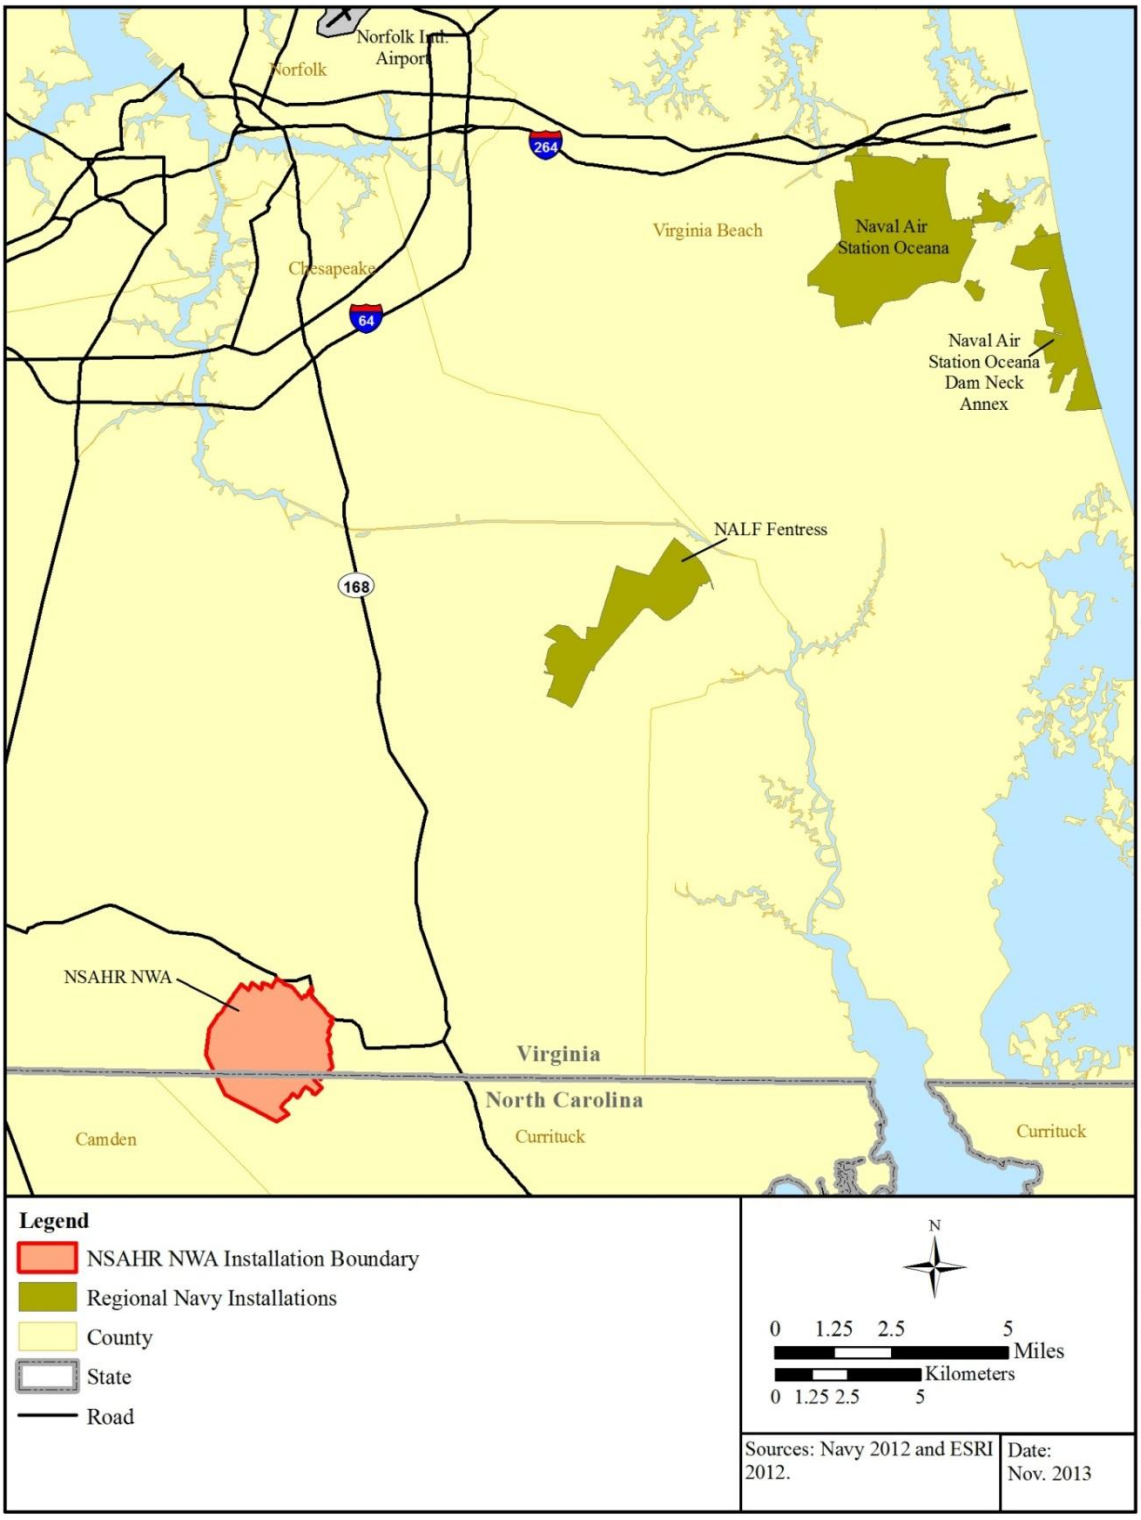

Figure 1. General Location of NSAHR NWA.

1.3 NATURAL RESOURCES OVERVIEW

Natural resources management on NSAHR NWA is part of a region-wide Navy natural resources program that is overseen by the mid-Atlantic regional natural resources program manager. The Natural Resources Manager (NRM), stationed at Naval Air Station (NAS) Oceana, supervises natural resources management activities on NSAHR NWA. Program administration includes 10 management issues and concerns. The primary natural resources issues are listed below.

- Wetlands and Water Quality
- Urban Forest Management and Landscaping
- Agricultural Outlease
- Forest Management
- Outdoor Recreation and Environmental Awareness
- Integrated Pest Management
- Fish and Wildlife Management
- Rare, Threatened, and Endangered Species Protection
- Forest Management
- Integrated Pest Management

There are three predominant land use areas recognized for planning of natural resources management activities. The land use areas include core management (urban/developed areas), operations (mission support areas), and forest conservation areas. Nuisance wildlife issues from coyote and nutria could occur in all areas of NSAHR NWA, but would be of greatest concern in the urban/developed and mission support areas.

2.0 ROLES AND RESPONSIBILITIES

Navy program requirements for ensuring military readiness and sustainability while complying with natural resource protection laws, and conserving and managing natural resources includes coordination of roles and responsibilities. Specific assignment of responsibilities, centralized supervision, professionally trained personnel, and stakeholder coordination are necessary for managing natural resources, including nuisance wildlife, on Navy lands as specified in the Operational Navy Instruction Manual (OPNAVINST 5090.1D, M-5090.1), *Environmental Readiness Program*. Coordination with state and other federal agencies enhances the Navy's ability to achieve stewardship of natural resources in support of readiness and sustainability.

2.1 STATE

The Virginia Department of Game and Inland Fisheries (VDGIF) is responsible for non-migratory game and non-game wildlife management in the Commonwealth of Virginia. Department biologists can assist planning and compliance with state regulations pertaining to the management of wildlife, including nuisance species. VDGIF provides additional information on coyote control at http://www.dgif.virginia.gov/wildlife/problems/coyotes/, including the no kill permit requirement, continuous open season, no Sunday hunting or killing permitted, and requirement to contact the Commonwealth Attorney's office for local information regarding legal methods of animal removal (some cities or counties have stricter regulations than state law). The Invasive Species Working Group of Virginia was established in 2009 by the General Assembly (Code of Virginia § 2.2-220.2) to develop a state invasive species management plan and list of invasive species that pose the greatest threat to the Commonwealth (Virginia Invasive Species Working Group 2012). The nutria is included in the list of invasive species that are actively managed or monitored in Virginia.

2.2 FEDERAL

The U.S. Department of Agriculture, Animal and Plant Health Inspection Service, Wildlife Services Division (USDA-APHIS-WS) is the federal program authorized by law to reduce damage caused by wildlife in accordance with the Animal Damage Control Act of 1931, as amended (7 U.S. Code [U.S.C.] 426-426c) and the Rural Development, Agriculture, and Related Agencies Appropriations Act of 1988 (7 U.S.C. 426c). USDA-APHIS-WS provides technical assistance for control of nuisance wildlife. Their mission is to provide federal leadership and expertise to resolve wildlife conflicts and allow people and wildlife to coexist. Additional information is provided at www.aphis.usda.gov/wildlife_damage. Executive Order (EO) 13112, *Invasive Species,* directs USDA-APHIS-WS to provide national leadership and oversight in managing invasive species, including nuisance wildlife, in cooperation with other federal agencies. All USDA-APHIS-WS wildlife damage management is conducted in compliance with state and federal relevant laws, regulations, policies, orders, and procedures.

2.3 DEPARTMENT OF DEFENSE

Management of nuisance wildlife concerns is specified in the NSAHR NWA INRMP (Navy 2014b). EO 11987, *Exotic Organisms*, and EO 13112 address the control of invasive, non-native species on federal facilities. Procedures and responsibilities for management and control of

nuisance wildlife are prescribed in COMNAVREG MIDLANT INST 11015.3 (*Natural Resources Management for Fish and Wildlife, Feral Animals, Invasive Species, and Certain Pests*) (Appendix A). These documents direct installations to prevent introductions, conduct surveys on the distribution and abundance of non-native species, and to provide management for their control.

NAVFAC MIDLANT is responsible for management and control of, and providing services pertaining to, fish and wildlife, feral animals, invasive species, and pests. Pest management services are provided through the Environmental Services Department, which responds to routine service calls for removal of non-migratory birds and control of feral animals. Requests for services involving animals not under the purview of the Environmental Services Department are referred to NRMs.

Natural Resource Specialists, under the direction of the Regional Natural Resources Program Manager, are responsible for implementation of practices and procedures to manage fish and wildlife and control certain feral, nuisance, and invasive species. Under the direction of NRMs, Conservation Officers are responsible for enforcing fish and wildlife and other natural resources laws and regulations. They may conduct field inspections and employ approved control methods for certain species, perform wildlife forensic investigations, and respond to wildlife damage complaints.

Authority and responsibility for nuisance wildlife ultimately resides with the NAVFAC MIDLANT Core Environmental (EV) director. The NAVFAC MIDLANT CORE EV director may delegate this authority to the NAVFAC MIDLANT Core and/or the NAVFAC MIDLANT Installation NRM. The NAVFAC MIDLANT CORE EV director or an appointed delegate maintains the permits necessary for controlling species protected by federal or state law.

3.0 INSTALLATION DESCRIPTION

NSAHR NWA (Figure 2) was established by the Navy in 1951 for use by the Navy as a radio receiving station. NSAHR NWA is located along the southeastern border of Virginia and the northeastern border of North Carolina. The installation encompasses approximately 3,661 acres (ac, 1,481 hectares [ha]); most (75 percent) is in Chesapeake, Virginia, and the remaining 25 percent is in Currituck County, North Carolina. The surrounding area is largely undeveloped and is comprised of agricultural land and forested wetlands. The mission is to coordinate the provision of shore activity support to tenant commands and to the operational forces of the United States and its allies as required. This installation description is taken from the INRMP (2014b), which provides more detailed information on the physical and biological resources that are abbreviated below.

3.1 PHYSICAL RESOURCES

NSAHR NWA is located in Virginia's outer Atlantic Coastal Plain. The climate is moderated by the Atlantic Ocean; January is typically the coldest month (average 32.6^{o} Fahrenheit [F], 0.3^{0} Celsius [C]) and July is typically the warmest month (average 87.4^{o} F, 30.8^{0} C). The area receives an average of 45.7 inches of rain per year. The normal growing season (daily minimum temperatures higher than 32^{o} F, 0.0^{0} C) is approximately 250 days from 22 March to 21 November.

The outer Atlantic Coastal Plain physiographic province is characterized as flat with low relief and elevations of 0–60 feet (0–18 meters) above mean sea level. The eastern half of NSAHR NWA has elevations of 5 to 20 feet (1.5 to 6 meters) above mean sea level. The western half is lower and is generally 5 feet above mean sea level.

Half of the soils on NSAHR NWA are hydric and have severe constrains for development due to wetness. The hydric soil associations encompass approximately 90 percent of the land area. Eight soil types are classified as Prime Farmland.

NSAHR NWA lies in the Chowan River–Dismal Swamp Basin, which is bordered by the James River Basin to the north and drains southward to the Albemarle Sound in North Carolina. The 100-year floodplain occurs on a small portion of NSAHR NWA.

3.2 BIOLOGICAL RESOURCES

Wetlands occur on 1,518 ac (614 ha), widely scattered across NSAHR NWA. All the wetlands are classified as palustrine and most is palustrine forested wetland.

The vegetative communities on NSAHR NWA include mesic mixed hardwood forest, nonriverine swamp forest, nonriverine pine-hardwood forest, coastal plain/piedmont bottomland forest, loblolly pine stands, and early successional communities. The fauna is generally representative of the natural areas of southeastern Virginia and northeastern North Carolina, with a diversity of mammals, reptiles and amphibians, fish, and birds. No federally-listed terrestrial wildlife species are known to occur on NSAHR NWA. The Virginia state-endangered canebrake rattlesnake (*Crotalus horridus*) and dismal swamp southeastern shrew (*Sorex longirostris fisheri*) are known to occur on NSAHR NWA. No North Carolina listed species are known to occur.

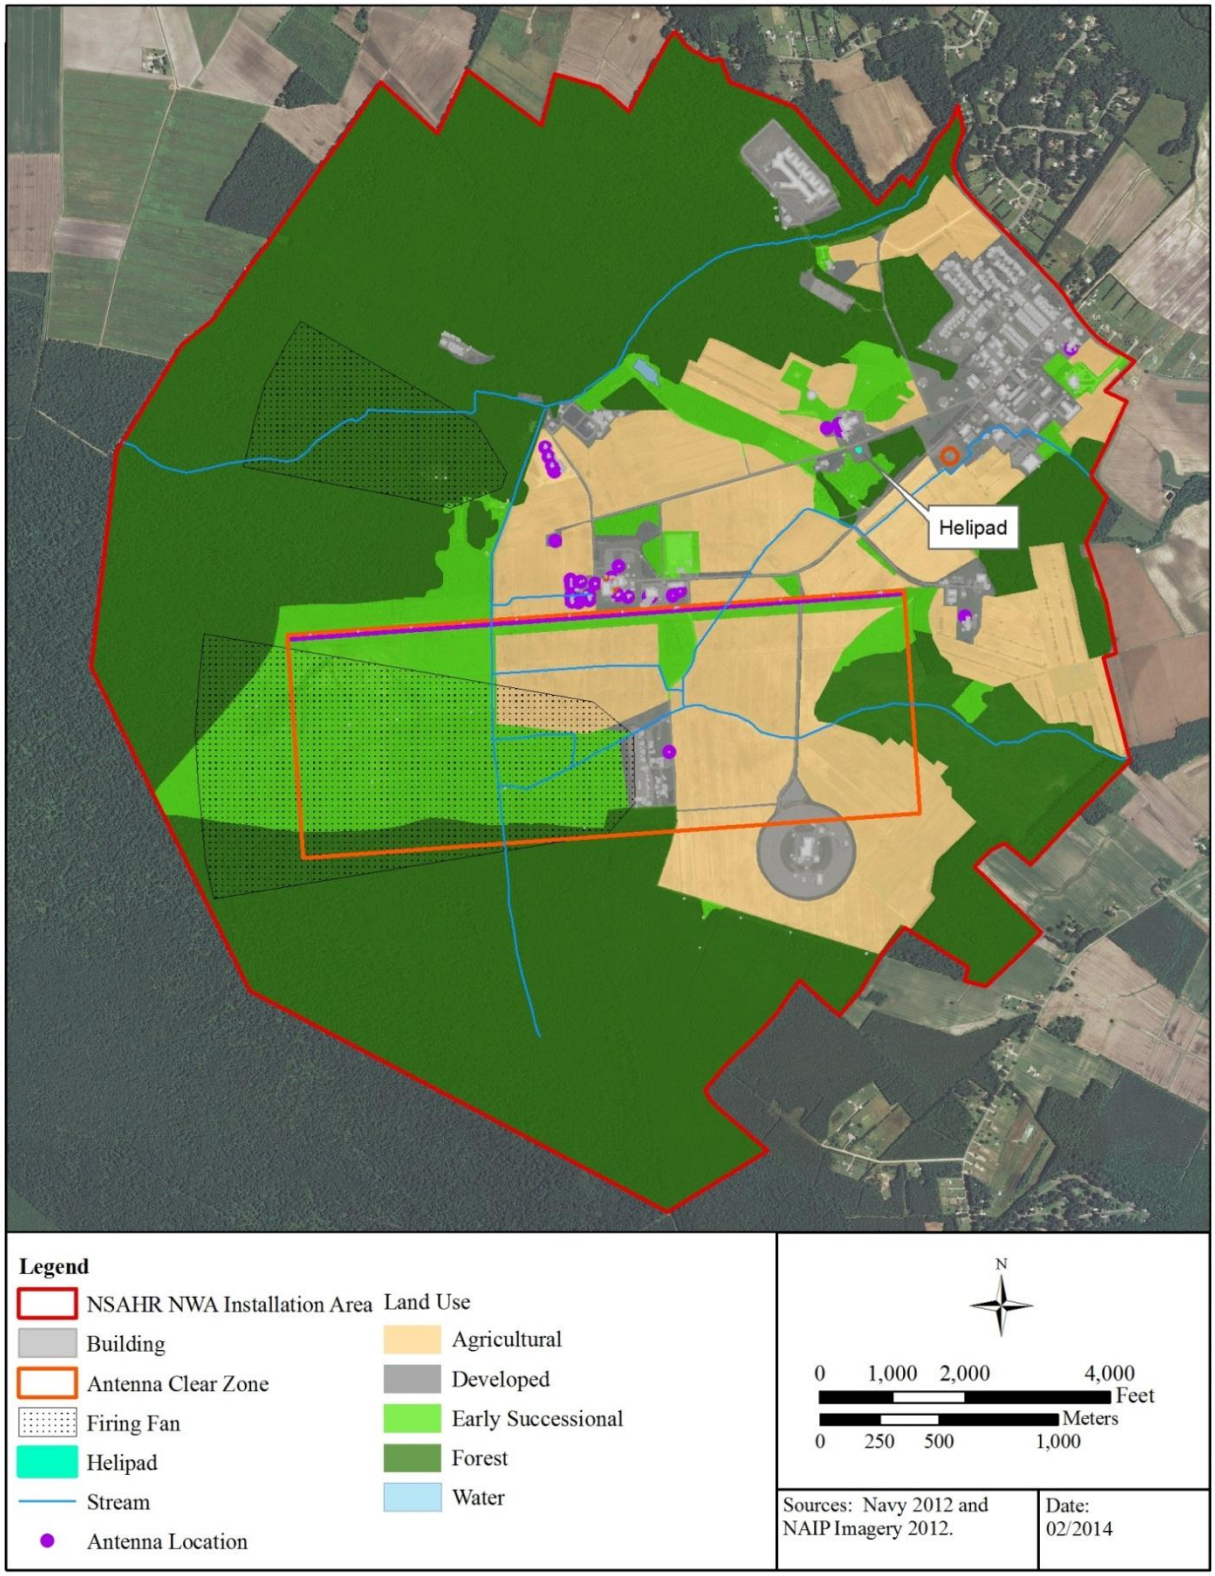

Figure 2. NSAHR NWA Land Use Areas.

4.0 NUISANCE WILDLIFE

The house mouse, Norway rat, black rat, European starling, English sparrow, and pigeon are known to or likely occur at NSAHR NWA. The bird and small mammal species at the time of this plan, do not pose a significant threat to the health and safety of personnel or the military mission.

The VDGIF has created a feral hog committee to address the growing feral hog problem in Virginia (http://www.dgif.virginia.gov/wildlife/feral-hogs/). At the time of this plan, no feral hogs are reported as occurring on NSAHR NWA; however, recent VDGIF reports indicate that feral hogs are in the vicinity. The woodchuck is present everywhere in Virginia except the eastern shore and the extreme southeastern corner of the state. Although the feral hog has the potential to someday expand its range to NSAHR NWA and the woodchuck does occur at NSAHR NWA, at the time of this plan the feral hog and woodchuck do not present significant threats to the health and safety of personnel or the military mission.

Of the 10 species listed as nuisance wildlife in Virginia, the coyote and nutria were considered to have the greatest potential to adversely affect mission activities on NSAHR NWA. Early detection and rapid response management of coyote and nutria is required to avoid harm to the well-being of domestic animals, other wildlife, property, or human health and safety. Accordingly, the other listed species are not considered further in this management plan. As new information becomes available on the distribution and abundance of nuisance wildlife and their potential impact on NSAHR NWA, an updated version of this management plan will be prepared. Brief background information for the coyote and nutria are presented within the following sections.

Prevention or control of wildlife damage, which often includes removal of the animals responsible for the damage, is an essential and responsible part of wildlife management (The Wildlife Society 1990).

4.1 COYOTE

Historically, coyotes were most commonly found on the Great Plains of North America. Their range now includes all of the continental United States (USDA 2011). The coyote was first observed in Virginia in the early 1950s (VFWIS 2013a). The coyote's great adaptability to almost any circumstances has led to its widespread occurrence. Factsheets (USDA 2011) with additional information are provided in Appendix B.

Coyotes are about the size and weight of a medium-sized dog. Coyotes in the eastern United States are typically larger than coyotes elsewhere. The average weight of females is 35 pounds (15 kilograms [kg]) and average weight of males is 40 pounds (18 kg) (VDGIF n.d.).

Male and female coyotes form a pair bond and defend a home range that may range from 1,000 acres (404 ha) to 25,000 acres (10,117 ha). There is currently no published data on home-range sizes in the mid-Atlantic region (Mastro 2011). Litters range from 3 to 12 pups and may be born between late March and May. Coyotes have a high reproductive rate; both mates and offspring from a previous litter contribute to feeding the pups (VDGIF n.d.).

The coyote is a habitat generalist and thrives in a wide variety of habitats. Being primarily nocturnal and secretive during the daytime hours, some dense cover nearby is often associated with coyote habitats. Small mammals and deer make up the majority of their diet, although vegetation and fruits are often listed as food items.

The coyote occurs throughout the Commonwealth of Virginia. Coyote populations in forested landscapes are generally less abundant than in their preferred habitats of semi-forested or open farm and pasture lands. Hunter surveys by the VDGIF have been the only estimates of coyote abundance and indicate that the coyote population is more abundant in counties west of the Blue Ridge Mountains (VDGIF n.d.).

Coyotes can carry rabies, which is contagious to humans. Typical signs of rabies include drooling, convulsions, circling, disorientation, partial paralysis, unprovoked aggression, and uncharacteristic tameness. If a person is bitten by a coyote, the animal should be captured without damaging the head and kept for analysis. The NRM should be immediately contacted for coordination with USDA-APHIS–WS to analyze the animal for rabies.

The coyote is filling an ecological niche that was void since the extirpation of wolves from Virginia around the beginning of the 20th century. In addition to preying on small (e.g., rodents and birds) to large (e.g., turkeys and deer) prey species, coyotes tend to kill or exclude red fox from their territories and thus potentially limit red fox population abundance (VDGIF n.d.). Coyotes are opportunistic feeders and will also take advantage of carrion, livestock, and pets (VFWIS 2013a).

Coyotes can be a nuisance to residents and present hazards to operating on NSAHR NWA. Animals that lose their natural fear of humans are more likely to pose a danger to humans and adversely impact the military mission. If food is deliberately or inadvertently provided by people, coyotes quickly learn not to fear humans. They will take advantage of easy food sources and their boldness to occupy residential areas could endanger human health and safety. Encouraging coyote avoidance behavior of humans by zero tolerance of coyotes around residences and facilities reduces the threat of coyotes in an area.

4.2 NUTRIA

The nutria is a large semi-aquatic mammal native to South America that has been introduced to numerous countries around the world, primarily for fur farming. Nutria are often confused with beavers or muskrats; however, nutria are much smaller than the beaver and much larger than the muskrat. Nutria have a thin, rounded, and pointed tail; beavers have a broad, horizontally flattened tail and muskrats have a vertically flattened tail. Nutria's hind legs are much longer than the front legs, giving the species a hunched appearance when on land. Nutria's prominent incisors are yellow to dark orange (LeBlanc 1994). Factsheets (USDA 2010) with additional information are provided in Appendix B.

Nutria are large rodents and average 12 pounds (5.4 kg). Males can grow to 20 pounds (9 kg) and females grow to 18 pounds (8 kg). Mature adults measure 2 feet (0.6 meters) in length (LeBlanc 1994). Nutria are almost entirely herbivorous and eat animal material incidentally when they feed on plants. Nutria consume a large variety of aquatic, semi-aquatic, and terrestrial plants including agricultural crops, lawn grasses, and ornamental plants.

Nutria have a very high reproductive potential; they are polygamous, breed throughout the year, and can produce up to three litters per year. Litter size varies between 2 and 11 and the gestation period is only four months. The young are precocial, leaving the nest or burrow and feeding on solids within one day of birth. Sexual maturity is reached at approximately six months (VFWIS 2013b).

The nutria in Virginia originated from releases in Dorchester County, Maryland in 1943 to establish an experimental fur station at the Blackwater National Wildlife Refuge (Maryland Sea Grant 2013). By 1998, the nutria population in the refuge had increased to 50,000. Initiated in 2002, the Chesapeake Bay Nutria Eradication Project has reduced nutria populations to near zero on 150,000 wetland acres (USFWS 2012).

The first record of nutria in Virginia was in 1956. Coordinated nutria monitoring efforts in Virginia began in 2012 and populations are believed to be limited to the southeast corner of the state. Recent data by VDGIF indicate that nutria numbers and distribution appear to be increasing and the threat to Virginia wetlands may be increasing (VDGIF 2012).

Nutria are capable of carrying diseases, pathogens, and infections. Nutria are susceptible to rabies, equine encephalomyelitis, paratyphoid, salmonellosis, pappilomatosis, leptospirosis, toxoplasmosis, richettsia, coccidiosis, and sarcoporidiosis. Nutria also host a wide variety of internal and external parasites (Sheffels and Sytsma 2007). Pathogens and parasites can be transmitted to humans, livestock, and pets (LeBlanc 1994).

Damage to vegetation and crops; banks of ditches, lakes, and other water bodies; and vegetation destruction in marshes and other wetlands caused by nutria are a direct result of feeding and burrowing. Nutria have caused widespread ecosystem changes by decimating native plants that hold marsh soils together and support the survival of native wildlife species. Burrowing is the most commonly reported damage caused by nutria. Burrows can weaken roadbeds, ditches, stream banks, dams, and dikes, which could collapse when the soil is saturated or when subjected to the weight of heavy equipment (USDA 2010). The subsequent damage from nutria burrowing activity has the potential to adversely impact water management and drainage efforts.

Adverse impacts on biodiversity by nutria foraging have been documented to directly and indirectly harm native flora and fauna (Sheffels and Sytsma 2007). Where at-risk species occur and there is concern for potential listing and designation of critical habitat, nutria presence could only worsen the concern because of their foraging and burrowing activities. The potential for adverse impacts on biodiversity and contributing to species listings ultimately threatens the military mission.

5.0 NUISANCE WILDLIFE AT NSAHR NWA

As stated earlier, all of the state identified nuisance wildlife occur or have the potential to occur on NSAHR NWA. However, coyote and nutria were determined to present the greatest threat to the military mission due to their potential impacts on biodiversity, natural ecosystems, water control structures, as well as potential threats to human health and safety. To better understand the distribution and abundance of these two species, field surveys were initiated to provide support to this management plan.

Field surveys for coyote and nutria were conducted between January 16 and February 15, 2013. Prior to the 2013 surveys, there were no formal surveys, inventories, or assessments conducted for nuisance wildlife species on NSAHR NWA. The nuisance wildlife surveys are summarized in *NSAHR NWA Nuisance Wildlife Survey: Coyote* and Nutria (Navy 2014a). If additional nuisance species are determined to be of interest to the installation, similar studies and reports can be planned and generated to provide support for revisions of this management plan. The coyote and nutria survey results summaries and understanding of these species and threats on NSAHR NWA is provided in the following sections.

5.1 COYOTE

5.1.1 Survey, Abundance, and Distribution

Eleven remote camera scent stations were installed on NSAHR NWA to trap (photograph) coyotes to document occurrence and obtain baseline information for future comparisons. Placement of the scent station locations was based on aerial imagery assessments and field evaluations. Stations were placed at locations across the installations and focused on a variety of habitats, as coyote were expected to occur almost anywhere on the installation. Large wetland and inundated areas were avoided. Bait and lure (attractants) were used at each station and cameras were deployed for six camera days (24-hour periods). One of the 11 cameras recorded a single coyote visit during the survey period. One coyote was caught on camera and the detection index of 0.015 coyotes per camera night was recorded.

This camera station survey documented presence of the coyote at NSAHR NWA and provided preliminary and scientific based information on abundance. Similar future studies could allow more inferences on abundance or changes in abundance. In general, the coyote is likely to inhabit almost all areas of the installation and is even likely to venture into developed areas. The coyote is probably no more abundant at NSAHR NWA than on adjacent lands.

5.1.2 Threats

The coyote is not known currently to present significant threats to the mission or human health and safety at NSAHR NWA. There are no reports of human/coyote conflicts for this installation; however, the coyote has the potential to be a threat of zoonotic disease transfer to humans and other wildlife, especially if it becomes overabundant. Coyotes are attracted to open areas of airfields and runways where small mammals are often found in greater abundance or carrion may occur as a result of air strikes and vehicle collisions. Conversely, coyotes are top predators and likely provide some level of control of deer, wild turkey, and waterfowl populations that also present air strike hazards. Coyotes will also use open air fields to mark territories and as travel

lanes between habitats. Coyotes may den within dry culverts or within constructed embankments within open fields or agricultural fields. BirdStrike.org reports that over 1,030 civil aircraft collisions with deer and 400 collisions with coyotes were reported in the United States, 1990-2012.

KEEP THE WILD IN WILDIFE

ENCOURAGE COYOTE AVOIDANCE BEHAVIOR OF HUMANS (VDGIF)

Coyotes are wary creatures and are usually not aggressive toward humans except when humans attempt to feed or interact with them. Approaching any wildlife may provoke an attack if the animal feels threatened. Before confronting a coyote near a residence or any other human living space, be sure there is a safe position for escape in the event there is an unlikely attack and then scare off the animal by practicable means. Although there are very few recorded instances of coyotes attacking humans in the United States, coyotes that have contracted rabies may attack humans without warning. The possibility of an attack should always be considered for any close encounter with a coyote.

Coyotes typically hunt small mammals (i.e., mice, voles, and rabbits), but they will also make a meal of a pet cat if given the opportunity. Coyotes are medium-sized carnivores that are very territorial in nature, and generally will not tolerate other dogs in their territories, especially when coyotes are caring for their young between March and August. The territorial nature of coyotes poses a real risk to small, free-roaming dogs and cats. Dogs (especially small dogs) should be restrained on a leash when walking them outdoors. Pets are also vulnerable to attacks by coyotes when tethered outside; therefore, outdoor pets should be kept in a coyote-proof enclosure (7-foot high fence with outward slanting overhang) to prevent coyotes from attacking and killing a pet animal.

5.1.3 Current Management

Under the Code of Virginia (Title 4 VAC 15-20-160) the coyote is a nuisance species and may be killed at any time and in any manner allowed by law. According to VDGIF regulations, no hunting license is required to shoot nuisance wildlife. Under Virginia law, nuisance wildlife species can be killed at any time and in any manner that is legal under state and local laws. The Navy obtains a Kill Permit from VDGIF to be able to take coyote on NSAHR NWA any day of the year due to human health and safety concerns. However, for recreational trapping a trapping license is required to take coyote by legal trapping methods. It is not legal to live-trap nuisance wildlife and move them to another location. Hunting and trapping are permitted on NSAHR NWA; these recreational activities could contribute to control efforts for coyotes. An average of 425 hunting permits is sold each year for NAS Oceana, NAS Oceana Dam Neck Annex, Naval Auxiliary Landing Field Fentress, and Naval Support Activity Hampton Roads Northwest Annex.

5.2 NUTRIA

5.2.1 Survey, Abundance, and Distribution

Surveys were conducted to identify the available habitats for nutria on NSAHR NWA. Biologists reviewed aerial photography and other remote sensing data, coordinated with local experts from the USDA, and searched the available habitats for nutria and nutria field sign to assess

occupancy. A 50-foot (15-meter) buffer was added to streams and a 25-foot (7.6-meter) buffer was added to ditches to create polygons of potential habitat. Areas not considered to be viable habitat by the USDA experts were removed from the draft potential habitat map.

Approximately 284 ac (115 ha) of potential habitat were field surveyed to verify its designation as habitat and investigate nutria occupancy. All potential habitats were searched by biologists walking throughout the areas for nutria, tracks, scat, slides, and eat-out areas. Following the field surveys and further coordination with the USDA experts, 88 ac (25 ha) of potential nutria habitat was identified on NSAHR NWA. Nutria were observed on the installation, tracks were observed at several locations, and potential den sites were found along ditch banks. The data indicate that low numbers of nutria could be present. Future surveys in the designated habitat areas could be used to determine changes in the occurrence of nutria and level of potential habitat on NSAHR NWA.

5.2.2 Threats

The nutria is not currently known to present significant threats to the mission or human health and safety because of the low-level population that likely exist on NSAHR NWA. The nutria is documented in association with agricultural crop damage/crop loss and also with the destruction of stormwater control ditches that keep the installation from flooding. Farmers are required to factor in 10% crop loss due to wildlife damage. Although the data indicate the presence of low numbers, nutria could soon become a nuisance on NSAHR NWA and require management for control because of their high reproductive potential.

Nutria pose a general threat to the environment because of their foraging and burrowing habitats in wetlands, drainage ways, and croplands. Nutria can cause widespread ecosystem changes because of their destructive habits and in some areas the loss of soils and vegetation has caused permanent damage to ecosystems (USFWS 2012). The loss of vegetation increases erosion and reduces critical habitat for many species, including sensitive plant species, shorebirds, and waterfowl (Chesapeake Bay Nutria Working Group 2003).

Nutria can be infected with the bacterial disease tularemia, which can be transmitted to humans. Nutria droppings may contaminate water with giardia and cause infections when contaminated water is ingested. These infections cause flu-like symptoms in humans. Anyone handling a nutria should wear rubber gloves, and wash their hands well when finished.

5.2.3 Current Management

As a nuisance species (Title 4VAC15-20-160), nutria can be trapped year round for eradication. A trapping license is required for recreational trapping. As previously mentioned, it is not legal to live-trap nuisance wildlife and move them to another location. Nutria can also be taken by use of a firearm or other weapon at any time (except on Sunday). The NSAHR NWA INRMP lists the nutria as a nuisance species for management due to their non-native and invasive status. Shooting is recommended in the INRMP as the most effective method of control. Hunting and trapping are permitted on NSAHR NWA and these recreational activities could contribute to control efforts for nutria.

6.0 NUISANCE WILDLIFE MANAGEMENT

6.1 COYOTE

Prior to this plan, there was no plan for coyote management other than the general guidelines provided with the INRMP for nuisance wildlife control. The cited survey conducted in 2013 and this plan's attention to this species are due to its known presence and potential to quickly become problematic for the installation if disease or overabundance creates conflict with natural fauna or the military mission. As a result of the current condition, this plan focuses on treatment of individual incidents and provides guidance for the continuation of monitoring and additional studies to expand the coyote knowledge base.

6.1.1 Incidents/Encounters

All coyote encounters that are determined to be a threat or were reported as potential threat to installation personnel, visitors, or pets will be reported to the installation NRM. The report will include the location, the number of coyotes, and a description of the encounter or threat. The report should express the desire of the person (s) to have the situation resolved. Repeated incidents or problematic individual or groups of coyotes posing a non-immediate threat will each be evaluated by the NRM. The manager will develop a plan of action that may include passive actions (e.g., keep pets inside, habitat management) or more direct actions such as the removal of the coyote or group. If removal is warranted, the section below outlines the method for conducting such removal. Immediate threats to humans and pets will be handled by installation law enforcement officers at their discretion and reported to the NRM. Simple sightings of coyotes are not reportable incidents or encounters; a sighting must be accompanied by some sense of abnormal behavior or threat to safety.

6.1.2 Natural Fauna Conflicts

The impact of coyote on natural fauna, and therefore ecosystem health and biodiversity is unknown for NSAHR NWA. However, the coyote is native to the area and should be considered a natural predator and efforts to reduce or control the population should only be implemented if warranted. In a review of the effects of coyote control on their prey, Henke (1995) concluded that coyotes are often removed from an area because of their predatory nature, regardless of the effect such removal may have on the ecosystem. Questions to consider before concluding coyote removal is warranted include (1) will coyote control produce the desired effects, (2) would the increase in desired fauna expected as a result of coyote control be within the habitat carrying capacity, and (3) would coyote mortality be replaced with other mortality factors acting in a compensatory manner.

Coyotes are described as a keystone species (i.e., their presence effects other species around them). Coyotes tend to kill or exclude foxes from their territories and may subsequently limit fox population abundance. Studies have concluded that foxes are not eliminated but just become less common where coyotes occur. The coyote may indirectly benefit ground-nesting birds, by reducing ground-nest predators. In this way, coyotes help to maintain balance in the food web below and around them. Future study could focus on overabundance impacts on sensitive or

game species and/or consideration of its temporary control of sensitive or game species restoration opportunities (e.g., dismal swamp southeastern shrew, bobwhite quail).

6.1.3 Removal/Control

If the NRM determines that a removal action should be undertaken for population control, the manager will contact the USDA-APHIS–WS with the request. This will open the consultation phase and the NRM and WS will determine the best course of action to handle the removal attempt. There are several removal methods available including toxicants, trapping, and shooting (see Appendix B fact sheets for additional information). The selected method(s) will need to be adapted to the situation and left to the WS professionals or installation safety officers to implement. The NRM takes action for the removal of the occasional nuisance or sick animal call.

All coyotes that are taken, that area suspected of rabies will be tested for rabies. The NRM after review of the incident/encounter reports will determine if the rabies test is warranted and provide the direction to test to WS personnel. Any animal that is suspected to be sick or behaving abnormally (without obvious issues, such as a broken leg) should be tested. In addition, any coyotes taken or found dead that exhibit disease will be reported to the NRM. The NRM will provide direction on the need for a necropsy to WS personnel.

6.1.4 Habitat

Habitat management against the coyote is not practicable because the opportunistic nature of its foraging habits facilitates its occurrence in all habitat types. Eliminating brushy areas, dense thickets, and similar areas around residences, airfields, and facilities that coyotes may use as cover or foraging sites could be the focus of habitat management. However, these habitats also provide food and cover for many native species, so these efforts to reduce habitat should only be considered as responsive action rather than a proactive action. The NRM should coordinate with Public Works Department personnel responsible for grounds maintenance to eliminate habitats if it is determined to be the desired management action.

6.1.5 Survey

The 2013 nuisance wildlife survey for coyote provided an index of coyote abundance and should be replicated to determine changes in the occurrence of coyotes (Navy 2014a). The cameras should be deployed in the station locations that were used in 2013 for consistency and trend analysis. In addition, consistent tracking of data on coyotes and incident/encounters reported under implementation of this plan should provide additional insights on coyote abundance and better quantify the nuisance level.

6.2 NUTRIA

Other than the general guidelines provided in the INRMP for nuisance wildlife control, this plan provides the only guidance for nutria management on NSAHR NWA. This plan provides guidance for the continuation of monitoring and additional studies to expand the nutria knowledge base.

6.2.1 Removal/Control

The NRM should be notified upon first observance of a nutria(s) on the installation. Removal of all nutria is warranted because of their invasiveness and damage potential. Natural resources personnel will document the recommendations for removal. If the NRM determines that a removal action should be undertaken, the NRM will contact the USDA-APHIS–WS with the request. This will open the consultation phase and NRM and WS will determine the best course of action to handle the removal attempt. There are several removal methods available including toxicants, trapping, and shooting (see Appendix B fact sheets for additional information). The selected method(s) will need to be adapted to the situation and implemented by the WS professionals.

6.2.2 Habitat

Nutria use a wide variety of habitats including farm ponds and other freshwater impoundments, drainage canals, rivers and bayous, freshwater and brackish marshes, swamps, and combinations of various wetland types. Freshwater marshes are the preferred habitat. Nutria do not use well-drained land that is free of dense, weedy vegetation. Eliminating brush, weeds, and thickets adjacent to ditches, drainages, and waterways to reduce food and cover will discourage nutria use. Drainages that retain water may be used by nutrias as travel routes; eliminating standing water and ensuring positive drainage will reduce their attractiveness. Nutria prefer to burrow on steep slopes to allow tunneling upward for establishing the den site above the water level. Den entrances may be located at or below the water level. They can be discouraged by keeping side slopes to a 3:1 or less ratio, and by controlling vegetation growth (i.e., routine mowing). Contouring bank slopes at less than 45^{o} will discourage borrowing.

6.2.3 Survey

The 2013 nuisance wildlife survey for nutria confirmed the presence of nutria and should be replicated to determine changes in the occurrence of nutria. The potential habitats identified in 2013 should be surveyed using the same procedures for consistency and trend analysis. In addition to replicating the survey conducted in the winter of 2013, field surveys should be conducted in spring, summer, and fall to gather information on reproduction (observations of young of the year).

6.3 PROJECT IMPLEMENTATION

General guidelines to help reduce the potential for nuisance wildlife problems on NSAHR NWA are listed below.

1. Do not feed coyotes.
2. Secure garbage receptacles to avoid providing a potential food supply.
3. Conduct scheduled inspections of facilities to minimize nuisance wildlife entry.
4. Do not leave unconsumed pet food outdoors.
5. Remove or clean-up bird feeders if nuisance wildlife are attracted to the area.
6. Clear brushy areas around residences and facilities to reduce hiding and foraging cover.
7. Periodically inspect the major drainage ditches for nutria sign.
8. Contact the NRM to evaluate all nuisance wildlife concerns.

Environmental program priorities for control of nuisance wildlife are defined using environmental readiness levels (ERL) as specified in OPNAVINST 5090.1D, M-5090.1 and recurring or non-recurring natural resources management requirements as specified in the Department of Defense Instruction 4715.03, *Natural Resources Conservation Program*. Recognition of the potential for nuisance wildlife to threaten human health and safety or the military mission and determination that management action is necessary meet the ERL 4 funding priority and also contribute to investments in environmental leadership and general proactive environmental stewardship. The designation of enhancement actions beyond compliance for non-recurring natural resources management requirements is consistent with implementation of management actions to prevent nuisance wildlife from becoming a threat to NSAHR NWA military mission and operations. Table 1 provides the project implementation schedule for nuisance wildlife control on NSAHR NWA.

Table 1. Project Implementation Schedule.

Project No.	Project Description	Schedule
1	Distribute the USDA-APHIS–WS factsheets (Appendix B) on coyote and nutria to raise environmental awareness of nuisance wildlife on NSAHR NWA.	Recurring bi-annually, 2 times/year (Earth Day event and beginning of hunting season)
2	Conduct reconnaissance inspections of housing and facilities areas to look for incorrectly secured garbage receptacles that could become a food source for nuisance wildlife. Report corrective actions required to the Regional Environmental Program Manager.	Recurring bi-monthly, 6 times/year
3	Conduct reconnaissance inspections of housing and facilities areas to look for required actions to clear brush that could provide hiding and foraging cover for nuisance wildlife. Report corrective actions required to the Regional Environmental Program Manager.	Recurring bi-monthly, 6 times/year
4	Conduct reconnaissance inspections of roadsides and trails to look for evidence of coyote tracks and denning sites for early detection and rapid response. Coyotes may dig their own den or enlarge another animals den to the size that would accommodate a medium-sized dog. Report corrective actions required to the Regional Environmental Program Manager.	Recurring bi-monthly, 6 times/year
5	Conduct reconnaissance inspections of major drainage ditches to look for evidence of nutria burrowing activity	Recurring bi-monthly,

Project No.	Project Description	Schedule
	and denning as a means of early detection and rapid response. Report corrective actions required to the Regional Environmental Program Manager.	6 times/year
6	Replicate the 2013 nuisance wildlife surveys and expand the survey period seasonally to assess occurrences and determine the need for control of coyotes and nutrias. Report corrective actions required to the Regional Environmental Program Manager.	Recurring bi-annually, every other year

7.0 EDUCATION, TRAINING, AND PUBLIC OUTREACH

Public perception is an important consideration in management for nuisance wildlife problems. Misinformation leads to implementation of inappropriate management actions and unintended outcomes. Dissemination of current and factual information on the extent of nuisance wildlife problems is key to successful implementation of nuisance wildlife management. The following considerations for stakeholder coordination and public involvement provide the NRM opportunities to promote education, training, and public outreach for nuisance wildlife management on NSAHR NWA.

7.1 STAKEHOLDER COORDINATION

In 2011, the Mid-Atlantic Panel on Aquatic Invasive Species and the Virginia Tech Conservation Management Institute funded a collaborative project in Virginia to examine the expanding nutria population and to initiate the process of developing and implementing an eradication strategy. A steering committee of representatives from state and federal agencies has been formed to coordinate detection and response actions, maintain databases and records of nutria sightings, and prioritize future collaborations. The Virginia point of contact is Ray Fernald, 804-367-8364, Ray.Fernald@dgif.virginia.gov. Additional information on the Mid-Atlantic Panel on Aquatic Invasive Species is available at http://www.midatlanticpanel.org/.

Cooperation and coordination with external stakeholders is an integral part of the Navy's natural resources program. The NRM should coordinate annually with VDGIF and USDA-APHIS–WS for current information regarding nuisance wildlife management. The Virginia Wildlife Services point of contact is David Allaben, 804-739-7739, david.j.allaben@aphis.usda.gov. Additional information on nuisance wildlife assistance is available at http://www.aphis.usda.gov/wildlife_damage/state_office/virginia_info.shtml. In addition, the NRM should coordinate with the VDGIF and USDA-APHIS–WS stakeholders prior to any determination to conduct nuisance wildlife management actions on NSAHR NWA.

7.2 EMAMMAL

eMammal (http://emammal.wordpress.com/author/emammal/) is a project where citizen scientists work in collaboration with researchers at the Smithsonian Institution and North Carolina State University to document mammals throughout the mid-Atlantic region. Citizen volunteers place "camera traps", infrared activated cameras, across the landscape in parks and other natural areas to collect photos of mammals. These photos help researchers answer questions about mammal distribution and abundance and use this information for conservation. The Smithsonian Institution presents projects that have used camera traps for conservation at http://siwild.si.edu/about.cfm. The NRM could use eMammal to promote volunteerism in natural resources and as an additional means of increasing environmental awareness of nuisance wildlife concerns on NSAHR NWA.

Subj: NATURAL RESOURCES MANAGEMENT FOR FISH AND WILDLIFE, FERAL ANIMALS, INVASIVE SPECIES, AND CERTAIN PESTS

Ref: (a) E.O. 13112
(b) NAVFAC P-73, Vol. II
(c) OPNAVINST 5090.1 (Series)
(d) 18 U.S. Code § 42
(e) 16 U.S. Code §§ 703-704
(f) 16 U.S. Code §§ 668-668c
(g) 16 U.S. Code § 1361, *et seq.*
(h) 50 C.F.R. pt. 10
(i) 50 C.F.R. pt. 21
(j) SECNAVINST 6401.1 (Series)
(k) NASOCEANAINST 3750.2 (Series)

1. Purpose. To prescribe procedures and assign responsibility for management and control of fish and wildlife, feral animals, invasive species, and certain pests within Commander, Navy Region, Mid-Atlantic (COMNAVREG MIDLANT) Area of Responsibility (AOR). This includes the areas of Naval Weapons Station (WPNSTA), Yorktown (including Cheatham Annex); Naval Air Station (NAS), Oceana (including Naval Auxiliary Landing Field [NALF] Fentress, Camp Pendleton, and Dam Neck Annex); Naval Station (NAVSTA), Norfolk (including St. Julien's Creek Annex and St. Helena Annex); Naval Support Activity (NAVSUPPACT), Norfolk (including Northwest Annex); Naval Amphibious Base (NAVPHIBASE), Little Creek; Fleet and Industrial Supply Center (FISC), Norfolk (Craney Island Fuel Depot and Yorktown Fuel Terminal); and Norfolk Naval Shipyard (NAVSHIPYD Norfolk), Portsmouth, VA (only New Gosport Annex, Scott Center Annex, and South Gate Annex).

2. Policy

a. Per references (a) through (c), the Navy is authorized to take measures to control invasive species.

b. References (d) through (g), the Lacey, Migratory Bird Treaty, Eagle Protection, and Marine Mammal Protection Acts, respectively, protect designated wildlife and control activity involving protected wildlife parts. Violations of these statutes may result in criminal prosecution. Regulations contained in references (h) and (i) implement reference (e) and list species protected by Federal law. Reference (j) describes government responsibility for preventing injury and diseases from animals.

3. Definitions

a. Per reference (a), an "invasive species" is a species that is non-native (or alien to the ecosystem under consideration), and whose introduction causes, or is likely to cause harm to economic, environmental, or human health.

b. Per reference (e), "take" means to pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to pursue, hunt, shoot, wound, kill, trap, capture, or collect.

c. Per reference (c), "pest" refers to any organism (except for microorganisms that cause human or animal diseases) that adversely affects the well-being of humans or animals, attacks real property, supplies, equipment or vegetation, or is otherwise undesirable.

d. Per reference (j), "feral" refers to wild animals and unowned dogs, cats, or other domestic animals.

4. Responsibilities

a. Regional Engineer. The Commanding Officer, Navy Public Works Center/Regional Engineer (PWC/RE), Norfolk, as the Regional Environmental Program Manager, is responsible for management and control of, and for providing services pertaining to, fish and wildlife, feral animals, invasive species, and pests. On behalf of COMNAVREG MIDLANT, the Regional Engineer obtains natural resources permits required by Federal law to carry out this program. Regional Engineer authority, in natural resources matters, may be sub-delegated to a properly trained Regional Natural Resources Program Manager, under the supervision of the Regional Environmental Group Head.

(1) Environmental Services Desk. The PWC/RE Environmental Group provides pest management services through the Environmental Services Department. In addition, the Environmental Services Department responds to routine service calls for removal of non-migratory birds and control of feral animals. These services may be requested through the Environmental Services Desk at (757) 444-7528 during working hours and (757) 444-3477 after hours. Requests for services involving animals, such as sea turtles, marine mammals, game animals and migratory birds or raptors, not under the purview of the Environmental Services Department, will be referred by Service Desk personnel to Natural Resources Managers.

(2) Natural Resources Specialists. Under the direction of the Regional Natural Resources Program Manager, installation Natural Resource Specialists use integrated management practices and procedures to manage fish and wildlife and control certain feral, nuisance and invasive species. Per reference (k), Natural Resources personnel also develop and execute depredation and

dispersal procedures for Bird Animal/Aircraft Strike Hazard (BASH) purposes, and personally supervise these activities when lethal methods are required. Natural Resources Managers, and all other PWC/RE personnel involved in lethal control activities, must be properly trained and duly certified for all weapons employed in accordance with applicable regulations. These personnel are located in Storefront Compliance Departments of the Regional Environmental Group. Natural Resources personnel will also identify bird and/or other animal remains associated with aircraft mishaps in accordance with reference (k).

(3) Conservation Officers. Under the direction of Natural Resources Managers, Conservation Officers enforce fish and wildlife and other natural resources laws and regulations. They may conduct field inspections and employ approved control methods for certain species. Control measures include, but are not limited to, live trapping, relocation, and lethal methods. Conservation Officers also perform wildlife forensic investigations and respond to wildlife damage complaints.

(4) Regional Natural Resources Managers. Regional natural resources managers shall:

(a) Provide direction to natural resources managers and game wardens regarding the management of fish and wildlife and the control of feral animals, invasive species, and pests.

(b) Ensure appropriate approval and procedures are in place to properly issue, store, carry, and use firearms.

(c) Ensure the natural resource manager and game warden weapons qualifications cards are certified and remain current.

(d) Coordinate with local and regional security for required range time, qualifications, and DoD training as needed.

b. NAVSHIPYD Norfolk. Pest control services for NAVSHIPYD Norfolk are currently provided through government contract; these services may be requested through LANTNAVFACENGCOM at (757) 396-5121, extension 200.

c. Security Officers. Security Officers respond to emergency wildlife complaints and requests for services. Security Officers are an after-hours emergency contact point for Natural Resources Managers, Conservation Officers, and pest management personnel. Within existing resources and according to established training priorities, Security Officers also assist Natural Resources personnel in obtaining required weapons qualifications.

d. Airfield Facilities Division Officer. All bird/animal strikes should be investigated and reported in accordance with reference (k). Animal remains will be collected by the Airfield Facilities Division Officer and placed in appropriate BASH freezers located in Building 102 at NAS Oceana and LP-167 at Chambers Field, NAVSTA Norfolk.

e. Aviation Squadrons. All bird strikes must be reported in accordance with reference (k). Airfield Facilities or Natural Resources should be immediately contacted following any strike to ensure bird/animal remains are collected and identified.

5. Review. The Regional Natural Resources Program Manager is responsible for review and update of this instruction.

Coyotes in Towns and Suburbs

Wildlife Services (WS), a program of the U.S. Department of Agriculture's (USDA) Animal and Plant Health Inspection Service (APHIS), provides Federal leadership and expertise to resolve wildlife conflicts that threaten the Nation's agricultural and natural resources, human health and safety, and property.

As coyotes have become more common in urban and suburban settings, WS has received increased calls in every State to address coyote-related damage. Often the damage is linked to human activity that attracts the animals. WS can assist with problems using an integrated approach.

Historically, coyotes were most commonly found on the Great Plains of North America. Their range now extends from Central America to the Arctic. Except for Hawaii, coyotes live in all of the United States, Canada, and Mexico. More coyotes exist today than when the U.S. Constitution was signed.

Almost no animal in America is more adaptable to changing conditions than the coyote. Coyotes can live just about anywhere. They are found in deserts, swamps, tundra, grasslands, brush, and dense forests, from below sea level to high mountains. They have also learned to live in suburbs and cities like Denver, Los Angeles, New York, and Phoenix.

One of the keys to the coyote's success is its diet. A true scavenger, the coyote will eat just about anything. Identified as a killer of sheep, poultry, and deer, the coyote will also eat snakes and foxes, doughnuts and sandwiches, rodents and rabbits, fruits and vegetables, birds, frogs, grass and grasshoppers, pet cats and cat food, pet dogs and dog food, carrion, and just plain garbage.

Coyotes are active mainly during the night, but they can also move about during the day. Most sightings of coyotes occur during the hours close to sunrise and sunset.

Adult coyotes weigh between 20 and 45 pounds. Females are generally smaller than males, and western coyotes are generally smaller than eastern coyotes.

Coyotes look like small collie dogs. They have erect pointed ears, slender muzzle, and a bushy tail. Most coyotes are brownish gray in color with a light gray to cream-colored belly. However, a coyote's color varies and may be somewhat darker or lighter depending upon the geographic region and the time of year. Most coyotes have dark or black hairs over their back and tail.

Coyotes quickly learn not to fear humans and develop a dependency on easy food sources.

A high reproductive rate and the rapid growth of its offspring also aid in the coyote's success. Coyotes breed in February and March, and pups are born about 60 days later. During this time, territorial male coyotes do not tolerate other canines in their territory; many conflicts between coyotes and domestic dogs result from this territorial behavior. An average coyote litter contains four or five pups, born in dens. In urban environments, dens can be in storm drains, under storage sheds, in holes dug in vacant lots, parks, or golf courses, or any other dark, dry place.

Coyote pups are cared for, fed, and protected by both parents. The pups mature quickly and can eat meat and move about well by the time they are a month old. By 6 months, pups have permanent teeth and are taught to hunt for food. During this time of pup rearing, the amount of food that coyotes hunt and eat increase significantly. As a result, conflicts between coyotes and humans are common. It is not unusual to observe a family of coyotes traveling through urbanized areas such as parks or golf courses. If food is deliberately or inadvertently provided by people, the pups quickly learn not to fear humans and develop a dependency on easy food sources.

The pups are fully independent at about 9 months, and they disperse. During the next year, these young adults may be seen as nuisances in urban/suburban areas while they seek safe living areas away from established coyote territories. A few pups may stay with the parents, forming family groups as population densities increase or where food is abundant, such as in urbanized areas. Coyotes adapting to an urban environment can become bolder because they are less likely to be harmed and more likely to associate people with an easy and dependable food source.

Urban Area Coyote

Coyotes have learned that small dogs and cats are easy prey. Newspapers across the country have carried stories of coyotes harassing leashed dogs on walks with their owners in and near parks and golf courses within city limits. Calls to WS for help or information about urban coyotes often pertain to the animals attacking pets, eating garbage, or simply coming too close to houses or people on foot.

Remember, all wild animals are unpredictable and caution is the watchword when they are around. Don't ever put food out to lure them closer. Nearly all wild animal bites occur when people attempt to feed wildlife or treat them like domestic animals.

Here are some steps you can take to reduce the chance of human-coyote conflicts:

- Do not feed coyotes!
- Eliminate sources of water, particularly in dry climates.
- Bird feeders should be positioned so that coyotes cannot get feed. Coyotes are attracted by bread, table scraps, and even seed. They may also be attracted by the birds and rodents that come to feeders.
- Do not discard edible garbage where coyotes can get to it.
- Secure garbage containers and eliminate garbage odors.
- Feed pets indoors whenever possible. Pick up any leftovers if feeding outdoors. Store pet and livestock feed where it is inaccessible to wildlife.
- Trim and clean, near ground level, any shrubbery that provides hiding cover for coyotes or prey.
- Fencing your yard could deter coyotes. The fence should be at least 6 feet high with the bottom extending at least 6 inches below ground level for best results.
- Don't leave small children unattended outside if coyotes have been frequenting the area.
- Don't allow pets to run free. Keep them safely confined and provide secure nighttime housing for them. Walk your dog on a leash and accompany your pet outside, especially at night. Provide secure shelters for poultry, rabbits, and other vulnerable animals.

- Discourage coyotes from frequenting your area. If you start seeing coyotes around your home or property, chase them away by shouting, making loud noises, or throwing rocks.

  These steps may decrease the frequency of coyote sightings in your area if practiced continuously. However, coyotes are adaptable to change and are quick to learn new ways of survival. Occasional sightings most likely will continue. By making life for coyotes in your neighborhood more difficult, you will increase the likelihood that they will go somewhere else.

Suburban/Semi-rural

"Hobby farms" and "ranchettes" are more common today than ever before. Many Americans are enjoying a return to the rural lifestyle, living on a few acres and keeping poultry, horses, and other livestock. Many of these new "farmers" and "ranchers" are shocked to discover that coyotes kill and eat pets, poultry, and stock.

WS suggests (and offers technical assistance for) the following nonlethal methods to reduce coyote damage:

- Use net-wire or electric fencing to keep coyotes away from livestock.
- Shorten the length of calving or lambing seasons.
- Confine livestock in a coyote-proof corral at night when coyotes are most likely to attack livestock.
- Use lights above corrals.
- Remove dead livestock so coyotes won't be attracted to scavenge.
- Remove habitats that provide homes to natural prey of coyotes, like rabbits, from lambing and calving areas.
- Use strobe lights and sirens to scare coyotes away.
- Use guard animals, such as dogs, donkeys, and llamas, to protect livestock.

Additional Information

For more information about this and other WS programs contact your WS State office at 1–866–4–USDA–WS (1–866–487–3297) or visit www.aphis.usda/wildlife_damage. WS is not the sole source for wildlife damage management services; these services may be available from private sector providers.

Nutria, an Invasive Rodent

Wildlife Services (WS), a program within the U.S. Department of Agriculture's (USDA) Animal and Plant Health Inspection Service (APHIS), provides Federal leadership and expertise to resolve wildlife conflicts that threaten the Nation's agricultural and natural resources, human health and safety, and property.

The increased population and range of invasive species can harm native ecosystems, impact agricultural resources, and increase disease transmission. Under an Executive Order that directs Federal agencies to address invasive species damage, the WS program works to control and prevent damage caused by nutria.

The nutria (*Myocastor coypus*), a large, semi-aquatic rodent native to South America, originally was brought to the United States in 1889 for its fur. When the nutria fur market collapsed in the 1940s, thousands of nutria were released into the wild by ranchers who could no longer afford to feed and house them. Entrepreneurs began selling the herbivores to control noxious weeds. Wildlife agencies further expanded the range of the nutria by introducing the species into new areas of the United States. While the nutria did devour weeds and overabundant vegetation, they also destroyed native aquatic vegetation, crops, and wetland areas.

Recognized in the United States as an invasive wildlife species, nutria have been found in 22 States, and are currently established in 16 States. The nutria's relatively high reproductive rate combined with a lack of population controls have resulted in a proliferation of the species. In many regions they cause severe damage. Nutria are most abundant in the Gulf Coast States, but they also cause problems in other southeastern States and along the Atlantic coast. In addition to damaging vegetation and crops, nutria destroy the banks of ditches, lakes, and other water bodies. Of greatest significance, however, is the permanent damage nutria can cause to marshes and other wetlands.

In these areas, nutria feed on native plants that hold wetland soil together. The destruction of this vegetation intensifies the loss of coastal marshes that has been stimulated by rising sea levels.

Identification

Nutria are approximately 2-feet long, with a large head, short legs and a stout body that appears hump-backed on land. They are dark brown in color, although occasional light-colored and albino animals are observed. Because nutria spend much of their time in the water,

A small bay area along Maryland's Chesapeake Bay shows recovery in the 2 years after invasive nutria were removed by Wildlife Services biologists and specialists.

they are highly adapted for a semi-aquatic existence.

Their hind feet are partially webbed for swimming, and their eyes, ears, and nostrils are set high on their heads, so they can stay above the waterline when swimming. Nutria are excellent swimmers, and valves in their nostrils and mouths seal out water when submerged to swim or feed. When pursued, they can swim long distances underwater, seeing well enough to evade capture. Female nutria have teats located high on their backs so that their young can suckle when floating in the water. From a distance, nutria often are mistaken for beavers and muskrats. All three species are dark brown in color and semi-aquatic with large front teeth that are yellow to orange in color. However, at 15- to 20-pounds for a large adult, nutria are about one-third the size of an adult beaver (45 pounds) and 5 to 8 times larger than an adult muskrat (2–4 pounds).

Sometimes mistaken for beaver or muskrat, some characteristics can assist in identifying nutria. These include large front teeth that are yellow to orange in color; a heavy, rat-like tail thinly covered in bristly hairs; and noticeable white whiskers that protrude from either side of their nose and can be easily seen from a distance (USFWS photo).

Additionally, the tails and whiskers of the three species are distinctly different. Beavers have large broad flat tails that they often smack loudly on the water to signal alarm. Muskrats have long narrowly flattened tails that can be seen whipping snake-like behind when swimming the water. Nutria have a heavy, rat-like tail thinly covered in bristly hairs that trails smoothly behind when swimming. In northern climates, nutria often suffer frostbite to their tails and may retain only a stub tail following a cold winter. Another distinguishing characteristic of nutria are the long (3–5 inch) noticeable white whiskers that protrude from either side of their nose and can be easily seen from a distance. Beaver and muskrat have subtle black whiskers that can only be viewed from very close.

Nutria adapt to a wide variety of habitats but are usually closely associated with water. In the United States, the largest nutria populations are located in freshwater marshes in coastal areas along Gulf Coast States. These regions have an abundance of small trees, shrubs, and vegetation with underwater roots and surface leaves. In these areas, nutria live in farm ponds and other fresh water impoundments, drainage canals, rivers, bayous, freshwater and brackish marshes, and swamps. In cities, they can be found under buildings, in overgrown lots, on golf courses, and in storm drains.

Beaver create lodges from mud and sticks and muskrat create mounded huts from mud and vegetation. Nutria do not create their own shelters from the elements. Nutria sometimes live in burrows; in

Included in the nutria's preferred diet are the roots, rhizomes and tubers of cattails, cordgrass, and bulrush.

marshes they often create flat, nest-like platforms of dead vegetation for feeding, loafing, grooming, and birthing. Sometimes, nutria will burrow into muskrat houses and displace their residents.

Damage

Nutria damage is evident to varying degrees in every area they are found. Burrowing causes the most noticeable damage. Nutria are notorious in Louisiana and Texas for undermining and breeching water-retention levees in flooded fields used to produce rice and crawfish. Nutria burrows also can damage flood-control levees that protect low-lying areas; weaken the foundations of reservoir dams, buildings, and roadbeds; and erode the banks of streams, lakes, and ditches.

Nutria damage, however, is not limited to burrowing. Depredation on crops is well documented.

In the United States, sugarcane and rice are the primary crops damaged by the nutria. Grazing on rice plants can significantly reduce yields, with severe localized loss. Other crops damaged by the nutria include corn, milo, sugar and table beets, alfalfa, wheat, barley, oats, peanuts, various melons, and a variety of vegetables. This depredation can lead to significant losses, especially for small farmers.

The negative impact this invasive species has on native vegetation and associated wetlands is critically important. In Louisiana, some nutria feed on seedling bald cypress with such intensity that the trees cannot survive. Similarly, nutria can severely damage coastal marshes by decimating native plants that hold marsh soils together and support the survival of native wildlife species. The impact of nutria on disappearing marshlands along the Gulf Coast and the Chesapeake Bay in Maryland has been well documented. Nutria have caused widespread ecosystem changes. In some cases, nutria damage to marsh vegetation and soils is so severe that these resources are permanently lost. The destruction of these marshlands also increases the vulnerability of adjacent upland sites to erosion and flooding during storms.

Nutria also can impact public health and safety. The rodents can serve as hosts for several pathogens, including tuberculosis and septicemia, which can infect people, pets, and livestock. In addition, nutria can carry parasites, such as blood flukes, tapeworms, and liver flukes and a nematode known to cause a rash called "nutria itch." Many of these organisms—found in nutria feces and urine—can contaminate drinking water supplies and swimming areas.

Highly adapted for a semi-aquatic existence, from a distance, nutria often are mistaken for beavers and muskrats while swimming.

How Wildlife Services Manages the Damage

WS is authorized by Congress to resolve damage caused by wildlife. A 1997 Executive Order also directs USDA to provide national leadership and oversight in managing invasive species, such as the nutria, in cooperation with other Federal agencies.

When requested, WS provides nutria assistance; WS program specialists work closely with Federal, State, and local governments to develop comprehensive management plans that include

Their eating, digging, rooting, and swimming causes massive erosion, converting healthy marsh and habitat for native species into open water habitat.

provisions for protecting native vegetation, marsh soil, and other natural resources against nutria damage.

Preventive measures should be used whenever possible, especially in areas where nutria damage is common. Habitat management can help reduce rodent numbers by manipulating vegetation and water sources attractive to nutria. Small areas, such as gardens, can be enclosed by partially buried fences. Wire tubes can be used to protect bald cypress and other tree seedlings from nutria damage and bulkheads can be used to deter burrowing into banks. These methods can be expensive to implement and are not always effective or practical.

When damage cannot be resolved by nonlethal measures, WS has the expertise to remove nutria populations in problem areas. Relocation is not a viable option; nutria are an invasive species that threaten both native wildlife species and vegetation. Relocating nutria to a new area just relocates the problem, and can lead to the establishment of new nutria colonies and new damage concerns.

Coexisting with Coyotes

U.S. Fish and Wildlife

If you live in North Carolina, you've probably seen a coyote, or know someone who has.

The animal's unique ability to adapt to a wide range of habitats, including suburban environments, along with rapid human population growth across the state, has led to an increase in sightings. While in most cases coyotes are harmless, people can take steps to prevent conflicts with the animals.

Coyote Quick Facts

National Park Service

Where did coyotes come from?
Coyotes were once found only in the mid-western portion of North America. But as Europeans settled across the country, the subsequent landscape changes, coupled with elimination of wolves, allowed the coyote to expand its range toward the eastern United States. By the 1980s coyotes started to appear in western North Carolina as a result of natural range expansion from our neighboring states. Coyotes are now established in all 100 counties of North Carolina and live in many towns.

What do coyotes look like?
Often described as a "mangy-looking dog," coyotes weigh about 20-45 pounds (similar to a mid-sized dog) with, typically, reddish to dark gray thick fur. They have long slender snouts, a bushy tail and pointed ears.

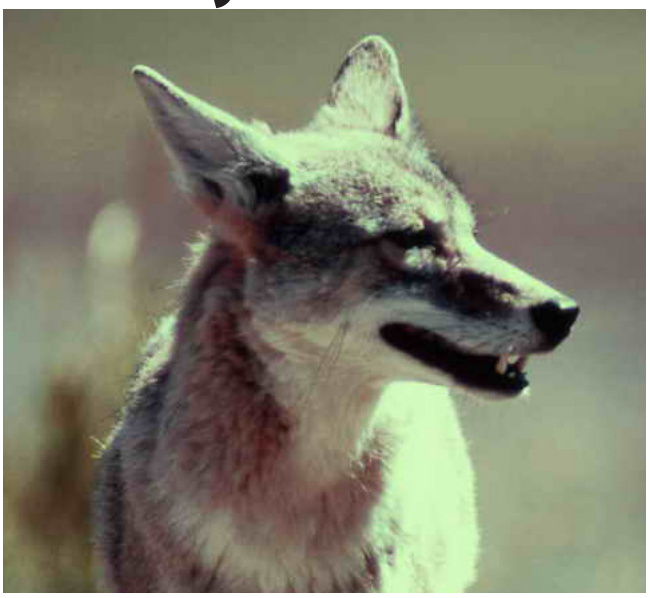
Do they make noise?
Yes, coyotes howl. While some find it unnerving, this howl serves many purposes, none of which are malicious. If you hear a family of coyotes howling, it is easy to think that the area is overflowing with coyotes. In reality, there are usually only 2-6 coyotes, including the pups.

Will coyotes attack me or my child?
Attacks on people, including children, are extremely rare. Normal coyote behavior is to be curious, but wary, when close to humans. Like other wildlife, they will become bold and habituated if people feed them, either purposely or inadvertently, such as with garbage or outdoor pet food. They rarely contract rabies.

Will coyotes attack my pet?
Possibly. Coyotes view outdoor cats and small unleashed dogs as prey, while larger dogs are viewed as threats to their territory and/or their pups. Coyotes are most likely to confront larger dogs during the mating and pup birthing period, January through June.

What should I do if I see a coyote?
Simply seeing a coyote is not cause for concern. If you see a coyote frequently, you and your neighbors should take steps to prevent conflicts with it and other wildlife.

Preventing Conflicts with Coyotes



National Park Service

To prevent problems with coyotes:

- **Secure garbage** in containers with tight-fitting lids, and take them out in the morning of pick up, not the night before. Coyotes and other wildlife will scavenge trash.
- **Don't feed or try to pet** coyotes. Feeding a coyote rewards it for coming in close proximity to people. Once a coyote becomes habituated, it loses its natural wariness of people and may become bold and aggressive.
- **Protect your pets by keeping them inside**, leashed, or inside a fenced area.
- **Install coyote-proof fencing** around your home to protect unsupervised pets.
- **Feed pets indoors** or remove food when your pet is finished eating outside. Coyotes and other wildlife are attracted to pet food left outdoors.
- **Keep bird-feeder areas clean**. Use bird feeders that keep seed off the ground. Coyotes are attracted to small animals congregating on the ground. If coyotes are frequently seen, remove all feeders.
- **Close off crawl spaces** under sheds and porches. Coyotes and other wildlife may use these spaces for resting and raising young.
- **Cut back brushy edges** in your yard, which provide cover for coyotes.
- Don't be intimidated by a coyote. Maintain its wariness by throwing a small object, such as a tennis ball, at it, making a loud noise or spraying it with a hose. Let it know it is unwelcome near your home.
- **Clear fallen fruit** from around fruit trees.
- **Educate your neighbors.** Your efforts to prevent coyote conflicts will be less effective if some neighbors are still providing foods.
- **Allow hunters or trappers** access to your property, so the local coyote population can be managed. Coyotes avoid areas in which threats are perceived.

If you already have a problem with a coyote:

- **Implement the non-lethal steps** described above.
- **Contact a Wildlife Damage Control Agent**, a private individual who charges for his/her services. A list is available at www.ncwildlife.org under "Coexisting with Wildlife."
- **Contact a licensed trapper** during the regulated trapping season. See the list at www.ncwildlife.org under "Coexisting with Wildlife."
- **Coyotes can be hunted** year-round using firearms and archery equipment. However, check to see if local ordinances restrict the discharge of firearms. A landowner can shoot a coyote in the act of causing damage.

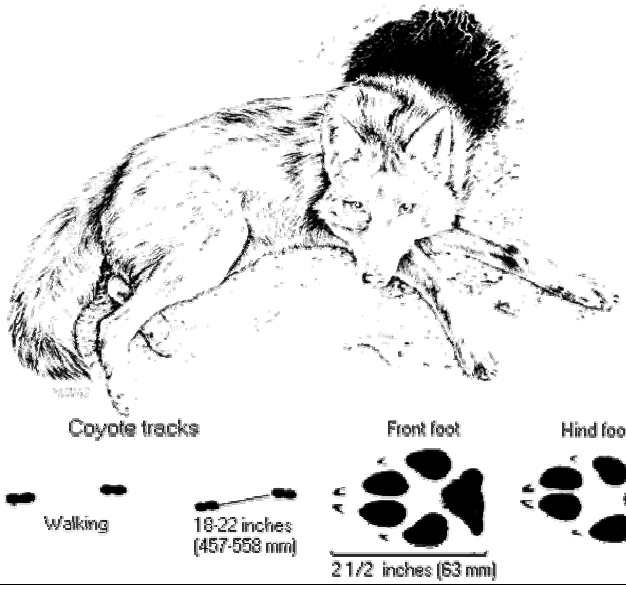
VIRGINIA DEPARTMENT OF GAME AND INLAND FISHERIES

LIVING WITH THE COYOTE IN VIRGINIA



The coyote population in Virginia continues to become more abundant and is distributed throughout the Commonwealth. To avoid conflicts with coyotes, it is important to understand coyote behavior and to consider the following advice:

❖ **KEEP THE WILD IN WILDIFE – ENCOURAGE COYOTE AVOIDANCE BEHAVIOR OF HUMANS**

REMOVE ACCESS TO UNNATURAL FOOD SOURCES: Unnatural man-made food sources alter coyote behavior and may result in coyotes becoming tolerant of and dependent on humans. In addition, feeding or unintentionally providing a food source (such as pet food on your porch or in your back yard) over a long period of time may result in coyotes becoming less wary of your presence or actions. **Such behavior may result in coyotes becoming bold and even aggressive towards humans.** If you feed pets in your yard or on your porch, feed only enough food that can be completely consumed by your pet in a short amount of time. Secure garbage cans and lids in order to prevent coyotes from overturning the can for an easy meal.

DEFEND YOUR LIVING SPACE: Tolerating coyotes around your residence may result in coyotes becoming less wary of your presence or actions. **Such behavior may result in coyotes becoming bold and even aggressive around humans.** It is the responsibility of everyone living in a residential community to dissuade coyotes from occupying or using space in areas frequented by humans. When coyotes attempt to extend their living space to include space around your residence, find a safe position that affords you an opportunity to escape an unlikely attack, and yell, throw non-edible objects in the direction of the coyote, or otherwise convey to any "trespassing" animal that it is not welcome in your "space".

❖ **AVOID COYOTE PREDATORY AND TERRITORIAL BEHAVIOR**

PEOPLE: Approaching any wildlife may provoke an encounter if the animal feels cornered or restricted in movement. This is particularly true of animals that have become accustomed to the presence of humans and their activities as a consequence of being fed, or because of access to a readily available food source such as pet food or refuse in a garbage can or compost pile. **Be aware that coyotes in other eastern states have attacked and severely injured small toddlers when left unattended for even a short period of time. Although the likelihood of such an attack is very remote, never leave small children unattended in areas frequented by coyotes.**

Consider removing habitat that provides protective cover for coyotes and their prey such as small rodents. Modifying such habitat around residential areas will dissuade coyotes from using the space as a part of a territory or home range and will reduce the likelihood of conflicts.

PETS: The territorial nature of predatory coyotes poses a real risk to small, free-roaming dogs and cats. Keep small dogs restrained on a leash when walking them outdoors and avoid walking in areas where coyotes are raising their pups from March – August. **Be aware that there have been a few recorded instances of coyotes attacking small dogs on a leash.**

Small dogs and cats are also vulnerable to attacks by coyotes when tethered outside of your house or even on your porch. Small dogs and cats should be kept in an enclosure when kept outdoors in order to prevent coyotes from attacking and killing a pet animal. **Even though a fence may dissuade coyotes from attacking your pet, be aware that coyotes can jump over fences less than 7-feet high and can climb over taller fencing that does not have an outward slanting overhang.**

LIVESTOCK: Contact the Virginia Department of Agriculture and Consumer Services - USDA Wildlife Services Virginia Cooperative Coyote Damage Control Program at 540-381-7387 to obtain information and assistance on preventing and alleviating coyote damage to livestock or other agricultural products.

VIRGINIA DEPARTMENT OF GAME AND INLAND FISHERIES

COYOTE INFORMATION

HISTORY OF THE COYOTE IN VIRGINIA: The coyote is not a native species of Virginia, and was first observed in the very western regions of the Commonwealth in the early 1950s.

DESCRIPTION: Coyotes are about the size and weight of a medium-sized dog. They generally have longer and thicker hair or fur than a dog. Their long black tipped tail is usually bushy and is pointed downward rather than outward or upward. The fur of the coyote in Virginia can vary from blond, light reddish-brown or tan, grayish black, or black with a small white blaze in the center of the chest. The coyote ears are pointed and erect, and the snout is relatively long and slender. The coyote in the eastern United States is typically larger than coyotes in the western United States. Female coyotes weigh on average 30 – 40 pounds, and male coyotes weigh on average 35 – 45 pounds. Coyotes can weigh as much as 60 pounds.

DISTRIBUTION AND ABUNDANCE: The coyote is distributed throughout the Commonwealth and prefers semi-forested or open farm and pasture lands. Coyote populations in more forested landscapes are generally less abundant and typically exhibit different foraging and social behaviors depending on forest prey species size and abundance. Surveys of hunter harvest of coyotes as well as surveys of hunter observations of coyotes while hunting big game indicate that the coyote population is more abundant in counties west of the Blue Ridge Mountains.

HABITS: Coyotes are elusive and normally avoid humans. They can be active at anytime of day or night, but are more typically observed at dawn and dusk. The coyote communicates by barking, yelping, and howling. Male and female coyotes form a pair bond and establish and defend a territory were they raise 3-12 pups that are born anytime between late March and May. The pups are fed by both the male and female, and sometimes by one or two offspring from a previous litter. The pups may disperse and leave the parents territory anytime after August. However, the parents may tolerate the pups occupying their territory as late February if prey resources are plentiful and large in size (e.g. deer). They remain active and do not hibernate in dens regardless of winter severity. Coyotes will develop a "search image" for a prey type that is more easily scavenged or killed. A coyote's "search image" includes visual, auditory, and olfactory senses. When the abundance of a specific prey decreases to the point that a coyote is opportunistically finding and consuming more of a different prey resource than it is actually hunting for, the search image of the coyote will change to reflect the more abundant or most easily accessible food resource available in it's home range. The habitat and space that the coyote hunts in may also change depending on the type of habitat that the predator is more likely to fill its belly. In situations where wild game is stocked to reestablish populations for hunting, or situations where livestock are raised and maintained throughout the year, coyotes may artificially retain a search image for the artificially abundant game or livestock that also tend to be more vulnerable to predation.

FOOD: The coyote is an opportunistic forager that will consume anything of nutritional value. They do not specialize in hunting and killing only one type of prey, and they will not turn down an easy meal if they happen to stumble onto other prey that they were not hunting for. Consequently, coyotes will prey and scavenge on anything including vegetable matter and fruits, insects, and the meat of wildlife killed or scavenged. Although coyotes generally prey on small rodents, rabbits, birds, snakes and frogs, they will kill larger animals such as big game and livestock during periods when the larger prey are more vulnerable to predation (e.g., turkey on nests; deer fawns in the spring and summer; lambs, kid goats, and newborn calves). The coyote will not pass up a free meal to feed its belly with artificial food resources. They will scavenge exposed garbage or other refuse, and may even kill and consume house cats.

LEGAL STATUS: The coyote is legally classified as a nuisance species and may be killed at anytime, except coyotes may not be killed with a gun, firearm, or other weapon on Sunday.

ECOLOGY: The coyote, a medium sized canid predator, occupies an ecological niche that has been void since the extirpation of wolves from Virginia around the beginning of the 20th century. In addition to inflicting mortality on small as well as large prey species such as beaver, turkey and deer, coyotes tend to kill or exclude red fox from their territories in red fox habitat and may subsequently limit red fox population abundance. The coyote may also indirectly benefit ground-nesting bird species, such as Bobwhite quail, by killing or excluding ground-nest predators such as raccoon, opossum and skunks.

MANAGEMENT: Coyote populations, not unlike all wildlife populations, will continue to grow until their numbers are limited by food availability or space. Unlike most wildlife populations, the reproductive potential of coyotes is such that harvesting coyotes for recreation or fur pelts or other economic incentive will not generally have any impact on limiting or even reducing the abundance of the coyote population. In general, increasing coyote mortality through hunting and trapping will tend to only change the age distribution of the population rather than change pre-whelping population density.

When populations of game species decline, hunters and some game resource managers may sensibly conclude that coyote predation on game is reducing or limiting game populations. Under certain conditions coyote predation has been shown to limit the abundance of big game populations. However, under normal conditions – that is when there is an abundance of game habitat available and the game population has not been decimated by disease or by another catastrophic mortality factor – **predation will rarely limit the population abundance of a game species**. In fact, it is more often the case that overall prey abundance and diversity will dictate the total number of coyotes that can thrive in a given area. If you feel coyotes are reducing big game populations in your area, please obtain a copy of "Coyote Management Strategies to Enhance Big Game Survival" for information on determining if it is necessary and feasible to manage coyote predation in your area.

INTERACTION WITH PETS: Coyotes are medium sized carnivores that are very territorial in nature, and generally will not tolerate other coyotes or dogs trespassing in their territories. This behavior is even more pronounced when coyotes are caring for their young anytime between March and August. For this reason, **coyotes have been known to show aggression and attack or even kill free-roaming small domestic dogs and cats that live within a coyote family's territory.** Attacks have also been known to occur in the yard or on the porch of houses.

INTERACTION WITH HUMANS: There are very few recorded instances of coyotes attacking humans in the United States. Coyotes that have contracted rabies, as is the case with any domestic animal or wildlife that contracts rabies, may attack humans without warning. However, **there are very few recorded instances of non-rabid coyotes actually attacking humans unprovoked.** In most cases where coyotes act aggressively towards humans, a coyote is responding to the presence of a dog with the human and the aggression occurs within a few hundred yards of a den with pups. In those instances where coyotes have actually attacked humans, coyote populations were very abundant and coyotes were residing and foraging for food in residential areas. In most cases, the attacks occurred on small children, and may have been due to hunger or due to the territorial nature of the coyote to exclude small "animals" from it's territory.

Aquatic Invasive Species
in the Chesapeake Bay

A MARYLAND SEA GRANT BRIEF

Nutria

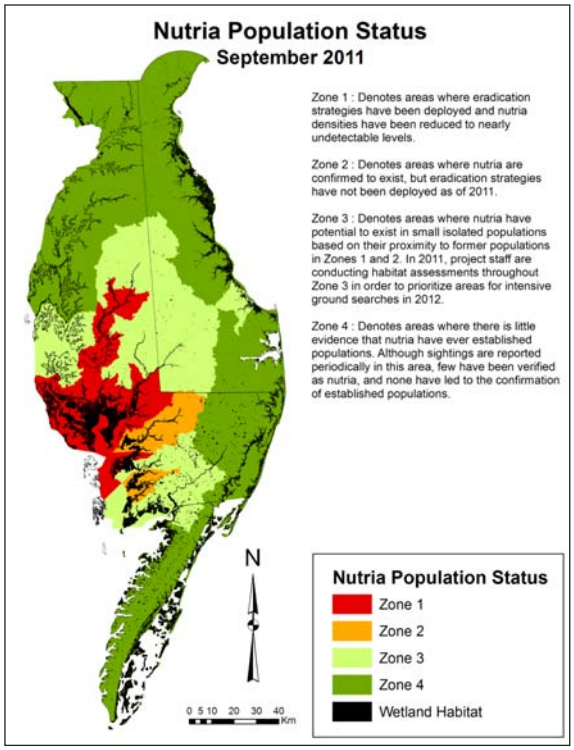
What Are Nutria?

Nutria (*Myocastor coypus*) are prolific aquatic rodents native to South America. They were introduced into the United States during the late 1800s and early 1900s to establish a fur farm industry. However, nutria farming was not successful, and nutria were intentionally released into the wild or translocated to the Southeast to serve as "weed cutters" to control undesirable vegetation.

The species was first introduced into Maryland's Lower Eastern Shore in 1943 in order to establish an experimental fur station at the Blackwater National Wildlife Refuge. The nutria population in the wildlife refuge increased to approximately 50,000 by the early 1990s.

Why Are They Harmful to the Chesapeake Bay?

Feeding behaviors by nutria are extremely damaging to marsh ecosystems. Nutria can eat 25 percent of their body weight in a single day. They consume plants by excavating the roots, creating circles of mudflats called "eat outs." As a result, these areas become highly susceptible to erosion, and the wetlands are quickly converted to open water, removing valuable habitat for native species. Nutria also create deep swimming channels through marshes, fragmenting the area and preventing marsh-dependent species from using all of the available habitat. Over 7,000 acres of marshland in Blackwater National Wildlife Refuge have been destroyed since the introduction of nutria — almost half the refuge's total acreage.



What Is Being Done to Control Them?

Management efforts to control or eradicate nutria in Maryland began in the late 1980s. They led to the development in 2000 of a three-year pilot program. It brought together state, federal, and private organizations to investigate

and apply the most successful methods. These include sending out teams to track and trap the animals.

In 2002 the Chesapeake Bay Program (CBP), in partnership with Maryland Sea Grant, sponsored a workshop aimed at developing Baywide management strategies for problematic invasive species, including nutria. In 2003 President George W. Bush signed a law that provided $20 million over five years for nutria eradication in Maryland. The CBP — the partnership of federal and state agencies that oversees Bay restoration efforts — concluded that the nutria populations needed to be eliminated throughout the Chesapeake Bay region, not just in Maryland. The CBP created a Chesapeake Bay Nutria Working Group in 2003 to develop a Baywide management plan, which set a target date of 2009 to eradicate the animals.

What is Their Status?

Management efforts have resulted in substantial progress in controlling the nutria population in the Chesapeake region. As of 2004, nutria have been completely eradicated from Blackwater National Wildlife Refuge. Intensive surveys conducted throughout the Delmarva Peninsula from 2010 to 2012 indicate that the remaining nutria populations are confined to Maryland's Lower Shore in Wicomico and Somerset Counties, primarily in the Wicomico and Manokin rivers. Eradication efforts continue, and resource managers hope to remove the remaining populations within a few years.

NUTRIA

Fig. 1. Nutria (*Myocastor coypus*)

Damage Prevention and Control Methods

Exclusion

Protect small areas with partially buried fences.

Wire tubes can be used to protect baldcypress or other seedlings but are expensive and difficult to use.

Use sheet metal shields to prevent gnawing on wooden and styrofoam structures and trees near aquatic habitat.

Install bulkheads to deter burrowing into banks.

Cultural Methods and Habitat Modification

Improve drainage to destroy travel lanes.

Manage vegetation to eliminate food and cover.

Contour stream banks to control burrowing.

Plant baldcypress seedlings in the fall to minimize losses.

Restrict farming, building construction, and other "high risk" activities to upland sites away from water to prevent damage.

Manipulate water levels to stress nutria populations.

Frightening

Ineffective.

Repellents

None are registered. None are effective.

Toxicants

Zinc phosphide on carrot or sweet potato baits.

Fumigants

None are registered. None are effective.

Trapping

Commercial harvest by trappers.

Double longspring traps, Nos. 11 and 2, as preferred by trappers and wildlife damage control specialists.

Body-gripping traps, for example, Conibear® Nos. 160-2 and 220-2, and locking snares are most effective when set in trails, den entrances, or culverts.

Live traps should be used when leghold and body-gripping traps cannot be set.

Long-handled dip nets can be used to catch unwary nutria.

Shooting

Effective when environmental conditions force nutria into the open. Night hunting is illegal in many states.

Other Methods

Available control techniques may not be applicable to all damage situations. In these cases, safe and effective methods must be tailored to specific problems.

Identification

The nutria (*Myocastor coypus,* Fig. 1) is a large, dark-colored, semiaquatic rodent that is native to southern South America. At first glance, a casual observer may misidentify a nutria as either a beaver (*Castor canadensis*) or a muskrat (*Ondatra zibethicus*), especially when it is swimming. This superficial resemblance ends when a more detailed study of the animal is made. Other names used for the nutria include coypu, nutria-rat, South American beaver, Argentine beaver, and swamp beaver.

Nutria are members of the family Myocastoridae. They have short legs and a robust, highly arched body that is approximately 24 inches (61 cm) long. Their round tail is from 13 to 16 inches (33 to 41 cm) long and scantily haired. Males are slightly larger than females; the average weight for each is about 12 pounds (5.4 kg). Males and females may grow to 20 pounds (9.1 kg) and 18 pounds (8.2 kg), respectively.

The dense grayish underfur is overlaid by long, glossy guard hairs that vary in color from dark brown to yellowish brown. The forepaws have four well-developed and clawed toes and one vestigial toe. Four of the five clawed toes on the hind foot are interconnected by webbing; the fifth outer toe is free. The hind legs are much larger than the forelegs. When moving on land, a nutria may drag its chest and appear to hunch its back. Like beavers, nutria have large incisors that are yellow-orange to orange-red on their outer surfaces.

In addition to having webbed hind feet, nutria have several other adaptations to a semiaquatic life. The eyes, ears, and nostrils of nutria are set high on their heads. Additionally, the nostrils and mouth have valves that seal out water while swimming, diving, or feeding underwater. The mammae or teats of the female are located high on the sides, which allows the young to suckle while in the water. When pursued, nutria can swim long distances under water and see well enough to evade capture.

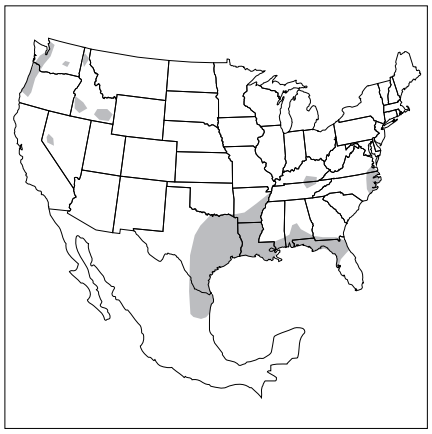

Fig. 2. Range of the nutria introduced in North America.

Range

The original range of nutria was south of the equator in temperate South America. This species has been introduced into other areas, primarily for fur farming, and feral populations can now be found in North America, Europe, the Soviet Union, the Middle East, Africa, and Japan. *M. c. bonariensis* was the primary subspecies of nutria introduced into the United States.

Fur ranchers, hoping to exploit new markets, imported nutria into California, Washington, Oregon, Michigan, New Mexico, Louisiana, Ohio, and Utah between 1899 and 1940. Many of the nutria from these ranches were freed into the wild when the businesses failed in the late 1940s. State and federal agencies and individuals translocated nutria into Alabama, Arkansas, Georgia, Kentucky, Maryland, Mississippi, Oklahoma, Louisiana, and Texas, with the intent that nutria would control undesirable vegetation and enhance trapping opportunities. Nutria were also sold as "weed cutters" to an ignorant public throughout the Southeast. A hurricane in the late 1940s aided dispersal by scattering nutria over wide areas of coastal southwest Louisiana and southeast Texas.

