NASO Forest Stand Stock Tables

Based on field reconnaisance 3/14 - 5/14

Volume units are:
- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft^3 of wood and bark in one cord

Weight units are:
- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

NASO Forest Stand Stock Tables

Based on field reconnaisance 3/14 - 5/14

Volume units are:
- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft^3 of wood and bark in one cord

Weight units are:
- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

NASO Forest Stand Stock Tables

Based on field reconnaisance 3/14 - 5/14

Volume units are:
- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft^3 of wood and bark in one cord

Weight units are:
- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

NASO Forest Stand Stock Tables

Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords: 80 ft^3 of wood and bark in one cord

Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

NASO Forest Stand Stock Tables

Based on field reconnaisance 3/14 - 5/14

Volume units are:
- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft^3 of wood and bark in one cord

Weight units are:
- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

NASO Forest Stand Stock Tables

Based on field reconnaisance 3/14 - 5/14

Volume units are:
- Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
- Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
- Hardwood and softwood pulpwood: Cords: 80 ft^3 of wood and bark in one cord

Weight units are:
- Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

Appendix K
NALFF Forest Stand Summary

Appendix K: NALFF Forest Stand Summary Table These tables summarize, at the stand level, basal area, and number of trees, volume, and weight by hardwood/softwood and product category (sawtimber, chip-n-saw, and pulpwood), and value, both per acre and for the entire installation. Additional variables describing the inherent productivity, character, and condition of the stand such as site index species, site index, growth, forest type, age, and size class are reported.

NALFF Forest Stand Summary Tables
Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, International ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords; 80 ft^3 of wood and bark in one cord
Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons.

QMD is quadratic mean diameter, the diameter of the tree of average basal area
Average height is Lorey's mean height (BA-weighted height), the arithmetic average of the trees selected by variable radius point sampling.
Site index values are all reported with base age of 50, and growth is calculated from ΔMean Stand Diameter, a method more robust than counting rings on individual trees.
Type-inventory is assigned on the basis of the majority of basal area; Pine: >=75% softwood BA; Pine-Hardwood: >=50 - <75% softwood BA;
Hardwood-Pine: >=25 - <50% softwood BA; Hardwood: <25% softwood BA.
Size class is assigned on the basis of majority basal area, and can take the values sawtimber, chip-n-saw, or pulpwood.

NALFF Forest Stand Summary Tables
Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, International ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords; 80 ft^3 of wood and bark in one cord
Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons.

QMD is quadratic mean diameter, the diameter of the tree of average basal area
Average height is Lorey's mean height (BA-weighted height), the arithmetic average of the trees selected by variable radius point sampling.
Site index values are all reported with base age of 50, and growth is calculated from ΔMean Stand Diameter, a method more robust than counting rings on individual trees.
Type-inventory is assigned on the basis of the majority of basal area; Pine: >=75% softwood BA; Pine-Hardwood: >=50 - <75% softwood BA;
Hardwood-Pine: >=25 - <50% softwood BA; Hardwood: <25% softwood BA.
Size class is assigned on the basis of majority basal area, and can take the values sawtimber, chip-n-saw, or pulpwood.

Appendix L
NALFF Statistical Summary Table

Appendix L: NALFF Timber Inventory Statistical Summary Table: This table provides sampling error for overall quadratic mean diameter, and basal area, volume, and weight for hardwoods, softwoods, and product categories (sawtimber, chip-n-saw, and pulpwood). Sampling error is reported as the 90% confidence limit half-width expressed as a percent of the mean, for each compartment, forest type, and installation. Installation sampling error is stratified based on forest type.

90% confidence limit half-width as percent of the mean for major timber category totals for 2014 forest inventory at NALFF. A value of zero indicates no trees of the category were sampled in the stratum.

Appendix M
NALFF Stock Tables

Appendix M-1: NALFF Forest Installation Stock Tables: These tables summarize at the installation level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2" dbh class, the mean number of trees per acre, mean basal area per acre (ft^2/ac), mean volume per acre (cords for pulp, board-feet Doyle log rule for hardwood sawlog volume, or board-feet Int'l ¼-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood & bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. Installation means and totals are based on stratification by forest type and so vary from totals aggregated from compartment sub-totals. Total installation area is 1,053.44 acres. Null (blank) entries in the table indicate no trees were sampled of that particular combination of dbh and stock class.

NALFF Forest Installation Stock Tables
Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords: 80 ft^3 of wood and bark in one cord

Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

Appendix M-2: NALFF Forest Compartment Stock Tables: These tables summarize at the compartment level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2" dbh class, the mean number of trees per acre, mean basal area per acre (ft^2/ac), mean volume per acre (cords for pulp, mean board-feet Doyle log rule for hardwood sawlog volume, or board-feet Int'l ¼-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood & bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. The total area of the compartment is also provided. No stratification is performed to arrive at means and totals at this hierarchical level. Null (blank) entries in the table indicate no trees were sampled of that particular combination of dbh and stock class. Compartment designations were retained from the prior inventory, if present (which it was for NALFF), and compartment designations were not updated as part of the 2014 inventory. As such, there is a single compartment at NALFF.

Appendix M-3: NALFF Forest Type Stock Tables: These tables summarize at the forest type level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2" dbh class, the mean number of trees per acre, mean basal area per acre (ft^2/ac), mean volume per acre (cords for pulp, board-feet Doyle log rule for hardwood sawlog volume, or board-feet Int'l ¼-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood & bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. The total area of the type contained in the installation is also provided. Null (blank) entries in the table indicate no trees were sampled of that particular combination of dbh and stock class.

NALFF Forest Type Stock Tables
Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords; 80 ft^3 of wood and bark in one cord

Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

NALFF Forest Type Stock Tables
Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords; 80 ft^3 of wood and bark in one cord

Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

NALFF Forest Type Stock Tables
Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords; 80 ft^3 of wood and bark in one cord

Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

Appendix M-4: NALFF Forest Stand Stock Tables: These tables summarize at the forest stand level, for each stock class (hardwood pulpwood, softwood pulpwood, chip-n-saw, and sawtimber by species) and 2" dbh class, the mean number of trees per acre, basal area per acre (ft^2/ac), mean volume per acre (cords for pulp, board-feet Doyle log rule for hardwood sawlog volume, or board-feet Int'l ¼-inch log rule for softwood sawlog and chip-n-saw volume), and mean weight per acre (short tons, green volume basis, wood & bark in merchandised portion of tree); as well as the total number of trees and total weight using the above units, and total value. The total area of the stand is also provided. Null (blank) entries in the table indicate no trees were sampled of that particular combination of dbh and stock class.

NALFF Forest Stand Stock Tables
Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords; 80 ft^3 of wood and bark in one cord

Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

NALFF Forest Stand Stock Tables
Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords; 80 ft^3 of wood and bark in one cord

Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

NALFF Forest Stand Stock Tables
Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords; 80 ft^3 of wood and bark in one cord

Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

NALFF Forest Stand Stock Tables
Based on field reconnaisance 3/14 - 5/14

Volume units are:
·Hardwood sawtimber: Board-feet, Doyle log rule (form class 78)
·Softwood sawtimber and chip-n-saw: Board-feet, Int'l ¼ inch log rule (form class 80)
·Hardwood and softwood pulpwood: Cords; 80 ft^3 of wood and bark in one cord

Weight units are:
·Tons, equivalent to the cubic volume of wood and bark in the merchandised portion of the tree, converted to green weight in tons

EXECUTIVE SUMMARY

This Project assessed the current condition of selected streams and ponds at Naval Air Station Oceana (NASO). The pond assessments included seasonal boat electrofishing surveys, water quality, shoreline habitat, and fish habitat improvements. The stream assessments included seasonal backpack electrofishing surveys, evaluating the current suitability of habitat (e.g., fish passage) and the potential for enhancements to habitat accessibility.

These data will be used to supplement the existing data and used in current and future environmental planning and management at NASO. Additionally, these data were analyzed to develop improvement recommendations to habitat as well as fish populations, which are presented in this report. Survey biologists used a modified version of the U.S. Environmental Protection Agency's (EPA) Rapid Bioassessment Protocols (RBP) for fish to collect a representative sample of the fish assemblage from the appropriate habitat composition in NASO ponds and streams (Barbour et al. 1999). Field crews used the Habitat Assessment Field Data Sheets for Low Gradient Streams, as provided in Barbour et al. (1999). The RBP protocols are included as Appendix D to this report. A "score" was assigned to each of these categories for each surveyed reach so that relative comparisons can be made between reaches and streams. Qualitative habitat surveys were also used to assess pond habitat quality. Additionally, a barrier survey using a combination of assessment protocols was used to identify potential impediments to fish migration within NASO streams. Water quality was recorded *in situ* at every stream and pond during each sampling event, using a hand held multi-parameter meter. Additionally, water grab samples were obtained with a horizontal water sampler in ponds and submitted for laboratory analyses.

In accordance with EPA RBP standards, NASO streams all fell within marginal and suboptimal categories for habitat quality. Fish surveys at NASO steams yielded fish assemblages typical of degraded, channelized coastal plain steams. NASO streams yielded 1,350 individual fishes represented by 22 species. Notably, migratory species were present in NASO waterbodies (gizzard shad and American eel). Barrier survey data recorded both potential and apparent impediments to fish migration through the NASO Installation. These data show that NASO streams offer little to no recreational value and periodic monitoring and repair of some culverts is necessary. NASO ponds offered suitable habitat to support healthy fish communities and a recreational fishery. NASO-P1 and NASO-P2 both can support healthy fish assemblages and recreational fisheries. Pond fish survey results yielded 1,167 individual fish represented by 10 species.

1 INTRODUCTION

1.1 OBJECTIVES

The purpose of this survey was to assess the current condition of the biological resources and habitats of select streams and ponds at Naval Air Station Oceana (NASO). The stream assessment included seasonal backpack electrofishing surveys, habitat and water quality measurements, and the characterization of physical barriers to migratory fishes, especially American eel (*Anguilla rostrata*) and alosines, including alewife (*Alosa pseudoharengus*), blueback herring (*A. aestivalis*), American shad (*A. sapidissima*), and hickory shad (*A. mediocris*). The pond assessment included seasonal electrofishing surveys, shoreline habitat, and water quality measurements.

The results of this survey and assessment will be used to supplement the existing data and be incorporated into current and future environmental planning documents, such as the Integrated Natural Resources Management Plans (INRMP) or Environmental Assessments (EA) at NASO.

1.2 SITE DESCRIPTION

Naval Air Station Oceana (NASO) is located in the southeastern portion of the City of Virginia Beach, Virginia (Figure 1) and encompasses 5,846 acres (ac) (2,366 hectares [ha]). The Installation is bound by the Norfolk and Southern Railroad to the north, Oceana Boulevard to the east, Harper's Road to the south, and London Bridge Road to the west. Several additional parcels lie north of the railroad tracks and east of Oceana Boulevard. A detailed description of the site's current and historical operations and land use can be found in the facility's Final INRMP (Navy 2014).

Surface waters at NASO are limited to mostly drainage ditches, channelized streams, and several small ponds. The ponds of NASO were formed as a result of borrow pit excavations including the 2-ac (1-ha) Concrete Dump Pond, which is located north of the airfield across London Bridge Road; the 9-ac (4-ha) Oceana Pond, which is located just east of Oceana Boulevard; two small ponds located in the VACAPES area that have a combined area of 3.5 ac (1.4 ha); two small ponds adjacent to Building 78 (Natural Resources Center [NRC]); the Aeropines Mitigation Site and Stormwater Retention Pond (between the weapons compound and the Golf Course); several stormwater retention ponds across the Installation; and numerous small golf course ponds. The eastern parcel abuts Owl's Creek, which includes two small ephemeral streams draining into Rudee Inlet and the Atlantic Ocean. The Virginia Aquarium is adjacent to this parcel, and has been collecting water quality data in the estuarine portion of Owl's Creek since 1998.

1.3 FISHERIES MANAGEMENT

Previous fish surveys at NASO have documented several species of fish that were either intentionally stocked or released into the ponds by fishermen. Largemouth bass, bluegill, redear sunfish (*Lepomis microlophus*), and channel catfish (*Ictalurus punctatus*) were stocked to provide recreational fishing opportunities. Other species collected during previous fisheries surveys are listed in Table 1.

NASO is primarily a landlocked installation, therefore the ichthyofauna is largely comprised of freshwater species; however, Owl's Creek, a small tidal estuary that empties into the Atlantic Ocean through Rudee Inlet is used as a nursery area by marine and estuarine fish species. The current study focused on the freshwater streams and ponds at NASO. Therefore only freshwater and migratory (i.e., anadromous and catadromous) fishes are discussed. The drainage ditches and channelized streams that occur at NASO provide habitat that supports a limited diversity of fish, though (Navy 2008). The eastern mosquitofish (*Gambusia holbrooki*) is found in these types of habitats at NASO. The ponds at NASO support several species of fish that were either intentionally stocked or released by fishermen. Largemouth bass (*Micropterus salmoides*), bluegill (*Lepomis macrochirus*), redear sunfish (*Lepomis microlophus*), and channel catfish (*Ictalurus punctatus*) were stocked to provide recreational fishing opportunities.

Table 1: Historical Fish Species Observed at Naval Air Station Oceana

Date of Observation	Common Name	Species	Abundance	Length (mm)	Weight (g)
2012 Oceana Pond[1]	Black crappie	*Pomoxis nigromaculatus*	5	89–116	9–18
	Bluegill	*Lepomis macrochirus*	28	38–184	4–113
	Redear sunfish	*Lepomis microlophus*	16	144–223	49–72
	Warmouth	*Lepomis gulosus*	1	120	31
	Largemouth bass	*Micropterus salmoides*	13	93–410	12–1004
	Yellow perch	*Perca flavescens*	3	98–177	10–53
1994 Oceana Pond[2]	Bluegill	*Lepomis macrochirus*	74	102*	19*
	Black Crappie	*Pomoxis nigromaculatus*	2	134*	25*
	Largemouth bass	*Micropterus salmoides*	24	258*	396*
	Redear sunfish	*Lepomis microlophus*	16	105*	24*
	Pumpkinseed	*Lepomis gibbosus*	1	104*	17*
	Channel catfish	*Ictalurus punctatus*	1	225*	90*
1989 Borrow Pond[3]	Largemouth bass	*Micropterus salmoides*	14	163–430	61–1080
	Redear sunfish	*Lepomis microlophus*	17	98–218	18–120
	Bluegill	*Lepomis macrochirus*	77	100–149	19–56
	White perch	*Lepomis microlophus*	1	284	294
	Golden shiner	*Notemigonus crysoleucas*	1	240	145
	Common carp	*Cyprinus carpio*	1	730	4950
1990 Concrete Dump Pond[3]	Largemouth bass	*Micropterus salmoides*	25	80–390	8–800
	Bluegill	*Lepomis macrochirus*	55	129–178	37–97

* Average across survey(s)

No rare, threatened, or endangered fish species listed under the federal Endangered Species Act (ESA) have been identified at the Installation; however, blueback herring (*Alosa aestivalis*) and American eel (*Anguilla rostrata*) have been petitioned for listing with ranges that overlap NASO. American eel has been identified on the NASO Installation (Navy 2008). A 2013 status review by the National Marine Fisheries Service (NMFS) of blueback herring found that a listing under the ESA was not warranted (78 FR 48943-48994), however this determination continues to be controversial and could be revisited by regulators and petitioners. The American eel was petitioned for listing under the ESA in 2010. In 2011, the U.S. Fish and Wildlife Service (USFWS) issued a finding that listing of the species may be warranted, and initiated a status review (76 FR 60431-60444), which has not yet been completed.

Oceana Pond at NASO has been managed as a recreational fishery to varying degrees since the early 1990s (Navy 2014). In the early 1990s, 2,000 fingerling channel catfish, 150 trophy-sized largemouth bass (up to 6 lb. [3 kg]) and 50 channel catfish (up to 14 lb. [6 kg]) were stocked for a catch-and-release tournament. Active management at Oceana Pond includes periodic fish stocking; maintaining boat ramp; patrolling to ensure that recreational fishers have the appropriate permits; and conducting surveys of fish populations. Previous biological surveys indicate that the Installation supports a diverse warmwater fish population with excellent size classes of largemouth bass and good water quality. Fishing is a relatively popular outdoor recreation at NASO with an average of 123 fishing permits being sold annually by the Navy's Morale, Welfare & Recreation (MWR) division (Navy 2008). Portions of the streams and ponds at NASO are impaired for recreation and aquatic life use due to reported *Enterococcus* bacteria concentrations and low dissolved oxygen concentrations (VDEQ 2012). Recommendations for the management of fish resources, such as conservation of fish diversity, cooperation with state and federal agencies, and regular monitoring of natural resources, have been included in the most recent INRMP from 2014 (Navy 2014). The Navy also supports the protection of watersheds through initiatives such as establishing or enhancing riparian forest buffers along unprotected waterways.

2 ASSESSMENT METHODS

The purpose of this study was to perform fish community assessments on targeted streams and ponds located at NASO. An additional goal was to qualitatively characterize habitat and identify barriers to fish movement that may affect anadromous and catadromous species by performing a walk-over survey of the streams. In total, seven streams and two ponds were surveyed on a seasonal basis (spring, early summer, late summer, and fall); habitat and barrier surveys were conducted once. The resulting data and analyses presented here will help characterize existing fish populations and habitat within these Installations; this characterization will aid in ensuring compliance with applicable federal, state, and local statutes and regulations, and with Department of Defense (DOD) policies, instructions, and guidance.

2.1 WATERBODY SELECTION

Geographic Information System (GIS) layers were used to identify all freshwater stream reaches and ponds within the NASO boundaries. Identified waterbodies were cross-referenced with the U.S. Geological Survey (USGS) stream layer and the surface water course centerlines layer to focus only on freshwater streams (no marine or estuarine areas). A list of streams and ponds were selected during a site visit on 19 September 2013, based on data needs, accessibility, and scoping requirements. The streams and ponds listed in Table 2 represent those selected for evaluation during this survey (Figure 2).

Table 2: Streams and Ponds Surveyed at Naval Air Station Oceana

Waterbody type	Site ID	Name	Location and description
Streams	NASO-S1	Unnamed	Near VACAPES Pond, running parallel to northeast portion of runway; intermittent flow
	NASO-S2	Unnamed	Drains into residential area off of London Bridge Rd. northwest portion of runway; intermittent flow
	NASO-S3	Unnamed	Drains southwest portion of runway towards London Bridge Rd.; intermittent flow
	NASO-S4	Unnamed	Tributary of Golf Course Stream, east of Hornet Dr.
	NASO-S5	Unnamed	Tributary of Golf Course Stream, east of Hornet Dr.
	NASO-S6	Golf Course Stream	Lower Reach – below mitigation site; perennial flow
	NASO-S7	Golf Course Stream	Upper Reach – above mitigation site; perennial flow
Ponds	NASO-P1	Oceana Pond	East of Oceana Blvd.
	NASO-P2	VACAPES Pond	Off of Bells Rd. Gate

For consistency throughout this report, the streams (S1 to S7) and ponds (Oceana Pond [P1], VACAPES Pond [P2]) surveyed will be referred to by their assigned numbers, as shown in Table 2.

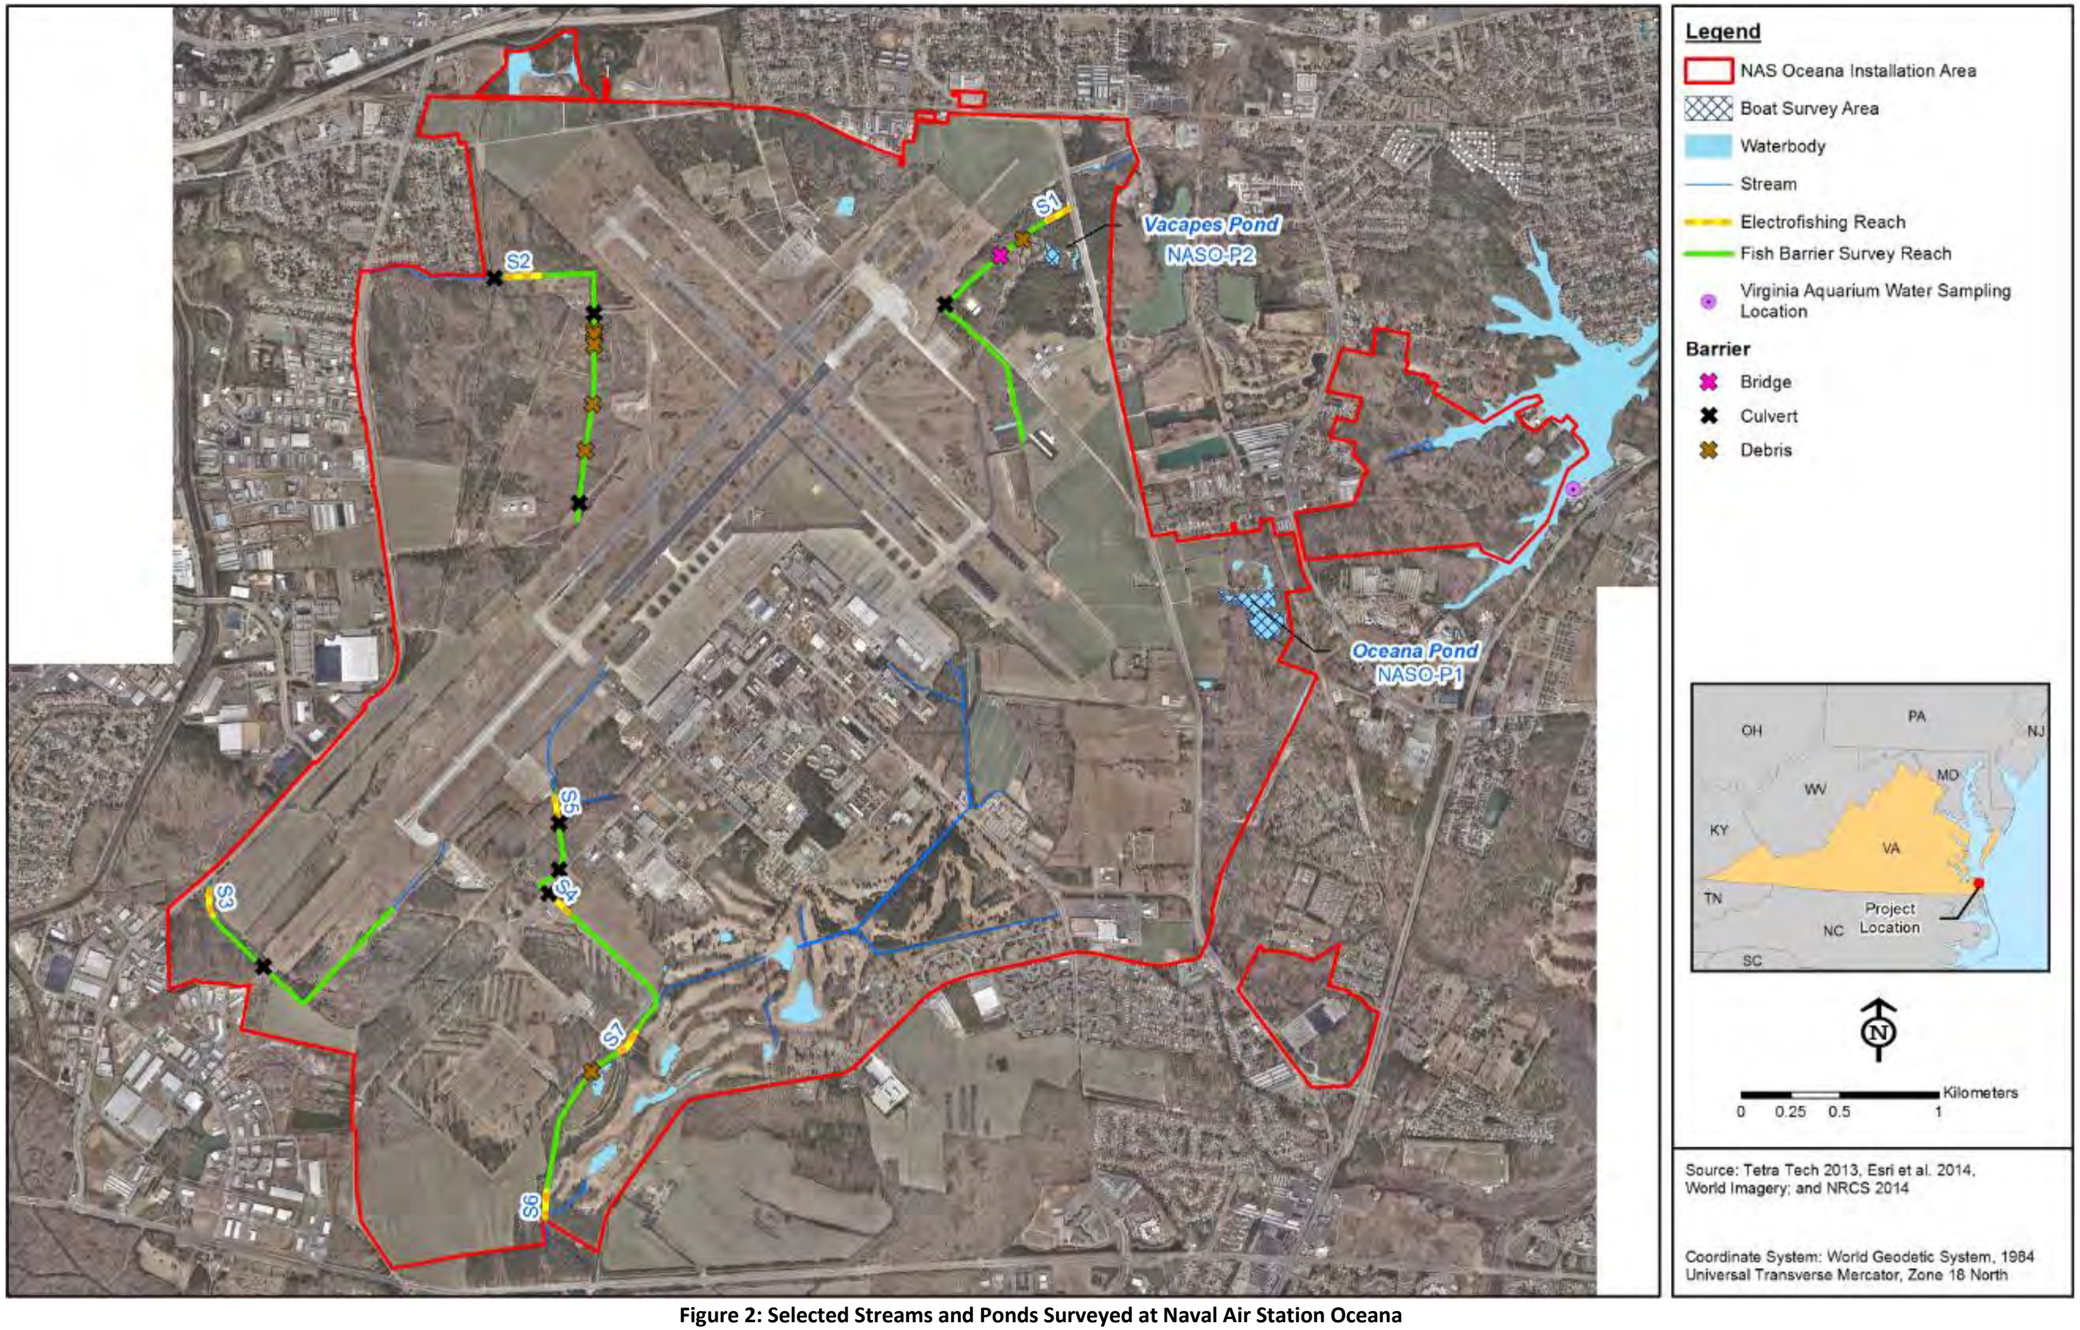

Figure 2: Selected Streams and Ponds Surveyed at Naval Air Station Oceana

This page intentionally left blank.

2.2 STREAMS

The stream survey methods consisted of a biological (fish) and physical habitat assessment, as modified from the U.S. Environmental Protection Agency's (EPA) Rapid Bioassessment Protocols (RBP) developed by Barbour et al. (1999) (Appendix D). Fish surveys at all stream locations used backpack electrofishing methods in accordance with the modified RBP. The one-time habitat assessment used visual-based observations to quantify the conditions of the habitat. Water quality was collected seasonally.

2.2.1 HABITAT SURVEY

Most of the stream habitat assessment parameters are based on physical characteristics; therefore, the habitat characterization was conducted as a "one-time" characterization for each stream reach. Other parameters, such as water quality (*in-situ* and grab samples), flow, channel depth, wetted channel width, etc. are dynamic and were recorded during each visit.

The RBP habitat survey was performed once on each stream reach that was also sampled for the fish assessment by a small field team during a walk-over survey. Tetra Tech biologists attempted to walk the wadeable portions of each stream, ensuring that the 150-m survey reaches would capture a representative sample of stream features (e.g., riffles, runs, pools). Where applicable, natural fish barriers or habitat breaks were used to delineate the start or end of a reach.

For this study, Tetra Tech used the Habitat Assessment Field Data Sheets for Low Gradient Streams, as provided in Barbour et al. (1999) (see Appendix B for blank data sheets). A "score" was assigned to each of these categories for each surveyed reach (NASO-1 to NASO-7) so that relative comparisons can be made between reaches and streams (Table 3). Further detail on scoring and criteria used can be found in Barbour et al. 1999.

By assigning a score and condition category to the ten visual-based habitat assessment parameters described in Table 3, a stream can be assessed and given a total score related to its condition. Scores ranging from 0 to 20 were assigned to each of the ten visual-based habitat assessment parameters, with 0 being a "poor" score and 20 being an "optimal" score. After scoring all parameters, a final score was determined for each reach. The final score can range from 0 to 200 with a score of 0 to 59 representing a "poor" condition; 60 to 112 representing a "marginal" condition; 113 to 165 representing a "suboptimal" condition; and 166 to 200 representing an "optimal" condition. This rapid, qualitative physical habitat assessment was conducted at each NASO stream reach that was also assessed for fish populations. Water quality sampling methods were similar between streams and ponds, and are therefore described in Section 2.3.2.

Table 3 : Rapid Bioassessment Protocol (RBP) Parameters

RBP habitat parameter	Components analyzed in this survey
Physical characterization (one-time)	• Riparian and watershed land use • Stream origin and type • Riparian/canopy vegetation features • Instream parameters – channel width, depth, relative flow, high water mark, and substrate • Proportion of riffles, runs, and pools • Degree of channelization • Potential fish barriers (not part of RBP, but included in this survey)

Water quality (each visit)	• *In situ* measurements, such as water temperature, dissolved oxygen, and conductivity were collected for each stream reach.
	• Grab samples were collected to measure a total of three parameters (listed below) for each stream reach:
	  ○ Total Nitrogen (TN)
	  ○ Total Phosphorus (TPhos) & ortho-Phosphate (SRP) – Method 365.1
	  ○ Total Suspended Solids (TSS) – Method SM 2340D

Habitat features (one-time)	• Large woody debris/debris dams • Aquatic vegetation • Available cover
Visual-based habitat assessment (low gradient streams) (one-time)	• Epifaunal substrate/available cover • Pool substrate characterization • Pool variability • Sediment deposition • Channel flow status • Channel alteration • Channel sinuosity • Bank stability • Bank vegetative protection • Riparian vegetative zone width

2.2.2 BARRIER SURVEY

A combination of assessment protocols was used to identify potential barriers to fish migration within NASO streams. Fish barrier surveys are typically implemented to assess the potential for habitat use by migratory fishes that may encounter obstacles in their migration, such as culverts, debris dams, beaver dams, or other physical blockages to migration. Additional data forms were included to facilitate the fish barrier survey as a supplement to the modified RBP survey. The fish barrier survey and accompanying data forms were adapted from a similar survey on the Rappahannock River (McIninch and Garman 2004, 1999), which were also applied to a stream habitat survey at NSA Northwest Annex (Tetra Tech and Stell 2014). Additional culvert and bridge data forms were adapted from the Vermont Agency of Natural Resources (2009). Copies of field data forms are included in Appendix C. During the modified RBP survey, each of the potential barriers to fish migration were inventoried for as much of a stream as possible, beyond the reaches assessed for habitat and fish. The entire stream was walked by two field scientists starting at the downstream end of each stream (at the installation boundary, or confluence

with another stream) and walking upstream until reaching an apparent habitat break or other boundary. Tetra Tech staff walked the entire wadeable length of each stream to the furthest extent practical to record and characterize potential barriers to fish migration. Each bridge or culvert crossing and other potential barrier (e.g., beaver dam or large debris dam) was inventoried during the survey and physical measurements of the barrier were obtained in accordance with the data sheet. Photographs were also taken for each potential barrier and included in the photograph log (Appendix A).

2.2.3 FISH SURVEY

Fish surveys were conducted at seven stream sites within NASO. The goal was to sample all seven sites during each sampling event, but high water conditions precluded the fish survey at NASO-S6 and NASO-S7 in April. The fish sampling methods were modified from the EPA's RBP for fish (Barbour et al. 1999). Field biologists used the 150 meters (m) fixed-distance sampling as outlined in the RBP to collect a representative sample of the fish assemblage from the appropriate habitat composition (e.g., riffles, runs, pools) (further details described in USEPA 2007). Where applicable, natural fish barriers or habitat breaks were used to delineate the start or end of a reach.

The downstream start point at each surveyed reach was marked with a temporary pin flag and recorded as a GPS point. A tape measure was used to delineate the 150-m reach of the stream. The upstream end of the reach was also marked with a temporary pin flag and a GPS point. Water quality measurements, including temperature, specific conductance, dissolved oxygen, and percent oxygen saturation, were obtained at the downstream start point of each surveyed reach.

A Smith-Root LR-24 backpack electrofishing unit was used for all stream sites. The LR-24 was calibrated through the "auto-setup" function; then settings such as voltage, frequency, and duty-cycle were fine-tuned according to water parameters to maximize the effectiveness of the electrofishing unit and safety of the fish and operator. A single-pass protocol was used. Backpack electrofishing protocols were consistent with those used by the U.S. Fish and Wildlife Service (USFWS 2010) and the American Fisheries Society (AFS 2008). The survey began at the downstream end of each reach at physical fish barriers to prevent fish escape, as recommended by the RBP protocol. The fish survey continued upstream in a bank-to-bank sweeping technique, covering all wadeable habitats within the reach. Effort was measured in duration (seconds) of active electrofishing, or "trigger" time. Variation between reaches is typical due to stream width, depth, and habitat types.

At the end of the reach, fish were identified and counted. A subsample of up to 30 specimens of each species were measured (total length [TL] to the nearest millimeter [mm]], mass in grams [g]), prior to being released back into the stream. All individuals were observed for any deformities, erosion, lesions, or tumors (DELT anomalies). All individuals were identified to lowest practicable taxonomic level in the field based on external characteristics using taxonomic keys, including "The Freshwater Fishes of Virginia" (Jenkins and Burkhead 1994). Page et al. (2013) was used to ensure accurate common and scientific fish names.

2.3 PONDS

Similar to streams, most of the pond habitat assessment parameters are based on physical characteristics; therefore the habitat characterization was conducted as a "one-time" characterization for each pond. Other parameters, such as water quality (*in-situ* and grab samples) and vegetation are dynamic and were recorded during each visit.

The methods used for pond surveys for this study consisted of a biological (fish) assessment, as well as a physical habitat assessment, within a similar framework as outlined above for streams.

2.3.1 HABITAT SURVEY

The pond habitat assessment at NASO included a site-walk (or by boat) around the perimeter of each pond to collect qualitative habitat data. Data sheets modified from the EPA National Lakes Assessment Program (USEPA 2012) were used to support the qualitative assessment of the ponds, by characterizing the shoreline/littoral zone, macrophytes, and water quality (see Appendix B). Table 4 lists the parameters included in the pond habitat assessment. These data were used to develop an overall assessment of fisheries habitat for the selected NASO ponds.

Table 4: Pond Habitat Survey Parameters

Pond habitat parameter	Components analyzed in this survey
Physical characterization (one-time)	• Shoreline and watershed land use • Pond origin and type • Inlet/outlet stream(s) • Shoreline vegetation features • Hydrology – depth, high water mark, modifications, and substrate • Shoreline stability/erosion

Water quality (seasonal)	• *In situ* measurements, such as water temperature, dissolved oxygen, and conductivity was collected from the middle, or deepest point, of each pond.
	• Grab samples were collected to measure a total of three parameters (listed below) for each stream reach:
	  ○ Total Nitrogen (TN)
	  ○ Total Phosphorus (TPhos) & ortho-Phosphate (SRP) – Method 365.1
	  ○ Total Suspended Solids (TSS) – Method SM 2340D

Habitat features (one-time)	• Aquatic vegetation • Available cover

2.3.2 WATER QUALITY

Water quality was recorded *in situ* at every stream and pond during each sampling event, using a hand held multi-parameter meter (YSI 556). Parameters measured included water temperature (degrees Celsius [°C]), dissolved oxygen (milligrams per liter [mg/L] and percent [%] saturation), pH, and conductivity (milliSiemens per centimeter [mS/cm]).

Additionally, water grab samples were obtained with a horizontal water sampler in ponds and submitted for laboratory analyses at TestAmerica Laboratories Inc. in Savannah, GA. Laboratory analysis measured total nitrogen (TN), total phosphorus (TPhos), ortho-phosphate (SRP), and total suspended solids (TSS). TN was measured using EPA Method 351.2, as well as a calculated method. TPhos was analyzed in accordance with EPA Method 365.4. SRP analysis used EPA Method 365.1. TSS was measured using SM 2540D.

2.3.3 FISH SURVEY

Fish surveys at all pond locations used boat electrofishing, with hook-and-line as a back-up option. Both NASO-P1 and NASO-P2 were most effectively sampled by electrofishing boat, which occurred April/May, June, August, and October.

A 12-ft. jon-boat equipped with a Smith-Root 1.5 KVA pulse box electrofishing unit was used to sample fish inhabiting these ponds. In general, boat electrofishing protocols were consistent with those used by the USFWS (USFWS 2010) and the American Fisheries Society (AFS 2008). Boat electrofishing occurred in and along littoral habitats, targeting structure and beds of submerged aquatic vegetation. Stunned fish were captured and stored in a livewell until they were processed at the end of the survey.

Qualitative hook-and-line methods were also used to provide supplementary qualitative data for sportfish populations; therefore, these methods included gear and level of effort typically used by recreational fishers. Hook and line surveys were performed in the West Concrete Dump Pond and East Concrete Dump Pond on 14 August and 02 October during the 2014 sampling efforts. Each hook and line survey was conducted for 45 minutes.

At the end of each survey (for each method), fish were identified and counted. A subsample of up to 25 specimens of each species were measured (TL to the nearest mm), prior to being released back into the pond. All individuals were observed for any deformities, erosion, lesions, or tumors (DELT anomalies). All individuals were identified to lowest practicable taxonomic level in the field using the same resources as described for streams in Section 2.2.3.

2.4 DATA ANALYSIS

Field data were transferred from field data sheets to a Microsoft Excel spreadsheet. Metrics calculated from the data included catch per unit effort (CPUE) and a species diversity index. CPUE allows for a standardization of the fishing effort across streams, which enables comparisons where effort was not consistent. CPUE was calculated by dividing the total number of fish collected at each stream by the total sampling time (in seconds) of each stream. Species richness, commonly denoted as *R*, is simply the number of different species present in the dataset. A diversity index allows for comparisons of species diversity among multiple locations (streams in this case). The Simpson index (λ) measures the degree of concentration and is calculated by:

$$\lambda = \sum_{i=1}^{R} {p_i}^2$$

where p_i is the proportional abundance of each species within each sampling reach (number of individuals of species *i*, divided by the total number of individuals [*n*] in each sampling reach) and *R* is species richness. Values of λ range from 0 to 1, with lower values representing higher diversity. Another diversity parameter that is often used is the Shannon-Wiener diversity index (*H'*), which is calculated by using the proportional abundance of each species observed in the sample, as follows:

$$H' = -\sum_{i=1}^{R} p_i \cdot \ln p_i$$

In this equation, p_i is again the proportional abundance of each species and *R* is species richness. The resulting *H'* values are the Shannon-Wiener diversity index values for each sampling reach, with higher values corresponding to greater diversity.

3 RESULTS

In general, fish surveys encountered a wide range of species, with 22 species captured in the NASO streams and 10 species in the NASO ponds. NASO stream surveys captured over 1,300 individual fishes with the most abundant species being pirate perch, eastern mosquitofish, and bluegill, respectively. The average time spent electrofishing the NASO streams was 1,536 seconds. NASO ponds yielded similar total abundance as NASO streams with over 1,100 individual fishes captured during the pond electrofishing efforts. The most abundant species were the recreationally important bluegill, largemouth bass, and American eel in order of abundance. The average time spent electrofishing the NASO ponds was 3,470 seconds. All fishes collected from the NASO stream and pond sampling efforts are shown in Table 5.

Table 5: All Fishes Collected from the 2014 NASO Stream and Pond Sampling

Common Name	Species	*NASO*	
		Streams	Ponds
American Eel	*Anguilla rostrata*	●	●
Banded Sunfish	*Enneacanthus obesus*	●	
Black Bullhead	*Ameiurus melas*	●

3.1 STREAMS

3.1.1 HABITAT

The habitat and barrier surveys were conducted across two survey events from 29–30 April and 03–04 June 2014, with NASO-S1 through -S5 surveyed during the April event and NASO-S6 and S7 surveyed during the June survey event. All of the reaches were 150 m in length. The reach locations are shown in Figure 2. Table 6 highlights the physical characteristics of the stream, with full results of the habitat survey and RBP assessment provided in Appendix C.

Overall, the NASO streams were mostly perennial, originating as runway drainage. Only S3 exhibited ephemeral characteristics, with a dry stream channel noted in June (See Photo 00087, Appendix A). They were most often highly channelized and surrounded by forest, open field, and military lands, with trees providing partial to full shade. Nearly all of the banks were stable with minimal erosion or scouring within the surveyed reach. None of the surveyed reaches showed signs of non-point source pollution, or irregular odors or oils in the water and sediment. However, areas of fine-grained sedimentation in the stream channel were prevalent in S7 (see photo DSCF0149, Appendix A), suggesting an upstream or riparian source of erosion/sediment transport.

The results of the physical habitat surveys of NASO streams showed that they are highly disturbed and do not offer optimal habitat for aquatic organisms (Table 7). Most of the surveyed stream reaches fell within the "marginal" category, with the exception of NASO-S1 and S3, which were characterized as better "suboptimal" habitat. Most streams lacked suitable pool habitat, greatly limiting sufficient habitat variability throughout the surveyed streams. Channel sinuosity was a second parameter that most surveyed reaches lacked because of the channelization of each stream section. This also contributes to the lack of pool habitat throughout most reaches as well. Generally, NASO streams scored well on bank stability, falling within the "optimal" and "suboptimal" categories; although NASO-S6 scored in the "marginal" category (Table 7). Fish barriers are presented in Table 8.

NASO-S1. This reach averaged 6.6 m wide, and ranged from 0.1 to 0.6 m deep and was highly channelized. This reach was a drainage channel for the runway, and was surrounded by forest, field, military, and commercial use. The dominant riparian vegetation was a mix of scrub oak and pine, which provided a shaded canopy. The morphological stream types that comprised the reach were: 90% run, 5% riffle, and 5% pool. The water at NASO-S1 was opaque with very little rooted submergent vegetation throughout the reach. The bottom was soft and mostly consisted of silt (60%) and sand (30%), with some clay. Abundant organic detritus and muck-mud were present. NASO-S1 scored a 122 based on the RBP, which is considered "suboptimal."

The NASO-S1 barrier survey reach covered from Oceana Boulevard up to the road crossing/culvert near the VACAPES facility. There were three potential fish passage barriers encountered: a debris dam, a bridge, and a culvert; all had medium to high potential for fish passage. Debris dam #1, composed of leaf litter and small woody debris, had a medium likelihood of passage (Photo DSCF0040). Bridge #1 had a high likelihood of fish passage, due to its high clearance and lack of blockage (Photo DSCF0058). Culvert #1 also had a high potential for passage, because the concrete structure was at grade and was not obscured up or downstream (Photo DSCF0051). An additional three partial debris dams (not blocking the channel width) were observed within the surveyed reach.

NASO-S2. Similar to the S1 reach, S2 was also highly channelized and drained storm water from the runway. It was between 4 and 5 m wide, and 0.3 to 1.0 m deep, surrounded by forest and military uses.

Mixed hardwoods provided shade to most of the reach, which was dominated by runs (95%) with some pools (5%). The water at NASO-S2 was mostly clear to slightly turbid with no aquatic vegetation present. The bottom consisted almost entirely of sand (90%) with small portions of detritus and muck-mud present throughout the reach. With an RBP score of 91, this section was considered "marginal."