Accidental and intentional releases have led to the establishment of widespread and localized populations of nutria in various wetlands throughout the United States. Feral animals have been reported in at least 40 states and three Canadian provinces in North America since their introduction. About one-third of these states still have viable populations that are stable or increasing in number. Some of the populations are economically important to the fur industry. Adverse climatic conditions, particularly extreme cold, are probably the main factors limiting range expansion of nutria in North America. Nutria populations in the United States are most dense along the Gulf Coast of Louisiana and Texas (Fig. 2).

Habitat

Nutria adapt to a wide variety of environmental conditions and persist in areas previously claimed to be unsuitable. In the United States, farm ponds and other freshwater impoundments, drainage canals with spoil banks, rivers and bayous, freshwater and brackish marshes, swamps, and combinations of various wetland types can provide a home to nutria. Nutria habitat, in general, is the semiaquatic environment that occurs at the boundary between land and permanent water. This zone usually has an abundance of emergent aquatic vegetation, small trees, and/or shrubs and may be interspersed with small clumps and hillocks of high ground. In the United States, all significant nutria populations are in coastal areas, and freshwater marshes are the preferred habitat.

Food Habits

Nutria are almost entirely herbivorous and eat animal material (mostly insects) incidentally, when they feed on plants. Freshwater mussels and crustaceans are occasionally eaten in some parts of their range. Nutria are opportunistic feeders and eat approximately 25% of their body weight daily. They prefer several small meals to one large meal.

The succulent, basal portions of plants are preferred as food, but nutria also eat entire plants or several different parts of a plant. Roots, rhizomes, and tubers are especially important during winter. Important food plants in the

United States include cordgrasses (*Spartina* spp.), bulrushes (*Scirpus* spp.), spikerushes (*Eleocharis* spp.), chafflower (*Alternanthera* spp.), pickerelweeds (*Pontederia* spp.), cattails (*Typha* spp.), arrowheads (*Sagittaria* spp.), and flatsedges (*Cyperus* spp.). During winter, the bark of trees such as black willow (*Salix nigra*) and baldcypress (*Taxodium distichum*) may be eaten. Nutria also eat crops and lawn grasses found adjacent to aquatic habitat.

Because of their dexterous forepaws, nutria can excavate soil and handle very small food items. Food is eaten in the water; on feeding platforms constructed from cut vegetation; at floating stations supported by logs, decaying mats of vegetation, or other debris; in shallow water; or on land. In some areas, the tops of muskrat houses and beaver lodges may also be used as feeding platforms.

General Biology, Reproduction, and Behavior

General Biology

In the wild, most nutria probably live less than 3 years; captive animals, however, may live 15 to 20 years. Predation, disease and parasitism, water level fluctuations, habitat quality, highway traffic, and weather extremes affect mortality. Annual mortality of nutria is between 60% and 80%.

Predators of nutria include humans (through regulated harvest), alligators (*Alligator mississippiensis*), garfish (*Lepisosteus* spp.), bald eagles (*Haliaeetus leucocephalus*), and other birds of prey, turtles, snakes such as the cottonmouth (*Agkistrodon piscivorus*), and several carnivorous mammals.

Nutria densities vary greatly. In Louisiana, autumn densities of about 18 animals per acre (44/ha) have been found in floating freshwater marshes. In Oregon, summer densities in freshwater marshes may be 56 animals per acre (138/ha). Sex ratios range from 0.6 to 1.6 males per female.

In summer, nutria live on the ground in dense vegetation, but at other times of the year they use burrows. Burrows may be those abandoned by other animals such as armadillos (*Dasypus novemcinctus*), beavers, and muskrats, or they may be dug by nutria. Underground burrows are used by individuals or multigenerational family groups.

Burrow entrances are usually located in the vegetated banks of natural and human-made waterways, especially those having a slope greater than 45°. Burrows range from a simple, short tunnel with one entrance to complex systems with several tunnels and entrances at different levels. Tunnels are usually 4 to 6 feet (1.2 to 1.8 m) long; however, lengths of up to 150 feet (46 m) have been recorded. Compartments within the tunnel system are used for resting, feeding, escape from predators and the weather, and other activities. These vary in size, from small ledges that are only 1 foot (0.3 m) across to large family chambers that measure 3 feet (0.9 m) across. The floors of these chambers are above the water line and may be covered with plant debris discarded during feeding and shaped into crude nests.

In addition to using land nests and burrows, nutria often build flattened circular platforms of vegetation in shallow water. Constructed of coarse emergent vegetation, these platforms are used for feeding, loafing, grooming, birthing, and escape, and are often misidentified as muskrat houses. Initially, platforms may be relatively low and inconspicuous; however, as vegetation accumulates, some may attain a height of 3 feet (0.9 m).

Reproduction

Nutria breed in all seasons throughout most of their range, and sexually active individuals are present every month of the year. Reproductive peaks occur in late winter, early summer, and mid-autumn, and may be regulated by prevailing weather conditions.

Under optimal conditions, nutria reach sexual maturity at 4 months of age. Female nutria are polyestrous, and nonpregnant females cycle into estrus ("heat") every 2 to 4 weeks. Estrous is maintained for 1 to 4 days in most females. Sexually mature males can breed at any time because sperm is produced throughout the year.

The gestation period for nutria ranges from 130 to 132 days. A postpartum estrus occurs within 48 hours after birth and most females probably breed again during that time.

Litters average 4 to 5 young, with a range of 1 to 13. Litter sizes are generally smaller during winter, in suboptimal habitats, and for young females. Females often abort or assimilate embryos in response to adverse environmental conditions.

Young are precocial and are born fully furred and active. They weigh approximately 8 ounces (227 g) at birth and can swim and eat vegetation shortly thereafter. Young normally suckle for 7 to 8 weeks until they are weaned.

Behavior

Nutria tend to be crepuscular and nocturnal, with the start and end of activity periods coinciding with sunset and sunrise, respectively. Peak activity occurs near midnight. When food is abundant, nutria rest and groom during the day and feed at night. When food is limited, daytime feeding increases, especially in wetlands free from frequent disturbance.

Nutria generally occupy a small area throughout their lives. In Louisiana, the home range of nutria is about 32 acres (13 ha). Daily cruising distances for most nutria are less than 600 feet (183 m), although some individuals may travel much farther. Nutria move most in winter, due to an increased demand for food. Adults usually move farther than young. Seasonal migrations of nutria may also occur. Nutria living in some agricultural areas move in from marshes and swamps when crops are planted and leave after the crops are harvested.

Nutria have relatively poor eyesight and sense danger primarily by hearing. They occasionally test the air for scent. Although they appear to be

clumsy on land, they can move with surprising speed when disturbed. When frightened, nutria head for the nearest water, dive in with a splash, and either swim underwater to protective cover or stay submerged near the bottom for several minutes. When cornered or captured, nutria are aggressive and can inflict serious injury to pets and humans by biting and scratching.

Damage and Damage Identification

Kinds of Damage

Nutria damage has been observed throughout their range. Most damage is from feeding or burrowing. In the United States, most damage occurs along the Gulf Coast of Louisiana and Texas. The numerous natural and human-made waterways that traverse this area are used extensively for travel by nutria.

Burrowing is the most commonly reported damage caused by nutria. Nutria are notorious in Louisiana and Texas for undermining and breaking through water-retaining levees in flooded fields used to produce rice and crawfish. Additionally, nutria burrows sometimes weaken flood control levees that protect low-lying areas. In some cases, tunneling in these levees is so extensive that water will flow unobstructed from one side to the other, necessitating their complete reconstruction.

Nutria sometimes burrow into the styrofoam flotation under boat docks and wharves, causing these structures to lean and sink. They may burrow under buildings, which may lead to uneven settling or failure of the foundations. Burrows can weaken roadbeds, stream banks, dams, and dikes, which may collapse when the soil is saturated by rain or high water or when subjected to the weight of heavy objects on the surface (such as vehicles, farm machinery, or grazing livestock). Rain and wave action can wash out and enlarge collapsed burrows and compound the damage.

Nutria depredation on crops is well documented. In the United States, sugarcane and rice are the primary crops damaged by nutria. Grazing on rice plants can significantly reduce yields, and damage can be locally severe. Sugarcane stalks are often gnawed or cut during the growing season. Often only the basal internodes of cut plants are eaten. Other crops that have been damaged include corn, milo (grain sorghum), sugar and table beets, alfalfa, wheat, barley, oats, peanuts, various melons, and a variety of vegetables from home gardens and truck farms.

Nutria girdle fruit, nut, and shade trees and ornamental shrubs. They also dig up lawns and golf courses when feeding on the tender roots and shoots of sod grasses. Gnawing damage to wooden structures is common. Nutria also gnaw on styrofoam floats used to mark the location of traps in commercial crawfish ponds.

At high densities and under certain adverse environmental conditions, foraging nutria can significantly impact natural plant communities. In Louisiana, nutria often feed on seedling baldcypress and can cause the complete failure of planted or naturally-regenerated stands. Overutilization of emergent marsh plants can damage stands of desirable vegetation used by other wildlife species and aggravate coastal erosion problems by destroying vegetation that holds marsh soils together. Nutria are fond of grassy arrowhead (*Sagittaria platyphylla*) tubers and may destroy stands propagated as food for waterfowl in artificial impoundments.

Nutria can be infected with several pathogens and parasites that can be transmitted to humans, livestock, and pets. The role of nutria, however, in the spread of diseases such as equine encephalomyelitis, leptospirosis, hemorrhagic septicemia (Pasteurellosis), paratyphoid, and salmonellosis is not well documented. They may also host a number of parasites, including the nematodes and blood flukes that cause "swimmer's-itch" or "nutria-itch" (*Strongyloides myopotami* and *Schistosoma mansoni*), the protozoan responsible for giardiasis (*Giardia lamblia*), tapeworms (*Taenia* spp.), and common liver flukes (*Fasciola hepatica*). The threat of disease may be an important consideration in some situations, such as when livestock drink from water contaminated by nutria feces and urine.

Damage Identification

The ranges of nutria, beavers, and muskrats overlap in many areas and damage caused by each may be similar in appearance. Therefore, careful examination of sign left at the damage site is necessary to identify the responsible species.

On-site observations of animals and their burrows are the best indicators of the presence of nutria. Crawl outs, slides, trails, and the exposed entrances to burrows often have tracks that can be used to identify the species. The hind foot, which is about 5 inches (13 cm) long, has four webbed toes and a free outer toe. A drag mark left by the tail may be evident between the footprints (Fig. 3).

Droppings may be found floating in the water, along trails, or at feeding sites. These are dark green to almost black in color, cylindrical, and approximately 2 inches (5 cm) long and 1/2 inch (1.3 cm) in diameter. Additionally, each dropping usually has deep, parallel grooves along its entire length (Fig. 4).

Trees girdled by nutria often have no tooth marks, and bark may be peeled from the trunk. The crowns of seedling trees are usually clipped (similar to rabbit [*Sylvilagus* spp.] damage) and discarded along with other woody portions of the plant.

In rice fields, damage caused by nutria, muskrats, and Norway rats (*Rattus norvegicus*) can be confused. Nutria and muskrats damage rice plants by clipping stems at the water line in flooded fields; Norway rats reportedly clip stems above the surface of the water (E. A. Wilson, personal communication).

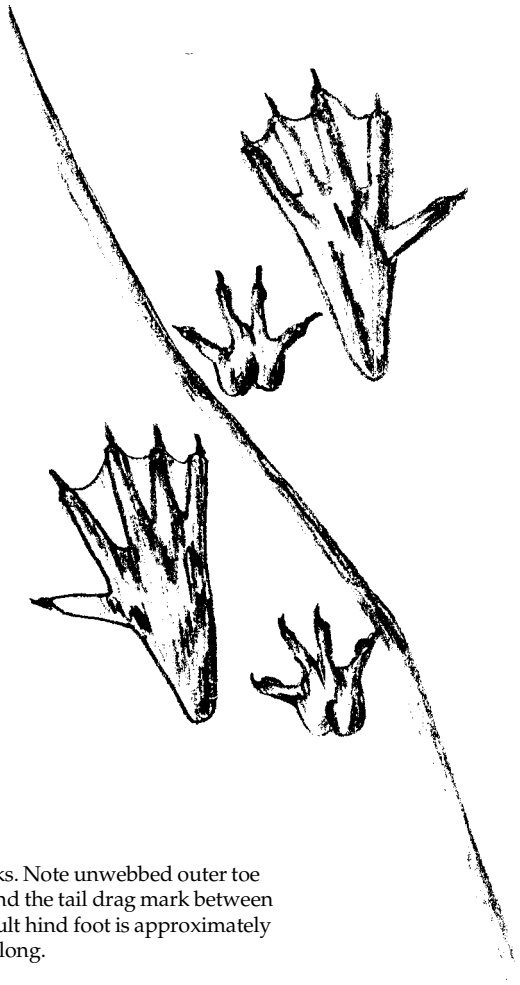

Fig. 3. Nutria tracks. Note unwebbed outer toe on the hind foot and the tail drag mark between the tracks. The adult hind foot is approximately 5 inches (12.7 cm) long.

Fig. 4. Nutria dropping in relation to a 2-inch (5.1-cm) camera lens cover. Note longitudinal grooves along the length of the dropping.

Legal Status

Nutria are protected as furbearers in some states or localities because they are economically important. Permits may be necessary to control animals that are damaging property. In other areas, nutria have no legal protection and can be taken at any time by any legal means. Consequently, citizens experiencing problems with nutria should be familiar with local wildlife laws and regulations. Complex problems should be handled by professional wildlife damage control specialists who have the necessary permits and expertise to do the job correctly. Your state wildlife agency can provide the names of qualified wildlife damage control specialists and information on pertinent laws and regulations.

Damage Prevention and Control Methods

Preventive measures should be used whenever possible, especially in areas where damage is prevalent. When control is warranted, all available techniques should be considered before a control plan is implemented. The objective of control is to use only those techniques that will stop or alleviate anticipated or ongoing damage or reduce it to tolerable levels. In most cases, successful control will depend on integrating a number of different techniques and methods.

Timing and location of control activities are important factors governing the success or failure of any control project. Control in sugarcane, for example, is best applied during the growing season, after damage has started. At this time, nutria in affected areas are relatively stationary and concentrated in drainages adjacent to fields. Conversely, efforts to protect rice field levees or the shorelines of southern lakes and ponds should be initiated during the winter when animals are mobile and concentrated in major ditches and other large bodies of water.

Nutria are best controlled where they are causing damage or where they are most active. Baiting is sometimes used to concentrate nutria in specific locations where they can be controlled more easily. After the main concentrations of nutria are removed, control efforts should be directed at removing wary individuals.

Exclusion

Fences, walls, and other structures can reduce nutria damage, but high costs usually limit their use. As a general rule, barriers are too expensive to be used to control damage to agricultural crops. Low fences (about 4 feet [1.2 m]) with an apron buried at least 6 inches (15 cm) have been used effectively to exclude nutria from home gardens and lawns. Sheet metal shields can be used to prevent gnawing damage to wooden and styrofoam structures and trees. Barriers constructed of sheet metal can be expensive to erect and unsightly.

Protect baldcypress and other seedlings with hardware cloth tubes around individual plants or wire mesh fencing around the perimeter of a stand. Extensive use of these is neither practical nor cost-effective. Plastic seedling protectors are not effective in controlling damage to baldcypress seedlings because nutria can chew through them.

Sheet piling, bulkheads, and riprap can effectively protect stream banks from burrowing nutria. Installation requires heavy equipment and is expensive. Use is usually restricted to industrial or commercial applications.

Cultural Methods and Habitat Modification

Land that is well-drained and free of dense, weedy vegetation is generally unattractive to nutria. Use of other good farming practices, such as precision land leveling and weed management, can minimize nutria damage in agricultural areas.

Draining and Grading. Any drainage that holds water can be used by nutria as a travel route or home site. Consequently, eliminate standing water in drainages to reduce their attractiveness to nutria. This may be extremely difficult or impossible to accomplish in low-lying areas near coastal marshes and permanent bodies of water. Higher sites, such as those used for growing sugarcane and other crops, are better suited for this type of management.

On poorly drained soils, contour small ditches to eliminate low spots and sills and enhance rapid drainage. Use precision leveling on well-drained soils to eliminate small ditches that are occasionally used by nutria.

Grading and bulldozing can destroy active burrows in the banks of steep-sided ditches and waterways. In addition, contour bank slopes at less than 45° to discourage new burrowing. Sculpting rice field levees to make them gently sloping is similarly effective. Continued deep plowing of land undermined by nutria can destroy shallow burrow systems and discourage new burrowing activity.

Vegetation Control. Eliminate brush, trees, thickets, and weeds from fence lines and turn rows that are adjacent to ditches, drainages, waterways, and other wetlands to discourage nutria. Burn or remove cleared vegetation from the site. Brush piles left on the ground or in low spots can become ideal summer homes for nutria.

Water Level Manipulation. Many low-lying areas along the Gulf Coast are protected by flood control levees and pumps that can be used to manipulate water levels. By dropping water levels during the summer, stressful drought conditions that cause nutria to concentrate in the remaining aquatic habitat can be simulated, thus increasing competition for food and space, exposure to predators, and emigration to other suitable habitat. Raising water levels in winter will force nutria out of their burrows and expose them to the additional stresses of cold weather. Water level manipulation is expensive to implement and has not yet been proven to be effective. Nevertheless, this method should be considered when a comprehensive nutria control program is being developed.

Other Cultural Methods. Alternate field and garden sites should be considered in areas where nutria damage has occurred on a regular basis. New fields, gardens, and slab-on-grade buildings should be located as far as possible from drainages, waterways, and other water bodies where nutria live.

Late-planted baldcypress seedlings are less susceptible to damage by nutria than those planted in the spring. For this reason, plant unprotected seedlings in the early fall when alternative natural foods are readily available.

Frightening

Nutria are wary creatures and will try to escape when threatened. Loud noises, high pressure water sprays, and other types of harassment have been used to scare nutria from lawns and golf courses. The success of this type of control is usually short-lived and problem animals soon return. Consequently, frightening as a control technique is neither practical nor effective.

Repellents

No chemical repellents for nutria are currently registered. Other rodent repellents (such as Thiram) may repel nutria, but their effectiveness has not been determined. Use of these without the proper state and federal pesticide registrations is illegal.

Toxicants

Zinc Phosphide. Zinc phospide is the only toxicant that is registered for controlling nutria. Zinc phosphide is a Restricted Use Pesticide that can only be purchased and applied by certified pesticide applicators or individuals under their direct supervision. It is a grayish-black powder with a heavy garlic-like smell and is widely used for controlling a variety of rodents. When used properly, zinc phosphide poses little hazard to nontarget species, humans, pets, or livestock.

Zinc phosphide is highly toxic to wildlife and humans, so all precautions and instructions on the product label

should be carefully reviewed, understood, and followed precisely. Use an approved respirator and wear elbow-length rubber gloves when handling this chemical to prevent accidental poisoning. Mix and store baits treated with zinc phosphide only in well-ventilated areas to reduce exposing humans to chemical fumes and dust. When possible, mix zinc phosphide at the baiting site to avoid having to store and transport treated baits. Never transport mixed bait or open zinc phosphide containers in the cab of any vehicle. Store unused zinc phosphide in a dry place in its original watertight container because moisture causes it to deteriorate. Immediately wash off any zinc phosphide that gets on the skin.

Past studies have shown that zinc phosphide can kill over 95% of the nutria present along waterways when applied to fresh baits at a 0.75% (7,500 ppm) rate. Today, the use of zinc phosphide at this concentration is illegal. Federal and state registrations, however, allow lower rates to be used. For example, the label held by USDA-APHIS-ADC (EPA Reg. No. 56228-9) allows for a maximum 0.67% (6,700 ppm) treatment rate. At this rate, approximately 94 pounds (42.7 kg) of bait can be treated with 1 pound (0.4 kg) of 63.2% zinc phosphide concentrate.

Where to Bait. The best places to bait nutria are in waterways, ponds, and ditches where permanent standing water and recent nutria sign are found. Baiting in these areas increases efficiency and reduces the likelihood that nontarget animals will be affected. Small chunks of unpeeled carrots, sweet potatoes, watermelon rind, and apples can be used as bait.

The best baiting stations for large waterways are floating rafts spaced 1/4 to 1/2 mile (0.4 to 0.8 km) apart throughout the damaged area. In ponds, use one raft per 3 acres (1.2 ha). Rafts measuring 4 feet (1.2 m) square or 4 x 8 feet (1.2 x 2.4 m) are easily made from sheets of 3/8- to 3/4-inch (1.0- to 1.9- cm) exterior plywood and 3-inch (7.6-cm) styrofoam flotation. Install a thin wooden strip around the perimeter of the raft's surface to keep bait from rolling into the water. The raft should float 1 to 4 inches (2.5 to 10.2 cm) above the surface and should be anchored to the bottom with a heavy weight or tied to the shore (Fig. 5).

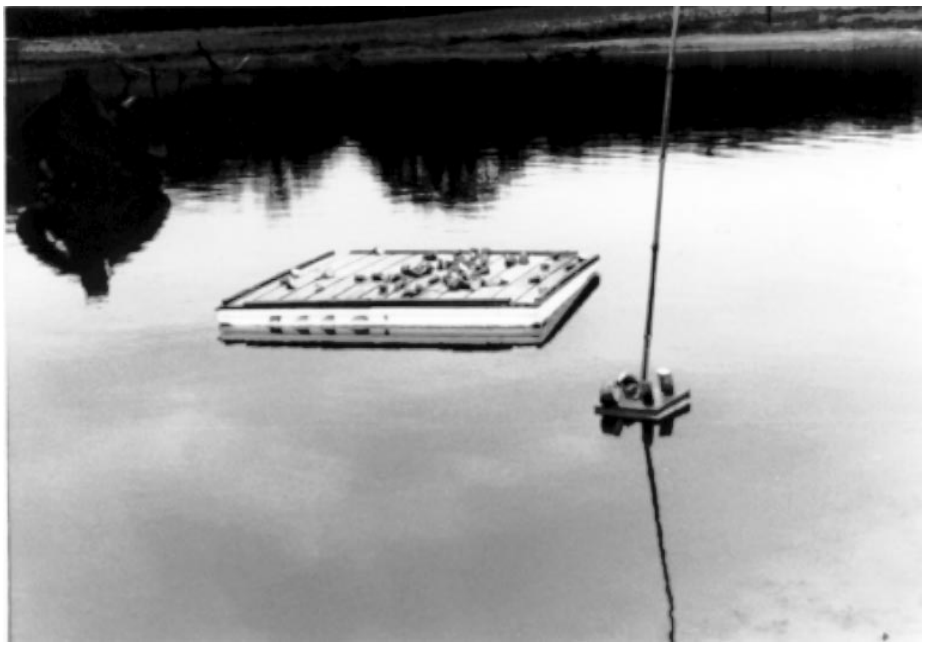

Fig. 5. Examples of a 4-foot (1.2-m) square raft (left) and a 6-inch (15.2-cm) square baiting board, which are used to concentrate nutria for shooting, trapping, or poisoning. These baiting platforms are constructed of plywood and styrofoam and baited with sweet potatoes.

In small ditches or areas where nutria densities are low, use 6-inch (15.2-cm) square floating bait boards made of wood and styrofoam, in lieu of rafts (Fig. 5). These can be maintained in place with a long slender anchoring pole made of bamboo, reed, or other suitable material that is placed through a hole in the center of the platform. This allows the board to move up and down as water levels change. Attach baits to small nails driven into the surface of the platform. Bait boards should be spaced 50 to 100 feet (15.2 to 30.5 m) apart in areas where nutria are active.

Other natural sites surrounded by water can also be baited for nutria. Small islands, exposed tree stumps, floating logs, and feeding platforms are excellent baiting sites. Avoid placing baits on muskrat houses and beaver lodges. Baits can be attached to trees, stumps, or other structures with small nails and should be kept out of the water.

Baiting on the ground should only be used when water sites are unsuitable or lacking. Ground baiting is justified and effective when eliminating the last few nutria in a local population. Use care when ground baiting because baits may be accessible to nontarget animals and humans. Place ground baits near sites of nutria activity, such as trails and entrances to burrows.

Prebaiting. Prebaiting is a crucial step when using zinc phosphide because it leads to nutria feeding at specific sites on specific types of food (such as the baits; carrots or sweet potatoes are preferred). Nutria tend to be communal feeders, and if one nutria finds a new feeding spot, other nutria in the area will also begin feeding there.

To prebait, lightly coat small (approximately 2-inch [5.1-cm] long) chunks of untreated bait with corn oil. Place the bait at each baiting station in late afternoon, and leave it overnight. Use no more than 10 pounds (4.5 kg) of bait per raft, 4 pieces of bait per baiting board, or 2 to 5 pieces at other sites at one time. Prebaiting should continue at least 2 successive nights after nutria begin feeding at a baiting site. Large

(more than 1 week) gaps in the prebaiting sequence necessitate that the process be started over.

Observations of prebaited sites will help you decide how the control program should proceed. If nontarget animals are feeding at these sites (as determined by sign or actual observations of animals), then prebaiting should start over at another location. Prepare and apply zinc phosphide-treated baits when nutria become regular users of prebaited baiting stations and nontarget animals are not a problem.

Applying Zinc Phosphide. Prepare zinc phosphide baits as needed to prevent deterioration. Treated baits are prepared in 10-pound (4.5-kg) batches (enough to treat one raft) by using the following ingredients: 10 pounds (4.5 kg) of bait (carrots or sweet potatoes are preferred), prepared as for prebaiting; 1 fluid ounce or 2 tablespoons (30 ml) of corn oil; and 1.7 ounces or 7.5 tablespoons (48.2 g) of 63.2% zinc phosphide concentrate.

To prepare treated baits, add corn oil to the bait in a 5 gallon (18.9 l) plastic or metal container. Stir the mixture until the bait is lightly coated with corn oil. Sprinkle zinc phosphide over the mixture and stir until the bait is uniformly coated. Treated baits have a shiny black appearance and should be dried for about 1 hour in a well-ventilated area until the color changes to a dull gray. Properly dried baits are weather-resistant and remain toxic until they deteriorate. Although treated baits can survive light rain, they should not be used when heavy rains are expected or on open water that is subject to heavy wave action.

The amount of untreated bait eaten the last night of prebaiting determines how much treated bait should be used on the first night. When all or most of the untreated prebait is gone from baiting stations by morning, the same amount of treated bait is used on the stations the following night (e.g., up to 10 pounds [4.5 kg] per raft, 4 pieces per baiting board, and 2 to 5 pieces at other sites). When smaller quantities are eaten, reduce the amount of treated bait that is used per station proportionately. When only a few pieces of prebait on a raft are eaten, the raft should be removed and replaced with several scattered baiting boards.

The quantity of treated bait eaten each treatment night is the quantity that should be put out the following afternoon. Continue baiting until no more bait is being taken. Most nutria can be controlled after 4 nights of baiting. When densities are high, control may require more time.

Post-Control Procedures. Usually only 25% of the poisoned nutria die where they can be found. Many nutria die in dens, dense vegetation, and other inaccessible areas. Carcasses of nutria killed with zinc phosphide should be collected as soon as possible and disposed of by deep burial or burning to prevent exposure of domestic and wild scavengers to undigested stomach material containing zinc phosphide. Dispose of any leftover treated bait in accordance with label directions.

Cessation of damage is the best indicator that zinc phosphide is controlling problem animals. You can quantify the reduction in nutria activity by putting out untreated bait at baiting stations after the last application of zinc phosphide. The amount eaten at this time is compared to the amount of bait eaten on the last night of prebaiting.

Fumigants

Several fumigants are registered for controlling burrowing rodents but none are registered for use against nutria. Some, such as aluminum phosphide, may have potential as nutria control agents, but their efficacy has not been scientifically demonstrated. Carbon monoxide gas pumped into dens has reportedly been used to kill nutria, but this method is neither practical nor legal because it is not registered for this purpose.

Trapping

Commercial Harvest. Damage to crops, levees, wetlands, and other resources is minimal in areas where nutria are harvested by commercial trappers. The commercial harvest of nutria on private and public lands should be encouraged as part of an overall program to manage nutria-caused damage. Landowners may be able to obtain additional information on nutria management, trapping, and a list of licensed trappers in their area from their state wildlife agency.

Leghold traps. Leghold traps are the most commonly used traps for catching nutria. Double longspring traps, No. 11 or 2, are preferred by most trappers; however, the No. 1 1/2 coilspring, No. 3 double longspring, or the soft-catch fox trap can also be used effectively. Legholds are more efficient and versatile than body-grip traps and are highly recommended for nutria control work. Leghold traps should be used with care to prevent injury to children and pets.

Several ways of setting leghold traps are effective. Set traps just under the water where a trail enters a ditch, canal, or other body of water. Make trail sets by placing a trap offset from the trail's center line so that nutria are caught by the foot. Traps can be lightly covered with leaves or other debris to hide them, but nutria are easily captured in unconcealed traps.

Bait can be used to lure nutria to leghold sets. Nutria use their teeth to pick up large pieces of food; therefore, bait should be placed beside, rather than inside, the trap jaws. Leghold traps are also effective when set on floating rafts that have been prebaited for a short period of time.

Use drowning sets when deep water is available. Otherwise, stake leghold traps to the ground, or anchor them to solid objects in the water or on land (such as floating logs, stumps, or trees and shrubs). Nutria caught in non-drowning leghold sets should be humanely dispatched with a shot or hard blow to the head. Nontarget animals should be released.

Live Traps. Nutria are easily captured in single- or double-door live traps that measure 9 x 9 x 32 inches (22.8 x 22.8 x 81.3 cm) or larger. Use

Fig. 6. Hand-caught nutria must be handled carefully to avoid being bitten or clawed.

these when leghold and body-grip traps cannot be set or when animals are to be translocated. Bait live traps with sweet potatoes and carrots and place them along active trails or wherever nutria or their sign are seen. A short line of baits leading to the entrance of a live trap will increase capture success. Live traps placed on floating rafts will effectively catch nutria but prebaiting is necessary. A large raft can hold up to 8 traps. Unwanted nutria should be destroyed with a shot or blow to the head. Nontarget animals should be released.

Floating, drop-door live traps catch nutria but are bulky and cumbersome to use. The same is true for expensive suitcase-type beaver traps. Unwary nutria can be captured using a long-handled dip net. This method should only be used by trained damage control professionals who should take special precautions to prevent being bitten or clawed (Fig. 6). Live nutria can be immobilized with an injection of ketamine hydrochloride. Funnel traps are not effective for controlling nutria.

Body-gripping Traps. The Conibear® trap, No. 220-2, is the most commonly used body-gripping trap for controlling nutria. Nos. 160-2 and 330-2 Conibear® traps can also be used. Place sets in trails, at den entrances, in culverts, and in narrow waterways. Large body-grip traps can be dangerous and should be handled with extreme caution. These traps should not be set in areas frequented by children, pets, or desirable wildlife species.

Other Traps. Use locking snares to catch nutria when other traps cannot be set. Snares are relatively easy to set, safer than leghold and body-grip traps, and almost invisible to the casual observer. Snares constructed with 3/32-inch (0.2-cm) diameter, flexible (7 x 7-winding) stainless steel or galvanized aircraft cable are suitable for catching nutria. Ready-made snares and components (for example, cable, one-way cable locks, swivels, and cable stops) for making homemade snares can be purchased from trapping suppliers.

Place set snares in trails and other travel routes, feeding lanes, trails, and bank slides. Snares do not kill the animals they catch, so anchor the snare securely. Check snares frequently because they are often knocked down by nutria and other animals. Snared nutria should be dispatched with a shot or blow to the head. Release any nontarget animals that are captured.

Shooting

Shooting can be used as the primary method of nutria control or to supplement other control techniques. Shooting is most effective when done at night with a spotlight, however, night shooting is illegal in many states and should not be done until proper permits have been obtained. Once shooting has been approved by the proper authorities, nutria can be shot from the banks of waterways and other bodies of water or from boats. In some cases, 80% of the nutria in an area can be removed by shooting with a shotgun or small caliber rifle, such as the .22 rimfire. Care should be taken when shooting over open water to prevent bullets from ricocheting.

Shooting at Bait Stations. Baits can attract large numbers of nutria to floating rafts, baiting boards, and other areas where they can be shot. Shooting from dusk to about 10:00 p.m. for 3 consecutive nights is effective once a regular feeding pattern has been established. Feeding sites should be lit continuously by a spotlight and easily visible to the shooter from a vehicle or other stationary blind. At night, nutria can be located by their red-shining eyes and the V-shaped wake left by swimming animals. As many as 4 to 5 nutria per hour may be taken by this method. Shooters should wait 2 to 3 weeks before shooting nutria at the same site again.

Boat Shooting. Shooting can also be done in the late afternoon or early evening from a small boat paddled slowly along waterways and large ditches or along the shores of small lakes and ponds. Nutria are especially vulnerable to this method when water levels are extremely high or vegetative

cover is scarce. At times, animals can be stimulated to vocalize or decoyed to a boat or blind by making a "maw" call, which imitates the nutria's nocturnal feeding and assembly call. This call can be learned from someone who knows it or by listening to nutria vocalizations at night. Nutria become wary quickly, so limit shooting to no more than 3 nights, followed by 2 to 3 weeks of no activity.

Bank Shooting. Nutria can be shot by slowly stalking along the banks of ditches and levees; this can be an effective control method where nutria have not been previously harassed. Unlike night shooting from a boat or blind, bank shooting is most effective at twilight, both in the evening and morning. Several nutria can usually be shot the first night, however, success decreases with each successive night of shooting. Daytime shooting from the bank of a waterway is effective in some situations.

Economics of Damage and Control

Nutria can have either positive or negative values. They are economically important furbearers when their pelts provide income to commercial trappers. Conversely, they are considered pests when they damage property.

From 1977 to 1984, an average of 1.3 million nutria pelts were harvested annually in the United States. Based on prices paid to Louisiana trappers during this period, these pelts were worth about $7.3 million.

The estimated value of sugarcane and rice damaged by nutria each year has ranged from several thousand dollars to over a million dollars. If losses of other resources are added to this amount, the estimated average loss would probably exceed $1 million annually.

Management plans developed for nutria should be comprehensive and should consider the needs of all stakeholders. Regulated commercial trapping should be an integral part of any management scheme because it can provide continuous, long-term income to trappers; maintain acceptable nutria densities; and reduce damage to tolerable levels.

The value of the protected resource must be compared with the cost of control when determining whether nutria control is economically feasible. Most people will not control nutria if costs exceed the value of the resource being protected or if control will adversely impact income derived from trapping. Of course, there are exceptions, especially when the resource has a high sentimental or aesthetic value to the owner or user.

Acknowledgments

This chapter is a revision of an earlier chapter written by Evans (1983). Kinler et al. (1987) and Willner (1982) were the primary sources consulted for biological information on nutria.

Executive Summary

This Integrated Pest Management Plan (IPMP) provides a comprehensive, long-range document that captures all the pest management operations and pesticide-related activities conducted at the Naval Support Activity (NSA) Hampton Roads (HR), Portsmouth Annex, located in Portsmouth, Virginia. It incorporates pest management practices and the local, State, Federal and Department of Defense regulations conforming to the requirements of DOD Instruction 4150.07 and OPNAVINST 6250.4C while providing comprehensive information to installation staff and internal and external compliance auditors.

This IPMP was prepared by Naval Facilities Engineering Command Atlantic (NAVFAC LANT) Applied Biology (AB), from data collected through pest management data collection, on-site observations, and interviews with installation personnel, and document reviews.

The main goal of the various pest control functions is to support the mission of NSA HR Portsmouth Annex. DOD Civilian pest control operators provide general pest control services. Grounds maintenance is performed by NAVFAC DOD civilian personnel. Grounds maintenance does not conduct any pesticide applications; if there is a need for pesticides, they will coordinate with the on-site DOD Civilian pest control operator. Most of the MWR and NEX facilities at NSA HR Portsmouth Annex receive pest control services through contract with Ecolab. Pest control services are needed at NSA HR Portsmouth Annex to:

(1) Provide services that will prolong the life of the structures through subterranean termite and nuisance pest control;

(2) Maintain the safety and security of industrial and storage areas through weed control;

(3) Provide nuisance pest control to all buildings (except PPV housing) and outdoor areas to ensure a good working and living environment;

(4) Control weed and insect pests in all recreational and lawn areas to maintain aesthetics and provide recreational facilities to personnel;

(5) Provide control of mosquitoes, flies and other potential disease vectors to ensure the comfort and well-being of all personnel; and

(6) Provide vertebrate pest control, including rodent control, to all areas of NSA HR Portsmouth Annex.

For the current level of work to be accomplished, a sufficient staff of qualified applicators must be maintained. Contract personnel must meet state certification requirements specified by contract. Performance Assessment Representatives (PARs) must successfully take an initial Pest Management PAR Course. To maintain their certification, the PARs and DOD pesticide applicators must successfully pass a DOD pest management training and recertification course every three years. Pest control facilities must comply with current safety standards to provide a safe workplace and to minimize pesticide hazards.

The focus of this IPMP is on safe, environmentally sound, and cost-effective control of pests through Integrated Pest Management (IPM). IPM depends on education, proper surveying and identification of pests; non-chemical and chemical control methods, and individual responsibility for pest prevention.

1. Introduction

1.1. The Integrated Pest Management Plan

1.1.1. Scope

The Naval Support Activity (NSA) Hampton Roads (HR), Portsmouth Annex Integrated Pest Management Plan (IPMP) is a long-range, comprehensive planning and operational document that establishes the strategy and methods for conducting a safe, effective, and environmentally sound Integrated Pest Management (IPM) program. The IPMP covers all pest management and pesticide-related activities conducted by civilian and military DOD personnel and commercial contractors within all functional areas of NSA HR Portsmouth Annex. A glossary of acronyms used in this document is found in Appendix B.

1.1.2. Authority

OPNAVINST 6250.4C and OPNAVINST 5090.1C, Chapter 17 require all Navy activities that conduct pest management operations to have an IPMP. Pest management programs at Navy activities shall be conducted under an IPMP in accordance with DODINST 4150.07 and OPNAVINST 6250.4C.

1.1.3. Purpose and Structure

The IPMP provides a comprehensive overview of pest management and pesticide-related operations on NSA HR Portsmouth Annex and can be used as a reference by all installation personnel. The IPMP is structured as follows:

- Section 1 addresses the purpose of the IPMP and its maintenance and implementation. It also provides background on the installation and an overview of the current pest management program and requirements.
- Section 2 describes the organization and responsibilities of the functional area of the program and the administrative requirements and documentation.
- Section 3 describes the field operation of pest management including Integrated Pest Management (IPM), pesticide management, contracting, and current practices.
- Section 4 provides lists and descriptions of hazards and hazard abatement practices associated with pest management.
- Section 5 addresses the environmental considerations of the program including regulatory compliance, and the application of environmental management systems to pest management.
- Section 6 describes emergencies that are the result of infestations.
- Section 7 provides a list of resources available to the installation.
- The Appendices provide references and supporting documents. The NAVFAC Pest Management Resource CD is included in Appendix L, which includes downloadable forms and templates, pest management technical guides and handbooks, DOD directives, and pest management website links.

1.1.4. IPMP Implementation

The IPMP must be reviewed and approved by installation stakeholders and Professional Pest Management Consultants (PPMCs) from Naval Facilities Engineering Command Atlantic (NAVFAC LANT) and Navy Bureau of Medicine and Surgery (BUMED). The IPMP is implemented upon signature of the Installation Commanding Officer. The Integrated Pest Management Coordinator (IPMC) has the task of implementing, coordinating and executing the IPMP among each of the functional areas of the installation.

1.1.5. IPMP Maintenance

Once the IPMP has been developed and implemented, it must be reviewed annually and updated as necessary. The annual IPMP update form is located in Appendix D. The installation IPMC is responsible for maintaining the IPMP.

1.1.5.1. Internal Review

An internal review is conducted annually by the IPMC in coordination with the Pest Management Service Providers (PMSPs) and other functional area Points of Contact (POC). The review should include updating contract information, applicator certifications, pesticides and pest management operations to be used on the installation, and ensuring all pesticide use is reported. An Internal Assessment Plan (IAP) for the pesticide program should be used by the IPMC as a tool to review compliance issues during the internal review. A sample IAP can be found in Appendix I and other compliance self-assessments can be found in Appendix D.

1.1.5.2. Off-site Review

The IPMC may request a review by a NAVFAC LANT Applied Biology Professional Pest Management Consultant (PPMC) for review of regulatory requirements, reporting and pesticide approval procedures.

1.1.5.3. On-site Review

An on-site review of the entire pest management program shall be performed by the NAVFAC LANT Applied Biology PPMC every 3 years to ensure compliance with the IPMP. The review may be performed more frequently if extensive program problems exist.

1.1.5.4. IPMP Rewrite

The IPMP should be rewritten every 5 years to reflect new contracts, personnel, pest management practices, and regulatory changes.

1.2. Installation Background

1.2.1. Mission

Provide 4-Star Installation Management to the region's second largest Naval Facility including Security, Facilities Management, Safety, Medical Facility Improvement, Environmental Protection and Reclamation, and DOD Personnel Services.

1.2.2. Location and Facilities

Naval Support Activity Hampton Roads, Portsmouth Annex, home of Naval Medical Center Portsmouth, has proudly served the military and their families since 1830, making it the Navy's oldest continuously operating hospital. Nationally acclaimed, this state of the art medical center offers premier research and teaching programs designed to prepare new doctors, nurses and hospital corpsmen for the future.

Located on historic Hospital Point, NSA HR Portsmouth Annex is home to 5,000 men and women who live and work by the Navy's core values of honor, courage and commitment. NSA HR Portsmouth Annex is geographically located in the Southeastern corner of the Commonwealth of Virginia. The area is collectively known as "Hampton Roads" and is commonly referred to as such by residents. Hampton Roads generally includes the cities of Newport News, Hampton, Norfolk, Portsmouth, Virginia Beach, Chesapeake, and Suffolk, and is populated by over 1.5 million people. The region is homeport to the majority of the 186 ships, 1,300 aircraft and 118,000 Sailors and Marines assigned to the Atlantic Fleet. NSA HR Portsmouth Annex is one of many regional installations that constitute the largest military concentration in the world.

1.3. Pest Management Program Overview

1.3.1. Overview

The pest management program is summarized below.

- The currently designated Integrated Pest Management Coordinator (IPMC) for NSA HR Portsmouth Annex is an employee in the NAVFAC MIDLANT Environmental Core (EV12) whose office is located at Naval Station Norfolk.
- General pest control services are provided in-house by the regional NAVFAC Environmental Services pest control shop, which is located on-site at NSA HR Portsmouth Annex. This includes larval and adult mosquito control, when necessary.
- Grounds maintenance is done by NAVFAC DOD civilian personnel. Grounds maintenance does not conduct any pesticide applications; if there is a need for pesticides, they will coordinate with the on-site DOD Civilian pest control operator.
- Most of the MWR and NEX food facilities (i.e. Dancing Goat 1 and 2, NEX Food Court, and Olde Glory Coffee Company) contract with Ecolab for pest control services.
- Lincoln PPV Housing is responsible for obtaining their own pest management services and contracts with Orkin for pest control services for the only home on NSA HR Portsmouth Annex. Valleycrest is the grounds maintenance contractor for Lincoln.
- Preventive Medicine performs food service sanitation and facilities habitability inspections and oversees programs to prevent vector-borne and other infectious diseases.

In addition to the PMSPs, individual personnel including employees and housing tenants have a responsibility for preventing and reducing pest infestations in their workplace and/or berthing/residence areas. This IPMP encompasses all of the activities of the PMSPs and individuals.

1.3.2. Pest Management Objectives

The objectives of the NSA HR Portsmouth Annex pest management program are:

1. **The prevention of pest-related health and safety problems that affect the mission.** Examples of health related pests that may affect the mission include, but are not limited to mosquitoes, fire ants, and bed bugs. Any pest may impact the mission when its numbers become excessive. Prevention of pest-borne disease and injury is a component of Force Health Protection (FHP). FHP seeks to maintain a healthy and fit military and civilian force in order to maintain the highest levels of readiness. Pest management is a "Force Multiplier" for construction battalions, maintenance commands, and other deployable units. Additionally, the military and civilian infrastructure on the installation must be protected in order to provide the necessary support to these units as well. Readiness also means ensuring that all installation personnel, including dependents, are provided with healthy work and living conditions that will contribute to a high quality of life.
2. **The prevention of pest damage to equipment and subsistence used to support the operational mission of the activities and tenant commands.** Equipment and materials are susceptible to physical damage by pests. Rodents, for example, can cause considerable damage to electronic equipment through gnawing on electrical components. Examples of pests that may damage equipment and subsistence include, but are not limited to rodents, wood destroying pests and stored product pests.
3. **Vegetation management to protect the local environment.** The introduction of non-native/invasive species of plants can increase the risk of fire and degrade the surrounding native environment that is home to a number of endangered and threatened animal and plant species.
4. **The protection of government real property, materiel and aesthetics.** Buildings and roads that form the infrastructure of the installation are susceptible to pests. Termites can cause extensive damage to wood structures if not adequately prevented and controlled. Weeds can cause damage to roadways and increase the risk of fire.
5. **The reduction of the use and dependence on pesticides.**

1.3.3. Program Requirements

1.3.3.1. Administration

Proper administration of the pest management program ensures accountability and documentation through planning, record keeping, reporting, training, pesticide and contract approval and regulatory compliance. Table 1-1 outlines the pest management administrative program requirements.

1.3.3.2. Operations

Operations are the day-to-day management of pests through pesticides and non-chemical means. Pest management on NSA HR Portsmouth Annex includes the following categories of operations:

- **Ornamental and turf -** Control and management of pests of landscape plants and turf, including arthropods, fungi, and weeds.
- **Right-of-way -** Control and management of vegetation along roadways. It also includes vegetation control near fuel farms to reduce fire risk and along fence lines to enhance security.
- **Aquatic Weed Control -** Control of vegetation in ponds and ditches.
- **Industrial, Institutional, Structural, and Health-Related -** Control and management of pests in and around buildings. Pests may include cockroaches, termites, bees, venomous animals, stored product insects, rodents, and feral animals.
- **Public Health -** Control and management of human and animal disease vectors such as rodents, mosquitoes, flies, and fleas.
- **Nuisance Pest Control** - Control of insect pests that are a nuisance or annoyance to base personnel but do not present a health risk.
- **Invasive weeds -** Removal of non-native species of plants that are detrimental to native plant and animal habitats.
- **Vertebrate Control -** Control of animal predators that prey upon endangered or threatened animals and their habitats, or infest food and material storage.

Each of these operations must meet various requirements that are listed and described in Table 1-2.

Table 1-1: PEST MANAGEMENT ADMINISTRATIVE PROGRAM REQUIREMENTS

Requirement	Description	Reference	Responsibility
PLANNING	Review and revise the Integrated Pest Management Plan annually.	OPNAVINST 6250.4C; DODINST 4150.07	IPMC
RECORDING	Record all pest management operations conducted on the Base after each operation.	OPNAVINST 6250.4C; DODINST 4150.07; 7 CFR 110* (applies to restricted-use pesticides only)	All pesticide applicators
MAINTAINING	Maintain records of all pest management operations conducted on Base on-site indefinitely	OPNAVINST 6250.4C; DODINST 4150.07; 7 CFR 110* (applies to restricted-use pesticides only)	IPMC in coordination with PMPARs
REPORTING	Compile and report all pest management operations to NAVFAC Atlantic Applied Biology monthly.	OPNAVINST 6250.4C; DODINST 4150.07; 7 CFR 110* (applies to restricted-use pesticides only)	IPMC in coordination with PMPARs
PESTICIDE APPLICATOR CERTIFICATION	Ensure that all personnel applying pesticides on installations have current DOD pesticide applicator certification if in-house or state commercial applicator certification if contracted.	OPNAVINST 6250.4C; DODINST 4150.07; 40 CFR 171* (applies to restricted-use pesticides only)	IPMC in coordination with PMPARs
COMPLIANCE	Ensure that all program elements are in compliance with all Federal regulations. The Base is also encouraged to comply with County and State regulations.	OPNAVINST 6250.4C; DODINST 4150.07	IPMC in coordination with PMPARs
PESTICIDE APPROVAL	Compile and submit list of new pesticides to NAVFAC Atlantic Applied Biology for approval for use on the Base.	OPNAVINST 6250.4C; DODINST 4150.07	IPMC in coordination with PMPARs
CONTRACT REVIEW	Review pest management contract specifications for compliance with the Integrated Pest Management Plan and submit to NAVFAC Atlantic Applied Biology for final review and approval prior to advertising.	OPNAVINST 6250.4C; DODINST 4150.07	Facilities Support Contracts, PMPARs

Table 1-2: PEST MANAGEMENT OPERATIONS PROGRAMS REQUIREMENTS

Requirement	Description	Reference	Responsibility
INTEGRATED PEST MANAGEMENT	"Federal agencies shall use Integrated Pest Management techniques in carrying out pest management activities and shall promote Integrated Pest Management through procurement and regulatory policies, and other activities."	USC Title 7, Chapter 6, Subchapter II, Sec. 136r-1	IPMC/pesticide applicators
STORAGE	Pesticides kept on installations must be procured and stored in accordance with installation Base and Federal regulations. The Base is also encouraged to comply with County and State regulations.	OPNAVINST 6250.4C; AFPMB TG 17-Military Handbook; 40 CFR 165	Pest control shop supervisor
CONTAINERS	All containers used to store or transport a pesticide must have the original or copy of the original label attached. Service containers must have attached label identifying person responsible for the container, name of chemical and signal word.	OPNAVINST 6250.4C; DODINST 4150.07; 40 CFR 156	Pesticide applicators
VEHICLES	Must carry pesticide spill kits and properly secure pesticides and pesticide application equipment when not in use.	OPNAVINST 6250.4C	Pesticide applicators / vehicle operators
APPLICATION	Only registered pesticides will be used. Applications of pesticides must be performed to ensure safety and protection of the environment. A copy of the pesticide label shall be available at the application site.	OPNAVINST 6250.4C; DODINST 4150.07; 40 CFR 166	Pesticide applicators
APPLICATOR SAFETY	Procedures, medical support, equipment and supplies to ensure the safety of DOD pesticide applicators during pest control operations must be provided by the installation.	OPNAVINST 6250.4C; 29 CFR 1910	Naval Medical Clinic, Safety Department
OCCUPATIONAL HAZARDS MONITORING	Workplace monitoring shall be conducted by the medical department to ensure a safe and healthful environment for pest management personnel.	OPNAVINST 6250.4C; OPNAVINST 5100.23G	Naval Medical Clinic
CLEANING AND DISPOSAL	Equipment shall be cleaned to prevent health and environmental hazards due to chemical residues. Rinse water from container and equipment rinsing should be prevented from entering storm drains and water bodies. Dispose of empty containers properly.	OPNAVINST 6250.4C; 40 CFR 165	Pesticide applicators
SPILL PREVENTION	Spill kits should be maintained in pest control shops and on pest control vehicles. Pest management personnel should be familiar with the installation spill contingency plan.	OPNAVINST 6250.4C	Pesticide applicators

2. Program Administration

2.1. Roles and Responsibilities

The success of the pest management program depends largely on a clear understanding of the roles and responsibilities for the organizations and personnel involved. The following is a listing of the key organizations and personnel and their duties as presented in DOD guidance documents for the implementation of the IPMP.

2.1.1. Installation Commanding Officer (ICO)

- Designate an Integrated Pest Management Coordinator in writing;
- Implement and support the IPMP;
- Ensure appropriate funding of pest management programs to provide for effective and safe control of pests based on pest management objectives for the installation;
- Ensure that installation personnel performing pest control receive adequate training, and achieve pest management certification as required;
- Ensure that all pest management operations are conducted safely and have minimal impact on the environment;
- Ensure that contract specifications that include the use of pesticides are approved by a NAVFAC pest management consultant prior to advertisement for bid;
- Ensure that an IPM program, minimizing the use of pesticides, is implemented; and
- Ensure that the installation IPM plan and program are in compliance with all applicable environmental protection statutes.

2.1.2. Integrated Pest Management Coordinator (IPMC)

The IPMC is designated by the ICO in writing to coordinate all installation pest management activities. The IPMC works in the NAVFAC MIDLANT Environmental Core (EV12) located at Naval Station Norfolk. The IPMC designation letter is located in Appendix K.

- Coordinate NSA HR Portsmouth Annex's pest management program including implementation, maintenance, and annual update of the IPMP;
- Coordinate rewrite of the IPMP every 5 years;
- Promote Integrated Pest Management (IPM) in the pest management program to cost-effectively and safely manage pests and to prevent adverse environmental impact;
- Coordinate reporting of pest management and pesticide use on the installation to NAVFAC Atlantic Applied Biology;
- Ensure current certification and continuing pest management training of pesticide applicators and PMPARs;
- Receive and compile lists of new pesticides and uses from all Pest Management Service Providers (PMSPs) on NSA HR Portsmouth Annex and submit to NAVFAC Atlantic Applied Biology for review and approval;
- Maintain current list of approved pesticides;
- Act as liaison between NSA HR Portsmouth Annex and NAVFAC Atlantic Applied Biology and local, State of Virginia, and Federal agencies for pest management and pesticide regulatory issues;
- Ensure that the NSA HR Portsmouth Annex Contracting Officers submit pest management contract specifications to the NAVFAC Atlantic Applied Biology PPMC for review prior to advertising; and
- Act as the Installation Commanding Officer's advisor for pest management issues.

2.1.3. NAVFAC MIDLANT Environmental Services Pest Control

The NAVFAC MIDLANT Environmental Services pest control shop performs routine pest management and responds to service requests from tenants.

- Control of nuisance, public health, and structural pests;
- Pest control inside buildings and facilities; and
- Pest control on improved grounds, when requested.

2.1.4. NAVFAC MIDLANT Environmental Core, EV12

Regional oversight on environmental protection and compliance regarding pest management operations falls within the NAVFAC MIDLANT Environmental Core, EV12, Pesticide Program Manager, who is also designated as the IPMC.

- Review and approve new pesticides and pest management operations that may adversely impact the environment;
- Conduct internal compliance assessments of the pesticide and pest management program; and
- Provide technical review of the IPMP.

2.1.5. Public Works Department (PWD) Naval Support Activity (NSA) Hampton Roads (HR) and PWD Portsmouth, Environmental Departments

PWD NSA HR and PWD Portsmouth Environmental Departments are able to provide support to the NAVFAC MIDLANT Environmental Core (EV12) with oversight on environmental protection and compliance regarding pest management operations on NSA HR Portsmouth Annex.

- Provide assistance with the review and approval of new pesticides and pest management operations that may adversely impact the environment;
- Provide assistance with internal compliance assessments of the pesticide and pest management program; and
- Provide assistance with the technical review of the IPMP.

2.1.6. PWD Portsmouth, Facilities Engineering and Acquisition Division (FEAD)

The FEAD prepares, manages, and assesses pest control and grounds maintenance contracts. The Performance Assessment Representative (PAR) monitors and evaluates the performance of contracted PMSPs to ensure that pest control measures are properly applied.

- Prepare contracts ensuring that all requirements of the IPMP are included in the contract specifications;
- Coordinate pest management contract specifications prior to bidding with the IPMC for review prior to submittal to the NAVFAC Atlantic Applied Biology PPMC for review and final approval;
- Maintain copy of each contract on file;
- Monitor pest management contractors ensuring effective and safe application of pest management practices and identify and document discrepancies and seek corrective action with contractor in accordance with the contract; and
- Ensure that the contractors record all pest management activities and submit reports including actual pesticide use through the NAVFAC Online Pesticide Reporting System or to the IPMC on a monthly basis.

2.1.7. Preventive Medicine

NSA HR Portsmouth Annex Preventive Medicine provides public health support in accordance with NAVMED P-5010.

- Act as advisor and liaison to ICO for public health pest prevention and management;
- Conduct surveys for pests of medical importance, such as cockroaches, mosquitoes, bedbugs, etc., through habitability and food service sanitation inspections;
- Establish and maintain liaison with local health agencies as they pertain to vector management and vector-borne and zoonotic disease prevention;
- Maintain current certification as DOD Category 8 (public health) pesticide applicator;

- Develop and maintain an emergency plan for vector and pest control during a vector-borne disease outbreak or disaster; and
- Provide technical review of the IPMP.

2.1.8. Contract Pest Management Service Providers (PMSP)

Commercial contractors (Ecolab) provide pest control services to most of the MWR and NEX food facilities on NSA HR Portsmouth Annex. Contract PMSPs at NSA HR Portsmouth Annex are required to be certified as pesticide applicators by the State of Virginia. These responsibilities also apply to all other contractors on the installation.

- Conduct pest management operations in accordance with the contract specifications or lease agreements, the IPMP and in compliance with Federal and State of Virginia laws and regulations;
- Submit a list of pesticides proposed for use on the installation to their Government representative;
- Communicate all pest management issues and requirements via the Government representative; and
- Submit daily management operation records to the Government representative.

2.1.9. Navy Exchange (NEX) Manager

Oversee retail sales of pesticides and NEX pest control contractors.

- Ensure that pesticides are displayed in accordance with the pesticide label and other Federal, State and local regulations.
- Provide access to the IPMC to all pesticide application records; and
- Ensure that only current State licensed pesticide applicators apply pesticides.

2.1.10. PPV Housing Manager

Provides pest control and landscape maintenance for the one PPV home on NSA HR Portsmouth Annex.

- Provide the IPMC or NAVFAC LANT PPMC with access to all outdoor pesticide application records; and
- Ensure that only current State licensed pesticide applicators apply pesticides.

2.1.11. Building Occupants and Barracks / Housing Residents

- Apply good sanitary and pest exclusionary practices to prevent pest infestations;
- If permitted for personal use, use pesticides in accordance with the pesticide label; and
- Coordinate and cooperate fully with PMSPs in scheduling pest management and preparing the areas for pesticide treatment if necessary.

2.2. Pesticide Approval

Only pesticides approved by both the EPA and the State shall be used. Additionally, DOD and DON directives require installations to submit a list of all pesticides that will be used during control operations to the cognizant NAVFAC LANT PPMC for review and approval (OPNAVINST 6250.4C). The purpose of this approval process is to ensure that only registered pesticides which are safe, effective and appropriate for the site will be used on the installation. Requests for pesticide approval will be submitted to the NAVFAC LANT PPMC via the installation IPMC using the NAVFAC Online Pesticide Reporting System (NOPRS) (see section 2.3.3.1) or the Pesticide Approval Spreadsheet (PAS). Once a pesticide is approved, it may be used on-site as per the label directions. New pesticides may also be added to the list and submitted for approval as needed. The list should be reviewed and updated annually by the IPMC as part of the IPMP maintenance. Pesticides currently approved for use on the installation are listed in Appendix E. The electronic PAS is included in the NAVFAC Pest Management Resource CD that accompanies this IPMP in Appendix L.

2.2.1. Pesticide Labels and MSDSs

A copy of the manufacturer's label and an MSDS for each pesticide on the approved pesticide list can be maintained by the IPMC, PMPAR, and PMSP. Labels may be maintained by hard copy, electronically, or online. Pesticide labels and their registration status can be found on the EPA's National Pesticide Information Retrieval System, http://iaspub.epa.gov/apex/pesticides/f?p=PPLS:1.

2.3. Records and Reporting

"All shore installations, ships, and units performing pest management operations shall maintain records of pesticide applications and report pesticide use" (OPNAVINST 6250.4C pg 31 and OPNAVINST 5090.1C Ch. 17, Section 17-4.2, pg 17-6).

2.3.1. Pest Management Record Keeping

All PMSPs shall record pest management operations daily. Records shall include all pest management operations including surveys and non-chemical control operations performed on the installation by commercial contractors as well as work performed by DOD pest management personnel. The records will include the following information: date of application, location and site, type of operation, target pest, amount of area treated, name of applicator, pesticide information (trade name, active ingredient, and formulation), amount of pesticide applied, final concentration, and calculated pounds of active ingredient applied. The following operations are excluded from the record keeping requirement:

- Personal use of insect repellent.
- Application of repellent by deployable units during mass treatment of clothing and tentage.
- Application of pesticides for personal relief by residents of military housing.
- Application of pesticides for flea and tick control to pets by pet owners and veterinary services.

Records shall be submitted to the IPMC monthly by either the NAVFAC Online Pesticide Reporting System (section 2.3.3.1) or the electronic Pest Management Record System (section 2.3.3.2).

2.3.2. Maintaining Pest Management Operations Records

NSA HR Portsmouth Annex must archive on-site indefinitely, complete daily pest management operation records. Pesticide applications for each building, structure, or outdoor site must be accounted for. Past hardcopy records must be archived so as to prevent them from being destroyed. Electronic records shall be stored to prevent destruction or loss; back-up copies are recommended. All records reported to NAVFAC LANT will be stored and may be used as a back-up. Downloading of records from NOPRS and maintaining them on-site is highly recommended.

2.3.3. PMSP Reporting Procedures

Two methods of reporting are available. Reports will be reviewed by the IPMC and NAVFAC LANT PPMC to provide program oversight to the installation and to generate data for tracking overall DON pesticide usage.

2.3.3.1. NAVFAC Online Pesticide Reporting System (NOPRS)

All NSA HR Portsmouth Annex PMSPs that have internet access must use the NAVFAC Online Pesticide Reporting System (https://clients.emainc.com/dcs/pestmanagement/pesticidelogon.asp) to record, report and manage pesticide and pest management records. This system is preferred to other methods because it eliminates the need to send hardcopy or electronic records to the IPMC and then to the PPMC. The records are entered directly into a central database that can be accessed by the PPMC and the IPMC and downloaded into a spreadsheet. The only

computer requirement is reliable internet access. IPMCs that wish to use this on their installation must contact the NAVFAC LANT PPMC to establish a "Supervisor" account. PMSP applicators can then contact the IPMC to request an "Applicator" account.

2.3.3.2. Pest Management Record System (PMRS)

An alternate method for record keeping and reporting, for those without internet access, is the PMRS. The PMRS template is a Microsoft® Excel ™ file. The template and instructions are available on the NAVFAC Pest Management Resource CD. Using the PMRS requires the following minimum computer hardware and software:

- Computer capable of running Microsoft® Office software
- CD drive, or e-mail capability in order to transfer files

The PMRS does not require Navy and Marine Corps Intranet (NMCI) approval since it runs on an NMCI-approved program. The user should have basic knowledge of MS Excel®, e-mail, and computer file management. The completed PMRS should be sent to the IPMC, Ronnie Stephens (ronnie.s.stephens@navy.mil). The IPMC shall submit the PMRS's monthly to the NAVFAC LANT PPMC at sabra.scheffel@navy.mil, NAVFAC LANT Applied Biology, Code EV51, 6506 Hampton Blvd, Norfolk, VA 23508.

2.4. Training, Certification and Licensing

2.4.1. General Requirements

IPM requires personnel who are properly trained to investigate and diagnose pest problems, select the appropriate pest management method, apply the appropriate pesticide, perform these operations so that they are safe to humans and the environment, and educate and advise their customers on pest prevention methods. All DON personnel who select or apply pesticides shall be trained and certified within two years of employment in accordance with the DOD Plan for the Certification of Pesticide Applicators (OPNAVINST 6250.4C pg 22).

2.4.2. Verification of Qualifications

Copies of contractor or lessee State licenses shall be obtained from all PMSP personnel applying pesticides on NSA HR Portsmouth Annex. Verification of DOD pesticide applicator license / IPMC and PMPAR accreditation can be obtained from the NAVFAC Atlantic PPMC at (757) 322-4320 or sabra.scheffel@navy.mil. A list of applicators and their certification / license numbers as well as a list of business licenses is found in Appendix K. Virginia pesticide applicator certificates are also searchable on the Virginia Department of Agriculture and Consumer Services website: http://www.vdacs.virginia.gov/pesticides/pdffiles/reports-applicators.pdf.

2.4.3. Requirements for DOD Pesticide Applicators

DOD applicators may be certified in the following categories:

- Category 2: Forestry
- Category 3: Ornamental and Turf (landscape arthropod and vertebrate pests)
- Category 5: Aquatic (aquatic weeds in lakes, ponds, rivers, streams, irrigation canals)
- Category 6: Right-of-Way (weeds on sidewalks, along fence lines, parking lots, road ways, storage tank grounds)
- Category 7: Industrial, Institutional, Structural, and Health-Related (termites and other wood-destroying insects, cockroaches, crickets and other invading organisms)
- Category 8: Public Health (mosquitoes, ticks, fleas, rodents)
- Category 11: Aerial Application (application of pesticides for any pest by fixed or rotary-wing aircraft)

Preventive Medicine Technicians (PMTs) are required to be certified only in Category 8 and receive certification during PMT School. Golf course applicators are only required to be certified in categories 3, 5, and 6.

Initial certification in Categories 2, 3, 5, 6, 7, and 8 for civilian employees is a three and a half week course conducted by a designated DOD training agency. Currently, the Navy course is conducted by the Navy Entomology Center of Excellence (NECE) in Jacksonville, Florida. Initial certification and recertification in Category 11 is a one week course conducted by the Air Force Reserve in Vienna, Ohio. Certification for all categories is valid for three years. With proper justification, certifications can be extended for an additional six months by the applicator's certifying authority. Recertification courses for civilians in all categories except Category 11 are conducted annually by NAVFAC Atlantic. Initial and recertification course schedules can be viewed at http://www.afpmb.org/pubs/courses/courses.htm.

2.4.4. Requirements for Commercial Contract Applicators

"Licensed firms shall perform all pest management services procured by contract using only trained operators who are certified in the applicable state in the required EPA pest management categories for the work planned. Copies of state or host nation business licenses and applicator certifications shall be reviewed prior to award" (OPNAVINST 6250.4C pg 27). Copies of contractor business licenses and applicator certificates can be found in Appendix K. Contractors who hold a Virginia registered technician certificate have not completed the EPA category tests and are NOT allowed to apply pesticides on DOD property. All contract pesticide applicators applying pesticides on NSA HR Portsmouth Annex must hold a Virginia Commercial Pesticide Applicator's License.

2.4.5. Requirements for Natural Resource Management Applicators

Commercial applicators applying herbicides for invasive weed control or habitat restoration must hold a state license. Maintenance wildlife managers that use pesticides for control must also hold an appropriate state license.

2.4.6. Requirements for Performance Assessment Representatives

Pest Management Performance Assessment Representatives (PMPARs) assess the performance of contractors in the Performance Based Acquisition (Contracting) Program. Installations shall train personnel who provide performance assessment for commercial pest control services in pest management within one year of appointment, and send them to refresher training every three years (OPNAVINST 6250.4C pg 27 and OPNAVINST 5090.1C Ch. 17, Section 17-4.1, pg 17-5). NAVFAC Atlantic provides initial and refresher PMPAR training annually. Go to http://www.afpmb.org/pubs/courses/courses.htm#pestmgmtquaassurance for initial training schedules. PMPARs may attend the DOD pesticide applicator recertification course for refresher training. Go to http://www.afpmb.org/pubs/courses/courses.htm#pestapprecert for refresher training schedules.

2.4.7. Requirements for Integrated Pest Management Coordinators and Environmental Personnel

"The IPMC shall have the educational background, technical knowledge, and management skills to implement and oversee the pest management program" (DODINST 4150.07, Para. E4.4.1). Newly designated IPMCs are required to receive training in the administrative and operational requirements of installation pest management. Environmental personnel who have compliance oversight of pesticides on the installation should also receive training. The initial PMPAR and IPMC course provides the necessary training. NAVFAC conducts this course annually. Go to http://www.afpmb.org/pubs/courses/courses.htm#pestmgmtquaassurance for training

schedules. If the IPMC will be applying pesticides or recommending pesticide applications, then they must be certified as a DOD pesticide applicator.

2.5. Pest Management Contracting

Contracts requiring the use of pesticides must be reviewed and approved by NAVFAC Atlantic Applied Biology. This includes contracts issued by non-appropriated activities and tenant commands on the installation. Pest control contracts are required to be monitored by a trained PMPAR (OPNAVINST 6250.4C).

2.5.1. Pest Management Contracts

Contracts are prepared and managed by the Facilities Engineering and Acquisition Division (FEAD) within the Public Works Department (PWD). Most of the NEX and MWR food facilities (i.e. Dancing Goat 1 and 2, NEX Food Court, and Olde Glory Coffee Company) have their own contract with Ecolab for pest control services. Contract documents are included in Appendix G (if available).

2.5.2. Contract Specifications and Review

Pest management contract specifications must be written to ensure effectiveness, safety, and regulatory compliance. Specifications should state that the contractor:

- Shall comply with Federal, State, and local laws and regulations which also includes DOD, DON and USMC directives and this IPMP;
- Shall provide copies of pesticide applicator and business licenses to verify that they are current;
- Shall request approval of all pesticides to be used on the installation prior to their use;
- Shall use pest control vehicles that are properly marked and provide secure storage for pesticides;
- Shall report pesticide use and all pest management activities to the installation IPMC via the Government Representative; and
- Shall not store, mix, or dispose of pesticides or clean pest control equipment on the installation.

The Facilities Support Contract / Base Operation Support (FSC/BOS) performance-based contract template for pest control (Sub-annex 1503020) and grounds maintenance (Sub-annex 1503050) is available from NAVFAC Atlantic or on the NAVFAC Portal at https://portal.navfac.navy.mil/portal/page/portal/pw/fsc/template (requires login). The facilities contracting officer (KO) or contracting officer representative (COR) can provide additional information. Additional guidance on writing contracts can be found in AFPMB TG 39: *Guidelines for Preparing DOD Pest Control Contracts using Integrated Pest Management*. The online version (http://www.afpmb.org/sites/default/files/pubs/techguides/tg39.pdf) also contains links to the DOD Guide Performance Work Statement. The KO shall send the contract specifications to the NAVFAC Atlantic PPMC for review prior to procurement (OPNAVINST 6250.4C pg 26).

Termite pretreatment contract specifications shall also be reviewed by the NAVFAC Atlantic PPMC prior to procurement. The Unified Facilities Guide Specifications (UFGS) 31 31 16 Soil Treatment for Subterranean Termite Control (http://www.wbdg.org/ccb/DOD/UFGS/UFGS%2031%2031%2016.pdf) should be included in all new construction contracts for termite pretreatment. See section 3.2.4.2 for more information on termite treatment contracts.

2.5.3. Government Representatives

Contractors will communicate and submit required pest management reports via their Government representative. For the pest control and grounds maintenance (FSC/BOS) contracts, the representative is the PMPAR who is responsible for assessing the contract.

For Non-Appropriated Fund (NAF) (i.e. NEX, MWR) contracts, the representative is the local NAF organization manager. In cases where a Government representative is not available, then the installation IPMC may liaison with a contractor's representative.

2.5.4. Contract Requirements

The application of pesticides by contractors is strictly regulated by Department of Defense and Navy regulations, this IPMP and State regulations. These requirements apply to all pesticide applications including insecticides, herbicides, fungicides, molluscides, etc. to turf, ornamentals, trees, and all indoor work. These requirements apply to any size contract (small purchase or facility support contract generated) and services acquired by any other means including government purchase cards (EBUSOFFINST 4200.1, Para.7). The specific requirements for contracted pest control operators working on Navy properties are:

- Contractor Work Plan (CWP): If required by the contract, a CWP shall be submitted as part of the contractor's proposal. The CWP specifies how the contractor will meet the contract requirements. If available, the CWP will be included in this IPMP in Appendix H.
- Pesticide Applicator Certification: All contractor personnel, who apply pesticides (which include all herbicides), shall be certified / licensed in the appropriate applicator category in accordance with section 2.4.4 of this IPMP. All contractors who will apply pesticides shall, prior to the start of work, supply a copy of the certificate(s) / license(s) in accordance with contract specifications. Pesticide business licenses and pesticide applicator certificates are included in Appendix K.
- Pesticide Approval: Pesticides used by contractors must be approved and added to the installation AUL, before use, by the NAVFAC Atlantic PPMC as described in section 2.2. The list of proposed pesticides shall be included in the CWP or submitted to the designated Government representative using the format designated in the contract specifications. The AUL is in Appendix E of this IPMP.
- Pesticide Mixing, Storage, and Disposal: Contractors shall not store, mix, or dispose of pesticides or clean pest control equipment on the installation. One exception to this is soil treatment for termite prevention during building construction; the contractor must mix the termiticide on-site while the PMPAR or IPMC is there to witness.
- Pesticide Applications: Only pesticides listed on the AUL shall be used and applied in a manner consistent with the pesticide label.
- Pest Management Reporting: Contractors shall submit reports in accordance with the reporting requirements in section 2.3.3.
- Contractor Vehicles:
  - Safety equipment: Vehicles used to transport pesticides shall be equipped with a fire extinguisher and a spill and decontamination kit, capable of handling the maximum amount of pesticide transported at any given time.
  - Security: All pesticides carried on the vehicles shall be secured in locked compartments at all times. Vehicles shall not be left unattended at any time unless properly locked and secured.
  - Identification: Vehicles will be clearly identified as a pest control vehicle.
  - Appearance: All vehicles shall be maintained with a clean and orderly appearance, free from observable pesticide spills, residues, or build-up.
  - Transporting pesticides: Pesticides shall not be transported in the cab or occupied part of any vehicle. They shall always be carried in a separate compartment from the occupied cab.
- Compliance Assessment: All contractors are subject to regulatory compliance assessments by the PMPAR, IPMC, environmental compliance staff, and other authorized Government personnel. Pest control vehicles, pesticide applications, and administrative requirements are subject to inspection. Authorized Government personnel may also require the contractor to stop work if the work is not being performed in a safe manner.

2.5.5. Contract Performance Assessment

Contracts shall be assessed by a trained PMPAR to ensure environmental and contractual compliance. For FSC/BOS contracts, Functional Assessment Plans (FAP) for pest control and grounds maintenance should be developed and implemented. FAP templates are available from the KO or NAVFAC Atlantic. Assessments for pests prior to, during, and after pest control operations should be conducted to ensure efficacy of the services. Pest survey methods for contract performance assessments are found in Appendix H on each of the Integrated Pest Management Sheets. Inspection of the contractors during pesticide application should also be conducted to ensure safety measures are being taken. The contractors' vehicles and equipment must be made available for inspection when requested. In the absence of a PMPAR, the installation Preventive Medicine Technician (PMT) can provide information on the efficacy of pest control in some facilities. The PMT conducts monthly inspections that include pest surveys of food service facilities and child development centers. The PMPAR and the IPMC should liaison and coordinate performance assessment activities with the PMT.

3. Operations

3.1. Integrated Pest Management (IPM)

3.1.1. Federal Regulation and Policy

Presidential executive order (EO 13514), October 5, 2009, requires federal agencies to promote pollution prevention and eliminate waste by implementing integrated pest management and other appropriate landscape management practices. US Code states "Federal agencies shall use Integrated Pest Management techniques in carrying out pest management activities and shall promote Integrated Pest Management through procurement and regulatory policies, and other activities" (USC Title 7, Chapter 6, Subchapter II, Sec. 136r-1). It is DOD policy to "Incorporate sustainable Integrated Pest Management (IPM) philosophy, strategies, and techniques in all aspects of DOD and Component vector control and pest management planning, training, and operations, including installation Integrated Pest Management Plans and other written guidance to reduce pesticide risk and prevent pollution" (OPNAVINST 6250.4C).

3.1.2. What is IPM?

IPM is "a planned program incorporating education, continuous surveillance, record keeping, and communication to prevent pests and disease vectors from causing unacceptable damage to operations, people, property, materiel, or the environment. IPM uses targeted, sustainable (effective, economical, environmentally sound) methods including habitat modification, biological, genetic, cultural, mechanical, physical, and regulatory controls, and when necessary, the judicious use of least hazardous pesticides" (OPNAVINST 6250.4C). There are significant differences between IPM and "traditional" pest control methods. Table 3-1 lists some of the differences.

Table 3-1. Comparison of Traditional Pest Control and IPM Methods

Pest Management	Traditional Pest Control	IPM
Program Strategy	Reactive	Preventive
Customer Education	Minimal	Extensive
Potential Liability	High	Low
Emphasis	Routine pesticide application	Pesticides used when exclusion, sanitation, and other non-chemical methods are inadequate
Inspection and Monitoring	Minimal	Extensive
Pesticide Application Frequency	By schedule	By need
Pesticide Application Target	Area-wide spraying	Spot treatment of areas where pests are found
Customer Involvement in Preventing Pests	Minimal	Extensive

In IPM programs, treatments are not made according to a predetermined schedule. Rather, they are made only when and where monitoring has indicated that the pest will cause unacceptable economic, medical, or aesthetic damage. Treatments are chosen and timed to be most effective and least hazardous to non-target organisms and the general environment.

Under an IPM program, execution of individual pest management practices involves the following steps:

- **Identify** pests and possible natural enemies;
- **Develop plans/strategies**, an integration of treatment methods, that are effective against the pest, least disruptive to natural controls and least hazardous to human health and the environment;
- **Establish action thresholds** or the size of the pest population correlated with a threshold, sufficient to warrant treatment. In determining threshold levels, the amount of aesthetic or economic damage that can be tolerated must be correlated with the population size of pests, natural enemies, time in the season, and/or life stage of the pest or host;
- **Monitor pest population** for regular sampling of pest and natural enemy populations. Monitoring is an ongoing activity;
- **Control pest** (optional);
- **Document results**; and
- **Evaluate/redesign plan** to determine the outcome of treatment actions.

Controlling pests has traditionally been the responsibility of the pest control operator. **In IPM, preventing and controlling pests is the responsibility of all personnel on the installation.**

3.1.3. IPM Compliance

All pesticide applicators are trained in IPM techniques during initial and refresher licensing or certification training. Government representatives shall assess the PMSP's compliance with IPM. This may include:

- Reviewing the approved pesticide list for use of less toxic pesticides, baits with sustainable control, short-residual and pest-specific products, and products used for spot treatment rather than broadcast application.
- Contractor work plans and partner pest management plans that incorporate IPM.
- Reviewing pest management records to ensure that only approved pesticides are used, spot applications are performed, non-chemical methods are used, and routine surveys are being performed.
- Observing pest control service calls to ensure pest control operators identify conditions conducive to pest infestations, provide information to building occupants on how they can prevent pests, use only approved pesticides, perform spot treatments, properly apply baits, conduct routine surveys, and monitor baits / bait stations / traps.

3.1.4. Integrated Pest Management Sheets

The IPM sheets in Appendix H provide guidelines for the integrated control of pests at the installation. They may be used as a reference for surveillance and non-chemical and chemical control alternatives.

3.2. Current Pest Management Operations

3.2.1. General Household and Nuisance Pests

Pest control, for the purposes of this IPMP, is the control of arthropod and vertebrate pests in and around buildings. Sanitation, glue traps and exclusion are the primary means of non-chemical control in and around structures. Low toxicity insecticidal baits are used effectively for cockroaches and ants. Most pesticide applications involve the application of contact chemicals or those that have short residual efficacy.

3.2.1.1. Cockroaches

German and American cockroaches are common pests. The general adaptability of the German cockroach makes it an important pest problem in food service areas. An integrated approach of using both preventive and corrective techniques is the only practical means of controlling this pest.

3.2.1.2. Preventive Control Measures

Preventive control measures including inspection, interior and exterior facility sanitation, and exclusion methods such as closing harborage areas by caulking or other modifications, reduce the chances for pest survival by limiting needed food, water, and shelter. In buildings that are most susceptible to pest infestation, services are performed on a scheduled basis through preventive maintenance contracts. Service includes inspection, recommendations on pest proofing and sanitation and chemical control, if needed. Common use areas and food consumption areas of other buildings, i.e., areas used by people as a group, such as heads, coffee messes, lounge areas, and vending machine rooms, are serviced on either a monthly or quarterly basis, depending on the preventive maintenance contract for that building, with response to call-backs as necessary. This also includes common use areas of the barracks, warehouses, and administration buildings. Buildings where there is no food and where problems occur only occasionally such as shops and storage buildings, are handled on a service call basis. Pesticide treatments in food handling areas shall be confined to crack and crevice placement when using residual aerosol or dust formulations. Insect Growth Regulators and baits are used to complement other control measures. Self-contained light traps may also be utilized in these areas. Low odor formulations are used in offices and in other spaces where a pesticide odor would be objectionable.

3.2.2. Grounds Maintenance

Grounds maintenance is performed on improved or landscaped grounds. Pest management during grounds maintenance may involve weed control, control of pests and disease on plants, trees and turf, and control of vertebrate animals (i.e. squirrels, moles) that may destroy plants and turf. Mechanical removal of weeds and mowing are routinely performed. Grounds maintenance also includes weed control in drainage ditches that may contribute to mosquito control and bird habitat removal. Weed control is performed along roadways, fence lines, and at fuel farms where they pose fire and visibility concerns.

3.2.2.1. Weed Control

A wide variety of herbicides are available for controlling unwanted vegetation. Extreme care should be taken when using herbicides around waterways. Herbicides can be used around mowing obstacles such as signs, fire hydrants and manholes. Herbicides can also be used to control weeds along cracks in sidewalks and asphalt parking areas, along fence lines, around buildings, and along ditch banks. Selective herbicides are used to control various weeds that occur in lawns on the Base. Various cultural and chemical controls can be used to deal with these and other weed control problems. When using chemical control, both selective and non-selective herbicides may be used.

3.2.3. Aquatic Weed Control

The policy of NSA HR Portsmouth Annex is to control and limit the spread of invasive species of plants, and to protect native aquatic plant species.

3.2.4. Structural Pests

Structural pests which have an impact on activity operations include termites, powder post beetles, wood borers, and wood destroying fungi. Of these, subterranean termites and wood destroying (decay) fungi cause the most damage.

3.2.4.1. Structural Control Program

A well managed structural pest control program includes inspection, prevention and chemical treatments when needed. All susceptible structures that contain wood or wooden structural members should be inspected on an annual basis. Records should note when a building was inspected, the location of any infestation found, and the description of any treatment performed.

3.2.4.2. Administration of Termite Treatment Contracts and Warrantees

Various control techniques including: (1) the use of construction practices which protect wood from attack; (2) controlling moisture through proper drainage and ventilation; (3) the use of termiticides for barrier treatment of soil and hollow masonry units of building foundations, and (4) the use of treated wood and or metal and concrete supporting structures, are part of an integrated approach to structural pest control. Corrective chemical treatments should be performed when termites are found actively damaging wood. Control operations should be based on annual inspections of buildings and reports of termite swarming from building occupants. Top priority is given to preventive control treatments, such as preconstruction termite soil treatments and the use of treated wood to protect wood from attack.

The NAVFAC LANT PPMC should review contract specifications for termite control. Termiticides, when needed, must be applied at the highest EPA-labeled concentration and application rate. Soil treatment for termite prevention will be conducted during building construction in accordance with the Unified Facilities Guide Specifications (UFGS) 31 31 16 (DODINST 4150.07, para. E.4.7.15.1). In accordance with UFGS 31 31 16, the contractor shall provide a warranty of no less than five years. This ensures that if termite activity is discovered during the five year warranty period, the contractor will re-treat the soil and repair or replace any damage that has been caused by termite infestation. Termiticides used for termite control must be nonrepellent, such as pesticides with the active ingredient of fipronil, imidacloprid, chlorfenapyr, or chlorantraniliprole. DOD-certified pesticide applicators or PMPARs trained in pest control shall inspect applications of pesticides by contractors to control termites or other wood-destroying organisms

Once treated with termiticides, care must be taken to prevent disturbance of the soil barrier within one foot of the foundation (if moved by gardening activity or covered when raised flower beds are installed against a building). This can be a serious problem in housing areas where people are encouraged to beautify their yards. Raised beds must be four-sided (i.e. not using the foundation as one side) and soil within one foot of the foundation can't be cultivated for planting. All wood that is damaged by termites or wood rot fungi should be replaced with treated wood to prevent future damage.

3.2.5. Stored Product Pests

Stored product pests are a potential problem at NSA HR Portsmouth Annex. Receipt inspection and rejection of obviously infested materials generally prevents heavily infested material from being placed in the storage area.

3.2.5.1. Dermestid Beetle

If the dermestid beetle *Trogoderma* is found in a commodity, the whole lot of food must be condemned. The pointed hairs on the larvae will cause digestive problems if the contaminated food is eaten. An accurate identification of *Trogoderma* is required to condemn the lot. For the most part, sanitation (keeping storage areas clean) and stock rotation minimize or prevent pest infestation. If an infestation is found, the most effective way to control *Trogoderma* is through deep cleaning, vacuuming and discarding or segregating the infested product while surveying adjacent areas. ULV space treatments and residual sprays are used to stop movement of an infestation to clean stock within food storage areas.

3.2.5.2. MRE Stores

More stringent controls are required for prevention of stored products pests. Guidance on this program can be found in the AFPMB Technical Guide #38 (http://www.afpmb.org/sites/default/files/pubs/techguides/tg38.pdf).

3.2.6. Health Related Pests

Mosquitoes, biting flies and gnats (*Culicoides*), and filth flies constitute the most important insect groups from the standpoint of both disease transmission and general annoyance. Ticks are rarely a problem on base, and are identified to species and handled on a case-by-case basis when they occur. Operations directed at controlling potential disease vectors must be based on a thorough knowledge of the target pest. Survey operations are essential in determining the species present, the population level involved and the potential hazard of disease transmission. Surveys also serve as a valuable tool in evaluating control operations.

3.2.6.1. Mosquito Surveillance

Mosquito surveys are necessary to determine the species present, their abundance, the potential hazard of disease transmission, and information on which to base an efficient control program. Mosquito surveillance includes conducting both larval and adult surveys. Larval surveys are important because they determine exactly where mosquitoes are breeding, providing the information necessary to manage or eliminate mosquitoes at the source. Larval surveys involve regular dipping stations that are selected, noted on a map and inspected periodically throughout the mosquito season. In areas where mosquito control is conducted, random larval sampling should be made to check the effectiveness of the control program. Adult mosquito surveys may be conducted by either collecting mosquitoes from resting sites or using light traps. Adult collections are then counted and identified to genus or species so that the level of disease threat can be assessed. Adult surveys are focused on collecting female mosquitoes because they are the only ones that bite. Female mosquitoes require a blood-meal before they can lay viable eggs. The male mosquito feeds on plant sugars such as nectar, and does not bite. A high proportion of adult males in a trap collection usually will indicate a nearby larval habitat, and a survey of the area should be done to locate possible breeding sites. BUMED (Entomologists with the Navy Entomology Center of Excellence and also the Navy Environmental and Preventive Medicine Units) is responsible for providing professional guidance, recommendations, and on-site assistance on all technical matters relating to disease vectors and other medically important pests (OPNAVINST 6250.4C).

NSA HR Portsmouth Annex does not have a mosquito problem, and there is currently no need for adult mosquito surveillance or control to be conducted. The DOD civilian pesticide applicator at NSA HR Portsmouth Annex conducts larval mosquito surveillance and control.

3.2.6.2. Mosquito Control

Mosquito control methods are either permanent (e.g. eliminating the water source) or temporary (e.g. chemical control) in nature and may be directed against larvae or adults. Larviciding is the most effective way to control mosquitoes. Larvicides (*Bacillus thuringiensis var. israelensis* (Bti)) are applied by EV Services pest control when results of mosquito dip counts exceed two larvae per dip. Larvicides should be applied to areas where water stands for longer than 7 days. Biological control can be accomplished by the introduction of mosquito fish (*Gambusia* sp.), which are surface feeders that are predaceous on mosquito larvae. *Gambusia* species have the ability to outcompete other species, so it is important to consult with the Environmental Department prior to introducing them, as well as to only introduce them into waters that do not drain into other waterways. To decrease the amount of standing water it is important to have a drainage system allowing proper runoff of rain water from roadways. Ditches should be maintained free of weed growth. This increases water flow in the ditch allowing access of natural mosquito predators.

If adult mosquito surveillance is conducted and female mosquito counts exceed 25 per night per trap, Ultra Low Volume (ULV) insecticide treatments can be initiated by EV Services pest control. If a trap count exceeds the threshold, the area surrounding that trap should be surveyed to identify and treat the active breeding site. For most species, mosquito activity is greatest from dusk to dawn. Adult mosquito control efforts should be made during peak mosquito activity. ULV operations should be conducted in the early morning hours before the sun warms the ground, or in the evening after the ground has cooled. Regular testing of ULV aerosol droplet dispersal is required to assure maximum control, minimum insecticide use, and prevention of automobile finish spotting caused by droplets that are too large. This testing must be done at the beginning of each spray season and for every 50-100 hours of operation, or when the pesticide is changed. More information is included in the Armed Forces Pest Management Board Technical Guide #13: *Ultra Low Volume Dispersal of Insecticides by Ground Equipment* (http://www.afpmb.org/sites/default/files/pubs/techguides/tg13.pdf). Slides for aerosol droplet size testing can be obtained from and analyzed by the Testing and Evaluation Department at the Navy Entomology Center of Excellence, Jacksonville.

3.2.6.3. Filth Fly Management

Filth flies (houseflies, blow flies, flesh flies, bottle flies, etc.) can be a problem during the warm summer months if high sanitation levels are not maintained. Timely disposal of garbage and routine cleaning of garbage cans and dumpsters helps to minimize the problem. Garbage cans and dumpsters should be placed on concrete pads at least 100 feet from facilities to reduce breeding under and around the containers and to minimize access to the facilities. Continuous monitoring of sanitation conditions in and around food service areas helps assure that significant fly breeding will not occur.

The choice of fly control techniques must be based on an on-site evaluation of the problem. Pest control personnel inspect areas where garbage is handled and treat these locations with approved insecticides when flies exceed control limits. Preventive Medicine personnel also inspect these areas and report significant findings to appropriate people for corrective action. Exclusion devices such as screens and air curtains help prevent the entrance of flying insects into buildings when installed and properly maintained. Aerosol insecticide treatments are provided when adult flies become a problem in indoor spaces. Automated pesticide misting devices are not allowed by DOD instruction. Light trap devices are also helpful for filth fly control in food handling areas, but only when they are placed inside of the building. Use only non-contaminating light traps with some way of containing the dead insects. For more information on this, see AFPMB Technical Guide No. 29: *Integrated Pest Management In and Around Buildings* (http://www.afpmb.org/sites/default/files/pubs/techguides/tg29.pdf).

3.2.6.4. Bed Bug Management

Within the past decade, there has been a significant resurgence of bed bugs worldwide. Bed bugs are blood-feeding ectoparasites that are usually associated with humans, bats, or birds. These insects have a number of features that make them very effective pests and thus difficult to control: their small, flattened body design allows them to take harborage in inconspicuous places such as cracks and crevices; a female can lay several hundred eggs during her lifetime; they can survive a long time without feeding; and many insecticides have been rendered ineffective due to resistance development. The most common way bed bugs are introduced is by the movement of infested items (*i.e.,* bedding, clothing, and luggage) from one place to another. The common bed bug is not known to transmit human disease. For most people, the bite of a bed bug is painless and will usually go unnoticed, though many people can have allergenic skin reactions, ranging in severity from local inflammation and itchiness, to asthmatic symptoms and anemia. Since this is a public health issue the involvement of installation Preventive Medicine personnel is highly recommended.

Because of their cryptic lifestyle, bed bugs can be difficult pests to detect without a diligent survey strategy. Bed bugs typically feed at night when the host is asleep, and seek off-host harborage in cracks and crevices during the day. It is very important to *thoroughly* inspect areas where bed bug infestation is suspected. Typical harborage areas might include mattress seams, box springs, bed frames, night stands, picture frames, loose wallpaper, and curtains. Bed bugs typically travel 5-20 feet from their harborage area to feed. When populations are small, infestations may go unnoticed. Some tell-tale signs of a larger bed bug population include the presence of fecal spotting, shed skins, increased biting frequency, and in serious cases a distinct “obnoxiously sweet” odor produced by the bugs. Persons conducting inspections and surveys should be properly trained on what to look for and where to look for infestations.

Bed bug control may be more difficult to achieve today with increased travel and more stringent limitations on available control materials. A successful control program will require a carefully planned and integrated approach. For more information on controlling bed bugs see the AFPMB's Technical Guide 44, Bed Bugs - Importance, Biology, and Control Strategies (http://www.afpmb.org/sites/default/files/pubs/techguides/tg44.pdf).

3.2.6.5. Red Imported Fire Ant

The red imported fire ant was recently introduced into Virginia through the movement of infested nursery stock and fill soil. The fire ant’s mound building and stinging behavior interferes with recreational and grounds maintenance activities. Bait and residual insecticides are available for control of fire ants. Monthly inspections for fire ant mounds should be made in all improved and unimproved areas, with treatment as necessary. Infested areas shall be treated with bait, followed by a drench of any mounds 6 to 8 weeks later. An imported fire ant quarantine map is included in Appendix A.