The NASO-S2 barrier survey covered from the western perimeter fence at the culvert beneath Sludge Rd., where "Boom 5" was deployed to prevent debris from clogging the culvert that drains this stream outside of the installation. There were nine potential fish passage barriers encountered: four culverts and five debris dams. Four of the barriers had no potential for fish passage, except for American eel which can easily climb instream or overland barriers. Culvert #1 showed no potential for fish passage, primarily due to the 0.3 m vertical drop from the culvert mouth to the stream below (Photo DSCF073). Debris dam #1 in NASO-S2 had no potential for fish passage, with a barrier height of 0.5 m (Photo DSCF087). NASO-S2's debris dam #4 had no potential for fish passage, with a 0.2 m barrier height (Photo DSCF0103). Culvert #4 appeared to prevent fish passage, due to a 1.2 m wide barrier (Photo DSCF0107). Culvert #2, which actually had two culverts, had a medium likelihood for fish passage, since there was no vertical drop from the concrete structures (Photo DSCF075). The third culvert in the S2 reach (culvert #3) had high potential for fish passage despite some upstream blockage. This culvert consisted of two culverts, one of which had an obstruction, but the other was clear (Photos DSCF065 and 66). Debris dams #2 and #3, both composed of leaf litter, showed low potential for fish passage, due to the 0.3 and 0.1 m respective barrier heights(Photos DSCF095 and 98) . Small woody debris and leaf litter made up debris dam #5, which had a barrier height of 0.2 m, which created a low potential for fish passage (Photo DSCF105). An additional 18 partial debris dams (not blocking the channel width) were observed within the surveyed reach.

NASO-S3. This reach was a channelized, shallow (0.1-0.2 m) stream about 2.8 m wide. This shaded portion drained storm water from the runway, and was bordered by forest, field, and military land. Runs comprised 100% of this reach, which had stained, turbid water. A very small portion of the reach (1%) contained rooted submergent aquatic vegetation. The bottom was primarily sand (75%) with pockets of silt and some clay mixed throughout. The RBP characterized this stretch as "suboptimal," with a score of 122.

The NASO-S3 barrier survey reach covered from the western perimeter fence, upstream of the culvert beneath London Bridge Rd., upstream to the runway clearing. There was one potential fish passage barrier encountered on this stream within the installation. One steel, double-arch culvert (culvert #5) was partially obscured, but was deemed to be highly passable for fish (Photo DSCF062). An additional five partial debris dams (not blocking the channel width) were observed within the surveyed reach.

NASO-S4. This reach was a 5.0 m-wide, highly channelized stream about 1.1 m deep, fed by storm water from the runway and surrounded by industrial and military land, with no forest canopy. S4 was located upstream from the confluence of the Golf Course Stream, alongside a former landfill. S3 was a continuous, straight run. It contained abundant vegetation (50% coverage), consisting of rooted submergent and floating algae. The water was opaque. The bottom was soft, consisting mostly of silt (70%) and sand (20%), with abundant organic detritus and muck-mud. A score of 100 from the RBP indicated the stream was "marginal" in quality.

The NASO-S4 barrier reach covered from the split of the Golf Course Stream with S4, up to the Hornet Drive culvert, marking the beginning of S5. There were no partial or full barriers to fish passage observed within the surveyed reach.

NASO-S5. This reach was also channelized, fed by drainage from the runway and surrounded by industrial and military land. S5 was located immediately upstream from S4, where the stream flows through a culvert beneath Hornet Dr. This reach was about 2.1 m wide and 0.3 m deep. The surrounding landscape consisted of military land (i.e., runway) and forest. The hardwood trees partly shaded this stream section, which was primarily runs (95%) with some pools (5%). Rooted emergent and floating algae was present in 50% of the reach. Clear water was underlain by substrate made up primarily of clay (70%), with some silt (20%) and sand (10%). The RBP score of 109 indicated that the habitat quality was "marginal."

The NASO-S5 barrier survey reach began at the Hornet Dr. culvert marking the end of the S4 reach, continuing upstream to the runway clearing. The first barrier, culvert #1, was a triple-pipe culvert with a gradual riffle down to the stream, creating a medium potential for fish passage (Photo DSCF012). The second barrier, culvert #2, was a four-pipe culvert with a gradual riffle down to the stream, creating a medium potential for fish passage. The third barrier, culvert #3, was a double-pipe culvert that was deemed to be highly passable for fish (Photo DSCF023). An additional partial debris dam (not blocking the channel width) was observed within the surveyed reach.

NASO-S6. This reach was a channelized stream section, about 5.0 m wide and 0.3 m deep. This reach is located downstream of the Aeropines wetland mitigation site, on the Golf Course Stream, beginning at the perimeter fence. S6 was surrounded by mixed pine/hardwood forest. Trees such as red maple (*Acer rubrum*), loblolly pine (*Pinus taeda*), and sweet gum (*Liquidambar*) shaded this reach. S6 only contained runs. Approximately 6 square meters of large woody debris occupied this reach. No aquatic vegetation was present. The water was opaque and slightly turbid, with a mix of clay (50%), sand (30%), and silt (20%) on the bottom, with abundant organic detritus and muck-mud present throughout. The stream quality was "marginal" according to the RBP score of 85.

The NASO-S6 barrier survey reach covered from the southern perimeter fence, upstream to the first opening to the Aeropines mitigation wetland, where the S7 reach began. There was a single debris dam barrier composed of woody debris (debris dam #1), but it was considered to be highly passable for migratory fish. There were no partial debris dams observed within the surveyed reach.

NASO-S7. This reach was channelized and originated in swamp and bog habitat. This reach was about 6.0 m wide and 0.2 m deep. This reach is located upstream of the Aeropines wetland mitigation site, on the Golf Course Stream. Surrounded by military land and forest, this reach was shaded mostly by red maple, sweet gum, and privet (*Ligustrum sp.*). S7 consisted primarily of pool habitat (80%), but also contained riffles (10%) and runs (10%). The dominant type of aquatic vegetation was rooted submergent, present in about 10% of the reach. The bottom was a mix of sand (75%) and silt (20%), with small amounts of detritus and muck-mud organic material. The S7 reach was classified as "marginal," scoring 101 with the RBP assessment.

The NASO-S7 barrier survey began at the first opening to the Aeropines mitigation wetland and continued to the confluence where the Golf Course Stream split from the S4 stream. There were no partial or full barriers to fish passage observed within the surveyed reach.

3.1.2 FISH

A total of 1,350 fishes, represented by 22 species, were collected from electrofishing the seven NASO stream reaches across four different time periods (Table 9). All individuals were positively identified at the species level in the field with the exception of juvenile gizzard shad (*Dorosoma cepedianum*), which were vouchered on their first occurrence and later verified in the laboratory. Fish sampling at each stream reach was an average of 1,536 s (Table 9).

Table 9: Backpack Electrofishing Effort at Naval Air Station Oceana by Sampling Period and Stream

Stream ID	Sampling duration (seconds)			
	Apr	Jun	Aug	Sep/Oct
NASO-S1	2,028	1,680	1,237	1,793
NASO-S2	3,083	1,314	1,471	1,758
NASO-S3	1,737	233	461	801
NASO-S4	2,880	1,036	1,206	1,845
NASO-S5	1,481	1,159	2,646	966
NASO-S6	Not surveyed	1,524	1,830	1,632
NASO-S7	Not surveyed	1,608	1,217	1,322

Pirate perch (*Aphredoderus sayanus*) was the most abundant species, representing 24.7% of the total catch, followed by eastern mosquitofish (*Gambusia holbrooki*) at 16.4%, and bluegill (*Lepomis macrochirus*) at 14.4%. The frequency of occurrence for each species was different in each of the seven surveyed streams (Table 10). There were no fish species that were universally found in all seven surveyed stream reaches. Banded sunfish (*Enneacanthus obesus*), American eel (*Anguilla rostrata*), bluegill, eastern mudminnow (*Umbra pygmaea*), largemouth bass (*Micropterus salmoides*), pirate perch, and redfin pickerel (*Esox americanus*) occurred in six of seven streams. Eastern mosquitofish, golden shiner (*Notemigonus crysoleucas*), bluespotted sunfish (*Enneacanthus gloriosus*), pumpkinseed (*Lepomis gibbosus*), and yellow bullhead (*Ameiurus natalis)* occurred in five of seven streams. All other species occurred in only one to four streams. The overall length distributions for most species were comparable among all surveyed streams.

Table 10: Number, Relative Abundance, Frequency of Occurrence, and Length of All Fishes Collected in Naval Air Station Oceana Streams

Common name	Scientific name	Number of individuals	Total relative abundance (%)	Range of total length (mm)	Range of mass (g)
Pirate perch	*Aphredoderus sayanus*	333	24.7%	29-113	0.3-22.5
Eastern mosquitofish	*Gambusia holbrooki*	222	16.4%	20-56	0.1-2.0
Bluegill	*Lepomis macrochirus*	194	14.4%	38-162	1-87.5
Eastern mudminnow	*Umbra pygmaea*	133	9.9%	25-109	0.1-16.1
Banded sunfish	*Enneacanthus obesus*	90	6.7%	36-108	1.0-24.7
Pumpkinseed	*Lepomis gibbosus*	84	6.2%	73-188	6.5-121.3
Golden shiner	*Notemigonus crysoleucas*	58	4.3%	39-194	1.0-44.5
Yellow bullhead	*Ameiurus natalis*	40	3.0%	38-260	0.4-244.8
Redfin pickerel	*Esox americanus*	39	2.9%	48-289	0.5-137.0
American eel	*Anguilla rostrata*	35	2.6%	95-301	8.6-85.0
Eastern silvery minnow	*Hybognathus regius*	32	2.4%	34-89	0.6-6.1

The time sampled was similar across all streams with the exception of NASO-S3 and NASO-S7. The total number of fishes collected, species richness, and resulting species diversity varied across the seven reaches, with the highest total number of individuals collected at NASO-S4 (318 individuals), NASO-S2 (305 individuals), the least number of species and individuals were collected at NASO-S3. The 18 species that occurred at NASO-S4 resulted in a species diversity index that was greater than any other surveyed stream; NASO-S6 and S7 followed closely with 17 species each. The following tables and summaries present results of the fish survey by stream reach to enable comparisons among streams and seasons.

NASO-S1. A total of 26 fish, represented by seven species, were collected from NASO-S1 on 29 April 2014. Bluegill was the most abundant species, representing 30.8% of the total catch, followed by eastern mudminnow at 23.1%, and pirate perch at 19.2% (Table 11). During the second sampling event, a total of 25 fish, represented by five species, were collected from NASO-S1 on 03 June 2014. Pirate perch was the most abundant species, representing 56.0% of the total catch, followed by eastern mudminnow at 24.0%, and redfin pickerel at 12.0%. A total of 36 fish, represented by eight species, were collected from NASO-S1 on 13 August 2014. Pirate perch was the most abundant species,

representing 47.2% of the total catch, followed by eastern mudminnow at 22.2%, and American eel at 8.3%. During the last sampling event, a total of 92 fish, represented by eight species, from NASO-S1 on 30 September 2014. Bluegill was the most abundant species, representing 37.0% of the total catch, followed by pirate perch at 30.4%, and eastern mudminnow at 15.2%.

Table 11: Fish Composition in NASO-S1 by Sampling Period

Common name	Apr		Jun		Aug		Sep/Oct		Total
	Number	%	Number	%	Number	%	Number	%

NASO-S2. A total of 30 fish, represented by four species, were collected from NASO-S2 on 29 April 2014. Pirate perch was the most abundant species, representing 80.0% of the total catch, followed by eastern mudminnow at 13.3%, and green sunfish and largemouth bass both at 3.3% (Table 12). In the second fish sampling event, a total of 153 fish, represented by eight species, were collected from NASO-S2 on 03 June 2014. Pirate perch was the most abundant species, representing 60.8% of the total catch, followed by eastern mudminnow at 27.5%, and eastern mosquitofish at 5.9%. A total of 38 fish, represented by four species, were collected from NASO-S2 on 13 August 2014. Pirate perch was the most abundant species, representing 81.6% of the total catch, followed by eastern mudminnow at 10.5%, and American eel at 5.3%. A total of 84 fish, represented by eight species, were collected from NASO-S2 on 30 September 2014. Pirate perch was the most abundant species, representing 70.2% of the total catch, followed by bluegill at 8.3%, and golden shiner at 7.1%.

NASO-S3. A total of 3 eastern mudminnow were collected from NASO-S3 on 29 April 2014. This was the only species collected in the first sampling effort (Table 13). Again in June, only eastern mudminnow were found in NASO-S3, which consisted of isolated shallow pools of water; a total of 27 fish were collected on 05 June 2014. Sampling duration was short because the stream bed was dry, consisting of only seven small pools within 10% of the reach; there was zero flow. No fish were present during the August sampling event. Similar to the June event, sampling duration was short because the stream bed was dry or almost dry at various points of the stream. On 30 September 2014, 3 fish, represented by two species, were collected from NASO-S3. The eastern mosquitofish was more abundant (66.7%) than the eastern mudminnow (33.3%).

NASO-S4. A total of 32 fish, represented by five species, were collected from NASO-S4 on 30 April 2014. The eastern mosquitofish was the most abundant species, representing 78.1% of the total catch, followed by redfin pickerel at 9.4%, and pumpkinseed at 6.3% (Table 14). A total of 136 fish, represented by 10 species, were collected from NASO-S4 on 04 June 2014. The eastern mosquitofish was the most abundant species, representing 84.6% of the total catch, followed by pirate perch at 3.7%, and largemouth bass and bluespotted sunfish both at 2.2%. During the third sampling event on 12 August 2014, a total of 7 fish, represented by six species, were collected from NASO-S4. The most abundant species in August was the eastern mosquitofish, representing 28.6% of the total catch, followed by pirate perch, yellow bull head, and eastern mudminnow, and largemouth bass all at 14.3%. On 01 October 2014, 155 fish, represented by 16 species, were collected from NASO-S4. One lesion was identified on one golden shiner. Banded sunfish was the most abundant species, representing 38.1% of the total catch, followed by bluegill at 12.9%, and golden shiner at 10.3%.

NASO-S5. Only two fish (both bluespotted sunfish) were collected from NASO-S5 on 30 April 2014. During the second sampling event on 04 June 2014, four individuals, each a different species, were collected from NASO-S5 (Table 15). American eel, bluespotted sunfish, eastern mosquitofish, and pirate perch were equally abundant with one individual each. A total of 55 fish, represented by six species were collected from NASO-S5 on 12 August 2014. The eastern mosquitofish was the most abundant species, representing 70.9% of the total catch, followed by bluespotted sunfish (14.5%), and yellow bullhead (9.1%). The last sampling event, on 01 October 2014, collected 51 fish, from eight species in NASO-S5. Bluegill was the most abundant species, representing 47.1% of the total catch, followed by eastern mosquitofish at 17.6%, and largemouth bass at 11.8%.

Table 15: Fish Composition in NASO-S5 by Sampling Period

NASO-S6. No survey was conducted for NASO-S6 in April, because the water was too deep to effectively electrofish. During the next sampling event on 04 June 2014, 88 fish, from thirteen species, were collected from NASO-S6. Bluegill was the most abundant species, representing 25.3% of the total catch, followed by pirate perch at 19.5%, and pumpkinseed (*Lepomis gibbosus*) at 14.9% (Table 16). On 12 August 2014, 29 fish, represented by ten species, were collected from NASO-S6. Pirate perch was the most abundant species, representing 40.0% of the total catch, followed by American eel (13.3%), and golden shiner (13.3%). During the last sampling event on 01 October 2014, 97 fish from nine species were collected from NASO-S6. Bluegill was the most abundant species, representing 41.2% of the total catch, followed by eastern silvery minnow at 32.0%, and pirate perch at 12.4%. Gizzard shad ranged in size from 56 to 119 mm, which are most likely first year and second year age class shad (Ross 2001).

NASO-S7. Similar to NASO-S6, a fish survey could not be conducted in April, due to high water at NASO-S7. On 04 June 2014, 45 fish from twelve species were collected from NASO-S7. The most abundant species was banded sunfish (31.1%), followed by pumpkinseed (20.0%), and American eel and pirate perch (both 8.9%) (Table 17). A total of 32 fish, represented by nine species, were collected from NASO-

S7 on 12 August 2014. Yellow bullhead was the most abundant species, representing 31.3% of the total catch, followed by golden shiner at 28.1%, and American eel and pirate perch at 9.4%. On 01 October 2014, a total of 97 fish, from 14 species, were collected in NASO-S7. Bluegill and pumpkinseed were the two most abundant species, each representing 34.0% of the total catch, followed by golden shiner, yellow bullhead, and yellow perch, all at 5.2%.

Table 17: Fish Composition in NASO-S7 by Sampling Period

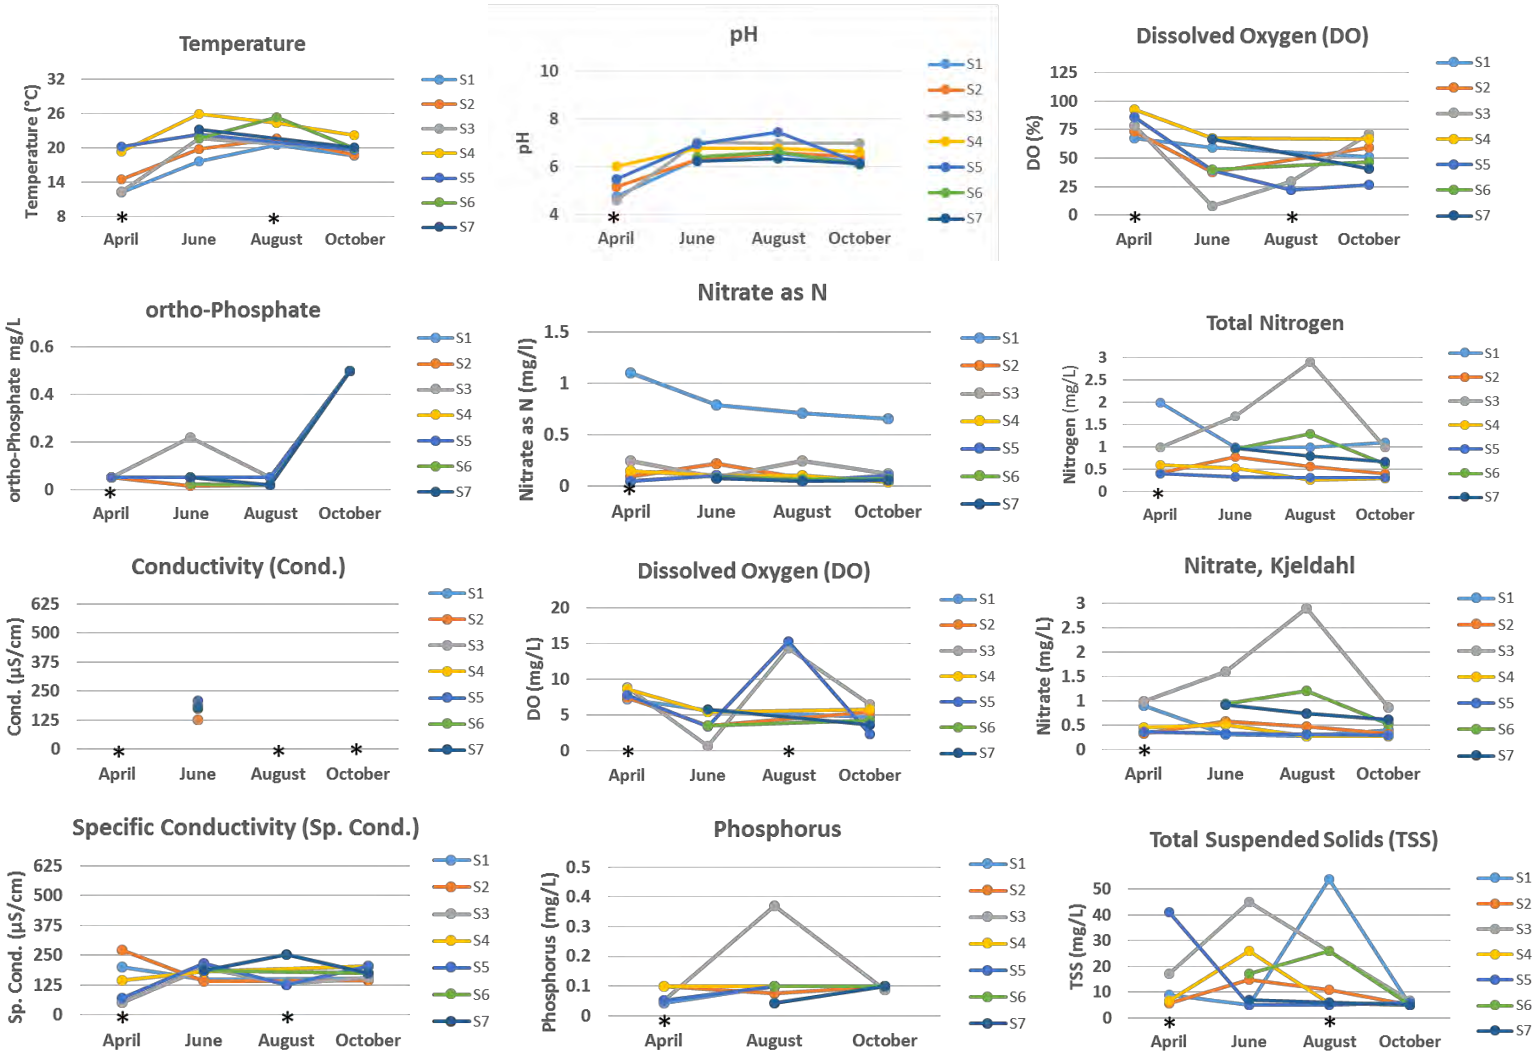
3.1.3 WATER QUALITY

In-situ and laboratory analysis water quality results varied by stream and season. In general, NASO streams ranged from acidic to slightly basic (pH 4.58 to 7.44). Dissolved Oxygen levels were low, but relatively stable, throughout the survey period. NASO-S3 had an August spike in dissolved oxygen, Phosphorus, Nitrogen, and Kjeldahl Nitrate levels. Temperature patterns were consistent with expected seasonal trends at each stream. Water quality results for streams are presented in Figure 3.

The estuarine portion of Owl's Creek has been monitored for various water quality parameters since 1998, as summarized in Appendix E. This data is presented for informational purposes only and has limited applicability to the current survey because of its estuarine nature.



Note: * Missing data due to YSI malfunction.

Figure 3: *In-situ* and Laboratory Water Quality Analysis Results for Naval Air Station Oceana Streams

In general, NASO streams displayed low velocities, especially NASO S3 which was dry in June. All streams showed decreasing velocities as the seasons progressed, with many streams (NASO-S1, -S2, -S3, -S4, and -S5) displaying their lowest discharges in August (Table 18). Velocities are displayed in cubic feet per second (cfs).