3.2.6.6. Rodent Management

Rodent control work is an ongoing program to eliminate the causes of rodent infestations. Major emphasis is placed on sanitation and exclusion to limit the amount of food and harborage available to rodents. Tamper-proof bait stations should be maintained in high infestation areas. There are new EPA requirements for first generation anticoagulant products (warfarin, chlorophacinone, and diphacinone), second generation anticoagulant products (brodifacoum, bromadiolone, difenacoum, and difethialone) and non-anticoagulants (bromethalin, cholecalciferol and zinc phosphide). Bait stations are required for all outdoor, above-ground placements and are also required indoors if exposure to children, pets, or non-target animals is possible. All outdoor above ground use must be in a bait station and be applied within 100 feet of man-made structures. Mechanical traps (snap traps, glue traps, etc.) are another effective control method. Trapping is an effective way of quickly reducing a large mouse population.

3.2.6.7. Bird Management

Pigeons are the primary bird pests. Pigeons, English sparrows, and starlings can be controlled without a permit because they are not covered under the Migratory Bird Treaty Act. Other bird species require special permits before any control measures can be taken. Bird control methods vary according to the situation. Bird droppings pose a health hazard, as a possible cause of histoplasmosis and other respiratory problems when airborne. Bird ectoparasites, such as mites, can also fall on installation employees. Ultrasonic devices and plastic owls and snakes, etc. are not effective for bird control. The best alternative for bird control is "bird proofing" or the exclusion of birds by closing up all openings. Because of its permanency, bird proofing (i.e., the placing of hardware cloth and chicken wire over potential roosts) is considered the most cost effective means of control. Population reduction techniques (i.e., destruction of nests accessible by a ladder or "cherry picker") can sometimes be used effectively. Repellent chemicals which produce alarm reactions and cause a flock to leave or avoid an area are often used. Control personnel should

continually monitor bird population levels and take appropriate control actions when required.

3.2.6.8. Feral Cat Management

Cats may occasionally be found near food handling areas or dwelling in crawl spaces under buildings where they can cause flea problems inside of the buildings. The elimination of available food by keeping garbage cans and dumpsters sealed will decrease the appeal of the area to the cats. Elimination of shelter is also a good means of control. The activity should discourage people from feeding stray cats. EV Services pest control uses live traps for the capture and subsequent transport of these cats to the local animal shelter. Guidance on this control plan can be found in AFPMB Technical Guide # 37 (http://www.afpmb.org/sites/default/files/pubs/techguides/tg37.pdf).

3.2.7. Pest Management in Housing

3.2.7.1. Public Private Venture Housing

The NSA HR Portsmouth Annex PPV house is under a Public Private Venture (PPV) partnership with Lincoln Military Housing. Lincoln Military Housing is responsible for providing pest management services and responsible for upholding the agreements set forth in the Partner's Plan for Pest Control included in Appendix G. General pest control services are currently being provided by contract with Orkin and grounds maintenance services are being provided by Valleycrest (certificates located in Appendix K). Contractors providing services in the PPV areas must follow all state and local laws.

3.2.7.2. Pet Management

Pet dogs and cats released or lost by owners on base can become a pest problem. Feral cats and dogs are susceptible to and can carry disease, damage natural habitats, harm protected wild animals, become a vehicle strike hazard, and attack and injure personnel. Pet owners are encouraged to microchip their pets. Microchipping is a permanent pet identification system using a computer chip implant in the skin of the animal. This allows a lost pet to be identified even if the collar tag is missing.

3.2.8. Prohibited Operations and Devices

3.2.8.1. Occupied spaces

"Installations shall not permit the application of liquid, dust, or aerosol pesticide formulations in any space occupied by unprotected personnel. However, pesticides contained in gel or paste bait formulation may be applied in occupied spaces in accordance with pesticide label directions." (OPNAVINST 6250.4C pg 25 and OPNAVINST 5090.1C Para. 17-4.13)

3.2.8.2. Preventive or Scheduled Pesticide Treatments

"Regularly scheduled, periodic pesticide applications are not approved for DOD property except in situations where the IPM plan clearly documents that no other technology or approach is available to protect personnel or property of high value. Installations shall not use preventive pesticide treatments, to include automated misting devices, unless the appropriate pest management consultant has given approval based upon current surveillance information or records documenting past disease vector or pest problems that require this approach." (DODINST 4150.07, Para. E4.10.3)

3.2.8.3. Paints and Coatings Containing Pesticides and Other Biocides

"Paints containing insecticides are not approved for use on DoD property. This guidance applies to interior and exterior pesticide-containing paints intended for application to structural surfaces, such as walls, ceilings, and siding. It also applies to insecticides formulated and labeled for use as paint additives. Paints containing fungicides as mildew inhibitors may be used when application directions specify no special restrictions due to the

fungicide. Approved marine anti-fouling compounds or coatings may be applied to protect surfaces of watercraft" (DoDINST 4150.07, Para. E4.10.2).

3.2.8.4. Electrically Operated Devices

"Electromagnetic exclusion or control devices, ultrasonic repellent or control devices, and **outdoor** devices for electrocuting flying insects are not approved for use on DOD installations (DODINST 4150.07, Para. E4.10.1); this does not apply to **indoor** use of selected devices, carefully placed, for electrocuting flying insects. Pest surveillance traps and monitoring equipment, such as non-electrocuting mosquito light traps, may also be used by trained personnel.

3.3. Regulatory Compliance

3.3.1. Policy

Department of Defense policy is to ensure that DOD pest management programs achieve, maintain, and monitor compliance with all applicable Executive Orders and applicable Federal, State, and local statutory and regulatory requirements. When there is a conflict between Federal and local regulations, the installation will comply with the more stringent of the two. This may occur with pesticides limited for use by the State of Virginia, which are not necessarily restricted by the EPA. In this case, the installation must comply with Virginia regulations.

3.3.2. Pesticide Regulation and Enforcement

3.3.2.1. Pesticide Regulation

The U.S. Environmental Protection Agency (EPA) has the primary authority to regulate pesticides in the U.S. The EPA delegates pesticide enforcement authority to states through cooperative agreements. OPNAVINST 6250.4C requires Navy installations to comply with state and local pesticide use regulations.

3.3.2.2. Enforcement

The responsibility for compliance and enforcement lies with the installation CO. As the CO's pest management advisor, the IPMC shall be familiar with Federal, State and local pesticide use regulations and ensure that all applicators conduct operations in compliance with these regulations. Regulatory enforcement for each of the PMSPs is provided.

- **Commercial contractor applicators:** PMPARs shall provide assistance by monitoring contract PMSPs for compliance with all applicable regulations as specified in the contract and will recommend appropriate actions to the contracting officer if the contractor does not comply. PMTs conducting inspections of food service facility pest management programs can also ensure compliance for safe pesticide use and applicator licensing / certification (Inspection guidelines are found in NAVMED P-5010 Chapters 1 and 8).
- **DOD applicators:** The pesticide applicator's immediate supervisor, with the assistance of the IPMC, shall also ensure that pesticide use is in compliance. Under the authority of DOD Instruction (DODINST) 4150.07 and DOD Directive 5134.01 and per DOD 4150.07, Volume 1, the DOD may deny, suspend, or revoke the certificate of any DOD employee who violates any provision of FIFRA or falsifies records. In accordance with DOD 4150.07, Volume 1, the installation CO may initiate a formal review if FIFRA violations are suspected. Violations shall be reported through appropriate command channels to the NAVFAC Atlantic certifying authority for review. The certifying authority shall determine if further action is required. That action may include suspension of the applicator's certification. See DOD 4150.07, Volume 1 for more information http://www.afpmb.org/sites/default/files/pubs/directives_mous/415007m_vol1.pdf..

NAVFAC Atlantic Applied Biology shall provide assistance to the installation IPMC with compliance and enforcement issues and clarification of regulations. The senior pest management consultant is the certifying official for DOD certified pesticide applicators on the installation.

3.3.3. Laws and Regulations

3.3.3.1. Primary Pesticide Regulations

- **Federal:** U.S. Code of Federal Regulations (CFR) at 40 CFR Section E, 152-180: Pesticide Programs (http://www.access.gpo.gov/nara/cfr/waisidx_03/40cfrv21_03.html).
- **DOD and Navy:** DODINST 4150.07, DOD Pest Management Program; OPNAVINST 6250.4C, Navy Pest Management Programs; OPNAVINST 5090.1C, Environmental Readiness Program Manual.
- **Virginia:** The Virginia Department of Agriculture and Consumer Services, Office of Pesticide Services regulates the Pest Control Industry (http://www.vdacs.virginia.gov/pesticides).

3.3.3.2. The Pesticide Label

The primary source of pesticide regulations for the pesticide applicator is found on the pesticide label in accordance with 40 CFR 156. Virginia may add supplementary labels which are regulations that must be complied with in the State. **It is a violation of Federal and/or State law to use a pesticide in a manner inconsistent with the label.** Note, however, that the pesticide label does not provide specific information for each site where the pesticide may be applied. For example, the pesticide label may allow application of an herbicide to unimproved grounds, but if those grounds are within a ringed map turtle habitat, then pesticide use may be restricted under the Endangered Species Act. Pesticide applicators should be aware of environmentally sensitive areas before beginning any new pesticide application and should consult the installation's Environmental Department. For more on the pesticide label, see http://www.epa.gov/pesticides/label/.

Endangered Species Protection Bulletins set forth geographically specific pesticide use limitations for the protection of endangered or threatened species and their designated critical habitat. If your pesticide label directs you to the EPA Bulletins Live! Website (http://epa.gov/espp/bulletins.htm), you are required to follow the pesticide use limitations found in the Bulletin for your county, pesticide active ingredient and application month.

3.3.3.3. Other Regulations

Other applicable directives, laws, and regulations concerning pesticide applicators and pest management operations are listed and described in Appendix C.

3.4. Pesticide Management

Chemical control of pests using pesticides can be an integral part of an IPM program. Proper management of pesticides will ensure a safe and cost-effective pest management program. Management of pesticides includes the proper selection of pesticides, pesticide approval, procurement, storage, mixing, use of pesticide application equipment, and clean-up. The pesticide label provides most of the information needed to manage pesticide use and must be affixed to the container at all times.

3.4.1. Pesticide Selection

The following criteria should be used when selecting a pesticide:

- **Determine the need for a pesticide.** Is a chemical pesticide really needed? In some situations non-chemical control methods may be more effective or less costly and time-consuming in the long term. Will exclusion or habitat elimination take care of the problem?

- **Choose a pesticide with a low toxicity.** Can the pest be sufficiently controlled with a pesticide that has a low toxicity to humans?
- **Choose pesticides and pesticide formulations with minimal environmental impact.** Avoid using "Restricted Use" pesticides if possible. The environmental impact of pesticide spills is reduced when using a granular pesticide formulation rather than a liquid. Can attractant bait stations be used instead of broadcast application of a pesticide?
- **Choose pesticides that provide a long-term or sustainable solution.** For example, contact insecticides applied to ant trails will only temporarily halt the infestation, and may cause the colony to bud and form new colonies, while baits can kill the entire colony including the queen.

3.4.2. Pesticide Procurement

Pesticides used by contractors are included in the cost of the contract and are procured through commercial sources. Pesticides used by DOD personnel may be purchased through the Federal Stock System. Contractors cannot purchase pesticides through the Federal Stock System. A list of pesticides approved by DOD and found in the Stock System can be found at http://www.afpmb.org/pubs/standardlists/DOD%20pesticides%20list.pdf (these are not the only pesticides that may be used on the installation). Only pesticides listed on the installation's Authorized Use List (AUL) in Appendix E may be purchased. All pesticide products and pest control services procured via government credit cards must also be pre-approved by the NAVFAC LANT PPMC (NAVSUPINST 4200.99). For information on requesting new pesticides to the installation AUL, see section 2.2 Pesticide Approval.

3.4.3. Pesticide Storage

3.4.3.1. Pesticide Storage

NAVFAC MIDLANT Environmental (EV) Services pest control maintains a pest control shop on NSA HR Portsmouth Annex located in Building 277, which is in good order. Pesticides used by commercial contractors are stored off-site in contractor-owned facilities. DODINST 4150.07 (Para. E4.5.1.) states that pesticide storage facilities "shall comply with all applicable regulatory standards and shall, where feasible, be modified to meet the minimum standards for new pesticide storage facilities." The DOD standards are described in *AFPMB TG 17: Military Handbook, Design of Pest Management Facilities* (http://www.afpmb.org/sites/default/files/pubs/techguides/tg17.pdf).

3.4.3.2. Retail Sale Pesticide Storage

Household pesticides displayed and sold at the NEX shall be stored in their original, sealed containers.

3.4.3.3. Vehicles

Pest control vehicles must carry pesticide spill kits in accordance with OPNAVINST 6250.4C. Pesticides shall not be transported in the vehicle's passenger compartment and pesticide containers shall be secured to vehicles to prevent spillage.

3.4.4. Mixing

EV Services pest control conducts pesticide mixing at the NSA HR Portsmouth Annex pest control shop located in Building 277. All pesticide mixing conducted by commercial contractors is done off-site. One exception to this is soil treatment for termite prevention during building construction; the contractor must mix the termiticide on-site while the PMPAR or IPMC is there to witness. Pest control operators must mix pesticides in accordance with the pesticide label in appropriate areas that minimize the risk of safety and environmental hazards. Contracted pest control operators must also mix pesticides in accordance with the contract specifications. Persons mixing pesticides with water shall protect the water supply

from back-siphoning of the pesticide mixture. They shall also ensure accurate measurement of concentrated pesticide to ensure proper application rate. Precautions must be taken to minimize the risk of a pesticide spill. See Section 5.3.4 for pesticide spill prevention measures. Spill kits must be maintained on pest control vehicles and must be available at the mixing site.

3.4.5. Application

3.4.5.1. Service containers

Containers other than the original pesticide container that are used for transporting pesticides to the job site must have a copy of the label attached. Service containers used for the application of a pesticide must have the following information on a tag attached to the container: name of party responsible for the container, the identity of the chemical in the container, and signal word of the chemical. Containers commonly used for food, drink, or household products **shall not be used** to hold pesticides.

3.4.5.2. Equipment

Only pest control equipment that is in good repair and safe to operate shall be used by PMSPs. The equipment should be in good condition, free from corrosion, clean and free from leaks. The PMPAR shall inspect equipment used by contract applicators. Applicators shall also ensure that they use equipment suitable to ensure proper application of pesticides.

3.4.5.3. Pesticide Application

All pesticides shall be applied in accordance with Federal, State and label directions. Application of pesticides should be timed to ensure contact with and maximum kill of the pest and to prevent use under adverse weather conditions that can cause drift of the chemical outside the target area. See section 4.2.2 for more information on timing and drift prevention

3.4.6. Post-application Clean Up

All pest control equipment shall be properly cleaned. Contract PMSPs are not allowed to dispose of excess pesticide, used containers, or residues on the installation per contract specifications; they must conduct all cleaning off-site. Spray tanks and pesticide containers must be triple-rinsed prior to storage or disposal. Disposal of pesticide spray tank rinse water should be performed by applying to a site listed on the pesticide label, used for future mixing of the same pesticide, or disposed of as hazardous waste. Rinse water shall not be allowed to enter storm drains.

3.5. Minimum Risk Pesticides

Minimum risk pesticides, such as those marketed under the EcoEXEMPT® brand, may be used by pest management service providers (PMSP) as part of their IPM program. According to the EPA, “Minimum risk pesticides are a special class of pesticides that are not subject to federal registration requirements because their ingredients, both active and inert, are *demonstrably* safe for the intended use.” These pesticides are exempt from federal registration under section 25(b) of the FIFRA and are not labeled with an EPA registration number. Since there is no federal review of these pesticides or their pesticide label, there is no federal review of the instructions for effective use of these products. Although these pesticides are exempt from federal registration, they still need to be approved prior to use on DOD property, primarily for efficacy and safety reasons.

3.6. Cancelled Pesticides

In recent years several common organophosphate pesticide registrations have been cancelled or restricted. Chlorpyrifos (i.e. Dursban®, Lorsban®) and diazinon were widely used pesticides by private

and commercial pesticide users that have been cancelled. The following actions are allowed with these pesticides:

- End users (e.g. PMSPs and private, residential users) are allowed to use the pesticides until depleted.
- PMPARs should monitor the use of the pesticides by contractors to ensure that they are not using an increased amount of the pesticides as a means of using up their stock.

The EPA is also cancelling most organic arsenical pesticide registrations, which consist of monosodium methanearsonate (MSMA), disodium methanearsonate (DSMA), calcium acid methanearsonate (CAMA), and cacodylic acid and its sodium salt. Organic arsenical pesticides are used or have been used as herbicides on cotton and other agricultural crops, in forestry, on residential and other lawns and turf, and in non-crop areas such as rights of way, drainage ditch banks, fence rows, and storage yards. All uses of DSMA, CAMA, and cacodylic acid and its sodium salt were canceled as of September 30, 2009.

All uses of MSMA **except** cotton, sod farms, golf courses, and highway rights-of-way, were canceled as of September 30, 2009. Use of MSMA on sod farms, golf courses, and highway rights-of-way **was** to have been prohibited after December 31, 2013, but because the EPA is considering newly-submitted information, these uses remain registered. These uses, in addition to the cotton use, will be considered in the pending registration review process for MSMA. **Users can continue to apply MSMA on sod farms, golf courses, and highway rights-of-way until further notice, but thoughtful use and consideration of depleting stocks is highly encouraged.**

4. Health and Safety

4.1. Pesticide Applicator Safety

To ensure the safe use of pesticides, pesticide applicators shall handle and apply pesticides in accordance with the product's label directions.

4.1.1. Potential Occupational Hazards

The following hazards may be encountered by pesticide applicators or Government representatives that may be exposed while inspecting pest management operations. Occupational Safety and Health guidance is found in the OPNAVINST 5100.23G: *The Navy Occupational Safety and Health Program Manual*.

4.1.1.1. Direct Contact Toxic Chemical Exposure

Many chemicals used as pesticides are also harmful to humans. The three routes of exposure to applicators are dermal, inhalation and ingestion. For applicators the most common route of exposure is dermal; frequently due to not wearing the appropriate personal protective equipment. Severity of the harmful effects is determined by duration of exposure and toxicity of the chemical. The effects can be acute (rapid onset due to high dosage, high toxicity) or chronic (slow or delayed onset; due to long term exposure to low dosage, low toxicity chemicals). The highest risk for severe acute chemical exposure occurs during pouring and mixing of concentrated pesticide resulting in high dose, rapid onset chemical poisoning. Chronic exposure can occur when the applicator fails to use appropriate PPE during frequent pesticide applications and the chemical accumulates in the body of the individual over a period of time leading to delayed or gradual onset of illness or injury. Direct chemical exposure can result not only in pesticide poisoning, but in skin burns due to corrosive chemicals.

4.1.1.2. Heat

The use of protective equipment such as respirator, goggles, gloves and coveralls increases the risk of heat injury especially in warm climates. Heat injury can occur during long periods of work outdoors during warm weather or in enclosed spaces where machinery or equipment may generate heat.

4.1.1.3. Noise

Some pesticide application equipment use gas-powered air compressors or pumps that produce noise hazards. Gas-powered backpack sprayers are particularly hazardous due to the proximity of the noise source to the ears.

4.1.1.4. Eye Hazards

Eye hazards may result from chemical splashed into the eyes causing corrosive, toxic, or impact injury. Some pesticides are labeled "Restricted Use" due to their corrosive nature. Highest risk occurs during pesticide pouring, mixing and application. During pesticide applications, chemicals may enter the eyes through "splashback" when applying the chemical under pressure into a crack or crevice or when applying pesticides overhead. Injury may also occur during equipment cleaning.

4.1.1.5. Infectious Zoonotic Disease

Care should be taken when trapping and handling live or dead animals. Hantavirus may be transmitted from rodents to humans through body fluid exposure or when breathing aerosolized rodent excreta. Pest management providers may be exposed when handling rodent carcasses after trapping or handling traps contaminated with rodent urine and feces. Feral dogs, cats, skunks, raccoons, and bats may carry and transmit rabies through a bite.

4.1.1.6. Inhalation Hazards

Many pesticides release hazardous vapors and are particularly hazardous in enclosed spaces. Some pesticides are labeled "Restricted Use" due to the high risk of inhalation injury. Personnel may be exposed during mixing, application, and cleaning.

4.1.1.7. Electrical and Fire Hazards

Spot and crack and crevice applications may require application of a pesticide to areas near motors of refrigerators, compressors and other machinery where it can become an electrical shock hazard. They may also be applied to areas near pilot lights resulting in an explosion and/or fire hazard.

4.1.1.8. Head Impact and Sharp Hazards

Surveys and pest control procedures may be done in attics, crawl spaces, basements, and other areas with low overheads where head impact hazards exist. Some devices used for bird roosting exclusion and rodent control have sharp edges and can cause cuts, puncture wounds, and abrasions.

4.1.1.9. Trip and Fall Hazards

Trip hazards may occur when applicators are spraying without close attention to where they are stepping. Spraying around buildings where there are various obstacles (i.e. plants, utility boxes, plumbing) in the path of the applicator can be particularly hazardous. Pest control may also need to be performed from ladders, on roofs, in ceilings, and in trees. Wet surfaces on the ground or on elevated surfaces can increase the risk of trips and falls.

4.1.1.10. Exposure to Harmful Animals

Venomous animals such as bees, wasps, rattlesnakes, and spiders are potential hazards when attempting to control them. Some of these are very dangerous due to envenomation and allergic reactions. Feral dogs, cats, coyotes, raccoons, and other large pest animals can inflict serious bites or clawing wounds.

4.1.2. Hazard Abatement

4.1.2.1. Operational Risk Management

Operational Risk Management (ORM) is a decision making tool to reduce the risk of mishaps, whether in military contingency or support operations. Pest management operations pose risks to human health and the environment that affect the installation's mission that can be reduced and minimized by ORM. Pest management ORM uses the following process to minimize hazards:

- **Identify hazards** – the hazards may involve the pesticide or the application equipment (see list of hazards above)
- **Assess hazards** – determine the degree of risk based on the probability and severity of these hazards. For example, the risk may be high if a highly toxic pesticide is used daily.
- **Make risk decisions** – Develop risk control options. Decide whether benefits of control outweigh the risks involved.
- **Implement controls**
  - Engineering controls – Example: use a less toxic pesticide for controlling the pest
  - Administrative controls – Example: place warning placards around pesticide vehicles and pesticide storage areas
  - Personal protective equipment – Example: wear a respirator when an inhalation hazard exists
- **Supervise** – Follow-up to determine effectiveness of controls and monitor changes to hazards.

For more information on ORM go to the Navy Safety website at http://www.safetycenter.navy.mil/.

4.1.2.2. Training and education

Pesticide safety is a core requirement for DOD and civilian pesticide applicator certification and licensing programs. Topics included in the DOD training are listed in DOD Manual 4150.07, Volume 1, DOD Pest Management Training and Certification Program: The DOD Plan for Pesticide Applicators. Safety topics are also given during recertification courses. See section 2.4 for specific training information.

4.1.2.3. Read the Pesticide Label

Pesticide labels are found on all pesticide containers used by installation PMSPs. The pesticide label provides directions for mixing, applying, and disposing of pesticides safely. It also includes a list of hazards to humans and first aid treatment. It may also include a list of personal protective equipment that must be worn and user safety recommendations. The label should always be read completely and thoroughly by the applicator before purchasing and using a pesticide. The label is a legal document mandated by Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

4.1.2.4. Personal Protective Equipment

Personal Protective Equipment (PPE) should always be used when applying pesticides. The type and level of protection needed will be determined by the toxicity, formulation and method of application of the pesticide. The pesticide label provides guidance on what PPE to use.

- Respirator
- Chemical-proof gloves
- Coveralls or long-sleeve shirt and long pants
- Chemical-proof boots
- Hard hat
- Goggles
- Apron
- Faceshield
- Self-contained breathing apparatus (for fumigation)

PPE must be appropriate for the type and application of the pesticide being used. It is the applicator's responsibility to maintain the PPE. Contractors must provide appropriate PPE to their applicators.

4.1.2.5. Pest Control Vehicle Safety Devices

Pest control vehicles should be equipped with safety devices and information. This may include:

- Emergency medical information including nearest emergency treatment center
- Fire extinguisher
- Spill kit
- First aid kit
- Cell phone or radio
- Drinking water supply
- Rinse water supply for washing pesticide off skin.

4.1.2.6. Pesticides and Equipment

The risk of pesticide exposure can be reduced by selecting the appropriate pesticide and equipment for the job. Applying small amounts of low toxicity pesticide using appropriate and properly maintained equipment greatly reduces the risk of harm. Using pesticides that are formulated (i.e. contain emetics) or packaged (i.e. water-soluble packets) to minimize chemical exposure and increase safety should be considered when purchasing pesticides.

Pesticide selection is addressed in section 3.4.1. Equipment should be tested with water prior to application to ensure proper application and that it is not leaking. Situational awareness, such as monitoring meteorological conditions and location, also prevents harmful exposure to pesticides.

4.1.2.7. Protection from Infectious Zoonotic Diseases

Pest control personnel who handle trapped animals or dead animal carcasses should wear gloves to prevent exposure to potentially infectious body fluids. A respirator fitted with a high efficiency particulate air filter should be worn when entering enclosed spaces with large amounts of rodent feces that might be disturbed and become airborne. Additional protection from Hantavirus can be provided by spraying dead rodents and rodent feces with a commercial disinfectant. This will kill Hantavirus as well as wet the feces to prevent it from becoming airborne. Detailed guidance on rodent handling is found in AFPMB TG 41: *Protection from Rodent-borne Diseases with Special Emphasis on Occupational Exposure to Hantavirus* (http://www.afpmb.org/sites/default/files/pubs/techguides/tg41.pdf).

4.1.2.8. Hazard Communication

All pesticide applicators must receive OSHA Hazard Communication training (29 CFR 1910.1200). Contractors must carry material safety data sheets (MSDSs) in their vehicles or, as appropriate, at their on-base administration office. Applicators must understand all of the hazards associated with the chemicals they will use and be able to communicate those to the customer if necessary.

4.1.2.9. Medical Surveillance Program

DOD pesticide applicators are required to be in a medical surveillance program depending on their hazard exposure. Medical surveillance is conducted by the occupational health clinic at the Naval Medical Clinic in accordance with Navy Environmental Health Center Technical Manual (NEHC-TM-OEM) 6260.1: Occupational and Environmental Medicine Field Operations Manual and Medical Matrix.

4.2. Public Safety

4.2.1. Potential hazards to public

4.2.1.1. Direct Contact with Pesticides

Pesticide exposure can occur through dermal contact with a pesticide on a surface, inhalation of vapors, or ingestion of pesticide contaminated food or eating utensils. This type of exposure can occur if a pesticide application is done while unprotected building occupants are present, occupants are allowed entry into buildings before the pesticide has dried, or food and food preparation and serving equipment were not properly protected or cleaned after an application.

4.2.1.2. Pesticide Drift

Pesticide drift occurs when a pesticide leaves the target area and affects unprotected persons outside the area. This commonly occurs outdoors when winds can carry the pesticide off-site. Drift can occur indoors if there is air movement or pesticides are drawn up through ventilation ducts. Pesticide applications that involve small pesticide droplets, such as fogging or ultra-low volume (ULV) application, or dusts are most susceptible to drift.

4.2.1.3. Contact with Contaminated Water

Some pesticides can move through soil and contaminate groundwater used for drinking. Others, if applied in or close to surface water, can cause contamination of recreational waterways.

4.2.1.4. Injury Due to Animals

The use of an inappropriate pesticide may cause collateral injury due to an insufficient "knockdown" of the target pest. This can occur with bees and wasps. Some insecticides do not knockdown the insects rapidly and may actually excite them causing them to become more aggressively defensive in behavior. Unprotected persons blocks away from the pesticide application may become the target of their aggression. Injury can also occur when persons get too close to or try to release a trapped animal or try to capture feral animals by themselves.

4.2.1.5. Fumigation Exposure

Fumigants are highly toxic and can cause immediate death upon exposure. Fumigations can be performed in the housing area where it poses a potential hazard to neighbors and pets. During fumigation the chemical is injected into a tarped structure and allowed to remain for 24 hours. The highest risk of injury or death occurs if a person or animal were to enter the tarp during this period or after the tarp is removed and the before the building is completely ventilated. The fumigant, when exposed to air, dissipates rapidly and readily.

4.2.2. Hazard Abatement

4.2.2.1. Proper Timing of Pest Control Operations

Most indoor application of pesticides should be conducted when building occupants are not present. An exception to this is the application of pesticide baits that are enclosed in a tamper-proof bait station that does not allow exposure to occupants or pets. The building occupants must remain out of the building to allow the liquid pesticide to dry. Some pesticide labels are specific about re-entry times (time after application that occupants are allowed back into the treated building). Some pesticides such as fumigants provide specific directions on aeration of spaces to remove pesticide prior to re-entry. Certain operations, such as bee and wasp control or removal are best conducted after the area has been cleared of unprotected persons. Refer to the product label for specific information.

4.2.2.2. Preventing Pesticide Drift

Pesticide drift from target areas to areas where humans, animals and plants can be affected can be reduced through the following means (adapted from University of Nebraska publication G1773: Spray Drift of Pesticides at http://www.ianrpubs.unl.edu/epublic/live/g1773/build/g1773.pdf).

- Select low or nonvolatile pesticides.
- Read and follow the pesticide label. Apply a pesticide only if an application is warranted.
- Use spray additives that decrease drift within label guidelines. This will increase the droplet sizes and pesticide effectiveness.
- Use larger spray nozzle orifice sizes. This will give larger droplets and will increase the number of tank refills, but will improve coverage and effectiveness.
- Avoid high pressure. High pressure creates finer droplets; 45 PSI should be considered maximum for conventional broadcast spraying.
- Use drift-reduction nozzles. They will produce larger droplets when operated at low pressures.
- Use wide angle nozzles, low boom heights, and keep the boom stable.
- Drift is minimal when wind velocity is less than 10 mph. Do not spray when wind is greater or blowing towards sensitive crops, gardens, dwellings, livestock, or water sources.
- Use shielded spray booms. When banding, use shroud covers to keep chemical from drifting.
- For indoor applications, turn off ventilation and close doors to prevent air currents.

4.2.2.3. Prevent Tampering with Animal Traps

Caged animals can be very aggressive. Traps should be placed in areas where they will not be tampered with by humans or pets. Warning signs can be placed on the traps and area occupants can be warned of the risk of injury. Live and dead rodents in traps can also be a hazard for Hantavirus. Traps should be placed in areas where humans or domestic animals will not be exposed to the rodents.

4.2.2.4. Protection of Fumigation Sites

Warning signs should be posted at the fumigation site warning of the hazards. Some installation contracts require the contractor to provide a 24-hour roving watchperson to patrol the fumigation site to prevent entry by unauthorized personnel.

4.2.3. Special Safety Considerations

4.2.3.1. Medical Treatment Facilities

Persons undergoing medical or dental treatment may be sensitive to pesticides and pesticide odors in the environment. Additionally, medical equipment and supplies may be contaminated during pesticide applications. Alternative IPM methods must be considered prior to using pesticides in medical treatment areas. If pesticides must be used, the preferred method is to use baits, then crack and crevice treatments with low toxicity pesticides. Application of any liquid or dust formulation must only be done when the area is unoccupied. Guidelines for pest management in medical treatment facilities are found in AFPMB TG 20: *Pest Management Operations in Medical Treatment Facilities* (http://afpmb.org/sites/default/files/pubs/techguides/tg20.pdf).

4.2.3.2. Child Development Center

Children can be sensitive to pesticides and other chemicals. Parents are also concerned about potential hazards that their children may be exposed to and have a right to know about these hazards. Best practice is to minimize pesticide use in and around child development centers and schools, use only enclosed baits and low toxicity pesticides, do not apply pesticides when people are present, and inform staff and parents of any pesticides to be used on the property. IPM should be used to reduce the health risks of pesticides to children.

4.2.3.3. Food Service Areas

Food contaminated with pesticides can lead to pesticide poisoning. Sanitation and exclusion should be the primary means of preventing and reducing pest infestations. Pesticide use in food service areas should be limited to low-toxicity pesticides applied to cracks and crevices and baits. The area should be properly prepared for treatment by putting away utensils and equipment and covering food preparation services. After treatment the area should be thoroughly cleaned to prevent contamination.

4.2.4. Emergency Planning and Community Right-to-know Act (EPCRA)

Executive Order 12856 requires all Federal agencies, including the DOD, to comply with the provisions of EPCRA. EPCRA is intended to 1) encourage and support emergency planning between the installation and the surrounding community, 2) provide the community with information about potential chemical hazards stored and used on the installation, and 3) establish a framework for local and state emergency planning. Chemical lists and applicable EPCRA sections and threshold quantities are found in the EPA List of Lists, which can be searched at: http://yosemite.epa.gov/oswer/lol.nsf/homepage.

4.2.4.1. Section 302: Emergency Planning Notification

Some pesticide active ingredients are Extremely Hazardous Substances (EHSs), and storage of them over a threshold planning quantity requires the installation to submit a facilities profile form to the State's Emergency Response Commission (SERC) and/or a

Local Emergency Planning Committee (LEPC). However, typical pesticide storage does not incur an additional regulatory burden, because the installation stores other extremely hazardous substances that would require notification under this section.

4.2.4.2. Section 304: Emergency Release Notification

EHSs or CERCLA (Comprehensive Environmental Response, Compensation, and Liability Act) listed hazardous substances that are accidentally released at or above their reportable quantity **must be reported** to local, state and federal authorities. Pesticides applied in accordance with the pesticide label are exempt from this requirement. Pesticide spills are not exempt. The amount of pesticides stored, used and transported on the installation should be minimized to prevent accidental spills.

4.2.4.3. Section 311 and 312: Hazardous Chemical Inventory Reporting

This applies to OSHA hazardous chemicals which are any chemicals with an MSDS. Nearly all the pesticides used on the installation have MSDSs. This applies to pesticide storage and pesticides in spray tanks. Although it is unlikely that pesticide amounts in storage will exceed the threshold quantity at any given time, stored pesticides must be reported to the IPMC because reporting is cumulative.

4.2.4.4. Section 313: Toxic Chemical Release Reporting

40 CFR 372.38 (c)(2) exempts the use of toxic chemicals contained in products for routine janitorial and installations grounds maintenance. The routine maintenance exemption is intended to cover janitorial or other custodial maintenance and all other installation grounds maintenance activities using substances such as cleaning supplies, fertilizers, pesticides, fungicides, herbicides, rodenticides, and insecticides similar in type and concentrations to consumer products.

4.2.5. Specific State Laws:

Information specific to Virginia can be found at http://www.vdacs.virginia.gov/pesticides/index.shtml.

4.3. Pest Control Accidents

4.3.1. First Aid

First aid for pesticide accidents is included on the pesticide label. The applicator should be familiar with first aid procedures required for the pesticide they are using. A copy of the label must be available at the application site. For some pesticides, immediate first aid and medical treatment may be required.

4.3.2. Medical Emergencies

All pesticide applicators or persons responding to an injured applicator should call the installation's emergency number in the event of a medical emergency. The name, address, and telephone number of an emergency medical care facility should be posted in the commercial applicator's vehicle. For pesticide poisonings, a copy of the pesticide label should be given to the medical first responders or taken to the emergency medical facility. If cholinesterase-inhibiting pesticides (i.e. malathion) are used then the emergency room shall maintain the proper antidotes, atropine, and 2-pam chloride.

5. Environmental Considerations

5.1. Environmental Management System (EMS) for Pesticides

This IPMP puts pesticide management within the framework of the DOD and Navy EMS. This Plan provides the tools and products to include pesticide management in the installation's overall EMS program.

5.1.1. Department of Defense Policy

DOD policy states that "The Department of Defense shall integrate EMS into missions, activities, functions, contracts, and installation support agreements as a business practice for improving overall performance. EMS is a vital supporting component of the DOD mission and is therefore the responsibility of all DOD personnel. It is not just an environmental function responsibility, but requires active participation from all functions and organizations." The remainder of this policy and details on the EMS program are found in DODINST 4715.17 of 15 Apr 2009.

5.1.2. What is an EMS?

"Environmental Management System means a set of processes and practices that enable an organization to increase its operating efficiency, continually improve overall environmental performance and better manage and reduce its environmental impacts, including those environmental aspects related to energy and transportation functions. EMS implementation reflects accepted quality management principles based on the "Plan, Do, Check, Act," model found in the ISO 14001:2004(E) International Standard and using a standard process to identify and prioritize current activities, establish goals, implement plans to meet the goals, evaluate progress, and make improvements to ensure continual improvement." Council on Environmental Quality, "Instructions for Implementing Executive Order 13423, Strengthening Federal Environmental, Energy, and Transportation Management," March 29, 2007.

5.1.3. Conformance of the Pest Management Program to EMS

An EMS is comprised of five basic components. The components and how the pest management program conforms to these components are listed:

5.1.3.1. Policy

The installation has established an environmental policy to support "mission readiness through environmental stewardship". Pest management environmental objectives to meet this policy are:

- Reduce pesticide pollution that affects the installation's neighbors through the use of IPM to prevent adverse impact on air, water, and land resources.
- Use IPM to preserve aspects of the natural environment by managing and controlling invasive and nuisance pests and preventing pesticide pollution.
- Ensure and maintain the competence of pest management personnel through certification and training to ensure that effective operations and technologies are used to control pests that minimize waste, prevent air and water pollution, minimize health and safety risks, and dispose of waste safely and responsibly.
- Enable the IPMC to maintain effective oversight and coordination of the program and liaison with local agencies in order to ensure regulatory compliance.

5.1.3.2. Planning

This IPMP is the installations primary planning document. Specific planning items included in the IPMP are:

- Legal and other requirements are identified in Section 3.3, Appendix C, and listed throughout the plan.
- General objectives and targets are included in Section 1.3.2 and specific pest management objectives are included in the IPM project sheets in Appendix H.
- Environmental aspects of pesticide use and the pest management program are included in the Environmental Impact Log in Appendix I. Also included are personnel responsible for the practice, specific aspects of each pest management practice and the impacts on installation vulnerable assets are also identified for each practice.

5.1.3.3. Implementation

Implementation of the EMS is addressed in the following sections of the plan:

- Roles and responsibilities – Section 2.1
- Pest management personnel training and awareness – Section 2.4
- Program documentation includes record keeping, reporting and IPMP updates. These are addressed in Sections 2.3 and 1.1.5.
- Operational control is the responsibility of the pest management service providers. This is maintained through their contract or lease agreement. Operational requirements are found in Section 2.5. IPM is the operation used for reducing environmental impacts and supporting mission priorities. Safety considerations are in Chapter 4.

5.1.3.4. Checking and Corrective Action

The success of an EMS depends on the ability for an installation to assess and correct itself. The Internal Assessment Plan (IAP) provides the basis for a self-assessing and self-correcting system. The IAP inventory lists the practices and practice owners identified in the environmental impact log and creates a "checklist" for assessment. The IAP inventory for pest management is found in Appendix I. Additionally, a self-assessment checklist is included in Appendix D. Compliance is addressed in Section 3.3.2.

5.1.3.5. Management Review

The major claimant, Navy Installations Command (NIC), conducts periodic EMS reviews that will include the pest management program.

5.2. Environmental Considerations on the Pesticide Label

If the pesticide is potentially harmful to the environment, information will be provided in the following sections:

- Directions for Use: If pesticide drift is a potential environmental hazard, then the directions may require certain application equipment and/or the addition of an anti-drift agent to the tank mix.
- Environmental Hazards: This section may indicate the pesticide is particularly hazardous to specific animals (i.e. bees, fish). It will also provide information on how to avoid environmental damage.

5.3. Managing Environmental Impact

Many procedures to reduce the impact of pest management practices on vulnerable assets are already in place. Many of these are contained within existing NSA HR Portsmouth Annex environmental management plans.

5.3.1. Pesticide Pollution

5.3.1.1. Synthetic Pyrethroids

Pyrethroids are insecticides that are widely used for household, garden and agricultural pest control. Most were replacements for the more toxic and environmentally-hazardous organophosphate and carbamate insecticides. Recent State—wide surveys have indicated that some pyrethroids are being found in urban stream sediment and at least one chemical

has been shown to be toxic to sediment dwelling organisms. The specific pyrethroids of concern are:

- Bifenthrin (i.e. Talstar®)
- Cyfluthrin (i.e. Cykick®, Tempo®)
- Beta-Cyfluthrin (i.e. Tempo Ultra®)
- Cypermethrin (i.e. Demon®, Cynoff®)
- Deltamethrin (i.e. Deltadust®)
- Lambda-Cyhalothrin (i.e. Demand®)
- Permethrin (i.e. Permanone®)
- Tralomethrin

Outdoor operations pose the greatest risk for pyrethroid contamination of surface water and stormwater runoff. Increased risk operations that may use pyrethroids include landscape plant insect control, agricultural insect control, and uniform repellent treatment.

5.3.1.2. Bee Protection from Pesticides

Bees are an important resource as they provide crop and natural plant pollination. Certain classes of insecticides are highly toxic to bees. These are organophosphates, carbamates, and neonicotinoids (i.e. imidacloprid). The greatest risk for bee poisoning is application of these insecticides for ornamental plants and agricultural crops. Insecticide labels include specific precautions to protect bees. These include timing applications when plants aren't blooming, bees aren't foraging, and at night when bees aren't active. The label will also include a residual toxicity (RT) time that is the time after application until there is minimal toxic effect on bees.

5.3.1.3. Pollution Prevention

A pesticide is unique as a potential environmental pollutant. When it is applied properly for the correct target pest and to the target location, it is not considered a pollutant. When a pesticide is applied or it drifts outside of the target area, then it becomes a pollutant. Pollution can occur during most pest management practices as the result of accidental spills, air and water emissions, and container disposal. Pollutants can be in the form of pesticide residues from equipment and container cleaning or as waste containers. The following pollution prevention best practices should be used on the installation:

- Conduct surveillance first to determine the need for pesticide use.
- Apply pesticides and clean equipment away from storm drains to prevent storm water contamination.
- Do not pour pesticide container rinsate into drains. Apply rinsate to a site listed on the pesticide label, store rinsate to use for future pesticide mixing, or dispose of according to local regulations.
- Use less-toxic and target-specific pesticides.
- When applying Permethrin repellent to uniforms outdoors: Do not mix or apply near storm drains or where water run-off will result in storm water contamination; Avoid overspray of pesticide onto the ground; and apply spray tank rinsate to uniforms.
- Minimize outdoor applications of pyrethroids.
- Use spot spraying and crack and crevice applications rather than broadcast or baseboard spraying.
- Minimize pesticide storage on the installation through proper inventory management and not allowing contractors to store pesticides on the installation.
- Use rodent traps rather than rodenticides.

5.3.2. Natural Resource Protection

Natural resources on NSA HR Portsmouth Annex have the potential to be impacted by pest management operations or have an impact on these operations. These operations include, but are not limited to, surveys, trapping, weeding, biological control, and pesticide use.

5.3.2.1. Environmentally Sensitive Areas

No individuals of federally listed threatened or endangered species of plant or animal are known to be found on the installation. However, these negative results do not mean that individuals of a threatened or endangered species are not present or will not be found at some time in the future. Habitat suitable for several species is present on the installation, which leaves open the possibility of a population of one of these species being found. The current management plans call for continued surveys for threatened or endangered species on a regular basis, and to protect the habitat necessary for any threatened or endangered species that may be found during a biological survey.

5.3.2.2. Invasive Species Prevention

Invasive species can cause damage to native habitats and introduce diseases to native plants and animals. All military vehicles and materials that have been in contact with foreign soil and returning from foreign locations including Hawaii are required to be cleaned by the deployed unit and inspected by U.S. Department of Agriculture Plant Pest Quarantine Officers prior to disembarkation on U.S. soil per SECNAVINST 6210.2A, Quarantine Regulations of the Armed Forces. The purpose of these inspections is to prevent the introduction of disease causing organisms and plant pests. Although the inspections are generally thorough, the equipment of recently redeployed units should be monitored to ensure that any introduced pests are destroyed properly. Any pests found on this equipment should be reported to the Environmental Department.

5.3.3. National Pollutant Discharge Elimination System (NPDES)

Water pollution degrades surface waters making them unsafe for drinking, fishing, swimming, and other activities. As authorized by the Clean Water Act, the National Pollutant Discharge Elimination System (NPDES) permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States. The permit is available to operators who discharge to waters of the U.S. from the application of (1) biological pesticides or (2) chemical pesticides that leave a residue when application is for one of four use patterns:

- Mosquito and other flying insect control
- Aquatic weed control
- Aquatic Nuisance Animal Control
- Forest Canopy Pest Control

If pesticide applications for the above use patterns are expected to exceed thresholds, a Notice of Intent (NOI) and preparation of a Pesticide Discharge Management Plan (PDMP) (PDMP template included in Appendix I) may be required. Practicing integrated pest management, recordkeeping, and monitoring are also requirements under the NPDES permits. The Virginia General Permit to Discharge Pesticides in Water is included in Appendix I. The Hampton Roads Regional Pesticide Discharge Management Plan, which covers mosquito control and aquatic weed control use patterns for all of the Hampton Roads Navy Installations, is also included in Appendix I.

5.3.4. Spill Prevention and Management

Installation spill prevention guidelines shall be followed. The following spill prevention actions shall be taken:

- Spill kits shall be readily accessible in all pest management vehicles, mixing sites and pesticide storage facilities.
- Pesticides shall only be stored in an area with containment to hold a spill and without a floor drain.
- Portable mixing pads shall be used when appropriate.
- All pesticide applicators shall be familiar with the installation spill contingency plan (included in Appendix I, if available).

All pesticide applicators are trained on spill response procedures as part of their initial pest management certification/licensing training. Spills will be managed as described in the installation spill contingency plan. Further information on preventing and controlling pesticide spills is contained in the AFPMB TG #15: *Pesticide Spill Prevention and Management* (http://www.afpmb.org/sites/default/files/pubs/techguides/tg15.pdf).

5.3.5. Hazardous Materials and Hazardous Waste Management

Pesticides, being hazardous materials, shall be managed in accordance with the installation's Hazardous Material Management Plan. Proper inventory management and planning will prevent waste generation. The appropriate use of pesticides produces very little hazardous waste. Rinse water containing pesticide residues usually has very small quantities of chemical and is often applied to the target pest site. Not permitting contractor storage of pesticides and on-site disposal of pesticide waste eliminates hazardous material and waste management. In general, pesticides that are not applied must be disposed of as hazardous waste. Large quantities of hazardous waste may be produced when a pesticide is not used by its expiration date. It may also be produced if a pesticide is not used up before the registration for that pesticide is cancelled and the stop-use date has occurred. These pesticides may be disposed of as Universal Waste only when allowed by the Standards for Universal Waste Management found in 40 CFR Part 273 and when approved by Environmental. Any excess pesticides or absorbent material used for spill clean-up requiring disposal requires evaluation by the Hazardous Waste Coordinator in the Environmental Department to ensure proper disposition.

6. Emergency Pest Management

6.1. Public Health Emergencies

Pests become a public health emergency when the pests increase in number and/or are found to carry human disease pathogens. A public health emergency, or potential emergency, requiring pest management action, may be indicated in several ways:

6.1.1. Natural or Manmade Disaster

Usually pest problems do not develop immediately after a disaster, such as earthquakes, wildfires, floods, vehicle accidents and terrorist attacks. Public health pest problems may be the result of increased amounts of refuse, collapse of local infrastructure (i.e. lack of garbage pick-up), decaying human and animal bodies, and accumulation of standing water. The potential pest related consequences are vector-borne or zoonotic disease outbreaks and increased contact with rodents and feral animals that may cause injury.

6.1.2. Vector-borne or Zoonotic Disease

- Reports of human cases – Many human cases of vector-borne and zoonotic disease identified in local medical facilities are reportable to the local and/or State health agencies. A report of a human case of West Nile Virus (WNV) or other disease may initiate an investigation and result in alerts going out to other hospitals and clinics if it appears that the case was locally acquired. Immediate vector control may be necessary to prevent further transmission.
- Detection of infected mosquitoes or sentinel animals – Routine surveillance for mosquito-borne diseases are conducted by local and State health agencies. These agencies report testing results through the public health system. This surveillance program is an early warning system that indicates when vector control should be initiated or increased to prevent human disease.
- USGS Disease Maps, http://diseasemaps.usgs.gov/, provide mosquito-borne disease information by state.

6.1.3. Animal Attack

Africanized Honey Bees (AHB) are of specific concern due to their aggressive defensive behavior. The local fire department is usually the primary responder to bee sting incidents. Fire department personnel have been trained to protect and manage bee sting victims. A stinging incident is not considered a pest control response issue, but rather, an emergency response and any and all appropriate bee control measures can be used. If fire department response is delayed installation first responders should be trained how to protect themselves and victims from bee stings.

6.2. Agricultural Emergencies

Agricultural emergencies are the result of the introduction of insects or other animals that can cause extensive damage to agriculture or forestry in the State. Examples of introduced agricultural pests include the Mexican fruit fly and gypsy moth. Military installations can be a conduit for the introduction of these pests due to the movement of military equipment and personnel in and out of the State and the Country. The military's role in preventing introduction of these pests is described in SECNAVINST 6210.2A: Quarantine Regulations of the Armed Forces. Inspections to prevent importation of pests are normally conducted at the port of debarkation in the foreign country.

6.3. Emergency Pest Management Resources

Installation PMSPs maintain pesticides and equipment to manage most emergencies. Contract PMSPs can be used for emergencies if it is written in the contract specifications. The Naval Branch Health Clinic should develop an Emergency Disease Vector Control Plan (EDVCP) to manage public health emergencies (included in Appendix J, if available). It includes additional Navy and local government contingency vector surveillance and control resources.

7. Program Resources

NSA HR Portsmouth Annex has access to the following support agencies and organizations for pest management assistance. Contact information is located in Appendix L.

7.1. NAVFAC Atlantic Applied Biology, Code EV51, Norfolk, VA

NAVFAC Atlantic Applied Biology is currently staffed by six full time civilian DOD Professional Pest Management Consultants certified in DOD pesticide applicator categories 3,5,6,7,8 and 11. These personnel are assigned the following responsibilities:

- Review and approve the IPMP in accordance with DOD and Navy policy;
- Provide technical assistance to the installation IPMC, environmental manager, safety officer, medical officer and other regional and installation personnel regarding pest management and pesticide regulatory compliance;
- Review and approve or reject pesticides and equipment to be used on the installation;
- Conduct on-site program reviews and environmental compliance program external assessments (EA) to ensure compliance with the regulations and the IPMP;
- Compile and report actual pesticide use and pest management operations to appropriate DOD agencies;
- Provide IPM recommendations and pest identification;
- Assist installations with writing or re-writing IPMPs; and
- Provide recertification training for DOD certified applicators as well as initial and recertification training for PMPARs/IPMCs.

Website: https://portal.navfac.navy.mil/portal/page/portal/ev/applied_biology (This is on the NAVFAC intranet and is only available to NAVFAC, CNIC and USMC personnel who have an account. Personnel may individually request an account.)

7.2. Navy Environmental and Preventive Medicine Unit TWO (NEPMU-2), Norfolk, VA

NEPMU-2 is staffed by three full-time active duty Navy entomologists. The entomologists are certified in DOD pesticide applicator categories 3,5,6,7,8 and 11 and are assigned the following responsibilities:

- Act as Navy Medicine (BUMED) Professional Pest Management Consultants to provide BUMED review of IPMP and Emergency Disease Vector Control Plan;
- Provide initial and recertification training in categories 7&8 for Preventive Medicine Technicians;
- Provide technical assistance on the surveillance and control of vectors on the installation;
- Provide vector-borne disease risk assessments and disease prevention recommendations when requested;
- Provide disease vector management consultation and identification services; and
- Provide contingency pest management in the event of a disaster or disease outbreak.

Website: (http://www.med.navy.mil/sites/nepmu2/Pages/default.aspx).

7.3. Navy Entomology Center of Excellence (NECE), Jacksonville, FL

NECE is staffed by full-time active duty Navy entomologists. The entomologists are certified in DOD pesticide applicator categories 3,5,6,7,8 and 11 and are assigned the following responsibilities:

- Act as Navy Medicine (BUMED) Professional Pest Management Consultants to provide BUMED review and approval of IPMP;
- Provide initial training for DOD certified pesticide applicators;
- Provide technical assistance on the surveillance and control of vectors on the installation;
- Provide vector-borne disease risk assessments and disease prevention recommendations when requested;
- Provide disease vector management consultation and identification services; and
- Provide contingency pest management in the event of a disaster or disease outbreak.

Website: (http://www.nmcphc.med.navy.mil/field_activities/nece_overview.aspx).

7.4. Virginia Department of Agriculture and Consumer Services

Personnel from the Office of Pesticide Services in this department are the pesticide regulatory officials for the State of Virginia. Pesticide enforcement personnel can provide information regarding State and local pesticide regulations. Website: http://www.vdacs.virginia.gov/pesticides.

7.5. Virginia Cooperative Extension Service

Virginia Cooperative Extension responds to the needs of individuals and organizations in the State of Virginia by providing information and guidance in the areas of agriculture, natural resources, and consumer sciences. Website: http://www.ext.vt.edu/.

EXECUTIVE SUMMARY

This Integrated Pest Management Plan is a comprehensive, long-range document that captures all of the pest management operations and pesticide-related activities conducted on the installation. It incorporates pest management practices and the local, State, federal, and Department of Defense regulations, and conforms to the requirements of Department of Defense Instruction 4150.07, DOD Pest Management Program, and Chief of Naval Operations Instruction 6250.4C, Navy Pest Management Programs. It supplies comprehensive information about the pest management program to installation staff and internal and external compliance auditors.

The Naval Facilities Engineering Command, Atlantic's Applied Biology Center prepared this plan using information obtained through pest management data collection, on-site observations, installation personnel interviews, and document reviews.

The main goal of the various pest control functions is to support the mission of NSA Hampton Roads. Commercial contract pest control operators currently provide the majority of the pest control services at the Northwest Annex, and in-house pest control operators provide pest control to other areas of the installation and at Sewell's Point golf course. Pest control services are needed on the installation in order to:

1. Provide services that will prolong the life of the structures through subterranean termite and nuisance pest control

2. Maintain the safety and security of industrial and storage areas through weed control

3. Provide nuisance pest control to all buildings (except public-private venture housing) and outdoor areas to ensure a good working and living environment

4. Control weed and insect pests in all recreational and lawn areas to maintain aesthetics and provide recreational facilities to personnel

5. Provide control of mosquitoes, flies, and other potential disease vectors to ensure the comfort and well-being of all personnel

6. Provide vertebrate pest control, including rodent control, to all areas of the installation.

For the current level of work to be accomplished, a sufficient staff of qualified applicators must be maintained. Contract personnel must meet Virginia certification requirements as specified by the contract. Pest management performance assessment representatives must successfully take an initial pest management performance assessment representatives course. To maintain their certification, the pest management performance assessment representatives and Department of Defense pesticide applicators must successfully pass a Department of Defense pest management training and recertification course every three years. Pest control facilities must comply with current safety standards to provide a safe workplace and to minimize pesticide hazards.

This plan focuses on safe, environmentally-sound, and cost-effective control of pests through integrated pest management. Integrated pest management depends on education, proper surveillance, and identification of pests, non-chemical and chemical control methods, and individual responsibility for pest prevention.

CHAPTER 1

Introduction

1.1 INTEGRATED PEST MANAGEMENT PLAN

The Integrated Pest Management Plan (IPMP) is a long-range, comprehensive planning and operational document that establishes the strategy and methods for conducting a safe, effective, and environmentally-sound Integrated Pest Management (IPM) program. The IPMP covers all pest management and pesticide-related activities conducted by civilian and military Department of Defense (DOD) personnel and commercial contractors within all functional areas of the installation.

1.1.1 Authority

Department of Defense Instruction (DODI) 4150.07, DOD Pest Management Program; Chief of Naval Operations Instruction (OPNAVINST) 6250.4C, Navy Pest Management Programs; and Chief of Naval Operations Manual (OPNAV M) 5090.1, Environmental Readiness Program Manual, Chapter 24—Pesticide Compliance Ashore, require that all Navy installations develop and implement an IPMP in accordance to the guidelines. The IPMP will detail all aspects of pesticide management including administration, procurement, contract services, storage, disposal, safety, reporting, vehicles, integrated pest management, and applicable laws and regulations.

1.1.2 Department of Defense Measures of Merit

This plan provides the framework for the installation to meet the DOD's annual goals or measures of merit (MoMs). As established in DODI 4150.07, and updated by the Armed Forces Pest Management Board, the MoMs are:

1. Measure of Merit 1: All DOD installations will maintain installation Pest Management Plans that have been reviewed and approved by a DOD-certified Pest Management Consultant and annually updated by the installation pest management coordinator.

   NSA Hampton Roads helps meet this goal by implementing (via the commanding officer's signature) this plan.

2. Measure of Merit 2: All DOD installations will adhere to the principals of integrated pest management and the DOD will maintain the goal of minimizing annual pesticide use by both government and contractor pesticide applicators on its installations. This goal is set at 425,000 lbs of active ingredient, the DOD's average annual usage for Fiscal Years 2007–2009 and an overall 52 percent reduction from the original fiscal year 1993 baseline.

   NSA Hampton Roads provides data for this MoM through the reporting requirement (section 2.3).

3. Measure of Merit 3: All DOD pesticide applicators will be certified. All contracted employees shall have appropriate State or host-nation pesticide applicator certification in the appropriate categories at the time the contract is let.

   NSA Hampton Roads ensures proper certification of all applicators through regular verifications and maintains a list of certifications in appendix E of this plan. See section 2.4 for training and certification requirements.

1.1.3 Integrated Pest Management Plan Implementation

The IPMP must be reviewed and approved by installation stakeholders and professional pest management consultants (PPMCs) from Naval Facilities Engineering Command (NAVFAC), Atlantic and the Bureau of Medicine and Surgery (BUMED). The IPMP is implemented upon signature of the installation's commanding officer. The integrated pest management coordinator (IPMC) has the task of implementing, coordinating, and executing the IPMP among each of the functional areas of the installation.

1.1.4 Integrated Pest Management Plan Maintenance

Once the IPMP has been developed and implemented, it must be reviewed annually and updated as necessary. The installation IPMC is responsible for maintaining the IPMP.

1.1.4.1 Internal Review

The IPMC shall conduct an internal review annually in coordination with the pest management service providers (PMSPs) and other functional area points of contact (POCs). The review should include updating contract information, applicator certifications, pesticides, and pest management operations to be used on the installation, as well as, updating pesticide use records. The pest management program self-assessment checklist (appendix C) is available as a tool to review compliance issues during the internal review.

1.1.4.2 Off-Site Review

The IPMC may request that a NAVFAC Atlantic Applied Biology PPMC perform a review of regulatory requirements, reporting, and pesticide approval procedures.

1.1.4.3 On-Site Review

The NAVFAC Atlantic Applied Biology PPMC shall perform an on-site review of the entire pest management program every three years to ensure compliance with the IPMP. The review may be performed more frequently if extensive program problems exist.

1.1.4.4 Integrated Pest Management Plan Rewrite

The IPMP should be rewritten every five years to reflect new contracts, personnel, pest management practices, and regulatory changes.

1.2 INSTALLATION BACKGROUND

NSA Hampton Roads has the largest concentration of fleet headquarters administrative and communication facilities outside of Washington, D.C. More than 6,000 personnel work at the installation, including major tenant commands.

1.2.1 Mission

NSA Hampton Roads is committed to providing effective and efficient world-class support to our customers to enable our fighters and support our families. Major tenant commands include: U.S. Fleet Forces Command, Joint Staff Hampton Roads, U.S. Marine Corps Forces Command, Naval Submarine Forces, Atlantic, Naval Reserve Forces Command, and Naval Medical Center Portsmouth.

Northwest Annex provides a wide array of support services for 11 tenant commands, comprising United States Coast Guard and Department of Homeland Security operational units, United States Navy and United States Marine Corps Anti-Terrorism/Force Protection training commands, and United States Navy, United States Coast Guard and NATO strategic communication activities. Northwest Annex maintains and operates the largest small-arms range facilities in Commander, Navy Region Mid-Atlantic.

1.2.2 Location and Facilities

NSA Hampton Roads is primarily located in three separate areas. The headquarters and several tenants are located off Terminal Blvd. in Norfolk, Virginia. The Northwest Annex is located off Ballahack Road in Chesapeake, Virginia and borders North Carolina. Northwest Annex is composed of approximately 3,600 acres, of which 2,300 are forested. The Portsmouth Annex, which is covered under a separate IPMP, is located in the city of Portsmouth, Virginia on the Elizabeth River.

1.3 PEST MANAGEMENT PROGRAM OVERVIEW

The pest management program is summarized below.

1) NAVFAC Mid-Atlantic Environmental Services provides general pest control services at the Norfolk locations of NSA Hampton Roads, including larval and adult mosquito control.

2) Didlake, Inc. performs grounds maintenance at the Norfolk locations of NSA Hampton Roads.

3) Hampton Roads Termite & Pest Control, Inc., a subcontractor under Global Management Services, LLC., provides general pest control services at Northwest Annex under the Base Operating System (BOS) contract. This includes larval and adult mosquito control.

4) NAVFAC Mid-Atlantic Environmental Services provides termite and fire ant control at the Northwest Annex.

5) J & J Maintenance, Inc., a subcontractor under Global Management Services, LLC., performs grounds maintenance at Northwest Annex under the Base Operating System (BOS) contract.

6) Raytheon, Inc. provides vegetation control along the antenna array at Northwest Annex.

7) One DOD-certified in-house applicator maintains the Marine Corps Security Forces Training Company firing ranges at Northwest Annex.

8) One DOD-certified and two state certified in-house applicators maintain the MWR Sewell's Point golf course.

9) The NEX food court vendors (staff college area) contract pest control with several vendors separately from the base contract.

10) Public-private venture housing (Lincoln Military Housing) at the Northwest Annex contracts pest control services with Hampton Roads Termite & Pest Control, Inc.

11) The Marine Corps Exchange (MCX) in Norfolk sells a selection of retail pesticides.

12) Branch Health Clinic Naval Station Norfolk preventive medicine department performs food service sanitation and facilities habitability inspections, and oversees programs to prevent vector-borne and other infectious diseases at the Norfolk facilities of NSA Hampton Roads.

13) Naval Medical Center Portsmouth preventive medicine department performs food service sanitation and facilities habitability inspections, and oversees programs to prevent vector-borne and other infectious diseases at the Northwest Annex.

1.3.1 Pest Management Objectives

The objectives of the installation's pest management program are:

1. The prevention of pest-related health and safety problems that affect the mission.

   Examples of health-related pests that may affect the mission include, but are not limited to mosquitoes, fire ants, and stinging insects. Any pest may impact the mission when its numbers become excessive. Prevention of pest-borne disease and injury is a component of force health protection. Force health protection seeks to maintain a healthy and fit military and civilian force in order to maintain the highest levels of readiness. Pest management is a force multiplier for construction battalions, maintenance commands, and other deployable units. Additionally, the military and civilian infrastructure on the installation must be protected in order to provide the necessary support to these units as well.

2. The prevention of pest damage to equipment and subsistence used to support the operational mission of the activities and tenant commands.

   Equipment and materials are susceptible to physical damage by pests and the financial costs of such damage can be high. Rodents, for example, can cause considerable damage to electronic equipment through gnawing on electrical components. Examples of pests that may damage equipment and subsistence include, but are not limited to rodents, wood-destroying pests, and stored-product pests.

3. Vegetation management to protect the local environment.

   The introduction of non-native/invasive species of plants can increase the risk of fire and degrade the surrounding native environment that is home to a number of endangered and threatened animal and plant species.

4. The protection of government real property, materiel, and aesthetics.

   Buildings and roads that form the infrastructure of the installation are susceptible to pests. If not adequately prevented and controlled, termites can cause extensive damage to wood structures. Weeds can cause damage to roadways and increase the risk of fire.

5. The reduction of the use of and dependence on pesticides.

1.3.2 Program Requirements

1.3.2.1 Administration

Proper administration of the pest management program ensures accountability and documentation through planning, record keeping, reporting, training, pesticide and contract approval, and regulatory compliance. Table 1-1 outlines the pest management administrative program requirements.

Requirement	Description	Reference	Responsibility	Locator
PLANNING	Review and revise the Integrated Pest Management Plan annually.	• OPNAVINST 6250.4C • DODI 4150.07	• IPMC	Section 1.2
RECORDING	Record all pest management operations conducted on the installation after each operation.	• OPNAVINST 6250.4C • DODI 4150.07 • 7 C.F.R.§110*	• All pesticide applicators	Section 2.3.1
MAINTAINING	Maintain records of all pest management operations conducted on installation on-site indefinitely.	• OPNAVINST 6250.4C • DODI 4150.07 • 7 C.F.R.§110*	• IPMC in coordination with PMPARs	Section 2.3.2
REPORTING	Compile and report all pest management operations to NAVFAC Atlantic Applied Biology monthly.	• OPNAVINST 6250.4C • DODI 4150.07 • 7 C.F.R.§110*	• IPMC in coordination with PMPARs	Section 2.3.3
PESTICIDE APPLICATOR CERTIFICATION	Ensure that all personnel applying pesticides on installations have current DOD pesticide applicator certification if in-house or State commercial applicator certification if contracted.	• OPNAVINST 6250.4C • DODI 4150.07 • 40 C.F.R.§171*	• IPMC in coordination with PMPARs	Section 2.4
COMPLIANCE	Ensure that all program elements are in compliance with all federal regulations. Navy policy is to comply with local/State regulations.	• OPNAVINST 6250.4C • DODI 4150.07	• IPMC in coordination with PMPARs	Section 3.3
PESTICIDE APPROVAL	Compile and submit list of new pesticides to NAVFAC Atlantic Applied Biology for	• OPNAVINST 6250.4C • DODI 4150.07	• IPMC in coordination with PMPARs	Section 2.2

	approval for use on the installation.			
CONTRACT REVIEW	Review pest management contract specifications for compliance with the Integrated Pest Management Plan and submit to NAVFAC Atlantic Applied Biology for final review and approval prior to advertising.	• OPNAVINST 6250.4C • DODI 4150.07	• Facilities Support Contracting personnel • PMPARs	Section 2.5
• * (applies to restricted-use pesticides only)				

Table 1-1. Pest management administrative program requirements.

1.3.2.2 Operations

Operations are the day-to-day management of pests through pesticides and non-chemical means. Pest management on the installation includes the following categories of operations:

1. Ornamental and turf—Control and management of pests of landscape plants and turf including arthropods, fungi, and weeds.

2. Right-of-way—Control and management of vegetation along roadways as well as vegetation control near fuel farms to reduce fire risk and along fence lines to enhance security.

3. Aquatic Weed Control—Control of vegetation in ponds and ditches.

4. Industrial, Institutional, Structural, and Health-Related—Control and management of pests in and around buildings. Pests may include cockroaches, termites, bees, venomous animals, stored product insects, rodents, and feral animals.

5. Public Health—Control and management of human and animal disease vectors such as rodents, mosquitoes, flies, ticks, and fleas.

6. Nuisance Pest Control—Control of insect pests that are a nuisance or annoyance to base personnel, but do not present a health risk.

7. Invasive weeds—Removal of non-native species of plants that are detrimental to native plant and animal habitats.

8. Vertebrate Control—Control of animal predators that prey upon endangered or threatened animals and their habitats, or infest food and material storage.

Each of these operations must meet various requirements that are listed and described in table 1-2.

Requirement	Description	Reference	Responsibility	Locator
INTEGRATED PEST MANAGEMENT	"Federal agencies shall use Integrated Pest Management techniques in carrying out pest management activities and shall promote Integrated Pest Management through procurement and regulatory policies, and other activities."	• 7 U.S.C. § 136r-1	• IPMC • Pesticide applicators	Section 3.1.1
STORAGE	Pesticides kept on installations must be procured and stored in accordance with installation and federal regulations. Navy policy is to comply with local/State regulations.	• OPNAVINST 6250.4C • AFPMB TG 17 • 29 C.F.R.§1910 • 40 C.F.R.§165	• Pest control shop supervisor	Section 3.4.3
CONTAINERS	All containers used to store or transport a pesticide must have the original or copy of the original label attached. Service containers must have attached label identifying: the person responsible for the container, the name of chemical, and the signal word.	• OPNAVINST 6250.4C • DODI 4150.07 • 40 C.F.R.§156	• Pesticide applicators	Section 3.4.5.1
VEHICLES	Must carry pesticide spill kits and properly secure pesticides and pesticide application equipment when not in use.	• OPNAVINST 6250.4C	• Pesticide applicators • Vehicle operators	Section 3.4.3.3

APPLICATION	Only registered pesticides will be used. Applicators must apply pesticides in a manner that ensures safety and protects the environment. A copy of the pesticide label shall be available at the application site.	• OPNAVINST 6250.4C • DODI 4150.07 • 40 C.F.R.§166	• Pesticide applicators	Section 3.4.5
APPLICATOR SAFETY	The installation must provide procedures, medical support, equipment, and supplies to ensure the safety of DOD pesticide applicators during pest control operations.	• OPNAVINST 6250.4C • 29 C.F.R.§1910	• Naval Branch Health Clinic • Safety Department	Section 4.1
OCCUPATIONAL HAZARDS MONITORING	Workplace monitoring shall be conducted by the medical department to ensure a safe and healthful environment for pest management personnel.	• OPNAVINST 6250.4C • OPNAVINST 5100.23G	• Naval Branch Health Clinic	Section 4.1.2.9
CLEANING AND DISPOSAL	Equipment shall be cleaned to prevent health and environmental hazards due to chemical residues. Prevent water from container and equipment rinsing from entering storm drains and water bodies. Dispose of empty containers properly. Manage and dispose hazardous waste	• OPNAVINST 6250.4C • 40 C.F.R.§165 • 40 C.F.R.§260-273	• Pesticide applicators	Section 3.4.6

	and non-hazardous waste properly.			
SPILL PREVENTION	Spill kits should be maintained in pest control shops and on pest control vehicles. Pest management personnel should be familiar with the installation spill contingency plan.	• OPNAVINST 6250.4C • 40 C.F.R.§300	• Pesticide applicators	Section 5.3.4

Table 1-2. Pest management operations program requirements.

THIS PAGE IS INTENTIONALLY BLANK.

CHAPTER 2

Program Administration

2.1 ROLES AND RESPONSIBILITIES

The success of the pest management program depends largely on a clear understanding of the roles and responsibilities for the organizations and personnel involved. The following is a listing of the key organizations and personnel and their duties as presented in DOD guidance documents for the implementation of the IPMP.

2.1.1 Commander, Navy Installations Command

The CNIC is responsible for the funding and prioritizing of the pest management program.

2.1.2 Installation Commanding Officer

The installation commanding officer (CO) is responsible for the compliance and enforcement of the pest management program. The installation commanding officer delegates compliance and enforcement of the pest management program to the IPMC via the IPMC designation letter. Responsibilities of the installation CO include:

1. Budgeting for IPMPs, training, operations, and facilities in compliance with legal and DOD requirements.

2. Designating an integrated pest management coordinator in writing

3. Implementing and supporting the IPMP

4. Ensuring all pest management operations are conducted safely and have minimal impact on the environment

5. Ensuring an IPM program, minimizing the use of pesticides, is implemented

6. Ensuring the installation's IPM plan and program are in compliance with all applicable federal, State, and local laws as well as DOD regulations.

2.1.3 Integrated Pest Management Coordinator

The IPMC is designated by the installation CO in writing as the advisor to the installation CO and coordinator of all installation pest management activities. The IPMC designation letter is in appendix E. Responsibilities of the IPMC include:

1. Coordinating the installation's pest management program including implementation, maintenance, and annual update of the IPMP

2. Coordinating the rewrite of the IPMP every 5 years

3. Promoting integrated pest management (IPM) in the pest management program to cost-effectively and safely manage pests and to prevent adverse environmental impact

4. Coordinating reporting of all pest management operations on the installation to NAVFAC Atlantic Applied Biology

5. Ensuring current certification and continuing pest management training of pesticide applicators and pest management performance assessment representatives (PMPARs)

6. Receiving and compiling lists of new pesticides and uses from all PMSPs on the installation and submitting them to NAVFAC Atlantic Applied Biology for review and approval

7. Maintaining current list of approved pesticides

8. Acting as liaison between installation and Applied Biology and local, State, and federal agencies for pest management and pesticide regulatory issues

9. Ensuring the installation contracting officers submit pest management contract specifications to the Applied Biology PPMC for review prior to advertising.

2.1.4 Environmental Division

The installation environmental division provides oversight on environmental protection and compliance regarding pest management operations. Responsibilities of the department include:

1. Reviewing and approving new pesticides and pest management operations that may adversely impact the environment

2. Conducting internal compliance assessments of the pesticide and pest management program

3. Providing technical review of the IPMP.

As part of the environmental division, the natural resources manager is responsible for managing natural resources at the installation. In this capacity, the manager may be responsible for conducting or contracting some pest management operations (e.g., invasive species management). The role of the natural resources section is further described in the Integrated Natural Resources Management Plan (INRMP) for Northwest Annex. The other areas of NSA Hampton Roads are not covered under an INRMP, however the installation instruction will be modified to address invasive species management and protection of threatened and endangered species as needed. Responsibilities of the natural resources manager include:

1. Providing information on protected species, endangered or threatened species, noxious or invasive species, and environmentally-sensitive sites

2. Providing guidance on the management of nuisance wildlife.

The cultural resources manager is responsible for managing cultural resources at the installation, including properties that are officially listed in or eligible for inclusion in the National Register of Historic Places. In this capacity, the manager may be responsible for approving pest control in and around

these areas. The cultural resources are further described in the installation's Integrated Cultural Resources Management Plan (ICRMP).

2.1.5 Facilities Engineering and Acquisition Division

The Facilities Engineering and Acquisition Division (FEAD) prepares, manages, and assesses pest control and grounds maintenance contracts. The performance assessment representative (PAR) monitors and evaluates the performance of contracted PMSPs to ensure that pest control measures are properly applied. The PAR serves as liaison between the contractor and the IPMC. Responsibilities of the FEAD include:

1. Preparing contracts ensuring that all requirements of the IPMP are included in the contract specifications

2. Coordinating with the NAVFAC Atlantic Applied Biology PPMC for a review of pest management contract specifications prior to advertisement for bid

3. Maintaining copy of each contract on file

4. Monitoring pest management contractors; ensuring effective and safe application of pest management practices, identifying and documenting discrepancies, and seeking corrective action with contractors in accordance with the contract

5. Ensuring contractors record all pest management activities and submit reports including actual pesticide use through the NAVFAC Online Pesticide Reporting System (NOPRS) or to the IPMC on a monthly basis.

All PMPARs shall be delegated the authority (in the contract and in the PMPAR appointment letter) to halt any contract pesticide applications that:

1. Endanger or present a hazard to humans, animals, or the environment

2. Violate contract specifications, or applicable federal, State, DOD, or Navy laws/regulations

3. Violate the pesticide label.

2.1.6 Naval Medical Center Portsmouth

The Naval Medical Center includes preventive medicine, industrial hygiene, and occupational health departments. The industrial hygiene and occupational health departments are located within the naval hospital at the Portsmouth Annex. This section discusses responsibilities for each department.

2.1.6.1 Preventive Medicine

The Naval Medical Center and Naval Branch Health Clinic Sewell's Point both provide public health support to the installation in accordance with Navy Medical (Command) (NAVMED) P-5010, Manual of Naval Preventive Medicine, and OPNAVINST 6250.4C. Responsibilities of the health clinic include:

1. Acting as advisor and liaison to the installation CO for public health pest prevention and management

2. Conducting surveys for pests of medical importance, such as cockroaches, mosquitoes, bed bugs, etc., through habitability and food service sanitation inspections

3. Establishing and maintaining liaison with local health agencies as they pertain to vector management and vector-borne and zoonotic disease prevention

4. Maintaining current certification as DOD category 8 (public health) pesticide applicator

5. Developing and maintaining an emergency plan for vector and pest control during a vector-borne disease outbreak or disaster

6. Providing technical review of the IPMP.

2.1.6.2 Industrial Hygiene

Industrial hygiene (IH) personnel perform surveys (i.e., for pest management employees) to characterize occupational exposures (i.e., to inherent chemical, physical, ergonomic, and biological stressors) and control measures (e.g., engineering–local exhaust and mechanical dilution ventilation systems; administrative–warning signs, standard operating procedures, training requirements, etc.; and personal protective equipment–respiratory protection and chemical resistant clothing). In addition, IH surveillance information is used to initiate, continue, or end medical surveillance.

2.1.6.3 Occupational Health

Occupational health personnel are responsible for performing all necessary medical surveillance (such as physical examinations and blood testing) for government pest management personnel, as deemed necessary.

2.1.7 Contract Pest Management Service Providers

Contract PMSPs are required to be certified as pesticide applicators by the Commonwealth of Virginia. These responsibilities apply to all contractors on the installation. Responsibilities of contract PMSPs include:

1. Conducting pest management operations in accordance with the contract specifications or lease agreements and the IPMP and in compliance with federal and State laws and regulations

2. Submitting a list of pesticides proposed for use on the installation to their government representative

3. Communicating all pest management issues and requirements via the government representative

4. Submitting daily pest management operation records to the government representative or through NOPRS.

2.1.8 Morale, Welfare, and Recreation

Morale, welfare, and recreation (MWR) provides recreational activities for military and civilian personnel on the installation. This includes maintenance of the golf course and athletic fields. Additionally, MWR oversees commercial food concessions including the Pub One Grille and Community Center, Sewell's Point Club House, the Mariner Community Center, and the Retro Bowling Center. With respect to golf course and athletic field maintenance, MWR must:

1. Ensure that all personnel who apply pesticides maintain current certifications in the appropriate categories (see section 2.4 for more information)

2. Ensure that all pesticides are approved, prior to use, by the NAVFAC PPMC

3. Provide copies of the pesticide labels to the IPMC

4. Maintain and report records of all pesticide applications in accordance with the requirements outlined in this IPMP

5 Maintain the pesticide storage and mixing facility in accordance with the requirements of this IPMP and installation regulations

6. Obtain adequate supplies of pesticides, pesticide dispersal equipment, and personal protective equipment (PPE), and ensure equipment is properly maintained

7. Ensure that all pesticide applicators practice IPM

8. Ensure that landscape cultural management practices are used to maintain the health of plants and turf to prevent disease and pest infestations

9. Ensure that new plants brought onto the installation for landscaping in recreational areas are not invasive, infested with pests, or infected with disease.

With respect to MWR food establishments, MWR must:

1. Ensure that proper sanitation is maintained in all food handling facilities

2. Submit any contract specifications (outside of the installation pest management contract) for pest management to the IPMC for technical review prior to submitting the contract for bid

3. Ensure that only current, state-licensed pesticide applicators apply pesticides

4. Ensure that all pest management activities are reported in accordance with the requirements outlined in this IPMP (for pest management that is conducted separately from the installation contract).

2.1.9 Marine Corps Exchange and Navy Exchange

The Marine Corps Exchange (MCX) in Norfolk and the Navy Exchange (NEX) at Northwest Annex display and sell household and garden pesticides for retail sale. Additionally, the NEX runs commercial food concessions at their staff college location, including Panda Express, Subway, and White Lotus Sushi. With respect to pesticide sales, the MCX and NEX must:

1. Ensure that pesticides are displayed in accordance with the pesticide label and other federal, State, and local regulations.

2. Ensure that store employees are properly trained on emergency procedures in the event of a pesticide spill.

With respect to food concessions, the NEX must:

1. Ensure proper sanitation is maintained in all food handling facilities

2. Submit any contract specifications (outside of the installation pest management contract) for pest management to the IPMC for technical review prior to submitting the contract for bid

3. Ensure only current, State-licensed pesticide applicators apply pesticides

4. Ensure all pest management activities are reported in accordance with the requirements outlined in this IPMP (for pest management that is conducted separately from the installation contract).

2.1.10 United States Army Veterinary Services

The veterinary services department provides clinical support for military working dogs and services for privately-owned pets and animals. Veterinary technicians also provide food inspection for the commissary and for other food items delivered to the installation. Responsibilities of the veterinary services include:

1. Conducting surveillance for pests which damage, destroy, and contaminate food stored in the commissary and installation facilities

2. Ensuring stored field rations (e.g., meals, ready to eat (MREs), etc.) are free from pests

3. Advising preventive medicine and the IPMC of any zoonotic diseases that may require pest management

4. Providing advice and education to pet owners on preventing pest infestations.

2.1.11 Public Private Venture Housing

The public-private venture (PPV) housing manager provides pest control and landscape maintenance for military family housing residents. Responsibilities of the PPV housing manager include:

1. Ensure that pesticide usage reports for outdoor pesticide applications (including herbicides) are forwarded to the IPMC or the NAVFAC Atlantic PPMC, or reported using NOPRS

2. Ensure that only current, State-licensed pesticide applicators apply pesticides.

2.1.12 Building Occupants and Barracks/Housing Residents

All installation personnel have the responsibility for:

1. Applying good sanitary and pest exclusionary practices to prevent pest infestations

2. If permitted for personal use, use pesticides in accordance with the pesticide label

3. Coordinate and cooperate fully with PMSPs in scheduling pest management and preparing the areas for pesticide treatment if necessary.

2.1.13 Agricultural Outleases

1. Ensure that all pesticides are approved prior to use and that all pesticide usage reports are forwarded to the IPMC or the NAVFAC Atlantic PPMC, or reported using NOPRS

2. Ensure that only current, state-licensed pesticide applicators apply pesticides.

2.1.14. In-House Pest Control Shop

The in-house pest control shop is located on Naval Station Norfolk (NAVSTA Norfolk) performs routine pest management on the installation and responds to service requests from tenants. At the Northwest Annex, they provide fire ant and termite control only. Responsibilities of the shop include:

1. Controlling nuisance, public-health, and structural pests
2. Conducting pest control inside buildings and facilities
3. Conducting pest control on improved grounds.

2.2 PESTICIDE APPROVAL

Only pesticides approved by both the Environmental Protection Agency (EPA) and the State shall be used. Additionally, DOD and Department of the Navy (DON) directives require installations to submit a list of all pesticides that will be used during control operations to the cognizant NAVFAC Atlantic PPMC for review and approval (OPNAVINST 6250.4C, paragraph 4). The purpose of this approval process is to ensure that only registered pesticides which are safe, effective, and appropriate for the site will be used on the installation. Requests for pesticide approval will be submitted to the NAVFAC Atlantic PPMC via the installation IPMC using NOPRS (see section 2.3.3). Once a pesticide is approved, it may be used on-site as per the label directions. New pesticides may also be added to the list and submitted for approval as needed. The list should be reviewed and updated annually by the IPMC as part of the IPMP maintenance. Pesticides currently approved for use on the installation are listed in appendix D.

The IPMC shall maintain a hard copy or electronic version of the manufacturer's label and safety data sheet (SDS) for each pesticide on the pesticide authorized use list (AUL); these should be made easily accessible to installation personnel upon request. The PMPARs or the PMSPs should also maintain copies. Pesticide labels and their registration status can be found on the EPA's National Pesticide Information Retrieval System at http://ppis.ceris.purdue.edu/.

2.3 RECORDS AND REPORTING

All shore installations and units performing pest control operations shall maintain daily records of pesticide applications and submit reports of pest management operations at least monthly to the cognizant PPMC. (OPNAVINST 6250.4C, paragraph 23 and OPNAV M-5090.1, paragraph 24-3.4)

2.3.1 Pest Management Record Keeping

All PMSPs shall record pest management operations daily. Records shall include all pest management operations including surveys and non-chemical control operations performed on the installation by commercial contractors as well as work performed by DOD pest management personnel. The records will include the following information: date of application, location and site, type of operation, target pest, area treated, name of applicator, pesticide information (trade name, active ingredient, and formulation), amount of pesticide applied, and calculated pounds of active ingredient applied. The following operations are excluded from the record keeping requirement:

1. Personal use of insect repellent
2. Application of repellent by deployable units during mass treatment of clothing and tentage

3. Application of pesticides for personal relief by residents of military housing

4. Application of pesticides for flea and tick control to pets by pet owners and veterinary services.

Records shall be submitted to the IPMC monthly via the NAVFAC Online Pesticide Reporting System (section 2.3.3)

2.3.2 Maintaining Pest Management Operations Records

The installation must archive complete daily pest management operation records on-site indefinitely. Pesticide applications for each building, structure, or outdoor site must be accounted for. Past hardcopy records must be archived so as to prevent them from being destroyed. Electronic records shall be stored to prevent destruction or loss; back-up copies are recommended. All records reported to NAVFAC Atlantic will be stored and may be used as a back-up. Downloading records from NOPRS at least annually and maintaining them on-site is highly recommended.

2.3.3 Pest Management Service Provider Reporting Procedures

Reports will be reviewed by the IPMC and the NAVFAC Atlantic PPMC to provide program oversight to the installation and to generate data for tracking overall DON pesticide usage.

All PMSPs that have Internet access must use the NAVFAC Online Pesticide Reporting System to record, report, and manage pesticide and pest management records. This system is preferred to other methods because it eliminates the need to send hardcopy or electronic records to the IPMC and then to the PPMC. The records are entered directly into a central database that can be accessed by the PPMC and the IPMC and downloaded into a spreadsheet. The only computer requirement is reliable Internet access. Integrated pest management coordinators must contact the NAVFAC Atlantic PPMC to establish a supervisor account. Pest management service provider's applicators can then contact the IPMC to request an applicator account. The NOPRS Web site is at: https://noprs.pestlogics.com/. The NOPRS PowerPoint tutorial is included on the CD of supporting documents provided with this plan.

2.4 TRAINING, CERTIFICATION, AND LICENSING

Integrated pest management requires personnel who are properly trained to investigate and diagnose pest problems, select the appropriate pest management method, apply the appropriate pesticide, perform these operations so that they are safe to humans and the environment, and educate and advise their customers on pest prevention methods. All DOD personnel who apply or supervise the application of pesticides shall be trained and certified within two years of employment in accordance with the DOD Plan for the Certification of Pesticide Applicators, or EPA-approved State certification plan (OPNAVINST 6250.4C, paragraph 11). Additionally, professional pest management personnel shall be certified if their duties include:

1. Making recommendations for the use of pesticides, applying pesticides, or directly supervising the application of pesticides

2. Conducting demonstrations on the proper use and techniques of pesticide application or the supervision of pesticides

3. Conducting field research that includes using or supervising the use of pesticides.

An exception to the standard training and certification requirements are those individuals approved by the IPMC to apply ready-to-use pesticides as part of the self-help program.

2.4.1 Verification of Qualifications

Copies of contractor or lessee State licenses shall be obtained from all PMSP personnel applying pesticides on the installation. Verification of DOD pesticide applicator certifications, as well as IPMC and PMPAR accreditation, can be obtained from the NAVFAC Atlantic PPMC. A list of applicator certifications as well as a list of pest control business licenses is found in appendix E.

2.4.2 Requirements for Department of Defense Pesticide Applicators

DOD applicators may be certified in the following categories:

1. Category 2—Forestry
2. Category 3—Ornamental and Turf (e.g., landscape arthropod and vertebrate pests)
3. Category 5—Aquatic (e.g., aquatic weeds in lakes, ponds, rivers, streams, irrigation canals)
4. Category 6—Right-of-Way (e.g., weeds on sidewalks, along fence lines, parking lots, road ways, storage tank grounds)
5. Category 7—Industrial, Institutional, Structural, and Health-Related (e.g., termites and other wood-destroying insects, cockroaches, crickets and other invading organisms)
6. Category 8—Public Health (e.g., mosquitoes, ticks, fleas, rodents)
7. Category 11—Aerial Application (e.g., application of pesticides for any pest by fixed or rotary-wing aircraft).

Preventive medicine technicians (PMTs) are required to be certified only in Category 8 and receive certification during PMT school. Golf course applicators are only required to be certified in categories 3, 5, and 6.

Initial certification in categories 2, 3, 5, 6, 7, and 8 for civilian employees is a three and a half week course conducted by a designated DOD training agency. The Navy course is conducted by the Navy Entomology Center of Excellence (NECE) in Jacksonville, Florida and also the Navy Environmental Preventive Medicine Units (NEPMUs). Initial certification and recertification in category 11 is a one week course conducted by the Air Force Reserve. Certification for all categories is valid for three years. With proper justification, certifications can be extended by the applicator's certifying authority for an additional six months for civilian personnel or an additional 12 months for military personnel. Recertification courses for civilians in all categories except category 11 are conducted annually by NAVFAC Atlantic. Initial and recertification course schedules can be viewed at http://www.acq.osd.mil/eie/afpmb/training_Certification.html.

2.4.3 Requirements for Commercial Contract Applicators

"Licensed firms shall perform all pest management services procured by contract using only trained operators who are certified in the applicable State in the required EPA pest management categories for the work planned. Copies of State or host nation business licenses and applicator certifications shall be

reviewed prior to award" (OPNAVINST 6250.4C, paragraph 15b). Copies of contractor business licenses and applicator certificates can be found in appendix E. All contract pesticide applicators applying pesticides on the installation must hold a Virginia commercial or government pesticide applicator's license. Virginia pesticide applicator categories equivalent to DOD categories are found in table 2-1.

In order to apply pesticides or herbicides on the installation for grounds maintenance, apply pesticides inside and outside buildings to control household or structural pests, or conduct mosquito control, the contracted pesticide applicator must hold a pesticide applicator license in the appropriate categories issued by the Virginia Department of Agriculture and Consumer Services, Office of Pesticide Services. More information can be found at: http://www.vdacs.virginia.gov/pesticides.shtml.

DOD		VIRGINIA	
2	Forest	2	Forest Pest Control
3	Ornamental and Turf	3A, 3B	Ornamental Pest Control, Turf
5	Aquatic	5A	Aquatic Pest Control
6	Right-of-Way	6	Right-of-Way Pest Control
7	Industrial, Institutional, Structural, and Health-Related	7A	General Pest Control
		7B	Wood-Destroying Pest Control
		7C	Fumigation (Non-Agricultural)
		7D	Vertebrate Pest Control
		7E	Sewer Root Control
8	Public Health	8	Public Health Pest Control
11	Aerial Application	11	Aerial Pesticide Application
No DOD equivalent		1A, 1B	Agricultural Pest Control
		1C, 1D	Fumigation of Soil and Agricultural Products, Chemigation
		4	Seed Treatment
		5B	Marine Anti-Foulant Paints
		9	Regulatory Pest Control
		12	Wood Preservation and Wood Products Treatment

Table 2-1. Category equivalents between DOD and Virginia pesticide certifications.

2.4.4 Requirements for Natural Resource Management Applicators

Commercial contract applicators applying herbicides for invasive weed control or habitat restoration must hold a State license. Personnel using pesticides for wildlife control must also hold an appropriate State license. Department of defense employees applying pesticides for invasive weed control or habitat restoration should be DOD-certified as a pesticide applicator.

2.4.5 Requirements for Performance Assessment Representatives

Pest management performance assessment representatives assess the performance of contractors in the Performance-Based Acquisition (contracting) Program. The installation is required to train personnel to provide performance assessment for commercial pest control or grounds maintenance services in pest management within one year of appointment and send them to refresher training every three years

(OPNAV M-5090.1, paragraph 24-3.19). Naval Facilities Engineering Command provides initial and refresher PMPAR training annually. The training schedule is available at the Armed Forces Pest Management (AFPMB) Web site at: http://www.acq.osd.mil/eie/afpmb/training_Certification.html.

2.4.6 Requirements for Integrated Pest Management Coordinators and Environmental Personnel

"The IPMC shall have the educational background, technical knowledge, and management skills to implement and oversee the pest management program" (DODI 4150.07, section E.4.4.1). Newly designated IPMCs are required to receive training in the administrative and operational requirements of installation pest management. Environmental personnel who have compliance oversight of pesticides on the installation should also receive training. The initial PMPAR and IPMC course provides the necessary training. Naval Facilities Engineering Command, Atlantic conducts these courses annually. If applying pesticides or recommending pesticide applications, the IPMC must be certified as a DOD pesticide applicator. Training schedules are available at: http://www.acq.osd.mil/eie/afpmb/training_Certification.html.

2.5 PEST MANAGEMENT CONTRACTING

Contracts requiring the use of pesticides must be reviewed and approved by the NAVFAC Atlantic Applied Biology PPMC. This includes contracts issued by non-appropriated activities and tenant commands on the installation. Pest control contracts are required to be monitored by a trained PMPAR (OPNAVINST 6250.4C, paragraph 1).