Table 18: Naval Air Station Oceana Stream Discharge Results

Stream Name	Date	Discharge (cubic feet per second)
NASO-S1	4/29/14	5.83
	6/3/14	0.38

	8/12/14	1.37
NASO-S7	6/4/14	0.93
	8/12/14	2.37

3.2 PONDS

3.2.1 HABITAT

Habitat surveys were conducted for NASO-P1 and NASO-P2 on 14 August 2014. The results of the pond habitat survey are presented here for each pond (Table 19).

NASO-P1. This pond, categorized as eutrophic, was 3.1 m deep, with extensive forest surrounding the shore. Shrub and grass were also present, though sparse. Submergent vegetation and macrophytes were present along the shoreline, with small amounts of emergent or floating plants. Of the shoreline, 90% was stable, with 10% showing bare ground but no erosion lines. A man-made boat dock and natural ramp was present, but there were no other major anthropogenic disruptions. The bottom substrate consisted of gravel and sand, with some cobble. There was some light and dark brown organic muck-mud at the shoreline in addition to the vegetation. For fish cover, submerged aquatic vegetation provided the most habitat, supplemented with some woody debris, overhanging vegetation (e.g., shrubs or tree limbs), and man-made structures. American waterweed (*Elodea sp*.) and cattail were the most common aquatic vegetation observed. A blue heron (*Ardea herodias*) was present.

NASO-P2. This pond, categorized as mesotrophic, was 2.3 m deep, with forest, grass, and wetland, and sparse shrubs, around the pond. Emergent, submergent, and macrophytes all occurred in moderate amounts. All of the shoreline appeared stable, with no evidence of development. The substrate was primarily gravel, with sand and some silt/clay; no odor was detected in the light brown substrate. Some woody debris was observed. Aquatic vegetation provided the most fish cover, but woody debris, live trees, and overhanging plants also provided some cover for the sunfish species noted. Emergent shrubs and American waterweed covered approximately 20% of the shoreline. NASO-P2 had significant plots (30% of the shoreline) of invasive common reed (*Phragmites australis*) at the time of inspection. A wood duck box was present, but no wildlife was observed. The water appeared to have good clarity, with a slight green tint.

	Wildlife Observed	Blue heron	None, one birdhouse is present along shoreline, no birds observed at time of
	Additional Notes	Shoreline was covered with floating bubble algae, banks were mostly stable, only a few bare spots (> 2%)	Clarity of water was good with slight green tint ~50% of shoreline is inundated with Phragmites and shrubs present

3.2.2 FISH

A total of 1,167 fishes, represented by 10 species, were collected from the two NASO ponds during the April, June, August, and October 2014 survey periods. All individuals were positively identified at the species level in the field and no deformities, lesions, or abnormalities were observed in any of the specimens collected. Total electrofishing sampling effort duration was 31,238 seconds across all three ponds (Table 20). Table 21 presents the relative abundance, and range of length for all species collected.

Table 20 : Boat Electrofishing Effort at Naval Air Station Oceana, by Sampling Period and Pond

Stream ID	Sampling duration (seconds)			
	April	June	August	October

NASO-P1. A total of 140 fish, represented by seven species, were collected from NASO-P1 on 29 April 2014. Bluegill was the most abundant species, representing 45.0% of the total catch, followed by American eel at 27.1%, warmouth at 12.9%, and largemouth bass at 12.1% (Table 22). A total of 69 fish, represented by eight species, were collected from NASO-P1 on 02 June 2014. American eel was the most abundant species, representing 36.2% of the total catch, followed by bluegill at 34.8%, and largemouth bass, pumpkinseed, and warmouth, all at 7.2%. A total of 143 fish, represented by eight species, were collected from NASO-P1 on 13 August 2014. Bluegill was the most abundant species, representing 33.6% of the total catch, followed by American eel at 19.6%, and largemouth bass at 16.8%. On 09 October 2014, a total of 268 fish, represented by nine species, were collected from NASO-P1. Bluegill was the most abundant species, representing 51.1% of the total catch, followed by pumpkinseed at 24.3%.

NASO-P2. Results of fish sampling at NASO-P2 are summarized below in Table 23. A total of 149 fish, represented by two species, were collected from NASO-P2 on 29 April 2014. Largemouth bass was the most abundant species, representing 57.7% of the total catch, followed by bluegill at 42.3% (Table 23). A total of 126 fish, represented by two species, were collected from NASO-P2 on 3 June 2014. During this second sampling effort, bluegill was the most abundant species, representing 87.3% of the total catch, followed by largemouth bass at 12.7%. On 13 August 2014, 141 fish, represented by two species, were collected from NASO-P2. Of these, bluegill was the most abundant species, representing 87.2% of the total catch, followed by largemouth bass at 12.8%. A total of 132 fish, represented by three species, were collected from NASO-P2 on 07 October 2014. Bluegill was the most abundant species, representing 77.3% of the total catch, followed by the eastern mudminnow at 12.1%.

In addition to electrofishing, supplemental qualitative hook and line surveys were conducted at the Concrete Ponds at the north end of the installation. Hook and line fishing yielded just two species of fish in the West Concrete Pond and East Concrete Pond on NASO during August and October. The results are presented in Table 24.

Table 24: Hook and Line Fish Survey Results from the West Concrete Pond and East Concrete Pond

Location	Date	Total Effort	Species	Length (mm)	Weight (lb.)
West Concrete Pond	8/14/2014	45 min	Largemouth Bass	440	2.50
			Largemouth Bass	570	3.75
			Largemouth Bass	300	1.5
East Concrete Pond	10/2/2014	45 min	Common Carp	No recorded lengths (approx. range = 250 to 550 mm)	No recorded weights (approx. range = 1 to 3 lbs.)

Length frequency data are often to derive growth estimates, and can also be used to get a first assessment of the demographics of a stock. For the purposes of this Project, length frequency graphs were generated for recreationally important and migratory species including: bluegill, and largemouth bass. Figures 4 and 5 illustrate length frequency data for combined surveys across NASO ponds. Bluegill size classes were skewed right, with disproportionately greater small size classes, with most individuals falling between 40 and 100 mm for both ponds. Bluegill were abundant in both ponds; however, NASO-P2 had more, yet smaller, individuals than NASO-P1.

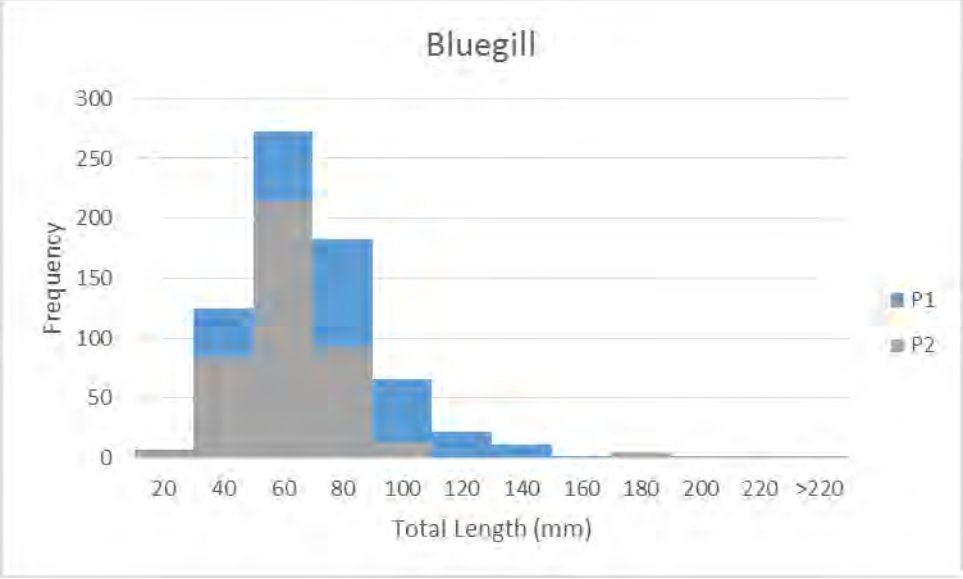

Figure 4: Length Frequency Results for Bluegill in Naval Air Station Oceana Ponds Surveyed in 2014

Largemouth bass length frequency results (Figure 5) show that these fish were more abundant in NASO-P2 than in NASO-P1. Size classes of largemouth bass were wide ranging, with both small and large size classes well represented in both ponds.

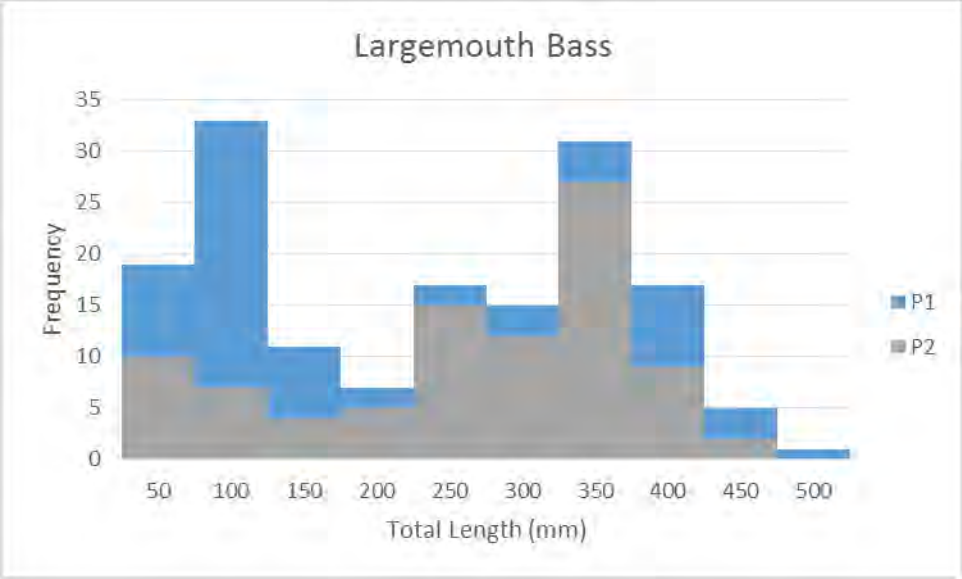

Figure 5: Length Frequency Results for Largemouth Bass in Naval Air Station Oceana Ponds Surveyed in 2014

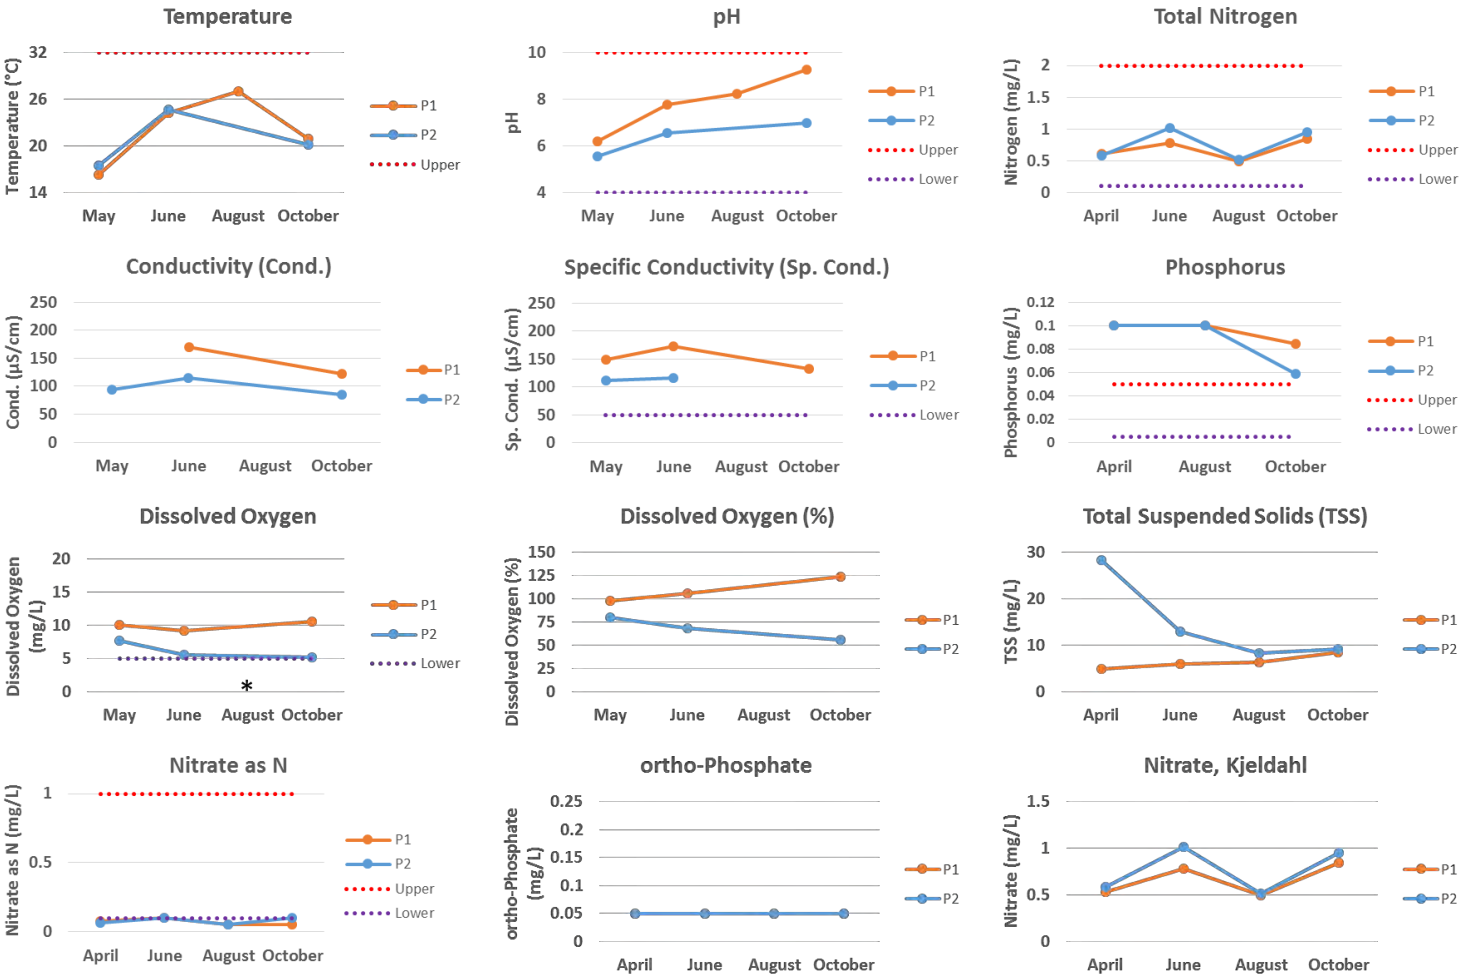
3.2.3 WATER QUALITY

Water quality results varied by location and depth and are displayed in Figure 6. In general, NASO ponds ranged from acidic to very basic (pH 5.39 to 9.27). NASO-P1 showed the widest range of pH from 5.39 in the spring to 9.27 in the fall. (Figure 6). Dissolved oxygen levels remained fairly stable throughout the summer. Temperature patterns were consistent with expected seasonal trends at each pond.



Note: * Missing data dues to YSI malfunction.

Figure 6: Water Quality Parameters for Naval Air Station Oceana Ponds

4 DISCUSSION AND MANAGEMENT RECOMMENDATIONS

The discussion and management recommendations in this section include general suggestions, as well as more specific discussion based on the findings from this survey. Prior to implementing any changes to the natural resources management at NASO, a more thorough evaluation of all available options would be necessary to ensure the best possible outcome for the management objectives of the ponds and streams within the context of the NASO military mission.

4.1 RECREATIONAL FISHERIES

Length frequency analysis of the recreationally important species such as bluegill and largemouth bass in NASO streams showed that most individuals were generally too small to represent much recreational fishing potential. Largemouth bass were typically not very abundant, with less than 15 individuals captured across all streams during the most productive sampling period (October). According to EPA reports, largemouth bass between 50 and 150 mm are first-year fish, with second-year fish up to 250 mm long. They do no typically exceed 350 mm until three years of age; however, 100% are expected to reach sexual maturity at lengths of 229 mm (EPA 2000; Laarman and Schneider 1985). Therefore, most bass in the NASO streams have not yet reached spawning size. Stream conditions, including seasonal water level fluctuations, limited prey species, and unfavorable water quality, may contribute to the small size and limited abundance of largemouth bass.

Bluegill typically reach sexual maturity around 100 mm at age-1, which indicates that many of the individuals captured in NASO streams were capable of reproduction (IADNR 2015; Peterson et al. 2010). It can be assumed that bluegill were successfully spawning given the numerous young-of-the-year individuals under 100 mm that were recovered from NASO streams.

Both ponds surveyed at NASO offer favorable recreational fishing opportunities. Both ponds supported healthy populations of game fish including largemouth bass, yellow perch, black crappie, and bluegill. Additionally, electrofishing surveys showed that both ponds supported healthy populations of smaller forage fish to provide food sources for larger game fish.

Historical comparison of recreationally important fish species at Oceana reveals a potential absence of species that were once present and the addition of certain new species previously unseen in the 1994 and 2012 surveys. Overall, species composition remained relatively constant over the twenty year time span between the 1994 and 2014 surveys with sport fish such as largemouth bass, bluegill, yellow perch, and black crappie present most years. However, channel catfish were captured in 1994, but were not encountered in either the 2012 or 2014 surveys.

In the early 1990s, 2,000 fingerling channel catfish, 150 trophy-sized largemouth bass (up to 6 lb. [3 kg]) and 50 channel catfish (up to 14 lb. [6 kg]) were stocked for a catch-and-release tournament. Since the 1990s NASO-P1 has periodically been stocked with largemouth bass, channel catfish, and other sport fishes. Fish surveys performed in 1994 through the USFWS Office of Fishery Assistance (Swihart et al. 1994), indicate that NASO-P1 supports a diverse warmwater fish population with excellent size classes of largemouth bass and good water quality. The absence of channel catfish currently may have resulted from the stocked channel catfish not able to sustain populations due to predation of juveniles by more established fish species.

Also noteworthy is the absence of American eel in previous finfish surveys in NASO-P1, while eels were relatively common in the 2014 surveys. American eels were some of the most abundant species encountered in 2014, with eels captured in each sampling event, except October (only 4 individuals).

The habitat present at both NASO-P1 and NASO-P2 was of higher quality than most streams on NASO. The shorelines were stable and shoreline vegetation provides important nursery habitat for juvenile fish and aquatic insects. However, approximately 30% of NASO-P1's shoreline was covered with invasive *Phragmites* grass.

Managing a pond for recreational fisheries is often centered around the bass-bluegill system, and using the relative abundances of these two juvenile species observed in this survey, it is possible to infer any potential imbalances in the pond. Based on Schramm and Willis (2012), the scenarios presented in Table 25 are likely explanations of bass and bluegill results and feasible solutions or recommended actions to take in the pond. The bass population of NASO-P1 exhibited a bimodal distribution, while that of NASO-P2 was skewed towards larger individuals. Both ponds had abundant juveniles in the range of 50 to 150 mm size classes. The bluegill population of both NASO-P1 and NASO-P2 exhibited an abundance of juveniles in the 40 to 80 mm size classes. This suggests a balanced fish community, with both bass and bluegill successfully reproducing, and bass are keeping bluegill in control. No further action required in terms of management actions (e.g., stocking, fertilizing, etc.) (Schramm and Willis 2012).

If fish stocking is considered in the future for NASO ponds, a more targeted pre-stocking survey would be recommended prior to implementation. According to the VDGIF, when stocking a pond using fingerlings, stock numbers should be around 350 bluegill, 150 redear sunfish, 50 largemouth bass, and 50 channel catfish (all numbers per acre) (VDGIF 2013). Additionally, future surveys should consider a benthic habitat survey using side scan sonar or underwater video surveys of each pond to assess underwater habitat features and where improvements to structured habitat (snags, spawning areas, etc.) could be made.

Table 25: Interpreting the Results of an Annual Juvenile Fish Monitoring Program to Assess the Status of the Largemouth Bass Fishery*

Status of Juvenile Largemouth Bass		Status of Juvenile Bluegill		Status of Fishery	Recommended Action
Juvenile largemouth bass are absent	***AND*** →	Many small bluegill present, but no intermediate sizes	***THEN*** →	✓ Successful bluegill spawning ✓ Good spawning conditions for largemouth bass are likely ✓ Heavy predation by adult largemouth bass	Reduce adult largemouth bass numbers
		Few small bluegill present, with many intermediate sizes		✓ Either reduced spawning or survival of bluegill ✓ Adult largemouth bass are likely in good condition if present	Reduce intermediate bluegill population
		No small bluegill present, and few intermediate sizes		✓ Habitat may be unsuitable for spawning/rearing, or ✓ Intense predation by largemouth bass may be occurring	Sample adult populations of bluegill and largemouth bass to further diagnose problem
Juvenile largemouth bass are present		No small bluegill present, and many intermediate sizes		✓ Too many bluegill interfere with reproduction of bluegill but not largemouth bass	Reduce intermediate bluegill
		Many small bluegill present, and no intermediate sizes		✓ Bass and bluegill are successfully reproducing, but ✓ Predation by largemouth bass may be excessive	Reduce adult largemouth bass numbers
		Many small bluegill present, and few intermediate sizes		✓ Both bass and bluegill are successfully reproducing, and ✓ Bass are keeping bluegill in control	Balanced fish community, no action required

NOTE: *Results analysis based on Schramm and Willis (2012).

4.2 MIGRATORY FISHERIES

NASO is connected to coastal waters in several ways; The S1 stream drains into Owl's Creek, with direct access to the Atlantic Ocean via Rudee Inlet. The S2 and S3 and S4-S7 streams drain into London Bridge Creek, with direct access to the Chesapeake Bay via Lynnhaven Inlet. The S4-S7 streams are also connected to the West Neck Creek, which drains into the North Landing River, with access to Currituck Sound, a protected inlet of the Atlantic Ocean located in northeastern North Carolina and southeastern Virginia. Because of this connectivity, there is the potential access for migratory fishes. Several migratory fish species utilize freshwater stream habitat within the Mid-Atlantic coastal plain (Rhode et al. 1994), including the herrings: alewife, blueback herring, American shad, and hickory shad. River herring are anadromous, meaning that they are born in freshwater and migrate into saltwater to mature. The American eel is also a ubiquitous migratory fish within these stream systems (Rhode et al. 1994). American eel are catadromous, meaning that they are born in saltwater and migrate into freshwater to mature (Jessop et al. 2002). Alewife and blueback herring (collectively river herring) were recently candidate species for listing as endangered or threatened under the Endangered Species Act (ESA). In July 2013, the National Marine Fisheries Service (NMFS) decided that listing river herring as threatened or endangered under the ESA was not warranted (NMFS 2013). American eel are currently

under petition as a candidate for listing under the ESA by the USFWS because they have undergone substantial declines throughout their range (USFWS 2011a).