2.5.1 Pest Management Contracts

The installation's pest management contracts are listed below.

2.5.1.1 Naval Facilities Engineering Command Mid-Atlantic Pest Management Contract

The installation has a pest management contract in place under the BOS contract for the Northwest Annex. This contract covers general indoor and outdoor pest management for invertebrate and vertebrate pests. Additionally, the contract requires the contractor to pick up dead vertebrates and dispose of them appropriately. To put in a call for pest management services, personnel must contact the public works call center at 757-341-0475 (Norfolk locations) or the BOS contractor trouble desk at 757-421-4121 (Northwest Annex). The names of the current contract companies are listed in appendix E.

2.5.1.2 Grounds Maintenance Contract

The installation has a grounds maintenance contract in place under the BOS contract. Grounds maintenance work includes the use of pesticides (herbicides) to control weeds in semi-improved and improved grounds including substations, fence lines, railroads, thermal lines, parking lots, ditches, and ponds. The contractor also uses non-chemical methods of weed control such as line trimming. To put in a call for grounds maintenance services, personnel must contact the public works call center at 757-341-0475 (Norfolk locations) or the BOS contractor trouble desk at 757-421-4121 (Northwest Annex). The names of the current contract companies are listed in appendix E.

2.5.1.3 Miscellaneous Pest Management Contracts

The Navy Exchange food court franchises perform their own pest management independently of the installation pest management service provider. The restaurants include Panda Express, Subway, and White Lotus Sushi.

2.5.2 Contract Specifications and Review

Pest management contract specifications must be written to ensure effectiveness, safety, and regulatory compliance. The facilities support contract/base operation support (FSC/BOS) performance-based contract template for pest control (sub-annex 1503020) and grounds maintenance (sub-annex 1503050) is available from NAVFAC Atlantic or on the NAVFAC Portal (requires login) at: https://hub.navfac.navy.mil/webcenter/portal/pw/FSC+Mgmt+and+Facility+Services++/FSC/BOS+Templates. The facilities contracting officer (KO) or contracting officer representative (COR) can provide additional information. The KO shall send the contract specifications to the NAVFAC Atlantic PPMC for review prior to sending the contract out for bidding (OPNAVINST 6250.4C, paragraph 4).

Termite pretreatment contract specifications for new construction shall also be reviewed by the NAVFAC Atlantic PPMC prior to procurement. The Unified Facilities Guide Specifications (UFGS) 31 31 16 Soil Treatment for Subterranean Termite Control should be included in all new construction contracts for termite pretreatment. See section 3.2.4.3 for more information on termite treatment contracts.

2.5.3 Government Representatives

Contractors will communicate and submit required pest management reports via their government representative. For the pest control and grounds maintenance (FSC/BOS) contracts, the representative is the PMPAR who is responsible for assessing the contract. For Non-Appropriated Fund Instrumentality programs (NAFI) (i.e., NEX, MWR) contracts, the representative is the local NAFI organization manager. In cases where a government representative is not available, the installation IPMC may liaison with a contractor's representative.

2.5.4 Contract Requirements

The application of pesticides on Navy properties by contractors is strictly regulated by Department of Defense and Navy regulations, this IPMP, and state regulations. These requirements apply to all pesticide applications including insecticides, herbicides, fungicides, molluscides, etc. to any area in or outdoors. These requirements apply to any size contract (small purchase or facility support contract generated) and services acquired by any other means including government purchase cards (EBUSOFFINST 4200.1, chapter 6, paragraph 7). The specific requirements for contracted pest control operators working on Navy properties are:

1. Contractor Work Plan (CWP): If required by the contract, a CWP shall be submitted as part of the contractor's proposal. The CWP specifies how the contractor will meet the contract requirements.

2. Pesticide Applicator Certification: All contractor personnel, who apply pesticides (which include all herbicides), shall be certified/licensed in the appropriate applicator category in accordance with section 2.4.4 of this IPMP. All contractors who will apply pesticides shall, prior to the start of work, supply a copy of the certificate(s)/license(s) in accordance with contract specifications. Pesticide business licenses and pesticide applicator certificates are included in appendix E of this IPMP.

3. Pesticide Approval: Pesticides used by contractors must be approved and added to the installation pesticide AUL, before use, by the NAVFAC Atlantic PPMC as described in section 2.2. The list of proposed pesticides shall be included in the CWP or submitted to the designated Government representative using the format designated in the contract specifications. The pesticide AUL is in appendix D of this IPMP.

4. Pesticide Mixing, Storage, and Disposal: Contractors shall not store, mix, or dispose of pesticides or clean pest control equipment on the installation unless an approved pesticide storage and mixing area is specified in the contract and authorized by the KO. One exception to this is soil treatment for termite prevention during building construction; the contractor must mix the termiticide on-site while the PMPAR or IPMC is there to witness.

5. Pesticide Applications: Only pesticides listed on the pesticide AUL shall be used and applied in a manner consistent with the pesticide label.

6. Pest Management Reporting: Contractors shall submit reports in accordance with the reporting requirements in section 2.3.3.

7. Contractor Vehicles:

    a. Safety equipment: Vehicles used to transport pesticides shall be equipped with a fire extinguisher and a spill and decontamination kit, and be capable of cleaning up the maximum amount of pesticide transported at any given time. Clean water shall be carried for use in emergency personal decontamination.

    b. Security: All pesticides carried on the vehicles shall be secured in locked compartments at all times. Vehicles shall not be left unattended at any time unless properly locked and secured.

    c. Identification: Vehicles will be clearly marked as pest control vehicles.

    d. Appearance: All vehicles shall be maintained with a clean and orderly appearance, free from observable pesticide spills, residues, or build-up.

    e. Transporting pesticides: Pesticides shall not be transported in the cab or occupied part of any vehicle. They shall always be carried in a separate compartment from the occupied cab.

8. Compliance Assessment: All contractors are subject to regulatory compliance assessments by the PMPAR, IPMC, environmental compliance staff, and other authorized government personnel. Pest control vehicles, pesticide applications, and administrative requirements are subject to inspection. Authorized government personnel may also require the contractor to stop work if the work is not being performed in a safe manner.

2.5.5 Contract Performance Assessment

Contracts shall be assessed by a trained PMPAR to ensure environmental and contractual compliance. For FSC/BOS contracts, Functional Assessment Plans (FAPs) for pest control and grounds maintenance should be developed and implemented. Functional Assessment Plan templates are available from the KO or NAVFAC Atlantic Applied Biology. Periodic assessments for pests prior to, during, or after pest control operations should be conducted to ensure efficacy of the services. Pest survey methods for contract performance assessments are found in chapter 8 on each of the Integrated Pest Management Sheets. Periodic assessment of the contractors during pesticide application should also be conducted to

ensure appropriate safety measures are being taken. The contractors' vehicles and equipment must be made available for inspection when requested. In the absence of a PMPAR, a preventive medicine technician can provide information on the efficacy of pest control in some facilities. The PMT conducts monthly inspections that include pest surveys of food service facilities and child development centers. The PMPAR and the IPMC should liaison and coordinate performance assessment activities with the PMT.

CHAPTER 3

Operations

3.1 INTEGRATED PEST MANAGEMENT

Presidential Executive Order (EO) 13514, Federal Leadership in Environmental, Energy, and Economic Performance, October 5, 2009, requires federal agencies to promote pollution prevention and eliminate waste by implementing integrated pest management and other appropriate landscape management practices. United states Code (7 U.S.C. § 136r-1) states, "Federal agencies shall use Integrated Pest Management techniques in carrying out pest management activities and shall promote Integrated Pest Management through procurement and regulatory policies, and other activities." Department of Defense policy is to, "Incorporate sustainable Integrated Pest Management (IPM) philosophy, strategies, and techniques in all aspects of DOD and Component vector control and pest management planning, training, and operations, including installation Integrated Pest Management Plans and other written guidance to reduce pesticide risk and prevent pollution" (OPNAVINST 6250.4C).

3.1.1 Integrated Pest Management Defined

Integrated pest management is, "a planned program incorporating education, continuous surveillance, record keeping, and communication to prevent pests and disease vectors from causing unacceptable damage to operations, people, property, materiel, or the environment. IPM uses targeted, sustainable (effective, economical, environmentally sound) methods including habitat modification, biological, genetic, cultural, mechanical, physical, and regulatory controls, and when necessary, the judicious use of least hazardous pesticides" (OPNAVINST 6250.4C, paragraph 2). There are significant differences between IPM and traditional pest control methods. Table 3-1 lists some of the differences.

In IPM programs, treatments are not made according to a predetermined schedule. Rather, treatments are made only when and where monitoring has indicated that the pest will cause unacceptable economic, medical, or aesthetic damage. Treatments are chosen and timed to be most effective and least hazardous to non-target organisms and the general environment.

Pest Management	Traditional Pest Control	IPM
Program Strategy	Reactive	Preventive
Customer Education	Minimal	Extensive
Potential Liability	High	Low
Emphasis	Routine pesticide application	Pesticides used when exclusion, sanitation, and other non-chemical methods are inadequate
Inspection and Monitoring	Minimal	Extensive
Pesticide Application Frequency	By schedule	By need

Pest Management	Traditional Pest Control	IPM
Pesticide Application Target	Area-wide spraying	Spot treatment of areas where pests are found
Customer Involvement in Preventing Pests	Minimal	Extensive

Table 3-1. Comparison of traditional pest control and integrated pest management methods.

Under an IPM program, execution of individual pest management practices involves the following steps:

1. Identify pests.

2. Establish action thresholds that are sufficient to warrant treatment. In determining threshold levels, the amount of public health, aesthetic, or economic threat that can be tolerated must be correlated with the population size of pests, natural enemies, time in the season, and/or life stage of the pest or host.

3. Develop plans/strategies through an integration of treatment methods that are effective against the pest, least disruptive to natural controls, and least hazardous to human health and the environment.

4. Monitor pest population before and after treatment. Monitoring is an ongoing activity.

5. Implement pest control measures if economic damage or public health threat are above the established action threshold.

6. Document results.

7. Evaluate/redesign plan to determine the outcome of treatment actions.

Controlling pests has traditionally been the responsibility of the pest control operator. Using IPM, preventing and controlling pests is the responsibility of all personnel on the installation.

3.1.2 Integrated Pest Management Compliance

All pesticide applicators are trained in IPM techniques during initial and refresher licensing or certification training. Government representatives shall assess the PMSP's compliance with IPM. This may include:

1. Reviewing the approved pesticide list for use of less toxic pesticides, baits with sustainable control, short-residual and pest-specific products, and products used for spot treatment rather than broadcast application

2. Ensuring contractor work plans and partner pest management plans incorporate IPM

3. Reviewing pest management records to ensure that only approved pesticides are used, spot applications are performed, non-chemical methods are used, and routine surveys are being performed

4. Observing pest control service calls to ensure pest control operators identify conditions conducive to pest infestations, provide information to building occupants on how they can prevent pests, use only approved pesticides, perform spot treatments, properly apply baits, conduct routine surveys, and monitor baits/bait stations/traps.

3.1.3 Integrated Pest Management Sheets

The IPM sheets in chapter 8 provide general guidelines for the integrated control of pests. They may be used as a reference for surveillance and non-chemical and chemical control alternatives.

3.2 CURRENT PEST MANAGEMENT OPERATIONS

Nuisance and health-related pests and vegetation are managed on the installation.

3.2.1 Inspections

Routine inspections provide early detection of pests. Pest inspections should be conducted routinely at all food service, sales, and storage facilities. Preventive medicine technicians conduct food safety inspections including surveys for pests and pest signs at the galleys and food facilities each month. They also inspect the child development center, exchanges, and barber shops. The preventive medicine department provides monthly and quarterly sanitation inspection reports and, if necessary, immediate recommendations to facility managers when contractor-administered pest control operations are needed to control pests. United States (U.S.) Army Veterinarian food inspectors conduct food quality inspections that include examining food items for pests at the commissary and at food service and sales locations.

3.2.2 General Household and Nuisance Pests

Sanitation, glue traps, and pest exclusion are the primary sustainable means of non-chemical control. Low-toxicity insecticidal baits are used effectively against cockroaches and ants. Most pesticide applications can be effective in immediate reduction of pest populations, but have short residual efficacy and are not sustainable in the long term.

3.2.2.1 Cockroaches

German and American cockroaches are common pests. The general adaptability of the cockroach makes it both an important pest problem and the most common pest problem in food service areas. An integrated approach of using both preventive and corrective techniques is the only practical means of controlling this pest.

3.2.2.2 Control Measures

Non-chemical preventive control measures—including inspection, interior and exterior facility sanitation, and exclusion methods such as closing harborage areas by caulking or other modifications—reduce pest populations by limiting food, water, and shelter. In buildings that are most susceptible to pest infestation, these measures are performed on a scheduled basis through preventive maintenance contracts. Common use areas and food consumption areas of other buildings, such as restrooms, coffee messes, lounge areas, and vending machine rooms, are serviced on either a monthly or quarterly basis, depending on the preventive maintenance contract for that building, with response to call-backs as necessary. This also includes common use areas of the barracks, warehouses, and administration buildings. Buildings where there is no food and where problems occur only occasionally such as shops and storage buildings, are handled on a service call basis. Pesticide treatments in food handling areas shall be confined to crack and

crevice placement when using residual aerosol or dust formulations. Insect growth regulators and baits are used to complement other control measures. Self-contained light traps may also be utilized in these areas. Low-odor formulations are used in offices and in other spaces where a pesticide odor would be objectionable.

3.2.3 Grounds Maintenance

Grounds maintenance is performed on improved or landscaped grounds. Pest management during grounds maintenance may involve weed control; control of pests and disease on plants, trees, and turf; and control of vertebrate animals (e.g., squirrels, moles) that may destroy plants and turf. Mechanical removal of weeds and mowing are routinely performed. Grounds maintenance also includes weed control in drainage ditches that may contribute to mosquito control and bird habitat removal. Weed control is performed along roadways, fence lines, and at fuel farms where they pose fire and visibility concerns.

3.2.3.1 Turf and Ornamental Pests

Turf and ornamental pests include insects and diseases. White grubs and ants infest the soil and roots of plants. Japanese beetles, bagworms, tent caterpillars, sod webworms, and armyworms feed on the leaves of plants. Leafhoppers, scale insects, and aphids are referred to as plant sucking insects and feed on the fluids inside of plants. Oak borers and bark beetles are insects that bore into plants or trees and disrupt the plants' ability to transport nutrition and water. Various plant diseases including brown patch and dollar spot are also possible turf diseases that may be encountered. Ornamental diseases can cause leaf spots, blights, mildews, and wilts from fungi, bacteria, and viruses.

3.2.3.2 Weed Control

A wide variety of herbicides are available for controlling unwanted vegetation. Extreme care should be taken when using herbicides around waterways. Herbicides can be used around mowing obstacles such as signs, fire hydrants, and manholes. Herbicides are used to control weeds along cracks in sidewalks and asphalt parking areas, along fence lines, around buildings, and along ditch banks. Selective herbicides are used to control various weeds that occur in lawns on the installation. Various cultural and chemical controls can be used to deal with these and other weed control problems. When using chemical controls, both selective and non-selective herbicides may be used.

3.2.3.3 Aquatic Weed Control

Aquatic weed control work should be conducted in accordance with the Integrated Natural Resource Management Plan. The policy is to control and limit the spread of invasive species of plants, and to protect aquatic plant species. Each pesticide must be approved prior to use to prevent harm to the natural resources that feed in the ponds.

3.2.4 Golf Course and Athletic Fields

Pest management operations include the following:

1. Weed, fungus, and insect control on golf course grounds
2. Weed control on ball fields
3. Weed control in miscellaneous MWR facilities.

The golf course includes 138 acres of greens, fairways, and rough. The golf course contains Bermuda grass on the greens and fairways, and mixed grasses on the rough. Undesirable vegetation in the turf grass, including sedges and crabgrass, are controlled by using pre- and post-emergent selective herbicides.

3.2.4.1 Mole Cricket Control

Mole crickets are an infrequent problem on the lawns and golf course areas. Because the nymphal stage feeds on the roots of the grass, it is a very destructive pest. Mole crickets are best controlled by using insecticidal baits and residual insecticides on the nymphal (feeding) stage. Control of the adult stage is done only when damage levels present are excessive. Effective treatment requires proper timing through the consideration of weather conditions and the stage of the insect. An area-wide treatment of all continuous lawn areas is much more effective than scattered spot treatments. Subsurface insecticide applications are more effective since they direct the application where the insect lives. This treatment should be performed once a year when mole crickets are in the nymphal stage and repeated if the population builds back up.

3.2.4.2 Nematode Control

Sting and lance nematodes have historically not been known to be pests on the golf course. Nematodes are difficult to control and are often responsible for large amounts of turf damage. The best management practices for golf courses with nematode problems are:

1. Avoid other stresses on the grass as much as possible
2. Monitor nematode populations by sampling frequently
3. Apply nematicides when needed.

Historically, most nematicides have been toxic at low levels and water soluble in order to move into the soil profile and get to the nematodes. Many of the effective nematicides used in the past have been withdrawn from the market during the last 25 years for environmental and health reasons until only a handful remain. When using any nematicide, the product label must be strictly adhered to in order to minimize human and environmental health impacts and to avoid liability. It is a NAVFAC Atlantic Applied Biology policy that the presence of nematodes must be verified by a soil test before a nematicide can be used. The soil samples should be taken and the results forwarded to the NAVFAC Atlantic PPMC before approval can be given for the purchase of nematicides.

3.2.4.3 Other Golf Course Pests

Other insect pests include sod webworm, armyworm, and chinch bugs. The major turf diseases are brown spot, dollar spot, and pythium. Significant damage to the turf can often be avoided by inspecting the turf daily during the periods when pest and disease problems are likely to occur. Disease occurrence is often decreased or avoided through cultural control, such as proper fertilization and watering. Natural controls are maximized when chemical control operations are based on need instead of a schedule. This careful use of chemical control can help avoid environmental and pest resistance caused by overuse of pesticides. The only exemptions to need-based control are the preventive treatments for pythium and dollar spot.

3.2.5 Structural Pests

Structural pests which have an impact on activity operations include termites, powder post beetles, wood borers, and wood destroying fungi. Of these, subterranean termites and wood destroying (decay) fungi cause the most damage.

3.2.5.1 Structural Control Program

A well-managed structural pest control program includes inspection, prevention, and chemical treatments when needed. All susceptible structures that contain wood or wooden structural members should be inspected on an annual basis. The records should note when a building was inspected, the location of any infestation found, and the description of any treatment performed.

3.2.5.2 Termite Control

Various control techniques as part of an integrated approach to structural pest control include:

1. The use of construction practices which protect wood from attack
2. The control of moisture through proper drainage and ventilation
3. The use of termiticides for barrier treatment of soil and hollow masonry units of building foundations
4. The use of treated wood and or metal and concrete supporting structures
5. The fumigation for extensive drywood termite infestations.

Corrective chemical treatments should be performed when termites are found actively damaging wood. Control operations should be based on annual inspections of buildings and reports of termite swarming from building occupants. All wood that is damaged by termites or wood rot fungi should be replaced with treated wood to prevent future damage.

Top priority is given to preventive control treatments, such as preconstruction termite soil treatments and the use of treated wood to protect wood from attack. Once treated with termiticides, care must be taken to prevent disturbance of the soil barrier within one foot of the foundation (if moved by gardening activity or covered when raised flower beds are installed against a building). This can be a serious problem in housing areas where people are encouraged to beautify their yards. Raised beds must be four-sided (i.e., not using the foundation as one side) and soil within one foot of the foundation can't be cultivated for planting.

3.2.5.3 Administration of Termite Treatment Contracts and Warrantees

Termite treatment contracts shall follow all of the requirements found in section 2.5.4. The NAVFAC Atlantic PPMC should review contract specifications for termite control. Termiticides, when needed, must be applied at the highest EPA-labeled concentration and application rate. Soil treatment for termite prevention will be conducted during building construction in accordance with the Unified Facilities Guide Specifications (UFGS) 31 31 16 (DODI 4150.07, section E.4.7.15.1). In accordance with UFGS 31 31 16, the contractor shall provide a warranty of no less than five years. This ensures that if termite activity is discovered during the five year warranty period, the contractor will re-treat the soil and repair or replace any damage that has been caused by termite infestation. Termiticides used for termite control must be

nonrepellent, such as pesticides with the active ingredient of fipronil, imidacloprid, chlorfenapyr, or chlorantraniliprole. DOD-certified pesticide applicators or PMPARs trained in pest control shall inspect applications of pesticides by contractors to control termites or other wood-destroying organisms.

3.2.6 Invasive and Non-Indigenous Species Management

Executive order (EO) 13112 is implemented at DOD installations through DODI 4150.07 (section E4.7.6) which requires that installations prevent, detect, and monitor invasive species. Guidance on the use of available control techniques may be obtained from the installation's NAVFAC Atlantic PPMC. More information on invasive species can be found in the installation INRMP. Primary invasive species of concern at Northwest Annex include the red imported fire ant, phragmites (common reed), kudzu, and bamboo. The nutria (*Myocastor coypus*), a large semiaquatic rodent introduced from South America, has become increasingly common in the Tidewater area of Virginia and may present a threat to wetlands and waterways on the installation.

3.2.7 Stored Product Pests

Stored product pests are a potential problem at any installation. Inspection upon receipt of products and rejection of obviously infested materials generally prevents heavily infested material from being placed in the storage area.

3.2.7.1 Dermestid Beetle

If the dermestid beetle (*Trogoderma*) is found in a commodity, the whole lot of food must be condemned. The pointed hairs on the larvae will cause digestive problems if the contaminated food is eaten. An accurate identification of *Trogoderma* is required to condemn the lot. For the most part, sanitation (keeping storage areas clean) and stock rotation minimize or prevent pest infestation. If an infestation is found, the most effective way to control *Trogoderma* is through deep cleaning, vacuuming, and discarding or segregating the infested product while surveying adjacent areas.

3.2.7.2 Storing Meal, Ready-to-Eat Rations

More stringent controls are required for prevention of stored products pests when storing meal, ready-to-eat (MRE) rations. Guidance on this program can be found in AFPMB Technical Guide No. 38, Protecting Meals, Ready-to-Eat Rations (MREs) and Other Subsistence during Storage.

3.2.8 Health-Related Pests

In accordance with OPNAVINST 6250.4C (paragraph 4c), the Naval Branch Health Clinic Preventive Medicine Department is responsible for conducting inspections and surveys aboard the installation to determine the species, source, location, and density of medically-important arthropods and provide the results to the public works and facilities departments for use in planning pest control operations. Mosquitoes, biting flies, and filth flies constitute the most important insect pests for both disease transmission and general annoyance. Controlling these insect pests should be based on a thorough knowledge of the target pest, actionable surveillance data, and compelling evidence of an infestation that poses an emergent public health risk.

3.2.8.1 Mosquito Biology and Medical Importance

There are over 3,000 mosquito species worldwide and about 150 species in the U.S. All mosquitoes have the same life cycle and are similar in their biology and habits. However, differences in breeding habitats

and host preference occur between the species and these subtle differences affect how we survey and control them. Mosquitoes can be separated into two groups, depending on where they lay their eggs. The flood-water mosquitoes lay their eggs in temporary bodies of water such as artificial containers, tree holes, tidal marches, etc. Eggs of flood-water mosquitoes are laid on moist substrate just above the surface of the water; this group includes *Aedes* and *Psorophora* species. Permanent-water mosquitoes lay their eggs in permanent or semi-permanent water such as ponds, lakes, marshes, ditches, etc. Eggs of permanent water mosquitoes are laid on the water's surface; this group includes *Anopheles* and *Culex* species. It is only the female mosquito that bites; female mosquitoes require a blood-meal before they can lay viable eggs. The male mosquito feeds on plant sugars such as nectar, and does not bite. The Navy Bureau of Medicine and Surgery entomologists, centered at the Navy Entomology Center of Excellence (NECE) and the Navy Environmental and Preventive Medicine Units (NEPMUs), are responsible for providing professional guidance, recommendations, and on-site assistance on all technical matters relating to disease vectors and other medically important pests (OPNAVINST 6250.4C, paragraph 4c).

Mosquitoes are both a major nuisance and a medically important pest. Protozoan pathogens (e.g., Malaria), nematode worms (e.g., dog heartworm), and a number of different viruses (e.g., West Nile Virus, Zika Virus), can all be transmitted by mosquitoes. The NECE West Nile Virus Surveillance and Control Guide for U.S. Navy and Marine Corps Installations can be found at: http://www.med.navy.mil/sites/nmcphc/Documents/nece/WNV-Surveillance-and-Control-Guide-2014.pdf

Dengue, Chikungunya virus (CHIKV), and Zika virus are all known to be transmitted by *Aedes aegypti* and *Aedes albopictus* mosquitoes, which are common in tropical and subtropical areas throughout the world. *Aedes aegypti* can also transmit Yellow Fever. *Aedes* mosquitoes breed in containers and generally bite during the day. Humans are the reservoir for Dengue, CHIKV, and Zika virus. These diseases can be introduced into an area by persons infected during travel in areas where these diseases are found. Local transmission can occur if the vector mosquito species is present in the area, and the vector mosquito becomes infected after biting an infected person. Transmission of Zika virus through blood and sexual contact has also been reported. *Aedes* mosquitoes are an invasive species whose eggs, which remain viable when dried, are easily transported throughout the world in shipping containers, equipment, and vehicles. Because *Aedes* mosquitoes are active during the day, surveillance and control operations should be targeted during the daytime hours. Additional information on *Aedes* vector surveillance, control, and the viruses they transmit can be found on the web site for the Navy and Marine Corps Public Health Center (http://www.med.navy.mil/sites/nmcphc/program-and-policy-support/Pages/Chikungunya.aspx), and the Armed Forces Pest Management Board (http://www.acq.osd.mil/eie/afpmb/).

3.2.8.2 Mosquito Surveillance and Control

Routine mosquito surveys are the responsibility of preventive medicine technicians. However, if a PMT is not available, a pest control provider can conduct mosquito surveillance. If additional assistance is needed, Navy entomologists from the Navy Entomology Center of Excellence or the Navy Environmental and Preventive Medicine Units can provide assistance in mosquito surveillance. Survey operations are essential to determine the species present, the population level involved, and the potential risk of disease transmission. Surveys also serve as a valuable tool in evaluating control operations. Mosquito surveillance includes conducting both larval and adult surveys. Larval surveys are important because they determine exactly where mosquitoes are breeding, providing the information necessary to manage or eliminate mosquitoes at the source. Larval surveys involve regular dipping stations that are selected, noted on a map, and inspected periodically throughout the mosquito season. In areas where mosquito control is conducted, random larval sampling should be made to check the effectiveness of the control program.

Adult mosquito surveys may be conducted by either collecting mosquitoes from resting sites or using traps. Traps should be placed near where the mosquitoes are expected to be found, during the periods they are active. Two adult mosquito traps that are available with National Stock Numbers (NSNs) are the CDC light trap and the Biogents (BG) Sentinel trap. Traps should be baited with CO_2 from dry ice, when available or, in the case of the BG traps, with the manufactures' recommended lure. The BG Sentinel trap is specifically designed to collect daytime-feeding mosquitoes, and has been found to collect *Ae. aegypti* and *Ae. albopictus* (Zika vectors) more effectively than the standard CDC light trap. Adult collections are then counted, identified to genus or species, and then may be submitted to a regional Army or Air Force public health laboratory for testing, so that the disease transmission risk can be assessed. Adult surveys focus on collecting female mosquitoes because they are the only ones that bite. A high proportion of adult males in a trap collection usually will indicate a nearby larval habitat, and a survey of the area should be done to locate possible breeding sites.

Preventive Medicine (Branch Health Clinic NAVSTA Norfolk) surveys adult mosquitoes at the Norfolk locations using four to five BG Sentinel traps that are rotated among several sites including the golf course, Camp Allen, and housing area. During the mosquito season, preventive medicine collects mosquitoes one to two times a week. Adult collections are counted and identified in-house. Preventive Medicine (Naval Medical Center Portsmouth) is responsible for mosquito surveillance at Northwest Annex, however they were not conducting surveillance at the time this plan was written. They should use three to four BG Sentinel traps to monitor mosquitoes in developed areas of the annex and the campground. Employee and resident mosquito complaints can be made through the call center and then forwarded to preventive medicine.

Mosquito control methods are either permanent (e.g., eliminating the water source) or temporary (e.g., chemical control) in nature and may be directed against larvae or adults. The most effective way to control mosquitoes is to target the larval stage. Larvicides, pesticides specifically labeled to control mosquito larval stages, should be applied to areas where water stands for longer than 7 days when results of mosquito dip counts exceed 1-2 larvae per dip.

Biological control can be accomplished by the introduction of mosquito fish (*Gambusia* sp.), which are surface feeders that are predaceous on mosquito larvae. *Gambusia* have the ability to outcompete other species, so it is important to consult with the environmental division prior to introducing them, as well as to only introduce them into waters that do not drain into other waterways. To decrease the amount of standing water, it is important to have a drainage system allowing proper runoff of rain water from roadways. Ditches should be maintained free of weed growth. This increases water flow in the ditch allowing access of natural mosquito predators. It is also important to educate the public on source reduction when the problem mosquitoes originate from artificial containers (e.g., bird baths, gutters, flower pots) found around homes and other buildings.

This installation performs ultra-low volume (ULV) pesticide applications to control adult mosquitoes on an as needed basis. If 5 or more *Aedes* mosquitoes are caught per trap consult the Emergency Vector-borne Disease Plan (EVDCP). When female adult mosquito counts exceed 25 per night per trap, it is recommended that chemical control be initiated upon approval from preventive medicine. These recommended thresholds may vary depending on location of the installation and preventive medicine guidance. If local transmission of a disease is confirmed, thresholds will likely decrease. If a trap count exceeds the threshold, the area surrounding that trap should be surveyed to identify and treat the active breeding site. For many species, mosquito activity is greatest from dusk to dawn. However, as mentioned in the above mosquito biology section, *Aedes* mosquitoes are important vectors that continue to bite during the day. Ultra-low volume treatments must be made during peak mosquito activity when weather conditions are optimal; therefore, for control of non-*Aedes* mosquitoes, ULV pesticide applications should be conducted in the early morning hours before the sun warms the ground or in the evening after the

ground has cooled (when temperature inversion usually occurs). Control operations for *Aedes* mosquitoes should be targeted in the early morning or late afternoon rather than daytime because weather conditions are more favorable for the treatment.

Regular testing of ULV aerosol droplet dispersal is required to assure maximum control, minimum insecticide use, and prevention of automobile finish spotting caused by droplets that are too large. This testing must be done at the beginning of each spray season and for every 50–100 hours of operation, or when the pesticide is changed. More information is included in the AFPMB TG No. 13, Ultra Low Volume Dispersal of Insecticides by Cold Aerosol and Thermal Fog Ground Equipment. Government personnel can obtain slides for aerosol droplet size testing from the Testing and Evaluation Department at the Navy Entomology Center of Excellence, Jacksonville, Florida. Additionally, application of residual insecticides labeled for mosquito control in relatively small areas near the source of the mosquitoes has been shown to be highly effective. Automated pesticide misting devices are not allowed according to DODI 4150.07 (section E4.10.3).

If mosquito populations are extremely high or infestations occur in hard to reach areas, aerial application of adulticides or larvicides by helicopter or fixed-wing aircraft may be the only effective treatment method available. Refer to section 3.2.8.9 for requirements regarding aerial spraying.

3.2.8.3 Filth Fly Management

Performing routine sanitation is the best method to manage filth flies (houseflies, blow flies, flesh flies, bottle flies, etc.). Removal of refuse and routine cleaning of garbage cans and dumpsters will minimize the problem. Garbage cans and dumpsters should be placed on concrete pads at least 100 feet from facilities to reduce breeding under and around the containers and to minimize access to the facilities. Continuous monitoring of sanitation conditions in and around food service areas helps assure that significant fly breeding will not occur.

Chemical control of filth flies is short-term and unsustainable. The choice of fly control techniques must be based on an on-site evaluation of the problem. Pest control personnel inspect areas where garbage is handled and treat these locations with approved insecticides when flies exceed control limits. Preventive medicine technicians also inspect these areas and report significant findings to facility managers for corrective action. Exclusion devices, such as screens and air curtains, help prevent the entrance of flying insects into buildings when installed and properly maintained. Aerosol insecticide treatments are provided when adult flies become a problem in indoor spaces. Automated pesticide misting devices are not allowed according to DODI 4150.07 (section E4.10.3). Light trap devices are also helpful for filth fly control in food handling areas, but only when they are placed inside of the building. Use only non-contaminating light traps with some way of containing the dead insects. For more information on filth fly management, see AFPMB TG No. 29, Integrated Pest Management In and Around Buildings.

3.2.8.4 Bed Bug Management

Bed bugs belong to a family of blood-feeding, ectoparasitic insects called *Cimicidae*. They have a number of features that make them very effective pests and difficult to control. Their small, flattened body allows them to hide in inconspicuous places such as cracks and crevices. A female can lay several hundred eggs during her lifetime. Bed bugs can survive a long time without feeding; and many insecticides have been rendered ineffective due to resistance development. The most common way bed bugs are introduced is by the movement of infested items (e.g., bedding, clothing, and luggage) from one place to another. The common bed bug is not known to transmit human disease. For most people, the bite of a bed bug is painless and will usually go unnoticed, though many people can have allergenic skin reactions, ranging in severity from local inflammation and itchiness, to asthmatic symptoms and anemia. Although the

common bed bug seems to prefer human hosts, they are also capable of feeding on birds, rodents, or other mammals. While other cimicid species, like bat bugs and swallow bugs, mainly feed on bats or birds, but may incidentally bite people when their usual host abandons the nest or is eliminated from the building.

Bed bugs can be difficult pests to detect without a diligent survey strategy. Bed bugs typically feed at night when the host is asleep, and hide in cracks and crevices during the day. It is very important to thoroughly inspect areas where bed bug infestation is suspected. Typical harborage areas might include mattress seams, box springs, bed frames, night stands, picture frames, loose wallpaper, and curtains. Bed bugs typically travel 5–20 feet from their harborage area to feed. When populations are small, infestations may go unnoticed. Some tell-tale signs of a larger bed bug population include the presence of fecal spotting, shed skins, increased biting frequency, and in serious cases a distinct, obnoxiously sweet, odor produced by the bugs. Persons conducting inspections and surveys should be properly trained on what to look for and where to look for infestations. The NECE and EPMU personnel are available to provide training on bed bug inspections.

Bed bugs are a public health issue; installation preventive medicine department should be contacted immediately. Bed bug control may be more difficult to achieve today with increased travel and more stringent limitations on available control materials. A successful control program will require a carefully planned and integrated approach. For more information on controlling bed bugs see AFPMB Technical Guide No. 44, Bed Bugs—Importance, Biology, and Control Strategies.

3.2.8.5 Rodent Management

Rodent control work is an ongoing program to eliminate the causes of rodent infestations. Major emphasis is placed on sanitation and exclusion to limit the amount of food and harborage available to rodents. Tamper-resistant bait stations should be maintained in high infestation areas. There are specific EPA requirements for first generation anticoagulant products (warfarin, chlorophacinone, and diphacinone), second generation anticoagulant products (brodifacoum, bromadiolone, difenacoum, and difethialone), and non-anticoagulants (bromethalin, cholecalciferol, and zinc phosphide). Bait stations are required for all outdoor, above-ground placements and must be placed within 100 feet of man-made structures. Bait stations are also required indoors if exposure to children, pets, or non-target animals is possible. Mechanical traps (snap traps, glue traps, etc.) are another effective control method. Trapping is an effective way of quickly reducing a large mouse population.

3.2.8.6 Bird Management

Pigeons are the primary bird pests on most installations. Pigeons, English sparrows, and starlings can be controlled without a permit because they are not covered under the Migratory Bird Treaty Act. Other bird species require special permits before any control measures can be taken. Bird control methods vary according to the situation. Bird droppings pose a health hazard, as a possible cause of histoplasmosis and other respiratory problems when airborne. Bird ectoparasites, such as mites, can also fall on installation employees. Ultrasonic devices and plastic owls and snakes, etc. are not effective for bird control. The best alternative for bird control is bird-proofing or the exclusion of birds by closing up all openings. Because of its permanency, bird-proofing (i.e., the placing of hardware cloth and chicken wire over potential roosts) is considered the most cost effective means of control. Population reduction techniques (e.g., destruction of nests accessible by a ladder or cherry picker) can sometimes be used effectively. Repellent chemicals which produce alarm reactions and cause a flock to leave or avoid an area are often used. Control personnel should continually monitor bird population levels and take appropriate control actions when required.

3.2.8.7 Feral Animal Management

Feral or free-ranging domestic cats and dogs are considered by the professional wildlife management community to be one of the most widespread and serious threats to the integrity of native wildlife populations (e.g., birds, bats) and natural ecosystems in North America. Navy commands must prevent feral cat and dog populations, and ensure their humane removal from Navy lands through close coordination and cooperation between natural resources, pest management, security, veterinary, and housing personnel. In accordance with the Chief of Naval Operations Policy Letter Preventing Feral Cat and Dog Populations on Navy Property (10 Jan 2002) and OPNAV M-5090.1, chapter 12, Navy commands shall not allow trap-neuter-release or the release of unwanted house pets on their lands due to the potential of feral or free-ranging cat populations to act as disease reservoirs, threatening human health, native wildlife populations, and natural ecosystems.

Cats may occasionally be found near food handling areas or dwelling in crawl spaces under buildings where they can cause flea problems inside of the buildings. The elimination of available food by keeping garbage cans and dumpsters sealed will decrease the appeal of the area to the cats. Elimination of shelter is also a good means of control. The installation should discourage people from feeding stray cats. Guidance on feral cat management can be found in AFPMB Technical Guide No. 37, Integrated Management of Stray Animals on Military Installations.

3.2.8.8 Wildlife Management

Native and feral animals can adapt to and thrive within human habitations. The animals may become a nuisance, damage buildings or property, or be a source of human disease transmission. They can also kill native animals and plants or disrupt their habitats. Animals that may be pests at NSA Hampton Roads include Canada geese, raccoons, fox, and opossums. Animal damage control efforts will emphasize the use of integrated pest management techniques which exclude pests and mitigate damage rather than control populations whenever practical. The field use of chemical toxicants which cause secondary poisoning effects is generally prohibited for bird and mammal control by E.O. 11870. Public works environmental division will be called for wildlife or carcass removal. In cases where they cannot be reached and personnel or equipment may be at risk, the certified pesticide applicator may remove the animal.

3.2.8.9 Aerial Spraying

Aerial spraying can be conducted to effectively control disease-carrying insects, pest insects, and undesirable vegetation over a large area. No aerial spray operations are currently conducted or validated for NSA Hampton Roads. Validation for aerial spraying must be obtained from a category 11-certified pest management consultant with BUMED or NAVFAC Atlantic and clearance for aerial spray operations must be obtained from the Federal Aviation Administration. The validation Statement and the execution of a requirements type contract should be done before they are required to minimize delays in initiation of control operations.

The DoD tasks the 910th Airlift Wing at Youngstown Air Reserve Station, Ohio to maintain the DoD's only large area fixed-wing aerial spray capability to control disease-carrying insects, pest insects, undesirable vegetation and to disperse oil spills in large bodies of water. Missions may be executed in combat areas, on DoD installations or in response to disasters/emergencies as declared by the President of the United States.

3.2.8.10 Red Imported Fire Ant

Fire ants are a significant health concern due to their aggressive nature when disturbed and the allergic reaction that occurs in some people. The fire ant's mound building and stinging behavior interferes with recreational and grounds maintenance activities. Bait and residual insecticides are available for control of fire ants. Monthly inspections for fire ant mounds should be made in all improved and unimproved areas, with treatment as necessary. Infested areas should be treated with bait, followed by a drench of any mounds 6–8 weeks later. Any active mounds found in the interim should be retreated. Bait and residual insecticides are available for control of fire ants. Fire ants are a fairly recent invader in the area, and have only become a problem on the installation in the last decade.

3.2.9 Pest Management in Housing

Housing areas on the installation are under a PPV partnership with Lincoln Military Housing. The PPV partner is responsible for providing pest management services and for upholding the agreements set forth in the Partner's Plan for Pest Control. General pest control and grounds maintenance services are provided by contract. Certificates for the PPV contract pesticide applicators are located in appendix E. Contractors providing services in the PPV areas must follow all state and local laws.

Pet dogs and cats released or lost by owners on base can become a pest problem. Feral cats and dogs are susceptible to and can carry disease, damage natural habitats, harm protected wild animals, become a vehicle strike hazard, and attack and injure personnel. Pet owners are encouraged to microchip their pets. Microchipping is a permanent pet identification system using a computer chip implant in the skin of the animal. This allows a lost pet to be identified even if the collar tag is missing.

3.2.10 Self-Help Pest Management

Self-help pest control programs on DOD installations are authorized by DODI 4150.07 (section E4.7.7.3) when they are cost-effective and when IPM monitoring indicates the need for control. Self-help pest control allows uncertified personnel to use low-toxicity, ready-to-use (RTU) pesticides for small-scale pest control operations. Examples of self-help programs available are: stinging insect pest control for maintenance personnel, venomous spider control, fire ant control, vegetation control using glyphosate, and barracks/office pest control. Any personnel or departments conducting unauthorized pesticide applications should be directed to immediately cease applications. Requirements for self-help are:

1. The program shall be reviewed and approved by the IPM coordinator and then by the NAVFAC Atlantic PPMC

2. A program manager, who will be responsible for the program and be the primary point of contact, shall be designated

3. All personnel that will be applying pesticide must be trained and their training documented

4. Only RTU pesticides approved for use by the NAVFAC Atlantic PPMC shall be used

5. The area(s) to be treated should be small enough to be practically treated with RTU pesticides

6. All pesticides will be stored in a storage site as described on the pesticide label

7. All pesticide use will be reported.

To request review of a proposed program and submit a Statement of need, the IPMC must contact the NAVFAC Atlantic PPMC.

3.2.11 Prohibited Operations and Devices

Several operations and devices are prohibited by DOD and DON regulations.

Prohibited operations and devices include:

1. Occupied spaces—Installations shall not permit liquid spray and dust pesticide formulations in any space occupied by unprotected personnel. However, pesticides contained in gel or paste bait formulation may be applied in occupied spaces (OPNAV M-5090.1, paragraph 24-3.2).

2. Preventive or Scheduled Pesticide Treatments—DOD policy prohibits the use of regularly scheduled, periodic pesticide applications except in situations where the installation pest management plan clearly documents that no other technology or approach is available to protect personnel or property of high value (DODI 4150.07, section E4.10.3).

3. Electrically-Operated Devices—"Electromagnetic exclusion or control devices, ultrasonic repellent or control devices, and outdoor devices for electrocuting flying insects are not approved for use on DOD installations" (DODI 4150.07, section E4.10.1). This does not apply to indoor use of selected devices, carefully placed, for electrocuting flying insects. Pest surveillance traps and monitoring equipment, such as non-electrocuting mosquito light traps, may also be used by trained personnel.

4. Paints and Coatings Containing Pesticides and Other Biocides—DOD policy prohibits the use of paint containing insecticides on DOD property. This includes interior and exterior paints. Paints containing fungicides as mildew inhibitors and approved marine antifouling compounds or coatings may be applied to protect surfaces of watercraft (DODI 4150.07, section E4.10.2).

3.3 REGULATORY COMPLIANCE

The Department of Defense's policy is to ensure that DOD pest management programs achieve, maintain, and monitor compliance with all applicable executive orders and applicable federal, state, and local statutory and regulatory requirements. When there is a conflict between federal and local regulations, the installation will comply with the more stringent of the two. This may occur with pesticides limited for use by the state, which are not necessarily restricted by the EPA. In this case, the installation must comply with state regulations.

3.3.1 Pesticide Regulation and Enforcement

The U.S. Environmental Protection Agency has the primary authority to regulate pesticides in the United States. The EPA delegates pesticide enforcement authority to states through cooperative agreements. Per OPNAVINST 6250.4C, Navy installations must comply with state and local pesticide use regulations.

The responsibility for compliance and enforcement lies with the installation's commanding officer. As the installation CO's pest management advisor, the IPMC shall be familiar with federal, state, and local pesticide use regulations and ensure that all applicators conduct operations in compliance with these regulations. The environmental division should be familiar with these regulations as well due to the environmental hazards of pesticides. Regulatory enforcement for each of the PMSPs is provided.

1. Commercial contractor applicators: PMPARs shall provide assistance by monitoring contract PMSPs for compliance with all applicable regulations as specified in the contract and will recommend appropriate actions to the contracting officer if the contractor does not comply. Preventive medicine technicians conducting sanitation inspections of food service facility pest management programs can also ensure compliance for safe pesticide use and applicator licensing/certification. Inspection guidelines are found in NAVMED P-5010, chapters 1 and 8. The preventive medicine technicians will notify the IPMC of any potential pesticide application violations observed during the course of routine sanitation inspections.

2. DOD applicators: The pesticide applicator's immediate supervisor, with the assistance of the IPMC, shall also ensure that pesticide use is in compliance. Under the authority of DODI 4150.07 and DOD Directive 5134.01, and per Department of Defense Manual (DODM) 4150.07, Volume 1, DOD Pest Management Training and Certification Program, the DOD may deny, suspend, or revoke the certificate of any DOD employee who violates any provision of Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) or falsifies records under DODM 4150.07, Volume 1. In accordance with DODM 4150.07, Volume 1, the installation CO may initiate a formal review if FIFRA violations are suspected. Violations shall be reported through appropriate command channels to the NAVFAC Atlantic certifying authority for review. The certifying authority shall determine if further action is required. That action may include suspension of the applicator's certification.

Naval Facilities Engineering Command, Atlantic Applied Biology shall provide assistance to the installation IPMC with compliance and enforcement issues and clarification of regulations. The senior pest management consultant is the certifying official for DOD-certified pesticide applicators on the installation.

3.3.2 Pesticide Laws and Regulations

Primary pesticide regulations include:

1. Federal: U.S. Code of Federal Regulations (CFR) at 40 CFR Section E, 152-180: Pesticide Programs (http://www.access.gpo.gov/nara/cfr/waisidx_03/40cfrv21_03.html).

2. DOD and Navy: DODI 4150.07, DOD Pest Management Program; OPNAVINST 6250.4C, Navy Pest Management Programs; OPNAV M-5090.1, Environmental Readiness Program.

3. Virginia: The Virginia Department of Agriculture and Consumer Services, Office of Pesticide Services regulates the pest control industry (http://www.vdacs.virginia.gov/pesticides).

3.3.2.1 The Pesticide Label

The primary source of pesticide regulations for the pesticide applicator is found on the pesticide label in accordance with 40 CFR § 156. Virginia may add supplementary labels which are regulations that must be complied with in the state. It is a violation of federal and/or Virginia law to use a pesticide in a manner inconsistent with the label. Note, however, that the pesticide label does not provide specific information for each site where the pesticide may be applied. For example, the pesticide label may allow application of an herbicide to unimproved grounds, but if those grounds are within a ringed map turtle habitat, then pesticide use may be restricted under the Endangered Species Act. Pesticide applicators should be aware of environmentally sensitive areas before beginning any new pesticide application and should consult the installation's environmental division. For more on pesticide labels, see http://www.epa.gov/pesticides/label/.

Endangered Species Protection Bulletins set forth geographically-specific pesticide use limitations for the protection of endangered or threatened species and their designated critical habitat. If your pesticide label directs you to the EPA Bulletins Live Web site (http://epa.gov/espp/bulletins.htm), you are required to follow the pesticide use limitations found in the Bulletin for your county, pesticide active ingredient, and application month.

3.3.2.2 Other Regulations

Other applicable directives, laws, and regulations concerning pesticide applicators and pest management operations are listed and described in appendix F.

3.4 PESTICIDE MANAGEMENT

Chemical control of pests using pesticides can be an integral part of an IPM program. Proper management of pesticides will ensure a safe and cost-effective pest management program. Management of pesticides includes the proper selection of pesticides, pesticide approval, procurement, storage, mixing, use of pesticide application equipment, and clean-up. The pesticide label provides most of the information needed to manage pesticide use and must be affixed to the container at all times.

3.4.1 Pesticide Selection

The following criteria should be used when selecting a pesticide:

1. Determine the need for a pesticide. Is a chemical pesticide really needed? In some situations non-chemical control methods may be more effective or less costly and time-consuming in the long term. Will exclusion or habitat elimination take care of the problem?

2. Choose a pesticide with a low toxicity. Can the pest be sufficiently controlled with a pesticide that has a low toxicity to humans?

3. Choose pesticides and pesticide formulations with minimal environmental impact. Avoid using "Restricted Use" pesticides if possible. The environmental impact of pesticide spills is reduced when using a granular pesticide formulation rather than a liquid. Can attractant bait stations be used instead of broadcast application of a pesticide?

4. Choose pesticides that provide a long-term or sustainable solution. For example, contact insecticides applied to ant trails will only temporarily halt the infestation, and may cause the colony to bud and form new colonies, while baits can kill the entire colony including the queen.

3.4.2 Pesticide Procurement

Pesticides used by contractors are included in the cost of the contract and are procured through commercial sources. Pesticides used by DOD personnel may be purchased through the Federal Stock System. Contractors cannot purchase pesticides through the Federal Stock System. A list of pesticides approved by the DOD and found in the stock system can be found at http://www.acq.osd.mil/eie/afpmb/pest_equiplists.html. These are not the only pesticides that may be used on the installation. Only pesticides listed on the installation's pesticide AUL (appendix D) may be purchased. All pesticide products and pest control services procured via government credit cards must also be pre-approved by the NAVFAC Atlantic PPMC according to DON eBusiness Operations Office Instruction (EBUSOPSOFFINST) 4200.1A, Department of Navy Policies and Procedures For the Operation and Management of the Government Commercial Purchase Card Program (chapter 6,

paragraph 7). For information on requesting new pesticides to the installation pesticide AUL, see section 2.2, Pesticide Approval.

3.4.3 Pesticide Storage

Pesticide storage facilities, retail sales, and vehicles each have specific requirements in regards to pesticide storage.

3.4.3.1 Pesticide Storage Facilities

DODI 4150.07, section E4.5.1, states that pesticide storage facilities "shall comply with all applicable regulatory standards and shall, where feasible, be modified to meet the minimum standards for new pesticide storage facilities." The Department of Defense standards are described in AFPMB TG No. 17 Military Handbook, Design of Pest Management Facilities. The NAVFAC Atlantic PPMC should be consulted during the design phase of new pesticide storage facilities to ensure that the latest requirements are included.

At a minimum, all existing facilities shall meet the following standards:

1. An active ventilation system that provides a minimum of six air changes per hour
2. Backflow prevention on all water sources used for mixing/filling
3. No floor drains and a surrounding berm that provides containment of any pesticide spills
4. Warning signs
5. Surrounded by a climb-proof fence with access only through doors with locks.

Sewells Point golf course stores pesticides in outdoor Hazmat storage buildings in the maintenance area on the golf course.

Raytheon stores pesticides in Building 446 at the Northwest Annex per contract specifications. Other contractors are not permitted to store pesticides on the installation.

The Marine Corps Security Forces Training Company stores glyphosate herbicide and wasp killer (aerosol) in a designated locker inside a temporary building at the firing Range on Northwest Annex.

3.4.3.2 Retail Sale Pesticide Storage

Household, pet, and garden pesticides displayed and sold at the commissary and NEX shall be stored in their original, sealed containers.

3.4.3.3 Vehicles

Pest control vehicles must carry pesticide spill kits in accordance with OPNAVINST 6250.4C (paragraph 13d). Pesticides shall not be transported in the vehicle's passenger compartment and pesticide containers shall be secured to vehicles to prevent spillage.

3.4.4 Pesticide Mixing

Pest control operators must mix pesticides in accordance with the pesticide label in appropriate areas that minimize the risk of safety and environmental hazards. Contracted pest control operators must also mix pesticides in accordance with the contract specifications. Persons mixing pesticides with water shall protect the water supply from back-siphoning of the pesticide mixture. They shall also ensure accurate measurement of concentrated pesticide to ensure proper application rate. Precautions must be taken to minimize the risk of a pesticide spill. See section 5.3.4 for pesticide spill prevention measures. Spill kits must be maintained on pest control vehicles and must be available at the mixing site.

When contractors mix pesticides to apply a soil treatment for termite prevention during building construction, the contractor must mix the termiticide on-site while the PMPAR or IPMC is there to witness.

3.4.5 Pesticide Application

All pesticides shall be applied in accordance with federal, state, and label directions. In accordance with label directions, personal protective equipment should be worn during the application of pesticides. Application of pesticides should be timed to ensure contact with and maximum kill of the pest and to prevent use under adverse weather conditions that can cause drift of the chemical outside the target area. See section 4.2.2 for more information on timing and drift prevention

3.4.5.1 Service containers

Containers other than the original pesticide container that are used for transporting pesticides to the job site must have a copy of the label attached. Service containers used for the application of a pesticide must have the following information on a tag attached to the container: name of party responsible for the container, the identity of the chemical in the container, and the signal word of the chemical. Containers commonly used for food, drink, or household products shall not be used to hold pesticides.

3.4.5.2 Equipment

Only pest control equipment that is in good repair and safe to operate shall be used by PMSPs. The equipment should be in good condition, free from corrosion, clean, and free from leaks. The PMPAR shall inspect equipment used by contract applicators. Applicators shall also ensure that they use equipment suitable to ensure proper application of pesticides.

3.4.6 Pesticide Disposal

All pest control equipment shall be properly cleaned. Contract PMSPs are not allowed to dispose of excess pesticide, used containers, or residues on the installation per contract specifications; they must conduct all cleaning off-site. Spray tanks and pesticide containers must be triple-rinsed prior to storage or disposal. Disposal of pesticide spray tank rinse water should be performed by applying to a site listed on the pesticide label, used for future mixing of the same pesticide, or disposed of as hazardous waste. Rinse water shall not be allowed to enter storm drains.

3.4.6.1 Sprayer Clean-Outs

When cleaned, spray equipment will be triple rinsed in the field using 10 percent of the tank capacity divided into 3 doses. The rinse material will be sprayed on the application site in accordance with the pesticide label.

3.4.6.2 Empty Containers

OPNAV-M 5090.1 (paragraph 24-3.12) requires disposal of pesticide wastes be in accordance with 40 CFR § 262, EPA Regulations for Hazardous Waste Generators. The disposal of pesticides, their containers, and related wastes is strictly regulated. Empty liquid pesticide containers will be triple-rinsed with 10 percent of the container's capacity divided into 3 doses. Disposal of empty containers will be coordinated with the installation's environmental division. Empty containers will not be reused. If possible, pesticide containers shall be returned to the manufacturer for recycling.

3.4.6.3 Rinse Water

Water from rinsing out equipment will be used immediately. If it cannot be sprayed on the application site, rinse water should be stored in marked plastic containers and used as the diluent for the next time the same pesticide is formulated for application. Wastewater formulations that contain pesticides shall not be discharged into any storm or sanitary sewer system.

3.4.6.4 Excess Pesticides

Disposal or redistribution of excess pesticides shall be coordinated through Environmental and the IPMC. Environmental and the Consolidated Hazardous Material Reutilization and Inventory Management Program will determine whether the pesticide can be redistributed or if it needs to be disposed of. Excess pesticides shall never be disposed in any storm or sanitary sewer system.

3.5 MINIMUM RISK PESTICIDES

Minimum risk pesticides, such as those marketed under the EcoEXEMPT brand, may be used by pest management service providers as part of their IPM program. According to the EPA, "Minimum risk pesticides are a special class of pesticides that are not subject to federal registration requirements because their ingredients, both active and inert, are demonstrably safe for the intended use." These pesticides are exempt from federal registration under section 25(b) of the FIFRA and are not labeled with an EPA registration number. Since there is no federal review of these pesticides or their pesticide label, there is no federal review of the instructions for effective use of these products. Although these pesticides are exempt from federal registration, they still need to be approved prior to use on DOD property, primarily for efficacy and safety reasons.

3.6 CANCELED PESTICIDES

The EPA has canceled or restricted several common pesticides.

3.6.1 Organophosphates

Chlorpyrifos (e.g., Dursban, Lorsban) and diazinon were, widely used pesticides that have been canceled. The following actions are allowed with these pesticides:

1. End users (e.g., PMSPs and private, residential users) should check with NAVFAC Applied Biology or state/local regulatory agencies for guidance. Some canceled pesticides are allowed to be used until stocks are depleted, while others are under a stop use order.

2. PMPARs should monitor the use of the pesticides by contractors to ensure that they are not using an increased amount of the pesticides as a means of using up their stock.

Fenamiphos (e.g., Nemacur), a systemic insecticide/nematicide commonly used for the control of turf nematodes, was canceled by the EPA on May 31, 2008 with an end use date on October 6, 2017. Use any remaining stocks in accordance with the label until the end use date.

3.6.2 Organic Arsenicals

The EPA is also canceling most organic arsenical pesticide registrations, which consist of monosodium methanearsonate (MSMA), disodium methanearsonate (DSMA), calcium acid methanearsonate (CAMA), and cacodylic acid and its sodium salt. All uses of DSMA, CAMA, and cacodylic acid and its sodium salt were canceled as of September 30, 2009.

All uses of MSMA except cotton, sod farms, golf courses, and highway rights-of-way, were canceled as of September 30, 2009. Use of MSMA on sod farms, golf courses, and highway rights-of-way was to have been prohibited after December 31, 2013, but because the EPA is considering newly-submitted information, these uses remain registered. These uses, in addition to the cotton use, will be considered in the pending registration review process for MSMA. Users can continue to apply MSMA on sod farms, golf courses, and highway rights-of-way until further notice, but thoughtful use and consideration of depleting stocks is highly encouraged. For golf courses and highway right-of-ways, the following restrictions currently apply:

1. For golf courses:

    a. Spot treatments only (100 square feet per spot), not to exceed 25 percent of the total golf course acreage per year

    b. One broadcast treatment for newly constructed courses only.

2. For highway right-of-way:

    a. Two broadcast applications only on highway rights-of-way

    b. A 100-foot buffer around permanent water bodies.

CHAPTER 4

Health and Safety

4.1 PESTICIDE APPLICATOR SAFETY

To ensure the safe use of pesticides, pesticide applicators shall handle and apply pesticides in accordance with the product's label directions.

4.1.1 Potential Occupational Hazards

The following hazards may be encountered by pesticide applicators or Government representatives that may be exposed while inspecting pest management operations. Occupational safety and health guidance is found in the OPNAVINST 5100.23G, The Navy Occupational Safety and Health Program Manual.

4.1.1.1 Direct Contact Toxic Chemical Exposure

Many chemicals used as pesticides are also harmful to humans. The three routes of exposure to applicators are dermal, inhalation and ingestion. For applicators, the most common route of exposure is dermal and is frequently due to not wearing the appropriate personal protective equipment. Severity of the harmful effects is determined by duration of exposure and toxicity of the chemical. The effects can be acute (rapid onset due to high-dosage, high-toxicity chemicals) or chronic (slow or delayed onset due to long-term exposure to low-dosage, low-toxicity chemicals). The highest risk for severe acute chemical exposure occurs during pouring and mixing of concentrated pesticide resulting in high-dose, rapid-onset chemical poisoning. Chronic exposure can occur when the applicator fails to use appropriate PPE during frequent pesticide applications and the chemical accumulates in the body of the individual over a period of time leading to delayed or gradual onset of illness or injury. Direct chemical exposure can result not only in pesticide poisoning, but also in skin burns due to corrosive chemicals.

4.1.1.2 Heat

The use of protective equipment such as a respirator, goggles, gloves, and coveralls increases the risk of heat injury especially in warm climates. Heat injury can occur during long periods of work outdoors during warm weather or in enclosed spaces where machinery or equipment may generate heat.

4.1.1.3 Noise

Some pesticide application equipment use gas-powered air compressors or pumps that produce noise hazards. Gas-powered backpack sprayers are particularly hazardous due to the proximity of the noise source to the ears.

4.1.1.4 Eye Hazards

Eye hazards may result from chemical splashed into the eyes causing corrosive, toxic, or impact injury. Some pesticides are labeled "Restricted Use" due to their corrosive nature. The highest risk occurs during pesticide pouring, mixing, and application. During pesticide applications, chemicals may enter the eyes

through splash back when applying the chemical under pressure into a crack or crevice or when applying pesticides overhead. Injury may also occur during equipment cleaning.

4.1.1.5 Infectious Zoonotic Disease

Care should be taken when trapping and handling live or dead animals. Hantavirus may be transmitted from rodents to humans through body fluid exposure or when breathing aerosolized rodent excreta. Pest management providers may be exposed when handling rodent carcasses after trapping or handling traps contaminated with rodent urine and feces. Feral dogs, cats, skunks, raccoons, and bats may carry and transmit rabies through a bite.

4.1.1.6 Inhalation Hazards

Many pesticides release hazardous vapors and are particularly hazardous in enclosed spaces. Some pesticides are labeled “Restricted Use” due to the high risk of inhalation injury. Personnel may be exposed during mixing, application, and equipment cleaning.

4.1.1.7 Electrical and Fire Hazards

Spot and crack and crevice applications may require application of a pesticide to areas near motors of refrigerators, compressors, and other machinery where it can become an electrical shock hazard. They may also be applied to areas near pilot lights resulting in an explosion and/or fire hazard.

4.1.1.8 Head Impact and Sharp Hazards

Surveys and pest control procedures may be done in attics, crawl spaces, basements, and other areas with low overheads where head impact hazards exist. Some devices used for bird roosting exclusion and rodent control have sharp edges and can cause cuts, puncture wounds, and abrasions.

4.1.1.9 Trip and Fall Hazards

Trip hazards may occur when applicators are spraying without close attention to where they are stepping. Spraying around buildings where there are various obstacles (e.g., plants, utility boxes, plumbing) in the path of the applicator can be particularly hazardous. Pest control may also need to be performed from ladders, on roofs, in ceilings, and in trees. Wet surfaces on the ground or on elevated surfaces can increase the risk of trips and falls.

4.1.1.10 Exposure to Harmful Animals

Venomous animals such as bees, wasps, rattlesnakes, and spiders are potential hazards when attempting to control them. Some of these are very dangerous due to envenomation and allergic reactions. Feral dogs, cats, coyotes, raccoons, and other large pest animals can inflict serious bites or clawing wounds.

4.1.2 Hazard Abatement

Detecting and reporting unsafe or unhealthful working conditions as early as possible, and then promptly controlling the reported hazards, is essential to a successful safety and occupational health program.

4.1.2.1 Operational Risk Management

Operational risk management (ORM) is a decision-making tool to reduce the risk of mishaps, whether in military contingency or support operations Pest management operations pose risks to human health and

the environment that affect the installation's mission that can be reduced and minimized through ORM. Pest management ORM uses the following process to minimize hazards:

1. Identify hazards—the hazards may involve the pesticide or the application equipment (see list of hazards in section 4.1.1).

2. Assess hazards—determine the degree of risk based on the probability and severity of these hazards. For example, the risk may be high if a highly-toxic pesticide is used daily.

3. Make risk decisions—develop risk control options. Decide whether benefits of control outweigh the risks involved.

4. Implement controls

    a. Engineering controls—e.g., use a less-toxic pesticide for controlling the pest

    b. Administrative controls—e.g., place warning placards around pesticide vehicles and pesticide storage areas.

    c. Personal protective equipment—e.g., wear a respirator when an inhalation hazard exists.

5. Supervise—follow-up to determine effectiveness of controls and monitor changes to hazards.

For more information on ORM, go to the Navy Safety Web site at http://www.public.navy.mil/navsafecen/Pages/index.aspx.

4.1.2.2 Training and Education

Pesticide safety is a core requirement for DOD and civilian pesticide applicator certification and licensing programs. Topics included in the DOD training are listed in DODM 4150.07, Volume 1, The DOD Plan for the Certification of Pesticide Applicators. Safety topics are also given during recertification courses. See section 2.4 for specific training information.

4.1.2.3 Read the Pesticide Label

Pesticide labels are found on all pesticide containers used by installation PMSPs. The pesticide label provides directions for mixing, applying, and disposing of pesticides safely. It also includes a list of hazards to humans and first aid treatment. It may also include a list of personal protective equipment that must be worn and user safety recommendations. The label should always be read completely and thoroughly by the applicator before purchasing and using a pesticide. The label is a legal document mandated by FIFRA.

4.1.2.4 Personal Protective Equipment

Personal protective equipment (PPE) should always be used when applying pesticides. The type and level of protection needed will be determined by the toxicity, formulation, and method of application of the pesticide. The pesticide label provides guidance on what PPE to use.

1. Respirator

2. Chemical-resistant gloves

3. Chemical-resistant coveralls or long-sleeve shirt and long pants
4. Chemical-resistant boots
5. Hard hat
6. Goggles
7. Apron
8. Face shield
9. Self-contained breathing apparatus (for fumigation).

Personal protective equipment must be appropriate for the type and application of the pesticide being used. It is the applicator's responsibility to maintain the PPE. Contractors must provide appropriate PPE to their applicators.

4.1.2.5. Pest Control Vehicle Safety Devices

Pest control vehicles should be equipped with safety devices and information.

1. Labels and SDSs for all pesticides in vehicle
2. Emergency medical information including nearest emergency treatment center
3. Fire extinguisher
4. Spill kit
5. First aid kit
6. Cell phone or radio
7. Drinking water supply
8. Rinse water supply for washing pesticide off skin.

4.1.2.6 Pesticides and Equipment

The risk of pesticide exposure can be reduced by selecting the appropriate pesticide and equipment for the job. Applying small amounts of low-toxicity pesticide using appropriate and properly-maintained equipment greatly reduces the risk of harm. Using pesticides that are formulated (e.g., contain emetics) or packaged (e.g., water-soluble packets) to minimize chemical exposure and increase safety should be considered when purchasing pesticides. Pesticide selection is addressed in section 3.4.1. Equipment should be tested with water prior to use to ensure proper application and that it is not leaking. Situational awareness, such as monitoring meteorological conditions and location, may also prevent harmful exposure to pesticides.

4.1.2.7 Protection from Infectious Zoonotic Diseases

Pest control personnel who handle trapped animals or dead animal carcasses should wear gloves to prevent exposure to potentially infectious body fluids. A respirator fitted with a high-efficiency particulate air filter should be worn when entering enclosed spaces with large amounts of rodent feces that might be disturbed and become airborne. Additional protection from hantavirus can be provided by spraying dead rodents and rodent feces with a commercial disinfectant. This will kill hantavirus as well as wet the feces to prevent it from becoming airborne. Detailed guidance on rodent handling is found in AFPMB TG No. 41, Protection from Rodent-borne Diseases with Special Emphasis on Occupational Exposure to Hantavirus.

4.1.2.8 Hazard Communication

All pesticide applicators must receive Occupational Safety and Health Administration (OSHA) Hazard Communication training (29 CFR § 1910.1200). Contractors must carry safety data sheets in their vehicles or, as appropriate, at their on-base administration office. Applicators must understand all of the hazards associated with the chemicals they will use and be able to communicate those to the customer if necessary.

4.1.2.9 Medical Surveillance Program

Department of Defense pesticide applicators are required to be in a medical surveillance program depending on their hazard exposure. Applicators possibly facing exposure to organophosphate or carbamate pesticides should have their cholinesterase levels tested in accordance with https://nmcpeh-simweb.med.navy.mil/Content/medMatrix/MedicalMatrix.pdf, Medical Surveillance Procedures Manual and Medical Matrix. Medical surveillance is conducted by the occupational health clinic at the Naval Branch Health Clinic in accordance with http://www.med.navy.mil/sites/nmcphc/Documents/oem/OccMedFieldOpsManual_Aug2006.pdf, Occupational and Environmental Medicine Field Operations Manual.

4.2 PUBLIC SAFETY

By their nature, many pesticides may pose some risk to humans, animals, or the environment because they are designed to kill or otherwise adversely affect living organisms. Safely using pesticides depends on using the appropriate pesticide and using it correctly.

4.2.1 Potential Hazards to the Public

A potential hazard is the risk of harmful effects from pesticides and the level of risk depends on the toxicity of the pesticide and the exposure a human will receive in any situation.

4.2.1.1 Direct Contact with Pesticides

Pesticide exposure can occur through dermal contact with a pesticide on a surface, inhalation of vapors, or ingestion of pesticide through contaminated food or eating utensils. This type of exposure can occur if a pesticide application is done while unprotected building occupants are present, occupants are allowed entry into buildings before the pesticide has dried, or food and food preparation and serving equipment are not properly protected or cleaned after an application.

4.2.1.2 Pesticide Drift

Pesticide drift occurs when a pesticide leaves the target area and affects unprotected persons outside the area. This commonly occurs outdoors when winds can carry the pesticide off-site. Drift can occur indoors if there is air movement or pesticides are drawn up through ventilation ducts. Pesticide applications that involve small pesticide droplets, such as fogging or ultra-low volume application, or dusts are most susceptible to drift.

4.2.1.3 Contact with Contaminated Water

Some pesticides can move through soil and contaminate groundwater used for drinking. Others, if applied in or close to surface water, can cause contamination of recreational waterways.

4.2.1.4 Injury Due to Animals

The use of an inappropriate pesticide may cause collateral injury due to an insufficient knockdown of the target pest. This can occur with bees and wasps. Some insecticides do not knockdown the insects rapidly and may actually excite them causing them to become more aggressively defensive in behavior. Unprotected persons blocks away from the pesticide application may become the target of their aggression. Injury can also occur when persons get too close to or try to release a trapped animal or try to capture feral animals by themselves.

4.2.1.5 Fumigation Exposure

Fumigants are highly toxic and can cause immediate death upon exposure. Fumigations can be performed in the housing area where it poses a potential hazard to neighbors and pets. During fumigation the chemical is injected into a tarped structure and allowed to remain for 24 hours. The highest risk of injury or death occurs if a person or animal were to enter the tarp during this period or after the tarp is removed, but before the building is completely ventilated. The fumigant, when exposed to air, dissipates rapidly and readily.

4.2.2 Hazard Abatement

Pesticide applicators should continually be aware of the hazards associated with pesticide use in order to protect the public from exposure.

4.2.2.1 Proper Timing of Pest Control Operations

Most indoor application of pesticides should be conducted when building occupants are not present. An exception to this is the application of pesticide baits that are enclosed in a tamper-resistant bait station that does not allow exposure to occupants or pets. The building occupants must remain out of the building to allow the liquid pesticide to dry. Some pesticide labels are specific about re-entry times (time after application that occupants are allowed back into the treated building). Some pesticides, such as fumigants, provide specific directions on aeration of spaces to remove pesticide prior to re-entry. Certain operations, such as bee and wasp control or removal, are best conducted after the area has been cleared of unprotected persons. Refer to the product label for specific information.

4.2.2.2 Preventing Pesticide Drift

Pesticide drift from target areas to areas where humans, animals, and plants can be affected can be reduced through the following means (adapted from University of Nebraska publication G1773, Spray Drift of Pesticides).

1. Select low or nonvolatile pesticides.
2. Read and follow the pesticide label. Apply a pesticide only if an application is warranted.
3. Use spray additives that decrease drift within label guidelines. This will increase the droplet sizes and pesticide effectiveness.
4. Use larger spray nozzle orifice sizes. This will give larger droplets and will increase the number of tank refills, but will improve coverage and effectiveness.
5. Avoid high pressure. High pressure creates finer droplets; 45 PSI should be considered maximum for conventional broadcast spraying.
6. Use drift-reduction nozzles. These will produce larger droplets when operated at low pressures.
7. Use wide angle nozzles and low boom heights, and keep the boom stable.
8. Drift is minimal when wind velocity is less than 10 mph. Do not spray when wind is greater or blowing towards sensitive crops, gardens, dwellings, livestock, or water sources.
9. Use shielded spray booms. When banding, use shroud covers to keep chemical from drifting.
10. For indoor applications, turn off ventilation and close doors to prevent air currents.

4.2.2.3 Prevent Tampering with Animal Traps

Caged animals can be very aggressive. Traps should be placed in areas where they will not be tampered with by humans or pets. Warning signs can be placed on the traps and area occupants can be warned of the risk of injury. Live and dead rodents in traps can also be a hazard for hantavirus. Traps should be placed in areas where humans or domestic animals will not be exposed to the rodents.

4.2.2.4 Protection of Fumigation Sites

Warning signs should be posted at the fumigation site warning of the hazards. Some installation contracts require the contractor to provide a 24-hour roving watchperson to patrol the fumigation site to prevent entry by unauthorized personnel.

4.2.3 Special Safety Considerations

Certain areas require special considerations due to the sensitive nature of the area or the people contained in that area.

4.2.3.1 Child Development Center

Children can be sensitive to pesticides and other chemicals. Parents are also concerned about potential hazards that their children may be exposed to and have a right to know about these hazards. Best practice

is to minimize pesticide use in and around child development centers and schools, use only enclosed baits and low-toxicity pesticides, do not apply pesticides when people are present, and inform staff and parents of any pesticides used on the property. Integrated pest management methods should be used to reduce the health risks of pesticides to children.

4.2.3.2 Branch Clinic

Persons undergoing medical treatment may be highly sensitive to pesticides and pesticide odors in the environment. Additionally, medical equipment and supplies may be contaminated during pesticide applications. Alternative IPM methods must be considered prior to using pesticides in medical treatment areas. If pesticides must be used, then only crack and crevice treatments with low toxicity pesticides or enclosed baits can be used. Application of any liquid or dust formulation must only be done when the area is unoccupied. Guidance for pest management operations in medical treatment facilities can be found in AFPMB TG No. 20, Pest Management Operations in Medical Treatment Facilities.

4.2.3.3. Food Service Areas

Food contaminated with pesticides can lead to pesticide poisoning. Sanitation and exclusion should be the primary means of preventing and reducing pest infestations. Pesticide use in food service areas should be limited to low-toxicity pesticides, applied to cracks and crevices, and baits. The area should be properly prepared for treatment by putting away utensils and equipment and covering food preparation services. After treatment, the area should be thoroughly cleaned to prevent contamination.

4.3 PEST CONTROL ACCIDENTS

In the case of a pest control accidents, applicators should be trained in first aid procedures and identify the nearest medical services.

4.3.1 First Aid

First aid for pesticide accidents is included on the pesticide label. The applicator should be familiar with first aid procedures required for the pesticide they are using. A copy of the label must be available at the application site. For some pesticides, immediate first aid and medical treatment may be required.

4.3.2 Medical Emergencies

Pesticide applicators experiencing an acute exposure to hazardous pesticides or significant injuries sustained in control operations should immediately go to the nearest emergency room capable of treating their emergent condition. Pesticide applicators that are government employees enrolled in a medical surveillance program with the occupational health department should schedule a follow-up appointment after their condition has subsided. The name, address, and telephone number of an emergency medical care facility should be posted in the commercial applicator's vehicle. For pesticide poisonings, a copy of the pesticide label should be given to the medical first responders or taken to the emergency medical facility. If cholinesterase-inhibiting pesticides (e.g., malathion) are used, the proper antidotes include atropine and 2-pam chloride.

CHAPTER 5

Environmental Considerations

5.1 ENVIRONMENTAL MANAGEMENT SYSTEM FOR PESTICIDES

This IPMP puts pesticide management within the framework of the DOD and the Navy Environmental Management System (EMS). This plan provides the tools and products to include pesticide management in the installation's overall EMS program.

5.1.1 Department of Defense Policy

Department of Defense policy states, "The Department of Defense shall integrate EMS into missions, activities, functions, contracts, and installation support agreements as a business practice for improving overall performance. EMS is a vital supporting component of the DOD mission and is therefore the responsibility of all DOD personnel. It is not just an environmental function responsibility, but requires active participation from all functions and organizations." The remainder of this policy and details on the EMS program are found in DODI 4715.17, Environmental Management Systems.

5.1.2 Definition of an Environmental Management System

According to the Council on Environmental Quality, Instructions for Implementing Executive Order 13423, Strengthening Federal Environmental, Energy, and Transportation Management, March 29, 2007, "Environmental Management System means a set of processes and practices that enable an organization to increase its operating efficiency, continually improve overall environmental performance and better manage and reduce its environmental impacts, including those environmental aspects related to energy and transportation functions. EMS implementation reflects accepted quality management principles based on the "Plan, Do, Check, Act," model found in the ISO 14001:2004(E) International Standard and using a standard process to identify and prioritize current activities, establish goals, implement plans to meet the goals, evaluate progress, and make improvements to ensure continual improvement."

5.1.3 Conformance of the Pest Management Program to the Environmental Management System

An EMS is composed of five basic components. The components and how the pest management program conforms to these components are:

5.1.3.1 Policy

The installation has established an environmental policy to support "mission readiness through environmental stewardship." Pest management environmental objectives to meet this policy are:

1. Reduce pesticide pollution that affects the installation's neighbors through the use of IPM to prevent adverse impact on air, water, and land resources

2. Use IPM to preserve aspects of the natural environment by managing and controlling invasive and nuisance pests and preventing pesticide pollution

3. Ensure and maintain the competence of pest management personnel through certification and training to ensure that effective operations and technologies are used to control pests that minimize waste, prevent air and water pollution, minimize health and safety risks, and dispose of waste safely and responsibly

4. Enable the IPMC to maintain effective oversight and coordination of the program and liaison with local agencies in order to ensure regulatory compliance.

5.1.3.2 Planning

This IPMP is the installation's primary planning document. Specific planning items included in the IPMP are:

1. Legal and other requirements as identified in section 3.3, appendix F, and throughout the plan.

2. General objectives and targets as included in section 1.3.2 and specific pest management objectives included in the IPM sheets in chapter 8.

5.1.3.3 Implementation

Implementation of the EMS is addressed in the following sections of the IPMP:

1. Roles and responsibilities—section 2.1.

2. Pest management personnel training and awareness—section 2.4.

3. Program documentation includes record keeping, reporting, and IPMP updates—sections 2.3 and 1.1.4.

4. Operational requirements—section 1.3.3. Operational control is the responsibility of the pest management service providers and is maintained through their contract. Integrated pest management is the operation used for reducing environmental impacts and supporting mission priorities.

5. Safety considerations—chapter 4.

5.1.3.4 Checking and Corrective Action

The success of an EMS depends on the ability of an installation to assess and correct itself. The self-assessment checklist (appendix C) provides the basis for a self-assessing and self-correcting system.

5.1.3.5 Management Review

The review of the program is conducted during environmental audits by Commander, Navy Installations Command (CNIC).

5.1.3.6 Emergency Management System Definitions

The following are common terms used in EMS:

1. Practice—any activity conducted by an installation or its tenants in performing their missions that has an actual or potential impact on the installation's assets. The term practice includes equipment, processes, and facilities. It includes both business and management practices.

2. Practice owner—the person, unit, or organization that operates, conducts, controls, or is otherwise responsible for a practice.

3. Environmental aspects—elements of an organization's activities, products, or services which can interact with the environment.

4. Impact—the positive or negative effects on assets of conducting business and management practices.

5. Vulnerable assets—A resource on which the installation depends or for which it has some responsibility, and which may be impacted by the conduct of practices. Vulnerable assets may include environmental, historical, and cultural areas on and off the installation; personnel health and safety; mission effectiveness; military training lands; real property; financial resources; and public relations status.

5.2 ENVIRONMENTAL CONSIDERATIONS ON THE PESTICIDE LABEL

If the pesticide is potentially harmful to the environment, information will be provided in the following sections of the label:

1. Directions for Use—If pesticide drift is a potential environmental hazard, the directions may require certain application equipment and/or the addition of an anti-drift agent to the tank mix.

2. Environmental Hazards—This section may indicate the pesticide is particularly hazardous to specific animals (e.g., bees, fish). It will also provide information on how to avoid environmental damage.

5.3 MANAGING ENVIRONMENTAL IMPACT

Air, water, and soil risk contamination from pesticides. Pesticide drift to outside the target application area is the primary reason for contamination. Pesticides that pose the highest risk of contamination are herbicides applied to improved and unimproved grounds. Despite being applied in water, pesticides to control mosquito larvae pose a minimal risk due to the target-specific nature of the pesticide (e.g., the biopesticide, *Bacillus thuringiensis israelensis* (Bti), and insect growth regulators). Many procedures to reduce the impact of pest management practices on vulnerable assets are already in place.

5.3.1 Pesticide Pollution

A pesticide is unique as a potential environmental pollutant. When it is applied properly for the correct target pest and to the target location, it is not considered a pollutant. When a pesticide is applied or it drifts outside of the target area, it becomes a pollutant. Pollution can occur during most pest management practices as the result of accidental spills, air and water emissions, and container disposal. Pollutants can be in the form of pesticide residues from equipment and container cleaning or be waste containers.

5.3.1.1 Synthetic Pyrethroids

Pyrethroids are insecticides that are widely used for household, garden, and agricultural pest control. Most were replacements for more toxic and environmentally-hazardous organophosphate and carbamate

insecticides. Surveys have indicated that some pyrethroids are being detected in urban stream sediment and at least one chemical has been shown to be toxic to sediment dwelling organisms. Specific pyrethroids of concern include:

1. Bifenthrin (e.g., Talstar)
2. Cyfluthrin (e.g., Cykick, Tempo)
3. Beta-Cyfluthrin (e.g., Tempo Ultra)
4. Cypermethrin (e.g., Demon, Cynoff)
5. Deltamethrin (e.g., Deltadust)
6. Lambda-Cyhalothrin (e.g., Demand)
7. Permethrin (e.g., Permanone)
8. Tralomethrin

Outdoor operations pose the greatest risk for pyrethroid contamination of surface water and stormwater runoff. Increased risk operations that may use pyrethroids include landscape plant insect control, agricultural insect control, and uniform repellent treatment.

5.3.1.2 Pollinator Protection from Pesticides

The Office of the Under Secretary of Defense distributed a memorandum on the DoD Policy to Use Pollinator-Friendly Management Prescriptions dated 5 Sep 2014 (located in additional source documents). This memorandum is issued in accordance with and references DoD Instruction 4150.07 on DoD Pest Management and DoD Instruction 4715.03 on Natural Resources Conservation Programs. In response to this memorandum, NAVFAC Applied Biology put together the "Pollinator Friendly Pesticide Applicator Best Management Practices" fact sheet (located in additional source documents).

Pollinators, such as bees, bats, birds, and butterflies, are essential to the majority of the flowering plants in the environment and to the production of more than 130 different food crops. Protection of both managed bee colonies that are used in the agricultural outleases and feral bees must be considered in pest management operations. Pollinators are highly sensitive to many pesticides, especially insecticides. Best management practices to protect pollinators include:

1. Read the pesticide label for any precautions for bees and apply the product in a manner consistent with the label directions.
2. Use less hazardous insecticides. Certain classes of insecticides, such as organophosphates, carbamates, and neonicotinoids (i.e., imidacloprid), are highly toxic to bees.
3. Choose the least hazardous insecticide formulation if possible. Granules are the least hazardous. Dusts are the most hazardous because they are similar in size to pollen, stick readily to the hairs on the insect, and can be carried back to the nest.
4. Use insecticides with short residuals. The label will include a residual toxicity (RT) time that is the time after application until there is minimal toxic effect on bees.

5. Avoid applying any bee-toxic pesticides on blooming plants that attract bees.

6. Do not apply insecticides when temperatures are forecast to be unusually low or when the evening forecast is for dew. These conditions extend the period in which the insecticide residue remains toxic.

7. Apply pesticides that are toxic to bees at night when most honeybees have stopped foraging and returned to their hives.

8. Use ground applications instead of aerial applications to reduce pesticide drift out of the target area.

Efforts should be made to conserve bee colonies. If the situation allows, bee swarms and hives should be removed and relocated rather than destroyed. For more on protecting bees and other pollinators from pesticides go to the EPA Pollinator Protection Web site: http://www2.epa.gov/pollinator-protection.

5.3.1.3 Pollution Prevention

The following pollution prevention best practices should be used on the installation:

1. Determine the need for pesticide use by conducting surveillance.

2. Apply pesticides and clean equipment away from storm drains to prevent storm water contamination.

3. Do not pour pesticide container rinsate into drains. Apply rinsate to a site listed on the pesticide label, store rinsate to use for future pesticide mixing, or dispose of according to local regulations.

4. Use less-toxic and target-specific pesticides.

5. When applying permethrin repellent to uniforms outdoors, do not mix or apply near storm drains or where water run-off will result in storm water contamination, avoid overspray of pesticide onto the ground, and apply spray tank rinsate to uniforms.

6. Minimize outdoor applications of pyrethroid pesticides.

7. Use targeted spot spraying or crack and crevice applications rather than broadcast or baseboard spraying.

8. Minimize pesticide storage on the installation through proper inventory management and by not allowing contractors to store pesticides on the installation.

9. Use rodent traps rather than rodenticides.

5.3.2 Natural and Cultural Resources Protection

Natural resources on the installation have the potential to be impacted by pest management operations or have an impact on these operations. These pest management operations include, but are not limited to, surveys, trapping, weeding, biological control, and pesticide use. The installation's INRMP provides detailed information on the natural resources found on the installation. The INRMP also lists management objectives and recommendations to protect and enhance the installation's natural resources programs.

Any archeological sites on the installation are at low risk for damage due to pest management operations. Certain historical buildings may require special treatment depending on the pest management activity. The installation's ICRMP provides detailed information on the cultural resources found on the installation.

5.3.2.1 Environmentally-Sensitive Areas

Sensitive habitats are declared in the installation INRMP. The IPMC is responsible for knowing the boundaries and restrictions of sensitive habitat(s) on their respective site and communicating this information to any pest control or grounds contractors via the PMPAR. Although the IPMC should have a general knowledge of these areas, any proposed application of pesticides in any of these areas must first be coordinated and approved by the natural resources manager. Applications of pesticides to wetlands or other environmentally sensitive sites, such as tidal marshes and beaches, or around these areas should be carefully planned. Strict adherence to both the pesticide label and the clearances described in the INRMP are required.

5.3.2.3 Invasive Species Prevention

Invasive species can cause damage to native habitats and introduce diseases to native plants and animals. All military vehicles and materials that have been in contact with foreign soil and returning from foreign locations including Hawaii are required to be cleaned by the deployed unit and inspected by the U.S. Department of Agriculture Plant Pest Quarantine Officer prior to disembarkation onto U.S. soil per SECNAVINST 6210.2A, Quarantine Regulations of the Armed Forces. The purpose of these inspections is to prevent the introduction of disease causing organisms and plant pests. Although the inspections are generally thorough, the equipment of recently redeployed units should be monitored to ensure that any introduced pests are destroyed properly. Any pests found on this equipment should be reported to the environmental division.

5.3.2.4 Threatened and Endangered Species

Section 7(a) of the Endangered Species Act (ESA) (16 U.S.C. § 1536(a)-(d)), as amended, requires federal agencies to evaluate their actions with respect to any species that is proposed or listed as endangered or threatened and with respect to its critical habitat. Regulations governing this interagency cooperation are included in 50 C.F.R. § 402.

A comprehensive list of endangered and threatened species is listed on the U.S. Fish and Wildlife Service (USF&WS) Web site. Listed species habitats are also protected as critical habitat under the ESA. Critical habitat information can be found through species information found at the USF&WS Web site.

Most species of mammals (including bats, raccoons, and skunks) and all but a few birds are protected by state or federal law. Federally-protected species, their nests, or their eggs may not be taken without obtaining permits from the U.S. Fish and Wildlife Service. Control of state-protected species may require permits from the state. All attempts shall be made to solve the problem through habitat alteration, exclusion, fright techniques, or similar approaches before lethal control is attempted.

There is one species designated as threatened (T) by the federal government, and several state endangered (SE), state threatened (ST), or state species of special concern (SSC) which are known to occur on the Northwest Annex. These are the northern long-eared bat, *Myotis septentrionalis* (T), Rafinesque's big-eared bat (SE), canebrake rattlesnake (SE), bald eagle (ST), Dismal Swamp southeastern shrew (ST), Atlantic white cedar community (SSC), bald cypress community (SSC), silky camellia (SSC), and a southern coastal plain mesic mixed hardwood forest (SSC). No threatened or endangered species are

known to occur on the Portsmouth Annex, Lafayette River Annex, or the Norfolk locations of NSA Hampton Roads.

5.3.2.5 Cultural Resources

Pest control operations should be checked for consistency with the Integrated Cultural Resources Management Plan. Pest management operations requiring alteration of the historical structure, including exclusion modifications and significant changes in landscape, will require consultation with the cultural resources program manager (CRPM) through the IPMC.

Termites damage wooden structures and incidental wood in steel and concrete buildings, such as trim or molding, paneling, or door and window frames. Annual termite inspections detect termite infestations before significant damage occurs. Any termite inspections of historical buildings should be documented using DD Form 1070 and reported to the CRPM.

NSA Hampton Roads does not have any historic buildings or known cultural resources of importance, although uncovered archaeological sites may be present in undeveloped areas.

5.3.3 National Pollutant Discharge Elimination System

Water pollution degrades surface waters making them unsafe for drinking, fishing, swimming, and other activities. As authorized by the Clean Water Act, the National Pollutant Discharge Elimination System (NPDES) permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States. The permit is available to operators who discharge to waters of the United States from the application of either biological pesticides or chemical pesticides that leave a residue when application is for one of four use patterns:

1. Mosquito and other flying insect control
2. Aquatic weed control
3. Aquatic nuisance animal control
4. Forest canopy pest control.

If pesticide applications for the above use patterns are expected to exceed thresholds, a Notice of Intent (NOI) and preparation of a Pesticide Discharge Management Plan (PDMP) (PDMP template included in appendix G) may be required. Practicing integrated pest management, recordkeeping, and monitoring are also requirements under the NPDES permits.

5.3.4 Spill Prevention and Management

Installation spill prevention guidelines shall be followed. The following spill prevention actions shall be taken:

1. Spill kits shall be readily accessible in all pest management vehicles, mixing sites, and pesticide storage facilities.
2. Pesticides shall only be stored in an area with containment to hold a spill and without a floor drain.

3. Portable mixing pads shall be used when appropriate.

4. All pesticide applicators shall be familiar with the installation emergency management plan, if available, and whom to notify in case of a spill.

All pesticide applicators are trained on spill response procedures as part of their initial pest management certification/licensing training. In accordance with OPNAVINST 3440.17 "Navy Installation Emergency Management Program", spills will be managed as described in the installation emergency management plan. Further information on preventing and controlling pesticide spills is contained in the AFPMB TG No. 15, Pesticide Spill Prevention and Management.

5.3.5 Hazardous Materials and Hazardous Waste Management

Pesticides, being hazardous materials, shall be managed in accordance with the applicable hazardous materials regulations, instructions and installation orders/procedures. Proper inventory management and planning will prevent waste generation. The appropriate use of pesticides produces very little hazardous waste. Rinse water containing pesticide residues usually has very small quantities of chemical and is often applied to the target pest site. Not permitting contractor storage of pesticides and on-site disposal of pesticide waste eliminates the need for hazardous material and waste management. In general, pesticides that are not applied must be disposed of as hazardous waste. Large quantities of hazardous waste may be produced when a pesticide is not used by its expiration date. It may also be produced if a pesticide is not used up before the registration for that pesticide is canceled and the stop-use date has occurred. These pesticides may be disposed of as universal waste only when allowed by the standards for universal waste management found in 40 CFR § 273. Any excess pesticides or absorbent material used for spill clean-up requiring disposal requires evaluation by the hazardous waste coordinator in the environmental division to ensure proper disposition.

5.4 PUBLIC PERCEPTION

The misuse of pesticides that lead to animal or human injury can lead to negative publicity for the installation. This is also the case with accidental pesticide spills, especially if they occur off-base or cause contamination of a local natural or cultural resource.

CHAPTER 6

Emergency Pest Management

6.1 PUBLIC HEALTH EMERGENCIES

Pests create a public health emergency when the pests increase in number and/or are found to carry human disease pathogens. A public health emergency, or potential emergency, requiring pest management action may be indicated in several ways. See the Emergency Vector-borne Disease Control Plan (EVDCP) for more information (appendix H).

6.1.1 Natural or Manmade Disaster

Usually pest problems do not develop immediately after a disaster, such as earthquakes, wildfires, floods, vehicle accidents and terrorist attacks. Public health pest problems may be the result of increased amounts of refuse, collapse of local infrastructure (e.g., lack of garbage pick-up), decay of human and animal bodies, and accumulation of standing water. The potential pest-related consequences are vector-borne or zoonotic disease outbreaks and increased contact with rodents and feral animals that may cause injury.

6.1.2 Vector-Borne or Zoonotic Disease

The report of human cases of vector-borne or zoonotic disease or the detection of infected mosquitoes or sentinel animals is an indicator of a public health emergency or potential emergency and often warrants an increase in pest management activities.

1. Reports of human cases—Many human cases of vector-borne and zoonotic disease identified in local medical facilities are reportable to the local and/or state health agencies. A report of a human case of West Nile virus or other vector-borne disease may initiate an investigation and result in alerts going out to other hospitals and clinics if it appears that the case was locally acquired. Immediate vector control may be necessary to prevent further transmission.

2. Detection of infected mosquitoes or sentinel animals—Routine surveillance for mosquito-borne diseases are conducted by local and state health agencies. These agencies report testing results through the public health system. This surveillance program is an early warning system that indicates when vector control should be initiated or increased to prevent human disease. The CDC's ArboNET Maps, http://diseasemaps.usgs.gov/mapviewer/ provide mosquito-borne disease information by state.

6.1.3 Animal Attack

Attacks on humans by vertebrate animals almost always require an emergency medical response. If a person is bitten or scratched by a mammal such as a dog, cat, skunk, coyote, fox, raccoon, opossums, or bat, they are at risk of contracting rabies and should begin a treatment program. If the animal that was involved can be positively identified and safely captured, it should be held for testing to determine if it is infected with rabies or other zoonotic diseases.

Bites by venomous snakes are always emergencies, and the victim should be immediately transported to the nearest medical treatment facility. If the snake can be identified or killed/captured, it may help in the selection of the proper antivenin for treatment.

Certain ants, bees, and wasps can cause painful stings and, in some cases, severe allergic reactions. The local fire department is usually the primary responder to bee sting incidents. Fire department personnel have been trained to protect and manage bee sting victims. A stinging incident is not considered a pest control response issue, but rather, an emergency response and any and all appropriate bee control measures can be used. If fire department response is delayed, installation first responders should be trained how to protect themselves and victims from bee stings.

6.2 AGRICULTURAL EMERGENCIES

Agricultural emergencies are the result of the introduction of insects or other animals that can cause extensive damage to agriculture or forestry in the state. Examples of introduced agricultural pests include the Mexican fruit fly and gypsy moth. Military installations can be a conduit for the introduction of these pests due to the movement of military equipment and personnel in and out of the state and the country. The military's role in preventing introduction of these pests is described in OPNAVINST 6210.2, Quarantine Regulations of the Navy and SECNAVINST 6210.2A, Quarantine Regulations of the Armed Forces. Inspections to prevent importation of pests are normally conducted at the port of debarkation in the foreign country.

6.3 EMERGENCY PEST MANAGEMENT RESOURCES

Installation PMSPs maintain pesticides and equipment to manage most emergencies. Contract PMSPs can be used for emergencies if it is written in the contract specifications. The Naval Branch Health Clinic should develop an EDVCP to manage public health emergencies (appendix H). It includes additional Navy and local government contingency vector surveillance and control resources.

CHAPTER 7

Program Resources

NSA Hampton Roads has access to the following support agencies and organizations for pest management assistance. Contact information specific to the installation is included in appendix B.

7.1 NAVAL FACILITIES ENGINEERING COMMAND, ATLANTIC APPLIED BIOLOGY

Naval Facilities Engineering Command, Atlantic Applied Biology is currently staffed by full-time, civilian DOD professional pest management consultants certified in DOD pesticide applicator categories 3, 5, 6, 7, 8, and 11. These personnel are assigned the following responsibilities:

1. Review and approve installation IPMPs in accordance with DOD and Navy policies

2. Provide technical assistance to the installation IPMCs, environmental managers, safety officers, medical officers, and other regional and installation personnel regarding pest management and pesticide regulatory compliance

3. Review and approve or reject pesticides and equipment to be used on installations

4. Conduct on-site program reviews and environmental compliance program external assessments to ensure compliance with the regulations and IPMPs

5. Compile and report actual pesticide use and pest management operations to appropriate DOD agencies

6. Provide IPM recommendations and pest identification;

7. Assist installations with writing or re-writing IPMPs

8. Provide recertification training for DOD-certified applicators as well as initial and recertification training for PMPARs/IPMCs.

The NAVFAC Applied Biology Web site is at: https://hub.navfac.navy.mil/webcenter/portal/ev/EV+Divisions/EV2+Planning+and+Conservation/Applied+Biology. This site is on the Naval Facilities Engineering Command intranet and is only available to NAVFAC, CNIC, and U.S. Marine Corps personnel who have an account. To request an account, personnel must have a sponsor with access approve the request through the initial single sign-on page.

7.2 NAVY ENVIRONMENTAL AND PREVENTIVE MEDICINE UNIT TWO

The Navy Environmental and Preventive Medicine Unit Two (NEPMU-2) is staffed by three full-time, active duty Navy entomologists. The entomologists are certified in DOD pesticide applicator categories 3, 5, 6, 7, 8 and 11 and are assigned the following responsibilities:

1. Acts as BUMED's professional pest management consultants to provide BUMED review of Emergency Vector-borne Disease Control Plans

2. Provides technical assistance on the surveillance and control of vectors on installations

3. Provides vector-borne disease risk assessments and disease prevention recommendations when requested

4. Provides disease vector management consultation and identification services

5. Provides contingency pest management in the event of a disaster or disease outbreak.

The NEPMU-2 Web site is at: http://www.med.navy.mil/sites/nepmu2/Pages/default.aspx.

7.3 VIRGINIA COOPERATIVE EXTENSION

The Virginia Cooperative Extension responds to the needs of individuals and organizations in Virginia by providing information and guidance in the areas of agriculture, natural resources, and consumer sciences.

The Web site is at: https://www.ext.vt.edu/.

The Virginia Cooperative Extension, Norfolk and Chesapeake local offices serve the cities where NSA Hampton Roads is located. Pest management service providers can obtain soil sample kits from the office and send them in for analysis. Extension agents can also visit the base to help in diagnosing problems.

The Norfolk Virginia Cooperative Extension Web site is at: http://offices.ext.vt.edu/norfolk/. The office can be contacted at (757) 683-2816.

The Chesapeake Virginia Cooperative Extension Web site is at: http://offices.ext.vt.edu/chesapeake/. The office can be contacted at (757) 382-6348.

7.4 VIRGINIA DEPARTMENT OF AGRICULTURE AND CONSUMER SERVICES

Personnel from the Virginia Department of Agriculture and Consumer Services are the pesticide regulatory officials for the Virginia. The main office is located in Richmond and is staffed with personnel that can provide information regarding Virginia and local pesticide regulations.

The Virginia Department of Agriculture and Consumer Services Web site is at: http://www.vdacs.virginia.gov/.

7.5 VIRGINIA DEPARTMENT OF HEALTH

Public health biologists provide vector surveillance and control assistance throughout Virginia. They are Virginia-certified in public health pest management and provide assistance to counties that either do not have or only have limited vector surveillance programs.

The Virginia Department of Health, Vector Borne Disease Control Web site is at: http://www.vdh.virginia.gov/environmental-epidemiology/vector-borne-disease-control.

CHAPTER 8

Integrated Pest Management Sheets

The following sheets provide general guidance for control of common pests and are not installation specific. They should be used as a basis for pest management action, but should not be considered "regulations" for the job. Management sheets should be used as guidelines to help implement reasonable, cost effective, safe, environmentally responsible control of pests. The integrated pest management coordinator (IPMC) or other pest control personnel may choose to establish different thresholds and use IPM methods that are more appropriate to their local circumstances. Write in any new ideas or programs to maintain a document that will remain applicable over time. Any suggested pesticides from these sheets are required to be approved before use.

American Cockroaches

TARGET PEST	
TARGET PEST(S)	American cockroaches (*Periplaneta americana*)
TARGET SITE(S)	Office buildings, warehouses, residences, storm sewers
PURPOSE	Control cockroaches that may cause damage through food contamination, affect human health through allergic reactions or "entomophobia", or be an aesthetic or morale nuisance.
RESPONSIBILITY	• All Personnel: Ensure proper sanitation in all living and working spaces. • Preventive Medicine Technicians: Conduct facility sanitation inspections, enforce food-handling regulations, and provide pest management recommendations. • Pest Management Service Provider: Conduct integrated pest management to control pest infestations. • Integrated Pest Management Coordinator: Oversee all pest management operations and ensure the use of IPM. • Pest Management Performance Assessment Representative: Ensure contracted PMSPs perform work in accordance with contract specifications. • Facilities Maintenance Provider: Perform facility repairs and improvements that prevent and minimize pest infestations as requested.
SURVEILLANCE	

METHODS	• Visual inspections (visual surveys of low to moderate infestations may require visiting the facility at night)
	  o Observation of pests in harborages
	  o Inspect floor drains
	  o Inspect areas with heat and moisture
	• Application of a flushing agent to suspected harborages
	• Sticky trap surveys
	• Vacuum surveys of harborages
	• Personnel complaints: including information on when, where, and how many pests were observed
	• Conduct pre- and post-treatment surveys to determine whether control operation was effective

FREQUENCY	• Daily observation by building occupants • Monthly observation and/or sticky trap monitoring by cognizant pest management or preventive medicine personnel

RECOMMENDED ACTION THRESHOLD	• Visual sighting of one or more cockroaches (all life stages) per room per survey—flushing agents or sticky traps may be used • Sighting of one egg capsule per survey
NONCHEMICAL CONTROL	
SANITATION	• Thoroughly clean potential food sources in buildings, especially coffee messes and food preparation areas. • Clean spills up as soon as possible. • Clean out floor drains by rinsing with hot water or using cleaners specifically designed to remove sludge from pipes. • Store food in pest-proof containers. • Empty trash cans daily or avoid putting food items in trash. • Do not eat at desk; eat in a designated coffee mess or dining area.
ELIMINATE HARBORAGE	• Seal cracks and crevices with caulk. • Remove corrugated cardboard and other materials that can serve as harborage.
ELIMINATE STANDING WATER	• Fix leaking plumbing especially around sinks, faucets, and dishwashers. • Remove standing water from floors after daily cleaning.
PREVENTION	Inspect food boxes before bringing them into a building.
MECHANICAL REMOVAL	Vacuum cockroaches from their harborages. Use a wet/dry vacuum cleaner filled with water or empty and dispose of vacuum bag immediately.
PEST PROOFING	• Seal holes in walls and ceilings and other areas that may serve as cockroach harborage as required. Request support from facilities maintenance provider if necessary. • Screen floor drains if possible.
EDUCATION	Proper storage of food and sanitation to prevent infestations.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Pyrethroids, fipronil, hydramethylnon, indoxacarb, imidacloprid, abamectin, boric acid, insect growth regulators.
METHODS	• Flushing Agents: The pest management service provider may use aerosol contact pesticides directed into potential harborage areas to flush out and kill pests as needed. • Crack and Crevice/Spot Treatment Residuals: The pest management service provider may apply a residual pesticide spray to all known or suspected harborages, feeding sites, or passageways (such as under dishwashers and refrigerators or behind stoves). • Baits: Cockroach baits (station containing solid bait or injectable style gel baits) will be used as much as possible. Gel bait can be applied to a sheet of hardware cloth and hung in manholes. Proper bait placement is critical to the success of treatment. Do not apply other insecticides around bait treatment areas. • Dusts: Boric acid dust is an effective low-toxicity insecticide that can be applied to wall voids and into manholes of storm sewers. The treatment area should remain dry after the application to avoid washing the dust away. • Growth Regulators: Affect the growth of the insect and prevents them from developing into egg-laying adults. Insect growth regulators will always be mixed with knock-down pesticides.

CONSIDERATIONS	
SENSITIVE AREAS	• Exposed food products, food containers, counter tops, any surface where food may be stored or prepared, or any food storage area. • Minimize application of pesticides directly into drains. • Use care in selecting pesticides for use in storm sewers as this can lead to storm water pollution problems. Applications should be made when dry and storm water is not anticipated within a week.
PROHIBITED PRACTICES	• Do not do preventive baseboard spraying in the absence of a pest. • Do not apply liquid or dust formulations to occupied spaces or in the presence of exposed food. • In food service areas, use only insecticides specifically labeled for those areas.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Most insecticides used for indoor pest control are low in toxicity (signal word "Caution"), but care should be taken to prevent exposure to humans and domestic animals. • Outdoor treatments with pyrethroids are susceptible to runoff and contamination of storm water. • Disposing of pesticides in a drain or storm drain is strictly prohibited.

THIS PAGE IS INTENTIONALLY BLANK.

Cockroaches in Food Preparation Areas

TARGET PEST	
TARGET PEST(S)	Cockroaches (primarily German cockroach, *Blatella germanica*)
TARGET SITES(S)	• Food service facilities • All government dining facilities including galleys, sculleries, bakeries, storage, and mess decks. • All MWR facilities including clubs, restaurants, and storage. • All commercial lessees. • Coffee messes and snack bars in administrative areas.
PURPOSE	Control cockroaches that may cause food contamination, allergic reactions, or a nuisance.
RESPONSIBILITY	• Food Service Personnel: Ensure compliance with food handling regulations that prevent pest infestations. • Installation Preventive Medicine Technicians: Conduct food service inspections, enforce food handling regulations, provide quality assurance for pest control, and provide pest management recommendations. • Pest Management Service Provider: Conduct integrated pest management to control infestations. • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications. • Facilities Maintenance Provider: Perform facilities repairs and improvements that exclude and minimize pest infestations as requested.
SURVEILLANCE	

METHODS	• Visual inspections
	  ○ Observation of pests in harborages
	  ○ Application of a flushing agent
	• Sticky trap surveys
	• Vacuum surveys of harborages
	• Personnel complaints: including information on when, where, and how many pests were observed.
	• Conduct pre- and post-treatment surveys to determine whether control operation was effective.
	• Surveys should identify environmental conditions conducive to infestation.

FREQUENCY	• Daily observation by food service personnel. • Monthly observation and/or sticky trap monitoring by cognizant preventive medicine personnel.

ACTION THRESHOLD	• Visual sighting of 3 or more cockroaches (all life stages) per room per survey. Flushing agents or sticky traps may be used. • Sighting of 1 egg capsule per survey.
NONCHEMICAL CONTROL	
SANITATION	• Cleaning of floors and all surfaces to include debris and grease removal. • Clean up spills. • Store food in sealed containers. • Remove cardboard boxes from storage areas. • Keep garbage in containers with tight-fitting lids and use liners.
ELIMINATE STANDING WATER	• Fix leaking plumbing especially around sinks, faucets, and dishwashers. • Remove standing water from floors after daily cleaning.
MECHANICAL REMOVAL	Vacuum cockroaches from their harborages. Use a wet/dry vacuum cleaner filled with water or empty and dispose of vacuum bag immediately.
PEST PROOFING	Seal holes in walls, ceilings, and other areas that may serve as cockroach harborage as required. Request support from facilities maintenance provider if necessary.
EDUCATION	• Proper storage of food and sanitation to prevent infestations and increase effectiveness of pesticide applications • Understanding of how baits work
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Fipronil, hydramethylnon, boric acid, indoxacarb, imidacloprid and abamectin baits; boric acid dust; pyrethroids
METHOD OF DISPERSAL	• Flushing Agents: The pest management service provider may use aerosol contact pesticides directed into potential harborage areas to flush out and kill pests as needed. • Crack and Crevice Residuals: The pest management service provider may apply (by crack and crevice technique) a residual pesticide spray to all known or suspected harborages, feeding sites, or passageways. • Spot Treatment Residuals: A residual pesticide may be applied as a spot treatment to indicated areas (such as under dishwashers and refrigerators or behind stoves). • Baits: Cockroach baits (station or injectable style gel baits) will be used as much as possible. Gel baits can be more effective than dry baits due to the moisture in the bait and because it can be applied to more areas. • Growth Regulators: Insect growth regulators will always be mixed with knock-down pesticides.
RESTRICTIONS/ REGULATIONS/ PERMITS	• Do not do spot treatments indoors. • Do not apply to baseboards as a preventive residual spray. • Do not apply liquid or dust formulations of insecticides in occupied spaces.
CONSIDERATIONS	
SENSITIVE AREAS	• Exposed food products, food containers, counter tops, any surface where food may be stored or prepared, or any food storage area. • Ensure that insecticides do not enter drains, streams, lakes, or other surface water.

PROHIBITED PRACTICES	• Do not use ultrasonic pest repelling devices. • Do not use aerosols, dusts, and other insecticide formulations that can become airborne in occupied spaces or when food is exposed; baits may be applied when spaces are occupied • Do not do preventive baseboard spraying in the absence of a pest.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Allow for ventilation of spaces after liquid insecticides have been applied. • Clean food preparation surfaces after treatment. • Applicators must wear personal protective equipment as required by the product label. • Environmental impact is minimal since applications are performed indoors

THIS PAGE IS INTENTIONALLY BLANK.

Drain Flies

TARGET PEST	
TARGET PEST(S)	Drain flies (*Psychoda* sp.); sometimes called moth flies, sewage flies, or filter flies.
TARGET SITES(S)	Buildings where adult flies may become a nuisance. These flies may be very common around sewage treatment facilities, where they are considered beneficial decomposers of organic matter.
PURPOSE	Control flies that may be both a nuisance and a health hazard due to respiratory problems that can be associated with the inhalation of fly hairs and body parts. Drain flies are also able to mechanically transfer bacteria and other microorganisms from their breeding sites to places where humans live and work.
RESPONSIBILIES	• All personnel: Ensure proper sanitation in all living and working areas to avoid conditions that are attractive to flies. • Facilities Maintenance Service Provider: Periodically clean drain pipes to prevent buildup of organic matter where drain flies breed. • Pest Management Service Provider: Conduct integrated pest management to control infestations. • Pest Management Performance Assessment Representative: Ensure contracted pest management service provider performs work in accordance with contract specifications.
SURVEILLANCE	
METHODS	• Visual sighting: Adult drain flies will congregate on walls and windows of rooms containing drains where drain flies are breeding. Adults are weak fliers, and usually make a series of short, erratic flights to move from one area to another. The body and wings are hairy, and the wings are held roof-like over the body when at rest, giving the fly a moth-like appearance. Adult coloration is yellow, gray, or black. • Source drain: An attempt should be made to locate the drain(s) from which flies are emerging so that the breeding sites can be targeted. Sealing the suspected drain opening with a glue board, masking tape, or inverted plastic cup overnight should trap adult flies if they are present.
FREQUENCY	Scheduled surveys are not typically required. The presence of flies resting on walls in restrooms and other areas with drains will typically prompt a request for pest control.
ACTION THRESHOLD	Sufficient numbers of flies to constitute a nuisance indicate the need for treatment.

NONCHEMICAL CONTROL	
HABITAT REMOVAL	• Drain cleaning: Drain flies breed in accumulated organic matter inside drainpipes. This material may be removed with over-the-counter drain cleaners. A stiff brush may be necessary to remove heavy buildup. • Bacterial drain cleaners: Products containing a specialized complex of bacteria can be used to digest the organic matter in which drain fly larvae breed and should then be followed by rinsing with very hot water. These products cannot be used in conjunction with other cleaning products, and are only available to pest control operators.
EDUCATION	• Educate building occupants on sanitation, and proper food disposal.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Pyrethrum-based
METHOD OF DISPERSAL	Pyrethrum-based aerosols may be used to kill adult flies. However, the breeding site must be eliminated to prevent additional flies from emerging.
RESTRICTIONS/ REGULATIONS/ PERMITS	Do not apply liquid or dust formulations in occupied spaces.
CONSIDERATIONS	
SENSITIVE AREAS	• Chemical pesticide use inside hospitals should be minimized as much as possible to avoid exposing patients. Control should focus on drain cleaning, which will provide better control and reduce the health risks associated with pesticides. • Ensure that insecticides do not enter drains, streams, lakes and other surface water.
PROHIBITED PRACTICES	• Do not use ultrasonic pest repelling devices. • Do not apply aerosols, dust, and other insecticide formulations that can become airborne to occupied spaces or when food is exposed.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Allow for ventilation of spaces after liquid insecticides have been applied. • Clean food preparation surfaces after treatment. • Applicators must wear personal protective equipment as required by the product label. • Minimal

Fruit Flies

TARGET PEST	
TARGET PEST(S)	Small flies in the family Drosophilidae, commonly called fruit flies or vinegar flies.
TARGET SITES(S)	Refuse containers, offices with windows facing the loading docks, galleys, and other areas that may have ripening fruit.
PURPOSE	Control flies that reduce the quality of life.
RESPONSIBILITY	• All Personnel: Ensure proper sanitation in all living and working areas to avoid conditions that are attractive to flies. • Janitorial Personnel: Ensure that refuse containers are emptied daily. Also, periodically clean refuse containers to prevent the buildup of organic matter where flies breed. • Facilities Maintenance Provider: Provide necessary building repairs and modifications needed for pest exclusion. • Pest Management Service Provider: Conduct integrated pest management to control infestations. • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications.
SURVEILLANCE	
METHODS	• Flies are attracted to ripening and rotting fruit, as well as other decaying organic matter. • Flies can be seen hovering around refuse containers and resting on walls and cabinets near refuse containers. Fruit flies can be distinguished from other small flies by their tan or yellow colored bodies and red eyes.
FREQUENCY	• Scheduled fly surveying is generally not necessary. • Scheduled sanitation should prevent infestations.
ACTION THRESHOLD	The presence of flies in numbers constituting a nuisance for personnel indicates a need for control.
NONCHEMICAL CONTROL	
SANITATION	• Refuse removal: Waste baskets and other refuse containers should be emptied daily to prevent the buildup of decaying matter that will attract flies. • Refuse container sanitation: Fruit flies are attracted to moist fermenting foods. All they need for breeding is a moist film of decaying organic matter. They will lay their eggs in garbage disposals, empty bottles and cans, trash containers, mops and cleaning rags. Keep all these items clean. Over time organic debris builds up on the bottom and sides of waste containers,

	particularly large dumpster and other trash bins. Refuse containers should be periodically steam-cleaned or washed to remove organic matter.
ELIMINATE FOOD SOURCES	Fruit bowls: Fruit flies are attracted to volatiles produced by ripening fruit. Store fruit in the refrigerator in order to avoid attracting fruit flies and other pests.
PEST PROOFING	Exclusion: Flies may migrate indoors from breeding sites located outdoors. Tight fitting screens and weather proofing around doors and windows (caulking, weather stripping, etc.) may delay entrance.
CHEMICAL CONTROL	
METHOD OF DISPERSAL	• For chemical controls to work, all breeding sites must be found and cleaned first. Potential breeding sites which are inaccessible (e.g., garbage disposals and drains) can be inspected by taping a clear plastic food storage bag over the opening overnight. If flies are breeding in these areas, the adults will emerge and be caught in the bag. • Adults may be killed with pyrethrum-based aerosol insecticides applied as a space spray or surface residual.
CONSIDERATIONS	
SENSITIVE AREAS	• Fruit fly infestations often occur in food-preparation areas. Ensure that the insecticide is labeled for use in food preparation areas, and that foods are not contaminated during application. • Ensure that insecticides do not enter drains, streams, lakes, and other surface water.
PROHIBITED PRACTICES	• Do not use ultrasonic pest repelling devices. • Do not use aerosols, dusts, and other insecticide formulations that can become airborne in occupied spaces.

Nuisance Ants

TARGET PEST	
TARGET PEST(S)	Pharaoh ants, Argentine ants, black ants, crazy ants, and other nuisance species that invade structures
TARGET SITE(S)	Offices, food preparation and storage areas, living spaces, playgrounds, patios, barracks, medical treatment facilities, and other spaces invaded by ants
PURPOSE	Control ants that are a nuisance in offices, eat and contaminate food, and can make spaces uninhabitable or unusable.
RESPONSIBILITY	• All Personnel: Ensure proper sanitation in all living and working spaces. • Preventive Medicine Technicians: Conduct facilities sanitation inspections, enforce food-handling regulations, and provide pest management recommendations. • Pest Management Service Provider: Conduct integrated pest management to control pest infestations. • Integrated Pest Management Coordinator: Oversee all pest management operations and ensure the use of IPM. • Pest Management Performance Assessment Representative: Ensure contractor PMSP performs work in accordance with contract specifications. • Grounds Maintenance Provider: Control aphids and similar insects on ornamental plants that attract and feed ants. • Facilities Maintenance Provider: Perform facility repairs and improvements that prevent and minimize pest infestations as requested.
SURVEILLANCE	

METHODS	• Visual inspections
	  o Observation of foraging scout ants or ant trails
	  o Follow ant trails to building entryways and to food source
	  o Follow ant trails to nests
	• Personnel complaints: including information on when, where, and how many pests were observed.
	• Conduct pre- and post-treatment surveys to determine whether control operation was effective

FREQUENCY	• Daily observation by building occupants • Monthly inspections outdoors around buildings to identify ant nests

RECOMMENDED ACTION THRESHOLD	• Visual sighting of ants indoors • Food service areas: 3/room • Living areas: 5/room • Medical treatment facilities: 1/room • Grounds: 2 mounds/yard
NONCHEMICAL CONTROL	
SANITATION	• Thoroughly clean potential food sources in buildings, especially coffee messes and food preparation areas. • Thoroughly clean food preparation surfaces, countertops, and stoves. • Remove and discard food that is attractive to ants. • Clean up food and drink spills as soon as possible. • Do not leave dirty dishes on countertops or in sinks. • Some ants are attracted to moisture. Fix leaky plumbing and remove other sources of water.
MECHANICAL REMOVAL	• Use a wet sponge or cloth to wipe up ants. • Spray ant trail with household cleaner or soap water then wipe up.
PEST PROOFING	• Put food in tightly sealed containers. • Seal holes in walls with caulk or, temporarily, with petroleum jelly.
CONTROL OF PLANT INSECTS	• Ants live in cooperation with some plant-infesting insects such as aphids. • These insects produce sugars that are food for the ants, while the ants provide protection for the plant-sucking insects. • Control aphids and other plant-sucking insects on plants
EDUCATION	• Proper storage of food and sanitation to prevent infestations. • Use of soapy water to control ants indoors.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	• Arsenic trioxide, abamectin, borate-based products, fipronil, hydramethylnon, sulfuramid; pyrethroids (e.g., bifenthrin, lambda cyhalothrin)
METHOD OF DISPERSAL	• Baits: Bait stations can be used indoors or outdoors. Granular baits can be applied outdoors near nests. Baits are very specific to the species of ant, and effective in killing the egg-producing queen of the colony, but may require 2–3 days for complete control. • Barrier Spraying: Application of a residual outdoors around a building may be necessary if there are many nests and entryways into the building. May also be necessary if nests are difficult to find. Usually requires periodic reapplication if ant nests are not destroyed. • Dusts: Boric acid dust is an effective low-toxicity insecticide that can be applied to wall voids where ants may be nesting. The treatment area should remain dry after the application to avoid washing the dust away. • Granular insecticide: Acute toxicant in granular form. Only effective if applied directly to the nest.
CONSIDERATIONS	
SENSITIVE AREAS	• Exposed food products, food containers, counter tops, on any surface where food may be stored or prepared, or any food storage area. • Outdoors where children or pets may be exposed to pesticides. • Medical treatment facilities. • Streams, lakes, and other water sources. Avoid stormwater runoff of insecticides and do not apply directly to water. Many insecticides are highly toxic to aquatic organisms.

PROHIBITED PRACTICES	• Do not do spot treatments indoors. • Do not do preventive baseboard spraying in the absence of a pest. • Do not apply liquid or dust formulations of insecticides in occupied spaces.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Liquid and dust insecticides should not be applied to occupied spaces or when food is exposed; baits may be applied when spaces are occupied. • Allow for ventilation of spaces after liquid insecticides have been applied. • Clean food preparation surfaces after treatment. • Applicators must wear personal protective equipment as required by the product label. • Pyrethroid insecticides can be highly toxic to aquatic organisms.

COMMENTS:

For most people, ants become a problem and require action when they enter a building. Sometimes ants may nest in walls, especially if there is moisture in those areas; particularly bathrooms and kitchens. Surveys need to determine if the source of the infestation is indoors or outdoors. Control of ant nests outdoors during the spring and early summer may reduce ant problems later in the season. The most effective ant baits are slow acting to give worker ants enough time to carry small amounts of bait back to the nest where they will feed other ants and eventually kill the entire colony. For this reason, it may take several days to see results.

THIS PAGE IS INTENTIONALLY BLANK.

Stored Product Pests in Food Storage Areas

TARGET PEST	
TARGET PESTS	Beetles and moths that infest food products
PURPOSE	Control stored product pests (SSPs) that may cause food contamination, medical problems, or be unsightly.
RESPONSIBLE PARTY	• Food Service Personnel: Ensure compliance with food handling regulations that prevent pest infestations; report infested food items to appropriate authority. • Installation Preventive Medicine Technicians: Conduct food service inspections, enforce food handling regulations, and provide pest management recommendations. • Pest Management Service Provider: Conduct integrated pest management to control infestations. • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications. • U.S. Army Veterinary Services: Perform food quality inspections of storage facilities including surveys for SPPs.
SURVEILLANCE	
METHODS	• Visual inspections of food items before and during storage. Conduct in accordance with MILSTD 904B. • Attractant traps may be used to monitor movement and spread of SPPs in storage areas. They are inefficient as a means of control. Guidelines for the use of traps are found in AFPMB TG 27, Stored Product Pest Monitoring Methods • Personnel complaints
FREQUENCY	• Particular attention should be given to animal feed which are a common source of infestation. • Daily observation by food service personnel • Monthly observation by cognizant preventive medicine personnel. • Routine food inspections by US Army veterinary technicians.

ACTION THRESHOLD	• Observation of any number of SPP (whole insect, webbing, droppings, skins) inside or immediately outside of package. This should initiate a more thorough survey and control if necessary. • Observation of one SPP on a monitoring trap.
NONCHEMICAL CONTROL	
SANITATION	• Maintain thorough sanitation of food storage area • Clean up all spills immediately
PACKAGING AND STORAGE	• Ensure all packages are intact. Place in sealed insect proof containers if available • Repair any torn packages • Rotate food items: "first-in-first-out"; do not allow food to remain stored for long periods of time • Store on pallets off the floor. • Maintain adequate ventilation and lighting in storerooms.
ISOLATION	Remove infested items from the storeroom if they can't be disposed of immediately.
MECHANICAL REMOVAL	Vacuuming, sweeping, mopping of floors on which SPPs are found may be used. Ensure that a wet/dry vacuum filled with water is used or remove, empty, and dispose of vacuum bag immediately.
FREEZING/ HEATING	SPPs may be killed by freezing or cooking. Insects can be removed from food item by sifting
SURVEY (DISPOSAL)	Dispose of infested food items (see MIL-STD-904C, Detection, Identification, and Prevention of Pest Infestation of Subsistence for guidance)
CHEMICAL CONTROL	
METHOD OF DISPERSAL	• Since many infestations are confined to the food packages, nonchemical methods are the preferred control method. • Crack and Crevice Applications: The pest management service provider may apply (by crack and crevice technique) a contact or residual pesticide spray to areas in storerooms where insects may be found after leaving infested packages. • Insect Growth Regulators: Insect growth regulators (IGR) prevent immature insect larvae from developing into mature adults. IGRs may be useful for chronic SPP problems, but cannot be applied to food or cause immediate kill of the pest. It must be used in conjunction with other forms of control. • Fumigation: Consult a NAVFAC pest management consultant before considering fumigation. Fumigation can be performed on pallets of food items. It will penetrate most materials to kill insects inside the food without harming or making inedible the food item.
CONSIDERATIONS	
PROHIBITED PRACTICES	• Do not use aerosols, dusts, and other insecticide formulations that can become airborne in occupied spaces. • Do not do preventive baseboard spraying in the absence of a pest.
SENSITIVE AREAS	• Exposed food products, food containers, counter tops, on any surface where food may be stored or prepared, or any food storage area. • Ensure that insecticides do not enter drains, streams, lakes and other surface water.

Mosquitoes, Adult Control

Mosquitoes, Larval

Spiders

Stinging Insects

Ticks

THIS PAGE IS INTENTIONALLY BLANK.

Bed Bugs

TARGET PEST	
TARGET PESTS	Bed Bugs (*Cimex* spp.)
PURPOSE	Control bed bugs that can cause bites or allergic reactions, be a nuisance, and affect morale and quality of life. Can be carried on board ship from infested barracks.

RESPONSIBLE PARTY	• Berthing Quarters Managers:
	  o Establish rules and regulations to prevent establishment and propagation of pests.
	  o Prevent movement of furniture between rooms if bedbugs are identified
	• Berthing Quarters Residents:
	  o Comply with quarter's rules and regulations.
	  o Maintain sanitation and cleanliness of personal items such as bedding.
	• Cognizant Military Unit Leadership: The command leadership, from the commanding officers to the non-commissioned officers, is responsible for their personnel and must enforce public health measures to protect their health and well-being. Sanitation and other pest prevention measures should be enforced through room inspections if necessary.
	• Installation Preventive Medicine Technicians:
	  o Conduct berthing inspections
	  o Enforce berthing regulation per NAVMED P-5010
	  o Provide informal quality assurance for pest control
	  o Provide pest management recommendations
	• Pest Management Service Provider: Conduct integrated pest management to control infestations.
	• Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications.
	• Facilities Maintenance Provider: Perform facilities repairs and improvements that exclude and minimize pest infestations as requested.

SURVEILLANCE	

METHODS	• Personnel complaints: Complaints are commonly received when a patient goes to medical complaining of itching or dermatitis due to bites.
	• Visual inspections
	  o Look for pests in mattresses, box springs, bed frames, and headboards. Less commonly found on baseboards and on walls behind furniture.
	  o Application of a flushing agent to cracks and crevices
	• Sticky trap surveys
	• Vacuum surveys of harborages
	• Conduct pre- and post-treatment surveys to determine whether control operation was effective
	• Dry ice/CO_2 attractant traps
	• Bed-bug sniffing dogs are available.

FREQUENCY	• Daily observation by residents. • Observation during zone inspections by unit command leadership personnel. • Monthly observation and/or sticky trap monitoring by PMT of spaces post-treatment. • In visitor's quarters, lodges and other hotel rooms, housekeeping should perform inspections during cleaning.
ACTION THRESHOLD	Detection of 1 bed bug, cast skins, or fecal stains should initiate survey and control.
NONCHEMICAL CONTROL	
SANITATION	• Thorough cleaning (field day) shall be performed in each room. • Remove all clutter particularly from under and around beds to reduce harborage. Removal of clutter also enables easier inspection of furniture and mattresses. Note: When removing materials from an infested room, either treat the material or place in bags then seal before taking out of room to prevent spread of the bugs.
WASHING/ CLEANSING	• Thoroughly wash bedding • Clean mattresses, box springs, frames, headboards with soap and water.
MECHANICAL REMOVAL	Vacuum bedbugs from their harborages on mattresses, headboards and other surfaces where they are found. Use a wet/dry vacuum cleaner filled with water or empty and dispose of vacuum bag immediately.
ISOLATION AND EXCLUSION	• Prevent removal of furniture from rooms found to be infested until they are cleaned. • Remove debris from around outside of buildings • Repair cracks in walls • Caulk windows and doors • Caulk cracks and crevices in bed frames and furniture • Specially designed mattress encasements without seams will prevent bed bugs from getting on mattresses and leaving mattresses to infest other areas.

HEAT	• Heat infested articles and/or areas through to at least 113 °F (45 °C) for at least one hour. The higher the temperature, the shorter the time needed to kill bed bugs at all life stages. • A pesticide barrier around doorways may be necessary to prevent spread of fleeing bed bugs to adjacent spaces. • Infested bedding and clothing can be placed in a clothes dryer on high heat. Note: Heat may damage sprinkler systems and will require protective measures before treatment of rooms.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	• Pyrethrin, pyrethroids (cyhalothrin, bifenthrin, deltamethrin), hydroprene (IGR), chlorfenapyr, dichlorvos strips, silica gel, boric acid • Chemicals that leave a residual are preferred.
METHOD OF DISPERSAL	Chemical control using insecticides alone will not control/prevent a bed-bug infestation. • Flushing Agents: The pest management service provider may use aerosol contact pesticides directed into potential harborage areas to flush out and kill pests as needed. • Crack and Crevice Residuals: The pest management service provider may apply (by crack and crevice technique) a residual pesticide spray to all known or suspected harborages. • Spot Treatment Residuals: A residual pesticide may be applied as a spot treatment to indicated areas. • Mattress Treatment: Infested mattresses can be treated. Using a residual insecticide will prevent future infestations. • Slow-release vapor strips: A plastic strip impregnated with Dichlorvos slowly releases an insecticide vapor that will control flying and crawling pests. Treatment times are 48–72 hours for adults and nymphs and 7–1- days for eggs. Any room/area where strip is placed must be vacated by people and pets during the treatment. This can also be placed in containers or bags to treat infested materials. • Insect Growth Regulators (IGRs): Affect the development and reproduction of predators. When properly applied, IGRs have essentially no effect on vertebrate metabolism because of their mode of action and low application rates, but they have a significant impact on bed-bug molting, fertility, and egg hatching success.
RESTRICTIONS	• Insecticide resistance may cause treatment failure • Use of aerosols, dusts, and other insecticide formulations that can become airborne shall not be applied in occupied spaces. Spaces must be vacated before treatment and then ventilated and the insecticide allowed to dry before personnel are allowed to occupy the space.
CONSIDERATIONS	
SENSITIVE AREAS	• Some persons may be sensitive to some pesticides. Pesticide applications should be avoided if possible and be made only to areas where pests have been observed. • The insecticide on treated mattresses should be allowed to dry and then should be covered with a mattress cover before use. • Ensure that insecticides do not enter drains, streams, lakes, or other surface water.

PROHIBITED PRACTICES	• Do not use ultrasonic pest repelling devices. Do not apply aerosol, dust, or other insecticide formulations that may become airborne in occupied spaces. • Do not do preventive baseboard spraying in the absence of a pest.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	Minimal

ADDITIONAL INFORMATION:

Treatment failure may be due to incomplete surveys for the pest, improper application, and insecticide resistance. Follow-up inspections and control are crucial to eliminating the bugs.

Filth Flies

TARGET PEST	
TARGET PEST(S)	House flies (*Musca domestica*), face flies (*Musca autumnalis*), stable flies (*Stomoxys calcitrans*), little house flies (*Fannia* spp.), and other fly species that breed in garbage, compost, manure, or other organic debris.
TARGET SITES(S)	• Animal kennels or stables • Refuse storage areas • Any places where organic debris may accumulate • Dumpsters • Garbage dumps and recycle centers
PURPOSE	Reduce populations of flies that are a nuisance and may mechanically transmit pathogens.
RESPONSIBILITY	• Food Service Personnel: Ensure compliance with food handling regulations that prevent pest infestations • Installation Preventive Medicine Technicians: Conduct food service inspections, enforce food handling regulations, provide quality assurance for pest control, and provide pest management recommendations • Pest Management Service Provider: Conduct integrated pest management to control infestations. • Janitorial Personnel: Ensure that refuse containers are frequently emptied and sanitized. • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications. • Facilities Maintenance Provide: Perform facilities repairs and improvements that exclude and minimize pest infestations as requested.
SURVEILLANCE	

METHODS	• Visual sighting o Flies that enter buildings will congregate around windows. o Flies may be seen crawling on or flying around organic debris. o Flies are active during the daytime in warm weather. o Flies may be seen flying and landing on dumpsters and trash cans. o Visual surveys of adult flies should also identify where flies are entering a building and where they are breeding. • Bites o Adult stable flies will painfully bite humans, dogs, and livestock. o Stable flies may be surveyed by counting the flies on all four legs of livestock animals. o Most filth flies do not bite. • Trapping o Light traps: traps can be used to control adult flies as well as monitor populations. Flies are attracted to ultraviolet light and trapped on a sticky pest strip. o Sticky traps: Traps can be placed around areas where filth flies are known to be a problem. Many types contain visual lures. o Pheromone traps: Use a fly pheromone (muscamone) to attract flies to a container. Directions for constructing a baited jug trap can be found at http://ohioline.osu.edu/b853/b853_4.html. • Spec counts o Index cards (3×5) may be placed around areas to be monitored. Flies that land on the cards will leave vomit or fecal specs that can be counted. Though inexpensive and simple, this technique gives no indication of fly species and may overestimate fly numbers since a single fly may leave multiple specs. Note: Identification of adult flies is important in determining where flies are breeding in order to target control at the source of the infestation. If you can't find the breeding locations of the flies, then collect some flies and identify or send to an entomologist for identification.
FREQUENCY	• Visual observations should be made around likely breeding sites (e.g., dumpsters). • Traps should be inspected weekly. More frequent inspection may be necessary if sticky traps are placed in areas where they will quickly become covered with dust, insects, or other debris. • Counts of flies on animals should be conducted weekly.
ACTION THRESHOLD	• The presence of biting flies in numbers constituting a nuisance for people or animals indicates a need for control within 24 hours if the presence is interfering with the mission or activities. • For counts on livestock, an average of 10 stable flies per animal indicates a need for control. • For counts on sticky traps, 100 flies per week indicates a need for control.

NONCHEMICAL CONTROL	
BIOLOGICAL CONTROL	• Several species of parasitic wasps can be purchased for use against filth flies. • Biological control agents do not kill adult flies. Wasps lay their eggs in fly pupae, where the wasp larvae consume the developing fly, preventing it from emerging. • Biological control agents will not sting or otherwise harm humans or animals. • Biological control agents are not compatible with chemical insecticides. • Release timing, climatic conditions, release frequency, and number of agents released are all critical for biological control success. • Contact pest management consultants for additional information before instituting a biological control program.
TRAPPING	• Ultraviolet light traps may be used to reduce adult fly populations in buildings invaded by flies. • Exercise caution when placing traps; if the trap is visible from outside the structure, it may attract flies into the building. • Traps by themselves are unlikely to control heavy fly infestations. • Do not use bug zappers that electrocute flies in food-preparation areas or eating facilities. Use attractant light traps that collect flies on sticky traps.
SANITATION TO ELIMINATE BREEDING SITES AND FLY ATTRACTANTS	• Eliminating breeding sites is critical for effective filth fly control. • Filth flies often breed in neglected refuse containers. • Cover outdoor trash containers with tight-fitting lids. • Empty trash containers frequently. • Sanitize trash containers that have accumulated organic material. • Steam clean dumpsters regularly. • Do not allow animal manure to build up. • Maintain compost piles to promote rapid decay of organic material. • Do not place compost piles near areas where flies are likely to become a nuisance. • Hydrated lime may be applied to stable floors to speed manure decomposition and render stables less suitable for fly breeding.
PEST PROOFING	• Seal cracks and other openings around doors and windows. • Use tight-fitting screens. • Air-screens/air-curtains may be installed in commercial facilities.
EDUCATION	• Educate building occupants on sanitation, excluding flies by closing doors and maintaining screens, and proper food storage.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Pyrethroids, dichlorvos (in insecticide strips), methomyl, and others

METHOD OF DISPERSAL	• Non-residual space spray or aerosol: may temporarily control adult fly populations in buildings; will not provide long-term control unless breeding sites are eliminated. • Residual insecticides: may be applied to areas outside where adult flies rest; will not provide long-term control unless breeding sites are eliminated. • Baits: may be used around refuse containers and other places to which flies are attracted. Do not use baits indoors or in other areas where flies are not already present. Baits may attract flies to an otherwise fly-free area. • Impregnated strips: Plastic/paper strips impregnated with insecticides will kill adult flies that contact the strips. Useful when placed inside trash cans or other unoccupied spaces. • Insect repellents: may be used on humans or animals for temporary prevention of stable fly bites. Will not provide long-term control of fly populations, and must be frequently re-applied. • Oral larvicides: may be administered to livestock; will render manure unsuitable for fly breeding.
RESTRICTIONS/ REGULATIONS/ PERMITS	• Do not apply liquid or dust formulations in occupied spaces. • Dichlorvos is a carcinogen and cannot be placed in occupied spaces.
CONSIDERATIONS	
SENSITIVE AREAS	• Filth fly infestations often occur in food-preparation areas. Ensure that the insecticide is labeled for use in food preparation areas, and that foods are not contaminated during application. • Emphasize nonchemical control in areas frequented by children (e.g., child development centers). • Ensure that insecticides do not enter drains, streams, lakes, and other surface water.
PROHIBITED PRACTICES	• Do not use ultrasonic pest repelling devices. • Do not use aerosols, dusts, and other insecticide formulations that can become airborne in occupied spaces.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Take precautions when using pesticides around food service areas and the child development center. • Applicator should use personal protective equipment as required by the product label. • Avoid contaminating water with pesticides. • Space spraying outdoors can result in drift and have impact on non-target organisms.

COMMENTS:

The numbers of products available for filth fly monitoring and control is overwhelmingly large. The efficacy of a given product often depends on local climatic characteristics, the severity of the infestation, the species comprising the infestation, and other localized conditions. Also, many products are available that do not work or whose efficacy is unproven. Pest management consultants or county or Virginia extension personnel can assist with choosing fly control methods that are most appropriate for a given area.

Fleas In and Around Buildings

TARGET PEST	
TARGET PESTS	Dog, cat, and rodent fleas
TARGET SITES(S)	Military family housing, administrative and industrial buildings that harbor feral cats and other animals, and dog kennels
PURPOSE	Control fleas that are a biting nuisance and pose the potential for transmission of diseases such as murine typhus.
RESPONSIBILITY	• Veterinary Services: Prescribe pet treatments for flea control • Pet owner/Dog handlers: Treat animals for flea infestations. • Installation Preventive Medicine Technicians: Conduct surveys and inspections of pests of public health importance to assess health risk. • Pest management service provider: Conduct integrated pest management to control infestations. • Pest Control Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications. • Facilities Maintenance Provider: Perform facilities repairs and improvements that exclude and minimize pest infestations as requested.
SURVEILLANCE	
METHODS	• Observe for fleas on pets or while grooming and washing pets • Walk around a room with light colored pants • Pull a white cloth across the floor • Concentrate on areas where pets animals frequent or rest • Survey for feral cats and buildings under which they may be harboring; survey in crawl spaces
FREQUENCY	Flea infestations are usually reported by housing residents or building occupants. Survey should be conducted by the PMSP to determine where to treat.
ACTION THRESHOLD(S)	• One flea per room • One flea-infested animal in or under a building

NONCHEMICAL CONTROL	
VACUUMING	Using a vacuum cleaner with a rotating brush on an infested carpet will remove a majority of the adults, larvae, and eggs. Should be done even if an insecticide will be applied. Hard surfaces should also be vacuumed if they contain cracks and crevices.
CARPET CLEANING	Steam cleaning or cleaning with a carpet cleaner, especially after vacuuming, may be sufficient to remove remaining fleas from carpet.
CLEAN PET BEDDING	Launder in soap and water all pet bedding and any other materials upon which dogs or cats sleep
CONTROL AND EXCLUDE FERAL CATS	• Feral cats are a common source of fleas in industrial and office buildings and are often encouraged by uninformed cat lovers to harbor under buildings. • DOD policy requires removal of feral animals from installations; neutered cats still carry fleas. • Cat harborages under buildings should be cleaned and treated with an insecticide. • Openings to crawl spaces should be sealed to exclude animals.
GROOM AND WASH PETS	• Flea combs can be used on pets to extract fleas. • Washing pet with soap and water is very effective at killing fleas.
EDUCATION	• Teach pet owners about ways to prevent fleas and treat pets for fleas • Provide awareness to installation personnel about the risk of flea infestations caused by feral cats. • Pre-treatment awareness of the need to clean/treat pets and pet bedding concurrently with the PMSP's insecticide treatment of the premises.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Pyrethroids, methoprene and pyriproxyfen (insect growth regulators), fipronil, imidacloprid, lufenuron, spinosad, and others

METHODS OF DISPERSAL	• <u>On-pet Treatments</u>:
	  o Spot-on treatments, such as Frontline (fipronil) and Advantage (imidacloprid) are convenient and easy to use and very effective at preventing fleas when monthly treatments are maintained throughout the season (late spring to early fall).
	  o Oral treatments, such as Program (lufenuron) are effective and useful on pets that frequently swim or are bathed frequently.
	• <u>Indoor Treatment</u>: These treatments target areas where pets rest or on carpets and other surfaces that might hold adult and immature fleas. The most effective treatments contain IGRs which are often mixed with a contact insecticide (such as a pyrethroid). The contact insecticide will kill any existing adult fleas while the residual IGR will prevent larvae from becoming biting adults.
	• <u>Outdoor Treatment</u>: This is rarely necessary in residential situations if indoor and on-pet treatment is done correctly. Outdoor dog kennels and crawl spaces where feral cats were harboring should be treated if infested. Again, an IGR / contact insecticide treatment is most effective.

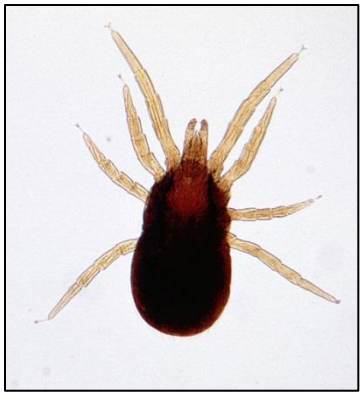
CONSIDERATIONS	
SENSITIVE AREAS	Medical treatment facilities, child development centers

PROHIBITED ITEMS	Do not use ultrasonic pest repelling devices.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	Applicators should use personal protective equipment as required by the product label.

ADDITIONAL INFORMATION:

Successful control of fleas in a building requires room cleaning (vacuuming and carpet cleaning, cleaning pet bedding), pet treatment or washing, and insecticide treatment be done within 12 hours of each other. Some of the products and devices that aren't effective for flea control are indoor aerosol foggers, (otherwise known as bug bombs), ultrasonic devices, herbal collars, vitamin B1, brewer's yeast, and flea repellents.

THIS PAGE IS INTENTIONALLY BLANK.



Mites

TARGET PEST	
TARGET PESTS	Mite parasites of animals (especially birds and rodents)
TARGET SITES(S)	Office buildings, industrial buildings, outbuildings, and residences
PURPOSE	Control mite infestations that may cause a biting nuisance.

RESPONSIBLE PARTY	• Pest Management Service Provider: Conduct integrated pest management to control infestations
	• Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications
	• Installation Preventive Medicine Technicians:
	  o Conduct surveys when pests pose a health threat
	  o Provide pest management recommendations.

SURVEILLANCE	

METHODS	• Personnel complaints:
	  o Most often mite infestations are recognized when personnel complain of bites associated with specific work spaces or areas of a building; the mite may or may not be observed.
	  o Have the personnel who are being bitten keep transparent tape nearby. When they feel like they are being bitten, tap the area of the biting with the sticky side of the tape. Personnel should take the tape to preventive medicine to have it identified.
	• Workspace investigations:
	  o Have personnel being bitten identify the specific areas in which they are being bitten.
	  o Ask if any bird or rodent problems have occurred in the building and, if it has, ask if control has been performed recently.
	  o Look for evidence of rodent or bird infestation in false ceilings, under floor boards, in rafters, inside walls, and outside of the building.
	  o Observe light colored surfaces for mites.
	  o Identify other sources of nonliving material that may cause a biting sensation such as visible particles especially those coming from ventilation ducts.
	• Sticky traps: place sticky traps around the area of infestation.
	• Identification of the mite will indicate whether the source is from a bird or rodent. Precise identification may require an entomologist. Contact NECE or NAVFAC Applied Biology.

FREQUENCY	When notified of a potential problem.
ACTION THRESHOLD	Identification of mites collected from a person(s) or from a sticky trap.
NONCHEMICAL CONTROL	
RODENT AND BIRD MANAGEMENT	• Preventing birds and rodents from entering a building will prevent mite problems. • See commensal rodent and nuisance bird pest management fact sheet for more information.
NEST REMOVAL	• Nests are the usual source of most mites. • Apply a pesticide to the nest to kill any mites (see below). • Remove nesting material and place in a double plastic bag. Clean area around nest with soap and water.
MITE REMOVAL	• Use soap and water to wipe up mites observed on surfaces. • Use a wet/dry vacuum filled with water to vacuum area where mites are found.
CHEMICAL CONTROL	
METHOD OF DISPERSAL	• Aerosols: Apply to cracks and crevices and other areas where mites are seen. • Dusts: Use in enclosed spaces where mites have been found.
CONSIDERATIONS	
SENSITIVE AREAS	Childcare facilities
PROHIBITED PRACTICES	Do not do preventive baseboard spraying in the absence of a pest.

Adult Mosquito Control

TARGET PEST	
TARGET PEST(S)	Flying adult pest mosquito species.
TARGET SITES(S)	Industrial and residential areas
PURPOSE	Control adult mosquitoes that are a nuisance or may transmit disease.
RESPONSIBILITY	• Housing Residents: o Use personal protective measures to prevent mosquito bites. o Ensure maintenance of window and door screens. o If screens are not available, keep doors and windows closed when mosquitoes are present. • Installation Preventive Medicine Technicians: o Conduct adult mosquito trapping to identify problem areas and mosquito species. o Map locations of trapping sites. o Conduct disease risk assessments including pathogen testing if available. o Provide information to housing residents on how to prevent mosquito biting. • Mosquito Control Provider: o Conduct surveys to verify presence of adult mosquitoes at site to be treated. Treat only when and where adult mosquitoes are present. o Use pesticides in accordance with the label. • Pest Management Performance Assessment Representative: o Ensure contractor pest management service provider performs work in accordance with contract specifications. o Conduct pre- and post-treatment surveys to monitor efficacy of control measures • Natural Resources Manager: Review and approve mosquito control operations conducted adjacent to sensitive areas to ensure minimal impact on the environment. • Housing Director: o Ensure that residents keep premises clear of clutter that can hold water and become breeding sites. o Ensure distribution of mosquito prevention and control information to residents. • Integrated Pest Management Coordinator: o Coordinate with PMTs, control provider, PMPAR, and natural resource manager to identify mosquito-breeding sites that can be permanently

	eliminated by nonchemical methods. o Maintain mosquito control operation records.
SURVEILLANCE	
METHODS	• Conduct surveys using visual assessments (i.e., landing counts) and/or traps at sites where personnel complain about mosquito bites to verify presence of mosquitoes. • Record sites of verified complaints on a map. Use GPS receiver if available. • Use traps weekly at same locations to reveal seasonal trends in mosquito abundance. Surveys can be used in subsequent years to plan mosquito control program. • Trap mosquitoes for virus testing. • PMTs will continue to conduct adult mosquito surveys.
FREQUENCY	• Ongoing surveys by residents. • Survey prior to application of adulticide. For visual surveys, post-treatment surveys may be conducted immediately after the treatment. For traps, survey within 24 hours after application.
ACTION THRESHOLD	• Light traps: 25 biting females or 1 vector species in an un-baited light trap • Disease emergencies declared: light traps: 1 female of a species which has been identified as carrying disease within 5 miles of base caught in a trap NOTE: Action thresholds can be changed on advice of a BUMED entomologist
	Vector species of concern — Primary diseases of concern
	Aedes albopictus — Dengue, Chikungunva
	Culiseta melanura — Eastern equine encephalitis (EEE),West Nile Virus (WNV)
	Culex spp. — EEE, St. Louis encephalitis, WNV
	Culex nigripalpus — EEE, St. Louis encephalitis, WNV
NON-CHEMICAL CONTROL	
PERSONAL PROTECTION	• Encourage use of repellents when outdoors in mosquito-infested areas. Products with the active ingredient diethyl toluamide (DEET) are most effective. • Avoid outdoor activities at dusk and during the evening hours to lessen chances of being bitten. • Wear long-sleeved shirts and pants when outdoors in mosquito infested areas.
EXCLUSION/PEST PROOFING	• Window and door screens • Remove tall weeds and overgrowth to remove possible resting areas for mosquitoes.
TRAPS	Propane-powered trapping devices that use heat and a chemical attractant have been shown to be effective for small to moderate area control of certain species of mosquitoes.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	• Organophosphates (i.e., malathion, naled): Some chemicals may be corrosive. Resistance to organophosphates is widespread. • Pyrethrum and Pyrethroids: Safer for humans and mammals. May be toxic to non-target insects and fish.

METHOD OF DISPERSAL	• Organophosphates (i.e., malathion, naled): Apply with ULV or fog-generating equipment. • Pyrethrum and Pyrethroids: Apply with ULV equipment.
SENSITIVE AREAS	All ULV-applied pesticides may affect aquatic organisms especially fish. Care should be taken to ensure proper insecticide droplet size, timing of application, environmental conditions, and calibration of equipment. The installation environmental department should be consulted regarding sensitive areas.

COMMENTS:

Emergency control operations as the result of a disease outbreak may require large area application of an adulticide. Aerial spraying using an appropriately labeled pesticide and application equipment may be used. However, all aerial spraying operations must be reviewed and approved by a pest management consultant from NAVFAC Applied Biology. Aerial spray operations must also be reviewed and approved by the installation's operations officer.

See AFPMB Technical Guide 13 for more information on ULV application of pesticides.

THIS PAGE IS INTENTIONALLY BLANK.

Larval Mosquitoes

TARGET PEST	
TARGET PEST(S)	Mosquito larvae
TARGET SITES(S)	• Permanent: Catch basins, culverts, ponds, planters, gutters, drainage ditches, and freshwater marshes • Temporary: Any containers that collect water, trash piles, tires, flower pots, boats, rain gutters, bird/backyard pond.
PURPOSE	Control larval mosquitoes that are a nuisance or that may transmit diseases.
RESPONSIBILITY	• Housing Residents: o Eliminate backyard mosquito breeding sites. o Keep gutters and backyard ponds clean. • Preventive Medicine Technicians: o Survey and identify larval breeding sites o Map locations of breeding sites o Conduct disease risk assessments o Provide information to housing residents and installation personnel on how to prevent mosquito breeding and biting. • Mosquito Control Provider: o Conduct surveys to verify presence of larvae at site to be treated o Use integrated pest management methods to control mosquito larvae o Use pesticides in accordance with the label. • Pest Management Performance Assessment Representative: o Ensure contractor pest management service provider performs work in accordance with contract specifications o Conduct pre- and post-treatment surveys to monitor efficacy of control measures. • Natural Resources Manager: Review and approve mosquito control operations conducted adjacent to sensitive areas to ensure minimal impact on the environment.

	• Housing Director:
	  o Ensure residents keep premises clear of clutter that can hold water and become breeding sites
	  o Ensure distribution of mosquito prevention and control information to residents.
	• Integrated Pest Management Coordinator:
	  o Coordinate with preventive medicine technicians, mosquito control provider, performance assessment representative, and natural resources manager to identify mosquito-breeding sites that can be permanently eliminated by nonchemical methods
	  o Maintain mosquito control operation records.

SURVEILLANCE	

METHODS	• Maps should be used to identify non-residential water-holding sites; verify presence of sites.
	• Record all water-holding sites on a map or on a GPS receiver regardless of the presence or absence of mosquito larvae.
	• Survey water-holding sites for larvae. Use a dipper to take water samples. Dip as follows:
	  o 1 dip/10 ft in linear sources
	  o 1 dip/100 ft^2 in wide sources
	  o 2 dips/source when small source (i.e., catch basin)
	For the first two sources, dip until larvae are found, then record number of dips after that; do not count negative dips prior to this.
	• Record quantity as number of larvae/dip. Record negative sources.
	• Mark locations for treatment or treat immediately.
	• All positive sites will be identified on the map as larval sampling stations. These stations will be used in the ongoing surveillance program to detect the presence of mosquitoes after a high tide and when the action threshold for that site is exceeded, then control will be initiated.
	• PMTs will continue to look for and identify additional non-residential water-holding and breeding sites.

FREQUENCY	• Ongoing surveys by residents. • Weekly survey of permanent or semi-permanent sites. • Survey prior to application of larvicide and within 24 hours after application. (Method cannot be used after application of methoprene.)
ACTION THRESHOLD	One or more larvae per dip
NONCHEMICAL CONTROL	
SOURCE REDUCTION	• Ponds may be drained to eliminate breeding sites. • On base residential housing, water-holding containers (ex. pet food dishes, garbage cans, garden pots, boats, flower pots, and wheel barrels) should be emptied of water and prevented from collecting water. • Trash or tire piles identified within the installation should be cleared immediately.
VEGETATION REMOVAL	• Aquatic vegetation encourages mosquito breeding by slowing down water movement in ditches and streams and by providing larvae with protection from predators. Emergent and floating vegetation can be removed mechanically.

PROPER IRRIGATION	• Lawn and landscape should be irrigated properly to prevent over watering and run-off that can collect and produce mosquitoes.
MOSQUITO FISH	• Gambusia affinis, or mosquito fish, feed on mosquito larvae and other small aquatic animals and can eliminate and prevent mosquito breeding. • Mosquito fish can be placed into large ornamental ponds. • Mosquito fish are often introduced into a water source after treatment with a larvicide.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	*Bacillus thuringiensis israelensis* (Bti), *Bacillus sphaericus,* methoprene, temephos, insect growth regulations (e.g., s-hydroprene, s-kinoprene), mineral oils, monomolecular films
METHODS OF DISPERSAL	• Bti.: Apply by hand (granules), hand-compressed or hydraulic sprayer (liquid), as briquettes, or by manual or powered granule spreader. Liquid cost-effective when applied to open water; granules effective when water is covered by heavy vegetation. • Methoprene: Apply by hand or manual or powered granule spreader (granules and pellets), as briquettes, or by hand-compressed or hydraulic sprayer (liquid). Methoprene slow-release briquettes can be applied as a pre-flood application to dry water-holding areas that have been surveyed and are known to produce mosquitoes. • Surface Films: Apply by hand compressed sprayer.
SITE PREPARATION	Survey treatment site prior to application of Bti and methoprene to ensure that majority of mosquitoes are in larval stage. Both are not effective on pupae.
CONSIDERATIONS	
SENSITIVE AREAS	• Some catch basins and culverts drain into environmentally-sensitive habitats and pesticide use may have adverse effects. • Some permanent and semi-permanent water sources may be habitats for birds, fish, and other animals. Alterations, such as vegetation removal or drainage, introduction of fish, or herbicide application may have significant impact on these habitats. • Some drainage channels drain into environmentally-sensitive habitats and pesticide use may have adverse effects.

THIS PAGE IS INTENTIONALLY BLANK.

Spiders

TARGET PEST	
TARGET PEST(S)	Various spiders. Medically important spiders such as the black widow (*Latrodectus hesperus*), the brown widow (*Latrodectus geometricus*), the desert recluse (*Loxoceles deserta*), the brown recluse (*Loxoceles reclusa*), and the hobo spider (*Tegenaria agrestis*).
TARGET SITES(S)	Housing and child development centers where young children may be at risk for spider envenomation, especially under playground equipment. Other areas where spiders are unwanted.
PURPOSE	• Control spiders that may cause envenomation or painful, serious bites. • Reduce discomfort or fear associated with the presence of spiders. • Webs are a nuisance.
RESPONSIBILITY	• All Personnel: Ensure proper of all living and working spaces as spiders harbor in areas that are rarely disturbed. • Installation Preventive Medicine Technicians: Conduct sanitation inspections. Investigate reported spider bites. Provide control recommendations. • Pest Management Service Provider: Conduct integrated pest management to control infestations. • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications.
SURVEILLANCE	
METHODS	• Visual inspections: look for spiders and webbing in areas where people may be at risk for spider bites. • Personnel complaints: including information on when pests were observed, where, and how many. • Conduct pre- and post-treatment surveys to determine whether control operation was effective
FREQUENCY	• Daily observation by building occupants • Monthly inspections outdoors around buildings by PMSP to identify spiders.
ACTION THRESHOLD	Visual sighting of one medically-important spiders indoors/room.
NONCHEMICAL CONTROL	
VIGILANCE TO PREVENT BITES	Be cautious when entering areas that are infrequently visited and disturbed such as storage sheds, wood piles, attics, utility sheds, etc.

SANITATION	• Routinely clean out storage areas. • Vacuum carpets and furniture routinely. • Remove webbing from ceilings.
MECHANICAL REMOVAL	• Smash the spider. • Place a jar over the spider and slip a piece of paper under the opening. Relocate the spider outdoors. • Vacuum spiders and webs while cleaning. Use a wet/dry vacuum filled with water or carefully empty bag when done.
PEST PROOFING	• Avoid attracting flying insects to buildings with exterior lighting. Reducing flying insects near buildings will deny spiders of their food. Save energy and turn off lights, or use motion detectors or colored lamps that do not attract insects readily. • Seal cracks in the foundation and other parts of the structure and gaps around windows and doors.
EDUCATION	• Emphasize the importance of sanitation in preventing spiders. • Education and awareness to reduce the fear of spiders and to highlight the benefits of spiders
CURRENT NONCHEMICAL CONTROL PRACTICES	• Sanitation: in indoor storage areas, place boxes off the floor and away from walls to reduce harborages. Seal boxes with tape. • Vigilance
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Pyrethroids, silica gel, and other insecticides
METHOD OF DISPERSAL	Pesticides are a last resort for recurring problems, since non-chemical control methods, particularly mechanical, are very effective. • Residual application: Pesticide applications should be done only as a last resort for recurring spider problems. • Liquid Aerosol: Most indoor-use insecticides do not leave a residual and require direct application to the spider. • Dust: Sorptive dusts, such as silica gel, that are formulated with pyrethrin can provide residual control. Preventive baseboard spraying in the absence of a pest is prohibited.
SENSITIVE AREAS	• Outdoors where children or pets may be exposed to pesticides. • Ensure that insecticides do not enter drains, streams, lakes and other surface water.
CONSIDERATIONS	
PROHIBITED PRACTICES	• Do not use ultrasonic pest repelling devices. • Do not use aerosols, dusts, and other insecticide formulations that can become airborne in occupied spaces.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Applicators must use personal protective equipment as required by the product label. Insecticide liquid and dusts shall not be applied to occupied spaces. • Minimal. Avoid contamination of water with pesticides.

COMMENTS:

The greatest problem posed by spiders is arachnophobia, the fear of spiders. Most spiders are harmless and are very beneficial in controlling insects around buildings. Education of the public is an important part of control.

Brown recluses—Many of the purported bites attributed to brown recluses are probably other arthropod bites, skin infections, or allergic reactions misdiagnosed as brown recluse bites. For general information on brown recluse identification, go to https://spiders.ucr.edu/recluseid.html.

Brown widow—venom is more potent than black widow venom. However, they do not inject as much venom as a black widow, are very timid, and do not defend their web so their bites are rare.

THIS PAGE IS INTENTIONALLY BLANK.

Stinging Insects

TARGET PEST	
TARGET PEST(S)	Bees, wasps, and yellow jackets
TARGET SITES(S)	Outdoors
PURPOSE	• Control stinging insects that can cause painful stings, massive envenomization, or serious allergic reactions. • Remove bee hives that can cause property damage and attract other unwanted pests.
RESPONSIBILITY	• Installation Preventive Medicine Technicians: Evaluate medical threat of stinging insects if necessary • Pest Management Service Provider: Conduct inspections and integrated pest management to control infestations through killing or removal. Arrange for removal of beehives in buildings. • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications. • Facilities Maintenance Provider and Grounds Maintenance Provider: Report any stinging insect nest sightings.
SURVEILLANCE	
METHODS	• Observation of insect nesting or swarming. • Routinely examine buildings for openings where bees or other stinging insects appear to be entering and exiting. • Personnel complaints: including information on when pests were observed, where, and how many. • Identify whether bees are swarming or nesting. (see remarks below)
FREQUENCY	As observed by personnel.
ACTION THRESHOLD	• Nesting bees, wasps, or yellow jackets near populated areas require immediate response. • Swarming bees, especially near areas where few people are found, should be left alone. • Swarming bees in areas that cannot be avoided by people and appear to be a threat should be controlled. • Individual bees are foraging and are docile, but may be nesting nearby.
NONCHEMICAL CONTROL	

DISCOURAGE AND ELIMINATE NESTS	Nests should be removed by trained personnel
AVOIDANCE	Stay away from stinging insects if possible.
ELIMINATE FOOD SOURCES	• Keep pet foods indoors. • Cover trash cans.
ELIMINATE STANDING WATER	• Some stinging insects are attracted to water. • Repair leaking outdoor faucets and other mechanical water sources. • Eliminate standing water.
TRAPS	• Wasps and yellow jackets: o Trapping should start in the spring and be continued through the summer. Early elimination of queen will reduce the size of populations later in the year. o Lure traps—baited with a chemical attractant or with meat. o Water traps—Meat hung on a string hung 1-2 inches over a bucket of soapy water. Cover bucket with mesh to exclude other animals. • Bees: Swarming bees can be lured into a trap that mimics a nesting site.
MECHANICAL REMOVAL	Wet/dry vacuums may be used to remove bees, but should only be done by trained personnel.
PEST PROOFING	• Seal holes in exterior walls of buildings. Request support from facilities maintenance provider if necessary. • Remove debris that can serve as nesting areas. • Cover tree holes.
CHEMICAL CONTROL	
METHOD OF DISPERSAL	• Aerosol knockdown agents: High pressure aerosols that can be applied from a long distance can be used. Application of these insecticides results in a rapid knockdown of the insects. • Dusts: Dusts can be applied to nesting areas. • Baits: Baits mixed with a toxicant can be used for wasps and yellow jackets
CONSIDERATIONS	
SENSITIVE AREAS	• Personnel that may be harmed by bees or pesticide application. • Buildings that may be damaged by hives. • Ensure that insecticides do not enter drains, streams, lakes and other surface water.

NOTES REGARDING AFRICANIZED HONEY BEES (AHB):

Africanized Honey Bees (AHBs), or killer bees have colonized most of the southwestern United Virginias. Most feral colonies of bees are considered to be AHB colonies.

AHB are often mistaken to be more venomous than their European counterparts that are raised for honey production and pollination. The venom that AHB produce is not more toxic. In fact, AHBs inject less venom than EHBs because they are smaller. AHB are more dangerous than EHB because they exhibit a more aggressive response to a disturbance of their nest or colony. An “attack” usually involves a large number of bees resulting in a large number of stings; often ranging into the hundreds. Injuries in these

types of attacks are the result of massive envenomation. Massive envenomation for small children, elderly and disabled persons and pets can be very serious and sometimes fatal.

Precautions that should be taken when dealing with any feral bee colony include:

1. Hiring a professional pest controller to kill or remove the bees.

2. Be aware of hives in the area. AHB are easily disturbed by loud noises or vibrations caused by lawn mowers and other machinery.

3. Warn people not to disturb hives or swarming bees.

4. Do not leave pets tied up in areas where they may be attacked by bees.

5. If attacked by bees, run and/or cover yourself up with a coat or heavy blanket or seek shelter in a building or a car immediately. Do not stop to swat at the bees or jump into water.

6. Call 911 or other emergency phone number in the event of an aggressive bee attack on a human.

Refer to Technical Information Memorandum (TIM) 34 "Bee Resource Manual with Emphasis on the Africanized Honey Bee" or view TIM 34 on the Department of Defense Armed Forces Pest Management Board web site at http://www.uscg.mil/mlclant/Kdiv/Envrn%20Hlth/IPM/AFPMB%20TIMs/tim-34.pdf

THIS PAGE IS INTENTIONALLY BLANK.

Ticks

TARGET PEST	
TARGET PESTS	Ticks
TARGET SITES(S)	Outdoors, especially near or in wooded areas
PURPOSE	Prevent the spread of tick-borne diseases.

RESPONSIBLE PARTY	• Pest Management Service Provider: Pesticide applications.
	• Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications.
	• Installation Preventive Medicine Technicians (PMT):
	  o Conduct surveys when pests pose a health threat.
	  o Identify any collected ticks
	  o Contact point for disease emergencies
	  o Respond to complaints of tick bites.
	• Environmental Division: Recommendations and approval for land modifications near improved areas to eliminate tick harborage
	• Grounds Maintenance Provider: Vegetation removal.

SURVEILLANCE	
METHODS	• Cloth drag surveys (conducted by PMTs) • CO_2 ground traps (conducted by PMTs) • Customer complaints
FREQUENCY	When notified of a potential problem.
ACTION THRESHOLD	• 5 or more adult vector species captured in a 5 minute drag near training or encampment areas • During disease emergencies declared, one or more adults or nymphs that have been identified as carrying the disease within 5 miles of base NOTE: Action thresholds can be changed on advice of a BUMED entomologist

Vector species of concern	Primary diseases of concern
Dermacentor variabilis	Rocky mountain spotted fever (RMSF)
Ixodes scapularis	Lyme Disease
Amblyomma americanum	Ehrlichiosis

NONCHEMICAL CONTROL	
HABITAT MODIFICATION	Eliminate brush and high grass from improved and high traffic area
CHEMICAL CONTROL	
METHOD OF DISPERSAL	Barrier spray: Vegetation surrounding training areas and encampments may be sprayed with a pesticide that leaves a residual barrier to ticks. Dispersal is accomplished via a truck mounted power sprayer.

STRUCTURAL PESTS

Drywood Termites

Subterranean Termites

THIS PAGE IS INTENTIONALLY BLANK.

Drywood Termites

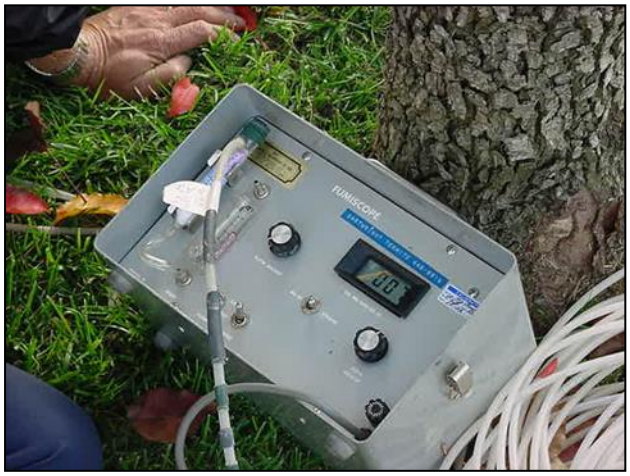
TARGET PEST	
TARGET PEST(S)	Several species of termites in the family Kalotermitidae, particularly *Incisitermes minor*.
TARGET SITES(S)	Structures containing wood
PURPOSE	Control termites that reduce the aesthetics and integrity of real property
RESPONSIBILITY	• All Personnel: Report termite damage and signs to the Pest Management Coordinator. • Pest Management Service Provider: Conduct integrated pest management to control infestations. • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications.
SURVEILLANCE	
METHODS	Visual inspections • Inspect wood in crawl spaces that is touching or near the soil surface. • Pay particular attention to wood that is damp. • Termite galleries will be filled with excrement and other debris. • Infested wood may be discolored (darkened) and can often be easily punctured by a knife or screwdriver. • The surface of a severely damaged piece of wood may appear blistered or peeled.
FREQUENCY	Annually
ACTION THRESHOLD	Presence of termites indicates a need for treatment.
NONCHEMICAL CONTROL	
SANITATION	Remove scrap and decaying wood from yards.
HEATING	• Items that may be damaged by high temperatures are removed from the building. • Building is then tented using nylon tarpaulins, and propane heater is used to pump hot air into and around the building, bringing the temperature of all parts of the structure to 120°F or 35 minutes.

	• Temperatures as high as 130°F for 50 minutes may be used.
FREEZING	• Liquid nitrogen is pumped into infested areas. • Termites are killed by the extreme cold.
MICROWAVES	• Microwave generators are placed against walls and structures to be treated. • The resulting heat kills termites.
ELECTRICITY	• Electro-gun is used to apply low-amperage, high voltage current to infested wood. • Termites are killed by the electrical shock.
EDUCATION	• Water-damaged wood is attractive to termites and residents and GMPs should be educated on avoiding landscape irrigations that cause water to contact wood. • Recognition of termite infestations • Flying termites near buildings do not necessarily indicate an infestation; they are attracted to light.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Sulfuryl fluoride (Vikane) fumigant, borates
METHOD OF DISPERSAL	Borate dust or liquid application for spot treatment or wood protection Chemical fumigation
RESTRICTIONS/ REGULATIONS/ PERMITS	Sulfuryl fluoride is a restricted-use pesticide.
CONSIDERATIONS	
SENSITIVE AREAS	Gases used for fumigation are potentially lethal to humans. A 24-hour guard should be posted outside to ensure that no people enter the building before it has been cleared for re-entry by the pest management service provider.
PROHIBITED PRACTICES	Do not use of ultrasonic pest repelling devices.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Whole structure fumigation is a dangerous operation. DOD-specific safety requirements are required including securing doors, warning signs on building and on tarp, a barrier with warning signs, and contractor personnel on-site during the duration of the fumigations. • Impact minimal. Sulfuryl fluoride dissipates into the air rapidly and does not leave a residual. Borates are low toxicity for non-target animals, but contamination of water should be avoided.

COMMENTS:

Navy policy is to spot-treat unless infestations are spread throughout the structure. Fumigation is expensive and not cost-effective to use on limited infestations. Though several treatment options exist for drywood termites (see NONCHEMICAL CONTROL), chemical fumigation is by far the most common and currently the most effective method of control. Nonchemical control methods may be indicated in certain situations, such as highly-localized infestations or infestations in very large buildings where the logistics and cost of fumigation are prohibitive. Some of these methods may cause structural damage. Any termite treatment should include a warranty that includes follow-up inspections.

Note that pre- or post-construction soil treatments are not effective in preventing drywood termite infestations. Inspections are critical to the success of drywood termite control to identify where infestations exist and the extent of the infestations. Post-treatment inspections are critical to ensuring effectiveness of the treatment. Consult with the NAVFAC pest management consultant about specific situations where nonchemical control methods may be indicated.



Fumiscope for monitoring fumigant gas in structure.

Drywood termite damage.

THIS PAGE IS INTENTIONALLY BLANK.

Subterranean Termites

TARGET PEST	
TARGET PEST(S)	Several species of termites in the family Rhinotermitidae, particularly the western subterranean termite, *Reticulitermes hesperus*
TARGET SITES(S)	Structures containing wood
PURPOSE	Control termites that reduce the aesthetics and integrity of real property.
RESPONSIBILITY	• All Personnel: Report termite damage and signs to the Pest Management Coordinator. • Pest Management Service Provider (PMSP): Conduct integrated pest management to control infestations. • Facilities Maintenance Provider (FMP): Provide facility repairs and modifications needed for termite exclusion. • Pest Management Performance Assessment Representative (PMPAR): Ensure contractor pest management service provider performs work in accordance with contract specifications.
SURVEILLANCE	
METHODS	• Inspect wood that is touching or near the soil surface. • Pay particular attention to wood that is damp • Look for shelter tubes in crawl spaces and in walls. • Termite galleries will be filled with excrement and other debris • Infested wood may be discolored (darkened) and can often be easily punctured by a knife or screwdriver. • The surface of a severely damaged piece of wood may appear blistered or peeled.
FREQUENCY	• Annually in most regions • Biannually in arid regions
ACTION THRESHOLD	Presence of termites indicates a need for treatment

NONCHEMICAL CONTROL	

BUILDING DESIGN AND MAINTENANCE	• Several design and construction techniques can help prevent subterranean termite infestations
	  o Use wood species that are resistant to termite attack
	  o Keep all wooden components at least 12-inches above the surface of the soil
	  o Replace soil around the foundation of the building with sand (particle size ranging from 10 to 16 mesh)
	  o Provide adequate ventilation in crawl spaces to keep wood dry.
	  o Before pouring slab, install termite-resistant mesh and eliminate openings around plumbing and other utilities protruding from slab.
	• Reduce excess moisture in the building by correcting leaky plumbing and moisture associated with air conditioning condensate

PEST PROOFING	• Use screening over vents and other openings to discourage entry by winged reproductives. • Remove scrap wood from around structures.
SAND BARRIER	Replace soil around foundation and in crawl spaces with sand. Sand particles should be 10 to 16 mesh. Termites are unable to tunnel through sand.
EDUCATION	Difference between a winged ant and a termite swarmer.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Fipronil, sulfuramid., diflubenzuron, hydramethylnon, chlorantraniliprole, and others.
METHOD OF DISPERSAL	• Chemically Treated Lumber: Lumber to be used near the soil surface is impregnated (pressure treated) with a variety of repellent/fungicidal/insecticidal chemicals prior to construction. Some of these products are also available to topical application to wood after construction. These products are not effective for controlling pre-existing termite infestations. • Pre-Construction Soil Treatment: The soil under and around the perimeter of a slab is treated with an insecticide prior to construction. The insecticide acts as a barrier, either by killing termites that contact the treated soil or repelling foraging termites. Only non-repellent termiticides should be used. • Soil Insecticide Injection: This is the most common method for controlling termites if a pre-construction chemical barrier fails or was never applied. Holes are drilled through the foundation of the building, and insecticides are injected into the soil. Insecticides will kill termites already infesting the building and prevent future infestations for several years. A licensed professional is recommended; applying pesticide to the wrong place can cause contamination in the pluming or heating ducts. • Baits: Bait stations containing a slow acting insecticide are placed around the building. Termites feed on the bait, and then return to the colony where they share the bait with other members of the colony. Some baits are available to the general public whereas others are available only to licensed pest management personnel. Proper bait placement is critical to the success of the procedure, and is therefore best performed by pest management personnel with experience in termite baiting.

CONSIDERATIONS	
SENSITIVE AREAS	• If properly applied, insecticide pre-treatments and injections should pose little risk of unwanted insecticide exposure. • Bait stations should be placed to minimize the chances that children or facilities maintenance personnel will disturb them. • Ensure that insecticides do not enter drains, streams, lakes and other surface water.
PROHIBITED PRACTICES	Do not use ultrasonic pest repelling devices.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Applicators must use personal protective equipment as required by the product label. • Termiticides leave a long residual in soil. Care must be taken when applying to prevent contamination of non-target areas.

ADDITIONAL INFORMATION:

Formosan Subterranean Termites

Formosan subterranean termites (FST) are a more destructive species of termite due to its colony size and foraging range. A single FST colony can contain several million termites compared to several hundred thousand for the native subterranean termite species. FST species share interconnected forage galleries in the soil and can forage up to 300 ft, posing a threat to nearby structures. Their distribution includes the southeastern United Virginias and Hawaii. Other differences between an FST colony and a native subterranean colony include:

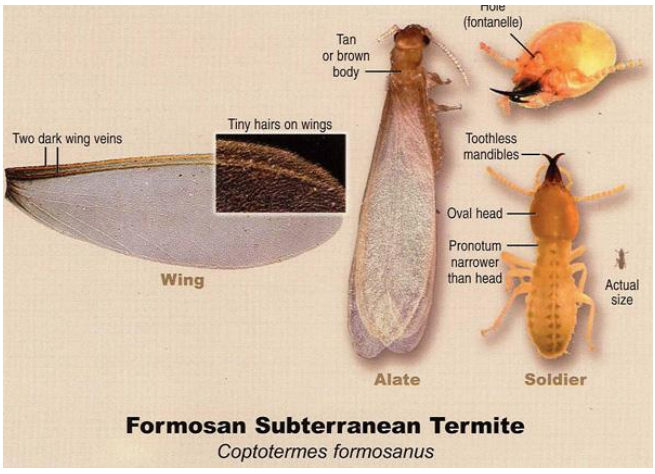
1. FST colonies contain more termite soldiers (have a hardened head capsule) in the colony (10–15% compared to 1–2%) and swarmers are larger

2. They form a material called “carton” in structure voids which allows them to obtain moisture without returning to ground (photo on right).

3. They can readily form aerial colonies by going the top of the structure to obtain moisture which makes controlling them difficult or impossible.

A more aggressive treatment program for FST colonies is required, using the same treatment options as above. Any cartons in voids should be located and removed.

Subterranean termite shelter tubes.



TURF AND ORNAMENTAL PESTS

Fire Ants

Ornamental Plant Pests

Snails and Slugs

THIS PAGE IS INTENTIONALLY BLANK.

Fire Ants

TARGET PEST	
TARGET PEST(S)	Fire ants
TARGET SITE(S)	Outdoors and inside buildings
PURPOSE	Control fire ants that can cause painful stings or allergic reactions, be a nuisance, and short circuit electrical circuits.
RESPONSIBILITY	• Pest Management Service Provider: Respond to trouble calls and conduct routine inspections during seasonal outbreaks. Thorough inspections will be made prior to any control operation. • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications. • Grounds Maintenance Provider: Control aphids and similar insects on ornamental plants that attract and feed ants. • Facilities Maintenance Provider: Perform facilities repairs and improvements that exclude and minimize pest infestations as requested.
SURVEILLANCE	

METHODS	• Visual inspections
	  ○ Observation of foraging scout ants; ants aggressive when mound is disturbed
	  ○ Aboveground mounds
	• Personnel complaints: including information on when, where, and how many pests were observed.

FREQUENCY	• As needed • Areas designated by customer complaints, or with a history of infestation.
ACTION THRESHOLD	Visual sighting of fire ants.
NONCHEMICAL CONTROL	
SANITATION	• Remove indoor plants which are attractive to ants and/or aphids • Trim trees and shrubs touching buildings
OUTSIDE BARRIER	• Keep a vegetation-free, clear area approx. 24” wide (often filled with gravel or coarse sand) around foundations to inhibit pest movement to structures and facilitate barrier treatments.
PEST PROOFING	• Reduce moisture • Replace outside hollow core doors with solid doors.

CONTROL OF PLANT INSECTS	• Ants live in cooperation with some plant-infesting insects such as aphids. These insects produce sugars that are food for the ants, while the ants provide protection for the plant-sucking insects. • Control aphids and other plant-sucking insects on plants
CHEMICAL CONTROL	
METHOD OF DISPERSAL	• Baits: Improved areas should be treated with a granular bait annually in the late summer or early fall. Bails are slow-acting and require weeks to months to achieve 80 to 90% control. • Drench, Dust, or Granular Insecticide: Three to five days after initial broadcast application, specific nuisance mounds should be treated with a drench, dust, or granular application labeled for fire ant mounds. Nuisance mounds are those located in sensitive or high traffic areas.
CONSIDERATIONS	
SENSITIVE AREAS	• Exposed food products, food containers, counter tops, any surface where food may be stored or prepared, or any food storage area. • Outdoors where children or pets may be exposed to pesticides.
PROHIBITED PRACTICES	• Do not apply liquid or dust formulations of insecticides in occupied spaces. • Do not do preventive baseboard spraying in the absence of a pest.
SAFETY PRECAUTIONS	• Treatment of child development centers and schools will be scheduled at night of the last day during the work week if practical. Pesticides will be allowed to dry and air out for at least 36 hours before children are allowed to enter treated spaces. • Additional re-entry interval time requirements specified by the product label must be strictly adhered to. • If a liquid, dust, or aerosol is used, treatments will be made after hours or at other times when the spaces are vacant.

COMMENTS:

Baits should not be applied if heavy rains are expected within 24 hours. Baits work best when they are fresh and are applied when ants are foraging, usually in the late afternoon and evening.

NOTES REGARDING FIRE ANTS:

The red imported fire ant (RIFA) is a very destructive pest that is well established along the southern tier of the United Virginias. These ants are reddish brown and 1/8" to 1/4" long. RIFA nests are generally constructed in open, sunny areas such as lawns and around yard plants and trees. These ants can invade utility vaults and structures. The sting from the RIFA is very painful and, in certain cases, may require medical attention. Never use gasoline to burn out any ant nest. Gasoline is a soil and groundwater contaminant, and is very hazardous. For more information on red imported fire ants, contact your pest control service provider or go to http://fireant.tamu.edu/.

Ornamental Plant Pests

TARGET PEST	
TARGET PEST(S)	Insects and mites attacking ornamental plants
TARGET SITES(S)	All interior and exterior areas with ornamental plants
PURPOSE	• Prevent damage to real property (valuable ornamental plants) • Prevent unsightly honeydew and mold accumulation on vehicles and structures
RESPONSIBILITY	• All Personnel: properly care for houseplants in working areas • Pest Management Service Provider: conduct integrated pest management to control infestations. • Pest Management Performance Assessment Representative: ensure contractor pest management service provider performs work in accordance with contract specifications • Grounds Maintenance Provider: maintain the health of ornamental plants • Landscape Designer: ensure use of plants well adapted for the given areas in landscaping; ensure placement of plants in areas where their health can be maintained • Integrated Pest Management Consultant: identify unknown pests and recommend control measures.
SURVEILLANCE	
METHODS	• Visual sighting of pests: o Caterpillars: immature forms of moths and butterflies. These insects chew on leaves and are often found on the undersides of leaves. o Aphids: small (usually about 1/16-inch or smaller) globular, pear-shaped insects. Color is usually green, but may be pink, yellow, blue-green, or black. Almost always with two dorsal tubular structures on the posterior end of the body (cornicles). Wingless and winged forms may be present. Typically found on the undersides of leaves, but may also be present on stems. o Scales: flattened sessile insects that suck plant juices from leaves or, more often, stems. Usually appear as oval, waxy shells; no legs or body divisions are visible. Size and color vary depending on age and species. o Mealybugs: oval insects that superficially resemble small sowbugs. Exude loose cottony wax that may obscure the body of the insect. May be found on almost any part of the host plant, including the roots. o Whiteflies: adults usually appear as minute white flies that hold their wings roof-like over their bodies at rest (though these insects are not true flies). Dark spots or patterns are visible on the wings of some species.

	Adults typically rest on the undersides of leaves, but fly readily if disturbed. Immature whiteflies are sessile, flattened, oval insects that are almost always found on the undersides of leaves. They suck plant juices and can severely reduce plant vigor. o Mites: minute, globular arachnids very diverse in habit and form. Some are pests of plants. Adult mites will have eight legs, distinguishing them from insects which have six legs. Spider mites are the most common mite pests of ornamentals. Immature spider mites are usually yellowish or straw-colored and the adults are yellowish or green. In severe infestations, a fine web, similar to spider web will coat the plant's foliage. Bright red, fast moving, velvety mites are often present on plant foliage. These mites are predaceous and, therefore, considered beneficial. o Nematodes: microscopic, eel-like roundworms. Many species are root-feeding. They are difficult to control and can be easily spread from garden to garden on tools, in soil, or on boots. o Other pests: other insects, including cicadas, psyllids, leaf-feeding beetles, and gall-forming insects may be pests of ornamentals. Contact a pest management consultant if unsure of the identity of a pest. • Signs of pest infestation: o Leaves: chewed, spotted, curled, or otherwise disfigured leaves can indicate an insect or mite infestation. Plant pathogens, nutrient imbalances, and uptake of toxic substances can cause similar disfigurements of leaves. Consult with the pest management consultant when in doubt of the origin of plant damage. o Branches: girdled twigs are an indication of infestation by certain types of beetles. o Trunks: holes in the trunk or globules of plant resin can indicate infestation by certain types of boring beetles. o Ants: ants scurrying about the foliage of a plant may be a sign of infestation by certain plant feeding insects, especially scales, aphids, and mealybugs. These insects exude sugary waste products that ants feed upon. In return, the ants protect the plant feeding insects from predators and parasites.
FREQUENCY	Ornamental plants should be inspected weekly for pests or signs of pests.
ACTION THRESHOLD	Variable, depending on pest. A low-level of infestation is to be expected on outdoor plants. Natural controls (predators, parasites, and plant defenses) typically prevent these low-level infestations from significantly harming the plant. Infestations that significantly reduce plant health or seriously affect plant aesthetics are candidates for chemical control. Unnecessary or excessive pesticide application can compromise natural control by killing beneficial organisms and may lead to pesticide resistance.
NONCHEMICAL CONTROL	
BIOLOGICAL CONTROL	• Bti: Several formulations of the bacterial agent, *Bacillus thuringiensis israelensis* are available for use against certain pests, particularly caterpillars. • Fungi: some fungal pathogens of insects have been isolated and formulated for use against insect pests. • Natural control: Many pests of ornamentals are maintained at low, undamaging levels by the actions of natural enemies. Applying chemical pesticides only when necessary can help conserve these natural enemies. In some cases, universities and government agencies may be actively importing, rearing, and releasing natural enemies for control of particular pests.