River herring spawn in a variety of habitats, ranging from swift moving rivers to small tributaries above the tidal zone (NMFS 2009). They migrate during the spring months to spawn in their natal rivers, then return to coastal waters in the summer. Juveniles mature for several years in coastal waters before making their first spawning run (NMFS 2009). River herring abundances are highly variable in Virginia coastal plain streams.

American eel migrate into freshwater streams as juveniles (i.e., elvers) where they mature into the yellow eel phase, remaining in freshwater for up to 30 years. After reaching spawning age (variable), they migrate back to the ocean (Jessop et al. 2002; USFWS 2011b). Eels are locally common, and often abundant, in Virginia coastal plain streams (Rhode et al. 1994). The eel's body form and anguilliform swimming mode is an important aspect of its ability to access freshwater habitats. The eel propels itself in an undulating motion, which they can adapt out to surfaces out of the water as well (Helfman et al. 2009). This allows juvenile elver and yellow-eel stages to "climb" under certain conditions (e.g., rough surfaces), enabling them to pass up and over what would otherwise be a barrier to migrating fishes (USFWS 2011a; Ellerby et al. 2001). Elvers have even been documented successfully climbing large vertical concrete structures, such as dams (Devine Tarbell & Associates 2006; Kleinschmidt 2000).

No river herring were observed during this survey, however gizzard shad were observed, which are known to move locally between fresh and brackish waters, and are sometimes included in the river herring category. Gizzard shad and American eel were captured during the survey throughout the season at various locations. American eel were present throughout the season at NASO-S2, although gizzard shad were completely absent. The size classes observed were consistent with the "elver" and "yellow" eel life stages. Therefore, the elvers present likely migrated into the NASO streams and ponds during spring 2014 and the yellow-phase individuals have been residents since at least the spring 2013 migration period, when they entered the streams and ponds as elvers. Yellow-phase eels reside in freshwater systems for 2 to 6 years (sometimes up to 18 years) until they reach maturity and migrate back to the ocean to spawn as "silver-phase" eels (VIMS 2015).

Additional targeted surveys of migratory fish species utilizing NASO streams to assess evidence of spawning runs of river herring or American eel would provide further evidence of migratory fish use of NASO streams and ponds. This can be done through:

- Periodic electrofishing surveys during migration windows of adult river herring or juvenile American eel, covering late-March through mid-April.
- Periodic electrofishing surveys during mid-summer, to document the presence of young-of-year river herring and juvenile/adult (yellow-phase) American eels

4.3 FISH PASSAGE

Migratory fishes may become excluded from available habitat by impediments to migration (i.e., fish barriers). Such barriers could be dams, perched culverts, or other physical structures. Coastal plain river systems in Virginia can lose portions of historical spawning and rearing habitat for migratory species because of such barriers. Many physical structures are not barriers to American eel, however, since they are capable of ascending (or "climbing") structures such as dams, or even moving over land (Devine Tarbell & Associates 2006; Kleinschmidt 2000; USFWS 2011a).

The Navy realizes the importance of ecosystem health and therefore uses the Virginia Department of Game and Inland Fish (VDGIF) guidance to ensure the protection of water resources on its installations. Due to future maintenance costs associated with culverts, and the loss of riparian and aquatic habitat, the VDGIF advises that stream crossings are constructed as clear-span bridges. However, if this is not possible, the VDGIF recommends countersinking any culverts below the streambed at least 6 in. (15 cm), or use of bottomless culverts, to allow passage of aquatic organisms. The VDGIF also recommends the installation of floodplain culverts to carry bankfull discharges (VDGIF 2007). Furthermore, culverts that are perched or blocked impede fish accessibility to upstream habitat. Culvert-1 at NASO-S2 was perched under the observed water conditions; therefore, although American eel may be able to pass, river herring would be limited. Improvements to NASO-S2 can be made through replacement or modification of the perched culvert to improve passage potential for migratory fish. Eliminating perched culverts and maintaining culvert clearance is recommended to support fish passage within existing conditions throughout the Installation.

While some of the debris dams currently in place may limit the upstream passage of river herring, their habitat value contributes to NASO streams' overall ecosystem. Therefore, dams should be left in the stream channel, even if only partially, whenever possible. As previously recommended, a routine culvert monitoring and maintenance plan would limit culvert blockages that form due to weather-related events or beaver activity. Periodic maintenance, through the removal of accumulated debris piles, downed trees, and other obstructions from these structures, would positively impact the overall fish population within the stream channel. However, it is important to note that debris dams are a natural habitat feature in streams and often provide high-quality structured fish habitat. Therefore any removal of debris from the stream should be limited to within the culverts only. A stream-wide removal of debris dams would be detrimental to the habitat quality of NASO streams.

While the habitat quality of NASO streams were suboptimal to marginal, fish passage is a relatively minor issue within NASO; although any fish passage issues downstream (off-installation) are not clear from this survey. In general, most barriers identified during the barrier survey were passable to migratory fish. However, NASO-S2 had five debris dams and two culverts that had low to no potential for non-eel fish passage. The culverts, identified in NASO-S2 that had no potential for fish passage were perched and prohibited fish from entering. At the outlet of these two culverts there was a change in stream elevation that the culvert outlet did not follow.

In summary, maintenance and alterations are recommended in the following tiered approach to improve habitat quality for migratory fish species within NASO:

1. Maintain culverts clear of debris or beaver dams.
2. Conduct a targeted survey of migratory fish species utilizing NASO streams to assess evidence of spawning runs of river herring or American eel (see Migratory Fisheries, Section 4.2)
3. Since migratory fishes are confirmed to be present, the first step at improving habitat for these fishes would be to modify the network of drainage ditches to minimize sedimentation within the stream channels, as suggested by EPA (2003).
4. Once sedimentation of the stream channel has been minimized, another step toward improving habitat quality would be to evaluate stream restoration options to include natural channel design options.

5. Determine which reach is most in need of immediate restoration by reviewing baseline information to determine if sediment removal would substantially improve migratory fish habitat.
6. Additional restoration-specific surveys would be needed to determine the appropriate restoration action and stabilization method(s) with the goal of improving fish habitat.
7. Restoration options like sediment removal, various bioengineering techniques, such as log or timber cribs, natural streambed substrate, live plantings, etc. should be given priority since they can provide enhanced habitat value.
8. Once the restoration option is determined, then the appropriate permitting application packages would be needed for submittal to state and federal agency approval, before executing the work.

4.4 CHANNELIZED STREAMS

All surveyed streams at NASO have been channelized to some degree. These modifications, likely made to improve drainage across the Installation, have had detrimental impacts on habitat quality. For example, channelization increases the streambed gradient and decreases the retention time of the water in the channel. The channelized streambed inhibits normal overbank flooding during storm events. The floodwater abatement and water quality protection functions normally provided by the floodplain and any adjacent wetlands are significantly diminished as a result (Navy 2014). This type of channelized system experiences drastic changes in water levels over a short time period, which can limit the diversity and sustainability of the fish populations. Results from this habitat assessment of NASO streams are consistent in characterizing them as a low-quality stream habitat.

4.5 WATER QUALITY

Currently, dissolved oxygen, pH, TSS, and nutrient levels recorded in NASO ponds and streams are considered sufficient to sustain native fish populations and promote productivity, without the need for supplemental fertilization. Water quality should continue to be monitored to determine any management actions. Poor water quality can be detrimental to both the physical and biological pond environment, therefore it should be monitored on a routine basis. Water quality parameters for NASO-P1 and NASO-P2 are described below in Table 26 along with corresponding proposed management actions. Water quality management (e.g., liming and fertilization) should be conducted prior to implementing a fish stocking program. In general, high turbidity in ponds reduces the amount of light that penetrates the water, reducing fish growth and algae photosynthesis. TSS measurements are directly related to turbidity and water clarity, therefore TSS concentrations between 40 and 80 mg/L result in water that appears cloudy (State of Michigan 2015). TSS in both NASO ponds was generally below 20 mg/L, with the exception of NASO-P2 in April (< 30 mg/L), therefore the turbidity is currently at healthy levels in both ponds. Water quality monitoring should continue to ensure these conditions persist.

Table 26: Proposed Water Quality Management

Water quality parameter	Current conditions in NASO-P2 and NASO-P1	Consequences	Proposed recommendation
pH and Alkalinity	Low pH (below 6 in May), indicative of low alkalinity and acidic water	Low pH alkalinity can cause toxic conditions lethal for fish fry	No action needed currently.

Water quality parameter	Current conditions in NASO-P2 and NASO-P1	Consequences	Proposed recommendation
Dissolved oxygen (DO)	Sufficient DO; all readings > 8.85 mg/L on top 2 m	Low DO can cause poor growth, disease, and suffocation	No action needed
Turbidity	Low turbidity and primary productivity	Increased turbidity results in slow growth throughout food web and aquatic vascular plant growth	No action needed

Water quality parameters such as pH, alkalinity, dissolved oxygen, and turbidity should all be considered in a pond management strategy to promote biological success. The continual assessment and monitoring of these indicators can help identify preventative management actions for issues such as eutrophication, sedimentation, and non-point source contamination. Regular water quality monitoring provides the baseline data necessary to inform a proactive pond management approach. Highlighted below are summaries for the water quality conditions at NASO and their implications for aquatic habitat quality.

- Laboratory water quality results showed that total nitrogen levels were not exceedingly high (ranged from 0.4 mg/L to 1.9 mg/L). Nitrogen concentrations above 3 mg/L can indicate pollutions from fertilizers, manures, or other nutrient-rich wastes (Swistock 2015). However, laboratory results also showed the phosphorus levels were high, both ponds reported results over 0.1 mg/L. Phosphorus levels above 0.025 mg/L can indicate a potential for nuisance algae and aquatic plant growth (Swistock 2015). Therefore both ponds have potential to reach eutrophic conditions.
- Laboratory nutrient analysis results showed that NASO-S3 had the highest total nitrogen concentrations for every sampling eventexcept October. Phosphorus also plays a key role in phytoplankton abundance and results were similar across most streams during most sampling events except August, when NASO-S3 had an almost three fold increase in phosphorus. Specific conductance was variable across locations and sampling event, with the large variations between streams in April. Dissolved oxygen was also highly variable for the most part. The most similar results were displayed in April; however, August had the most variable results for dissolved oxygen percentage, due to a malfunction in the water quality probe.
- Phosphorus is considered to be a more limiting nutrient with regard to freshwater algal growth. Bottom sediments are often more rich in phosphorus than the water column. Therefore, as these algae begin to form in the bottom sediments, they quickly can reach bloom levels as they rise to the surface and accumulate more nitrogen at the surface through atmospheric nitrogen fixation (Havens and Frasier 2012). This type of research shows that it is critical to control both nitrogen and phosphorus levels.
- Comparison with historical water quality data from a 2012 report conducted in NASO-P1 (Edwards 2012), reveals that the pH in NASO-P1 is variable (5.68 to 9.27 in 2014; 6.5 to 7.2 in 2012). While DO ranged from 7.68 to 13.9 mg/L in 2014, it remained more constant in 2012, ranging from 6.0 to 7.0 mg/L. However, water quality sampling depths were not reported in the 2012 report, which could explain some of the variations seen over time in NASO-P1. Overall, water quality parameters were very good with a pH measurement well within the suitable range

to support a diverse community of aquatic life. Dissolved oxygen was high enough to support a wide variety of finfish species.

- NASO-P1 appeared eutrophic because of abundant algae present along the shorelines. Nitrogen and phosphorus are two nutrients that are essential for the growth of plants and animals; however, excess nitrogen and phosphorus can lead to rapid increases of microscopic algae growth in the water column leading to less light penetration for aquatic plants and in extreme cases to hypoxic events that result in dissolved oxygen levels in the water, potentially harmful to fish.

One method to reduce nutrient input to the ponds and streams is to reduce the frequency of mowing or establishing no mowing zones along wetland edges to increase vegetative filters. Planting appropriate native trees, shrubs, and ground cover vegetation as wetland buffers is an effective method of establishing riparian buffers.

4.6 INVASIVE SPECIES

Invasive species that may affect ponds in the area include various types of aquatic algae, as well as free floating, submergent, and emergent species. Invasive fish species, such as snakehead, are also a concern in this region, but no individuals were observed during these surveys. Common carp are also invasive, but seem to be in control at NASO.

Fish kills can occur when high volumes of non-native vegetation die and decay, depleting oxygen in the process. Eutrophication is typically not an issue for well-constructed ponds that provide vegetation densities of less than 30 percent of the pond area (Boyd and Boyd 2012).

The common reed (*Phragmites australis*) is an invasive species that could potentially affect NASO-P1 and P2. Because this plant can be invasive in streams and ponds, and can tolerate both fresh and salt water. Alligator weed (*Alternanthera philoxeroides*), Asian spiderwort (*Murdannia keisak*), and Eurasian milfoil (*Myriophyllum spicatum*), and narrowleaf cattail (*Typha angustifolia*) have potential to become invasive species on the Installation and should be monitored for. Other invasive species to monitor include red-eared slider (*Chrysemys scripta elegans*) and Asian carp species.

The nutria (*Myocastor coypus*), a relative to the native muskrat (*Ondatra zibethicus*), is a semi-aquatic invasive species capable of negatively impacting environment. If present, nutria may feed on vegetation and outcompete native species, stunting growth of the aquatic ecosystem. The most effective method of controlling nutria populations is shooting or trapping. Other management actions include using hardwire cloth tubes and plastic seed protectors (USGS 2007). Although, no evidence of nutria was witnessed during these surveys, natural resource managers should respond with appropriate control measures if nutria are encountered on the Installation.

	Habitat Parameter	Condition Category			
		Optimal	**Suboptimal**	**Marginal**	**Poor**
Parameters to be evaluated in sampling reach	**1. Epifaunal Substrate/ Available Cover**	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are <u>not</u> new fall and <u>not</u> transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	4. Sediment Deposition	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach	Habitat Parameter	Condition Category			
		Optimal	**Suboptimal**	**Marginal**	**Poor**
	6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	7. Channel Sinuosity	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	8. Bank Stability (score each bank)	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
	SCORE ___ (LB)	Left Bank 10 9	8 7 6	5 4 3	2 1 0
	SCORE ___ (RB)	Right Bank 10 9	8 7 6	5 4 3	2 1 0
	9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream.	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
	SCORE ___ (LB)	Left Bank 10 9	8 7 6	5 4 3	2 1 0
	SCORE ___ (RB)	Right Bank 10 9	8 7 6	5 4 3	2 1 0
	10. Riparian Vegetative Zone Width (score each bank riparian zone)	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
	SCORE ___ (LB)	Left Bank 10 9	8 7 6	5 4 3	2 1 0
	SCORE ___ (RB)	Right Bank 10 9	8 7 6	5 4 3	2 1 0

Vegetative Protection (score each bank) Note: determine left or right side by facing downstream. 14	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE 7 (LB)	Left Bank 10 9	8 (7) 6	5 4 3	2 1 0
SCORE 7 (RB)	Right Bank 10 9	8 (7) 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone) 18	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE 9 (LB)	Left Bank 10 (9)	8 7 6	5 4 3	2 1 0
SCORE 9 (RB)	Right Bank 10 (9)	8 7 6	5 4 3	2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (FRONT)

STREAM NAME NASO - 52	LOCATION OCEANA	
STATION # _____ RIVERMILE _____	STREAM CLASS	
LAT _____ LONG _____	RIVER BASIN	
STORET #	AGENCY NAVFAC	
INVESTIGATORS		
FORM COMPLETED BY Dresser	DATE 4/30/14 TIME 10 00 (AM) PM	REASON FOR SURVEY

Parameters to be evaluated in sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
1. Epifaunal Substrate/ Available Cover 2	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 (2) 1 0
2. Pool Substrate Characterization 6	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 (6)	5 4 3 2 1 0
3. Pool Variability 2	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 (2) 1 0
4. Sediment Deposition 6	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 (6)	5 4 3 2 1 0
5. Channel Flow Status 19	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
SCORE	20 (19) 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
6. Channel Alteration 7	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 (7) 6	5 4 3 2 1 0
7. Channel Sinuosity 1	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 (1) 0
8. Bank Stability (score each bank) 18	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE 9 (LB)	Left Bank 10 (9)	8 7 6	5 4 3	2 1 0
SCORE 9 (RB)	Right Bank 10 (9)	8 7 6	5 4 3	2 1 0
9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream. 16	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE 8 (LB)	Left Bank 10 9	(8) 7 6	5 4 3	2 1 0
SCORE 8 (RB)	Right Bank 10 9	(8) 7 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone) 14	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE 7 (LB)	Left Bank 10 9	8 (7) 6	5 4 3	2 1 0
SCORE 7 (RB)	Right Bank 10 9	8 (7) 6	5 4 3	2 1 0

Total Score 91

STORET #	AGENCY
INVESTIGATORS Gaudet, Dreps, Lemontagne	
FORM COMPLETED BY Lemontagne	DATE 4/29 TIME 1500 AM (PM)
REASON FOR SURVEY	

Parameters to be evaluated in sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
1. Epifaunal Substrate/ Available Cover	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
SCORE 14	20 19 18 17 16	15 (14) 13 12 11	10 9 8 7 6	5 4 3 2 1 0
2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
SCORE 8	20 19 18 17 16	15 14 13 12 11	10 9 (8) 7 6	5 4 3 2 1 0
3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
SCORE 1	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 (1) 0
4. Sediment Deposition	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
SCORE 19	20 (19) 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
SCORE 19	20 (19) 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
SCORE 13	20 19 18 17 16	15 14 (13) 12 11	10 9 8 7 6	5 4 3 2 1 0
7. Channel Sinuosity	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE 1	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 (1) 0
8. Bank Stability (score each bank)	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE 9 (LB)	Left Bank 10 (9)	8 7 6	5 4 3	2 1 0
SCORE 9 (RB)	Right Bank 10 (9)	8 7 6	5 4 3	2 1 0
9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream.	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE 9 (LB)	Left Bank 10 (9)	8 7 6	5 4 3	2 1 0
SCORE 9 (RB)	Right Bank 10 (9)	8 7 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone)	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE 9 (LB)	Left Bank 10 9	8 7 6	5 (4) 3	2 1 0
SCORE 7 (RB)	Right Bank 10 9	8 (7) 6	5 4 3	2 1 0

Total Score 122

INVESTIGATORS TG DA MG		
FORM COMPLETED BY TG	DATE 4/30 TIME 11:30 AM PM	REASON FOR SURVEY

Parameters to be evaluated in sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
1. Epifaunal Substrate/ Available Cover	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
SCORE 8	20 19 18 17 16	15 14 13 12 11	10 9 (8) 7 6	5 4 3 2 1 0
2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
SCORE 11	20 19 18 17 16	15 14 13 12 (11)	10 9 8 7 6	5 4 3 2 1 0
3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
SCORE 1	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 (1) 0
4. Sediment Deposition	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
SCORE 16	20 19 18 17 (16)	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
SCORE 19	20 (19) 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
SCORE 6	20 19 18 17 16	15 14 13 12 11	10 9 8 7 (6)	5 4 3 2 1 0
7. Channel Sinuosity	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE 1	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 (1) 0
8. Bank Stability (score each bank) 18	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE 9 (LB)	Left Bank 10 (9)	8 7 6	5 4 3	2 1 0
SCORE 9 (RB)	Right Bank 10 (9)	8 7 6	5 4 3	2 1 0
9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream. 14	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE 7 (LB)	Left Bank 10 9	8 (7) 6	5 4 3	2 1 0
SCORE 7 (RB)	Right Bank 10 9	8 (7) 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone) 6	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE 3 (LB)	Left Bank 10 9	8 7 6	5 4 (3)	2 1 0
SCORE 3 (RB)	Right Bank 10 9	8 7 6	5 4 (3)	2 1 0

INVESTIGATORS TG, DA, MC		
FORM COMPLETED BY TG	DATE 4/30 TIME 12:10 (AM) PM	REASON FOR SURVEY

Parameters to be evaluated in sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
1. Epifaunal Substrate/ Available Cover	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
SCORE 9	20 19 18 17 16	15 14 13 12 11	10 (9) 8 7 6	5 4 3 2 1 0
2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
SCORE 14	20 19 18 17 16	15 (14) 13 12 11	10 9 8 7 6	5 4 3 2 1 0
3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
SCORE 3	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 (3) 2 1 0
4. Sediment Deposition	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
SCORE 15	20 19 18 17 16	(15) 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
SCORE 16	20 19 (18) 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
SCORE 7	20 19 18 17 16	15 14 13 12 11	10 9 8 (7) 6	5 4 3 2 1 0
7. Channel Sinuosity	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE 3	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 (4) 3 2 1 0
8. Bank Stability (score each bank) 14	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE 7 (LB)	Left Bank 10 9	8 (7) 6	5 4 3	2 1 0
SCORE 7 (RB)	Right Bank 10 9	8 (7) 6	5 4 3	2 1 0
9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream. 16	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE 8 (LB)	Left Bank 10 9	(8) 7 6	5 4 3	2 1 0
SCORE 8 (RB)	Right Bank 10 9	(8) 7 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone) 10	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE 5 (LB)	Left Bank 10 9	8 7 6	(5) 4 3	2 1 0
SCORE 5 (RB)	Right Bank 10 9	8 7 6	(5) 4 3	2 1 0

Total Score 109

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (FRONT)

STREAM NAME NASO-S6	LOCATION NAS Oceana / DNA
STATION # _____ RIVERMILE _____	STREAM CLASS
LAT GPS LONG _____	RIVER BASIN
STORET #	AGENCY
INVESTIGATORS Anderson, Cook	
FORM COMPLETED BY Cook	DATE 06/04/14 TIME 12:00 AM (PM)	REASON FOR SURVEY NASO/DNA Fish Survey

Parameters to be evaluated in sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
1. Epifaunal Substrate/ Available Cover	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
SCORE 7	20 19 18 17 16	15 14 13 12 11	10 9 8 (7) 6	5 4 3 2 1 0
2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
SCORE 6	20 19 18 17 16	15 14 13 12 11	10 9 8 7 (6)	5 4 3 2 1 0
3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
SCORE 1	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 (1) 0
4. Sediment Deposition	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
SCORE 12	20 19 18 17 16	15 14 13 (12) 11	10 9 8 7 6	5 4 3 2 1 0
5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
SCORE 16	20 19 18 17 (16)	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
SCORE 6	20 19 18 17 16	15 14 13 12 11	10 9 8 7 (6)	5 4 3 2 1 0
7. Channel Sinuosity	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE 1	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 (1) 0
8. Bank Stability (score each bank)	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE 4 (LB)	Left Bank 10 9	8 7 6	5 (4) 3	2 1 0
SCORE 4 (RB)	Right Bank 10 9	8 7 6	5 (4) 3	2 1 0
9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream.	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE 7 (LB)	Left Bank 10 9	8 (7) 6	5 4 3	2 1 0
SCORE 7 (RB)	Right Bank 10 9	8 (7) 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone)	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE 7 (LB)	Left Bank 10 9	8 (7) 6	5 4 3	2 1 0
SCORE 7 (RB)	Right Bank 10 9	8 (7) 6	5 4 3	2 1 0

Only 2 courses within 18m (riparian zone) of zone.