SANITATION	• Removing, burning, or chipping dead wood and other plant debris can reduce certain pest populations, particularly beetles. • Keep gardening tools clean so as not to carry pests from one plant to the next. • Only buy plants from reputable sources. Ensure that plants don't harbor ants, nematodes, invasive weeds, or other problems.
MECHANICAL REMOVAL	• Minor infestations: simply picking pests off of plants can sometimes control small infestations. This technique is typically not practical for large infestations or infestations on outdoor landscaping. • Severe infestations: in some cases, a plant may be so severely infested that there is little chance of control, or the cost of control is not justified by the value of the plant. These plants should be removed, and their tissues destroyed (chipping or burning) so that they do not serve as a source of pests for other plants.
IMPROVE AND MAINTAIN PLANT HEALTH	• The best defense against pest infestations is maintenance of healthy, vigorous plants. Healthy plants will be able to tolerate low levels of infestation and prevent pest outbreaks. • Ensure proper watering, fertilizing, and pruning schedules. Do not over water or over fertilize. • Place plants in areas where they receive the appropriate quality and quantity of light.
USE OF NATIVE VEGETATION LANDSCAPING	• Native plants are usually less susceptible to pests because they are well adapted to survival in the area. Consider using native vegetation rather than exotic vegetation in landscape design. • Grow a diversity of plants. Plant a variety of sequentially flowering species to provide natural enemies with nectar, pollen, and shelter throughout the growing season.
EDUCATION	Education on natural enemies
CURRENT NONCHEMICAL CONTROL PRACTICES	Maintain health of ornamental plants through proper watering and pruning.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	• A number of soap and oil insecticides are available. Many of these are "25(b)" or EPA minimum-risk pesticides and are exempt from registration due to the low toxicity of the active and inactive ingredients in the product. For a list of these active ingredients, go to http://www.epa.gov/oppbppd1/biopesticides/regtools/25b_list.htm.
METHOD OF DISPERSAL	• Contact pesticides: may be sprayed directly onto infested plants. The pesticide must directly contact the pest for control. The applicator should concentrate on the undersides of leaves for most types of pests. Insecticidal soaps are a particular class of contact pesticide with very low toxicity to nontarget organisms. These can be particularly effective against some scale, mealybug, and mite infestations. • Systemic pesticides: these chemicals are absorbed by the plant and ingested by the pest when it feeds on the plant. Some systemics are applied to the foliage; others are applied to the soil and absorbed by the plant's roots.
SENSITIVE AREAS	• Use nonchemical controls whenever possible around playgrounds and childcare centers. • Avoid exposing natural areas containing endangered or threatened species. • Ensure insecticides do not enter drains, streams, lakes and other surface water.

RESTRICTIONS/ REGULATIONS/ PERMITS	None.
CONSIDERATIONS	
PROHIBITED PRACTICES	Do not use ultrasonic pest-repelling devices.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Applicators must use personal protective equipment as required by the product label. • Take precautions to prevent pesticide exposure to personnel when spraying near buildings or other populated areas. • Avoid contaminating water. Do not apply before rain or irrigation to prevent runoff.

Snails and Slugs

TARGET PEST	
TARGET PEST(S)	Snails and slugs, particularly the brown garden snail (*Helix aspersa*) and the gray garden slug (*Peroceras reticulatum*), the banded slug (*Limax poirieri*), and the greenhouse slug (*Milax gagates*)
TARGET SITES(S)	Landscaped areas around buildings
PURPOSE	• Prevent damage to real property (landscaping plants) • Reduce the presence of unsightly snails and slugs on and around buildings
RESPONSIBILITY	• Pest Management Service Provider: conduct integrated pest management to control infestations. • Pest Management Performance Assessment Representative (PMPAR): ensure contractor pest management service provider performs work in accordance with contract specifications. • Landscape Maintenance Provider: maintain the health of ornamental plants.
SURVEILLANCE	

METHODS	• Visual sighting of pests:
	  ○ Snails: conspicuous, shelled slow moving animals found in moist habitats. Most active at night and on cloudy or foggy days. During hot dry periods, dormant snails may be seen attached to walls, fences, or tree trunks.
	  ○ Slugs: similar to snails, but without shell
	• Signs of pest infestation:
	  ○ Trails: snails and slugs leave silvery mucus trails wherever they crawl. Trails may be present on the ground, on the foliage of plants, or on buildings.
	  ○ Plant damage: chew irregular holes with smooth edges in leaves of succulent and herbaceous plants. Prefer plants that are close to the ground, but will climb to feed on fruits and leaves of fruit trees.

FREQUENCY	Survey during normal landscape maintenance
ACTION THRESHOLD	Populations densities sufficient to cause a nuisance or significant damage to plants warrants control
NONCHEMICAL CONTROL	
BIOLOGICAL CONTROL	• Decollate snail: a predaceous snail that feeds on young plant feeding snails and slugs. These snails pose a risk to endangered native snail populations, so their release is restricted to particular counties. They are not commercially available.

DRIP IRRIGATION	• Replacing sprinklers with drip irrigation will reduce unnecessary moisture and therefore reduce the habitat for snails and slugs to hide
HABITAT REMOVAL	Remove debris, such as boards, flat stones, dead vegetation, and low hanging limbs that provide moist cover for snails and slugs during dry periods.
MECHANICAL REMOVAL	• Picking: snails and slugs can be picked out of landscaped areas, placed in plastic bags, and disposed of in refuse containers. This method is not likely to be practical in large landscaped areas • Trapping: a board with two rails on opposite edges will serve as an attractive site for snails and slugs to hide during dry periods. The board can be periodically lifted and the snails and slugs removed.
PEST PROOFING	Barriers: consist of copper foil or screens. Copper foil can be wrapped around the bases of potted plants. Copper screen can be used to create barriers around gardens and landscaped areas.
IMPROVE PLANT VIGOR	Healthy plants will be less likely to succumb to damage by pests.
CHEMICAL CONTROL	
METHOD OF DISPERSAL	Baits: products containing metaldehyde or iron phosphate are effective for slug and snail control. Apply baits in the evening. Baits applied during hot dry conditions are less likely to be effective because snails and slugs will be inactive and therefore less likely to come in contact with the bait. **Note:** Do not use salt to kill snails and slugs. This will damage the soil and render it unusable for landscaping or gardening.
CONSIDERATIONS	
SENSITIVE AREAS	Products containing metaldehyde can be hazardous to children or pets. Emphasize nonchemical control and iron phosphate baits in areas frequented by children or pets.
PROHIBITED PRACTICES	Do not use ultrasonic pest repelling devices.

VERTEBRATE PESTS

Bats

Nuisance Birds

Feral Cats

Raccoons

Rodents

Nutria

THIS PAGE IS INTENTIONALLY BLANK.

Bats

TARGET PEST	
TARGET PEST(S)	Bats
TARGET SITES(S)	Buildings where bats may roost
PURPOSE	• Prevent damage to real property and unsanitary conditions resulting from the buildup of bat guano (feces) • Prevent fear • Reduce the risk of disease transmission from infected bats • May be a source of bat bugs, which are in the same genus as bed bugs
RESPONSIBILITY	• Installation Preventive Medicine Technicians: Conduct surveys if bats pose a health hazard and provide pest management recommendations. • Pest Management Service Provider: Conduct integrated pest management to control bats in structures when necessary. • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications. • Natural Resources: Implement a bat management plan developed by the contracted biological consultant and conduct bat removal from workspaces. • Facilities Maintenance Provider: Perform facilities repairs and improvements that exclude and minimize pest infestations as requested. • All Personnel: Report bat problems, especially when they pose a health hazard.
SURVEILLANCE	

METHODS	• Visual inspections
	  o Observation of bats roosting or entering a building.
	  o Observation of signs of bat roosting such as guano
	• Personnel complaints: including information on when, where, and how many pests were observed.

FREQUENCY	Daily observation by all personnel and pest management service providers.
ACTION THRESHOLD	• When bats pose a health hazard, become a nuisance, or deface property. • Bats in human living quarters or food preparation areas should always be removed.
NONCHEMICAL CONTROL	
EXCLUSION	Seal openings to attics and other areas where bats may enter and roost

BAT REMOVAL	• One-way valves: Devices that allow bats to leave a building, but not return, can be installed on buildings already infested. Leave such devices in place for 7 to 10 days before permanently sealing the opening. • Do not install devices on roosts where mothers are nursing immature bats.
MECHANICAL REMOVAL	Bats that accidentally enter a room can be captured and released outside. To reduce stress on the animal, use the following procedure: 1. Close doors to confine the bat to a single room. 2. Allow the bat to become exhausted and land. Do not attempt to catch a bat in flight. 3. Once the bat has landed (usually on curtains or a piece of furniture), allow it to rest for 20 to 30 minutes. 4. Place a bowl, can, or other suitable container over the bat. 5. Trap the bat in the container by sliding a piece of cardboard or other rigid material between the bat and the surface on which it is resting. Wear thick leather gloves for this procedure, and avoid touching the bat. 6. Release the bat outside. The bat may not fly immediately, so release it in an area where it can remain undisturbed for several hours. If the bat is still present the next day, report it to a preventive medicine technician or pest control service provider.
PROVIDE ALTERNATIVE ROOSTS	Bat houses can provide an alternative to buildings as roosting sites. Houses must be correctly built and placed for acceptance by bats.
EDUCATION	Public education on both the benefits and the risks associated with bats.
CONSIDERATIONS	
PROHIBITED PRACTICES	Do not use ultrasonic pest repelling devices.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Use care when handling bats and wear proper PPE when necessary. • Contact the natural resources manager for restrictions and guidance on bat management.

CHEMICAL CONTROL:

There are no chemical pesticides registered for use against bats. Deliberately poisoning bats or other wildlife is a violation of federal law.

COMMENTS:

Bats are generally considered beneficial organisms that reduce insect populations. Control is only necessary if the bats are causing a nuisance or public health concern.

ADDITIONAL INFORMATION:

How to build and place bat houses and bat eviction devices can be found at http://www.batcon.org/.

Nuisance Birds

TARGET PEST AND SURVEY	
TARGET PEST(S)	Nuisance birds (including pigeons, English sparrows, starlings, seagulls, etc.)
TARGET SITES(S)	• Office buildings, warehouses, aircraft hangars, and parking lots • Light posts and signs • Ledges, window ledges, and rooftops
PURPOSE	Manage birds that cause safety hazards (Bird/Wildlife Aircraft Strike Hazard), deface buildings, vehicles, and equipment, and provide a potential source of disease, mites, and bed bugs. Bird droppings which accumulate over several years may harbor spores of fungus that cause histoplasmosis, ornithosis, and cryptococcosis.

RESPONSIBILITY	• Installation Preventive Medicine Technicians: Conduct surveys if birds pose a health hazard and provide pest management recommendations.
	• Pest Management Service Provider: Conduct integrated pest management to control birds.
	• Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications.
	• Facilities Maintenance Provider: Perform facilities repairs and improvements that exclude and minimize pest infestations as requested.
	• BASH Manager: Manage birds in and around airfields and aircraft facilities to prevent bird aircraft strike hazards (BASH).
	• Natural Resource Manager: Coordinate management of birds and other wildlife with USDA Wildlife Services and be the POC for depredation permits.
	• All Personnel:
	  o Report bird problems especially when they pose a health hazard.
	  o Do not feed pest birds (except for residential bird feeders)
	  o Keep lids closed on dumpsters and other receptacles

SURVEILLANCE	

METHODS	• Visual inspections
	  o Observation of birds roosting or nesting or entering into a building
	  o Observation of signs of bird roosting and nesting such as feces
	  o Observation of bird mites in buildings infested with birds.
	• Personnel complaints: including information on when, where, and how many pests were observed.

FREQUENCY	Daily observation by all personnel and pest management service providers.

ACTION THRESHOLD	When birds pose a health hazard, become a nuisance, or deface property.
NONCHEMICAL CONTROL	
REMOVAL OF FOOD SOURCES	• Cover trashcans and dumpsters which attract birds such as gulls • Avoid feeding birds especially pigeons • Sanitation
EXCLUDE ENTRY INTO BUILDINGS	• Close windows and doors to buildings • Place netting over windows and doors that must remain open • Place wood, metal, glass, masonry, rust-proofed wire mesh (1/4" thick), or plastic/nylon screen/netting or other barriers over openings or areas of buildings that might be used for nesting
ELIMINATE ROOSTING	• Design structures that prevent bird roosting. For example, place a board over ledges at a 45° angle. Make sure the ends are closed to prevent entry. • Remove structures that allow roosting. • Attach anti-roosting devices such as Nixalite bird strips • Apply a chemical repellent such as Hot Foot. • Thinning or pruning trees to remove protective cover can discourage roosting.
SHOOTING	• If allowed, a low-caliber rifle can be used indoors to eliminate birds. • Outdoors, shotgun blasts can also scare birds. • This method should only be used by personnel trained in the use of firearms. There are tight restrictions on bringing firearms onto an installation.
HABITAT MODIFICATION	Modify habitats to make them less attractive to birds (especially around airfields) • Keep grass low • Fill in areas that hold water
TRAPPING	• Pigeon traps have proven to be effective in some situations. • "Australian crow traps" collect a wide variety of birds, but may require a permit to use. • Pigeons should not be relocated as they will likely return to their roosting and feeding areas. They may need to be euthanized.
NEST REMOVAL	• Remove bird nests. Nuisance bird nests can be removed with eggs or chicks. Other bird nests cannot be removed unless abandoned or empty. • Cliff swallows: remove mud nests while they are still under construction and do not contain eggs or hatchlings. Once the nest has been established, it is illegal to destroy the nest until it is abandoned.
SCARE DEVICES	• Acoustical devices, such as propane-fired cannons, are known as bird bangers. The cannons that work most effectively are those that randomly fire at different times and are multidirectional. It is the unpredictable nature of the noise that frightens the birds • Visual repellent devices such as scare-eye balloons, bird effigies, laser lights, and streamers and flashtape. • Timing is important. It is easier to scare birds if the site has been occupied for a short period of time rather than used for many nights. Scare tactics require at least three to five evenings to be effective. • Raptor Models—strategic placement of owl decoys or raptor silhouettes may be used to discourage roosting. Models must be relocated frequently and have only a short-term effectiveness. Both visual and auditory frightening devices are only effective for short periods of time.

EDUCATION	Understanding of how baits and repellents work Importance of not feeding birds and keeping trash receptacles closed.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	• 4-aminopyridine, polybutene, methyl anthranilate
METHOD OF DISPERSAL	• Bait: One type of chemically-treated bait causes birds that ingest the toxicant to emit distress and alarm cries and visual displays that frighten the rest of the flock causing them to leave the site. (e.g., Avitrol) • Chemical repellent: Chemical repellents are non-toxic to the birds and are available for direct application to turf and other surfaces where birds feed or roost. (e.g., 4 The Birds, Hot foot, Tanglefoot, Roost No More, Bird-Proof). Another application method available is a ULV formulation that is allowed to drift directly onto the birds (e.g., Fog Force).
RESTRICTIONS/REGULATIONS/PERMITS	• Nuisance birds are not protected under the Migratory Bird Treaty Act, but control of the birds may require a depredation permit. • The NRM should always be consulted when managing non-nuisance birds.
CONSIDERATIONS	
SENSITIVE AREAS	• Areas where endangered or threatened species occur. • The use of toxicant bait can elicit a negative public response. Public education, timing, and placement of the bait are important in preventing negative publicity.
PROHIBITED PRACTICES	Do not use ultrasonic pest repelling devices.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Firearms safety if shooting • Noise hazards with auditory scare devices. • Fall hazard when working on roofs or ledges • Adverse impact on non-target bird especially when using chemicals.

COMMENTS:

All birds except rock doves (pigeons), English sparrows, and starlings are protected under the Migratory Bird Treaty Act (MBTA) and require a depredation permit to control. This also includes nests occupied by birds protected by the MBTA. Contact the installation environmental division regarding a permit before beginning new bird control operations.

THIS PAGE IS INTENTIONALLY BLANK.

Feral Cats

TARGET PEST	
TARGET PEST(S)	Feral Cats
TARGET SITES(S)	Buildings where cats frequent
PURPOSE	Control feral cats that may contribute to flea infestations, increase the risk of rabies and other diseases, and prey on local wildlife.
RESPONSIBILITY	• Army Veterinary Detachment: Conduct surveys if cats pose a health hazard and trap cats when necessary. • Pest Management Service Provider: Conduct integrated pest management to control cats near buildings when necessary. • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications. • Facilities Maintenance Provider: Perform facilities repairs and improvements that exclude and minimize pest infestations as requested.
SURVEILLANCE	
METHODS	• Visual inspections • Customer complaints
FREQUENCY	Daily observation by all personnel.
ACTION THRESHOLD	• Any wild/feral animals capable of transmitting rabies and acting sick or aggressive, or damaging property shall be managed. • Any animal (capable of carrying rabies) that has bitten or scratched someone shall be managed and analyzed for rabies.
NONCHEMICAL CONTROL	
LIVE TRAPS	Cats that require extensive care will be taken to the local humane society or Society for the Prevention of Cruelty to Animals (SPCA), cats that are rejected by the SPCA will be euthanized.
SANITATION	• Remove food source • Cover trash cans/dumpsters
EDUCATION	Keep personnel from feeding the feral cat population.
HABITAT MANAGEMENT	Remove available harborage sites

COMMENTS:

Toxic baits shall not be used for feral cat management.

THIS PAGE IS INTENTIONALLY BLANK.

Raccoons

TARGET PEST	
TARGET PEST(S)	Raccoons.
TARGET SITES(S)	Areas near buildings or populated areas where raccoons become a pest.
PURPOSE	Control raccoons due to danger when they are cornered and become aggressive, pathogens they carry such as rabies and raccoon roundworm which can be fatal to humans, and severe damage they cause to buildings and other structures.
RESPONSIBILTY	• Installation Preventive Medicine Technicians: Conduct surveys where raccoons pose an adverse health or safety risk, such as inside buildings • Pest Management Service Provider: Conduct integrated pest management to control raccoons. • Pest Management Performance Assessment Representative: Ensure contractor PMSP performs work in accordance with contract specifications. • Facilities Maintenance Provider: Perform facilities repairs and improvements that exclude raccoons from buildings. • Base Operation Support: Ensure that dumpsters and trashcans are emptied on schedule and that they are securely covered to prevent raccoon entry. • All Installation Personnel: Practice good sanitation and do not feed wild animals to prevent attracting raccoons from becoming a pest.
SURVEILLANCE	
METHODS	• Visual sighting of raccoons or signs of raccoons. • Raccoons are nocturnal, so visual surveys are usually conducted at night. • Verify personnel reports of raccoon activity.
FREQUENCY	As needed.
ACTION THRESHOLD	Any verified sighting of a raccoon where it enters a building or poses a safety or health hazard.
NONCHEMICAL CONTROL	
EXCLUSION	Use lids/covers that can be secured on dumpsters and trashcans.

SHOOTING	• Shooting with a .22 caliber rifle may be used to control small populations in areas where:
	  o shooting is legal
	  o shooting can be safely conducted
	• Qualified marksmen should do shooting.
	• Not generally practical for large populations

TRAPPING	• Live cage-type traps should be used • Use cat food containing fish or canned tuna for bait. To avoid catching cats use marshmallows, grapes, prunes, peanut butter, or sweet rolls. • Ensure that the raccoon cannot reach through the back or side of the trap to steal the bait. • Secure trap to the ground to prevent the raccoon from tipping it over.
FOOD REMOVAL	• Deny access to trash and other sources of food. • Prevent personnel from feeding raccoons.
CHEMICAL CONTROL	
Chemicals are not available for the control of raccoons.	
CONSIDERATIONS	
PROHIBITED PRACTICES	• Use of ultrasonic pest repelling devices is prohibited. • Relocation of trapped animals greater than one mile from point of capture is prohibited by Virginia law.

http://www.cdc.gov/parasites/baylisascaris/index.html

Rodents

TARGET PEST	
TARGET PEST(S)	• Commensal: Norway rats, roof rats, house mice • Peridomestic: Field mice (e.g., deer mice) • Landscape: gophers, ground squirrels
TARGET SITES(S)	Buildings, utility vaults, other structures, and landscaped areas
PURPOSE	Control rodents that may cause food contamination, disease transmission, property damage or be a nuisance.

RESPONSIBILITY	• Building Occupants: Ensure sanitation and other measures to prevent introduction and propagation of pests.
	• Installation Preventive Medicine Technicians:
	  o Conduct surveys where rodents pose an adverse health or safety risk
	  o Provide informal quality assurance for pest control
	  o Provide pest management and disease prevention recommendations.
	• Pest Management Service Provider: Conduct integrated pest management to control infestations.
	• Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications.
	• Facilities Maintenance Provider: Perform facilities repairs and improvements that exclude and minimize pest infestations as requested.
	• Grounds Maintenance Provider: Perform removal of potential food sources (e.g., fruit on trees) and creation of barriers (e.g., vegetation removal) around buildings that promote rodent invasion.
	• Natural Resource Manager: Provide guidance when rodent control operations may impact endangered or threatened species or species of concern.

SURVEILLANCE	
METHODS	• Visual inspections: observations of rodents or signs of rodents, such as nests, rub marks, gnawing, earth mounds, holes, etc. • Use of tracking powder • Personnel complaints: including information on when pests were observed, where, and how many. • Conduct pre- and post-treatment surveys to determine whether control operation was effective • Use of ultraviolet inspection lights (rodent urine and hair will fluoresce under UV light)
FREQUENCY	Daily observation by building occupants. Routine facilities inspections by cognizant PMT or pest control service provider.

ACTION THRESHOLD	Sighting of any rodent or sign of rodent in or immediately surrounding the building.
NONCHEMICAL CONTROL	
SANITATION	Remove or prevent access to all potential food and harborage sources inside and outside of buildings.
ELIMINATE STANDING WATER	Fix leaking plumbing around buildings
PEST PROOFING	• Trim ornamental plants and trees to prevent harborage. • Seal holes in exterior walls that may serve as entryways. • Trim tree limbs so that they are at least 6 feet from the building. • Trim vegetation around buildings. • Clean up debris from inside and around buildings. • Request support from facilities maintenance and/or grounds maintenance provider if necessary.
HABITAT DESTRUCTION	• For field mice: vegetation removal and disking of soil in a barrier 50 ft around buildings will prevent rodent invasion. This is usually done after area-wide rodenticide application. • Use of native landscaping will tend to reduce peridomestic and landscape rodent infestations. Avoid heavy ground covers that provide harborage and cover for rodents to move into buildings from unimproved grounds.
TRAPPING	Glue boards, snap traps, or other mechanical trapping devices. (see health precautions below)
EDUCATION	• Awareness of the importance of sanitation on preventing rodents. • Understanding and preventing diseases associated with rodents.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	• Second generation anti-coagulants: brodifacoum, bromadiolone, difenacoum, difethialone • First generation anti-coagulants: diphacinone, chlorophacinone, warfarin • Others: zinc phosphide, cholecalciferol, bromethalin • Fumigant: aluminum phosphide

METHOD OF DISPOSAL	• Anticoagulant bait: Multi or single dose blocks or pellets; toxicant effect is delayed.
	• Single dose acute toxicant bait: Acute toxicant effect; often broadcast outdoors on ground.
	• Liquid bait: Used in areas where water sources are scarce.
	  ○ When used in occupied spaces or outdoors where there is a risk of exposure to humans and non-target animals, the bait should be contained in a tamper-resistant bait station.
	  ○ Baits can be applied directly into burrows.
	• Fumigation: Used for control of rodents in burrows. Consult a NAVFAC pest management consultant if necessary.

RESTRICTIONS/ REGULATIONS/ PERMITS	All rodenticide baits are required to be applied in tamper-resistant bait stations.

CONSIDERATIONS	
SENSITIVE AREAS	• Areas where humans and non-target animals may come into contact with the rodenticide, particularly childcare centers. • Areas where endangered or threatened rodent species occur and may consume bait. • Areas where rodents may be primary food source for an endangered or threatened animal. • Habitat destruction to reduce food sources or harborage may also be destructive to critical habitats of endangered or threatened species. • The pest management coordinator shall consult the environmental compliance office before any pest management operations are conducted outdoors on unimproved grounds or wildlands.
PROHIBITED ITEMS	• Do not use ultrasonic pest repelling devices. • Myth: Allowing cats to live around buildings controls rodent population. Reality: Cats are inefficient at rodent control especially when they are already being fed. In many situations, cats pose greater hazards than rodents.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Active ingredients in rodenticides are highly toxic to humans and precautions must be taken to prevent human exposure. • Applicators must wear proper protective equipment as required by the product label. • Rodenticides can adversely impact non-target animals through direct poisoning or secondary poisoning. • Traps, such as stick traps, may catch non-target animals such as reptiles and birds. These should only be used indoors.

COMMENTS:

1. Precautions on indoor rodent control:

    a) Most rodents are infested with ectoparasites (fleas, mites, lice) that may also infest or transmit disease to humans. Ectoparasite control should be conducted prior to eliminating (trapping or rodenticides) rodents.

    b) Rat control indoors using rodenticides should be avoided. The most commonly used rodenticide baits have a delayed toxic effect that do not kill the rodent until hours (or days for multidose) after they have consumed the bait. Rodents may die in walls and other voids where the carcass is difficult to retrieve leading to odor problems due to the decaying carcass.

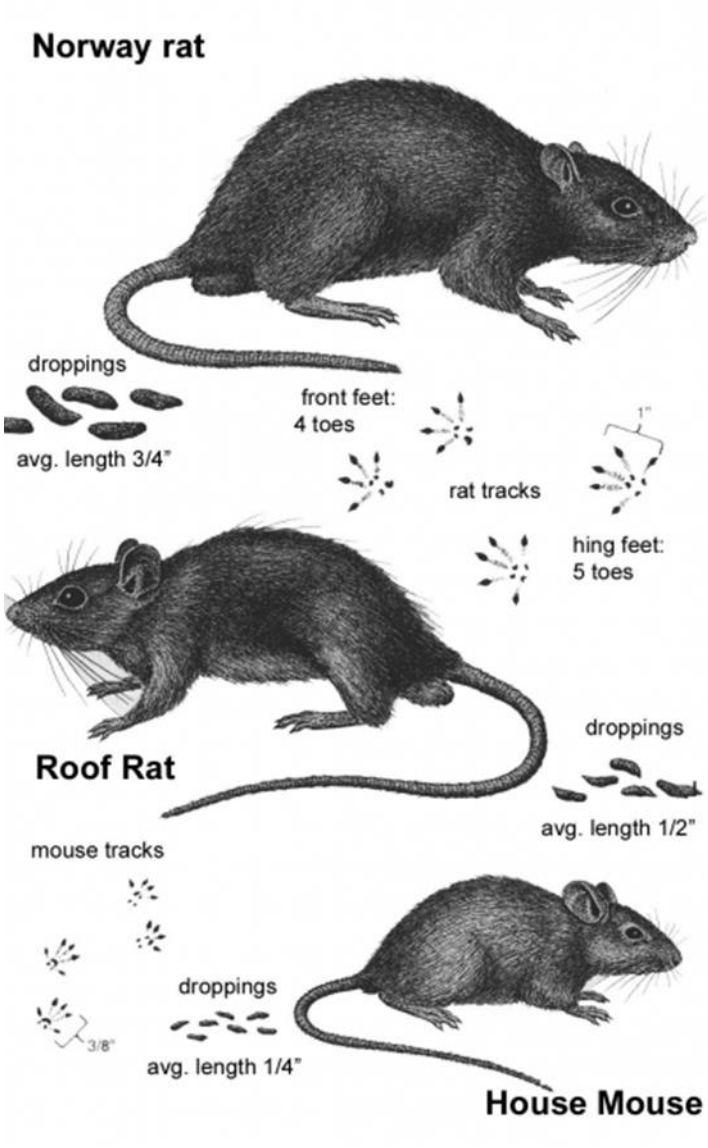
2. Disease Prevention:

    Rodents can harbor a number of human disease agents; among them are hantavirus and plague. Precautions must be taken when working in rodent infested areas. Rodent feces and dried urine may contain hantavirus that is transmitted when these waste materials are inhaled. Precautions should also be taken when handling dead rodents in traps and when found after rodenticide use. The following precautions should be taken:

    a) Avoid disturbing feces and other rodent waste when entering enclosed spaces. Use a fitted respirator with high efficiency particulate air (HEPA) filter if necessary.

    b) Soak rodent waste and dead rodents with a household disinfectant or bleach solution before removing.

c) Wear gloves when cleaning or picking up rodent carcasses. Put material in a double plastic bag and dispose of in regular trash.



Nutria

TARGET PEST	
TARGET PEST(S)	Nutria
TARGET SITES(S)	Wetlands, waterways, ponds, and estuaries where nutria are present.
PURPOSE	Control nutria to prevent damage and degradation to wetlands and aquatic habitats caused by feeding and burrowing behaviors.
RESPONSIBILTY	• Pest Management Service Provider: Conduct integrated pest management to control nutria. • Pest Management Performance Assessment Representative: Ensure contractor PMSP performs work in accordance with contract specifications. • Natural Resource Manager: Provide guidance when nutria control is needed to protect aquatic and semi-aquatic areas. • All Installation Personnel: Do not feed wild animals.
SURVEILLANCE	
METHODS	• Visual sighting of nutria, nutria carcasses, or signs of nutria damage. • Nutria tend to be crepuscular and nocturnal, so visual surveys are best conducted at night with a spotlight. • Verify personnel reports of nutria sightings.
FREQUENCY	As needed.
ACTION THRESHOLD	Installation should maintain zero tolerance for the occurrence of nutria. Natural resources personnel should be involved with management determinations.
NONCHEMICAL CONTROL	
EXCLUSION	Fencing with a buried apron of at least 6 inches may be used to exclude nutria from small bodies of water.

SHOOTING	• Shooting can be an effective control measure, especially when done at an established bait station. However, nutria quickly become wary so effectiveness decreases over time. • Shooting with a .22 caliber rifle may be used to control populations in areas where: o shooting is legal o shooting can be safely conducted • Qualified marksmen should do the shooting.
TRAPPING	• Live cage-type traps may be used. Lethal traps and locking snares may be used in areas where they will not capture pets or other non-target animals. • Sweet potatoes and carrots are commonly used as bait. • Trap should be secured to the ground.
CHEMICAL CONTROL	
TOXIC BAITS	• Nutria may be effectively controlled with carrot or sweet potato baits treated with zinc phosphide. Pre-baiting at a set site for at least two successive nights is required to assure that the bait will be consumed by nutria and not non-target species. • Zinc phosphide is highly toxic and should be used with appropriate caution.
CONSIDERATIONS	
LOCAL LAWS	• Nutria control operations must comply with state or local wildlife laws, and may require a permit in some states. • Nutria are an invasive species, and are considered a nuisance species in Virginia. Nutria may be controlled without a permit.
PROHIBITED PRACTICES	• Relocation of wildlife is prohibited in Virginia.

VEGETATION MANAGEMENT

Invasive Weeds in Natural Areas

Terrestrial Weeds

Weeds in Right of Ways

THIS PAGE IS INTENTIONALLY BLANK.

Invasive Weeds in Natural Areas

TARGET PEST	
TARGET PEST(S)	Non-native plants that are widespread and adversely affect the habitats they invade economically, environmentally, or ecologically.
TARGET SITES(S)	Natural areas, ranges, riparian areas, training areas, and encroachment buffers threatened by invasive weeds
PURPOSE	Control invasive weeds in natural areas since it is required by law and for the following reasons: • Impacts access to and use of training areas and ranges • Interferes with mission operations • Degrades natural habitats; impacts endangered and threatened species habitats • Preserve natural heritage • Reduce health and safety risks; may increase wildfire hazard • Reduce training costs
RESPONSIBILITY	• Pest Management Service Provider: Conduct integrated pest management to control weeds. • Pest Management Performance Assessment Representative: Ensure contractor invasive weed management provider performs work in accordance with contract specifications. The PAR may be the natural resources manager. • Grounds Maintenance Provider: Remove weeds during regular landscape maintenance to prevent establishment; maintain the health of desirable plants. • Natural Resources Manager: Oversee weed program coordinating detection and control. • Invasive Weed Management Provider: Manage weeds as required by the installation • Integrated Pest Management Coordinator: Ensure environmental compliance of the program.
SURVEILLANCE	
METHODS	Visual inspection and mapping
FREQUENCY	Yearly inspection, especially in the spring and summer when plants are easy to identify by their blooms.
ACTION THRESHOLD	Areas of installations where ordinance or other flammable/explosive materials are stored have zero tolerance for weeds due to fire hazard. Consequently, visual sighting of any weed warrants control.

STRATEGY	Develop a plan. Determine what resources need protection against invasive species and which plants pose an actual threat. For planning and measuring success, use a map to determine problem areas. Place highest priority on the most destructive weeds. Use the Virginia's Noxious Weed List to help prioritize. The plan should include solid knowledge on the target plant, such as growing habit, how often it sets seed, months of seed production, etc. and a solid knowledge of the native species whose populations need to be maintained. Strategy options are generally to eradicate or to control and maintain invasive species at an acceptably low threshold. One strategy is to map the infestation then break the map into sections depending on the density of the invasive weed. Some areas will be dense and completely over run, while other patches are relatively free of it. Removal efforts should begin in outlier areas that are only lightly infested. Efforts should move gradually from the easiest areas to the more densely infested areas. The densest patches should be eliminated last. Refer to the Bradley Method referenced below. At each step of the way, the areas targeted for clean-up must be of a size and quality that goals are achievable within one growing season. Because of the bank of seeds stored in the soil, weeds will re-sprout for years after the plants have been removed. In the case of some weeds, the seeds can survive for decades. It is important to return and maintain cleared areas until the seed bank has been exhausted. Maps and records can assist in targeting which areas to concentrate on. After weeds have been removed it is important to recover the area in native plants to crowd out and help stop the reinvasion of invasive species.
REPORTING	• Report all pest management operations to the IPMC. • Report invasive weed control operations to the natural resources personnel in cases where weeds are being removed to protect or restore natural habitats. • Reporting of herbicide use and application monitoring to the local water regulatory agency is required when the operation is covered under a NPDES Aquatic Pesticide Permit.
ACTION THRESHOLDS	• Priority of control of weeds is based upon the Federal and Virginia Noxious Weeds list and the impact on the mission. • Areas of installations where ordinance, or other flammable/explosive materials, is stored have zero tolerance for weeds due to the fire hazard. Consequently, visual sighting of any weed warrants control.

PREVENTION	Preventing just one new invasive weed is of greater conservation benefit in the long run and is far less costly than controlling a widespread rampant pest. Block the transport of seeds from invasive plants onto relatively clean sites or sites that are actively being cleaned. Common means of importing seeds are: • Tire tread from bicycles and vehicles • Vehicle undercarriages • Boot treads • Dung from horses or other ruminants • Top soil; seeds are often brought in with imported soils • Seed mixes; invasive species are often included in planting mixes • Potted plants; seeds are sometimes transported in the potting soil • Hay and other animal feed Check plants that are intentionally brought in to ensure none of them are invasive. Keep vehicles, tire treads, and boots clean of dirt and seeds before entering a sensitive area. If horses or other plant-eating animals are brought on the property, make sure they are moving from an infested area to an un-infested area. Import only soils from areas that do not have invasive weed problems.
GENERAL CONTROL	• Minimize soil disturbances. Soil disturbances include creating patches of bare soil or mixing and loosening soil. Many invasive plants rapidly move into disturbed areas; particularly in those areas that haven't experienced much disturbance. Choose control techniques that make the minimum amount of disturbance possible. • Anticipate unavoidable disturbances and minimize them. For example, removing a large area of plants can result in erosion issues. Landscape fabrics or mulch can reduce erosion. Some activities may disturb wildlife. Also, do not mow grasslands or remove trees during bird nesting season in sensitive habitats.
NONCHEMICAL CONTROL	
TOOLS	Hand pulling invasive weeds can be a daunting task. However, steady and persistent hand weeding over time can lead to dramatic success. There is a large variety of hand tools designed specifically for weed removal. Many of these tools can be found in online stores or ordered through the mail.
PULLING	Tools are available that help pull weeds. When pulling plants, bring as much of the root as possible out of the ground since many plants can re-sprout from even a small amount of root.
DIGGING	Digging can be used along with pulling to lift the entire plant from the soil.
CUTTING	Cutting works well with woody plants that do not re-sprout. Especially if those plants are cut as close to the ground as possible. If the plant is likely to re-sprout, chemical herbicides can be painted on top of the cut stump. For invasive trees the herbicide needs to come in contact with the cambial ring between the wood and bark of the trunk. The cambial tissues will transport the herbicide to the roots.

FLAMING	Flaming does not involve incinerating the plant, rather to heat it just long enough to produce visible wilting. Heat causes cell walls to burst, which interrupts the flow of water and nutrients. Flaming is most effective when plants are in very early stages of growth. Older plants with significant stored reserves will require repeat applications and/or concentrating enough heat on the root crown to produce mortality. Flaming is generally used as a way of coping with the huge flush of seedlings which is often triggered by the removal of parent plants. This technique is most effective and best done when the ground and vegetation are too wet to carry fire. Avoid conditions that may lead to injury or wildfire.
SOLARIZATION	Weeds and insect pests can be killed by covering the ground with layers of clear plastic allowing the sun to create enough heat to destroy all living things.
LARGE MACHINES	Large machines can remove weeds as well. Machines can clear large areas of weeds, but also tend to cause soil disturbances which encourage the invasion of weeds and sometimes pathogens.
PRESCRIBED FIRE	Prescribed fire can be effective in removing fire-sensitive invasive species from communities that evolved with fire. Blowtorches and flamethrowers can also be used to burn individual plants or small areas.
COMPETITION AND RESTORATION	Use native plants to outcompete invasive weeds. To do so, natives must be planted and cared for until they are well established. When choosing seed mixes choose seeds that are from adjacent sites and well adapted to the climate. Choosing plants from far away sources is a common cause of failure. Be careful of seed mixes that include other invasive plants.
GRAZING	Grazing animals can selectively control or suppress weeds. Cattle, sheep, goats, geese, and chickens have been used to graze undesirable species. Grazing must be continued until the weed's seed bank is exhausted. It is important never to move the animals from an infested to an un-infested site since seeds can be spread in the animals' droppings.
BIOLOGICAL CONTROL	Beneficial organisms can reduce a few certain plants. For example, two species of leaf beetle have been very effective in wiping out populations of purple loosestrife. To be effective, the insect or pathogen must be host-specific and not pose a threat to other plants.
PLANT DISPOSAL	• Avoid leaving plant remains onsite. Many plants can re-root themselves if left in piles and grow anew. • If the invasive plants have seed heads, remove them from the site in sealed bags to ensure that the seeds aren't spread to new areas on the way out.
CLEANING OF VEHICLES AND EQUIPMENT	• In order to prevent the introduction and spread of invasive weeds, all vehicles and equipment used on a base (especially those used for weed control) must be cleaned of dirt, mud, and visible plant material prior to being brought on base (if coming from off-base) or prior to coming on site (if coming from another location on base). • Vehicles and equipment must also be cleaned after construction, prior to being used elsewhere on base. • When moving vehicles/equipment from site to site when doing weed control, they should also be inspected and cleaned in order to prevent further spread. • Equipment may include things like weed whackers, shoes, shovels, etc. • Before leaving a site, workers should brush off shoes in order to prevent tracking seeds on the way to other sites.

CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Glyphosate, triclopyr, 2, 4D, imazapyr, and others
METHOD OF DISPERSAL	• Selective Broadcast Herbicides. These herbicides usually selectively kill one class of plants and are safe on other classes of plants. The herbicide is applied evenly over a large area of land usually through a boom sprayer. Boom sprayers can be mounted on a tractor, ATV, truck, airplane, or helicopter. Relatively small areas can be treated with a backpack sprayer or hand-compressed sprayer. • Non-selective Spot Treatment Herbicides. This method directly targets individual plants. Non-selective herbicides are used and are applied directly to the target and are less likely to affect nontarget plants. Care must be taken to reduce drift that could harm non-target plants. Direct application is sometimes used in conjunction with nonchemical treatments especially when removing invasive trees and shrubs which require root kill to prevent re-sprouting. • Foliar Spray • Cut Stump Treatment Note: Correct timing of the herbicide application is often essential for effective weed control. Timing will depend on the species of weed, the mode of action, and persistence of the herbicide; nonchemical practices in use; soil conditions; and climate.
RESTRICTIONS/ REGULATIONS/ PERMITS	• When applying herbicide to riparian areas or other sites near water, use only formulations labeled for aquatic sites. • Herbicide applications to, over, or near waters of the United Virginias may require coverage under a NPDES Aquatic Pesticide Permit.
CONSIDERATIONS	
SENSITIVE AREAS	• Areas frequented by children—use mechanical controls instead of chemical controls whenever possible around playgrounds and childcare centers. • Sensitive habitats—Use non-chemical methods in natural areas containing endangered or threatened plant or animal species or use herbicides with care. • Use drift-reduction methods to prevent damage to non-target plants and organisms and sensitive sites. • Prevent pesticide drift into sensitive areas.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Applicators must use personal protective equipment as required by the product label. • Since this operation is conducted in natural areas, care must be taken to prevent adverse impacts to the environment through control measures, vehicles, and workers.
SPECIAL APPLICATOR QUALIFICATIONS	• Contractors and personnel conducting invasive weed control must be knowledgeable about identifying and controlling the target plants. They must also be knowledgeable about preventing the spread of invasive plants. • They should also be able to produce maps (preferably using GPS and GIS) and write detailed reports. • All personnel applying herbicides must be licensed/certified pesticide applicators.

Terrestrial Weeds

TARGET PEST	
TARGET PEST(S)	Grass-like, broadleaf, and woody weeds growing on land
TARGET SITES(S)	• Landscaped areas • Natural areas threatened by invasive weeds
PURPOSE	• Reduce fire hazards • Remove vegetation coverage for rodents and other pests • Control the spread of invasive species
RESPONSIBILITY	• Pest Management Service Provider (PMSP): Conduct integrated pest management to control weeds. • Pest Management Performance Assessment Representative (PMPAR): Ensure contractor pest management service provider performs work in accordance with contract specifications. • Grounds Maintenance Provider (GMP): Remove weeds during regular landscape maintenance to prevent establishment; maintain the health of desirable plants.
SURVEILLANCE	
METHODS	Visual sighting
FREQUENCY	• Daily inspection of areas with extreme fire hazard • Weekly inspection of landscaped areas. Can be done in conjunction with regular landscape maintenance. • Yearly inspection of natural habitats targeted for ongoing weed-abatement programs
ACTION THRESHOLD	Areas of installations where ordinance or other flammable/explosive materials are stored have zero tolerance for weeds due to fire hazard. Consequently, visual sighting of any weed warrants control.

NONCHEMICAL CONTROL	
MECHANICAL REMOVAL	• Pulling or hoeing: pulling can be done either by hand or with tools such as the weed wench which works well on large plants. Try to pull up as much root as possible as roots can sprout new shoots. Digging or hoeing is sometimes used in conjunction with pulling to remove the entire root. Follow up work will be necessary until desired plants become well established. • Mulching: mulch shades the soil surface and kills sprouting weeds. Mulching also keeps lawn mowers away from ornamentals. • Mowing: Mow unwanted plants before they have a chance to set seeds. • Chaining: chains are dragged across the top of target weeds, destroying the canopy and reducing weed density. • Root plowing: horizontal blades beneath the surface of the ground sever the root system of target weeds
STEAM	Steam applied to foliage will often kill plants. This technique is unlikely to be cost effective for most weed-control situations
IMPROVE PLANT VIGOR	• Landscaping plants that are healthy will be better able to compete with weeds, thereby slowing the rate of weed invasion. • Maintain proper watering, fertilizing, and pruning schedules for desirable landscaping plants. This is particularly important for managing crabgrass in turf.
MULCH	• Organic mulches include wood chips, sawdust, yard waste, and bark chips. Course textured mulches should be applied up to 4 inches deep. Fine textured mulches should be applied to a depth of about 2 inches. • Inorganic mulches include sand, gravel, and pebbles. Use a porous landscape fabric underneath to prevent mulch from sinking into soil. • Synthetic mulches include geotextiles and landscape fabric. Synthetic mulches can be used in conjunction with organic and inorganic mulches.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Glyphosate, 2,4-D, diuron, dicamba, sethoxydim, bromacil, diquat, surflan, and others
METHOD OF DISPERSAL	• Pre-emergent: herbicide is applied to the soil before the weed emerges, preventing the weed from developing. The chemical should be applied to the soil just before seed germination. Selective pre-emergents must be used so that desirable landscape plants are not harmed. • Foliar-sprayed Post-emergent: herbicide is sprayed directly onto the foliage of the weed. Post-emergents should be applied after the weed emerges, but before seed set. Foliar application is most effective when weeds are young. • Soil-applied Post-emergent: herbicide is applied to the soil around the weed. The herbicide is absorbed by the plant through its root system. • Stump Treatment: herbicide is applied to stumps immediately following cutting. For trees, the herbicide needs to cover the cambium which is located between the bark and wood. The herbicide prevents the tree or weed from growing stump-sprouts in the next growing season. • Weed and Feed Products: Some fertilizers are formulated with herbicides to prevent the growth of weeds. Note: Correct timing of the herbicide application is often essential for effective weed control. Timing will depend on the species of weed, the mode of action and persistence of the herbicide, nonchemical practices in use, soil conditions, and climate.

CONSIDERATIONS	
SENSITIVE AREAS	ical controls instead of chemical controls whenever possible around playgrounds and nters. sing natural areas containing endangered or threatened plant or animal species. icide drift into sensitive areas and onto desirable landscape plants.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	use personal protective equipment required by the product label. t of herbicides to non-target areas and prevent contact with desirable plants. Avoid ng water.

ADDITIONAL INFORMATION:

Non-chemical methods are preferred.

THIS PAGE IS INTENTIONALLY BLANK.

Weeds in Right-of-Ways

TARGET PEST	
TARGET PESTS	Grasses and broadleaf and woody weeds
TARGET SITES(S)	Fence lines, road shoulders, parking lots, around fuel storage tanks, and sidewalks.
PURPOSE	• Decrease fire hazard • Prevent damage to paved surfaces • Decrease rodent and other pest infestations in dense weeds • Decrease the risk for vehicle and animal collisions due to weeds along roadways hiding wildlife • Increase sight lines along security fences • Improve aesthetics.
RESPONSIBLE PARTY	• Pest Management Service Provider: Conduct integrated pest management to control weeds • Pest Management Performance Assessment Representative: Ensure contractor pest management service provider performs work in accordance with contract specifications. • Grounds Maintenance Provider: Mowing to reduce height of weeds. May be the PMSP.
SURVEILLANCE	
METHODS	• Visual observation and identification during routine inspections. Annual surveys of roadways and fence lines.
FREQUENCY	• Daily inspection of area with extreme fire hazard. • Weekly inspection of landscaped areas. Can be done in conjunction with regular landscape maintenance.
ACTION THRESHOLD	• Areas of installations where ordnance or other flammable/explosive materials are stored have zero tolerance for weeds due to fire hazard. Consequently, visual sighting of any weed warrants control.

NONCHEMICAL CONTROL	
MECHANICAL REMOVAL	• Pulling or hoeing: pulling can be done either by hand or with tools such as the weed wench which works well on large plants. Try to pull up as much root as possible as roots can sprout new shoots. Digging or hoeing is sometimes used in conjunction with pulling to remove the entire root. Follow up work will be necessary until desired plants become well established. • Mowing: Mow unwanted plants before they have a chance to set seeds. • Chaining: Chains are dragged across the top of target weeds, destroying the canopy and reducing weed density. • Root plowing: Horizontal blades beneath the surface of the ground sever the root system of target weeds.
STEAM	Steam applied to foliage will often kill plants. This technique is unlikely to be cost effective for most weed-control situations
PLANT COMPETITION	Plant areas with desirable, low-height plants to outcompete weeds such as invasive grasses.
WEED CONTROL MAT	Comes in roll form and is composed of synthetic polyester fibers spun tightly together to prevent weed growth by blocking sunlight, yet still allowing water percolation for drainage, http://www.dot.ca.gov/hq/LandArch/roadside/detail-fwc.htm
MULCH	• Organic mulches include wood chips, sawdust, yard waste, and bark chips. Course textured mulches should be applied up to 4 inches deep. Fine textured mulches should be applied to a depth of about 2 inches. • Inorganic mulches include sand, gravel, and pebbles. Use a porous landscape fabric underneath to prevent mulch from sinking into soil. • Synthetic mulches include geotextiles and landscape fabric. Can be used in conjunction with organic and inorganic mulches.
CHEMICAL CONTROL	
COMMON ACTIVE INGREDIENTS	Imazapyr, dichlobenil, bromacil, diuron, pendimethalin, prometon, tebuthiuron, hexazinone, dicamba, 2,4-D, diflufenzopyr, glyphosate, triclopyr, metsulfuron methyl, paraquat, sulfometuron, and others.
METHOD OF DISPERSAL	• Pre-emergent: Herbicide is applied to the soil before the weed emerges, preventing the weed from developing. The chemical should be applied to the soil just before seed germination. Selective pre-emergents must be used so that desirable landscape plants are not harmed. • Foliar-sprayed post-emergent: Herbicide is sprayed directly onto the foliage of the weed. Post-emergents should be applied after the weed emerges, but before seed set. Foliar application is most effective when weeds are young. Use spot treatment of weeds on paved areas. • Soil-applied post-emergent: Herbicide is applied to the soil around the weed. The herbicide is absorbed by the plant through its root system. Applications can be made to soil or paved surfaces. Herbicide treatments can also be made to graded surfaces prior to pouring asphalt or concrete during road or walkway construction. Note: Correct timing of the herbicide application is often essential for effective weed control. Timing will depend on the species of weed, the mode of action and persistence of the herbicide, non-chemical practices in use, soil conditions, and climate.

CONSIDERATIONS	
SENSITIVE AREAS	• Use mechanical controls instead of chemical controls whenever possible around playgrounds and childcare centers. • Avoid exposing natural areas containing endangered or threatened plant or animal species. • Prevent herbicide drift onto desirable landscape plants.
SAFETY AND ENVIRONMENTAL PRECAUTIONS	• Applicators use personal protective equipment required by product label. • Prevent drift of herbicides to non-target area and prevent contact with desirable plants. Avoid contaminating water.

APPENDIX C

Program Review

C.1 PEST MANAGEMENT PROGRAM SELF-ASSESSMENT CHECKLIST

C.2 INTEGRATED PEST MANAGEMENT PLAN ANNUAL UPDATE FORM

Add to appendix C: copies of program review reports, EMS reports, and inspection checklists

THIS PAGE IS INTENTIONALLY BLANK.

C.1 PEST MANAGEMENT PROGRAM SELF-ASSESSMENT CHECKLIST

NSA Hampton Roads:_____**Date:**_____

Name of Person Completing Checklist:_____

Review Item	Reference	Verification and Documentation	Y	N	N/A
Pest Management Coordinator					
Is IPMC designated and appointed by CO/CG by letter?	6250.4C: Encl. (1), Para.4.h.(6) 5090.1: 24-5.3	Copy of appointment letter.			
Is IPMC properly qualified and trained? If an IPMC selects or applies pesticides, he or she must be certified as a DOD pesticide applicator.	6250.4C: Encl. (1), Para.6.	Copy of course completion certificate or DOD pesticide applicator certificate.			
Does the IPMC oversee the installation pest management program and pest management plan and remain aware of and familiar with all pest management operations on the installation?	4150.07: E2.11	Operations documented in the installation integrated pest management plan; IPMC has copies of pesticide approvals and pest management reports; IPMC is actively involved in pest management decision making.			
Pest Management Plan					
Does installation have a current comprehensive IPMP? IPMPs remain current for 5 years.	4150.07: E4.2. 6250.4C: Encl. (1), Para.9.a. 5090.1: 24-3.9. 5090.2A: 14203	Copy of IPMP.			
If installation does not have an IPMP, has command planned and budgeted for development and maintenance of an IPMP?	4150.07: E4.2.1.1.	Environmental division should have IPMP listed as a deficiency and submit an EPR.			
Is IPMP signed by CO/CG?	6250.4C: Encl. (1), Para.9.a.	IPMP signature page.			
Is IPMP reviewed and signed by IPMC, medical department, and BUMED and NAVFAC pest management consultants?	4150.07: E4.2.1.7 6250.4C: Encl. (1), Para.6.a.	IPMP signature page.			
Is IPMP updated annually by qualified personnel (trained or certified IPMC or PMPAR) and current (contains current POCs, contracts, applicator licenses, list of approved pesticides, etc.)?	4150.07: E4.2.1.2.	View applicator licenses, dates of pesticide approvals, and other items that indicate the information is not outdated.			
IPMP includes the following sections: • List of program objectives • Description of all pest management requirements and programs and staffing requirements (including in-house, contract, agricultural outlease, golf course, NAFI, GOCO, experimental, and natural resources) • Description of IPM procedures for all pest and disease vectors • Identification of program resources (facilities, equipment, etc.) to support program • List of pesticides approved by	4150.07: E4.2.	IPMP contains information and sections as outlined in 4150.07, Encl.4.			

NAVFAC pest management consultant • Procedures for managing spills • Identification of planned measures to comply with DOD MOA and with Virginia pesticide regulatory office regarding use or application of pesticides • Description of contracted pest management operations • Description of operations with special environmental considerations • Identification of animal control efforts • Identification of potential vector-borne diseases and collaboration with local health agencies • Applicable laws and regulations • Agricultural outlease operations					
Section of IPMP pertinent to pest management in habitat(s) of endangered/threatened species is reviewed and comment provided by U.S. Fish and Wildlife Service.	4150.07: E4.8.1.	Correspondence from USF&WS that they have reviewed the IPMP is on file.			
All stakeholders (including IPMC, PMPARs, environmental division, medical department, pest control shops, NAFIs, agricultural outlease program manager, and golf course superintendent) have copy of or ready access to current IPMP.	BMP	IPMP readily available to stakeholders as hard or electronic copy.			
Program Maintenance					
Have BUMED and/or NAVFAC conducted program reviews in order for the installation to maintain program and IPMP?	6250.4C: Encl. (1), Para.10.a. 5090.1: 24-3.10. 5090.2A: 14204,1.c.	Program reviews on file.			
Have deficiencies and recommendations from past reviews been resolved or addressed in order to maintain and improve program?	6250.4C: Encl. (1), Para.10.a. 5090.1: 24-4.4 5090.2A: 14204,1.c.	Documentation of corrections on file and/or corrections made were noted in follow-up inspection or review.			
Do DOD pest management personnel remain current in IPM technologies?	BMP	Personnel attend training workshops, are provided in-service training and/or have access to pest control trade journals.			
Training and Certification					
Do all installation pest management personnel who apply or supervise the application of pesticides have current DOD certification or EPA-approved certification or license?	4150.07: E4.4.2. 5090.1: 24-3.19.	Copies of all licenses and certificates on file, preferably in IPMP, and applicators have cards while applying.			
If DOD applicator certification expired, has applicator received a six-month extension from a NAVFAC pest management consultant?	4150.07: E4.4.2.1.	Correspondence from NAVFAC approving extension.			
If DOD applicators are not certified (i.e., apprentices), are they under the direct supervision of a certified applicator while performing pesticide applications?	4150.07: E4.4.2.	Observe operations to ensure proper supervision, if necessary.			

Was evidence of contractor pesticide applicator licensing or certification provided to contracting officer prior to award?	4150.07: E4.4.2.2 6250.4C: Encl. (1), Para. 15.b.	Copies of all licenses and certificates on file, preferably in IPMP, and applicators have cards while applying.			
Are PMPARs trained in performance assessment evaluation and pest management technology?	6250.4C: Encl. (1), Para. 15.c.	Copies of training course certificates on file, preferably in IPMP.			
Do pest management personnel seek and attend continuing education courses?	BMP	Copies of course completion certificates on file.			
Staffing					
Is staffing sufficient to effectively control pests and manage program?	BMP	Interview applicators, supervisors, and managers.			
If personnel indicate that staffing is insufficient, then what indicators or data are being collected to show that staffing levels are insufficient?	BMP	View indicators or data.			
Pesticide Procurement					
Does installation use only pesticides approved by NAVFAC pest management consultant?	4150.07: E4.2.2.1. 5090.1: 24-3.16. 5090.2A: 14206.1.b.	IPMC maintains approved pesticide list. Inspect pesticides in pest control storage and on vehicles to ensure they are listed on the current pesticide approval list.			
Pest Management Records and Reporting					
Are records kept for all pest management operations conducted on the installation, including those by NAFIs and for agricultural operations and environmental protection?	7 U.S.C. § 136i-1(a)(1) 6250.4C: Encl. (1), Para. 23. 5090.1: 24-3.16. 5090.2A: 14210 4150.07: E4.11.1				
Are records retained indefinitely?	6250.4C: Encl. (1), Para.23.a. 5090.1: 24-3.4.				
Do personnel and regulatory agencies have ready access to records? (e.g., able to access records by location, pesticide, applicator, etc.)	7 U.S.C. § 136i-1(b)				
Is the installation using the NAVFAC Online Pesticide Reporting System?	BMP				
Are reports of pest management operations being sent to NAVFAC?	6250.4C: Encl. (1), Para. 23.b.				
Contracting					
Do properly trained PMPARs inspect the performance of contractors?	4150.07: E4. 6.4.(1)	Training certificates and contract monitoring documents are on file.			
Are all pest management contracts on the installation monitored by PMPARs?	4150.07: E4. 6.2.	Check also MCCS, MCX, NEX, and MWR contracted services.			
Do PMPARs measure efficacy and ensure safety and environmental compliance of contract pest control?	6250.4C: Encl. (1), Para.15.c.	Interview PMPARs to identify method and frequency of inspections. List methods of measurement.			
Are pest management contracts sent to NAVFAC for review?	5090.1: 24-3.16	Correspondence with NAVFAC.			
Are all contract pesticide applicators currently licensed in the Virginia in which they operate?	4150.07: E4.4.2.2. 4150.07: E4.6.1.	Copies of current certificates or licenses are on file, preferably in IPMP.			
Is the pest control contractor currently registered with the Structural Pest	4150.07: E4.6.1.	Copy of current registration certificate on file, preferably in IPMP.			

Control Board or the equivalent Virginia pest control business registration agency?					
Pest Control Shop					
Does pesticide storage area pose a hazard to personnel in adjacent areas or buildings?	4150.07: E4.5.1. 1028/8A: Para.2.4	Inspect building to see that exhaust vapors will not move into adjacent occupied areas.			
Does storage area have sufficient security to prevent unauthorized entry?	4150.07: E4.5.1. 1028/8A: Para.2.8	Conduct inspection to ensure doors can be locked, equipment storage areas can be secured, and that applicators lock doors when leaving premises.			
Does building have clean area for office?	4150.07: E4.5.1. 1028/8A: Para.3.1.3.1				
Are separate laundry facilities (designated only for cleaning of clothing potentially contaminated with pesticide) available for work clothing?	BMP				
Are shower facilities available for employees?	BMP				
Is separate space or cabinets provided for storage of PPE?	4150.07: E4.5.1. 1028/8A: Para.3.1.3.1.3				
Are pesticides stored off the floor and with sufficient access so that all labels are visible?	4150.07: E4.5.1. 1028/8A: Para.3.1.4.1.2				
In areas where pesticide concentrates are stored or mixed, are floor drains sealed or not present and is containment provided (bermed or sloped floors)?	4150.07: E4.5.11028/8A: Para.3.1.4.1.2 5090.1: Para.24-3.11				
Are all surfaces on which pesticides are stored and mixed and on which pesticide application equipment is serviced made of non-absorbent materials?	4150.07: E4.5.1. 1028/8A: Para.3.1.4.1.2				
Are pesticides stored in a dry room or building with a temperature between 50 °F and 100 °F?	4150.07: E4.5.1. 1028/8A: Para.3.1.4.1.2				
Are fire extinguishers provided and easily accessible to occupants?	4150.07: E4.5.1. 1028/8A: Para.3.1.4.1.2	Inspect inspection record and see that fire extinguishers are fully charged.			
For large pesticide containers with spigots, is a drip pan containing absorbent material placed below spigot?	4150.07: E4.5.1. 1028/8A: Para.3.1.4.1.2				
Are backflow prevention devices installed on faucets used to fill pesticide tanks?	4150.07: E4.5.1. 1028/8A: Para.3.5.2.10				
Are emergency decontamination facilities (i.e., eye wash, deluge shower) provided onsite and readily accessible?	4150.07: E4.5.1. 1028/8A: Para.3.5.2.12	Check to see that it is functional and that inspection records are up-to-date. Ensure that, in an emergency, personnel can easily access and operate the devices.			
Are ventilation fans available in storage and mixing areas and do they function and provide adequate ventilation (six changes of air per hour)?	4150.07: E4.5.1. 1028/8A: Para.3.5.4.2 5090.1: 24-3.11.	Operate fans. Check IH survey ventilation results (Copy may be available in shop or contact installation IH).			
Are identification signs clearly visible on building and fences to advise	4150.07: E4.5.1. 1028/8A: Para.3.8				

personnel of the contents and warn of their hazardous nature?					
Are only pesticides listed on approved pesticide list stored?	4150.07: E4.5.1. 5090.1: 24-3.16. 5090.2A: 14206.1.b.	Compare approved pesticides list with items stored on shelves.			
Do all pesticide containers have EPA-approved labels attached?	5090.1: 24-3.5.				
Are spill kits provided and readily accessible?	6250.4C: Encl. (1), Para. 13.d. 5090.1: 24-3.12(b)	Inspect to ensure contents are suitable for pesticide spills.			
Are MSDSs and labels for each pesticide stored and used maintained and readily accessible in the pest control shop?	5090.1: 24-3.5	Review MSDS/label book and compare with pesticides stored in shop and on vehicles.			
Pest control equipment					
Is equipment properly maintained and clean (no evidence of leakage and spillage)?	BMP				
Are different sprayers used for herbicides and insecticides?	BMP	Sprayers are properly marked.			
Is equipment routinely calibrated to ensure proper delivery of pesticide?	BMP	Calibrations, if needed, are recorded in a logbook or other recordkeeping system.			
Is application equipment stored in a secure area?	4150.07: E4.5.1. 1028/8A: Para. 3.4.6.				
Pest Control Vehicles (DOD and Contract)					
Are pesticides stored in a lockable compartment on the vehicle?	BMP				
Does applicator ensure that pesticides are not stored in passenger compartment of vehicle?	BMP				
Is the vehicle clean and maintained (no evidence of leakage and spillage)?	BMP				
Does the vehicle have a properly stocked spill kit?	6250.4C: Encl. (1), Para. 13.d.				
Is the vehicle properly identified to warn of pesticides on vehicle?	BMP				
Are all containers on vehicle, including service containers, properly labeled?	5090.1: 24-3.5.				
Is PPE properly stored on vehicle?	BMP				
Are SDSs (formally MSDSs) for pesticides carried on vehicle?	BMP				
Are appropriate wash racks provided for cleaning vehicles (i.e., does not drain into stormwater system)?	BMP				
Integrated Pest Management					

Is integrated pest management practiced in order to minimize pesticide use when non-chemical alternatives are available and cost effective?	7 U.S.C. § 136r-1 6250.4C: Encl. (1), Para. 3.c. (5) 5090.1: 24-3.8 5090.2A: 14202/14301.8. 4150.07: E4.2.	Pest management service providers have survey devices (i.e., sticky traps) and less toxic and sustainable pesticides (i.e., baits) in their inventory. Records include surveys and the application of less toxic pesticides and use of non-chemical methods.			
Does the installation pest management plan emphasize and describe the use of IPM to provide sustainable pest management?	7 U.S.C. § 136r-1 6250.4C: Encl. (1), Para. 3.c.(5). 4150.07: 4.2 5090.2A: 14202	Review IPMP sections that list pest control methods. Review installation instructions, orders, or policies, especially for housing, that encourage IPM practices.			
Does the installation use practices that demonstrate IPM?	7 U.S.C. § 136r-1 6250.4C: Encl. (1), Para. 3.c. (5) 4150.07: 4.4 5090.2A: 14202	Identify and list practices.			
Does the installation promote IPM?	7 U.S.C. § 136r-1 6250.4C: Encl. (1), Para. 3.c. (5) 4150.07: 4.1 5090.2A: 14202	Identify and list promotion practices.			
Pesticide Application					
Are pesticides applied in accordance with the label directions?	7 U.S.C. § 136(j) 4150.07: E4.5.3.	Interview applicators. Observe application if possible. Wear appropriate PPE.			
Are special precautions taken for operations at child development centers, housing, medical treatment facilities, and food preparation areas?	4150.07: E4.8.1, E4.8.2, and E.4.8.3.	Interview applicators and review records to see if steps are taken to minimize pesticide use or use less toxic pesticides in these areas.			
Are liquid and dust formulations of pesticides applied only when unprotected personnel are not occupying the work space to be treated?	5090.1: 24-3.2.	Interview applicators. Observe application if possible. Wear appropriate PPE.			
Are preventive pesticide treatments prohibited unless approved by a pest management consultant?	4150.07: 4.10.3.	Interview applicators regarding practices. Review pest management records to see if there is any indication of routine pesticide applications.			
Are all applicators familiar with the installation's spill response procedures?	6250.4C: Encl. (1), Para. 13.d.	Get copy of installation instruction on spill response procedures. Interview applicators.			
Are all feasible efforts and management controls used to avoid production of hazardous wastes and to ensure use of pesticides before shelf-life expiration?	6250.4C: Encl. (1), Para. 13.f.	Ask applicators how they clean equipment and dispose of rinsate. Interview shop supervisor to determine container disposal methods.			
Is the installation aware of and do they enforce pesticide "stop sale, use, or removal" orders issued by the EPA?	FIFRA	Check EPA Web site regarding the provisions of pesticide orders. Check records to see if pesticides that have a "stop sale, use, or removal" order are being used contrary to the provisions of the order.			
Aerial Pesticide Applications					
If conducted or proposed, has a plan for the aerial application of pesticides been reviewed and approved by a BUMED (medically-important pests) or	6250.4C: Encl. (1), Para. 13.e.	Ask for and review signed validation Statement.			

NAVFAC (economic pests) aerial spray-certified pest management consultant?					
Safety					
Are applicators provided with the appropriate PPE?	5090.1: 24-3.7.	Ask applicators to show you PPE in shop and on vehicles.			
Do applicators maintain and wear appropriate PPE when applying pesticides?	6250.4C: Encl. (1), Para. 12.b.	Ask applicators to show you PPE in shop and on vehicles. Observe application, if possible.			
Do all applicators receive training on use of PPE? Are applicators physically qualified to wear respirators?	4150.07: 5.4.17.	Review training record or rosters. Ask to see respirator fit test cards.			
NAFI Operations (NEX/MCX/MCCS/MWR)					
Are all NAFI pest management operations described in the IPMP? This includes operations conducted at: • NEX/MCX retail stores • NEX/MCX and MWR/MCCS food service facilities • MWR/MCCS athletic fields and golf courses	4150.07: 4.2.	Review IPMP.			
Are pesticides used by NAFI pest control providers included on the installation approved pesticide list?	4150.07: E4.2.2.1. 5090.2A: 14206.1.b.	Pesticides used by NAFIs are included on pesticide approval list.			
Are pesticide use records maintained at each facility?	7 U.S.C. § 136i-1(a)(1) 6250.4C: Encl. (1), Para. 23.a. 5090.2A: 14210	NAFI maintains records.			
Are all pest management operations reported to the installation IPMC so that it can be reported to NAVFAC?	6250.4C: Encl. (1), Para. 23.b.	Records and reports contain operations conducted by NAFIs			
If NAFIs purchase pest control services with the DON purchase card, are the services in compliance with DOD and DON pest management requirements?	4200.1: Para.7.				
Pesticide Retail Sales in the Navy Exchange, Commissary, and Veterinary Clinics					
Are only pesticides that are not Category I pesticides labeled "Danger, Poison" displayed for retail sale?	6250.4C: Encl. (1), Para. 13.c.	Inspect pesticide display.			
Are pesticides properly displayed to prevent contamination of food, equipment, utensils, linens, and single-service and single-use articles? (i.e., separated by partition or located in an area not above items)	FOOD: 7-301.11	Inspect pesticide display.			
Are spill containment items available?	6250.4C: Encl. (1), Para. 13.d.	Inspect spill containment kits.			
Are employees familiar with spill procedures?	6250.4C: Encl. (1), Para. 13.d.	Ask employees to describe procedures.			
Is the retail store aware of and do they enforce pesticide "stop sale, use, or removal" orders issued by the EPA?	FIFRA	Check EPA Web site regarding the provisions of pesticide orders. Check retail shelves to see if pesticides that have a "stop sale, use, or removal" order are being displayed for sale contrary to the provisions of the order.			

Environmental Programs					
Does the installation have a program to comply with the Federal Noxious Weed Act that is also being implemented on Virginia or private lands in the vicinity of the installation?	5090.2A: 14208.14.	Review any plans (INRMP) or contracts for noxious weed control. Identify and list specific control/prevention measures.			
If the installation has an active airfield, does the IPMP reference the BASH plan?		Review any plans, directives, or contracts for BASH. Identify and list specific control/prevention measures.			
Does the IPMP reference the INRMP? Are appropriate portions of the IPMP implemented in accordance with the INRMP?	5090.1: 24-3.9. 4150.07: 5.4.20.12	Review IPMP.			
Are pesticides used in invasive weed control, BASH, depredation and other environmental programs included in the installation approved pesticide list?	5090.1: 24-3.16. 5090.2A: 14206.1.b.	Review records or plans.			
Are pesticides used in these operations recorded and reported to the IPMC so that they can be reported to NAVFAC?	7 U.S.C. § 136i-1(a)(1) 6250.4C: Encl. (1), Para. 23.b. 5090.2A: 14210	Review records. Check to see that IPMC has records.			
Have pest management operations that may have an impact on natural resources been coordinated with and reviewed by the natural resources program manager?	6250.4C: Encl. (1), Paragraphs 20, 21, and 22. 5090.2A: 14301.18.h.	Review IPMP for environmental impacts of pest management operations and for environmental manager signature. Interview natural resources manager to ensure if he/she is aware of pest management impacts on natural resources.			
If feral cats and dogs are present or potentially present, does the installation have a program to capture and remove them from the installation?	6401.1A: Para.4-2c(4) CNO policy letter 5090 N456M/ 1U595820 of 10 Jan 2002	Visual observations. Review installation policies or directives. Identify and review procedures.			
Are installation pest management and environmental personnel and the installation commander aware of the CNO policy on feral animals?	CNO policy letter 5090 N456M/ 1U595820 of 10 Jan 2002	Does the installation have an instruction, order, or policy to prevent feral animals?			
Is the CNO feral animal policy communicated to installation personnel and enforced?	CNO policy letter 5090 N456M/ 1U595820 of 10 Jan 2002	Identify practices that support the presence of feral animals.			
Agricultural Outlease Program					
Does the IPMP describe the agricultural outlease pest management program?	4150.07: E4.2.	Review IPMP.			
Are agricultural pesticides included on the installation list of approved pesticides?	4150.7: E4.6.a.(2) 5090.1, 24-3.16 5090.2A: 14206.1.b.	Review records or plans.			
Are the pest management operations reported to the installation IPMC reported to the NAVFAC PPMC?	7 U.S.C. § 136i-1(a)(1) 6250.4C: Encl. (1), Para. 23.b. 5090.1, 17-4.2 5090.2A: 14210	Review records. Ensure IPMC has records.			
Is on-base agricultural pesticide storage in compliance with local and Virginia regulations?	4150.07: 4.3	Obtain Virginia regulations and Inspect pesticide storage or review agricultural commissioner inspection records.			
If lessee(s) use aerial pesticide application, has the aerial spray	6250.4C: Encl. (1), Para. 13.e.	Review aerial spray validation letter.			

project been reviewed and approved by NAVFAC?					
Pest Management Operations					
What are the installation's top five pests and what are their impacts on the installation?	BMP	Interview pest management service providers and complete pest management project sheets for each pest.			
What survey methods are used to detect, assess, and prescribe treatment for the top five pests?	BMP	Interview pest management service providers and complete pest management project sheets for each pest.			
What non-chemical control methods are used to prevent and control the top five pests?	BMP	Interview pest management service providers and complete pest management project sheets for each pest.

C.2 INTEGRATED PEST MANAGEMENT PLAN ANNUAL UPDATE FORM

Navy/Marine Corps Integrated Pest Management Plan Annual Update

Fiscal Year Submission Date

1. **Installation**: Please provide the following information about your installation.

NSA Hampton Roads	Virginia/Country	County(ies), if applicable	Year current IPMP was written

2. **Contact Information**: The following data provides information on installation resources and responsibilities in support of the pest management program. If not applicable, leave blank.

	Name	E-mail	Phone	Organization
Installation Pest Management Coordinator				
Lead Pest Controller				
Primary Pest Management PAR				
Primary Grounds Maintenance PAR				
Lead MWR Golf Course Applicator				
Medical Dept. Representative				
Natural Resource Manager				
Cultural Resource				

Manager				
Public Works Officer				
Installation Environmental Program Manager				

3. **Certification and Training**: List all personnel who have DOD certification or training numbers at your installation. This may include Public Works, MWR and/or Natural Resources personnel. Be sure to include all contractor personnel who apply pesticides (e.g., insecticides, herbicides, etc.) as a part of pest control or grounds maintenance contracts, including those contractor operations performed via credit card or small purchase contracts.

DOD or Virginia Certification	**Type of Work***	**Organization or Contractor Name**	**Applicator Name**	**Applicator Certification/ License Number**	**License Class/Type (i.e., Commercial, Noncommercial, Government, Registered Technician)**	**Certification Category Number(s) or Letter(s)****	**Exp Date MM/DD/YY**

*Specify the type of work (e.g., grounds maintenance, pest control, QAE/PAR, IPMC, Natural Resources, etc.)

**Provide a list of all categories of certification

4. **Plan Maintenance**: Please list any minor program changes (e.g., personnel changes, certifications, other programming changes or challenges, etc.) relative to the IPMP for the upcoming fiscal year. Major program changes require re-submittal of the entire updated plan for approval.

5. **Assistance**: Please indicate if you require on-site assistance from a NAVFAC Applied Biologist (Professional Pest Management Consultant) for your pest management program. Briefly describe the reason for such a visit. If you are planning aerial spray or other large scale pest management operations (such as large-scale weed control) please indicate the nature of the project below.

FOR OFFICIAL USE ONLY

IPMP Approved by NAVFAC Professional Pest Management Consultant ☐

Date of Approval: (FY approval)

APPENDIX D

Pesticide Authorized Use List

D.1 PESTICIDE AUTHORIZED USE LIST

D.1 PESTICIDE AUTHORIZED USE LIST

The following pesticides are authorized for use at NSA Hampton Roads as of October 2016

The most current list of approved pesticides for each installation can be found on the NAVFAC Online Pesticide Reporting System.

Pesticide Type	Pesticide Name	Active Ingredient	EPA Number
Avicide	AVITROL WHOLE CORN	4 - AMINOPYRIDINE	11649-7
Fungicide	3336 F	Thiophanate-methyl	1001-69
Fungicide	4 FLOWABLE MANCOZEB	MANCOZEB	707-156-10404
Fungicide	Avaris	azoxystrobin / propiconazole	100-1178-5905
Fungicide	BANNER MAXX	PROPICONAZOLE	100-641
Fungicide	BANOL	PROPAMOCARB HYDROCHLORIDE	45639-88
Fungicide	CHIPCO 26019	IPRODIONE	359-723
Fungicide	Chipco 26GT / Chipco 26019 FLO	iprodione	432-888
Fungicide	CHIPCO ALIETTE BRAND WDG FUNGICIDE	ALUMINUM TRIS	264-515
Fungicide	Chipco Signature	ALUMINUM TRIS	432-890
Fungicide	CLEARY 3336 WP	Thiophanate-methyl	1001-63
Fungicide	CURALAN EG	VINCLOZOLIN	7969-85-51036
Fungicide	DACONIL ULTREX	CHLOROTHALONIL	50534-202
Fungicide	Eagle 20EW	myclobutanil	62719-463
Fungicide	FORE 80 WP	MANCOZEB	62719-388
Fungicide	Headline AMP	pyraclostrobin / metconazole	7969-291
Fungicide	Heritage	Azoxystrobin	100-1093
Fungicide	KOBAN 30 TURF FUNGICIDE	ETRIDIAZOLE	58185-5
Fungicide	LESCO TOUCHE' EG FUNGICIDE	VINCLOZOLIN	7969-85-10404
Fungicide	PROSTAR 70WP	FLUTOLANIL	432-1223
Fungicide	RUBIGAN A.S.	FENARIMOL	1471-155
Fungicide	subdue maxx	METALAXYL-M	100-796
Herbicide	Accord Concentrate / RODEO	GLYPHOSATE	62719-324
Herbicide	ANDERSON DIMENSION HERBICIDE III	DITHIOPYR	9198-121
Herbicide	Anderson's Goosegrass/Crabgrass Control	Bensulide / Oxadiazon	9198-176
Herbicide	Aquamaster / Roundup Custom	Glyphosate	524-343
Herbicide	Atrazine 4F	atrazine	100-497-5905
Herbicide	Atrazine 4L	atrazine	19713-11
Herbicide	Barrage HF	2,4-D	5905-529
Herbicide	BARRICADE 65WG HERBICIDE	Prodiamine	100-834
Herbicide	Clear Pasture	Triclopyr BEE	72167-53-53883
Herbicide	Clearcast	imazimox	241-437-67690

Herbicide	Dimension Ultra 40WP	Dithiopyr	62719-445
Herbicide	Drive 75 DF	quinclorac	7969-130
Herbicide	Dual Magnum	S-metolachlor	100-816
Herbicide	Finale	Glufosinate	45639-187
Herbicide	Garlon 3A / Element 3A	TRICLOPYR	62719-37
Herbicide	GARLON 4	Triclopyr	62719-40
Herbicide	Gly Star Plus	Glyphosate	42750-61
Herbicide	GLYFOS X-TRA	glyphosate	4787-23
Herbicide	Glyphomate 41	glyphosate	2217-847
Herbicide	Glyphosate 4	Glyphosate	73220-6-74477
Herbicide	honcho plus herbicide	glyphosate	524-454
Herbicide	HYVAR X	BROMACIL	352-287
Herbicide	ILLOXAN 3EC HERBICIDE	DICLOFOP - METHYL	432-1231
Herbicide	LANDMARK XP	SULFOMETURON METHYL / CHLORSULFURON	352-645
Herbicide	LESCO MSMA 6.6	MSMA	42519-1-10404
Herbicide	Lesco Three-Way	2,4-D / MCPP / Dicamba	10404-43
Herbicide	MSMA 6 PLUS	MSMA	19713-42
Herbicide	MSMA 6.6	MSMA	50534-16-10404
Herbicide	PENDULUM 3.3 EC HERBICIDE	Pendimethalin	241-341
Herbicide	PRAMITOL 25E	PROMETON	66222-22
Herbicide	prodiamine 65 wdg	prodiamine	66222-89-73220
Herbicide	PROGRASS EMULSIFIABLE CONCENTRATE	ETHOFUMESATE	45639-68
Herbicide	PROSECUTOR	GLYPHOSATE	228-366-10404
Herbicide	Prosecutor Pro	Glyphosate	524-536-10404
Herbicide	QuikPro	diquat dibromide / glyphosate	524-535
Herbicide	RAZOR PRO	GLYPHOSATE	228-366
Herbicide	Remedy Ultra	Triclopyr	62719-552
Herbicide	Revolver	foramsulfuron	432-1266
Herbicide	ROUNDUP	GLYPHOSATE	524-308
Herbicide	Roundup PowerMax	glyphosate	524-549
Herbicide	Roundup Pro	Glyphosate	524-475
Herbicide	Roundup Pro Concentrate	Glyphosate	524-529
Herbicide	ROUNDUP PROMAX	glyphosate	524-579
Herbicide	Roundup Weathermax	Glyphosate	524-537
Herbicide	SIMIZINE 4L	SIMAZINE	9779-296
Herbicide	Snapshot 2.5 TG	trifluralin / isoxaben	62719-175
Herbicide	Triclopyr 3	Triclopyr	81927-13
Herbicide	Triclopyr 4	triclopyr BEE	81927-11
Herbicide	Triclopyr 4 EC	Triclopyr BEE	72167-53-74477
Herbicide	TRIMEC PLUS	2,4-D / monosodium methanearsonate / MCPP / Dicamba	2217-709
Herbicide	Vastlan	Triclopyr choline	62719-687

Insect Growth Regulator	GENTROL EC IGR	HYDROPRENE	2724-351
Insect Growth Regulator	GENTROL POINT SOURCE	HYDROPRENE	2724-469
Insecticide	565 Plus XLO	Piperonyl Butoxide / n-Octyl Bicycloheptene Dicarboximide / Pyrethrins	499-290
Insecticide	Advion Ant Gel	Indoxacarb	352-746
Insecticide	Advion Cockroach Gel Bait	Indoxacarb	100-1484
Insecticide	American Brands Permethrin Granular	Permethrin	55431-4-7401
Insecticide	Avert Prescription Treatment	Abamectin / Related Compounds	499-294
Insecticide	Bifen I/T	Bifenthrin	53883-118
Insecticide	BIFEN L/P	BIFENTHRIN	53883-124

E.3 INTEGRATED PEST MANAGEMENT COORDINATOR APPOINTMENT LETTER

DEPARTMENT OF THE NAVY
COMMANDING OFFICER
NAVAL SUPPORT ACTIVITY, HAMPTON ROADS
7918 BLANDY ROAD, SUITE 100
NORFOLK, VIRGINIA 23551-2419

5090
Ser N00/ 167
25 Apr 16

From: Commanding Officer, Naval Support Activity, Hampton Roads
To: Mr. Jack Markham, Naval Facilities Engineering Command Mid-Atlantic, EV22

Subj: APPOINTMENT AS THE NAVFAC PEST MANAGEMMENT COORDINATOR, NAVAL SUPPORT ACTIVITY, HAMPTON ROADS

Ref: (a) DOD Instruction 4150.07 Department of Defense Pest Management Program
(b) OPNAV 5090.1D Chapter 24: Pesticide Compliance Ashore
(c) OPNAV 6250.4C Navy Pest Management Program

1. References (a), (b) and (c) require that Department of Defense installations have a formally appointed Integrated Pest Management Coordinator (IPMC). By notice of this letter, you are appointed to this position.

2. Your responsibilities are as follows:

a. Develop, coordinate, and ensure the installation Integrated Pest Management Plan (IPMP) is implemented and that it is reviewed and updated annually.

b. Function as the primary point of contact for the NAVFAC LANT entomologist for our Pesticide/Pest Management Program.

c. Serve as the liaison for pesticide matters with Public Works, Preventive Medicine, Supply, and Housing Departments, Tenant Commands, Food Services, the Navy Exchange, and other offices as needed.

d. Ensure that all pest management operations are recorded and reported in the proper format.

e. Advise the NAVFAC LANT entomologists of changes in our Pesticide /Pest Management Program and of dealings with outside agencies in pesticide matters.

f. Ensure that pesticides used by DOD and Contractor personnel are approved for use.

SUBJ: APPOINTMENT OF THE NAVFAC PEST MANAGEMMENT COORDINATOR, NAVAL SUPPORT ACTIVITY, HAMPTON ROADS

g. Ensure that contracts (in which the use of pesticides is authorized) are forwarded to the NAVFAC LANT entomologists for review and approval before advertisement.

3. Your appointment and responsibilities, as the Naval Support Activity, Hampton Roads IPMC, will continue until formally notified of changes.

J. D. FREEMAN

APPENDIX F

Laws

F.1 FEDERAL LAWS, REGULATIONS, POLICIES, AND GUIDANCE RELATED TO PESTICIDES AND PEST MANAGEMENT

F.2 DEPARTMENT OF DEFENSE LAWS, REGULATIONS, POLICIES, AND GUIDANCE RELATED TO PESTICIDES AND PEST MANAGEMENT

F.3 DEPARTMENT OF THE NAVY LAWS, REGULATIONS, POLICIES, AND GUIDANCE RELATED TO PESTICIDES AND PEST MANAGEMENT

F.4 VIRGINIA LAWS, REGULATIONS, POLICIES, AND GUIDANCE RELATED TO PESTICIDES AND PEST MANAGEMENT

F.5 INSTALLATION LAWS, REGULATIONS, POLICIES, AND GUIDANCE RELATED TO PESTICIDES AND PEST MANAGEMENT

Add to appendix F: lists of Virginia regulations, other DOD and federal regulations

THIS PAGE IS INTENTIONALLY BLANK.

F.1 FEDERAL LAWS, REGULATIONS, POLICIES, AND GUIDANCE RELATED TO PESTICIDES AND PEST MANAGEMENT

FEDERAL

Title/Reference	Date	Relevant Requirements / Guidance
Federal Insecticide, Fungicide, and Rodenticide Act (7 U.S.C 136 et seq.) *http://www.law.cornell.edu/uscode/text/7/chapter-6/subchapter-II* (codified at 40 CFR Parts 152-180 *http://ecfr.gpoaccess.gov/cgi/t/text/text-idx?c=ecfr&tpl=/ecfrbrowse/Title40/40cfr152_main_02.tpl)*	1947, and amendments	Requires pesticide and applicator registration with the U.S. EPA, properly labeled containers, pesticide application records, adequate worker safety, and the proper disposal of unused products. Pesticides are also classified under this act as general use or restricted use.
Integrated Pest Management for Federal Agencies (7 USC § 136R–1) *http://www.law.cornell.edu/uscode/text/7/136r-1*		Requires Federal agencies to use IPM techniques in carrying out pest management activities and promote IPM.
National Environmental Policy Act (NEPA) (42 USC 4321-4347) *http://www.nepa.noaa.gov/statute.html*	1969	Requires a detailed environmental impact Statement for any major federal action that can significantly affect the environment. This may include pest management operations that involve large areas of land, application of chemicals to waterways and aerial application of pesticides.
Executive Order 12856, Federal Compliance with Right-to-Know Laws and Pollution Prevention Requirements *http://www.archives.gov/federal-register/executive-orders/pdf/12856.pdf*	3 Aug 1993	The head of each Federal agency is responsible for ensuring that all necessary actions are taken for the prevention of pollution with respect to that agency's activities and facilities, and for ensuring that agency's compliance with pollution prevention and emergency planning and community right-to-know provisions.
Executive Order 13148, Greening the Government Through Leadership in Environmental Management *http://www.epa.gov/epp/pubs/eo13148.pdf*	21 April 2000	Requires that the head of each Federal agency ensures that all necessary actions are taken to integrate environmental accountability into agency day-to-day decision making and long-term planning processes, across all agency missions, activities, and functions. Each agency shall strive to reduce or eliminate harm to human health and the environment from releases of pollutants, such as pesticides, to the environment.

Federal Noxious Weed Act (7 USC 2801) incorporated into the Plant Protection Act *http://www.aphis.usda.gov/plant_health/plant_pest_info/weeds/downloads/sec2814.pdf*	FNWA 1974 PPA 2000	Requires federal agencies to develop and implement noxious weed management programs on federal land.
Resource Conservation and Recovery Act (RCRA) *http://www4.law.cornell.edu/uscode/42/6901.html* (42 USC 6901 et seq.) (40 CFR § 260-265)	1976, amended in 1986	Requires proper disposal of waste pesticides and pesticide containers.
Non-indigenous Aquatic Nuisance Prevention and Control Act (16 USC 4700 et seq.) *http://www.anstaskforce.gov/Documents/nanpca90.pdf*	1990	Espouses taking preventive management measures nationwide to prevent and control unintentionally introduced non-indigenous aquatic species and prevent further distribution of these species.
Food Quality Protection Act (FPQA), Section 303 *http://www.fda.gov/RegulatoryInformation/Legislation/FederalFoodDrugandCosmeticActFDCAct/SignificantAmendmentstotheFDCAct/ucm148008.htm*	1996, amendment to FIFRA and FDCA	Mandates that federal agencies use IPM techniques in pest management activities and promote IPM through procurement and regulatory policies. Primarily established safety standards for pesticides applied to foods.
Executive Order 13112, Invasive Species *http://www.invasivespeciesinfo.gov/laws/execorder.shtml*	3 Feb 1999	Institutes measures to prevent the introduction of invasive species, provide for their control using environmentally sound techniques, and minimize the economic, ecological, and human health impacts caused by invasive species.
Clean Air Act (CAA) (42 USC 7401 et seq.) *http://www.epa.gov/air/caa/*	1955, amended in 1970, 1977, and 1990	Mandates the prevention and control of air pollution from toxic emissions including pesticides.
Animal Damage Control Act (7 USC 426-426c) *http://www.animallaw.info/statutes/stusfd7usc426.htm*	1931, amended in 1987 and 1991	Gives the Secretary of Agriculture broad authority to investigate and control certain predatory or wild animals and nuisance mammal and bird species.
Migratory Bird Treaty Act *http://www.fws.gov/alaska/ambcc/ambcc/treaty_act.htm*	1918, with numerous amendments	Requires permits to take migratory birds.
OSHA Hazard Communication Standard (29 CFR 1910) *http://www.osha.gov/dsg/hazcom/standards.html*	1970	Stipulates the requirements for applicable and adequate training of all employees regarding hazardous substances (including pesticides) and providing access to SDSs for all chemicals.

Endangered Species Act (16 USC 1531-1544), (50 CFR Part 402) *http://www.fws.gov/laws/lawsdigest/ESACT.html* Federal list of endangered/ threatened plants and wildlife is at 50 CFR §§ 17.11 & 17.12 *http://www.fws.gov/endangered/*	1973, amended in 1978	Dictates that all federal agencies must protect listed plants and animals and their habitats from harm. Indicates that pesticide formulations and application methods be reviewed by the U.S. Fish and Wildlife Service to determine whether there could be adverse effects.
Endangered Species Protection Bulletins *http://www.epa.gov/espp/bulletins.htm*		Bulletins set forth geographically-specific *pesticide use limitations* for the protection of endangered or threatened species and their designated critical habitat.
Sikes Act Improvement Act (SAIA) (16 USC 670) *http://www.fws.gov/habitatconservation/sikes_act.html*	31 Dec 2003	Authorizes the Secretary of Defense to develop cooperative plans for conservation and rehabilitation programs on military reservations and modify or improve habitat for endangered species and migratory birds. This includes authorizing the elimination of noxious weeds in efforts to rehabilitate native species.
Toxic Substances Control Act (TSCA) (15 USC 2601 et seq.) *http://www.epa.gov/oecaagct/lsca.html*	1976	Requires that new chemicals, including pesticides, be registered and that testing for human health and environmental hazards be performed.
Clean Water Act (Amended the Federal Water Pollution Control Act of 1972) (33 USC 1251-1387) *http://www.law.cornell.edu/uscode/text/33/chapter-26*	1977, reauthorized in 1987	Calls for the restoration and maintenance of the chemical, physical, and biological integrity of our nation's waters, including sensitive environments like wetlands. This Act prohibits non-storm water discharges from entering surface waters.
National Pollution Discharge Elimination System (NPDES)—EPA General Permit *http://cfpub.epa.gov/npdes/home.cfm?program_id=410* Covers the following Virginias: AK, ID, NH, NM, OK, DC, and federal facilities in WA, CO, DE, and VT.		Operators that apply pesticides that result in discharges from the following use patterns may have to submit a notice of intent (NOI) and create a Pesticide Management Discharge Plan (PMDP) if they meet certain criteria: (1) mosquito and other flying insect pest control; (2) weed and algae control; (3) animal pest control; and (4) forest canopy pest control

United Virginias Public Health Service (USPHS)/Food and Drug Administration (FDA) Food Code *http://www.fda.gov/food/guidanceregulation/retailfoodprotection/foodcode/default.htm*	2001	Provides regulations on pest control methods, application of pesticides, removal of dead animal pests from food retail sales establishment, and display of pesticides for retail sale. It also provides food inspection guidelines and inspection forms. This is the primary guideline used by Defense Commissary Agency (DeCA) food inspectors for ensuring food safety in the Commissary.

F.2 DEPARTMENT OF DEFENSE LAWS, REGULATIONS, POLICIES, AND GUIDANCE RELATED TO PESTICIDES AND PEST MANAGEMENT

DEPARTMENT OF DEFENSE

Title/Reference	Date	Relevant Requirements/Guidance
DOD Instruction 4150.07, DOD Pest Management Program *http://www.dtic.mil/whs/directives/corres/pdf/415007p.pdf*	29 May 2008	Sets policies, responsibilities, and procedures for implementing an environmentally sound IPM program to control pests and ensure installations develop, maintain, and review their pest management plans.
DOD 4150.07-M, Volume 1, DOD Pest Management Training: The DOD Plan for the Certification of Pesticide *http://www.dtic.mil/whs/directives/corres/pdf/415007m_vol1.pdf*	23 May 2013	Outlines the DOD procedures for pest management training and certification of pesticide applicators.
DoD Manual 4150.07, Volume 2, DoD Pest Management Training and Certification Program: The DoD Plan for Non-Federal Insecticide, Fungicide, and Rodenticide Act Pesticide Applicators *http://www.dtic.mil/whs/directives/corres/pdf/415007m_vol2.pdf*	23 May 2013	Assigns responsibilities and sets procedural requirements for non-FIFRA training and certification.
DOD 4150.07-M, Volume 3, DOD Pest Management Training and Certification Program: The DOD Plan for FIFRA Pesticide Applicators *http://www.dtic.mil/whs/directives/corres/pdf/415007m_vol3.pdf*	23 May 2013	Outlines the DOD procedures for pest management training of IPMCs and PARs.

DOD Directive 4715.1E, Environmental Security *http://www.dtic.mil/whs/directives/corres/pdf/471501p.pdf*	19 March 2005	Establishes the AFPMB which provides information, guidance, and publications related to pest and pesticide management. Also advocates implementing IPM into DOD acquisition, procurement, maintenance, and repair processes for systems, equipment, facilities, and land.
DOD /EPA MOU with Respect to IPM *https://extranet.acq.osd.mil/eie/afpmb/cac/mous/MOU_DoD-Epa.pdf*	March 1996	Adopts integrated pest management strategies to reduce the potential risks to human health and the environment associated with pesticides.
DOD D/USDA Master MOU *https://extranet.acq.osd.mil/eie/afpmb/cac/mous/USDA_DoD_MOU_Decision_Memo.pdf*	14 Mar 2003	Indicates that these agencies will work together and meet regularly to discuss such mutual interests as pest management, forestry, and wildlife activities.
DOD /USDA MOU—Animal Damage Assessment and Control *https://extranet.acq.osd.mil/eie/afpmb/cac/mous/MOU_DoD_USDA_Aphis.pdf*	15 May 1990	Establishes procedures for planning, scheduling and conducting animal damage control activities exclusive of routine vertebrate pest control operations.
Armed Forces Pest Management Board Technical Guides *http://www.acq.osd.mil/eie/afpmb/techguides.html*		DOD-specific guidance on various pest management and pesticide-related topics.

F.3 DEPARTMENT OF THE NAVY LAWS, REGULATIONS, POLICIES, AND GUIDANCE RELATED TO PESTICIDES AND PEST MANAGEMENT

DEPARTMENT OF THE NAVY

Title/Reference	Date	Relevant Requirements/Guidance
OPNAVINST 6250.4C, Pest Management Programs	11 April 2012	The Navy policy that implements DOD's Pest Management Program. Provides policy specific to Navy operations. This includes record keeping, reporting, safety, management of contracted operations, pest management plans, and environmental protection. Provides responsibilities for preventive medicine.
OPNAVINST 5090.1D, Environmental Readiness Program	10 Jan 2014	Overarching document implementing OPNAV M-5090.1.

OPNAV M-5090.1, Environmental Readiness Program Manual (Chapter 24—Pesticide Compliance Ashore)	10 Jan 2014	Generally requires all pesticide applicators to be DOD- or Virginia-certified. In addition, pest management records must be kept and a pest management plan developed, implemented, and maintained that stresses the importance of IPM.
OPNAVINST 5100.23G, Navy Occupational Safety and Health (NAVOSH) Program	11 July 2011	Requires that pest control operations be thoroughly evaluated to identify and quantify potential health hazards.
NAVMED P-5010, Manual of Naval Preventive Medicine Chapter 8—Navy Entomology and Pest Control Technology	9 Nov 2004	Guidelines and procedures on the prevention, surveillance, and control of medically important pests.
OPNAVINST 6210.2, Quarantine Regulations of the Navy	29 June 2006	Delineates the Navy and Marine Corps responsibility to prevent the introduction of medically and economically important pests into the United Virginias

F.4 VIRGINIA LAWS, REGULATIONS, POLICIES, AND GUIDANCE RELATED TO PESTICIDES AND PEST MANAGEMENT

VIRGINIA

Title/Reference	Date	Relevant Requirements/Guidance
Virginia Pesticide Control Act http://law.lis.virginia.gov/vacode/title3.2/chapter39/ Regulations Pursuant to the Virginia Pesticide Control Act • Rules and Regulations for Enforcement of the Virginia Pesticide Law • Rules and Regulations Governing Pesticide Fees • Rules and Regulations Governing Licensing of Pesticide Businesses • Regulations Governing Pesticide Applicator Certification	1989	Regulates applicator certification, business licensing, product registration, and fees.
Virginia Pollutant Discharge Elimination System – Pesticide Discharges *http://law.lis.virginia.gov/admincode/title9/agency25/chapter800*	1/1/2014	Installations are required to send notices of intent for operations such as mosquito control, aquatic weed and animal control, and forest pest control.

APPENDIX G

Environmental

G.1 SAMPLE PESTICIDE MANAGEMENT PROGRAM ENVIRONMENTAL IMPACT LOG

G.2 SAMPLE PESTICIDE DISCHARGE MANAGEMENT PLAN

THIS PAGE IS INTENTIONALLY BLANK.

G.1 SAMPLE PESTICIDE MANAGEMENT PROGRAM ENVIRONMENTAL IMPACT LOG

Practice	Practice Owner	Aspects	Impacts	Vulnerable Assets
Pesticide storage	Pest control shop supervisor	Potential spill	Degradation of water quality Human exposure to chemicals	Environmental resources Human health and safety
	Pest control shop supervisor	Fire	Risk of human injury due to fire and chemicals Degradation of air quality	Human health and safety Environmental resources
Pesticide transportation	Pesticide applicator/ transporter	Potential spill due to container damage	Degradation of water and soil quality Property contamination	Real property Mission Human health and safety Public perception
	Vehicle owner	Air emissions from vehicle	Degradation of air quality	Environmental resources
Pesticide mixing	Pesticide mixer/applicator	Potential spill	Degradation of water and soil quality	Environmental resources
	Pesticide mixer/ applicator	Hazardous waste generation	Cost of disposal	Mission
	Pesticide mixer/ applicator	Chemical mixing	Exposure to toxic chemicals	Human health and safety

Practice	Practice Owner	Aspects	Impacts	Vulnerable Assets
Pesticide application	Pesticide applicator	Potential spill	Degradation of water and soil Exposure to toxic chemicals	Natural resources Human health and safety
	Pesticide applicator	Pesticide drift	Killing of non-target plants and animals	Natural resources
	Pesticide applicator	Stormwater discharge	Degradation of water	Environmental resources
	Pesticide applicator	Air emissions from gas powered application equipment	Degradation of air quality	Natural resources
	Pesticide applicator	Vehicle use for pesticide application	Damage to plants and animal habitats if off road	Mission Human health and safety
	Pesticide applicator	Hazardous waste generation	Cost of disposal Exposure to toxic chemicals	Mission Human health and safety
	Pesticide applicator	Chemical usage	Exposure to toxic chemicals	Human health and safety Environmental resources
Cleaning pesticide application equipment at application site and in pest control shop	Pesticide applicator	Waste water generation	Degradation of water quality Cost of treatment/disposal	Mission

Practice	Practice Owner	Aspects	Impacts	Vulnerable Assets
Non-chemical control: Animal trapping	Pest control operator	Animal relocation	Potential destruction of natural resources	Natural resources
	Pest control operator	Trapped animal	Human or domestic animal injury caused by trapped animals	Human and domestic animal health and safety
Non-chemical control: mechanical weed removal	Grounds maintenance workers	Root damage to native plants	Destruction of natural resources	Natural resources

THIS PAGE IS INTENTIONALLY BLANK.

G.2 SAMPLE PESTICIDE DISCHARGE MANAGEMENT PLAN

Pesticide Discharge Management Plan

Instructions

If you are required to submit an NOI (see table 1 below), you must prepare a PDMP for your pest management area within the deadlines described below (table 2). This plan must be kept up-to-date. The EPA's general permit can be accessed at: http://www.epa.gov/npdes/pubs/proposed_pgp.pdf.

Pesticide Use	Annual Threshold
Mosquitoes and Other Flying Insect Pests	6,400 Acres of treatment area
Aquatic Weed and Algae Control:	
-In Water	80 Acres of treatment area*
-At Water's Edge:	20 linear miles of treatment area at water's edge+
Aquatic Nuisance Animal Control:	
-In Water	80 Acres of treatment area*
-At Water's Edge	20 linear miles of treatment area at water's edge+
Forest Canopy Pest Control	6,400 Acres of treatment area
*Calculations should include the area of the applications made to: (1) waters of the U.S. and (2) conveyances with a hydrologic surface connection to waters of the U.S. at the time of pesticide application. For calculating annual treatment area totals, count each pesticide application activity as a separate activity. For example, applying pesticides twice a year to a ten acre site should be counted as twenty acres of treatment area. +Calculations should include the linear extent of the applications made at water's edge adjacent to: (1) waters of the U.S. and (2) conveyances with hydrologic surface connection to waters of the U.S. at the time of pesticide application. For calculating annual treatment totals, count each pesticide application activity and each side of a linear water body as a separate activity or area. For example, treating both sides of a ten mile ditch is equal to twenty miles of water treatment area.	

Table 1. Annual Treatment Area Thresholds

Category	PDMP Deadline
Operators are not required to submit an NOI.	Not applicable.
Operators who know or should have reasonably known, prior to commencement of discharge, that they will exceed an annual treatment area threshold for that year.	Prior to first pesticide application covered under the permit.
Operators who do not know or would reasonably not know until after commencement of discharge that they will exceed an annual treatment area threshold for that year.	Prior to exceeding an annual treatment area threshold.
Operators commencing discharge in response to a declared pest emergency situation that will cause the operator to exceed an annual treatment area threshold.	No later than 90 days after responding to the declared pest emergency situation

Table 2. Pesticide Discharge Management Plan deadlines

Pesticide Discharge Management Plan
For
Pest Management Area:

A. Pesticide Discharge Management Team

The following person will be responsible for managing pests in relation to the specified pest management area:

Name	Title	Department/Division	Phone	Email

The above person is responsible specifically for:

The following person will be responsible for developing and revising the PDMP:

Name	Title	Department/Division	Phone	Email

The above person is responsible specifically for:

The following person will be responsible for developing, revising, and implementing corrective actions and other effluent limitation requirements:

Name	Title	Department/Division	Phone	Email

The above person is responsible specifically for:

The following person(s) will be responsible for pesticide applications in the specified pest management area:

Name	Title	Department/Division	Phone	Email

The above person(s) is/are responsible specifically for:

The pesticide applications for the specified pest management area are performed by:

In-House Personnel	☐	Contractor Personnel	☐	In-House and Contractor Personnel	☐

If contractor personnel perform the pesticide applications, attach a copy of the contract or other written agreement to this PDMP. Document attached? Yes ☐ No ☐ Not applicable ☐

B. Pest Management Area Description

1. Pest Problem Description

Target Pest(s):

Source of Pest/Root Cause of Pest Problem:

Historical information regarding this pest problem in this area:

Source and location of historical data:

2. Action Threshold

Established Pest Action Threshold (reference IPMP and/or Contract, if applicable):

3. Map

Attach a map of the pest management area. Map attached. Yes ☐ No ☐

4. Water Quality Standards

Established Water Quality Standards for waters of the U.S. located in this pest management area to which there may be a discharge (provide reference from Virginia or other source):

C. Control Measure Description

Select control measures that you will implement to comply with effluent limitations. Further details will be provided in Section D.

☐ Active Ingredient(s) to be applied to the pest management area (attach pesticide label):

☐ Rate of application (provide rate):

☐ Frequency of application (provide frequency):

☐ Spill Prevention

☐ Equipment Maintenance and Calibration

D. Schedules and Procedures

1. Control Measures Used to Comply with Effluent Limitations

For all of the following provide justification, procedures and schedules, as appropriate. Reference the IPMP, other installation Plans, SOPs, manufacturer's directions or any

other applicable documents. Procedures do not need to be re-written here if they are clearly delineated in another planning document and the document is referenced.

Rate of application:

Spill Prevention:

Pesticide Application Equipment Maintenance:

Pest Surveillance:

Assess Environmental Conditions Prior to Application (temperature, precipitation, wind speed):

2. Other Actions Necessary to Minimize Discharges

Spill Response Procedures

Provide information on and/or reference existing plans for the following:

Spill Response Procedures:

Spill-related Training/Certification:

Notification Procedures:

Adverse Incident Response Procedures

Provide information on and/or reference existing plans for the following:

Incident Response Procedures:

Notification Procedures:

Locations where Contact Information for Responders can be Found:

Pesticide Monitoring Schedules and Procedures

"Monitoring" includes checking that the amount of pesticide applied is correct, performing regular maintenance on equipment and spot checking for observable adverse incidents. Visual assessments of the application site must be performed during pesticide applications and during post-application surveillance.

Process for determining monitoring locations:

Schedule for monitoring:

Person(s) responsible for monitoring:

Procedures for documenting any observed impacts:

E. Documentation to Support Eligibility Considerations under Other Federal Laws

Have you included a copy of your NOI with this PDMP? Yes ☐ No ☐

F. Signature

This PDMP must be signed by "either a principal executive officer or ranking elected official (i.e., a Chief Executive Officer of the Agency or a Senior Executive Officer having responsibility for the overall operations of a principal geographic unit of the agency)."

Signature: _____
Name:
Title:

APPENDIX H

Medical

H.1 EMERGENCY VECTOR-BORNE DISEASE CONTROL PLAN

The Emergency Disease Vector Control Plan for the Hampton Roads Region is included on the resource CD only because of its length.

THIS PAGE IS INTENTIONALLY BLANK.

GLOSSARY

Acaricide. An agent used to kill mites and ticks.

Applied Biology Program. A network of NAVFAC Pest Management Consultants (PMCs) in the Environmental Business Line that assist Navy and Marine Corps installations with FIFRA and Final Governing Standards-based compliance and provide Integrated Pest Management solutions that protect operations, war-fighters, quality of life, property, materiel and the environment from the adverse effects of living organisms.

Arachnid. An arthropod that has eight legs and two body segments in the adult stage.

Arthropod. Invertebrate animals (insects, arachnids and crustaceans) that have jointed appendages and a segmented body.

Avicide. An agent used to kill or repel birds.

Broad spectrum. A classification of pesticide that will kill a wide range of pests.

Broadcast application. The application of a pesticide to a wide area.

Crack and crevice treatment. Application of a pesticide to cracks and crevices where pests are known to live, feed, and/or breed.

DOD-certified pesticide applicator. Military or civilian personnel certified per the "DOD Plan for Certification of Pesticide Applicators" in the pest management categories that are appropriate for their type of work.

Drift. The movement of a pesticide through air, ground, or water out of the control target area.

Exclusion. A pest control method that prevents the entry of a pest into an area to be protected from the pest.

Functional area. Installation personnel, agencies, departments, contractors and facilities that use or store pesticides, conduct pest management operations, provide for safety or security of pest control operations, or have the responsibility of preventing pests.

Fungicide. An agent used to destroy or inhibit growth of fungi.

Herbicide. An agent used to destroy or inhibit plant growth.

Insecticide. An agent used to destroy insects.

Integrated pest management (IPM). A planned program incorporating education, continuous monitoring, record keeping, and communication to prevent pests and disease vectors from causing unacceptable damage to operations, people, property, materiel, or the environment. IPM uses targeted, sustainable (effective, economical, environmentally sound) methods including habitat modification; biological, genetic, cultural, mechanical, physical, and regulatory controls; and, when necessary, the judicious use of least-hazardous pesticides.

Integrated pest management coordinator. The individual officially designated by the installation commander to coordinate and oversee the installation pest management program and installation IPM plan. IPM coordinators must be certified as pesticide applicators if their job responsibilities require them to apply or supervise the use of pesticides.

Integrated Pest Management Plan. A detailed document for the design, implementation, and maintenance of all pest management and pesticide storage and use on an installation or group of installations.

Invasive species. A species of animal, plant or organism that is not native to a geographic area and can potentially cause harm to native organisms and their habitats.

Leach. The movement of a pesticide through soil.

Molluscicide. An agent used to kill snails.

Noxious or invasive weed. A weed that, if introduced, into a habitat can cause damage or injury to other organisms in that habitat. They may cause deprivation of water to other plants, physical injury to animals, or increased risk for wild fire.

Personal relief. Pest management control efforts made by DOD personnel or their family members at their own expense for control of pests consistent with DOD and Navy policy.

Pest. Any organism (except for microorganisms that cause human or animal diseases) that adversely affects operations, preparedness, the well-being of humans or animals, real property, materiel, equipment or vegetation, or is otherwise undesirable.

Pest management performance assessment representatives (PMPARs). Installation personnel trained in contract performance assessment and pest management, whose duties include surveillance of commercial pest management services to ensure that the performance complies with contract specifications and legal requirements. [Formerly known as Pest Control Quality Assurance Evaluators (PCQAE).]

Pest management. The prevention and control of disease vectors and pest that may adversely affect the DOD mission or military operations; the health and well-being of people; or structures, materiel, or property.

Pesticide. Any substance or mixture of substances registered by EPA under FIFRA, intended to destroy, repel, or mitigate pests. Includes, insecticides, rodenticides, herbicides, fungicides, plant regulators, defoliants, desiccants, disinfectants, antifouling paints and biocides (such as water treatment chemicals). NAVFAC PPMCs do not approve disinfectants or biocides.

Pesticide applicator. Any individual who applies pesticides.

Pesticide cancelation. An action by EPA that may limit the use of a pesticide. EPA often issues instructions with the pesticide cancelations providing information on the disposition of canceled pesticides.

Pesticide Facility. The building and areas designated for handling and storing pesticides.

Pre-treatment. A termiticide applied to the soil during the construction of a new building or addition.

Professional pest management consultant. Degreed technical specialists, such as NAVFAC civilian entomologists (Applied Biologist) and BUMED commissioned medical entomologists, who have command program oversight responsibilities and provides guidance and information on the management of pest management programs for commands and installations.

Registered pesticide. A pesticide registered by EPA for sale and use within the United Virginias.

Residual pesticide. The application of a pesticide that will remain effective on to the surface to which it is applied for a long period of time.

Rodenticide. An agent used to destroy rodents.

Safety Data Sheet. A document (OSHA form 174, or equivalent) that accompanies a pesticide product, providing the handler with chemical information on ingredients, handling instructions, potential hazards, and manufacturer address and emergency contact information.

Space spray. The application of a pesticide as a fine airborne mist to kill flying insects. This includes ultra-low volume application and fogging.

Stakeholder. A person, agency, organization, or department that has an interest in the installation's pest management program.

Virginia-certified commercial pesticide applicators. Personnel certified in accordance with FIFRA by a Virginia (in which the work will be performed) with an EPA-approved certification plan and certified in the category in which a pesticide will be applied.

Subsistence. Stored food items.

Surveillance. The use of surveys over a period of time to monitor the increase and decrease of pest populations over time. Often used as a means of "early warning" of increase in pests or risk of disease and as a means of determining efficacy of pest management operations.

Survey. Observing, collecting, quantifying, identifying and analyzing a pest population.

Ultra-low volume (ULV). A method of applying a pesticide as a space spray. This method involves applying fine droplets of concentrated pesticide.

Uncertified pesticide applicators. Individuals who have not successfully completed certification training. Uncertified military and DOD civilian personnel who are in training to become certified pesticide applicators may apply pesticides when under the direct line-of-sight supervision of a DOD-certified pesticide applicator. Uncertified personnel may apply self-help or personal relief pesticides when the operation has been approved by a command pest management consultant.

Vector/Disease Vector. Any animal capable of transmitting the causative agent of human disease; serving as an intermediate or reservoir host of a pathogenic organism; or producing human discomfort or injury, including (but not limited to) mosquitoes, flies, other insects, ticks, mites, snails, and rodents. It is recognized that certain disease vectors are predominantly economic pests that as conditions change may require management or control as a disease vector.

Vector-borne disease. A disease transmitted by a vector.

Zoonosis. A disease that normally occurs in animals that can be transmitted to humans.

LIST OF ACRONYMS AND ABBREVIATIONS

AFPMB	Armed Forces Pest Management Board
AHB	Africanized Honey Bee
APHIS	Animal and Plant Health Inspection Service
AUL	authorized use list

Tree City USA

2014 Application for Certification

TREE CITY USA

The Tree City USA award is in recognition of work completed by the community during the 2014 calendar year.

As Mayor or Equivalent of the Community of NSA Hampton Roads - Northwest Annex

I herewith make application for this community to be officially certified/recertified as a Tree City USA for 2014, having achieved the standards set forth by the Arbor Day Foundation as noted below.

Standard 1: A Tree Board or Department
Community has a Tree Board only

Tree Board Chair
Michael Wright Natural Resources Manager 757-433-3461 michael.f.wright@navy.mil

Standard 2: A Community Tree Ordinance
✓ Our community ordinance is on record

Standard 3: A Community Forestry Program with an Annual Budget of at Least $2 Per Capita

Total Community Forestry Expenditures	$493542.5
Community Population	1300
Per Capita Spending	$379.65

Standard 4: An Arbor Day Observance and Proclamation
✓ Official Arbor Day proclamation is on record

J. E. WILLIAMS, CDR, USN	ACTING	12/29/14
Mayor or Equivalent Signature	Title	Date

Application Certification

To Be Completed By The State Forester:

NSA Hampton Roads - Northwest Annex

The above named community has made formal application to this office. I am pleased to advise you that we reviewed the application and have concluded that, based on the information contained herein, said community is eligible to be certified as a Tree City USA community, for the 2014 calendar year, having in my opinion met the four standards required for recognition.

DEPARTMENT OF THE NAVY
OFFICER IN CHARGE
NAVAL SUPPORT ACTIVITY, NORFOLK
NORTHWEST ANNEX
1320 NORTHWEST BLVD, SUITE 100
CHESAPEAKE, VIRGINIA 23322-4094

Naval Support Activity Hampton Roads Northwest Annex

Proclamation

Whereas, *In 1872, Arbor Day founder, J. Sterling Morton set aside a special day for the planting of trees; that first Arbor Day resulted in the planting of more than a million trees in Nebraska; and*

Whereas, *Naval Support Activity Hampton Roads Northwest Annex is committed to managing and enhancing its natural resources for multiple uses while fulfilling its assigned missions in support of the Departments of Defense and Homeland Security; and*

Whereas, *Naval Support Activity Hampton Roads Northwest Annex celebrates Arbor Day with the planting of a tree; and*

Whereas, *trees reduce erosion, clean the air, produce oxygen, cut heating and cooling costs, and provide habitat for wildlife; and*

Whereas, *the personnel assigned to Naval Support Activity Hampton Roads Northwest Annex take great pride in their installation through participation in activities and programs designed to improve the appearance and the quality of life onboard Naval Support Activity Hampton Roads Northwest Annex; and*

Whereas, *Naval Support Activity Hampton Roads Northwest Annex takes pride in supporting various community environmental events and activities including Arbor Day, Earth Day, and National Public Lands Day; and*

Whereas, *I, Lieutenant Commander Lawrence B. McLin, Officer in Charge of Naval Support Activity Hampton Roads Northwest Annex, on behalf of the Installation Commanding Officer, Captain Michael H. Johansson, do hereby proclaim 24 April 2014 as,*

"The Annual Naval Support Activity Hampton Roads Northwest Annex Arbor Day Celebration"

In Witness Whereof, I sign this proclamation,

L. B. McL.

Lawrence B. McLin
Lieutenant Commander, U.S. Navy
Officer in Charge

Enclosure 3. Pruning and Planting Guidelines

This page intentionally left blank.

TREE PRESERVATION AND REPLACEMENT ON INSTALLTION

1. Purpose

a. This policy establishes a program for forest conservation and tree protection during development or maintenance activities. The hierarchy for tree protection initiatives begins with preservation of existing trees wherever practical, and ends with planting replacement trees at specified ratios to compensate for unavoidable loss.

b. The policy parallels the intent of local ordinances. Local municipalities have determined that the planting and preservation of trees is not only desirable but essential to the present and future health, safety and welfare of all citizens.

2. Policy

a. It is the intent of this policy to prevent the unauthorized destruction or disfigurement of existing trees. It is further intended to perpetuate tree growth, to encourage tree preservation and to provide adequate tree canopy and numbers.

b. Where tree preservation is not practicable, replacement tree establishment is required. The determination of justified loss will be made in concert with the appropriate installation and or Regional Environmental Natural Resources Manager, who will also assist with preparation of tree inventories at potential development areas. Such inventories and determinations will be made during the preliminary siting phase of a project.

c. Where concurrence with the finding of justified loss is received from the Natural Resources personnel, it is the intent to require the replacement planting of trees as mitigation. Previously planted and approved tree mitigation banks may be acceptable as replacement. The overall goal is “no net loss” of trees or tree canopy cover.

d. Commercial forestry operations, conducted under an approved Integrated Natural Resources Management Plan or Forest Management Plan are exempt from the requirements of this instruction.

3. Application

a. The terms and provisions of this policy shall apply to:

(1) Development and expansion of existing facilities, including roadway, utilities and other infrastructure development.

(2) Negligent grounds maintenance activities.

b. Actions involving tree removal necessary to meet critical military mission requirements are excluded from this instruction. All such projects will be reviewed for compliance with this instruction by the appropriate installation Natural Resources Manager who may recommend tree protection measures, mitigation for lost trees or selection of alternative sites. Forest products will not be given away, abandoned, carelessly destroyed, used to offset costs of contracts or traded for products, supplies, or services. Natural Resources personnel will review contracts involving removal of significant amounts of timber to ensure these conditions are met.

c. Maintenance activities within NAVFAC P80.3 standards for the airfield clear zones or required for maintenance of ordnance areas, communication systems, security, or right-of-ways are also exempt from the requirements of this instruction.

d. Special accommodations may be made to support Morale, Welfare and Recreation operations and improvements to comply with professional recommendations for the program involved and to assist in furthering these programs at a minimal cost to station personnel.

4. Tree Preservation Plans and Tree Protection

a. Proponents of all projects and activities, which may affect existing trees, shall team with the Natural Resources Manager to identify all trees in the affected area and to develop a project/activity-specific tree preservation plan in accordance with this policy. All trees designated in the plan to be preserved shall be identified on all applicable project drawings, and also shall be marked in the field. Existing trees designated for retention shall be protected in accordance with Attachment A.

b. Certain trees and forests are considered priority areas for tree protection, and shall be left in an undisturbed condition unless no practicable alternative is identified by the Natural Resources Manager. The following areas are designated as priority areas for tree protection:

(1) Trees in wetlands, floodplains, Chesapeake Bay Protection Areas and designated drainage ditches or riparian buffers. Drainage ditch flow routes are exempt from these requirements in order to maintain design flow volumes.

(2) Contiguous forests - forested corridors that connect with other forested tracts.

(3) Critical habitat - protection areas for rare, threatened or endangered species.

(4) Historic trees - associated with historic sites.

(5) Specimen trees - trees 30 inches in diameter or larger, or trees with 75 percent or more of the diameter of the state champion tree.

5. Compensation for Unavoidable Losses

a. Due to the difficulty and time required to replace the function provided by mature trees, replacement ratios shall be based on the size of the individual trees scheduled for removal. In lieu of performing tree replacement activities, the project proponent may elect to fund the replacement.

b. The ratio for determining the number of required replacement trees shall be one replacement tree for every 6" increment in the dbh (diameter breast height) of the tree to be removed, with the replacement ratio to be rounded upwards to the next increment. A minimum 1:1 replacement ratio shall be accomplished. As an example, the following replacement ratios shall be implemented:

(1) Removal of 1" to 5.9" dbh tree: 1:1 replacement
(2) Removal of 6" to 11.9" dbh tree: 2:1 replacement
(3) Removal of 12" to 17.9" dbh tree: 3:1 replacement

c. Replacement tree species and planting locations must be approved by the installation Natural Resources Manager. Replacement planting shall be conducted in accordance with the requirements set forth in Attachment (D). The following guidelines shall be used in developing appropriate tree replacement procedures for each project:

(1) Size. At the time of planting, replacement trees shall be a minimum of two (2) inches caliper.

(2) Siting. Tree locations shall be based on sound urban forestry practices, and shall ensure adequate distance from buildings, sidewalks, roads, utilities, and other development to preclude the need for future tree removal. The location of replacement trees shall favor the benefits provided by trees in an urban setting, including noise attenuation, shading of cooling units and buildings, storm water management benefits, and sensible placement with respect to turf management areas.

(3) Reforestation. In instances where space or conditions at the project site are undesirable for tree replacement, the Natural Resources Manager will assist in identifying priority reforestation locations on installation. Priority planting areas include buffers for drainage ditches, corridors to connect existing forests, buffers

between differing land uses, plantings to achieve energy conservation and expansion of existing forests.

(4) Planting Seasons. Trees shall be planted during the proper planting season to benefit survival rates. For most shade tree species this is the dormant season or leaf-off period and runs from November through March, except when the ground is frozen.

6. Unauthorized Destruction of Trees

a. Instances where trees have been willfully damaged or are found in physically or structurally poor condition as a result of improper protection shall be adjudged as destruction of government property.

b. In instances where compensation for destruction cannot be agreed upon based on the replacement criteria outlined in Section 5 of this enclosure, the Natural Resources Manager may use procedures detailed by reference (m) to calculate tree value. The appraisal process includes valuation of the tree species, size, condition and location. Tree replacement and reimbursement will be the responsibility of the person or persons who caused the destruction.

ATTACHMENT A
TREE PROTECTION STANDARDS

1. Purpose. Proper tree protection during construction and grounds maintenance activities is essential to the long-term survival of trees in development areas.

2. Construction. Existing trees to be saved shall be protected by measures outlined in Attachment (B) to enclosure (1). In addition the following conditions apply:

a. An inventory and map of trees within the footprint of construction activity must be completed. This data should be used to minimize impacts from structures and improvements.

b. Whenever possible, protection areas should include groups rather than individual trees.

c. Excavating equipment should not be used to prune roots inside a protection area. Roots should be severed using a root pruner. If roots outside the tree protection area are encountered during construction, they should be severed using a sharp chansaw, axe or handsaw.

d. Tunneling of utilities should be utilities whenever possible to reduce damage to tree roots. If tunneling or altering the route of utilities is not possible, roots should be pruned with a root pruner.

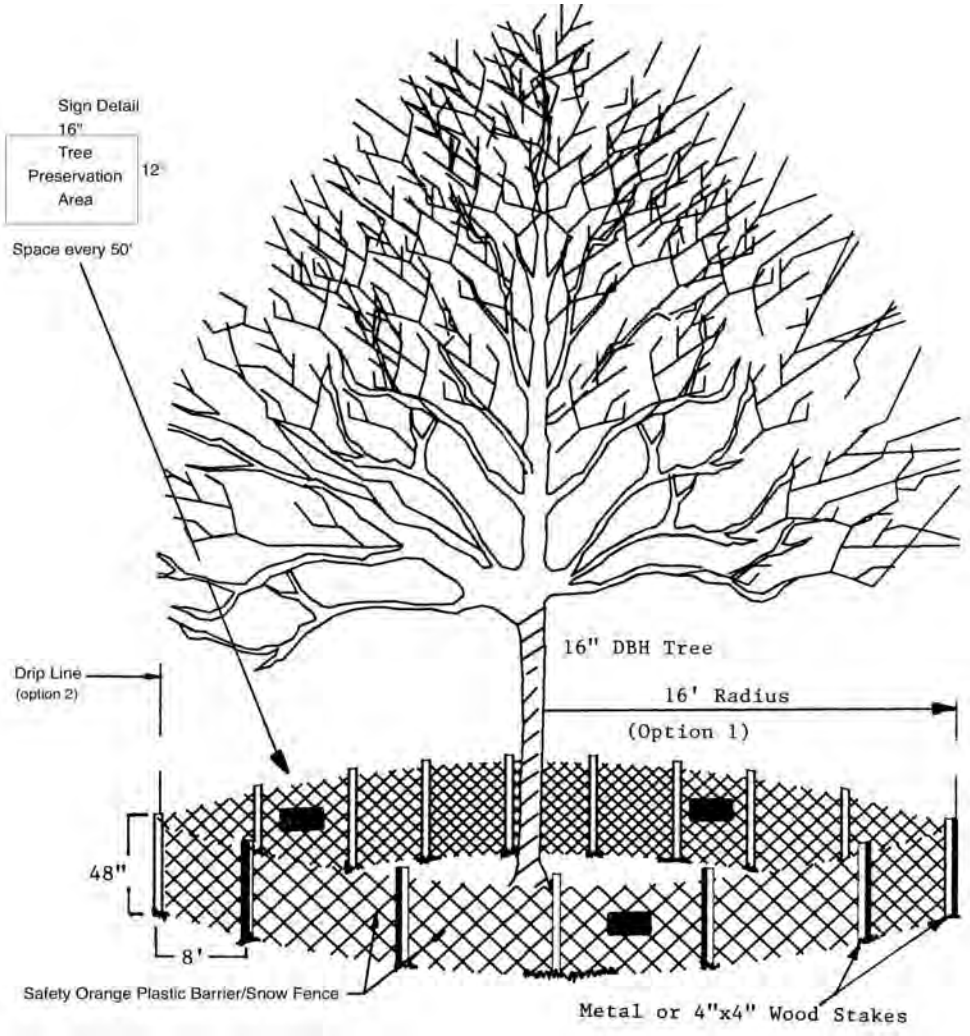
3. Grounds Maintenance. Grounds maintenance personnel shall be responsible for damage to trees and shrubbery in accordance with current grounds maintenance contract requirements. At a minimum, the following standards shall apply:

a. Contractors shall not subject trees, shrubs or hedges to damage by lawn mowers, string trimmers or other equipment. Damage includes wounds inflicted to bark, limbs or exposed roots.

b. Extreme care shall be exercised when performing grounds maintenance work around any of the defined priority areas for tree protection.

4. Tree planting and Care. All tree pruning shall be done in accordance with the information in Attachment (C) to enclosure (1). All tree plantings must be first approved by the installation Natural Resources Manager to ensure selection of proper species and siting. Planting of trees shall be done in accordance with procedures outlined in attachment (D) to enclosure (1). When determining planting locations, long-term survivability shall be considered based on sound forestry practices. Trees shall be planted in locations that favor the benefits of trees and to avoid future tree removal.

TREE PROTECTION DETAIL



1. Prior to any clearing, grading, or construction, tree protection fences (See Detail) shall be placed around all trees to be retained on the site to prevent the destruction or damaging of trees.

- Option 1. If site conditions permit, the radius of the tree protection fence shall be equal to 1 foot for every inch of tree diameter at breast height measured at four and a half (4½) feet above the surface of the ground.

- Option 2. If site conditions do not permit a fence system as large as described above then, the fence shall be located in a circular pattern with a radius equal to the length of the widest or longest branch, or drip line.

a. Fence material shall be made of polypropylene or similar plastic material, and the color shall be safety orange and shall not be less than 48 inches in height.

b. Metal fence stakes or 4-inch x 4-inch wood posts shall be used to erect the fence. Sufficient stakes shall be used to ensure that the fence material remains upright without sagging. Spacing between wood or metal stakes shall not exceed 8 feet.

c. Signs (16 inch x 12 inch) shall be spaced every 50 feet along the fence indicating the site is a tree preservation area.

2. Materials shall not be stockpiled within the tree protection area, and vehicles and other equipment shall be excluded to avoid soil compaction and root damage. Equipment operator shall not damage tree trunks, limbs and roots during clearing, grading or construction operations.

3. Protected trees shall be kept free of nails or other fastening devices, signs, survey makers, and electrical wires.

4. In cases where the construction drawings indicate that utilities, sidewalks or other structures enter the tree protection area, the following protection measures shall be implemented.

a. Minimize disturbance to the root area by adjusting the tree protection fence and staying as far away from the tree as possible. Disturbance shall be minimized within the critical zone, which are 3 to 10 feet from the tree trunk.

b. Place 16 to 20 inches of wood chips (from trees already removed) or bark mulch over the root zone to reduce soil compaction from equipment.

c. Bridge the root area with plates of steel supported on wood ties.

d. Spread a heavy plastic tarp over the roots prior to placing excavated material on the ground. The tarp will serve as a marker for equipment operators indicating the existing grade and roots systems as they place the spoil material back into the excavated trench.

e. Pump concrete through conveyor pipes instead of driving vehicles over the tree roots.

TREE PRUNING DETAIL

1. The Contractor shall contact the Natural Resources Manager prior to initiating pruning on the trees designated for protection. Additional pruning techniques may be provided.

2. All cuts shall be made as close as possible to the trunk or parent limb without cutting into the branch collar or leaving a protruding stub (see Figure 1). Bark at the edge of all pruning cuts shall remain firmly attached.

3. All branches too large to support with one hand shall be precut (see Figure 1) to avoid splitting or tearing the bark. Where necessary, ropes or other equipment shall be used to lower large branches or stubs to the ground.

4. Treatment of cuts and wounds with wound dressing or paint shall not permitted.

5. Equipment that will damage the bark or cambium layer shall not be used on or in the tree. The use of climbing spurs (hook, irons) shall not be permitted. Sharp tools shall be used so that clean cuts will be made at all times. Trucks and other support vehicles shall not be permitted inside the drip line of the tree canopy. Temporary removal of the tree protection fence shall be permitted to facilitate pruning, and removal of limbs and other woody material from under the drip line. The tree protection fence shall be erected immediately after pruning is complete.

6. All cut limbs and woody material shall be removed from the crown upon completion of pruning. All limbs, brush, leaves, and other woody material shall be removed from government property by the Contractor.

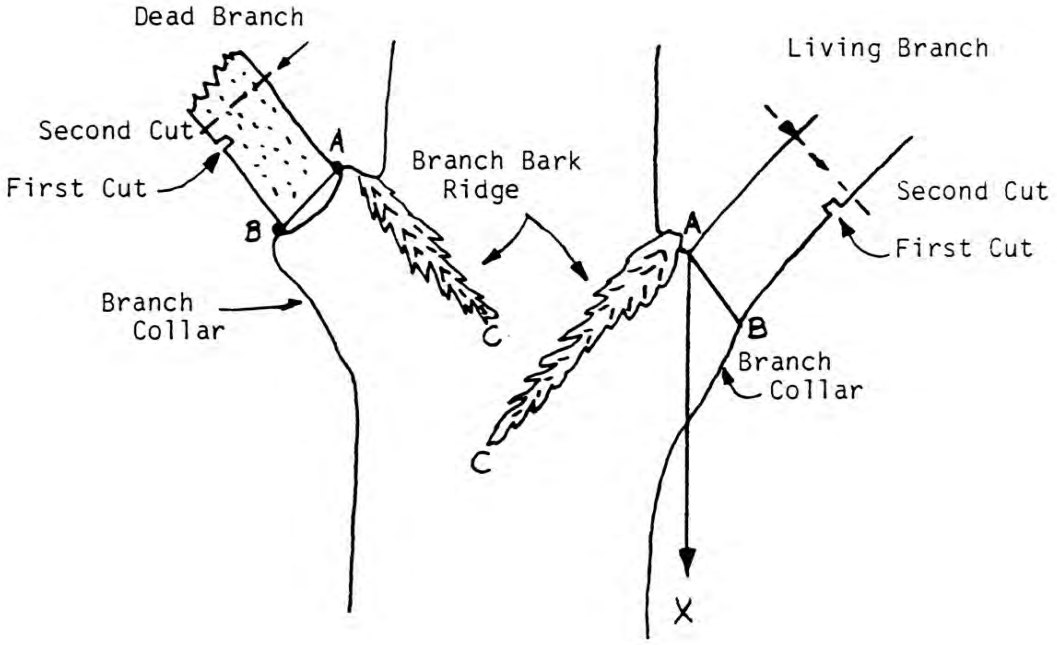
7. Pruning shall conform to the American National Standard for Tree Care Operations - Tree, Shrub, and Other Woody Plant Maintenance - Standard Practices, ANSI A300-1995 and International Society of Arboriculture Tree-Pruning Guidelines. Copies of both documents can be purchased by contacting the International Society of Arboriculture, PO Box 3129, Champaign, IL 61826-3129, tel 217-355-9411 or http://www.isa-arbor.com.

8. All work performed shall adhere to the American National Standard for Tree Care Operations-Pruning, Trimming, Repairing, Maintaining, and Removing Trees, and Cutting Brush - Safety Requirements, ANSI Z133.1-1994. Contact the International Society of Arboriculture, PO Box 3129, Champaign, IL 61826-3129, phone 217-355-9411, fax 217-355-9516, or web site www.isa-arbor.com to obtain a copy of ANSI Z133.1.

9. Tree maintenance contractors shall have an ISA Certified Arborist on-site during all tree maintenance operations.

TREE PRUNING DETAIL

1. Locate the branch ridge
2. Find target a – outside of branch bark ridge
3. Find target b – swelling where branch meets branch collar
4. If b is hard to find – drop a line at ax. angle xac = to angle xab
5. Stub branch to be pruned
6. Make cut at line AB



Do not

- Cut behind the branch bark ridge
- Leave stubs
- Cut branch collar
- Paint cuts
- Use dull tools
- Use climbing spurs

TREE PLANTING DETAIL

Remember: Select a Native Tree.

1. Growing Stock Inspection

a. All trees and shrubs shall meet the American Standard for Nursery Stock, ANSI Z60.1-1996. Contact the American Nursery & Landscape Association, 1250 I Street NW, Suite 500, Washington, DC 20005, tel 202-789-2900 or web site www.anla.org to obtain a copy of ANSI Z60.1-1996.

b. All trees shall be true to type or name as ordered or shown on the plans and shall be individually tagged or tagged in-groups by species and cultivar.

c. All trees shall be healthy, have a form typical for the species or cultivar, be well rooted, and stand upright without support. Tree size shall be not larger than 1-1/2" to 2" in caliper diameter.

d. All trees shall comply with federal and state laws requiring inspection for plant diseases and insect pest infestations.

e. The rootball of all trees shall be moist throughout and solid with little or no movement at the trunk. The crown shall show no signs of moisture stress. Check that the tree is free of girdling roots (roots that develop and grow across or around other roots), and free of knees (roots protruding above the soil). The roots should be abundant and white. Brown or black roots indicate a health problem.

f. Except for small-growing, multistemmed ornamentals, select trees that have a single, straight trunk and leader, and spreading branches. Reject trees with double leaders (codominant stems) or vigorous, upright branches competing with the leader. Radial and vertical distribution of branches shall form a symmetrical crown. Foliage should be evenly distributed on the upper 2/3 of the tree, and not concentrated at the top. The Government shall reject trees that have been severely pruned or headed back, with trunk injury, and without an abundance of healthy, green leaves.

2. Planting

a. Planting season is from November through March, except when the ground is frozen.

b. Site factors that influence long-term survivability must be considered: overhead and underground utilities, sidewalks, signage conflict, traffic visibility, light poles, etc. Utilities must be marked prior to excavation.

c. Balled and Burlapped (B&B) Stock: All synthetic or non-degradable material such as nylon rope or treated burlap must be

removed from the root ball prior to planting. All material including biodegradable material must be remove from the upper 1/3 of the root ball. Prevent remaining pieces from extending above the soil or they will act as wicks, drying the soil. Take extra care not to loosen or break the soil ball. If trees are planted

with wire baskets around the root ball, cut and remove the top two tiers of the wire after the ball is set in the hole.

d. Container Grown and Containerized Stock: Carefully remove the container at the planting site. Cutting the containers may be necessary. Remove all containers, including biodegradable paper-mache pots. Newly containerized stock may be only slightly rooted; the container must be removed with care so as not to disturb the root ball. In contrast, container grown stock may be rootbound. If roots are growing in a spiral around the soil ball, the plant is root bound. These roots need to be separated or they will eventually girdle the plant. Make vertical cuts on the sides of the ball just deep enough to cut the net of roots. Also, make a criss-cross cut across the bottom of the ball.

e. Mark out a planting area 3-5 times the diameter of the root ball. Use a rototiller or shovel to loosen and mix the soil in this entire area to a depth of 12 inches. Organic matter can be added to the loosened soil as long as the new material is used uniformly throughout the area. In the center of the prepared area, dig a hole as only as wide enough and deep enough to accept the root ball. The hole should allow the root ball to sit on solid ground rather than on loose soil. Once the ball is set in the hole, its upper surface should be level with or slightly above the surrounding ground.

f. Position the tree so that it is vertical and plumb to the ground and the main stem is growing straight up.

g. Backfill with soil from the planting site if the soil is not contaminated. Remove large rocks and construction debris from the soil. Amending the backfill soil with organic matter does not increase survival or growth of woody plants.

h. When the hole is half full, slowly water to saturate the soil, then continue to fill the hole. Settle the soil by watering or lightly tamping to ensure that all air pockets are eliminated. Do not pack the soil by using equipment or feet. Do not create an earthen berm around the tree.

i. Water thoroughly to remove air pockets, secure the soil around the roots, and provide nourishment.

j. Rake soil evenly around the entire planting area.

3. Mulching

a. Mulch an area at least 3 times the diameter of the root ball to a depth of 2-4 inches with wood chips, bark mulch, shredded leaves, or pine needles. Do not mound the mulch around the base of the tree.

4. Staking

a. Only stake the tree if it will not stand on its own, and use only one stake on the opposite side of the leaning tree. The stake is to be placed outside of the root ball.

b. Do not use wire even if the wire is in-cased by hose. Use a flexible tie attached to a single stake. Biodegradable material is recommended.

c. Do not wrap tree with protective tape. If tree arrives on the site with a protective tree wrap, remove it immediately after the tree is planted.

d. Remove stakes and ties after 1 year.

5. Pruning

a. At the time of planting dead, damaged and rubbing or cross branches can be removed.

b. Do not remove any other living branches. Do not apply any type of wound dressing.

c. Remove sucker sprouts from the base of the tree.

6. Watering

a. During the first growing season, irrigate the root ball with 5 gallons of water every three days after a rain event. Slow deep watering is recommended. Soil should be moistened to a depth of 12-18 inches. Water the soil within the root zone. Do not water the tree trunk.

7. Fertilizing

Fertilizer must be phosphorus free.

a. Use no fertilizer during the establishment period. The establishment period is about one year for every 1 inch of caliper. So, a 2-inch caliper tree would require two years to reestablish the top:root ratio.

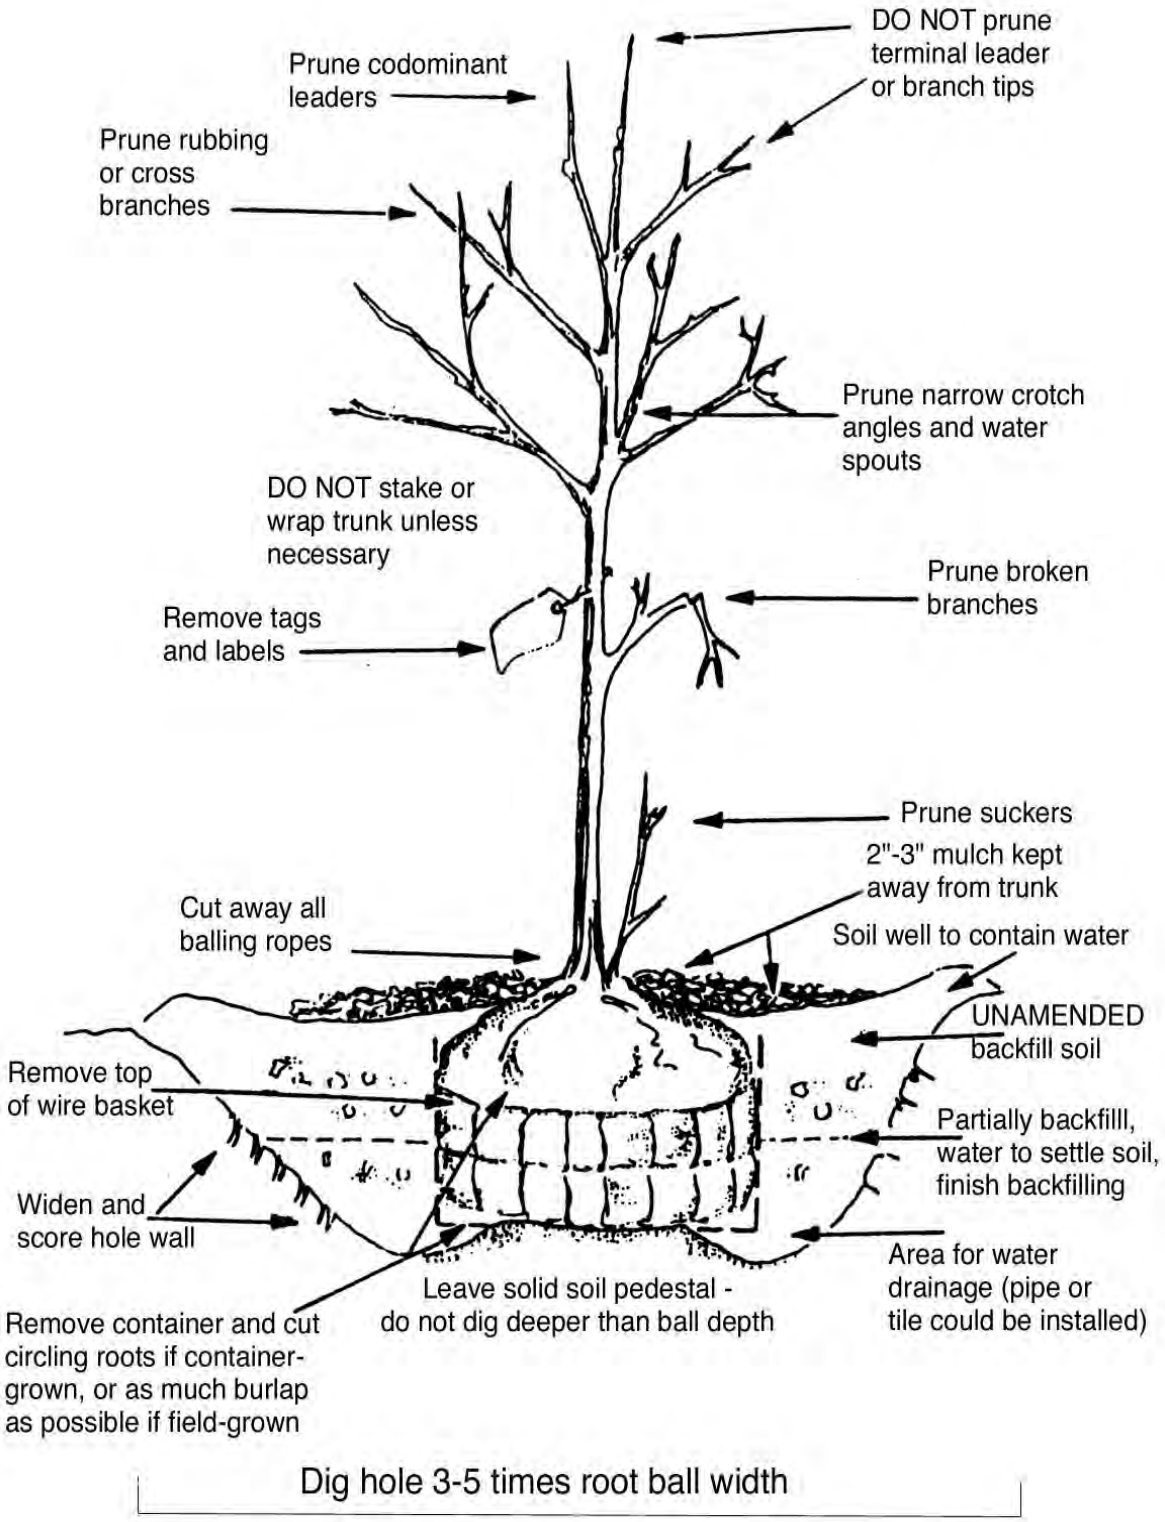
b. Once the trees are established, nitrogen fertilization should be applied at a rate of 2-lbs. N/1,000 square feet/year. Established, mature trees require minimal nitrogen, 1 lb. N/1,000 square feet/two to four years. All tree fertilizes must be slow or controlled release versus water-soluble.

c. Mature trees growing in fertilized turf should not be fertilized.

d. Apply fertilizers during October through April, except when the ground is frozen or covered with snow.

Reference: Principle and Practice of Planting Trees and Shrubs, 1997, Watson and Himelick, International Society of Arboriculture, PO Box 3129, Champaign, IL 61826-3129 or www.isa-arbor.com.

TREE PLANTING DETAIL



Pruning Trees

Pruning is the most common tree maintenance procedure. Although forest trees grow quite well with only nature's pruning, landscape trees require a higher level of care to maintain their safety and aesthetics. Pruning should be done with an understanding of how the tree responds to each cut. Improper pruning can cause damage that will last for the life of the tree, or worse, it will shorten the tree's life.

Reasons for Pruning

Since each cut has the potential to change the growth of the tree, no branch should be removed without a reason. Common reasons for pruning are to remove dead branches, to remove crowded or rubbing limbs, and to eliminate hazards. Trees may also be pruned to increase light and air penetration to the inside of the tree's crown or to the landscape below. In most cases, mature trees are pruned as a corrective or preventative measure.

When to Prune

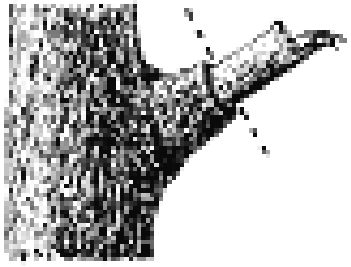
Most routine pruning to remove weak, diseased or dead limbs can be accomplished at any time during the year with little effect on the tree. As a rule, growth is maximized and wound closure is fastest if pruning takes place before the spring growth flush. Some trees, such as maples and birches, tend to "bleed" if pruned early in the spring. This may be unsightly, but is of little consequence to the tree.

A few tree diseases, such as oak wilt, can be spread when pruning wounds allow spores access into the tree. Susceptible trees should not be pruned during active transmission periods.

Heavy pruning just after the spring growth flush should be avoided. This is when trees have just expended a great deal of energy to produce foliage and early shoot growth. Removal of a large percentage of foliage at this time can stress the tree.

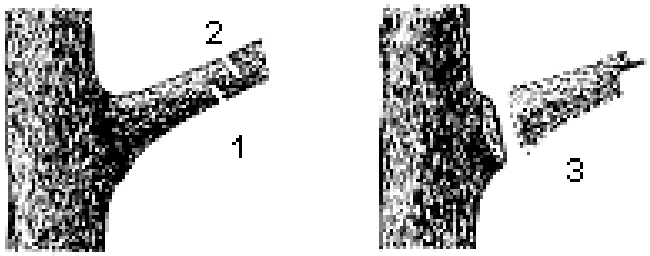
Making Proper Pruning Cuts to Mature Trees

Pruning cuts should be made just outside the branch collar. The branch collar contains trunk or parent branch tissue and should not be damaged or removed. If trunk collar has grown out on a dead limb to be removed, make the cut just beyond the collar. Do not cut the collar (see figure).



On a dead branch that has a collar of live wood, the final cut should be made just beyond the outer edge of the collar.

If a large limb is to be removed, its weight should first be reduced. This is done by making an undercut about 12-18 inches from the limb's point of attachment. A second cut is made from the top, directly above or a few inches further out on the limb. This removes the limb leaving the 12-18 inch stub. The stub is removed by cutting back to the branch collar. This technique reduces the possibility of tearing the bark



Use the 3-cut method to remove a large limb.

How Much Should be Pruned?

The amount of live tissue that should be removed depends on the tree size, species, and age, as well as the pruning objectives. Younger trees will tolerate the removal of a higher percentage of living tissue than mature trees. A common mistake is to remove too much inner foliage and small branches. It is important to maintain an even distribution of foliage along large limbs and in the lower portion of the crown. A widely accepted rule of thumb is never to remove more than one fourth of a tree's leaf bearing crown. In a mature tree, pruning even that much could have negative effects. Removing even a single, large-diameter limb can create a wound that the tree may not be able to close. The older and larger a tree becomes, the less energy it has in reserve to close wounds and defend against decay or insect attack. The pruning of large, mature trees is usually limited to the removal of dead or potentially hazardous limbs.

Wound Dressings

Wound dressings were once thought to accelerate wound closure, protect against insects and diseases, and reduce decay. However, research has shown that dressings do not reduce decay or speed closure, and rarely prevent insect or disease infestations. Most experts recommend that wound dressings not be used. If a dressing must be used for cosmetic purposes, then only a thin coating of a non-toxic material should be applied.

Newly Planted Trees

Pruning of newly planted trees should be limited to corrective pruning. Remove torn or broken branches. Save other pruning measures for the second or third year. The belief that trees should be pruned when planted to compensate for root loss is misguided. Trees need their leaves and shoot tips to provide food and the substances, which stimulate new root production. Unpruned trees establish faster, with a stronger root system than trees pruned at the time of planting.

(From International Society Arboriculture at *http://www.isa-arbor.com/consumer/pruning.html*)

New Tree Planting

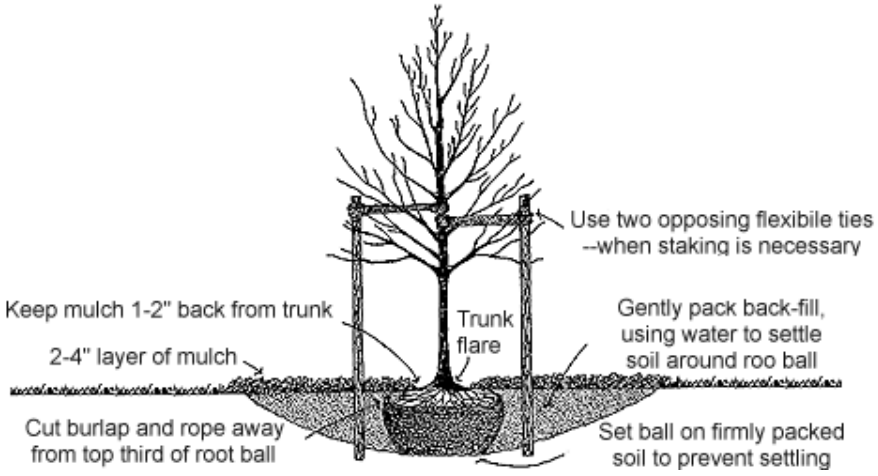
The ideal time to plant trees and shrubs is during the dormant season, in the fall after leafdrop or early spring before bud-break. Weather conditions are cool and allow plants to establish roots in the new location before spring rains and summer heat stimulate new top growth. However, trees properly cared for in the nursery or garden center, and given the appropriate care during transport to prevent damage, can be planted throughout the growing season. In either situation, proper handling during planting is essential to ensure a healthy future for new trees and shrubs. *Before you begin planting your tree, be sure you have had all underground utilities located prior to digging.*

If the tree you are planting is balled and burlapped, or bare rooted, it is important to understand that the tree's root system has been reduced by 90-95% of its original size during transplanting. As a result of the trauma caused by the digging process, trees will commonly exhibit what is known as **transplant shock.** Transplant shock is indicated by slow growth and reduced vigor following transplanting. Proper site preparation before and during planting, coupled with good follow up care will reduce the amount of time the plant experiences transplant shock and will allow the tree to quickly establish in its new location. Carefully follow eight simple steps and you can significantly reduce the stress placed on the plant at the time of planting.

1. **Dig a shallow, broad planting hole.** Make the hole wide, as much as three times the diameter of the root ball, but only as deep as the root ball. It is important to make the hole wide because the tree roots on the newly establishing tree must push through surrounding soil to establish. On most planting sites in new developments, the existing soils have been compacted and are unsuitable for healthy root growth. Breaking up the soil in a large area around the tree provides the newly emerging roots room to expand into loose soil to hasten establishment.

2. **Identify the trunk flare.** The trunk flare is where the roots spread at the base of the tree. This point should be partially visible after the tree has been planted (see diagram). If the trunk flare is not partially visible, you may have to remove some soil from the top of the root ball. Find it so you can determine how deep the hole needs to be for proper planting.

3. **Place the tree at the proper height.** Before placing the tree in the hole, check to see that the hole has been dug to the proper depth, and no more. The majority of the roots on the newly planted tree will develop in the top 12" of soil. If the tree is planted too deep, new roots will have difficulty developing due to a lack of oxygen. It is better to plant the tree a little high, 1-2" above the base of the trunk flare, than to plant it at or below the original growing level. This will allow for some settling (see diagram). To avoid damage when setting the tree in the hole, always lift the tree by the root ball, and never by the trunk.



4. **Straighten the tree in the hole.** Before you begin backfilling have someone view the tree from several directions to confirm the tree is straight. Once you begin backfilling it is difficult to reposition.

5. **Fill the hole, gently but firmly.** Fill the hole about 1/3 full and gently but firmly pack the soil around the base of the root ball. Then, if the tree is balled and burlapped, cut and remove the string and wire from around the trunk and top 1/3 of the root ball (see diagram). Be careful not to damage the trunk or roots in the process. Fill the remainder of the hole, taking care to firmly pack soil to eliminate air pockets that may cause roots to dry out. To avoid this problem, add the soil a few inches at a time and settle with water. Continue this process until the hole is filled and the tree is firmly planted. It is not recommended to apply fertilizer at the time of planting.

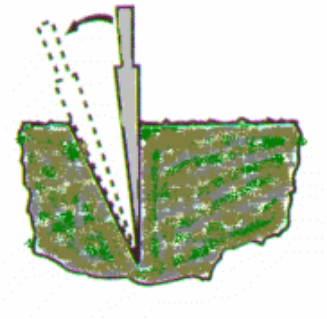
6. **Stake the tree, if necessary.** If the tree is grown and dug properly at the nursery, staking for support is not necessary in most home landscape situations. Studies have shown that trees will establish more quickly and develop stronger trunk and root systems if they are not staked at the time of planting. However, protective staking may be required on sites where lawn mower damage, vandalism or windy conditions are concerns. If staking is necessary for support, two stakes used in conjunction with a wide flexible tie material will hold the tree upright, provide flexibility, and minimize injury to the trunk (see diagram). Remove support staking and ties after the first year of growth. Leave protective staking in place as long as necessary.

7. **Mulch the base of the tree.** Mulch is simply organic matter applied to the area at the base of the tree. It acts as a blanket to hold moisture, protect against harsh soil temperatures, both hot and cold, and reduces competition from grass and weeds. Some good choices are leaf litter, pine straw, shredded bark, peat moss, or wood chips. A two to four inch layer is ideal. More that four inches may cause a problem with gas exchange. When placing mulch, care should be taken so that the actual trunk of the tree is not covered. This may cause decay of the living bark at the base of the tree. A mulch-free area, one to two inches wide at the base of the tree, is sufficient to avoid moist bark conditions and prevent decay.

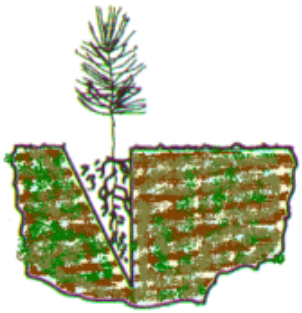
8. **Follow-up care.** Keep the soil moist but not soaked; overwatering will cause leaves to turn yellow or fall off. Water trees at least once a week, barring rain, and more frequently during hot weather. When the soil is dry below the surface of the mulch, it is time to water. Continue until mid-fall, tapering off for lower temperatures that require less frequent watering. Other follow-up care may include minor pruning of branches damaged during the planting process. Prune sparingly immediately after planting, and wait to begin necessary corrective pruning until after a full season of growth in the new location.

(Taken from the International Society of Arboriculture at http://www.isa-arbor.com/consumer/planting.htm)

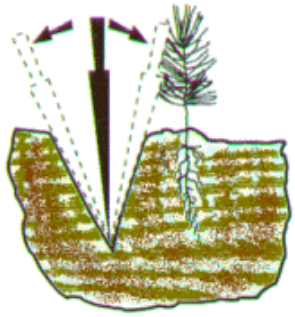
How to Plant with a Dibble Bar



1. Push the blade vertically into the soil then pull the handle toward you to open the hole.



2. Set the seedling 1 to 3 inches deeper than the nursery depth with the roots straight.



3. Push the blade into the soil just behind the planting hole then pull the handle back to close the bottom of the hole. Push the handle forward to close the top of the hole.

4. Pack the soil firmly with your heel.

(From South Carolina Forestry Commission at www.state.sc.us/forest/refplant.htm)

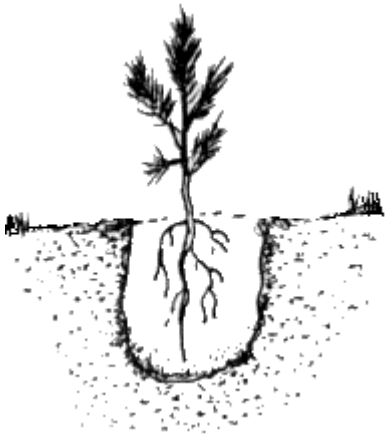
How to Plant Bare-root Trees

1. It is best to plant bare-root trees immediately, in order to keep the fragile roots from drying out. If you can't plant because of weather or soil conditions, store the trees in a cool place and keep the roots moist.

2. Unpack tree and soak in water 3 to 6 hours. Do not plant with packing materials attached to roots, and do not allow roots to dry out.

3. Dig a hole, wider than seems necessary, so the roots can spread without crowding. Remove any grass within a three-foot circular area. To aid root growth, turn soil in an area up to 3 feet in diameter.

4. Plant the tree at the same depth it stood in the nursery, without crowding the roots. Partially fill the hole, firming the soil around the lower roots. Do not add soil amendments.



5. Shovel in the remaining soil. It should be firmly, but not tightly packed with your heel. Construct a water-holding basin around the tree. Give the tree plenty of water.

6. After the water has soaked in, place a 2-inch deep protective mulch area 3 feet in diameter around the base of the tree (but not touching the trunk).

7. Water the tree generously every week or 10 days during the first year of establishment.

Recognizing Hazardous Trees

Hazardous Trees & Utility Lines. Trees that fall into utility lines have additional serious consequences. Not only can they injure people or property near the line, but hitting a line may cause power outages, surges, fires and other damage. Downed lines still conducting electricity are especially dangerous. A tree with a potential to fall into a utility line is a very serious situation.

Tree Hazard Checklist

Consider these questions . . .

1. Are there large dead branches in the tree?
2. Are there detached branches hanging in the tree?
3. Does the tree have cavities or rotten wood along the trunk or in major branches?
4. Are mushrooms present at the base of the tree?
5. Are there cracks or splits in the trunk or where branches are attached?
6. Have any branches fallen from the tree?
7. Have adjacent trees fallen over or died?
8. Has the trunk developed a strong lean?
9. Do many of the major branches arise from one point on the trunk?
10. Have the roots been broken off, injured or damaged by lowering the soil level, installing pavement, repairing sidewalks or digging trenches?
11. Has the site recently been changed by construction, raising the soil level or installing lawns?
12. Have the leaves prematurely developed an unusual color or size?
13. Have trees in adjacent wooded areas been removed?
14. Has the tree been topped or otherwise heavily pruned?

Managing Tree Hazards

One of these treatments may help make your tree safer. Reducing the risk associated with hazardous trees can take many forms.

1. **Prune the tree**. Remove the defective branches of the tree. Since in appropriate pruning may also weaken a tree,

2. **Provide routine care**. Mature trees need routine care in the form of water, fertilizer (in some cases), mulch and pruning as dictated by the season and their structure.

A number of treatments are best done by a Certified Arborist

1. **Cable and brace the tree.** Provide physical support for weak branches and stems to increase their strength and stability.

2. **Remove the tree.** Some hazardous trees are best removed. If possible, plant a new tree in an appropriate place as a replacement.

Enclosure 3. Native Plants for Landscaping

This page intentionally left blank.

ABOUT THE NATIVE PLANTS FOR CONSERVATION, RESTORATION AND LANDSCAPING PROJECT

This project is a collaboration between the Virginia Department of Conservation and Recreation and the Virginia Native Plant Society. VNPS chapters across the state helped to fund the 2011 update to this brochure.

The following partners have provided valuable assistance throughout the life of this project:

The Nature Conservancy – Virginia Chapter • Virginia Tech Department of Horticulture • Virginia Department of Agriculture and Consumer Services • Virginia Department of Environmental Quality, Coastal Zone Management Program • Virginia Department of Forestry • Virginia Department of Game and Inland Fisheries • Virginia Department of Transportation

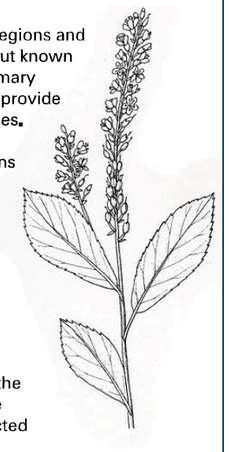
Native Plants

for Conservation, Restoration & Landscaping

Virginia Coastal Plain

WHAT ARE NATIVES?

Native species evolved within specific regions and dispersed throughout their range without known human involvement. They form the primary component of the living landscape and provide food and shelter for native animal species. Native plants co-evolved with native animals over many thousands to millions of years and have formed complex and interdependent relationships. Our native fauna depend on native flora to provide food and cover. Many animals require specific plants for their survival.



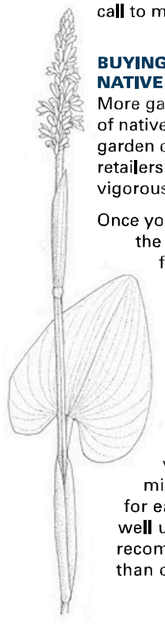
BENEFITS OF NATIVE PLANTS

Using native species in landscaping reduces the expense of maintaining cultivated landscapes and minimizes the likelihood of introducing new invasive species. It may provide a few unexpected benefits as well.

Native plants often require less water, fertilizer and pesticide, thus adding fewer chemicals to the landscape and maintaining water quality in nearby rivers and streams. Fewer inputs mean time and money saved for the gardener.

Native plants increase the presence of desirable wildlife, such as birds and butterflies, and provide sanctuaries for these animals as they journey between summer and winter habitats. The natural habitat you create with native plants can become an outdoor classroom for children, or a place for you to find peace and quiet after a busy day.

Native plants evoke a strong sense of place and regional character. For example, live oak and magnolia trees are strongly associated with the Deep South. Redwood trees characterize the Pacific Northwest. Saguaro cacti call to mind the deserts of the Southwest.



BUYING AND GROWING NATIVE PLANTS

More gardeners today are discovering the benefits of native plants and requesting them at their local garden centers. Because of this increased demand, retailers are offering an ever-widening selection of vigorous, nursery-propagated natives.

Once you've found a good vendor for native plants, the next step is choosing appropriate plants for a project. One of the greatest benefits of designing with native plants is their adaptation to local conditions. However, it is important to select plants with growth requirements that best match conditions in the area to be planted.

If you're planning a project using native plant species, use the list in this brochure to learn which plants grow in your region of Virginia. Next, study the minimum light and moisture requirements for each species, noting that some plants grow well under a variety of conditions. Many of the recommended species are well-suited to more than one of these categories.

For more information, refer to field guides and publications on local natural history for color, shape, height, bloom times and specific wildlife value of the plants that grow in your region. Visit a nearby park, natural area preserve, forest or wildlife management area to learn about common plant associations, spatial groupings and habitat conditions. For specific recommendations and advice about project design, consult a landscape or garden design specialist with experience in native plants.

WHAT ARE NON-NATIVE PLANTS?

Sometimes referred to as "exotic," "alien," or "non-indigenous," non-native plants are species introduced, intentionally or accidentally, into a new region by humans. Over time, many plants and animals have expanded their ranges slowly and without human assistance. As people began cultivating plants, they brought beneficial and favored species along when they moved into new regions or traded with people in distant lands. Humans thus became a new pathway, enabling many species to move into new locations.

WHAT ARE INVASIVE PLANTS?

Invasive plants are introduced species that cause health, economic or ecological damage in their new range. More than 30,000 species of plants have been introduced to the United States since the time of Columbus. Most were introduced intentionally, and many provide great benefits to society as agricultural crops and landscape ornamentals. Some were introduced accidentally, for example, in ship ballast, in packing material and as seed contaminants. Of these introduced species, fewer than 3,000 have naturalized and become established in the United States outside cultivation. Of the 3,500 plant species in Virginia, more than 800 have been introduced since the founding of Jamestown. The Virginia Department of Conservation and Recreation currently lists more than 100 of these species as invasive.

In the United States, invasive species cause an estimated $120 billion in annual economic losses, including costs to manage their effects. Annual costs and damages arising from invasive plants alone are estimated at $34 billion.

NATIVE PLANTS VS. INVASIVE PLANTS

Invasive plants have competitive advantages that allow them to disrupt native plant communities and the wildlife dependent on them. For example, kudzu (*Pueraria montana*) grows very rapidly and overtops forest canopy, thus shading other plant species from the sunlight necessary for their survival. A tall invasive wetland grass, common reed (*Phragmites australis ssp. australis*), invades and dominates marshes, reducing native plant diversity and sometimes eliminating virtually all other species.

Invasive species can marginalize or even cause the loss of native species. With their natural host plants gone, many insects disappear. And since insects are an essential part of the diet of many birds, the effects on the food web become far reaching. Habitats with a high occurrence of invasive plants become a kind of "green desert." Although green and healthy in appearance, far fewer native species of plants and animals are found in such radically altered places.

Virginia Coastal Plain

Virginia's Coastal Plain extends from the sands of Virginia Beach west to the fall line. Formed by marine sediments eroded from the Appalachian Highlands, the Coastal Plain varies in topography from north to south. In the north, the Northern Neck is somewhat hilly and well-drained. On the Middle Peninsula and Lower Peninsula, hills are less steep. South of the James River, the landscape levels off to about a 1-degree slope toward the ocean. In places, streams cut easily through the sands, gravels and clays to form well-developed ravine systems, and tidal rivers widen as the topography flattens. The Eastern Shore, separated from the mainland by the Chesapeake Bay, exhibits relatively little topography across the uplands extending from the Atlantic on the east to the bay on the west. From white sand beaches of the barrier islands, to tidal freshwater marshes, to blackwater swamps, to upland mixed hardwood and pine forests, the Coastal Plain has a diverse array of habitats for many native plant species.

Recommended Uses
W = Wildlife
H = Horticulture & landscaping
C = Conservation & restoration
D = Domestic livestock forage

Minimum Light Requirements
S = Shade
P = Partial sun
F = Full sun

Moisture Requirements
L = Low moisture
M = Moderate moisture
H = High moisture

Some species are marked with the following footnote symbols:

\+ May be aggressive in a garden setting

* Due to the rarity and sensitivity of habitat in Virginia, these species are recommended for horticultural use only. Planting these species in natural areas could be detrimental to the survival of native populations.

NAVSECGRUACT NORTHWEST INSTRUCTION 11015.1

From: Commanding Officer, Naval Security Group Activity Northwest

Subj: FIREWOOD CUTTING/REMOVAL

Ref: (a) NAVFAC P-73, Volume II, Chapter 3
(b) DOD Dir 4700.4 (Natural Resources Management Program)
(c) DOD Inst 7310.5 (Accounting for Production and Sale of Forest Products)

Encl: (1) Firewood Cutting Permit
(2) Firewood Pricing Structure
(3) Firewood Harvesting Instructions
(4) Firewood Cutting Areas Map

1. Purpose. To establish regulations and policy relative to firewood cutting/removal on board Naval Security Group Activity Northwest.

2. Cancellation. NSGANWINST 10320.1A

3. Revision markings. This instruction represents a major revision to the previous guidance and should be reviewed in its entirety. Revision markings have not been incorporated.

4. Background

a. In accordance with references (a) and (b), all naval installations having land areas with a potential for timber production shall have an active, progressive program for the conservation and management of their forest resources. Reference (c) further requires activities to charge a reasonable fee for the fair market value of their forest products. In accordance with references (a) and (c), proceeds collected from the sale of firewood will be deposited into the Navy forestry account. Firewood is defined as all timber marked by the Command Natural Resources Specialist for firewood removal, and any scrap lumber/wood found in the scrap lumber/brush pile. All firewood removed shall be for the personal use of the permittee and may not be resold. Firewood cutting will be authorized only when deemed compatible with other installation activities.

b. Authorized Personnel. The following personnel are authorized to cut firewood:

(1) Active and retired military personnel

(2) DOD civilian employees

(3) Other civilians approved by the Commanding Officer and/or the Natural Resources Specialist.

5. Action

a. Authorized personnel shall:

(1) Obtain a Firewood Cutting Permit (enclosure (1)), which will be sold during normal working hours on a cash or personal check basis at the Natural Resources Specialist Office located in Building #8. Regular permit fees will be charged as listed in the Firewood Pricing Structure (enclosure (2)). This pricing scale may be adjusted annually to reflect changes in the current market value of firewood. Permits will be issued for a specific area and cutting time period, and will be issued on a first come, first served basis.

(2) Display the firewood cutting permit on the vehicle dashboard during firewood collection.

(3) Comply with the conditions of the permit and the Firewood Harvesting Instructions (enclosure (3)) provided by the Natural Resources Specialist.

(4) Upon departure from the base with a load of firewood, deposit the permit with the gate guard who will inspect the wood for compliance with the permit.

b. The Natural Resources Specialist shall:

(1) Administer the firewood cutting program.

(2) Identify and mark appropriate firewood cutting areas, and update the Firewood Cutting Areas Map (enclosure (4)) as necessary.

(3) Determine the number of permits to be issued for each cutting area and cutting time period.

(4) Issue all firewood cutting permits and collect the appropriate fees.

(5) Review/update the Firewood Pricing Structure (enclosure (2)) annually to reflect current market values of firewood.

(6) Review/update the Firewood Harvesting Instructions (enclosure (3)) annually to reflect changes in harvesting techniques and policies.

(7) Issue permits for special firewood areas which may vary from the above mentioned prices or conditions when appropriate.

(8) Suspend cutting operations whenever necessary for the safety of individuals or the protection of natural resources.

c. Gate Guards shall:

(1) Collect firewood cutting permits from individuals leaving the station with a load of firewood.

(2) Inspect all loads of wood leaving the base for compliance with the conditions of the firewood cutting permit.

(3) Forward collected permits to the Natural Resource Specialist daily.

Pickups with dual rear tires:		$ 25.00/load
Flat bed trucks and trailers:	(will be measured for cubic foot volume and wood sold at $ 45.00/cord. One cord equals 128 cubic feet)	$ 45.00/cord

Encl (2)

FIREWOOD HARVESTING INSTRUCTIONS

1. Access. Vehicles are permitted to enter only the woodland area designated for cutting. Vehicles may not enter other woodland areas, forest access roads, logging roads, firebreaks or other unauthorized areas.

2. Harvesting

a. Unless otherwise specified on the permit, only trees within the designated cutting area that have been marked with a spot of paint at eye and ground levels may be taken. The cutting area boundary will be identified by two parallel lines painted diagonally on trees. These marked boundary trees and all other unmarked trees, both standing and on the ground, may not be cut or damaged.

b. No "dead timber", both standing and on the ground, may be cut or damaged unless specified on the permit.

c. No tree shall be left hanging up in another tree.

d. Tree stumps shall be left no higher than one foot.

e. All tree tops and limbs shall be cut to within two feet of the ground and piled at least 20 feet away from any road or firebreak.

f. All brush shall be removed from any stream, ditch or standing body of water.

3. Recommended safety precautions

a. Know and follow all chainsaw manufacturers safety and operating precautions.

b. Alert personnel in the immediate vicinity before felling a tree.

c. Wear snug fitting clothing, gloves and heavy boots.

d. Wear eye and ear protective devices.

e. Avoid kick-back. Never cut with the nose of the chainsaw guidebar.

f. Avoid over-reaching and cutting above shoulder height.

g. Have liquids on hand to prevent dehydration in both hot and cold weather.

h. Use a sharp chain set at the proper tension.

i. Stand clear of the cutting path of the chain saw.

4. Violations. Individuals found violating any provision of this instruction may have their firewood cutting privileges suspended or revoked and may be subject to civil prosecution.

5. Resource conservation. Proper conservation of natural resources shall be observed at all times. Unmarked trees shall be protected; wildlife shall not be harmed or harassed; ground disturbance shall be kept to a minimum to avoid soil erosion; and streams and ditches shall not be blocked or polluted. Littering will absolutely not be tolerated.

1 INTRODUCTION

1.1 Purpose

Forest management is an integral part of natural resources planning and is a required component of natural resources management on Naval Support Activity Hampton Roads Northwest Annex (NSAHR NWA). A forest inventory was conducted in 2014 (Department of the Navy [Navy] 2014) under a previous task order (N62470-13-D-8017, TO 0002) as an update to a 1998 forest inventory (Navy 1998). These inventories provide valuable information regarding the condition, health, and productivity as well as physical characteristics including forest type, age, height, and size class, and were used to determine stand densities, basal areas, timber volumes, and other forest characteristics at NSAHR NWA. The 2014 forest inventory is included in the NSAHR NWA Integrated Natural Resources Management Plan (INRMP), Appendix E.

Under the current task order (N62470-13-D-8017, TO 6209) Naval Facilities Engineering Command (NAVFAC) Mid-Atlantic contracted Versar, Inc. to develop a forest management plan based on the 2014 forest inventory data. This forest management plan has been developed as a component of the NSAHR NWA INRMP (Navy 2016) and will be added as an appendix for the next INRMP update and therefore does not extensively reiterate background information and forest descriptions summarized in the INRMP or forest summary data provided in the 2014 NSAHR NWA forest inventory (Navy 2014). This plan does provide:

1. a brief overview of forest composition and changes from earlier inventories
2. forest management objectives and strategies designed to meet Navy mission and stewardship requirements and fulfill management objectives specified in the installation INRMP,
3. recommended stand prescriptions and treatment schedule for an approximate 10-year time period, and
4. potential long-term forest management prescriptions based on current forest conditions and management objectives for each of the installation's 90 forest stands.

1.2 Authority

Environmental laws and regulations including the National Defense Natural Resources Management Program (32 U.S. Code of Federal Regulations Part 190 [USC]) and the Sikes Act (16 USC§670 et seq.), require an INRMP be developed for all military installations with significant natural resources and that forest management be provided for in the INRMP to the extent appropriate and applicable.

1.3 Policy

Department of Defense (DoD) and Navy policies on natural resources management are outlined in the DoD Manual 4715.03 – Integrated Natural Resources Implementation Manual and Chief of Naval Operations Manual (OPNAV-M) 5090.1 – Environmental Readiness Program Manual. A

key policy that applies to all aspects of the DoD natural resources program is to implement ecosystem-base management that maintains and improves the sustainability of native ecosystems, while supporting sustainable human activities, within the constraints of mission requirements.

It is Navy policy to manage forestlands by restoration, enhancement, and improvement of forest resources and related ecosystems through an active program of professional forest management, in a multi-disciplinary, ecologically sound manner. Navy forest management must include silvicultural treatments that foster forest health and vigor, structural and biological diversity, and regeneration. Such management actions must produce financial returns to the government, contribute commercial forest products to the economy, and maintain and improve the economic and ecological value, health, and diversity of the forest resources and related ecosystems (OPNAV-M 5090.1).

Navy policy further requires that Navy natural resources conservation programs ensure sustainable multipurpose use of the resources (OPNAV-M 5090.1). Multiple uses of the forest lands at NSAHR NWA include providing for:

- Military training activities such as land navigation and physical training,
- Outdoor recreational opportunities for the military community and installation personnel and their dependents,
- Wildlife habitat including a full suite of native birds, mammals, herpetofauna, and invertebrates,
- Habitat protection for special status plant and animal species,
- Ecosystem services such as flood regulation, water quality protection, and climate change abatement, and
- The production and sale of commercial forest products.

Any forest management action must contribute to the overall goals and objectives of natural resources management without degrading the long-term diversity and sustainability of the forest ecosystem. Navy policy also states that clearcutting should to be limited to where essential to meet specific forest plan objectives, as defined in the installation INRMP, or for cleanup after natural catastrophes such as hurricanes, tornadoes, and wildfires and that it is Navy policy to maintain old-growth forests in their natural state to preserve their unique biological, scientific, and aesthetic benefits (OPNAV-M 5090.1).

2 FOREST DESCRIPTION

2.1 Forest History and Stand Overview

Detailed descriptions of the forests at NSAHR NWA can be found in the installation INRMP and 2014 forest inventory report. Summary tables including trees per acre, basal area, average height, and timber volume and value are presented in the 2014 forest inventory report and its appendices. The following brief overview of NSAHR NWA forest resources, derived from historic and current forest inventories, is included to provide background information and a basis for understanding the recommended forest management prescriptions provided in this management plan.

Prior to Navy acquisition in the 1950s, portions of the land that now comprises NSAHR NWA had been drained and farmed, whereas other areas had been sporadically harvested (Navy 1988). Over time, much of the farmland converted to loblolly pine (*Pinus taeda*) and other early successional species such as sweetgum (*Liquidambar styraciflua*) and red maple (*Acer rubrum*). The primary area dominated by hardwood forests was an extensive area of the Dismal Swamp on the western side of the base plus a few remnant unharvested stands adjacent to Mill Creek. A forest inventory conducted during the 1980s, indicated approximately 36 percent of the forest was pure pine, 25 percent was pine-hardwood, and 39 percent was hardwood (Navy 1988).

In the 1998 forest inventory report, it was noted that much of the forest resource was transitioning to hardwood from the early domination by loblolly pine (Navy 1998) and 32 percent was pure pine, 16 percent was pine-hardwood, and 52 percent of the forest was hardwood and hardwood-pine mix at that time. In the absence of active forest management or natural disturbances, this transition was expected as species more tolerant of shade than loblolly pine became established in the understory and gradually increased in volume and importance in the stands.

NSAHR NWA stands have continued a transition to a greater component of hardwood mixed with loblolly pine and in the 2014 inventory, only 10 percent of the acreage was pure loblolly pine, 27 percent was mixed pine-hardwood, and 63 percent of the acreage was hardwood and hardwood-pine mix (**Figure 2-1**). Stands are also maturing as only 31 percent of the stands were in sawtimber in the 1980s, which increased to 70 percent in 1998, and to 94 percent in 2014.

Today, most of the mature pine stands have dense sweetgum and maple in the understories with lesser amounts of oaks and tuliptree (*Liriodendron tulipifera*). Hardwood stands in the Dismal Swamp portion of the base are more diverse and include numerous oaks such as southern red oak (*Quercus falcata*), swamp chestnut oak (*Q. michauxii*), cherrybark oak (*Q. pagoda*), laurel oak (*Q. laurifolia*), willow oak (*Q. phellos*), and water oak (*Q. nigra*). Other hardwoods include tuliptree, American beech (*Fagus grandifolia*), hickories (*Carya* spp.), elms (*Ulmus americana* and *U. rubra*), blackgum and swamp tupelo (*Nyssa sylvatica* and *S. biflora*), American holly (*Ilex opaca*), musclewood (*Carpinus caroliniana*), and others (Navy 2019).

NSAHR NWA also has a significant component of forests dominated by natural bald cypress (*Taxodium distichum*) swamps. Bald cypress occurs in stands 22, 29, 30, and 32, which are in the

southwestern portion of the base. Atlantic white cedar (*Chamaecyparis thyoides*) was documented in three forest stands (32, 38, and 50) in 1998, but was not recorded in 2014.

2.2 Current Stand Summary

The 2014 forest inventory resulted in 90 stands at NSAHR NWA totaling 1,989 acres (**Figure 2-2**). Forest type was determined using the relative percentage of stand-average per-acre total pine and hardwood basal area where:

Forest Type	Description
H	Hardwood (>75 percent total hardwood basal area)
HP	Hardwood/Pine (50-75 percent total hardwood basal area)
PH	Pine/Hardwood (50-75 percent total pine basal area)
P	Pine (>75 percent total pine basal area)

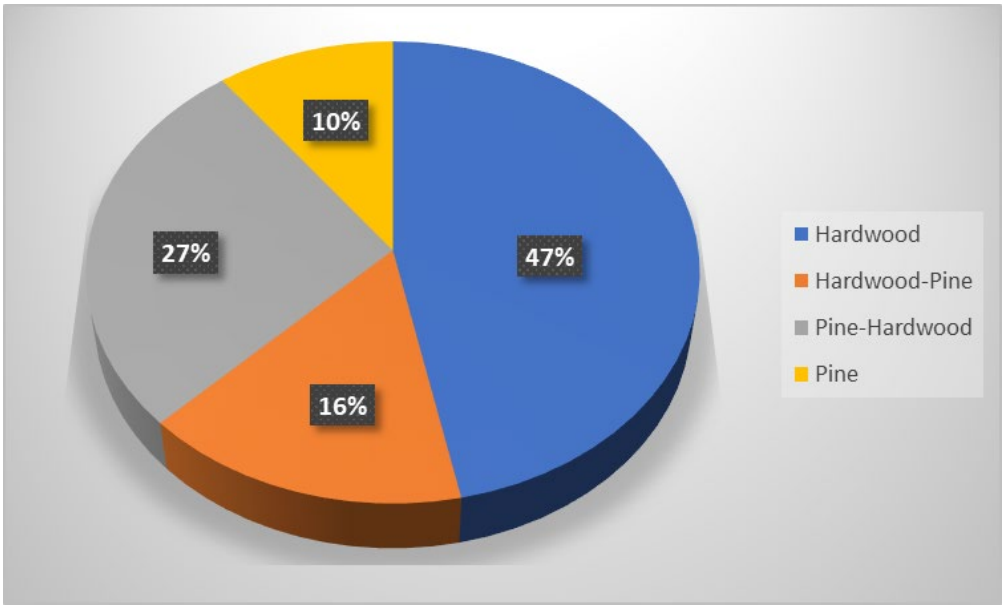

Figure 2-1. NSAHR NWA Forest Cover Types (2014)

2.3 Size and Age Class

Size class and age are important stand characteristics that indicate if a forest has a balance of mature and young regeneration aged trees. Size class was determined by a tree's diameter at breast height as follows:

Size Class Code	Description
1	Seedling/sapling < 6-inch DBH
2	Pulpwood – pine ≥6-9-inch DBH; hardwood ≥6-13-inch DBH
3	Chip-N-Saw ≥9-13-inch DBH (pine only)
4	Sawtimber 13-inch or greater DBH

The 2014 forest inventory data indicate the majority (93.8 percent) of stands at NSAHR NWA are composed of mature sawtimber and very few stands are in the mid-size (6.2 percent) or sapling (zero percent) class ranges (**Table 2-1**). However, it appears that trees under 6-inch DBH were not included in the inventory as none appear in the stand tally data for the 2014 inventory (Navy 2014, Appendix D). It is likely subplots would have been needed to capture the small diameter trees, which are therefore not represented in Table 2-1.

Table 2-1. Percent Forest Type and Size Class by Acreage

	Size Class			
Forest Type	**Pulpwood**	**Chip-n-saw**	**Sawtimber**	**Total**
Hardwood	13.6	-	916.2	929.8
Hardwood-Pine	7.6	-	307.1	314.7
Pine-Hardwood	-	-	540.2	540.2
Pine	-	101.9	102.4	204.3
Total	**21.2**	**101.9**	**1,865.9**	**1989.0**
Percent	**1.1**	**5.1**	**93.8**	**100**

The age distribution indicated by the 2014 inventory also indicates a prevalence of mature timber, particularly in the hardwood stands, where 45 percent was 90 to 101 years old, 25 percent was 60 to 70 years old, and less than 1 percent was 20 to 30 years old. Pine stands were younger and somewhat more evenly distributed across age classes (**Figure 2-2**). As with size class, excluding small diameter trees from the inventory precludes the assessment of existing stand regeneration.

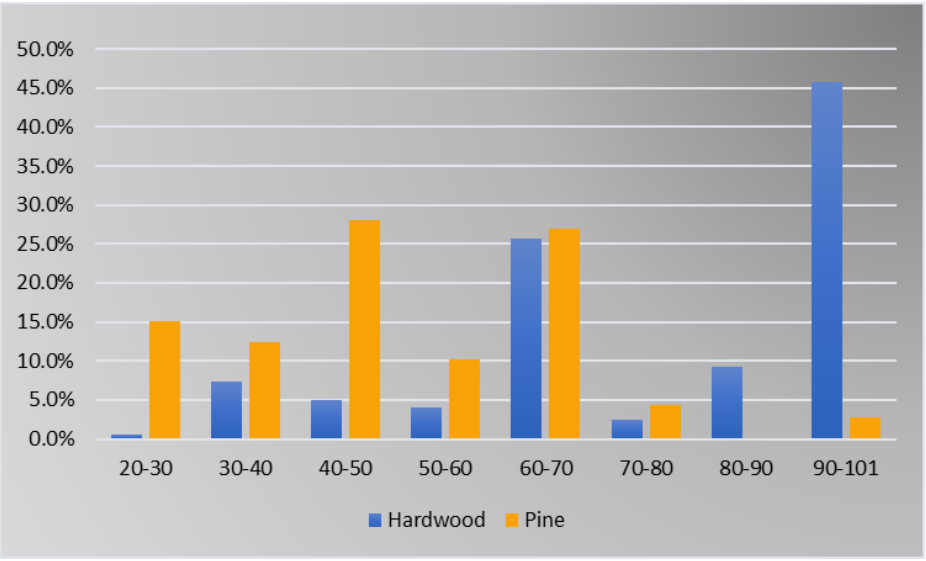

Figure 2-2. Forest Age Distribution by Acreage

2.4 Forest Pests and Disease

Forest insect and disease issues likely to be encountered at the installation are discussed in Section 3.7.3 of the NSAHR NWA INRMP. No assessment of insect or disease infestations or mortality was made in the 2014 forest inventory. However, the 1997 forest inventory report indicated that

mortality from southern pine beetle (*Dendroctonus frontalis*) was observed in 10 stands and this pest was identified as a primary management concern for the installation (Navy 1998).