REASON FOR SURVEY Fish Survey	

Parameters to be evaluated in sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
1. Epifaunal Substrate/ Available Cover	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
SCORE 8	20 19 18 17 16	15 14 13 12 11	10 9 (8) 7 6	5 4 3 2 1 0
2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
SCORE 12	20 19 18 17 16	15 14 13 (12) 11	10 9 8 7 6	5 4 3 2 1 0
3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
SCORE 8	20 19 18 17 16	15 14 13 12 11	10 9 (8) 7 6	5 4 3 2 1 0
4. Sediment Deposition	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
SCORE 9	20 19 18 17 16	15 14 13 12 11	10 (9) 8 7 6	5 4 3 2 1 0
5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
SCORE 7	20 19 18 17 16	15 14 13 12 11	10 9 8 (7) 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
SCORE 8	20 19 18 17 16	15 14 13 12 11	10 9 (8) 7 6	5 4 3 2 1 0
7. Channel Sinuosity	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE 7	20 19 18 17 16	15 14 13 12 11	10 9 8 (7) 6	5 4 3 2 1 0
8. Bank Stability (score each bank)	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE 7 (LB)	Left Bank 10 9	8 (7) 6	5 4 3	2 1 0
SCORE 7 (RB)	Right Bank 10 9	8 (7) 6	5 4 3	2 1 0
9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream.	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE 7 (LB)	Left Bank 10 9	8 (7) 6	5 4 3	2 1 0
SCORE 7 (RB)	Right Bank 10 9	8 (7) 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone)	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE 9 (LB)	Left Bank 10 (9)	8 7 6	5 4 3	2 1 0
SCORE 5 (RB)	Right Bank 10 9	8 7 6	(5) 4 3	2 1 0

5 HABITAT ASSESSMENT AND PHYSICOCHEMICAL PARAMETERS

An evaluation of habitat quality is critical to any assessment of ecological integrity and should be performed at each site at the time of the biological sampling. In general, habitat and biological diversity in rivers are closely linked (Raven et al. 1998). In the truest sense, "habitat" incorporates all aspects of physical and chemical constituents along with the biotic interactions. In these protocols, the definition of "habitat" is narrowed to the quality of the instream and riparian habitat that influences the structure and function of the aquatic community in a stream. The presence of an altered habitat structure is considered one of the major stressors of aquatic systems (Karr et al. 1986). The presence of a degraded habitat can sometimes obscure investigations on the effects of toxicity and/or pollution. The assessments performed by many water resource agencies include a general description of the site, a physical characterization and water quality assessment, and a visual assessment of instream and riparian habitat quality. Some states (e.g., Idaho DEQ and Illinois EPA) include quantitative measurements of physical parameters in their habitat assessment. Together these data provide an integrated picture of several of the factors influencing the biological condition of a stream system. These assessments are not as comprehensive as needed to adequately identify all causes of impact. However, additional investigation into hydrological modification of water courses and drainage patterns can be conducted, once impairment is noted.

The habitat quality evaluation can be accomplished by characterizing selected physicochemical parameters in conjunction with a systematic assessment of physical structure. Through this approach, key features can be rated or scored to provide a useful assessment of habitat quality.

5.1 PHYSICAL CHARACTERISTICS AND WATER QUALITY

Both physical characteristics and water quality parameters are pertinent to characterization of the stream habitat. An example of the data sheet used to characterize the physical characteristics and water quality of a site is shown in Appendix A. The information required includes measurements of physical characterization and water quality made routinely to supplement biological surveys.

Physical characterization includes documentation of general land use, description of the stream origin and type, summary of the riparian vegetation features, and measurements of instream parameters such as width, depth, flow, and substrate. The water quality discussed in these protocols are *in situ* measurements of standard parameters that can be taken with a water quality instrument. These are generally instantaneous measurements taken at the time of the survey. Measurements of certain parameters, such as temperature, dissolved oxygen, and turbidity, can be taken over a diurnal cycle and will require instrumentation that can be left in place for extended periods or collects water samples at periodic intervals for measurement. In addition, water samples may be desired to be collected for selected chemical analysis. These chemical samples are transported to an analytical laboratory for processing. The combination of this information (physical characterization and water quality) will provide insight as to the ability of the stream to support a healthy aquatic community, and to the presence of chemical and non-chemical stressors to the stream ecosystem. Information requested in this section (Appendix A-1, Form 1) is standard

to many aquatic studies and allows for some comparison among sites. Additionally, conditions that may significantly affect aquatic biota are documented.

5.1.1 Header Information (Station Identifier)

The header information is identical on all data sheets and requires sufficient information to identify the station and location where the survey was conducted, date and time of survey, and the investigators responsible for the quality and integrity of the data. The stream name and river basin identify the watershed and tributary; the location of the station is described in the narrative to help identify access to the station for repeat visits. The rivermile (if applicable) and latitude/longitude are specific locational data for the station. The station number is a code assigned by the agency that will associate the sample and survey data with the station. The STORET number is assigned to each datapoint for inclusion in USEPA's STORET system. The stream class is a designation of the grouping of homogeneous characteristics from which assessments will be made. For instance, Ohio EPA uses ecoregions and size of stream, Florida DEP uses bioregions (aggregations of subecoregions), and Arizona DEQ uses elevation as a means to identify stream classes. Listing the agency and investigators assigns responsibility to the data collected from the station at a specific date and time. The reason for the survey is sometimes useful to an agency that conducts surveys for various programs and purposes.

5.1.2 Weather Conditions

Note the present weather conditions on the day of the survey and those immediately preceding the day of the survey. This information is important to interpret the effects of storm events on the sampling effort.

5.1.3 Site Location/Map

To complete this phase of the bioassessment, a photograph may be helpful in identifying station location and documenting habitat conditions. Any observations or data not requested but deemed important by the field observer should be recorded. A hand-drawn map is useful to illustrate major landmarks or features of the channel morphology or orientation, vegetative zones, buildings, etc. that might be used to aid in data interpretation.

5.1.4 Stream Characterization

Stream Subsystem: In regions where the perennial nature of streams is important, or where the tidal influence of streams will alter the structure and function of communities, this parameter should be noted.

Stream Type: Communities inhabiting coldwater streams are markedly different from those in warmwater streams, many states have established temperature criteria that differentiate these 2 stream types.

Stream Origin: Note the origination of the stream under study, if it is known. Examples are glacial, montane, swamp, and bog. As the size of the stream or river increases, a mixture of origins of tributaries is likely.

5.1.5 Watershed Features

Collecting this information usually requires some effort initially for a station. However, subsequent surveys will most likely not require an in-depth research of this information.

Predominant Surrounding Land Use Type: Document the prevalent land-use type in the catchment of the station (noting any other land uses in the area which, although not predominant, may potentially affect water quality). Land use maps should be consulted to accurately document this information.

Local Watershed Nonpoint Source Pollution: This item refers to problems and potential problems in the watershed. Nonpoint source pollution is defined as diffuse agricultural and urban runoff. Other compromising factors in a watershed that may affect water quality include feedlots, constructed wetlands, septic systems, dams and impoundments, mine seepage, etc.

Local Watershed Erosion: The existing or potential detachment of soil within the local watershed (the portion of the watershed or catchment that directly affects the stream reach or station under study) and its movement into the stream is noted. Erosion can be rated through visual observation of watershed and stream characteristics (note any turbidity observed during water quality assessment below).

5.1.6 Riparian Vegetation

An acceptable riparian zone includes a buffer strip of a minimum of 18 m (Barton et al. 1985) from the stream on either side. The acceptable width of the riparian zone may also be variable depending on the size of the stream. Streams over 4 m in width may require larger riparian zones. The vegetation within the riparian zone is documented here as the dominant type and species, if known.

5.1.7 Instream Features

Instream features are measured or evaluated in the sampling reach and catchment as appropriate.

Estimated Reach Length: Measure or estimate the length of the sampling reach. This information is important if reaches of variable length are surveyed and assessed.

Estimated Stream Width (in meters, m): Estimate the distance from bank to bank at a transect representative of the stream width in the reach. If variable widths, use an average to find that which is representative for the given reach.

Sampling Reach Area (m^2): Multiply the sampling reach length by the stream width to obtain a calculated surface area.

Estimated Stream Depth (m): Estimate the vertical distance from water surface to stream bottom at a representative depth (use instream habitat feature that is most common in reach) to obtain average depth.

Velocity: Measure the surface velocity in the thalweg of a representative run area. If measurement is not done, estimate the velocity as slow, moderate, or fast.

Canopy Cover: Note the general proportion of open to shaded area which best describes the amount of cover at the sampling reach or station. A densiometer may be used in place of visual estimation.

High Water Mark (m): Estimate the vertical distance from the bankfull margin of the stream bank to the peak overflow level, as indicated by debris hanging in riparian or floodplain vegetation, and deposition of silt or soil. In instances where bank overflow is rare, a high water mark may not be evident.

Proportion of Reach Represented by Stream Morphological Types: The proportion represented by riffles, runs, and pools should be noted to describe the morphological heterogeneity of the reach.

Channelized: Indicate whether or not the area around the sampling reach or station is channelized (e.g., straightening of stream, bridge abutments and road crossings, diversions, etc.).

Dam Present: Indicate the presence or absence of a dam upstream in the catchment or downstream of the sampling reach or station. If a dam is present, include specific information relating to alteration of flow.

5.1.8 Large Woody Debris

Large Woody Debris (LWD) density, defined and measured as described below, has been used in regional surveys (Shields et al. 1995) and intensive studies of degraded and restored streams (Shields et al. 1998). The method was developed for sand or sand-and-gravel bed streams in the Southeastern U.S. that are wadeable at baseflow, with water widths between 1 and 30 m (Cooper and Testa 1999).

Cooper and Testa's (1999) procedure involves measurements based on visual estimates taken by a wading observer. Only woody debris actually in contact with stream water is counted. Each woody debris formation with a surface area in the plane of the water surface >0.25 m^2 is recorded. The estimated length and width of each formation is recorded on a form or marked directly onto a stream reach drawing. Estimates are made to the nearest 0.5 m , and formations with length or width less than 0.5 m are not counted. Recorded length is maximum width in the direction perpendicular to the length. Maximum actual length and width of a limb, log, or accumulation are not considered.

If only a portion of the log/limb is in contact with the water, only that portion in contact is measured. Root wads and logs/limbs in the water margin are counted if they contact the water, and are arbitrarily given a width of 0.5 m Lone individual limbs and logs are included in the determination if their diameter is 10 cm or larger (Keller and Swanson 1979, Ward and Aumen 1986). Accumulations of smaller limbs and logs are included if the formation total length or width is 0.5 m or larger. Standing trees and stumps within the stream are also recorded if their length and width exceed 0.5 m.

The length and width of each LWD formation are then multiplied, and the resulting products are summed to give the aquatic habitat area directly influenced. This area is then divided by the water

surface area (km^2) within the sampled reach (obtained by multiplying the average water surface width by reach length) to obtain LWD density. Density values of 10^3 to 10^4 m^2/km^2 have been reported for channelized and incised streams and on the order of 10^5 m^2/km^2 for non-incised streams (Shields et al. 1995 and 1998). This density is not an expression of the volume of LWD, but rather a measure of LWD influence on velocity, depth, and cover.

5.1.9 Aquatic Vegetation

The general type and relative dominance of aquatic plants are documented in this section. Only an estimation of the extent of aquatic vegetation is made. Besides being an ecological assemblage that responds to perturbation, aquatic vegetation provides refugia and food for aquatic fauna. List the species of aquatic vegetation, if known.

5.1.10 Water Quality

Temperature (°C), Conductivity or "Specific Conductance" (µohms), Dissolved Oxygen (µg/L), pH, Turbidity: Measure and record values for each of the water quality parameters indicated, using the appropriate calibrated water quality instrument(s). Note the type of instrument and unit number used.

Water Odors: Note those odors described (or include any other odors not listed) that are associated with the water in the sampling area.

Water Surface Oils: Note the term that best describes the relative amount of any oils present on the water surface.

Turbidity: If turbidity is not measured directly, note the term which, based upon visual observation, best describes the amount of material suspended in the water column.

5.1.11 Sediment/Substrate

Sediment Odors: Disturb sediment in pool or other depositional areas and note any odors described (or include any other odors not listed) which are associated with sediment in the sampling reach.

Sediment Oils: Note the term which best describes the relative amount of any sediment oils observed in the sampling area.

Sediment Deposits: Note those deposits described (or include any other deposits not listed) that are present in the sampling reach. Also indicate whether the undersides of rocks not deeply embedded are black (which generally indicates low dissolved oxygen or anaerobic conditions).

Inorganic Substrate Components: Visually estimate the relative proportion of each of the 7 substrate/particle types listed that are present over the sampling reach.

Organic Substrate Components: Indicate relative abundance of each of the 3 substrate types listed.

5.2 A VISUAL-BASED HABITAT ASSESSMENT

Biological potential is limited by the quality of the physical habitat, forming the template within which biological communities develop (Southwood 1977). Thus, habitat assessment is defined as the evaluation of the structure of the surrounding physical habitat that influences the quality of the water resource and the condition of the resident aquatic community (Barbour et al. 1996a). For streams, an encompassing approach to assessing structure of the habitat includes an evaluation of the variety and quality of the substrate, channel morphology, bank structure, and riparian vegetation. Habitat parameters pertinent to the assessment of habitat quality include those that characterize the stream "micro scale" habitat (e.g., estimation of embeddeddness), the "macro scale" features (e.g., channel morphology), and the riparian and bank structure features that are most often influential in affecting the other parameters.

EQUIPMENT/SUPPLIES NEEDED FOR HABITAT ASSESSMENT AND PHYSICAL/WATER QUALITY CHARACTERIZATION

- Physical Characterization and Water Quality Field Data Sheet*
- Habitat Assessment Field Data Sheet*
- clipboard
- pencils or waterproof pens
- 35 mm camera (may be digital)
- video camera (optional)
- upstream/downstream “arrows” or signs for photographing and documenting sampling reaches
- Flow or velocity meter
- *In situ* water quality meters
- Global Positioning System (GPS) Unit

* It is helpful to copy field sheets onto water-resistant paper for use in wet weather conditions

Rosgen (1985, 1994) presented a stream and river classification system that is founded on the premise that dynamically-stable stream channels have a morphology that provides appropriate distribution of flow energy during storm events. Further, he identifies 8 major variables that affect the stability of channel morphology, but are not mutually independent: channel width, channel depth, flow velocity, discharge, channel slope, roughness of channel materials, sediment load and sediment particle size distribution. When streams have one of these characteristics altered, some of their capability to dissipate energy properly is lost (Leopold et al. 1964, Rosgen 1985) and will result in accelerated rates of channel erosion. Some of the habitat structural components that function to dissipate flow energy are:

- sinuosity
- roughness of bed and bank materials
- presence of point bars (slope is an important characteristic)
- vegetative conditions of stream banks and the riparian zone
- condition of the floodplain (accessibility from bank, overflow, and size are important characteristics).

Measurement of these parameters or characteristics serve to stratify and place streams into distinct classifications. However, none of these habitat classification techniques attempt to differentiate the quality of the habitat and the ability of the habitat to support the optimal biological condition of the

region. Much of our understanding of habitat relationships in streams has emerged from comparative studies that describe statistical relationships between habitat variables and abundance of biota (Hawkins et al. 1993). However, in response to the need to incorporate broader scale habitat assessments in water resource programs, 2 types of approaches for evaluating habitat structure have been developed. In the first, the Environmental Monitoring and Assessment Program (EMAP) of the USEPA and the National Water-Quality Assessment Program (NAWQA) of the USGS developed techniques that incorporate measurements of various features of the instream, channel, and bank morphology (Meader et al. 1993, Klemm and Lazorchak 1994). These techniques provide a relatively comprehensive characterization of the physical structure of the stream sampling reach and its surrounding floodplain. The second type was a more rapid and qualitative habitat assessment approach that was developed to describe the overall quality of the physical habitat (Ball 1982, Ohio EPA 1987, Plafkin et al. 1989, Barbour and Stribling 1991, 1994, Rankin 1991, 1995). In this document, the more rapid visual-based approach is described. A cursory overview of the more quantitative approaches to characterizing the physical structure of the habitat is provided.

The habitat assessment matrix developed for the Rapid Bioassessment Protocols (RBPs) in Plafkin et al. (1989) were originally based on the Stream Classification Guidelines for Wisconsin developed by Ball (1982) and "*Methods of Evaluating Stream, Riparian, and Biotic Conditions*" developed by Platts et al. (1983). Barbour and Stribling (1991, 1994) modified the habitat assessment approach originally developed for the RBPs to include additional assessment parameters for high gradient streams and a more appropriate parameter set for low gradient streams (Appendix A-1, Forms 2,3). All parameters are evaluated and rated on a numerical scale of 0 to 20 (highest) for each sampling reach. The ratings are then totaled and compared to a reference condition to provide a final habitat ranking. Scores increase as habitat quality increases. To ensure consistency in the evaluation procedure, descriptions of the physical parameters and relative criteria are included in the rating form.

The Environmental Agency of Great Britain (Environment Agency of England and Wales, Scottish Environment Protection Agency, and Environment and Heritage Service of Northern Ireland) have developed a River Habitat Survey (RHS) for characterizing the quality of their streams and rivers (Raven et al. 1998). The approach used in Great Britain is similar to the visual-based habitat assessment used in the US in that scores are assigned to ranges of conditions of various habitat parameters.

A biologist who is well versed in the ecology and zoogeography of the region can generally recognize optimal habitat structure as it relates to the biological community. The ability to accurately assess the quality of the physical habitat structure using a visual-based approach depends on several factors:

- the parameters selected to represent the various features of habitat structure need to be relevant and clearly defined
- a continuum of conditions for each parameter must exist that can be characterized from the optimum for the region or stream type under study to the poorest situation reflecting substantial alteration due to anthropogenic activities

- the judgement criteria for the attributes of each parameter should minimize subjectivity through either quantitative measurements or specific categorical choices

- the investigators are experienced in or adequately trained for stream assessments in the region under study (Hannaford et al. 1997)

- adequate documentation and ongoing training is maintained to evaluate and correct errors resulting in outliers and aberrant assessments.

Habitat evaluations are first made on instream habitat, followed by channel morphology, bank structural features, and riparian vegetation. Generally, a single, comprehensive assessment is made that incorporates features of the entire sampling reach as well as selected features of the catchment. Additional assessments may be made on neighboring reaches to provide a broader evaluation of habitat quality for the stream ecosystem. The actual habitat assessment process involves rating the 10 parameters as optimal, suboptimal, marginal, or poor based on the criteria included on the Habitat Assessment Field Data Sheets (Appendix A-1, Forms 2,3). Some state programs, such as Florida Department of Environmental Protection (DEP) (1996) and Mid-Atlantic Coastal Streams Workgroup (MACS) (1996) have adapted this approach using somewhat fewer and different parameters.

Reference conditions are used to scale the assessment to the "best attainable" situation. This approach is critical to the assessment because stream characteristics will vary dramatically across different regions (Barbour and Stribling 1991). The ratio between the score for the test station and the score for the reference condition provides a percent comparability measure for each station. The station of interest is then classified on the basis of its similarity to expected conditions (reference condition), and its apparent potential to support an acceptable level of biological health. Use of a percent comparability evaluation allows for regional and stream-size differences which affect flow or velocity, substrate, and channel morphology. Some regions are characterized by streams having a low channel gradient, such as coastal plains or prairie regions.

Other habitat assessment approaches or a more rigorously quantitative approach to measuring the habitat parameters may be used (See Klemm and Lazorchak 1994, Kaufmann and Robison 1997, Meader et al. 1993). However, holistic and rapid assessment of a wide variety of habitat attributes along with other types of data is critical if physical measurements are to be used to best advantage in interpreting biological data. A more detailed discussion of the relationship between habitat quality and biological condition is presented in Chapter 10.

A generic habitat assessment approach based on visual observation can be separated into 2 basic approaches—one designed for high-gradient streams and one designed for low-gradient streams. High-gradient or riffle/run prevalent streams are those in moderate to high gradient landscapes. Natural high-gradient streams have substrates primarily composed of coarse sediment particles (i.e., gravel or larger) or frequent coarse particulate aggregations along stream reaches. Low-gradient or glide/pool prevalent streams are those in low to moderate gradient landscapes. Natural low-gradient streams have substrates of fine sediment or infrequent aggregations of more coarse (gravel or larger) sediment particles along stream reaches. The entire sampling reach is evaluated for each parameter. Descriptions of each parameter and its relevance to instream biota are presented in the following discussion. Parameters that are used only for high-gradient prevalent streams are marked with an “a”; those for low-gradient dominant streams, a “b”. If a parameter is used for both stream types, it is not marked with a letter. A brief set of decision criteria is given

for each parameter corresponding to each of the 4 categories reflecting a continuum of conditions on the field sheet (optimal, suboptimal, marginal, and poor). Refer to Appendix A-1, Forms 2 and 3, for a complete field assessment guide.

PROCEDURE FOR PERFORMING HABITAT ASSESSMENT

1. Select the reach to be assessed. The habitat assessment is performed on the same 100 m reach (or other reach designation [e.g., 40 x stream wetted width]) from which the biological sampling is conducted. Some parameters require an observation of a broader section of the catchment than just the sampling reach.

2. Complete the station identification section of each field data sheet and habitat assessment form.

3. It is best for the investigators to obtain a close look at the habitat features to make an adequate assessment. If the physical and water quality characterization and habitat assessment are done before the biological sampling, care must be taken to avoid disturbing the sampling habitat.

4. Complete the **Physical Characterization and Water Quality Field Data Sheet**. Sketch a map of the sampling reach on the back of this form.

5. Complete the **Habitat Assessment Field Data Sheet**, in a team of 2 or more biologists, if possible, to come to a consensus on determination of quality. Those parameters to be evaluated on a scale greater than a sampling reach require traversing the stream corridor to the extent deemed necessary to assess the habitat feature. As a general rule-of-thumb, use 2 lengths of the sampling reach to assess these parameters.

QUALITY ASSURANCE PROCEDURES

1. Each biologist is to be trained in the visual-based habitat assessment technique for the applicable region or state.

2. The judgment criteria for each habitat parameter are calibrated for the stream classes under study. Some text modifications may be needed on a regional basis.

3. Periodic checks of assessment results are completed using pictures of the sampling reach and discussions among the biologists in the agency.

Parameters to be evaluated in sampling reach:

1 EPIFAUNAL SUBSTRATE/AVAILABLE COVER

high and low gradient streams

Includes the relative quantity and variety of natural structures in the stream, such as cobble (riffles), large rocks, fallen trees, logs and branches, and undercut banks, available as refugia, feeding, or sites for spawning and nursery functions of aquatic macrofauna. A wide variety and/or abundance of submerged structures in the stream provides macroinvertebrates and fish with a large number of niches, thus increasing habitat diversity. As variety and abundance of cover decreases, habitat structure becomes monotonous, diversity decreases, and the potential for recovery following disturbance decreases. Riffles and runs are critical for maintaining a variety and abundance of insects in most high-gradient streams and serving as spawning and feeding refugia for certain fish. The extent and quality of the riffle is an important factor in the support of a healthy biological condition in high-gradient streams. Riffles and runs offer a diversity of habitat through variety of particle size, and, in many small high-gradient streams, will provide the most stable habitat. Snags and submerged logs are among the most productive habitat structure for macroinvertebrate colonization and fish refugia in low-gradient streams. However, "new fall" will not yet be suitable for colonization.

Optimal Range (*Mary Kay Corazalla, U. of Minn.*)

Poor Range

2a EMBEDDEDNESS

high gradient streams

Refers to the extent to which rocks (gravel, cobble, and boulders) and snags are covered or sunken into the silt, sand, or mud of the stream bottom. Generally, as rocks become embedded, the surface area available to macroinvertebrates and fish (shelter, spawning, and egg incubation) is decreased. Embeddedness is a result of large-scale sediment movement and deposition, and is a parameter evaluated in the riffles and runs of high-gradient streams. The rating of this parameter may be variable depending on where the observations are taken. To avoid confusion with sediment deposition (another habitat parameter), observations of embeddedness should be taken in the upstream and central portions of riffles and cobble substrate areas.

Optimal Range *(William Taft, MI DNR)*

Poor Range *(William Taft, MI DNR)*

2b POOL SUBSTRATE CHARACTERIZATION

low gradient streams

Evaluates the type and condition of bottom substrates found in pools. Firmer sediment types (e.g., gravel, sand) and rooted aquatic plants support a wider variety of organisms than a pool substrate dominated by mud or bedrock and no plants. In addition, a stream that has a uniform substrate in its pools will support far fewer types of organisms than a stream that has a variety of substrate types.

Poor Range

3a VELOCITY/DEPTH COMBINATIONS

high gradient streams

Patterns of velocity and depth are included for high-gradient streams under this parameter as an important feature of habitat diversity. The best streams in most high-gradient regions will have all 4 patterns present: (1) slow-deep, (2) slow-shallow, (3) fast-deep, and (4) fast-shallow. The general guidelines are 0.5 m depth to separate shallow from deep, and 0.3 m/sec to separate fast from slow. The occurrence of these 4 patterns relates to the stream's ability to provide and maintain a stable aquatic environment.

Optimal Range *(Mary Kay Corazalla, U. of Minn.)*
(arrows emphasize different velocity/depth regimes)

Poor Range *(William Taft, MI DNR)*

3b POOL VARIABILITY

low gradient streams

Rates the overall mixture of pool types found in streams, according to size and depth. The 4 basic types of pools are large-shallow, large-deep, small-shallow, and small-deep. A stream with many pool types will support a wide variety of aquatic species. Rivers with low sinuosity (few bends) and monotonous pool characteristics do not have sufficient quantities and types of habitat to support a diverse aquatic community. General guidelines are any pool dimension (i.e., length, width, oblique) greater than half the cross-section of the stream for separating large from small and 1 m depth separating shallow and deep.

Optimal Range *(Peggy Morgan, FL DEP)*

Poor Range *(William Taft, MI DNR)*

4 SEDIMENT DEPOSITION

high and low gradient streams

Measures the amount of sediment that has accumulated in pools and the changes that have occurred to the stream bottom as a result of deposition. Deposition occurs from large-scale movement of sediment. Sediment deposition may cause the formation of islands, point bars (areas of increased deposition usually at the beginning of a meander that increase in size as the channel is diverted toward the outer bank) or shoals, or result in the filling of runs and pools. Usually deposition is evident in areas that are obstructed by natural or manmade debris and areas where the stream flow decreases, such as bends. High levels of sediment deposition are symptoms of an unstable and continually changing environment that becomes unsuitable for many organisms.

5 CHANNEL FLOW STATUS

high and low gradient streams

The degree to which the channel is filled with water. The flow status will change as the channel enlarges (e.g., aggrading stream beds with actively widening channels) or as flow decreases as a result of dams and other obstructions, diversions for irrigation, or drought. When water does not cover much of the streambed, the amount of suitable substrate for aquatic organisms is limited. In high-gradient streams, riffles and cobble substrate are exposed; in low-gradient streams, the decrease in water level exposes logs and snags, thereby reducing the areas of good habitat. Channel flow is especially useful for interpreting biological condition under abnormal or lowered flow conditions. This parameter becomes important when more than one biological index period is used for surveys or the timing of sampling is inconsistent among sites or annual periodicity.

Parameters to be evaluated broader than sampling reach:

6 CHANNEL ALTERATION

high and low gradient streams

Is a measure of large-scale changes in the shape of the stream channel. Many streams in urban and agricultural areas have been straightened, deepened, or diverted into concrete channels, often for flood control or irrigation purposes. Such streams have far fewer natural habitats for fish, macroinvertebrates, and plants than do naturally meandering streams. Channel alteration is present when artificial embankments, riprap, and other forms of artificial bank stabilization or structures are present; when the stream is very straight for significant distances; when dams and bridges are present; and when other such changes have occurred. Scouring is often associated with channel alteration.

7a FREQUENCY OF RIFFLES (OR BENDS)

high gradient streams

Is a way to measure the sequence of riffles and thus the heterogeneity occurring in a stream. Riffles are a source of high-quality habitat and diverse fauna, therefore, an increased frequency of occurrence greatly enhances the diversity of the stream community. For high gradient streams where distinct riffles are uncommon, a run/bend ratio can be used as a measure of meandering or sinuosity (see 7b). A high degree of sinuosity provides for diverse habitat and fauna, and the stream is better able to handle surges when the stream fluctuates as a result of storms. The absorption of this energy by bends protects the stream from excessive erosion and flooding and provides refugia for benthic invertebrates and fish during storm events. To gain an appreciation of this parameter in some streams, a longer segment or reach than that designated for sampling should be incorporated into the evaluation. In some situations, this parameter may be rated from viewing accurate topographical maps. The "sequencing" pattern of the stream morphology is important in rating this parameter. In headwaters, riffles are usually continuous and the presence of cascades or boulders provides a form of sinuosity and enhances the structure of the stream. A stable channel is one that does not exhibit progressive changes in slope, shape, or dimensions, although short-term variations may occur during floods (Gordon et al. 1992).

Selected References

Hupp and Simon 1991, Brussock and Brown 1991, Platts et al. 1983, Rankin 1991, Rosgen 1985, 1994, 1996, Osborne and Hendricks 1983, Hughes and Omernik 1983, Cushman 1985, Bain and Boltz 1989, Gislason 1985, Hawkins et al. 1982, Statzner et al. 1988.

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
7a. Frequency of Riffles (or bends) **(high gradient)**	Occurrence of riffles relatively frequent; ratio of distance between riffles divided by width of the stream <7:1 (generally 5 to 7); variety of habitat is key. In streams where riffles are continuous, placement of boulders or other large, natural obstruction is important.	Occurrence of riffles infrequent; distance between riffles divided by the width of the stream is between 7 to 15.	Occasional riffle or bend; bottom contours provide some habitat; distance between riffles divided by the width of the stream is between 15 to 25.	Generally all flat water or shallow riffles; poor habitat; distance between riffles divided by the width of the stream is a ratio of >25.

Optimal Range
(arrows showing frequency of riffles and bends)

Poor Range

7b

CHANNEL SINUOSITY

low gradient streams

Evaluates the meandering or sinuosity of the stream. A high degree of sinuosity provides for diverse habitat and fauna, and the stream is better able to handle surges when the stream fluctuates as a result of storms. The absorption of this energy by bends protects the stream from excessive erosion and flooding and provides refugia for benthic invertebrates and fish during storm events. To gain an appreciation of this parameter in low gradient streams, a longer segment or reach than that designated for sampling may be incorporated into the evaluation. In some situations, this parameter may be rated from viewing accurate topographical maps. The "sequencing" pattern of the stream morphology is important in rating this parameter. In "oxbow" streams of coastal areas and deltas, meanders are highly exaggerated and transient. Natural conditions in these streams are shifting channels and bends, and alteration is usually in the form of flow regulation and diversion. A stable channel is one that does not exhibit progressive changes in slope, shape, or dimensions, although short-term variations may occur during floods (Gordon et al. 1992).

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
7b. Channel Sinuosity **(low gradient)**	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 2 to 3 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0

7b. Channel Sinuosity—Low Gradient

Optimal Range

Poor Range

8 BANK STABILITY (condition of banks)

high and low gradient streams

Measures whether the stream banks are eroded (or have the potential for erosion). Steep banks are more likely to collapse and suffer from erosion than are gently sloping banks, and are therefore considered to be unstable. Signs of erosion include crumbling, unvegetated banks, exposed tree roots, and exposed soil. Eroded banks indicate a problem of sediment movement and deposition, and suggest a scarcity of cover and organic input to streams. Each bank is evaluated separately and the cumulative score (right and left) is used for this parameter.

9 BANK VEGETATIVE PROTECTION

high and low gradient streams

Measures the amount of vegetative protection afforded to the stream bank and the near-stream portion of the riparian zone. The root systems of plants growing on stream banks help hold soil in place, thereby reducing the amount of erosion that is likely to occur. This parameter supplies information on the ability of the bank to resist erosion as well as some additional information on the uptake of nutrients by the plants, the control of instream scouring, and stream shading. Banks that have full, natural plant growth are better for fish and macroinvertebrates than are banks without vegetative protection or those shored up with concrete or riprap. This parameter is made more effective by defining the native vegetation for the region and stream type (i.e., shrubs, trees, etc.). In some regions, the introduction of exotics has virtually replaced all native vegetation. The value of exotic vegetation to the quality of the habitat structure and contribution to the stream ecosystem must be considered in this parameter. In areas of high grazing pressure from livestock or where residential and urban development activities disrupt the riparian zone, the growth of a natural plant community is impeded and can extend to the bank vegetative protection zone. Each bank is evaluated separately and the cumulative score (right and left) is used for this parameter.

10 RIPARIAN VEGETATIVE ZONE WIDTH

high and low gradient streams

Measures the width of natural vegetation from the edge of the stream bank out through the riparian zone. The vegetative zone serves as a buffer to pollutants entering a stream from runoff, controls erosion, and provides habitat and nutrient input into the stream. A relatively undisturbed riparian zone supports a robust stream system; narrow riparian zones occur when roads, parking lots, fields, lawns, bare soil, rocks, or buildings are near the stream bank. Residential developments, urban centers, golf courses, and rangeland are the common causes of anthropogenic degradation of the riparian zone. Conversely, the presence of "old field" (i.e., a previously developed field not currently in use), paths, and walkways in an otherwise undisturbed riparian zone may be judged to be inconsequential to altering the riparian zone and may be given relatively high scores. For variable size streams, the specified width of a desirable riparian zone may also be variable and may be best determined by some multiple of stream width (e.g., 4 x wetted stream width). Each bank is evaluated separately and the cumulative score (right and left) is used for this parameter.

5.3 ADDITIONS OF QUANTITATIVE MEASURES TO THE HABITAT ASSESSMENT

Kaufmann (1993) identified 7 general physical habitat attributes important in influencing stream ecology. These include:

- channel dimensions
- channel gradient
- channel substrate size and type
- habitat complexity and cover
- riparian vegetation cover and structure
- anthropogenic alterations
- channel-riparian interaction.

All of these attributes vary naturally, as do biological characteristics; thus expectations differ even in the absence of anthropogenic disturbances. Within a given physiographic-climatic region, stream drainage area and overall stream gradient are likely to be strong natural determinants of many aspects of stream habitat, because of their influence on discharge, flood stage, and stream power (the product of discharge times gradient). In addition, all of these attributes may be directly or indirectly altered by anthropogenic activities.

In Section 5.2, an approach is described whereby habitat quality is interpreted directly in the field by biologists while sampling the stream reach. This Level 1 approach is observational and requires only one person (although a team approach is recommended) and takes about 15 to 20 minutes per stream reach. This approach more quickly yields a habitat quality assessment. However, it depends upon the knowledge and experience of the field biologist to make the proper interpretation of observed of both the natural expectations (potentials) and the biological consequences (quality) that can be attributed to the observed physical attributes. Hannaford et al. (1997) found that training in habitat assessment was necessary to reduce the subjectivity in a visual-based approach. The authors also stated that training on different types of streams may be necessary to adequately prepare investigators.

The second conceptual approach described here confines observations to habitat characteristics themselves (whether they are quantitative or qualitative), then later ascribing quality scoring to these measurements as part of the data analysis process. Typically, this second type of habitat assessment approach employs more quantitative data collection, as exemplified by field methods described by Kaufmann and Robison (1997) for EMAP, Simonson et al. (1994), Meador et al. (1993) for NAWQA, and others cited by Gurtz and Muir (1994). These field approaches typically define a reach length proportional to stream width and employ transect measurements that are systematically spaced (Simonson et al. 1994, Kaufmann and Robison 1997) or spaced by judgement to be representative (Meador et al. 1993). They usually include measurement of substrate, channel and bank dimensions, riparian canopy cover, discharge, gradient, sinuosity, in-channel cover features, and counts of large woody debris and riparian human disturbances. They may employ systematic visual estimates of substrate embeddedness, fish cover features, habitat

types, and riparian vegetation structure. The time commitment in the field to these more quantitative habitat assessment methods is usually 1.5 to 3 hours with a crew of two people. Because of the greater amount of data collected, they also require more time for data summarization, analysis, and interpretation. On the other hand, the more quantitative methods and less ambiguous field parameters result in considerably greater precision. The USEPA applied both quantitative and visual-based (RBPs) methods in a stream survey undertaken over 4 years in the mid-Atlantic region of the Appalachian Mountains. An earlier version of the RBP techniques were applied on 301 streams with repeat visits to 29 streams; signal-to-noise ratios varied from 0.1 to 3.0 for the twelve RBP metrics and averaged (1.1 for the RBP total habitat quality score). The quantitative methods produced a higher level of precision; signal-to-noise ratios were typically between 10 and 50, and sometimes in excess of 100 for quantitative measurements of channel morphology, substrate, and canopy densiometer measurements made on a random subset of 186 streams with 27 repeat visits in the same survey. Similarly, semi-quantitative estimates of fish cover and riparian human disturbance estimates obtained from multiple, systematic visual observations of otherwise measurable features had signal:noise ratios from 5 to 50. Many riparian vegetation cover and structure metrics were moderately precise (signal:noise ranging from 2 to 30). Commonly used flow dependent measures (e.g., riffle/pool and width/depth ratios), and some visual riparian cover estimates were less precise, with signal:noise ratios more in the range of those observed for metrics of the EPA's RBP habitat score (<2).

The USEPA's EMAP habitat assessment field methods are presented as an option for a second level (II) of habitat assessment. These methods have been applied in numerous streams throughout the Mid-Atlantic region, the Midwest, Colorado, California, and the Pacific Northwest. Table 5-1 is a summary of these field methods; more detail is presented in the field manual by Kaufmann and Robison (1997).

Table 5-1. Components of EMAP physical habitat protocol.

Component	Description
1. Thalweg Profile	Measure maximum depth, classify habitat, determine presence of soft/small sediment at 10-15 equally spaced intervals between each of 11 channel cross-sections (100-150 along entire reach). Measure wetted width at 11 channel cross-sections and mid-way between cross-sections (21 measurements).
2. Woody Debris	Between each of the channel cross sections, tally large woody debris numbers within and above the bankfull channel according to size classes.
3. Channel and Riparian Cross-Sections	At 11 cross-section stations placed at equal intervals along reach length: • **Measure**: channel cross section dimensions, bank height, undercut, angle (with rod and clinometer); gradient (clinometer), sinuosity (compass backsite), riparian canopy cover (densiometer). • **Visually Estimate***: substrate size class and embeddedness; areal cover class and type (e.g., woody) of riparian vegetation in Canopy, Mid-Layer and Ground Cover; areal cover class of fish concealment features, aquatic macrophytes and filamentous algae. • **Observe & Record***: human disturbances and their proximity to the channel.
4. Discharge	In medium and large streams (defines later) measure water depth and velocity @ 0.6 depth (with electromagnetic or impeller-type flow meter) at 15 to 20 equally spaced intervals across one carefully chosen channel cross-section. In very small streams, measure discharge with a portable weir or time the filling of a bucket.

* Substrate size class and embeddedness are estimated, and depth is measured for 55 particles taken at 5 equally-spaced points on each of 11 cross-sections. The cross-section is defined by laying the surveyor's rod or tape to span the wetted channel. Woody

debris is tallied over the distance between each cross-section and the next cross-section upstream. Riparian vegetation and human disturbances are observed 5 m upstream and 5 m downstream from the cross section station. They extend shoreward 10 m from left and right banks. Fish cover types, aquatic macrophytes, and algae are observed within channel 5 m upstream and 5 m downstream from the cross section stations. These boundaries for visual observations are estimated by eye.

Table 5-2 lists the physical habitat metrics that can be derived from applying these field methods. Once these habitat metrics are calculated from the available physical habitat data, an assessment would be obtained from comparing these metric values to those of known reference sites. A strong deviation from the reference expectations would indicate a habitat alteration of the particular parameter. The close connectivity of the various attributes would most likely result in an impact on multiple metrics if habitat alteration was occurring. The actual process for interpreting a habitat assessment using this approach is still under development.

Table 5-2. Example of habitat metrics that can be calculated from the EMAP physical habitat data.

Channel mean width and depth
Channel volume and Residual Pool volume
Mean channel slope and sinuosity
Channel incision, bankfull dimensions, and bank characteristics
Substrate mean diameter, % fines, % embeddedness
Substrate stability
Fish concealment features (areal cover of various types, e.g., undercut banks, brush)
Large woody debris (volume and number of pieces per 100 m)
Channel habitat types (e.g., % of reach composed of pools, riffles, etc.)
Canopy cover
Riparian vegetation structure and complexity
Riparian disturbance measure (proximity-weighted tally of human disturbances)

8 FISH PROTOCOLS

Monitoring of the fish assemblage is an integral component of many water quality management programs, and its importance is reflected in the aquatic life use-support designations of many states. Narrative expressions such as “maintaining coldwater fisheries”, “fishable” or “fish propagation” are prevalent in state standards. Assessments of the fish assemblage must measure the overall structure and function of the ichthyofaunal community to adequately evaluate biological integrity and protect surface water resource quality. Fish bioassessment data quality and comparability are assured through the utilization of qualified fisheries professionals and consistent methods.

The Rapid Bioassessment Protocol (RBP) for fish presented in this document, is directly comparable to RBP V in Plafkin et al. (1989). The principal evaluation mechanism utilizes the technical framework of the Index of Biotic Integrity (IBI) — a fish assemblage assessment approach developed by Karr (1981). The IBI incorporates the zoogeographic, ecosystem, community and population aspects of the fish assemblage into a single ecologically-based index. Calculation and interpretation of the IBI involves a sequence of activities including: fish sample collection; data tabulation; and regional modification and calibration of metrics and expectation values. This concept has provided the overall multimetric index framework for rapid bioassessment in this document. A more detailed description of this approach for fish is presented in Karr et al. (1986) and Ohio EPA (1987). Regional modification and applications are described in Leonard and Orth (1986), Moyle et al. (1986), Hughes and Gammon (1987), Wade and Stalcup (1987), Miller et al. (1988), Steedman (1988), Simon (1991), Lyons (1992a), Simon and Lyons (1995), Lyons et al. (1996), and Simon (1999).

The RBP for fish involves careful, standardized field collection, species identification and enumeration, and analyses using aggregated biological attributes or quantification of the numbers (and in some cases biomass, see Section 8.3.3, Metric 13) of key species. The role of experienced fisheries scientists in the adaptation and application of the RBP and the taxonomic identification of fishes cannot be overemphasized. The fish RBP survey yields an objective discrete measure of the condition of the fish assemblage. Although the fish survey can usually be completed in the field by qualified fish biologists, difficult species identifications will require laboratory confirmation. Data provided by the fish RBP can serve to assess use attainment, develop biological criteria, prioritize sites for further evaluation, provide a reproducible impact assessment, and evaluate status and trends of the fish assemblage.

Fish collection procedures must focus on a multihabitat approach — sampling habitats in relative proportion to their local representation (as determined during site reconnaissance). Each sample reach should contain riffle, run and pool habitat, when available. Whenever possible, the reach should be sampled sufficiently upstream of any bridge or road crossing to minimize the hydrological effects on overall habitat quality. Wadeability and accessability may ultimately govern the exact placement of the sample reach. A habitat assessment is performed and physical/chemical parameters measured concurrently with fish sampling to document and characterize available habitat specifics within the sample reach (see Chapter 5: Habitat Assessment and Physicochemical Characterization).

8.1 FISH COLLECTION PROCEDURES: ELECTROFISHING

All fish sampling gear types are generally considered selective to some degree; however, electrofishing has proven to be the most comprehensive and effective *single* method for collecting stream fishes. Pulsed DC (direct current) electrofishing is the method of choice to obtain a representative sample of the fish assemblage at each sampling station. However, electrofishing in any form has been banned from certain salmonid spawning streams in the northwest. As with any fish sampling method, the proper scientific collection permit(s) must be obtained before commencement of any electrofishing activities. The accurate identification of each fish collected is essential, and species-level identification is required (including hybrids in some cases, see Section 8.3.3, Metric 11). Field identifications are acceptable; however, voucher specimens must be retained for laboratory verification, particularly if there is any doubt about the correct identity of the specimen (see Section 8.2). Because the collection methods used are not consistently effective for young-of-the-year fish and because their inclusion may seasonally skew bioassessment results, fish less than 20 millimeters total length will not be identified or included in standard samples.

ELECTROFISHING CONFIGURATION AND FIELD TEAM ORGANIZATION

All field team members must be trained in electrofishing safety precautions and unit operation procedures identified by the electrofishing unit manufacturer. Each team member must be insulated from the water and the electrodes; therefore, chest waders and rubber gloves are required. Electrode and dip net handles must be constructed of insulating materials (e.g., woods, fiberglass). Electrofishers/electrodes must be equipped with functional safety switches (as installed by virtually all electrofisher manufacturers). Field team members must not reach into the water unless the electrodes have been removed from the water or the electrofisher has been disengaged.