Invasive plant species are another forest management issue at NSAHR NWA, and invasive plant species mapping was conducted in 2013 at the installation (Appendix E in the NSAHR NWA INRMP). Japanese stiltgrass (*Microstegium vimineum*), privet (*Ligustrum* spp.), English ivy (*Hedera helix*), and Chinese wisteria (*Wisteria sinensis*) are the primary invasive plant species impacting forest health at NSAHR NWA, though Japanese honeysuckle (*Lonicera japonica*) can be problematic in areas. Natural forest regeneration can be severely restricted in areas with dense cover of stiltgrass and privet, whereas wisteria and honeysuckle can reduce vigor and physically weaken trees and are recommended for control.

The Virginia Department of Forestry (VDOF) website: http://www.dof.virginia.gov/health/insects/index.htm provides additional information on emerging forest health issues and quarantine regulations that may need to be addressed in future forest management plans.

Figure 2-3. NSAHR NWA Forest Stands Map

This page left blank.

3 FOREST MANAGEMENT

3.1 Management Goals and Objectives

Broadly stated, the forest management goals identified in the installation INRMP are to sustain healthy forested ecosystems while supporting the military mission and providing for a range of social, economic, and environmental benefits. To meet these goals and the Navy's sustainable-multiple use policy, six primary forest management objectives have been identified and are provided here with a brief discussion on strategies to meet the objective. The Navy may prioritize harvesting timber in areas adjacent to the ROTHR antenna. If implemented as a forestry action, these silviculture activities will meet current Virginia Department of Forestry (VDOF) and North Carolina Forest Services (NCFS) best management practices (BMP) requirements.

Objective 1: Improve forest health and vigor.

Strategies: Reducing stand density in over-stocked stands will increase the vigor of the remaining trees increasing their resistance to disease and insect attack. In some instances, final harvest and stand regeneration may be the best option to increase health and vigor.

Objective 2: Improve wildlife habitat value.

Strategies: Reducing stand density, particularly crown density, in over-stocked stands will allow sunlight to reach the forest floor and increase herbaceous and understory diversity and enhance wildlife habitat value. Favoring the regeneration of fruit and mast producing species such as oaks, hickories, ash, blackgum, persimmon, and sassafras will also improve wildlife value.

Objective 3. Enhance or establish the presence of ecologically unique and valuable species such as bald cypress, Atlantic white cedar, and longleaf pine (*Pinus palustris*).

Strategies: Stimulate bald cypress recruitment to ensure the continued presence of this relatively rare species. Crown thinning on wetter sites with existing bald cypress may be used to increase cypress recruitment, which currently seems to be low on the installation.

Continue to find opportunities to plant Atlantic white cedar in suitable locations and control competition until well established.

Use reforestation opportunities to establish longleaf pine in appropriate areas of the base.

Objective 4: Protect and maintain habitat for special status species and sensitive wildlife species.

Strategies: Extensive areas of intact mature forests with appropriate habitat for special status species and forest interior dwelling species should be maintained to the extent compatible with the installation mission. Reviewing the Navy geo-database is critical to identifying any previously documented special status species or habitats during the planning stages of any forest management activity. Sites should also be assessed for the presence of snags, cavity trees, and trees with sloughing bark that may serve as bat roost sites. During tree marking prior

to any timber sale potential roost trees should be marked to be left in place. In addition to the potential roost trees themselves, a patch of live trees should be left in place to protect and shade the potential roost tree. Additional beneficial treatments for bats found in Johnson and King (2018) should also be incorporated into forestry practices to the extent consistent with management objectives. Vernal pools and pocket wetlands are also important to identify and protect during planning as they provide habitat for a diversity of herpetofauna that occur at NSAHR NWA.

Objective 5: Protect and maintain water quality and wetlands.

Strategies: Assess the presence of streams and wetlands, including vernal pools and pocket wetlands, during the planning stages of any forest management activity. Implement BMPs outlined by the VDOF and NCFS to avoid impacting these valuable resources. All mandatory water quality guidelines must be enforced.

Objective 6: Provide visual or safety buffer for mission requirements and encroachment.

Strategies: Leaving a forested buffer of 100 feet or more along the base perimeter, particularly along Ballahack Road and the base housing area is recommended to reduce adverse visual impacts. Coordination with trainers and range managers is recommended to ensure safety zone buffer requirements are enforced.

3.2 Management Systems and Prescriptions

Forest management systems including harvest, reforestation, and timber stand improvement methods suitable for each forest type present at NSAHR NWA are described in Section 3.7.2 of the NSAHR NWA INRMP and are not repeated here. Of these, stand thinning, final harvest and replacement, and stand improvements are the primary silvicultural treatments prescribed for the NSAHR NWA forest stands at this time.

Stand thinning in dense pine stands that are not over-mature is recommended to reduce stress from over-crowding, increase herbaceous and shrub layer diversity, and increase growth in residual crop trees. Thinning priorities are primarily based on stocking density and percent growth and are generally restricted to stands under 30 to 35 years old. Thinning stands with a basal area of more than 120 ft^2 per acre to 60–80 ft^2 per acre for poletimber and 80–100 ft^2 per acre for sawtimber is recommended to meet objectives 1 and 2. Crown thinning is also specifically recommended for promoting regeneration of high value unique species such as bald cypress and Atlantic white cedar.

More mature pine stands (over 40 years old) are not expected to respond to thinning and are better candidates for final harvest and planting or allowing to reseed naturally. Because NSAHR NWA is within the historical range of longleaf pine (Boyer 1990), which has been greatly reduced from its historic extent, planting longleaf as an alternative to loblolly during stand establishment is strongly recommended.

Timber stand improvements are prescribed for several dense mixed pine-hardwood stands to reduce the number of less desirable species such as sweetgum and/or red maple that are over-

represented throughout the forest, have lower wildlife value, and have little economic value. Controlling invasive species is another stand improvement recommendation that is prescribed to promote stand vigor and recruitment as well as improve wildlife habitat. Chemical control and/or prescribed fire are recommended for controlling re-sprouts of the less desirable species and invasive species. Forest management objectives are being considered in a Wildland Fire Management Plan that is being developed for NSAHR NWA (Navy 2019 [under development]) and stands where prescribed fire offers an appropriate treatment method are identified.

No silvicultural treatments are recommended for large portions of the forested area at NSAHR NWA. In general, stands that form large, contiguous tracks of hardwood or hardwood-pine forests that provide habitat for forest interior dwelling birds are generally recommended as "leave to grow" to continue to provide on-base habitat for these at-risk species. Avoiding stands that serve as wetland or stream buffers are also recommended to protect these valuable resources. Stands that contain habitat for special status species have also been identified and recommendations to enhance or protect these stands have been made. Stands with low stocking and no particular needs at this time were also recommended as "leave to grow" until the next forest evaluation.

A work plan with prioritized stand prescriptions that could be accomplished over a 10-year period is presented in **Table 3-1**, **Figure 3-1**. An area south of Carolina Road that was periodically cleared for a Circularly Disposed Antenna Array that operated until 2001 is included in the stand prescriptions. This 47-acre area, which was excluded from the 2014 inventory, could be made into two or more stands and inventoried during the next forest inventory update. Long range management recommendations that may be considered for each of the installation's 90 forest stands are in **Appendix A** (on DVD).

Table 3-1. Prioritized Recommended Forest Stand Prescriptions

Stand	Acres	TPA	Pine_BA	HW_BA	Age	Objectives	Prescription	Priority
12/P-3	32.4	284.8	123.3	30	25	Improve forest health and vigor, reduce bark beetle risk, enhance wildlife habitat	Thin to 60-80 sq ft per ac	1

4 IMPLEMENTATION AND ADMINISTRATION

4.1 Funding

Funding for forest management activities is supported by revenues derived from commercial forestry operations on participating DoD installations. Installations participating in the forestry program must submit an annual budget (increment) for the following fiscal year (FY) to the NAVFAC Forester by 1 September of the previous year. The annual increment supports commercial forestry operations at installations (which must also be identified in an approved management plan). The funds are borrowed from NAVFAC Headquarters (HQ) at the beginning of each fiscal year and are reimbursed when forestry revenues are received from that installation. Forty percent of installation net proceeds are also distributed to the counties within which a military installation is located. Once the commercial forestry expenses are reimbursed and the distribution has been made to the state, any remaining funds are transferred to the DoD Forestry Reserve Account.

The DoD Forestry Reserve Account may be used for improvements of forest lands; unanticipated contingencies in the administration of forest lands, and the production of forest products for which other sources of funds are not available in a timely manner; and for natural resources management that implements approved plans and agreements (Section 2665 of 10 USC). NAVFAC usually solicits project proposals for the Forestry Reserve Account once there is an indication of the level of funding available (usually January or February). Proposals are submitted to NAVFAC are reviewed by the NAVFAC HQ before being forwarded to the DoD Conservation Committee for final selection. Installations need not harvest timber to be eligible for DoD Forestry Reserve Account funds.

4.2 Technical Assistance

Through a memorandum of agreement on Forest Pest Suppression on DoD lands, the U.S. Forest Service (USFS) provides technical assistance, information, and training opportunities to DoD personnel for the protection and suppression of forest insects and diseases. During periods of pest infestations or disease outbreaks, natural resources personnel may coordinate with the USFS to monitor pest populations and forest conditions. The USFS sends out an annual call for proposals for pest management projects on DoD forest lands in accordance with a memorandum of agreement (MOA) and form FS 3400-2 (**Appendix B**).

VDOF and NCFS can also provide technical advice on forest operations and supply plant materials for the establishment a of trees on DoD installations. VDOF and the Virginia Department of Conservation and Recreation (VDCR) have active longleaf pine restoration programs and would be valuable partners in assisting the Navy establish longleaf stands at NSAHR NWA.

4.3 Forestry Contracts

Service contracts are used to acquire services such as pre-commercial thinning, timber stand improvement, or planting and are handled in accordance with Federal Acquisition Regulations as outlined in NAVFAC P-68 – Contracting Manual. Sales contracts are used to dispose of forest products produced on Navy installations. Sales and service-type work may not be combined under one contract but may be accomplished by separately advertised and awarded contracts. Sale of forest products is accomplished in accordance with the procedures in NAVFAC P-73 – Real Estate Procedural Manual and are administered by the NAVFAC Forester.

DoDINST 4715.03 and OPNAVINST 5090.1 require that forest products not be given away, carelessly destroyed, or used to offset contract costs, but rather sold at their fair market value and the proceeds credited to the Navy's Forestry Program account. The basis for this procedure is that standing timber is considered real property, and real property must be disposed of at its fair market value. All installation construction contracts with marketable standing timber shall require contractors to reimburse the Navy for the value of the timber (NAVFAC P-73). If timetables do not allow for a timber sale when clearing timber on construction sites or for infrastructure and mission-related operations, specific payback rules and procedures apply (**Appendix C**).

A timber appraisal must be performed by a qualified professional forester. There is no minimum amount of timber necessary to trigger an appraisal. The forester will determine the volume and value of the timber present on a case by case basis and then supply the project manager with the commercial value of the timber to be removed. Normal procedures for disposal of timber include issuing a timber sale or salvage contract and timber is harvested over a specified period. Depending on the size of the harvest, timber sales may take several weeks to set up in the field, two to three months to advertise and award, and up to a year for harvesting to be completed.

Required timber sale documents include:

- NAVFAC Invitation for Bids
- SF114: Sale of Government Property, Bid & Award
- SF114C: General Terms, Sealed Bid
- SF1409: Bid Abstract
- SF1418: Performance Bond

4.4 Environmental Regulations

4.4.1 Clean Water Act

Facilities proposing to remove forest products must consider the environmental consequences of removal and comply with appropriate and applicable federal, state, and local environmental regulations including the Clean Water Act (CWA), National Historic Preservation Act, National Pollutant Discharge Elimination System construction permit(s), and erosion sediment control plan(s).

A silvicultural exemption to Section 404 of the CWA allows normal and established silvicultural activities in wetlands as long as state BMPs are implemented. Normal silvicultural practices covered by the silvicultural exemption include planting, seeding, cultivating, minor drainage, and harvesting. The silvicultural exemption does not include land-recontouring activities such as grading, land leveling, filling in low spots, converting to upland, or permanent conversion to other land use and management. Construction and maintenance of forest roads are exempt provided that all federally mandated BMPs for road construction and maintenance are followed (NCFS 2006 and VDOF 2011).

The Virginia Department of Forestry Best Management Practices (BMP) Guide for Water Quality is available on the VDOF website: http://www.dof.virginia.gov/water/index-BMP-Guide.htm.

The North Carolina Forest Service BMP Guide for Forestry Operations is available on the North Carolina Forest Service website: http://ncforestservice.gov/water_quality/bmp_manual.htm.

North Carolina Mandatory Forest Practices Guidelines for Water Quality are available on the North Carolina Forest Service website: https://www.ncforestservice.gov/publications/Forestry%20Leaflets/WQ01.pdf.

4.4.2 National Environmental Policy Act

Preparation of appropriate documentation required by the National Environmental Policy Act (NEPA) can be accomplished through a categorical exclusion (CATEX) during the site approval process. An Environmental Assessment (EA) is not considered necessary as all actions prescribed in the forest management plan are consistent with management current and previous INRMPs for NSAHR NWA. To fulfill NEPA requirements, an EA and Finding of No Significant Impact were prepared for implementation of the INRMP in 2006, which included forest management and prescribed fire actions. Therefore; the routine forest maintenance practices such as thinning, timber stand improvements, and harvests under one million board feet are consistent with practices described in the INRMP and will not require further NEPA documentation. Harvests greater than one million board feet are not within the scope of the INRMP and would likely require preparation of an EA.

Douglas A. Burkett, PhD
Environmental Biologist, Operations Division
Armed Forces Pest Management Board
2460 Linden Lane, Bldg 172
Silver Spring, M.D. 20910

Dear Dr. Burkett:

Each year the U.S. Forest Service provides technical assistance and funding for the suppression of forest insects and diseases on Federal lands. Forest Health Protection (FHP) field staffs work closely with the U.S. Department of Defense (DOD) staffs to identify facilities that have insect or disease outbreaks, and need suppression treatments.

When considering project selection we look at:

- The purpose and need for the project (we provide funding for insect and disease suppression treatments only),
- A completed biological evaluation by our field staff,
- Alignment of DOD and Forest Service priorities.

To initiate this process, DOD branch staffs should contact FHP field offices. A directory can be found at: http://www.fs.fed.us/foresthealth/publications/FHP_Staff_Directory_final.pdf .

Each branch must enter project proposal information directly into the Forest Service FHP database, which can be found at http://apps.fs.usda.gov/formap . The deadline for funding requests for Fiscal Year (FY) 2019 forest insect and disease suppression projects is **October 29, 2018.**

Additionally, we request that DOD report FY 2018 accomplishments into the same database by **October 29, 2018**. It is important that funding and accomplishments are entered into the database so we can track the success of the projects and address any future needs.

Please direct any questions or need for assistance (including access to the database) to Bob Rabaglia, Forest Health Protection Liaison at (703) 605-5338, or brabaglia@fs.fed.us .

Sincerely,

/s/ Richard A. Cooksey

MEMORANDUM FOR: SEE DISTRIBUTION

September 26, 2018

SUBJECT: DoD Forest Pest Suppression Project Proposals

DoD Forestry Colleagues,

Herewith the annual call for proposals being solicited for the FY 2019 Forest Health Protection (FHP) projects (Attachment 1). Please forward to your MAJCOM and installation natural resources/forestry managers as appropriate. Qualifying installations must read the criteria for selection procedures carefully starting with contacting the local regional forestry office to set up an evaluation. Per the Memorandum of Agreement (Attachment 2), the USDA Forest Service (USFS) annually provides free technical assistance and funding for the suppression of forest insects and diseases on Federal lands. Department of Defense installations with significant forest insect or disease pest problems are eligible for competitive FHP funding from USFS. Invasive species funding for DoD installations for Hawaii and the Caribbean also qualify for FHP funding.

If your installation has a qualifying forest pest suppression project, proposals must be submitted using the enclosed FS-3400-2 (Attachment 3). As part of this process, installation representatives should contact their regional FHP field staff to set up a biological evaluation. A directory of FHP field staff can be found at http://www.fs.fed.us/foresthealth/publications/FHP_Staff_Directory_final.pdf. Successful completion of a biological evaluation conducted by USFS is a prerequisite for proposal submission and competitive funding. Past FHP mitigation projects funded at DoD installations include emerald ash borer, gypsy moth, mountain pine beetle, southern pine beetle, pine engraver beetle, dwarf mistletoe, hemlock wooly adelgid, Dutch elm disease, and oak wilt. Examples of forest health advisories, interactive maps and qualifying FHP pests and diseases can be found at: http://foresthealth.fs.usda.gov/ and Alien Forest Pest Explorer at http://foresthealth.fs.usda.gov/portal/Flex/APE.

Please send your ranked Service proposals to Dr. Burkett by **25 October 2018** to allow sufficient time to review, rank and submit proposals to USFS. Proposals must be for single or multi-year projects that range between $1,000 and $200,000. Projects MUST focus on pest mitigation/suppression and NOT surveillance, prevention or timber harvest.

Please provide widest dissemination to your installation forestry/natural resources representatives with a reminder that this is free project money that can help pay for otherwise unfunded requirements.

For further questions and information, please contact the AFPMB Environmental Biologist, Dr. Douglas A. Burkett at DSN 295-8304, commercial (301) 295-8304, or e-mail douglas.a.burkett.civ@mail.mil.

MEMORANDUM OF AGREEMENT

between the

UNITED STATES DEPARTMENT OF AGRICULTURE

and the

UNITED STATES DEPARTMENT OF DEFENSE

for the

CONDUCT OF FOREST INSECT AND DISEASE SUPPRESSION ON LANDS ADMINISTERED BY THE U.S. DEPARTMENT OF DEFENSE

Suppression of damaging forest insect and disease outbreaks is essential for maintaining the health and productivity of the nation's forests. Annually, insects and diseases kill more trees and reduce forest growth more than all other destructive agents combined. This is a matter of great concern to the administrators responsible for managing and protecting forests on public and private lands.

Section 5 of the Cooperative Forestry Assistance Act of 1978 (16 U.S.C. 2101) authorizes the Secretary of Agriculture to protect trees and forests, wood products, stored wood and wood in use from insects and diseases. This is done directly by the USDA on National Forest System lands and in cooperation with other Federal land managing agencies, the States and private land owners on other forest lands. The Secretary of Agriculture has delegated the responsibility for carrying out the provisions of the Cooperative Forestry Assistance Act to the Forest Service. Annual appropriations, based on estimated suppression costs developed by the Forest Service, the Department of Defense, other Federal agencies, States and other cooperating entities, are necessary to implement this responsibility.

It is Agreed:

1. That the two Departments will, under the legal, fiscal and other limitations governing each, cooperate fully in the planning, coordination and execution of field operations to prevent and suppress damaging forest insect and disease outbreaks whenever it is determined to be necessary.

2. That the guiding principles of this cooperation shall be those established by authorizing legislation, agency policy and other direction specified in the Cooperative Forestry Assistance Act of 1978, the National Environmental Policy Act and the Federal Insecticide, Fungicide, and Rodenticide Act as amended.

3. That the Secretaries of the Department of Agriculture and the Department of Defense shall authorize their respective agencies concerned with the suppression of forest insects and diseases to develop and execute coordinated work programs and projects.

4. That, for coordinating and funding forest insect and disease suppression programs and projects, the Departments will:

A. *Responsibilities of the Department of Agriculture, Forest Service:*

(1) Designate an office which will be responsible for coordinating activities conducted under this MOA.

Attachment (2)

(2) Provide overall leadership and coordination for insect and disease suppression activities on forest lands when the activities are financed wholly or in part with Federal funds appropriated under Section 5 of the Cooperative Forestry Assistance Act of 1978 (16 USC 2101).

(3) To the extent possible, provide technical and financial assistance to agencies of the Department of Defense for forest insect and disease suppression programs and gypsy moth eradication projects on forest lands administered by the Department of Defense.

(4) Conduct detection surveys and biological evaluations of insect and disease outbreaks on forest lands administered by the Department of Defense.

(5) Subject to budgetary limitations, annually transfer from the USDA Forest Service, Forest Pest Management to Department of Defense Agencies such finances as are mutually determined as necessary for forest insect and disease suppression on forest lands administered by the Department of Defense. To the extent possible, jointly determine annual suppression funding needs by November 30.

(6) Assist agencies of the Department of Defense in organizing and performing general forest insect and disease field surveillance on forest lands administered by the Department of Defense.

(7) Inform local and national Department of Defense personnel of forest insect and disease conditions on other lands that may affect Department of Defense administered land.

(8) Suppress forest insect and disease outbreaks on National Forest System lands and cooperate with other agencies to suppress forest insect and disease outbreaks which threaten forest lands administered by the Department of Defense.

(9) Provide training opportunities for Department of Defense personnel in techniques for the prevention, detection and suppression of destructive forest insects and diseases in order to promote forest health.

b. *Responsibilities of agencies of the Department of Defense:*

(1) Designate an office which will be responsible for coordinating activities conducted under this MOA.

(2) Notify DoD Agencies that technical assistance is available from the Forest Service and that a biological evaluation or equivalent documentation is required before funds for a forest pest suppression project can be transferred from the Forest Service.

(3) Facilitate conduct of detection surveys and forest insect and disease evaluations by Forest Service personnel on Department of Defense administered lands.

(4) Base decisions on whether to implement suppression programs and projects on:

(a) An appraisal of current pest infestation significance and projected significance with and without suppression activities. This information, as well as a discussion of alternative pest management tactics, is provided by the Forest Service in a biological evaluation.

(b) An evaluation of the resources threatened within the context of management objectives.

(c) An analysis of possible adverse environmental effects of suppression alternatives.

(d) An economic analysis of the proposed action.

(5) Perform field surveillance and specialized detection surveys as necessary to supplement Forest Service activities.

(6) Conduct suppression activities on Department of Defense administered land.

(7) Cooperate with other agencies on adjacent or intermingled lands on forest insect and disease surveillance, prevention and suppression activities.

(8) Report suppression project accomplishments to the Forest Service by November 1 each year covering all forest insect and disease management expenditures for the previous fiscal year.

(9) Participate in an annual coordination meeting with the Forest Service to set priorities for funding proposed forest pest suppression projects.

(10) Submit a formal request for forest insect and disease suppression funding to USDA Forest Service by November 15 of each year.

This agreement is effective upon the date of signature by both parties. It defines, in general terms, the basis on which the parties will cooperate and is not a financial obligating document.

This agreement shall continue indefinitely, but may be modified or discontinued at the request of either party. Requests for termination or any change shall be submitted to the other party for consideration not less than 30 days in advance of the effective date desired.

F. Dale Robertson
Chief
Forest Service

Date: November 15, 1990

Appendix C – Timber Harvest on Construction Sites

This page left blank.

Timber on Construction Sites and Real Estate Easements

Lead Content Owner: Jeff Gardner (NAVFAC HQ)

Unless otherwise noted, the tasks identified below should all be accomplished by professional natural resources personnel at the cognizant Facilities Engineering Command (FEC).

Process Step	Associated Procedure	Resources
7.8.1 Identify Construction and Real Estate Actions That May Impact Forest Products	• Review site approvals request for early detection of construction sites with timber. • Review request for real estate easements, long-term leases and other real estate. • Identify and document areas with potential for loss of merchantable forest products resulting from construction or clearing.	
7.8.2 Verify the Existence of Forest Resources on the Proposed Sites	• Review existing forestry information to verify the existence of forest products (maps, inventories, work plans, data bases, aerial photographs). Make site visit if needed. • Determine if value is adequate to justify further action to realize fair market value.	
7.8.3 Identify Sites To Be Cleared in Near Future	• Professional forester will determine the fair market value of forest products on the site. [Does value justify further action? If not, stop here.] • Determine best way to remove forest products • Separate salvage contract to remove forest products prior to award of construction or clearing contract (lump sum preferred). • Insert "pay-back" clause in construction or clearing contract. Contractor pays Navy fair market value. Value not negotiable.	NAVFAC P-73, Natural Resources Management Procedural Manual Chapter 3, 6.d (2)(g) NAVFAC P-73, Natural Resources Management Procedural Manual, "Pay-back clause", Chapter 3, 6.d (2)(g)

Process Step	Associated Procedure	Resources
7.8.4 Perform Collection and Deposit of Receipts	• Salvage contract - Collect receipts from harvesting contractor and deposit in accordance with DoD 7000.14. • Pay back clause - Collect from construction or clearing contractor within 30 days after notice to proceed has been issued or real estate agreement has been executed. Deposit receipts in accordance with DoD 7000.14.	DoD 7000.14, Volume 11A, Chapter 16, 160204 NAVFAC P-73, Natural Resources Management Procedural Manual Chapter 3, 6.d (2)(g)
7.8.5 Identify Long Term Real Estate Actions Involving Forest Products	• Insert a clause in real estate agreements that reserves timber rights on the site and requires holder of the agreement to pay the Navy fair market value (to be determined by professional forester) for any forest products removed during the term of the agreement.	32 CFR 190. Appendix B.2.c DoD 4715.3, F.2.d
7.8.6 Monitor Construction Projects and Real Estate Agreements Involving Forest Products	• Periodically review plans and specifications of construction contracts and real estate actions, identified as involving forest products having commercial value, to ensure provisions are made to realize fair market value for these products.	32 CFR 190. Appendix B.1.e

TIMBER ON CONSTRUCTION SITES, ROW'S, URBAN AREAS, CLEAR ZONES, ETC. AND THE NAVY'S TIMBER PAYBACK CLAUSE

Federal regulations, Navy policy and instructions, and NAVFAC guidelines prohibit forest products from being given to the contractor, traded, or destroyed without proper compensation to the Navy Forestry Account. This includes tree removal associated with land clearing activities for construction, or the establishment, expansion, or maintenance of clear zones. Payback Clause and other forestry generated funding are used for base environmental projects, school funding in the county of harvest, and Navy forestry program reimbursement.

Pertinent code, regulations, and instructions are:

1. **USC Title 10, A, Part IV, Chap 159, Section 2665:** *"The President, through an executive department, may sell to any person or foreign government any forest products produced on land owned or leased by a military department…"* and provides for the distribution of proceeds of these sales.
2. **41 CFR Part 102–71.2**: Lists and identifies *"Standing timber…"* as real property.
3. **OPNAVINST 5090.1D Paragraph 12-5.26:** *"Forest products are those items produced from a forest such as sawtimber, veneer logs, poles, piles, posts, pulpwood, pine straw, stumpwood, bark and other mulch, cones, seeds, mistletoe, firewood, and wood chips.*
4. **DOD INSTRUCTION 4715.03 Enclosure (3), Paragraph 4.a.(1)**: *"Agricultural and forest products shall not be given away, abandoned, carelessly destroyed, used to offset contract costs, or traded for services, supplies, or products, or otherwise improperly removed; (a) Marketable forest products requiring removal, including those on lands designated for privatization, must be disposed of by the Military Service or the value of the forest products will be deposited into the Military Service forestry account. Marketable forest products shall not be abandoned, destroyed, or donated. Forest products may be sold for salvage when their condition or value is adversely affected by natural disasters, insect damage, or other events. Forest products include, but are not limited to, standing timber/trees, downed trees, and pine straw.*
5. **OPNAVINST 5090.1D Paragraph 12-3.8.j.(5):** *"…The Navy will not give away, nor abandon, nor carelessly destroy forest products, nor use them to offset the cost of contracts, nor trade them for products, supplies, or services. Proceeds collected from the disposal or sale of all merchantable forest products produced on a Navy installation will be turned over to the servicing Navy accounting and finance officer and deposited in the Navy Forestry Account…."*
6. **DoDI 4165.57 (Air Installations Compatible Use Zones), Table 1, Note 16:** *"Lumber and timber products removed due to establishment, expansion, or maintenance of Clear Zone lands owned in fee will be disposed of in accordance with applicable DoD guidance."*
7. **OPNAVINST 11010.36C (Air Installations Compatible Use Zones), Table 2, Note 13:** *"Lumber and timber products removed due to establishment, expansion, or maintenance of clear zones will be disposed of in accordance with appropriate DoD Natural Resources instructions."*
8. **OPNAVINST 11010.36C (Air Installations Compatible Use Zones), Enclosure (1), para 7:** OBSTRUCTION AND SAFETY CLEARANCES. This instruction addresses compatible land use with respect to aircraft noise and accident potential. Land uses in the vicinity of air installations are also subject to aircraft safety clearances and height restrictions. These restrictions are included by reference in this Instruction based upon tri-Service criteria published in Unified Facilities Criteria's UFC-3-260-01.

9. **United Facilities Criteria 3-260-01 (Airport and Heliport Planning and Design), Appendix B, Section 3, Note 11**: *"Lumber and timber products removed due to establishment, expansion, or maintenance of clear zones will be disposed of in accordance with appropriate DOD Natural Resources Instructions."*
10. **NAVFAC P-73 Volume II Paragraph 6.d.(2)(g)**: *"Where a construction contract might be delayed by advertising a timber harvesting contract prior to advertising the construction contract, a forester shall appraise the timber to be removed from within the designated limits of clearing. The construction contract shall contain provisions for reimbursing the Navy forestry account in the amount of the appraised value. Installations shall contact the Real Estate Division of the appropriate EFD on a case-by-case basis. The Invitation for Bids on such construction contracts must contain a provision as follows:*
    a. *'Valuable Standing Timber: Bidders are advised that there is marketable standing timber, having fair market value which the Government appraises to be $(amount), on the tract described as follows: (detail boundaries). The contractor is required to pay the appraised amount to the Government within 30 days after notice to proceed has been given, to be deposited in the Navy's forestry account.'"*
11. **NAVFAC Portal "NAVFAC BMS B-7.8 Timber on Construction Sites and Real Estate Easements"**: Lists process steps, associated procedures and resources for dealing with timber growing on these sites.

On all projects local environmental staff should be involved in the planning process as soon as practical, such as during the preliminary environmental baseline survey (PEBS) process. Once the project "footprint" is known, or approximately known, environmental staff can easily determine if forest products of concern are present on the site. If timber is on site, **prior to** the development of a request for bid or contract, either the installation forester (if one is available), NAVFAC Core forester or NAVFAC HQ Forestry PM should be contacted to appraise the timber value.

The appraisal must be performed by a qualified professional forester. There is no minimum amount of timber necessary to trigger an appraisal. The forester will determine the volume and value of the timber present on a case by case basis and then supply the project manager with the commercial value of the timber in question.

Normal procedures for disposal of timber include issuing a timber sale or salvage contract and timber is harvested over a specified period. Depending on the size of the harvest, timber sales may take several weeks to set up in the field, 2-3 months to advertise and award, and up to a year for harvesting to be completed.

If timetables do not allow for a timber sale, as stated in reference 10 above, the accepted procedure is to include the **"Timber Payback Clause"** in the construction contract whereby the contractor must reimburse the Navy Forestry Account for the appraised fair market value of the timber on the project. The appraised value, once included into the request for bids, is not negotiable. After the contractor pays the appraised value, the timber becomes his property and he may dispose of it in any manner he so chooses, including resale or destruction. If government timber on the site is ignored or allowed to become the property of the contractor without payment, it is a violation of references 4 and 5 above.

Contractors have 30 days from the date of notice to proceed to pay the appraised amount for the timber. Payment should be made and deposited into the Navy's forestry account with a copy of the transactions sent to NAVFAC HQ Forestry PM.

Trees managed primarily for landscaping and aesthetic purposes within the administrative, housing, or recreation areas of our installations fall into the category of "urban forestry," and most bases have more stringent, specific guidelines for their mitigation. The trimming, care, or removal of these urban trees is a base function usually addressed in the grounds maintenance portion of the INRMP and covered under O&M funding. Their designation as urban trees is a product of their location in the base environment. Whether or not these trees pose a safety concern is a safety issue rather than a forestry issue. Local environmental personnel address urban tree issues and while working along with their forester will determine if mitigation or payment is justified for their removal.

Should you have questions or comments about this information, please contact the NAVFAC HQ Forestry Program Manager: Jeff Gardner (202-685-9330).

Enclosure 7. Urban Forestry Program

This page intentionally left blank.

2014 Urban Forestry Program - Naval Support Activity Hampton Roads Northwest Annex – Annual Work Plan & Budget
(Formerly NSA Norfolk Northwest Annex)

Navy Regional Forestry Program Manager(s):
Emmett Carawan, NAVFAC MIDLANT Natural Resources Program Manager
Navy Southeast Regional Forestry Manager (NAVFAC SE), NAVFAC MIDLANT Forestry Program Consultant/Liaison
NAVFAC Atlantic Entomologist, NAVFAC MIDLANT Forestry Program Consultant/Liaison

Installation/City Forestry Program Manager:
Michael Wright, Natural Resources Program Manager/Team Leader

Additional Forestry Program Affiliates/Consultants:
Mike Aherron, VA Dept of Forestry
Donald Schwab, US Fish & Wildlife Services
John Gallegos, US Fish & Wildlife Services
Pete Acker, VA Dept of Game & Inland Fisheries
Lawrence McGrogan, US Navy
Mark Edwards, US Navy
Linda Hicks, US Navy
(These individuals are consulted regarding the development, management, and implementation of the Base's Integrated Natural Resources Management Plan, which includes the overall Forestry and Urban Forestry Programs.)

Tree Ordinance
A tree preservation and replacement standard operating procedure/instruction including pruning, planting, preservation and mitigation guidelines has been added to the installation's Integrated Natural Resources Management Plan (INRMP). The INRMP is a living and legally binding document required per the Sikes Act. The INRMP is reviewed annually for accuracy, functionality, enforcement, and update requirements. At a minimum of every 5 years the Navy, USFWS, State Wildlife Agency(ies), and NOAA-NMFWS (as appropriate) review the INRMP for operation and effect and issue letters or signatures of concurrence to implement the INRMP.

Community Forestry Program and Budget
The Regional and Installation Natural Resource Managers and staff consider all of the forest and landscape trees in planting and future development decisions. The INRMP Tree Preservation Instruction provides a framework for avoiding or mitigating tree loss due to development. The instruction also defines acceptable grounds maintenance practices with respect to proper tree protection, planting, and care. Execution of our hazardous tree removal plan, per a hazardous tree evaluation conducted by certified arborists, continues on NSAHR- Northwest Annex (NWA). The Facilities Engineering and Acquisitions Department (FEAD) accomplished the grounds- maintenance contract quality assurance. Any tree work contracted to a private company was managed by the FEAD and any necessary technical advice provided by the Regional and Installation Natural Resource staff. Any tree work conducted in-house was coordinated through the Navy Natural Resources program managers. In 2014, Navy, Marine, Coast Guard, Department of Defense civilians, and children from the Base's Child Development Center in NSAHR-NWA's inaugural Clean the Base Day and Arbor Day Celebrations. These basewide events included trimming, planting, maintenance of trees and mulching along with other non-tree related activities. Additional tree maintenance was accomplished by 15 Natural Resources Program volunteers and 4 Active Duty Military Self Help individuals for various programmatic objectives throughout the year.

Forestry Program Statistics:
Current Estimated Installation Property Acreage: ~3665 acres

Estimated Amount of Forest Cover upon/prior to Navy Acquisition: TBD

- Evergreen: TBD
- Deciduous: TBD
- Mixed: TBD

2014 Estimated Current Amount of Forest Cover: ~2000 acres

- Evergreen: ~205 acres
- Deciduous: ~930 acres
- Mixed: ~856 acres
- Upland: TBD
    - 2014 Estimated Upland Forest Cover Lost: 0
    - 2014 Estimated Upland Forest Cover Mitigated: ~0.1acre
- Wetland: TBD
    - 2014 Estimated Wetland Forest Cover Lost: 0
    - 2014 Amount of Forested Wetland Mitigation: 0

2014 Trees Planted: 12

2014 Trees Regenerating from Construction or Timber Harvest Activities:

- Since 2006, ROTHR Timber Harvest Phase I: 102 acres (~20,400 trees)
- Since 2008, ROTHR Timber Harvest Phases II & III: 190 acres (~38,000 trees)
- Since 2011, ROTHR Vegetation Clearing Field 11: 41 acres (~8,200 trees)
- Since 2011, BRIG Construction: 1 acre (~200 trees)
- Since 2012, IAMS range work: 33 acres (~6,682 trees)

2014 Merchantable Timber Trees Permanently Removed: 0

2014 Non-merchantable Timber Trees Removed: ~ 11 trees

- 2013, Fence Line Security Vegetation Clearing: ~7 trees
- 2013, Hazardous Tree Removals: 2 trees
- 2014, Main Gate Upgrades: 11 trees (11 trees planted to mitigate tree removal)

2014 Trees Removed as a Forestry Action (currently re-foresting naturally): 0

2014 Trees Pruned: ~20

2014 Firewood Sales: 0

Notes:

1. Living trees removed for non-construction purposes are replaced. Trees removed for construction purposes are replaced to the maximum extent practical. Trees removed for construction within a wetland area will be replaced or mitigation credits will be purchased within the watershed.
2. Currently, have Vegetation Community, Forest Inventory, and Invasive Species Projects underway or getting ready to be awarded, which will update existing Forestry Program Information and answer TBD information as appropriate/available.

3. All forest clearing and naturally regenerating estimates are based on 200 trees per acre at maturity. Any areas that are not naturally regenerating and are being specifically managed as part of a forestry program project will be reflected accordingly.

2014 Expenditures & Reimbursements:

Project Association	Acreage	# trees	Type of Action	Type of Funding	Expenditure/ Reimbursement (in 2014)	Info. Source
Service Call	...	10	Vegetation Trimming/Pruning	Service Call/CC	(-$2,495.42)	FMS

FY12 Award/FY14 Completed: Migratory and Breeding Bird Inventories		…	Avian Species Mngt. Program	NR	-$40,087.47 (-$19,043.74)	NR
FY12 Award/FY14 Completed: Invasive Species Inventory		…	Invasive Species Mngt. Program	NR	-$53,654.00 (-$26,596.47)	NR

FY12 Award/FY14 Complete: Vegetation Community Classification Mapping		…	Vegetative Mngt. Program	NR	-$74,398.65 (-$5,000.00)	NR
FY13 Award/FY14 Complete: Forest Inventory		…	Forest Mngt. Program	NR	-$36,397.33 (-$28,000.00)	NR
FY14 Awarded/FY16 Complete: Northern-Long-eared Bat Tracking		…	Endangered/Species of Concern Mngt. Program	NR	-$89,772.90 (-$44,886.45)	

2014 Total Urban Forestry Resources Funding Transactions = $476,313.01 *(Includes projects awarded in previous fiscal years, only those portions of funds executed in the current FY were reported. Includes funding associated with any Forest Resources action, including wildlife survey work.)*
2014 Total Urban Forestry Funding Reimbursements = $0.00
(Requirement = $2600.00 based on 1,300 population)

Arbor Day Observance and Proclamation

The annual Arbor Day Tree Planting took place at the NSAHR-NWA Chapel with the pre-school children on 24 April 2014. We planted a native Virginia live oak (*Quercus virginiana*) with: LCDR McLin, Officer in Charge; Michael Wright, Installation Natural Resources Manager; Scott Bachman, Virginia Department of Forestry Representative; several children from the NSAHR-NWA Child Development Center (CDC); and several adults from the community. 25 Children and 16 adults participated in and/or attended the actual tree planting ceremony. Many others contributed to the preparation for the ceremony and others provided continued care for the tree after the ceremony. The CDC classes and WMR staff adopted the tree to help nurse it into becoming a mature tree. The Natural Resources program, in addition to purchasing the tree, purchased tree gators, mulch, and tree protectors to help ensure adequate water supply during early development and to prevent landscaping (mowing & weedwhacking) practices from damaging/scaring the tree. Event announcements were made: on the US Navy Currents Magazine's Facebook and Twitter Accounts; via community email & word of mouth; and via a News Release by the Navy's Public Affairs Officer.

A map of Arbor Day Tree Celebration planting locations is available upon request from the installation's Natural Resources Manager, Mike Wright.

Enclosure 2. Soil and Water Conservation Plans

This page intentionally left blank.

SOIL AND WATER CONSERVATION PLAN

Naval Support Activity Hampton Roads, Northwest — Unit NW-1
Chesapeake, Virginia — Lease Area 192.8 Acres
February 28, 2020

GENERAL INFORMATION

This Plan was prepared by **Mr. Bryan Alexander the Agricultural Lease Manager at the Environmental Planning and Conservation Division, Naval Facilities Engineering Command (NAVFAC MID-Atlantic), Building Z-140, Room 116, 9324 Virginia Avenue, Norfolk, VA 23511 phone 757-341-1656.** Mr. Alexander will be the Government Representative of the Navy in administering the Soil and Water Conservation Plan.

The Real Estate Contracting Officer, Mr. Paul Moomaw, Hampton Roads, Naval Facilities Engineering Command (NAVFAC MID-ATLANTIC) Norfolk, Virginia Telephone 757-433-2678 will be the Government Representative for the Navy in administering the lease.

Daily operational access issues can be resolved by calling the **NSA HR-NWA Natural Resources Manager, Taylor Austin at 757-421-8240 or the NAVFAC MID-ATLANTIC Agricultural Lease Manager, Bryan Alexander at 757-341-1656.**

The unit of land available for agriculture leasing is located at Naval Support Activity Hampton Roads Northwest Annex (NSA HR-NWA), Chesapeake, Virginia. The gross area of 192.8 acres includes access roads and drainage ditches. Net farmable area will be less than the 192.8 acres. The unit is located on the northern side of the Station, and is accessed through the main gate off of Ballahack, Relay and Milepost Roads (Attachment "1").

Special Requirements

During the term of this lease it is required that lessee mow the road shoulders within his lease area. The road shoulders measure approximately 6 acres and immediately bound the lease area. The Lessee must mow these shoulders 2 times per year. The first mowing will take place in June after spring planting, the second in late August just prior to harvest. **Bids should reflect the cost of this mowing.**

Special Provisions

Current military use of the land requires maintaining large expanses of cleared land without obstructions that would interfere with communication operations. **There is a strict prohibition of electronic interference with communications.**

The installation requires that the lessee coordinate at least 72 hours prior to bringing equipment and/or chemicals onto the installation, with the NSA HR-NWA Natural Resources Manager, Taylor Austin at 757-421-8240.

In the event that the lessee experiences a delay or problem caused by the Navy, they must immediately notify the NSA HR-NWA Natural Resources Manager, Taylor Austin to resolve the problem at 757-421-8240.

Hunting on the leased lands is permitted. The Station is responsible for coordinating the programs with the lessee. Excessive damage caused by these activities must be reported immediately to the NSA HR-NWA Natural Resources Manager, Taylor Austin at 757-421-8240.

The Agricultural Lease Manager, Bryan Alexander 757-341-1656 requires a crop report including crop location and planting schedules be provided to him 1 month prior to field preparation and planting each season.

Farming operations are to be restricted to the current agricultural fields that are highlighted on the corresponding map in this plan and to the production of corn, soybeans, small grains, cotton, or hay/silage crops. Though this installation is not an airfield it does have a helicopter landing site and on occasion special event helicopter training exercises. As such, when agreeing to the terms and conditions of the agricultural lease, special attention shall be paid to crop selection and its underlying impacts to Bird/Animal Strike Hazard (BASH). To help mitigate BASH concerns crop location and planting schedules should be provided to the NSA HR-NWA Natural Resources Manager, Taylor Austin 757-421-8240 no later than within 72 hours of field preparation and planting each season.

No farming shall occur within the 20 foot buffer security strips bordering the SATCOM & MUOS fence lines in field 6 and the Classic Owl field. These buffer strips are identified on the map that is included in this plan, see (Attachment "2").

When harvesting crops, spillage should be minimized and cleaned up promptly.

No deviation in land use or drainage improvements, as outlined in this plan, shall be permitted without prior written consent of the Real Estate Contracting Officer.

Under Article 10B of the Lease General Provisions, cultivation of federally subsidized crops on the leased land is prohibited.

The Lessee is required to park and load all farm equipment and vehicles within leased property boundaries.

All equipment should be clean (no visible soil, plant or animal material) prior to arrival on the installation to minimize and avoid the spread of non-native invasive species. It is recommended that all equipment after utilization on the installation also be cleaned prior to utilization on other properties. If equipment is being utilized on one Navy installation and is transported to another Navy installation it must be cleaned prior to use on the other Navy property. Fueling and maintenance of farm equipment should be done offsite prior to being utilized on Navy property. In the event of an emergency, best management practices should be implemented with spill kit.

Cultural Resources

A "Phase I" archaeological survey has been completed at NSA HR-NWA. This survey has identified prehistoric and historic sites on the Station; many of these sites are found within the agricultural units. To alleviate any potential destruction of these sites the State Historic Preservation Officer (SHPO) recommends that the only ground-disturbing activity permitted will be the ongoing agricultural cultivation practices and be limited to the current plow zone. If the lessee anticipates a problem which would cause him to deviate from his current cultivation practices he shall notify the NAVFAC MID-ATLANTIC Agricultural Lease Manager, Bryan Alexander 757-341-1656.

Conservation Inventory

The 192.8 acres is considered a single farming unit. The land is wet and requires drainage. The land capability is Class IIIW for soil type 71 Acredale silt loam. The land capability is Class III when properly drained. Open ditch drainage is required to assure production.

Conservation Practices

All conservation practices shall be performed in accordance with standard specifications of the USDA Natural Resources Conservation Service (NRCS). The Lessee shall utilize the technical services of the local Field Office located at the Municipal Center, Chesapeake, Virginia, in the design, layout, construction, and supervision of the conservation practices performed. All improvements shall become the property of the government at the expiration of the lease.

Soil fertility shall be maintained at the optimum level for the crops that are to be grown. USDA NRCS should be notified if nutrient deficiencies arise and resolved in accordance with their recommendations. USDA NRCS or

the Virginia Tech Extension Service can assist in making fertilizer and lime recommendations that will be sufficient to maintain adequate pH levels and soil fertility.

The use of Hampton Roads Sanitation Division's biosolids disposal program will be approved on a case-by-case scenario. Coordination of this program must be made **30 days** prior to application with the NAVFAC MID-ATLANTIC Agricultural Lease Manager, Bryan Alexander and NSA HR-NWA Natural Resource Manager, Taylor Austin.

Herbicides/Pesticides

Pesticides to be used by the Lessee must be coordinated and approved by Mr. Christopher Martin (757-322-4611) at NAVFAC Atlantic's Applied Biology Section, within 30 days of award of the lease. This includes any potential pesticides used for aerial application. Pesticide requirements are found in Attachments 3 and 4 of this plan, as well as the Armed Forces Pest Management Board Technical Guide 15. All pesticide approvals and the reporting of pesticide use, must be done through the NAVFAC Online Pesticide Reporting System. The web address is: https://noprs.pestlogics.com Contact Mr. Martin @ 757-322-4611 for assistance setting up a NOPRS account. Actual application of herbicides/pesticides shall be reported annually into NOPRS as well as a hard copy submitted to the Agricultural Lease Manager, Bryan Alexander during the yearly agricultural inspection occurring during the month of December.

Application of pesticides will conform to the Environmental Protection Agencies "Worker protection standards" as stated on the Pesticide label.

Mixing of pesticides is allowed on site if the lessee uses spill containment equipment. Storing of pesticides on site is not allowed. Pesticides shall not be mixed or sprayed within the well buffer area identified in Attachment 1.

The Lessee shall report all farm chemical and/or fuel spills, leaks or releases to NSA HR-NWA via the Command Duty Officer number at 757-567-2850 and to the NSA HR-NWA Natural Resources Manager at 757-421-8240.

All aerial application request will be approved on a case by case scenario. The lessee must contact the Agricultural Lease Manager, Bryan Alexander at 757-341-1656 at least 72 hours prior to application event. The pilot of the crop dusting aircraft shall contact the Command Duty Officer (CDO) prior to takeoff to update ETA and location, and coordinate with Air Traffic Control, where required.

The Pilot shall contact the NTU Tower prior to entering the Class Delta airspace and receive clearance to begin the spray operations.

The Officer In Charge will determine whether or not to cancel or reschedule the operation.

The control and/or eradication of Federal and State listed noxious weeds, particularly **Johnsongrass,** *Sorghum halepense*, is required. Any pesticides and herbicides used for insect, disease, or weed control shall be approved and registered by the Environmental Protection Agency and the Commonwealth of Virginia. New pesticed requests are required to be submitted through NOPRS and must be approved prior to use.

The lessee is responsible for removal of all debris, refuse, garbage, pesticide containers, and unused residue of farm operations from the leased area and the Installation. The Lessee is encouraged to use the City of Chesapeake's pesticide container recycling program (see back of pesticide form for information).

Additional requirements for pesticide use on the property are provided in Attachment 3, Pesticide Mixing, Storage and Use on Navy-Owned Property Leased for Agricultural Purposes.

Conservation Requirements

Non-Reimbursable work

Soil and water conservation goals on this property include control of surface run-off and concurrent reduction in soil erosion, sedimentation and nutrient loading. The following measures will achieve these goals and are the responsibility of the lessee:

1. A conservation cropping system shall be established to include minimum tillage.

2. Maintenance of ditches and culverts is the responsibility of the lessee (subject to inspection at any time during the term of the lease) and shall include the following:

a. Mowing of ditch banks is required every other year of the lease. Mowing must be completed by 31 December. If this poses a problem for the lessee, he should notify the NAVFAC MID-ATLANTIC Agricultural Lease Manager, Bryan Alexander at 757-341-1656.

c. Boundary ditches are considered lease area to the ditch center-line

3. Any acreage not cropped shall be seeded to a cover crop of hay or silage for protection and erosion control. If land is left fallow crop residue shall be left on the soil surface as a winter cover to provide mulch and soil improvement until seedbed preparation the following spring. Minimum tillage practices are encouraged.

Yearly inspections by the Agricultural Lease Manager, Bryan Alexander will ensure compliance with these conditions and other environmental requirements.

Reimbursable Work

During the term of this lease, it is anticipated that reimbursable work will be requested. The reimbursable work will be based on a scope of work furnished by the Agricultural Lease Manager, Mr. Bryan Alexander. The Lessee will be requested to provide an estimate for the work based on the scope of work. If the Lessee decides not to do the work himself, he may contract with a third party to do so (to be approved by the Real Estate Contracting Officer), or inform the Government that he is not capable of performing the work.

If the proposal is acceptable the Real Estate Contracting Officer will either; (1) issue a letter of authorization to begin work or (2) will forward a lease modification to the lease authorizing the work. Work should not begin until the letter of authorization or lease modification has been received.

When the work has been completed, a joint inspection will be performed by the Lessee and the Agricultural Lease Manager, Bryan Alexander. If the work is complete and acceptable, terms of the letter or modification will be activated (i.e., rent reduction granted).

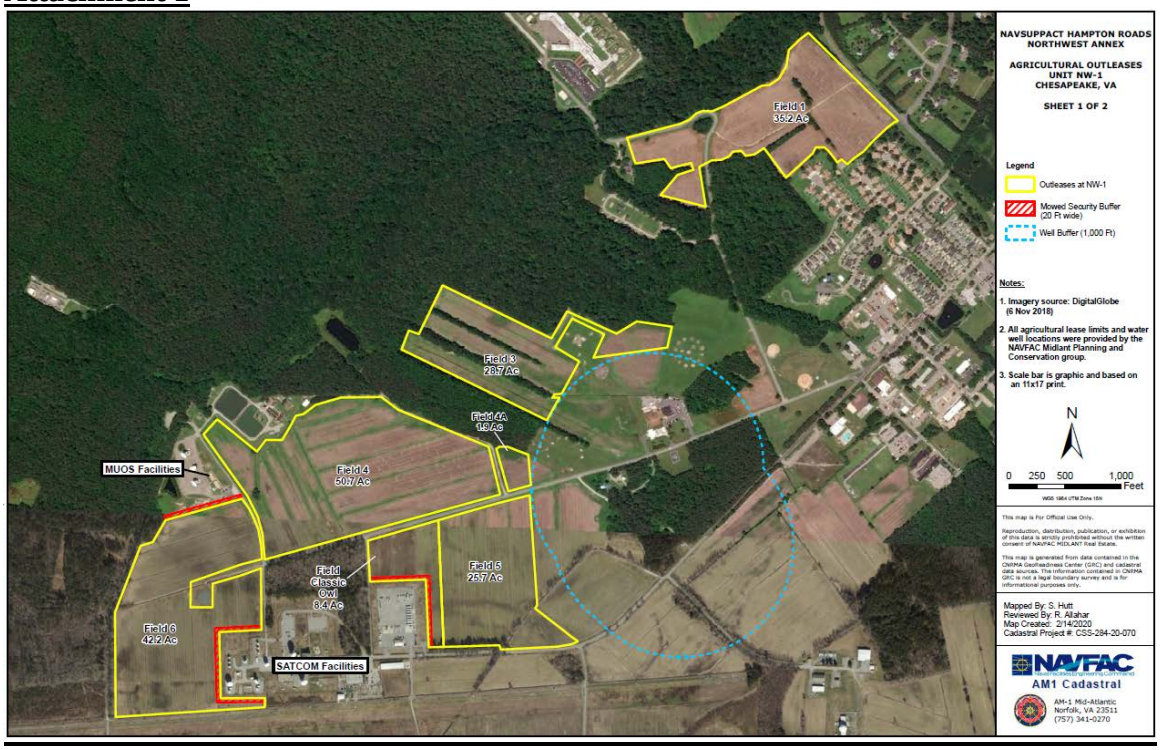
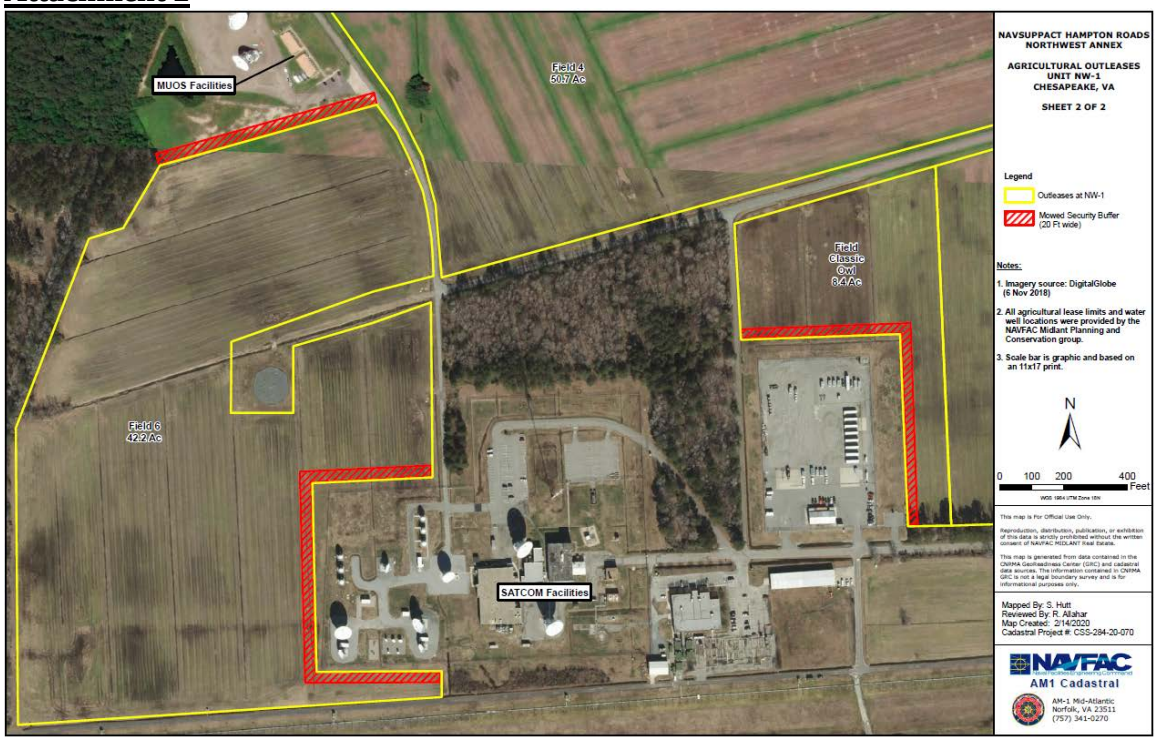
Attachment 1



Attachment 2



ATTACHMENT 3

Pesticide Mixing, Storage, and Use
on
Navy-Owned Property
Leased for Agricultural Purposes

1. a. Certified Applicators Requirement

All pesticide applications shall be performed by a State-certified pesticide applicator. Private applicator's licenses are acceptable if the Lessee performs the work. Commercial grade license(s) are required if the Lessee hires (for fee) an application company to apply the pesticide(s). "Registered Technician" status is not permitted to apply pesticides on DoD property. The pesticide applicator shall be certified in the category in which the work will be performed.

b. Integrated Pest Management

Integrated Pest Management (IPM) is a pest population management system that uses all suitable control techniques (chemical, biological, cultural, mechanical, or physical) to maintain pest populations at or below tolerable levels. Integrated Pest Management (IPM) techniques shall be used to the maximum extent practicable.

2. SUBMITTAL REQUIREMENTS

a. Business License

If a commercial applicator will apply pesticides (i.e. the Lessee does NOT have a private applicators license), the commercial applicator shall provide proof of a business license (as a pesticide application business) as required by the Commonwealth of Virginia. A copy of this business license shall be forwarded to the Agricultural Lease Manager, Bryan Alexander before the pesticide application(s) are performed.

b. Certificate of Insurance

If a commercial applicator will apply pesticide(s), proof of Insurance as a pesticide applicator business shall be forwarded to the Navy representative designated as responsible for oversight of the outlease before the pesticide application(s) are performed.

c. Pesticide Approval

All pesticides must be approved within 30 days after award of lease. Approval is based on EPA registration number. A list of the pesticide(s) proposed for use (by either a private and/or commercial applicator) shall be submitted into NOPRS for approval before the pesticide application(s) are performed. Any changes in pesticides to be used shall have prior approval before their use (Submittal for changes shall be entered into NOPRS).

d. Pesticide Labels and Safety Data Sheets

Submit copies of labels and safety data sheets to the Agricultural Lease Manager, Bryan Alexander.

e. Commercial Pesticide Applicators Certificate(s) In the Appropriate Categories

Submit legible copies of State pesticide applicators certificate(s) in the appropriate applicator categories (the category in which the work will be performed) to the Agricultural Lease Manager, Bryan Alexander.

f. Pesticide Label Reference Book

The Lessee shall maintain a reference book of approved pesticide labels and Safety Data Sheets (MSDS), and have it readily available **ON-SITE** (in the truck or other vehicle that was used to arrive on site) whenever any pesticides are on site. The reference book shall be readily available for inspection. Label and SDS requirements are based on EPA registration number.

g. Reporting Pesticide and Fertilizer Use

The Lessee shall report all pesticide and/or fertilizer use annually into NOPRS, as well as, submit a hard copy to the Agricultural Lease Manager, Bryan Alexander during the annual agricultural inspection occurring during the month of December.

3. PESTICIDE APPLICATION AND CONTROL OPERATIONS

All pesticides must be used in accordance with Federal, state, local, and installation publications, and any requirements identified in attachments. All pesticides shall be procured, processed, handled, and applied in strict accordance with the manufacturer's label. All pesticides shall be registered with the U.S. Environmental Protection Agency and the Commonwealth of Virginia's pesticide regulatory agency.

a. Pesticide Preparation and Use.

During preparation, and/or application of pesticides, the Contractor shall:

(1) Always store pesticides in original containers having EPA-registered labels or in containers meeting EPA label requirements; and
(2) Use application equipment appropriate for the nature and size of work, that is clean, calibrated, and in proper operational condition; and
(3) Never leave equipment unattended during filling and application/usage; and
(4) Use back flow preventers on hoses when connected to water outlets in filling operations, and
(5) Inspect equipment (per manufacturer's label) and the area during application to insure proper and safe treatment; and
(6) Keep safety equipment and spill kit available on site when pesticides are present.

b. Pesticide Mixing.

The Lessee shall mix pesticides on a portable containment device. The device shall be capable of containing 110% of capacity.

c. Storage of Pesticides.

No pesticides shall be stored at the site. Any pesticide container and/or application tank shall be secured against theft and vandalism when the site is unattended during the day. Only those pesticides expected to be used that day should be imported to the site.

d. Pesticide Disposal.

The Lessee shall not dispose of any pesticides, pesticide containers, pesticide residue, pesticide rinse water, or any pesticide contaminated articles on government property.

e. Spill Management.

A pesticide spill containment kit shall be available on site if pesticides are being applied. Follow the requirements that are written in the Armed Forces Pest Management Board Technical Guide 15 that is attached to this plan.

f. **Safety Equipment.**

When pesticides are being mixed or applied, a portable eyewash station and at least 2 gallons of fresh water (in plastic jugs marked “emergency wash water”) shall be within 25 feet of the operation.

g. Pesticide Spills and Decontamination.

The Lessee is responsible for properly cleaning, decontaminating, and reporting pesticide spills to the Agricultural Lease Manager, Bryan Alexander.

h. Pesticide Dispersal Equipment Markings.

All pesticide dispersal equipment shall be clearly and plainly marked with "DANGER"..."PESTICIDES".

4. SPECIFIC PESTICIDE USE PROVISIONS

a. The Lessee shall coordinate, 72 hours in advance, with the Agricultural Lease Manager, Bryan Alexander, that pesticide(s) and/or application equipment will be brought onto the site.

b. All application of pesticides shall conform to the Worker Protection Standards CFR 170 as amended.

c. All pesticide applications shall conform to all label and supplemental labeling of the pesticide product.

d. All applicable laws and regulations regarding notification and posting shall be strictly adhered to.

e. Pesticides shall not be mixed or sprayed within the well field buffer identified in Attachment 1.

5. HERBICIDE REQUIREMENTS

Only glyphosate herbicides may be used for non-selective vegetation management. Paraquat use is not permitted. Simizine or any simizine family herbicide use is not permitted. Selective herbicides may be approved for use. If lessee is growing cotton specialty defoliant herbicides will be authorized through the normal approval process.

ATTACHMENT "4"

REPORTING REQUIREMENTS

Item # Description	Submit To
1. Request pesticide additions through NOPRS	Submit online at https://noprs.pestlogics.com/
2. Submit copies of current State Certification For all employees that will be applying pesticides, Including those of contract Commercial Applicators 30 days after award of lease. Include copies of proof of insurance by Commercial Applicator.	Bryan Alexander, NAVFAC Mid-Atlantic Agricultural Lease Manager
.	
3. Submit Soil Test and Nutrient management plan 90 days after award of lease.	Bryan Alexander, NAVFAC Mid-Atlantic Agricultural Lease Manager
4. Report pesticide use on NOPRS annually Including negative reports	Submit online at https://noprs.pestlogics.com/
5. Pesticide Spill Report Immediately	NSA HR-NWA Natural Resources Manager Emergency Communication Center
6. Approval of Aerial Pesticide application 72 hours prior	Christopher Martin, NAVFAC Atlantic Entomologist Bryan Alexander, NAVFAC Mid-Atlantic Agricultural Lease Manager Taylor Austin, NSA HR-NWA Natural Resources Manager

Submit all pesticide approvals in the NAVFAC Online Pesticide Reporting System:
https://noprs.pestlogics.com/
Contact Christopher Martin @ 757-322-4611 for assistance setting up a NOPRS account.

SOIL AND WATER CONSERVATION PLAN

Naval Support Activity Hampton Roads, Northwest — Unit NW-2
Chesapeake, Virginia — Lease Area 456.3 Acres
February 28, 2020

GENERAL INFORMATION

This Plan was prepared by **Mr. Bryan Alexander the Agricultural Lease Manager at the Environmental Planning and Conservation Division, Naval Facilities Engineering Command (NAVFAC MID-Atlantic), Building Z-140, Room 116, 9324 Virginia Avenue, Norfolk, VA 23511 phone 757-341-1656.** Mr. Alexander will be the Government Representative of the Navy in administering the Soil and Water Conservation Plan.

The Real Estate Contracting Officer, Mr. Paul Moomaw, Hampton Roads, Naval Facilities Engineering Command (NAVFAC MID-ATLANTIC) Norfolk, Virginia Telephone 757-433-2678 will be the Government Representative for the Navy in administering the lease.

Daily operational access issues can be resolved by calling the **NSA HR-NWA Hampton Roads Natural Resources Manager, Taylor Austin at 757-421-8240 or the NAVFAC MID-ATLANTIC Agricultural Lease Manager, Bryan Alexander at 757-341-1656.**

The unit of land available for agriculture leasing is located at NSA HR-NWA , Chesapeake, Virginia. The gross area of approximately 456.3 acres includes access roads and drainage ditches. See (attachment "1").

Special Requirements

Except for Fields 1 and 2, during the term of this lease it is required that lessee mow the road shoulders within his lease area. The road shoulders measure approximately 5 acres and immediately bound the lease area. The Lessee must mow these shoulders 2 times per year. The first mowing will take place in June after spring planting, the second in late August just prior to harvest. **Lease bids should reflect the cost of this mowing.**

Special Provisions

Current military use of the land requires maintaining large expanses of cleared land without obstructions that would interfere with communication operations. **There is a strict prohibition of electronic interference with communications.**

The station requires that the lessee coordinate at least 72 hours prior to bringing equipment and/or chemicals onto the installation, with the NSA HR-NWA Natural Resources Manager, Taylor Austin at 757-421-8240.

In the event that the lessee experiences a delay or problem caused by the Navy, they must immediately notify the NSA HR-NWA Natural Resources Manager, Taylor Austin to resolve the problem at 757-421-8240.

Hunting on the leased lands is permitted. The Station is responsible for coordinating the programs with the lessee. Excessive damage caused by these activities must be reported immediately to the NSA HR-NWA Natural Resources Manager, Taylor Austin at 757-421-8240.

The Agricultural Lease Manager, Bryan Alexander 757-341-1656 requires a crop report including crop location and planting schedules be provided to him 1 month prior to field preparation and planting each season.

Farming operations are to be restricted to the production of corn, soybeans, small grains, cotton, or hay/silage crops with the exception of 54.2 acres that border the south side of the ROTHR antenna. In this 54.2 acre area, corn can not be grown. The 54.2 acres are identified on the map that is included with this plan, see (Attachment

"2"). Though this installation is not an airfield it does have a helicopter landing site and on occasion special event helicopter training exercises. As such, when agreeing to the terms and conditions of the agricultural lease, special attention shall be paid to crop selection and its underlying impacts to Bird/Animal Strike Hazard (BASH). To help mitigate BASH concerns crop location and planting schedules should be provided to the NSA HR-NWA Natural Resources Manager, Taylor Austin 757-421-8240 no later than within 72 hours of field preparation and planting each season.

When harvesting crops, spillage should be minimized and cleaned up promptly.

No deviation in land use or drainage improvements, as outlined in this plan, shall be permitted without prior written consent of the Real Estate Contracting Officer.

Under Article 10B of the Lease General Provisions, cultivation of federally subsidized crops on the leased land is prohibited.

The Lessee is required to park and load all farm equipment and vehicles within leased property boundaries.

All equipment should be clean (no visible soil, plant or animal material) prior to arrival on the installation to minimize and avoid the spread of non-native invasive species. It is recommended that all equipment after utilization on the installation also be cleaned prior to utilization on other properties. If equipment is being utilized on one Navy installation and is transported to another Navy installation it must be cleaned prior to use on the other Navy property. Fueling and maintenance of farm equipment should be done offsite prior to being utilized on Navy property. In the event of an emergency, best management practices should be implemented with spill kit.

Cultural Resources

A "Phase I" archaeological survey has been completed at NSA HR-NWA. This survey has identified prehistoric and historic sites on the Station; many of these sites are found within the agricultural units. To alleviate any potential destruction of these sites the State Historic Preservation Officer (SHPO) recommends that the only ground-disturbing activity permitted will be the ongoing agricultural cultivation practices and be limited to the current plow zone. If the lessee anticipates a problem which would cause him to deviate from his current cultivation practices he shall notify Mr. Bryan Alexander, Agricultural Lease Manager at NAVFAC MID-ATLANTIC 757-341-1656.

Conservation Inventory

The 456.3 acres is considered a single farming unit. The land is wet and requires drainage. The land capability is Class IIIW for soil type 71 Acredale silt loam. The land capability is Class III when properly drained. Open ditch drainage is required to assure production.

Conservation Practices

All conservation practices shall be performed in accordance with standard specifications of the USDA Natural Resources Conservation Service (NRCS). The Lessee shall utilize the technical services of the local Field Office located at the Municipal Center, Chesapeake, Virginia, in the design, layout, construction, and supervision of the conservation practices performed. All improvements shall become the property of the government at the expiration of the lease.

Soil fertility shall be maintained at the optimum level for the crops that are to be grown. USDA NRCS should be notified if nutrient deficiencies arise and resolved in accordance with their recommendations. USDA NRCS or the Virginia Tech Extension Service can assist in making fertilizer and lime recommendations that will be sufficient to maintain adequate pH levels and soil fertility.

The use of Hampton Roads Sanitation Division's biosolids disposal program will be approved on a case-by-case scenario. Coordination of this program must be made **30 days prior** to application with the NAVFAC MID-

ATLANTIC Agricultural Lease Manager, Bryan Alexander and NSA HR-NWA Natural Resource Manager, Taylor Austin.

Herbicides/Pesticides

Pesticides to be used by the Lessee must be coordinated and approved by Mr. Christopher Martin (757-322-4611) Entomologist at NAVFAC Atlantic, within 30 days of award of the lease. This includes any potential pesticides used for aerial application. Pesticide requirements are found in Attachments 3 and 4 of this plan, as well as the Armed Forces Pest Management Board Technical Guide 15. All pesticide approvals and the reporting of pesticide use, must be done through the NAVFAC Online Pesticide Reporting System. The web address is: https://noprs.pestlogics.com Contact Mr. Martin @ 757-322-4611 for assistance setting up a NOPRS account. Actual application of herbicides/pesticides shall be reported annually into NOPRS as well as a hard copy submitted to the Agricultural Lease Manager, Bryan Alexander during the yearly agricultural inspection occurring during the month of December.

Application of pesticides will conform to the Environmental Protection Agencies "Worker protection standards" as stated on the Pesticide label.

Mixing of pesticides is allowed on site if the lessee uses spill containment equipment. Storing of pesticides on site is not allowed. Pesticides shall not be mixed or sprayed within the well buffer area identified in Attachment 1.

The Lessee shall report all farm chemical and/or fuel spills, leaks or releases to NSA HR-NWA via the Command Duty Officer number at 757-567-2850 and to the NSA HR-NWA Natural Resources Manager, Taylor Austin at 757-421-8240.

All aerial application request will be approved on a case by case scenario. The lessee must contact the Agricultural Lease Manager, Bryan Alexander at 757-341-1656 at least 72 hours prior to application event. The pilot of the crop dusting aircraft shall contact the Command Duty Officer prior to takeoff to update ETA and location, and coordinate with Air Traffic Control, where required.

The Pilot shall contact the NTU Tower prior to entering the Class Delta airspace and receive clearance to begin the spray operations.

The Officer in Charge will determine whether or not to cancel or reschedule the operation.

The control and/or eradication of Federal and State listed noxious weeds, particularly **Johnsongrass,** *Sorghum halepense*, is required. Any pesticides and herbicides used for insect, disease, or weed control shall be approved and registered by the Environmental Protection Agency and the Commonwealth of Virginia. New pesticide requests are required to be submitted through NOPRS and must be approved prior to use.

The lessee is responsible for removal of all debris, refuse, garbage, pesticide containers, and unused residue of farm operations from the leased area and the Installation. The Lessee is encouraged to use the City of Chesapeake's pesticide container recycling program (see back of pesticide form for information).

Additional requirements for pesticide use on the property are provided in Attachment 3, Pesticide Mixing, Storage and Use on Navy-Owned Property Leased for Agricultural Purposes.

Conservation Requirements

Non-Reimbursable work

Soil and water conservation goals on this property include control of surface run-off and concurrent reduction in soil erosion, sedimentation and nutrient loading. The following measures will achieve these goals and are the responsibility of the lessee:

1. A conservation cropping system shall be established to include minimum tillage.

2. Maintenance of ditches and culverts is the responsibility of the lessee (subject to inspection at any time during the term of the lease) and shall include the following:

a. Mowing of ditch banks is required every other year of the lease. Mowing must be completed by 31 December. If this poses a problem for the lessee, he should notify the NAVFAC MID-ATLANTIC Agricultural Lease Manager, Bryan Alexander at 757-341-1656.

c. Boundary ditches are considered lease area to the ditch center-line.

3. Any acreage not cropped shall be seeded to a cover crop of hay or silage for protection and erosion control. If land is left fallow crop residue shall be left on the soil surface as a winter cover to provide mulch and soil improvement until seedbed preparation the following spring. Minimum tillage practices are encouraged.

Yearly inspections by the Agricultural Lease Manager, Bryan Alexander will ensure compliance with these conditions and other environmental requirements.

Reimbursable Work

During the term of this lease, it is anticipated that reimbursable work will be requested. The reimbursable work will be based on a scope of work furnished by the Agricultural Lease Manager, Mr. Bryan Alexander. The Lessee will be requested to provide an estimate for the work based on the scope of work. If the Lessee decides not to do the work himself, he may contract with a third party to do so (to be approved by the Real Estate Contracting Officer), or inform the Government that he is not capable of performing the work.

If the proposal is acceptable the Real Estate Contracting Officer will either; (1) issue a letter of authorization to begin work or (2) will forward a lease modification to the lease authorizing the work. Work should not begin until the letter of authorization or lease modification has been received.

When the work has been completed, a joint inspection will be performed by the Lessee and Navy representatives. If the work is complete and acceptable, terms of the letter or modification will be activated (i.e., rent reduction granted).

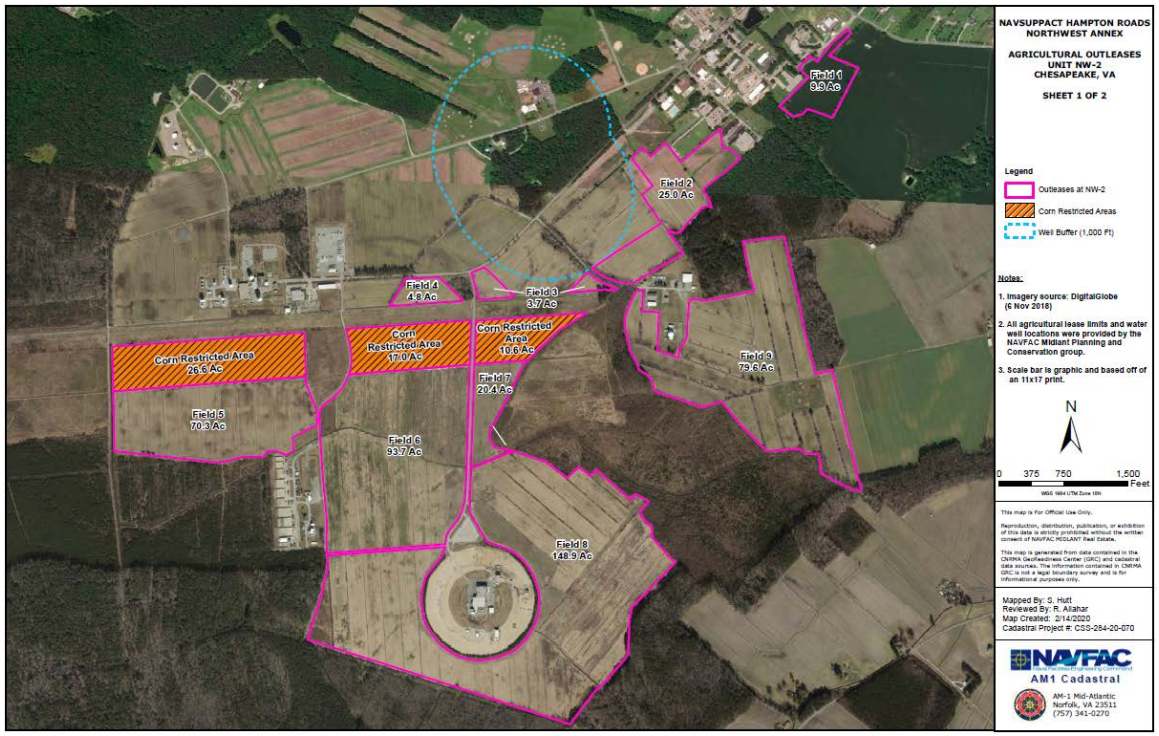
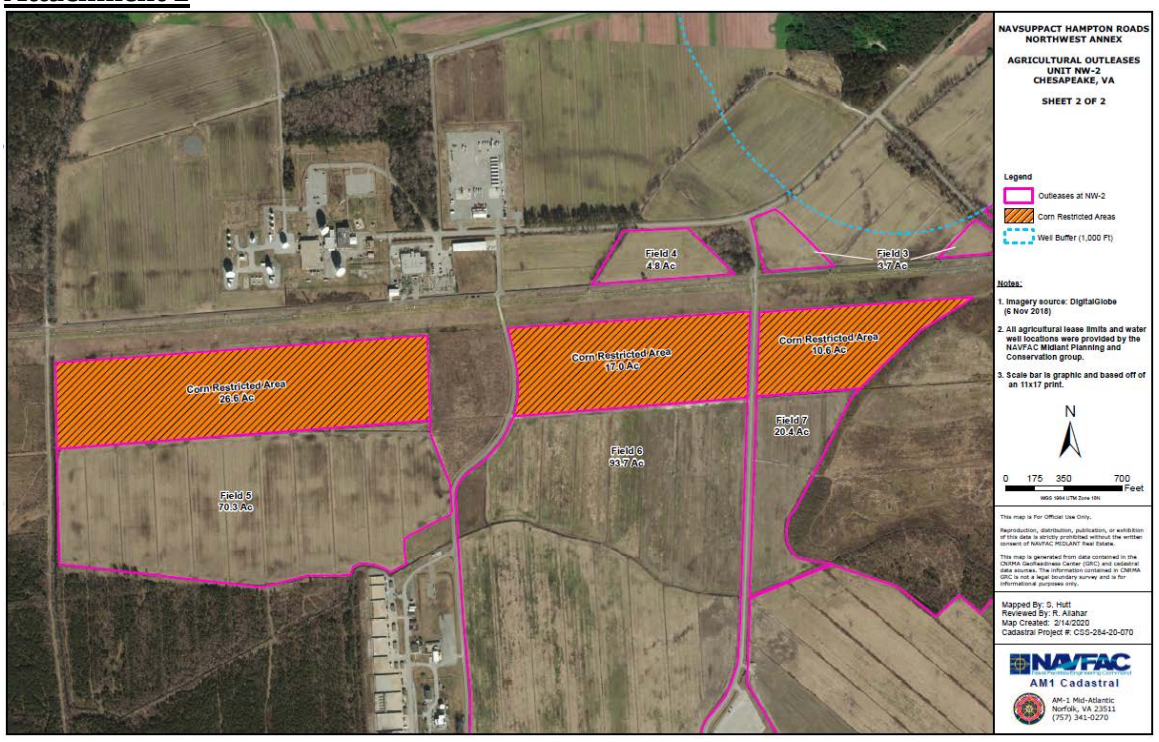
Attachment 1



Attachment 2



ATTACHMENT 3

Pesticide Mixing, Storage, and Use
on
Navy-Owned Property
Leased for Agricultural Purposes

1. a. Certified Applicators Requirement

All pesticide applications shall be performed by a State-certified pesticide applicator. Private applicator's licenses are acceptable if the Lessee performs the work. Commercial grade license(s) are required if the Lessee hires (for fee) an application company to apply the pesticide(s). "Registered Technician" status is not permitted to apply pesticides on DoD property. The pesticide applicator shall be certified in the category in which the work will be performed.

b. Integrated Pest Management

Integrated Pest Management (IPM) is a pest population management system that uses all suitable control techniques (chemical, biological, cultural, mechanical, or physical) to maintain pest populations at or below tolerable levels. Integrated Pest Management (IPM) techniques shall be used to the maximum extent practicable.

2. SUBMITTAL REQUIREMENTS

a. Business License

If a commercial applicator will apply pesticides (i.e. the Lessee does NOT have a private applicators license), the commercial applicator shall provide proof of a business license (as a pesticide application business) as required by the Commonwealth of Virginia. A copy of this business license shall be forwarded to the Navy representative designated as responsible for oversight of the outlease before the pesticide application(s) are performed.

b. Certificate of Insurance

If a commercial applicator will apply pesticide(s), proof of Insurance as a pesticide applicator business shall be forwarded to the Navy representative designated as responsible for oversight of the outlease before the pesticide application(s) are performed.

c. Pesticide Approval

All pesticides must be approved within 30 days after award of lease. Approval is based on EPA registration number. A list of the pesticide(s) proposed for use (by either a private and/or commercial applicator) shall be submitted into NOPRS for approval before the pesticide application(s) are performed. Any changes in pesticides to be used shall have prior approval before their use (Submittal for changes shall be entered into NOPRS).

d. Pesticide Labels and Safety Data Sheets

Submit copies of labels and safety data sheets to the Agricultural Lease Manager, Bryan Alexander.

e. Commercial Pesticide Applicators Certificate(s) In the Appropriate Categories

Submit legible copies of State pesticide applicators certificate(s) in the appropriate applicator categories (the category in which the work will be performed) to the Agricultural Lease Manager, Bryan Alexander.

f. Pesticide Label Reference Book

The Lessee shall maintain a reference book of approved pesticide labels and Safety Data Sheets (MSDS), and have it readily available **ON-SITE** (in the truck or other vehicle that was used to arrive on site) whenever any pesticides are on site. The reference book shall be readily available for inspection. Label and SDS requirements are based on EPA registration number.

g. Reporting Pesticide and Fertilizer Use

The Lessee shall report all pesticide and/or fertilizer use annually into NOPRS, as well as, submit a hard copy to the Agricultural Lease Manager, Bryan Alexander during the annual agricultural inspection occurring during the month of December.

3. PESTICIDE APPLICATION AND CONTROL OPERATIONS

All pesticides must be used in accordance with Federal, state, local, and installation publications and any requirements identified in attachments. All pesticides shall be procured, processed, handled, and applied in strict accordance with the manufacturer's label. All pesticides shall be registered with the U.S. Environmental Protection Agency and the Commonwealth of Virginia's pesticide regulatory agency.

a. Pesticide Preparation and Use.

During preparation, and/or application of pesticides, the Contractor shall:

(1) Always store pesticides in original containers having EPA-registered labels or in containers meeting EPA label requirements; and
(2) Use application equipment appropriate for the nature and size of work, that is clean, calibrated, and in proper operational condition; and
(3) Never leave equipment unattended during filling and application/usage; and
(4) Use back flow preventers on hoses when connected to water outlets in filling operations, and
(5) Inspect equipment (per manufacturer's label) and the area during application to insure proper and safe treatment; and
(6) Keep safety equipment and spill kit available on site when pesticides are present.

b. Pesticide Mixing.

The Lessee shall mix pesticides on a portable containment device. The device shall be capable of containing 110% of capacity.

c. Storage of Pesticides.

No pesticides shall be stored at the site. Any pesticide container and/or application tank shall be secured against theft and vandalism when the site is unattended during the day. Only those pesticides expected to be used that day should be imported to the site.

d. Pesticide Disposal.

The Lessee shall not dispose of any pesticides, pesticide containers, pesticide residue, pesticide rinse water, or any pesticide contaminated articles on government property.

e. Spill Management.

A pesticide spill containment kit shall be available on site if pesticides are being applied. Follow the requirements that are written in the Armed Forces Pest Management Board Technical Guide 15 that is attached to this plan.

f. **Safety Equipment.**

When pesticides are being mixed or applied, a portable eyewash station and at least 2 gallons of fresh water (in plastic jugs marked "emergency wash water") shall be within 25 feet of the operation.

g. Pesticide Spills and Decontamination.

The Lessee is responsible for properly cleaning, decontaminating, and reporting pesticide spills to the Agricultural Lease Manager, Bryan Alexander 757-341-1656.

h. Pesticide Dispersal Equipment Markings.

All pesticide dispersal equipment shall be clearly and plainly marked with "DANGER"..."PESTICIDES".

4. SPECIFIC PESTICIDE USE PROVISIONS

a. The Lessee shall coordinate, 72 hours in advance, with the Agricultural Lease Manager, Bryan Alexander, that pesticide(s) and/or application equipment will be brought onto the site.

b. All application of pesticides shall conform to the Worker Protection Standards CFR 170 as amended.

c. All pesticide applications shall conform to all label and supplemental labeling of the pesticide product.

d. All applicable laws and regulations regarding notification and posting shall be strictly adhered to.

e. Pesticides shall not be mixed or sprayed within the well buffer area identified in Attachment 1.

5. HERBICIDE REQUIREMENTS

Only glyphosate herbicides may be used for non-selective vegetation management. Paraquat use is not permitted. Simizine or any simizine family herbicide use is not permitted. Selective herbicides may be approved for use. If lessee is growing cotton specialty defoliant herbicides will be authorized through the normal approval process.

REPORTING REQUIREMENTS

Item # Description	Submit To	Date Required
1. Request pesticide additions through NOPRS	Submit online at https://noprs.pestlogics.com/	
2. Submit copies of current State Certification For all employees that will be applying pesticides, Including those of contract Commercial Applicators 30 days after award of lease. Include copies of proof of insurance by Commercial Applicator. .	Bryan Alexander, NAVFAC Mid-Atlantic Agricultural Lease Manager	
3. Submit Soil Test and Nutrient management plan 90 days after award of lease	Bryan Alexander, NAVFAC Mid-Atlantic Agricultural Lease Manager	
4. Report pesticide use in NOPRS annually Including negative reports	Submit online at https://noprs.pestlogics.com/	
5. Report Pesticide Spill immediately	NSA HR-NWA Natural Resources Specialist Emergency Communication Center	
6. Approval of Aerial Pesticide application 72 hours prior	Bryan Alexander, NAVFAC Mid-Atlantic Agricultural Lease Manager Taylor Austin, NSA HR-NWA Natural Resources Manager	

Submit all pesticide approvals in the NAVFAC Online Pesticide Reporting System:
https://noprs.pestlogics.com/
Contact Christopher Martin @ 757-322-4611 for assistance setting up a NOPRS account.

Project Number	Project Title	Description	ERL	Version	Progress Code	Guidebook	SIC	Fund Code	Process Step	Process Step Date
4275ANR201	1 S MA NSA HR - Threatened & Endangered Species Surveys (Various Species)	Conduct Presence/Absence Inventory of Federal and State Threatened and Endangered Species, Species At Risk (SAR), Birds of Conservation Concern (BCC), and Vegetation Communities of Concern.	4	N45 POM-22 Final/POM-23 Baseline	Non-Annual Recurring	12104	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 15:57
4275ANR202	CWA MA NSA HR - Wetland Mapping Inventory	conduct baseline wetland delineations and re-evaluation at all installations under NSA HR. Re-evaluation includes verification of previous inventory boundaries and updating the boundaries as necessary to reflect changes in the wetland property boundaries.	4	N45 POM-22 Final/POM-23 Baseline	Non-Annual Recurring	12105	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 15:58
4275ANR204	MBTA MA NSA HR - Migratory & Breeding Bird Surveys	Conduct migratory and breeding bird surveys to establish bird population, activity (Feeding, Breeding, Stop-over, Flight Pattern, etc.), frequency and habitat utilization data, which may include MAPS (which may be completed via CESU).	4	N45 POM-22 Final/POM-23 Baseline	Non-Annual Recurring	12101	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 15:58
4275ANR205	4 SAR MA NSA HR - Species and Habitat of Concern Protection	Implement various habitat enhancement and restoration projects in support of Species of Concern and Habitats of Concern in accordance with the resource's management plan.	4	N45 POM-22 Final/POM-23 Baseline	Recurring	12104	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 15:59

4275ANR206	SWCA MA NSA NWA - Forest Management	conduct an inventory and assessment of urban, natural, and timber harvest forest conditions every 5 - 10 years or sooner as deemed necessary due to major land or mission changes.	4	N45 POM-22 Final/POM-23 Baseline	Recurring	12108	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 15:59
4275ANR209	SWCA MA NSA HR -Soil & Water Conservation	Conduct base wide erosion and sediment control assessment as deemed necessary due to major land or mission changes. Identify areas in need of repair due to erosion. Identify causes for the erosion. Stop and repair the erosion problems.	4	N45 POM-22 Final/POM-23 Baseline	Non-Annual Recurring	12107	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 16:00
4275ANR211	SIKES MA NSA HR - Vegetation Classification Mapping	Produce and update Vegetation Community Classification Landcover surveys for NSA Hampton Roads installations	4	N45 POM-22 Final/POM-23 Baseline	Non-Annual Recurring	12101	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 16:01
4275ANR216	SWCA MA NSA HR â€“ Habitat Management	Habitat management areas require active habitat manipulation efforts in order to sustain biodiversity, protect at risk species, and meet military training needs.	4	N45 POM-22 Final/POM-23 Baseline	Non-Annual Recurring	12107	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 16:01
4275ANR218	EO 13751 MA NSA HR - Invasive Species	Develop an invasive species assessment and management plan (to be updated every 5 years); remove/control invasive species (as plan recommends upon approval), and conduct pre, during and post invasive species control monitoring (annually, contract/agreement awarded every 3 years).	4	N45 POM-22 Final/POM-23 Baseline	Recurring	12106	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 16:02

4275ANR219	SIKES MA NSA HR - Wildlife Emergency Response	Purchase of wildlife control equipment and supplies to support emergency wildlife calls supported by the Base Natural Resources Program Staff.	4	N45 POM-22 Final/POM-23 Baseline	Recurring	12999	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 16:03
4275ANR220	SIKES MA NSA NWA â€“ Nuisance Wildlife Inventory, Assessment & Removal	Develop a nuisance wildlife assessment and management plan (revised every 5 years); remove nuisance wildlife, and conduct pre, during and post nuisance wildlife removal effort monitoring (annually).	4	N45 POM-22 Final/POM-23 Baseline	Recurring	12101	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 16:03
4275ANR221	MSFCA MA NSA HR - Fisheries, Ditches & Streams	Conduct an inventory and assessment of ditch, stream, pond, and lake functions (this includes wildlife that live in and contribute to the functionality of the water resource, i.e. fish population assessments) and hydrology. Develop a Habitat enhancement plan for these water resources.	4	N45 POM-22 Final/POM-23 Baseline	Recurring	12101	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 16:04
4275ANR222	Sikes MA NSA HR - Outdoor Recreation Program Requirements	Maintain hunting, fishing, and nature: trails; boardwalks; fishing stations picnic shelters; ranges; elevated shooting stands/platforms; check-station; walk-in cooler; freezer; electronic permit sales; and brochures (i.e. mass production of rules & regulations pamphlets, maps, archery training materials, permits, etc.)	4	N45 POM-22 Final/POM-23 Baseline	Recurring	12109	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 16:05

4275ANR223	SIKES MA NSA NWA - Equipment Storage Structures	Repair and maintain equipment storage structures (annually) to protect natural resource management equipment.	4	N45 POM-22 Final/POM-23 Baseline	Recurring	12999	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	4/30/2020 16:06
4275ANR226	CHS MA NSA HR - INRMP	Funds labor and equipment purchases required for the update and periodic revision of the INRMP.	4	N45 POM-22 Final/POM-23 Baseline	Recurring	12103	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	5/4/2020 7:42
4275ANR233	5 DL MA NSA HR Nesting Bald Eagle Surveys	Develop a Cooperative Ecosystems Studies Unit (CESU) Agreement to conduct Winter Eagle Nest Surveys and banding of fledgling eagles.	4	N45 POM-22 Final/POM-23 Baseline	Non-Annual Recurring	12104	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	5/4/2020 7:42
4275ANR234	1 S MA NSAHR NWA Listed and SAR Bat Species Surveys and Tracking	Conduct basewide monitoring/roost/hibernacula tracking/identification surveys for the Northern long-eared bat.	4	N45 POM-22 Final/POM-23 Baseline	Non-Annual Recurring	12104	CN	O&MN	CNO Senior Leadership Advisory Panel(SLAP) Review	5/4/2020 7:42