It is recommended that at least 2 fish collection team members be certified in CPR (cardiopulmonary resuscitation). *Many* options exist for electrofisher configuration and field team organization; however, procedures will always involve pulsed DC electrofishing and a minimum 2-person team for sampling streams and wadeable rivers. Examples include:

- Backpack electrofisher with 2 hand-held electrodes mounted on fiberglass poles, one positive (anode) and one negative (cathode). One crew member, identified as the electrofisher unit operator, carries the backpack unit and manipulates both the anode and cathode poles. The anode may be fitted with a net ring (and shallow net) to allow the unit operator to net specimens. The remaining 1 or 2 team members net fish with dip nets and are responsible for specimen transport and care in buckets or livewells.

- Backpack electrofisher with 1 hand-held anode pole and a trailing or floating cathode. The electrofisher unit operator manipulates the anode with one hand, and has a second hand free for use of a dip net. The remaining 1 or 2 team members also aid in the netting of specimens, and in addition are responsible for specimen transport in buckets or livewells.

- Tote barge (pramunit) electrofisher with 2 hand-held anode poles and a trailing/floating cathode (recommended for large streams and wadeable rivers). Two team members are each equipped with an anode pole and a dip net. Each is responsible for electrofishing and the netting of specimens. The remaining team member will follow, pushing or pulling the barge through the sample reach. A livewell is maintained within the barge and/or within the sampling reach but outside the area of electric current.

The safety of all personnel and the quality of the data is assured through the adequate education, training, and experience of all members of the fish collection team. At least 1 biologist with training and experience in electrofishing techniques and fish taxonomy *must* be involved in each sampling event. Laboratory analyses are conducted and/or supervised by a fisheries professional trained in fish taxonomy. Quality assurance and quality control must be a continuous process in fisheries monitoring and assessment, and must include all program aspects (i.e., field sampling, habitat measurement, laboratory processing, and data recording).

Tote barge (pram unit) Electrofishing

Backpack Electrofishing

FIELD EQUIPMENT/SUPPLIES NEEDED FOR FISH SAMPLING—ELECTROFISHING

- appropriate scientific collection permit(s)
- backpack or tote barge-mounted electrofisher
- dip nets
- block nets (i.e., seines)
- elbow-length insulated waterproof gloves
- chest waders (equipped with wading cleats, when necessary)
- polarized sunglasses
- buckets/livewells
- jars for voucher/reference specimens
- waterproof jar labels
- 10% buffered formalin (formaldehyde solution)
- measuring board (500 mm minimum, with 1 mm increments)[a]
- balance (gram scale)[b]
- tape measure (100 m minimum)
- fish Sampling Field Data Sheet[c]
- applicable topographic maps
- copies of field protocols
- pencils, clipboard
- first aid kit
- Global Positioning System (GPS) Unit

[a] Needed only if program/study requires length frequency information

[b] Needed only if total biomass and/or the Index of Well-Being are included in the assessment process (see Section 8.3.3, Metric 13).

[c] It is helpful to copy fieldsheets onto water-resistant paper for use in wet weather conditions.

8.1.1 Field Sampling Procedures

1. A representative stream reach (see Alternatives for Stream Reach Designation, next page) is selected and measured such that primary physical habitat characteristics of the stream are included within the reach (e.g., riffle, run and pool habitats, when available). The sample reach should be located away from the influences of major tributaries and

bridge/road crossings (e.g., sufficiently upstream to decrease influences on overall habitat quality). The exact location (i.e., latitude and longitude) of the downstream limit of the reach must be recorded on each field data sheet. (If a Global Positioning System unit is used to provide location information, the accuracy or design confidence of the unit should be noted.) A habitat assessment and physical/chemical characterization of water quality should be performed within the same sampling reach (see Chapter 5: Habitat Assessment and Physicochemical Characterization).

2. Collection via electrofishing begins at a shallow riffle, or other physical barrier at the downstream limit of the sample reach, and terminates at a similar barrier at the upstream end of the reach. In the absence of physical barriers, block nets should be set at the upstream and downstream ends of the reach prior to the initiation of any sampling activities.

ALTERNATIVES FOR STREAM REACH DESIGNATION

The collection of a representative sample of the fish assemblage is essential, and the appropriate sampling station length for obtaining that sample is best determined by conducting pilot studies (Lyons 1992b, Simonson et al. 1994, Simonson and Lyons 1995). Alternatives for the designation of stream sampling reaches include:

- **Fixed-distance designation**—A standard length of stream, e.g., a 150-200-meter reach (Ohio EPA 1987), 100-meter reach (Massachusetts DEP 1995) may be used to obtain a representative sample. Conceptually, this approach should provide a mixture of habitats in the reach and provide, at a minimum, duplicate physical and structural elements such as riffle/pool sequences.

- **Proportional-distance designation**— A standard number of stream channel "widths" may be used to measure the stream study reach, e.g., 40 times the stream width is defined by Environmental Monitoring & Assessment Program (EMAP) for sampling (Klemm and Lazorchak 1995). This approach allows variation in the length of the reach based on the size of the stream. Application of the proportional-distance approach in large streams or wadeable rivers may require the establishment of sampling program time and/or distance maxima (e.g., no more than 3 hours of electrofishing or 500-meter reach per sampling site, [Klemm et al. 1993]).

3. Fish collection procedures commence at the downstream barrier. A minimum 2-person fisheries crew proceeds to electrofish in an upstream direction using a side-to-side or bank-to-bank sweeping technique to maximize area coverage. All wadeable habitats within the reach are sampled via a single pass, which terminates at the upstream barrier. Fish are held in livewells (or buckets) for subsequent identification and enumeration.

4. Sampling efficiency is dependent, at least in part, on water clarity and the field team's ability to see and net the stunned fish. Therefore, each team member should wear polarized sunglasses, and sampling is conducted only during periods of optimal water clarity and flow.

5. All fish (greater than 20 millimeters total length) collected within the sample reach must be identified to species (or subspecies). Specimens that cannot be identified with certainty in the field are preserved in a 10% formalin solution and stored in labeled jars for subsequent laboratory identification (see Section 8.2). A representative voucher collection must be retained for unidentified specimens, very small specimens, new locality records, and/or a particular region. In addition to the unidentified specimen jar, a voucher collection of a

subsample of each species identified in the field should be preserved and labeled for subsequent laboratory verification, if necessary. Obviously, species of special concern (e.g., threatened, endangered) should be noted and released *immediately* on site. Labels should contain (at a minimum) location data (verbal description and coordinates), date, collectors' names, and sample identification code and/or station numbers for the particular sampling site. Young-of-the-year fish less than 20 millimeters (total length) are not identified or included in the sample, and are released on site. Specimens that can be identified in the field are counted, examined for external anomalies (i.e., deformities, eroded fins, lesions, and tumors), and recorded on field data sheets. An example of a "Fish Sampling Field Data Sheet" is provided in Appendix A-4, Form 1. Space is available for optional fish length and weight measurements, should a particular program/study require length frequency or biomass data. However, these data *are not required* for the standard multimetric assessment. Space is allotted on the field data sheets for the *optional* inclusion of measurements (nearest millimeter total length) and weights (nearest gram) for a subsample (to a maximum 25 specimens) of each species. Although fish length and weight measurements are optional, recording a range of lengths for species encountered may be a useful routine measure. Following the data recording phase of the procedure, specimens that have been identified and processed in the field are released on site to minimize mortality.

6. The data collection phase includes the completion of the top portion of the "Fish Sampling Field Data Sheet" (Appendix A-4, Form 1),

QUALITY CONTROL (QC) IN THE FIELD

1. Quality control must be a continuous process in fish bioassessment and should include all program aspects, from field collection and preservation to habitat assessment, sample processing, and data recording. Field validation should be conduced at selected sites and will involve the collection of a duplicate sample taken from an adjacent reach upstream of the initial sampling site. The adjacent reach should be similar to the initial site with respect to habitat and stressors. Sampling QC data should be evaluated following the first year of sampling in order to determine a level of acceptable variability and the appropriate duplication frequency.

2. Field identifications of fish *must* be conducted by qualified/trained fish taxonomists, familiar with local and regional ichthyofauna. Questionable records are prevented by: (a) requiring the presence of at least one experienced/trained fish taxonomist on every field effort, and (b) preserving selected specimens (e.g., Klemm and Lazorchak 1995 recommend a subsample of a maximum 25 voucher specimens of each species) and those that cannot by readily identified in the field for laboratory verification and/or examination by a second qualified fish taxonomist (see Section 8.2). Specimens must be properly preserved and labeled (refer to Section 8.1.1, number 5). When needed, chain-of-custody forms must be initiated following sample preservation, and must include the same information as the sample container labels.

3. All field equipment must be in good operating condition, and a plan for routine inspection, maintenance, and/or calibration must be developed to ensure consistency and quality of field data. Field data must be complete and legible, and should be entered on standardized field data forms and/or digital recorders. While in the field, the field team should possess sufficient copies of standardized field data forms and chains-of-custody for all anticipated sampling sites, as well as copies of all applicable Standard Operating Procedures (SOPs).

which duplicates selected information from the physical/chemical field sheet. Information regarding the sample collection procedures must also be recorded. This includes method of fish capture, start time, ending time, duration of sampling, maximum and mean stream widths. The percentage of each habitat type in the reach is estimated and documented on the data sheet. Comments should include sampling conditions, e.g., visibility, flow, difficult access to stream, or anything that may prove to be valuable information to consider for future sampling events or by personnel unfamiliar with the site.

8.2 LABORATORY IDENTIFICATION AND VERIFICATION

Fish records of questionable quality are prevented by preserving specimens (that cannot be readily identified in the field) for laboratory examination and/or a voucher collection for laboratory verification. Specimens must be properly preserved (e.g., 10% formalin for tissue fixing and 70% ethanol for long-term storage) and labeled (using museum-grade archival labels/paper, and formalin/alcohol-proof pen or pencil). Labels should contain (at a minimum) site location data (i.e., verbal description and site coordinates), collection date, collector's names, species identification (for fishes identified in the field), species totals, and sample identification code and/or station number. All samples received in the laboratory should be tracked using a sample log-in procedure (Appendix A-4, Form 2). Laboratory fisheries professionals *must* be capable of identifying fish to the lowest possible taxonomic level (i.e., species or subspecies) and should have access to suitable regional taxonomic references (see Section 8.4) to aid in the identification process. Laboratories that do not typically identify fish, or trained fisheries professionals that have difficulty identifying a particular specimen or group of fish, should contact a taxonomic specialist (i.e., a recognized authority for that particular taxonomic group). Taxonomic nomenclature *must* be kept consistent and current. Common and scientific names of fishes from the United States and Canada are listed in Robins et al. (1991).

QUALITY CONTROL (QC) FOR TAXONOMY

1. A representative voucher collection must be retained for unidentified specimens, small specimens, and new locality records. In addition, a second voucher jar should be retained for a subsample of each species identified in the field (e.g., Klemm and Lazorchak 1995 recommend a subsample of 25 voucher specimens of each species). The vouchers must be properly preserved, labeled, and stored in the laboratory for future reference (see Section 8.2).

2. Voucher collections should be verified by a second qualified fish taxonomist, i.e., a professional other than the taxonomist responsible for the original field identifications. The word "validated" and the name of the taxonomist that validated the identification should be added to each voucher label. Specimens sent from the laboratory to taxonomic specialists should be recorded in a "Taxonomy Validation Notebook" (see Chapter 7), noting the label information and date sent. Upon return of the specimens, the date received and findings should also be recorded in the notebook (and the voucher label), along with the name of the person who performed the validation.

3. Information on samples completed (through the identification/validation process) will be tracked in a "Sample Log" notebook, to track the progress of each sample (Appendix A-4, Form 2). Sample log entries will be updated as each step is completed (e.g., receipt, identification, validation, archive).

4. A library of taxonomic literature is essential for the aid and support of identification/verification activities, and must be maintained (and updated as needed) in the laboratory. A list of selected taxonomic references is provided in Section 8.4.

8.3 DESCRIPTION OF FISH METRICS

Through the IBI, Karr et al. (1986) provided a consistent theoretical framework for analyzing fish assemblage data. The IBI is an aggregation of 12 biological metrics that are based on the fish assemblage's taxonomic and trophic composition and the abundance and condition of fish. Such multiple-parameter indices are necessary for making objective evaluations of complex systems. The IBI was designed to evaluate the quality of small Midwestern warmwater streams but has been modified for use in many regions (e.g., eastern and western United States, Canada, France) and in different ecosystems (e.g., rivers, impoundments, lakes, and estuaries).

The metrics attempt to quantify a biologist's best professional judgment (BPJ) of the quality of the fish assemblage. The IBI utilizes professional judgment, but in a prescribed manner, and it includes quantitative standards for discriminating the condition of the fish assemblage (Figure 8-1). BPJ is involved in choosing both the most appropriate population or assemblage element that is representative of each metric and in setting the scoring criteria. This process can be easily and clearly modified, as opposed to judgments that occur after results are calculated. Each metric is scored against criteria based on expectations developed from appropriate regional reference sites. Metric values

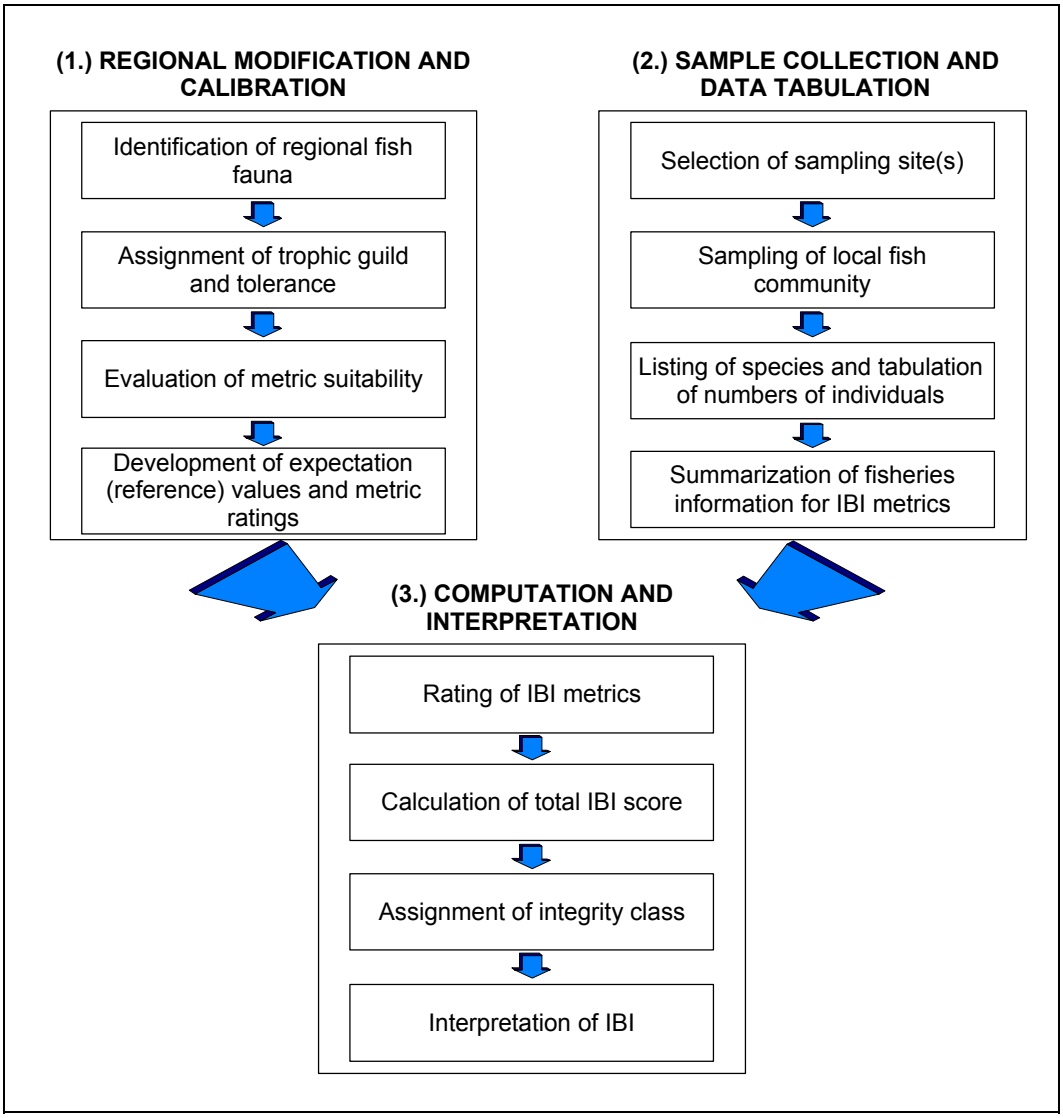

Figure 8-1. Sequence of activities involved in calculating and interpreting the Index of Biotic Integrity (adapted from Karr et al. 1986).

approximating, deviating slightly from, or deviating greatly from values occurring at the reference sites are scored as 5, 3, or 1, respectively. The scores of the 12 metrics are added for each station to give an IBI ranging from a maximum of 60 (excellent) to a minimum of 12 (very poor). Trophic and tolerance classifications of selected fish species are listed in Appendix C. Additional classifications can be derived from information in State and regional fish texts, by objectively assessing a large statewide database, or by contacting authors/originators of regional IBI programs or pilot studies. Use of the IBI by water resource agencies may result in further modifications. Many modifications have occurred (Miller et al. 1988) without changing the IBI's basic theoretical foundations.

The IBI serves as an integrated analysis because individual metrics may differ in their relative sensitivity to various levels of biological condition. A description and brief rationale for each of the 12 IBI metrics is outlined below. The original metrics described by Karr (1981) for Illinois streams are followed by substitutes used in or proposed for different geographic regions and stream sizes. Because of zoogeographic differences, different families or species are evaluated in different regions, with regional substitutes occupying the same general habitat or niche. The source for each substitute is footnoted below. Table 8-1 presents an overview of the IBI metric alternatives and their sources for various areas of the United States and Canada.

8.3.1 Species Richness and Composition Metrics

These metrics assess the species richness component of diversity and the health of resident taxonomic groupings and habitat guilds of fishes. Two of the metrics assess assemblage composition in terms of tolerant or intolerant species.

Metric 1. Total number of fish species Substitutes (Table 8-1): Total number of resident native fish species and salmonid age classes.

This number decreases with increased degradation; hybrids and introduced species are not included. In coldwater streams supporting few fish species, the age classes of the species found represent the suitability of the system for spawning and rearing. The number of species is strongly affected by stream size at most small warmwater stream sites, but not at large river sites (Karr et al. 1986, Ohio EPA 1987).

Metric 2. Number and identity of darter species Substitutes (Table 8-1): Number and identity of sculpin species, benthic insectivore species, salmonid juveniles (individuals); number of sculpins (individuals); percent round-bodied suckers, sculpin and darter species.

These species are sensitive to degradation resulting from siltation and benthic oxygen depletion because they feed and reproduce in benthic habitats (Kuehne and Barbour 1983, Ohio EPA 1987). Many smaller species live within the rubble interstices, are weak swimmers, and spend their entire lives in an area of 100-400 m^2 (Matthews 1986, Hill and Grossman 1987). Darters are appropriate in most

Mississippi Basin streams; sculpins and yearling trout occupy the same niche in western streams. Benthic insectivores and sculpins or darters are used in small Atlantic slope streams that have few sculpins or darters, and round-bodied suckers are suitable in large midwestern rivers.

Metric 3. Number and identity of sunfish species. Substitutes (Table 8-1): Number and identity of cyprinid species, water column species, salmonid species, headwater species, and sunfish and trout species.

Table 8-1. Fish IBI metrics used in various regions of North America.[a]

Note: X = metric used in region. Many of these variations are applicable elsewhere.

a Taken from Karr et al. (1986), Leonard and Orth (1986), Moyle et al. (1986), Fausch and Schrader (1987), Hughes and Gammon (1987), Ohio EPA (1987), Miller et al. (1988), Steedman (1988), Simon (1991), Lyons (1992a), Barbour et al. (1995), Simon and Lyons (1995), Hall et al. (1996), Lyons et al. (1996), Roth et al. (1997).

b Metric suggested by Moyle et al. (1986) or Hughes and Gammon (1987) as a provisional replacement metric in small western salmonid streams.

c Boat sampling methods only (i.e., larger streams/rivers).

d Excluding individuals of tolerant species.

e Non-coastal Plain streams only.

f Coastal Plain streams only.

These pool species decrease with increased degradation of pools and instream cover (Gammon et al. 1981, Angermeier 1987, Platts et al. 1983). Most of these fishes feed on drifting and surface invertebrates and are active swimmers. The sunfishes and salmonids are important sport species. The sunfish metric works for most Mississippi Basin streams, but where sunfish are absent or rare, other

groups are used. Cyprinid species are used in coolwater western streams; water column species occupy the same niche in northeastern streams; salmonids are suitable in coldwater streams; headwater species serve for midwestern headwater streams; and trout and sunfish species are used in southern Ontario streams. Karr et al. (1986) and Ohio EPA (1987) found the number of sunfish species to be dependent on stream size in small streams, but Ohio EPA (1987) found no relationship between stream size and sunfish species in medium to large streams, nor between stream size and headwater species in small streams.

Metric 4. Number and identity of sucker species. Substitutes (Table 8-1): Number of adult trout species, number of minnow species, and number of suckers and catfish.

These species are sensitive to physical and chemical habitat degradation and commonly comprise most of the fish biomass in streams. All but the minnows are longlived species and provide a multiyear integration of physicochemical conditions. Suckers are common in medium and large streams; minnows dominate small streams in the Mississippi Basin; and trout occupy the same niche in coldwater streams. The richness of these species is a function of stream size in small and medium sized streams, but not in large (e.g., non-wadeable) rivers.

Metric 5. Number and identity of intolerant species. Substitutes (Table 8-1): Number and identity of sensitive species, amphibian species, and presence of brook trout.

This metric distinguishes high and moderate quality sites using species that are intolerant of various chemical and physical perturbations. Intolerant species are typically the first species to disappear following a disturbance. Species classified as intolerant or sensitive should only represent the 5-10 percent most susceptible species, otherwise this becomes a less discriminating metric. Candidate species are determined by examining regional ichthyological books for species that were once widespread but have become restricted to only the highest quality streams. Ohio EPA (1987) uses number of sensitive species (which includes highly intolerant and moderately intolerant species) for headwater sites because highly intolerant species are generally not expected in such habitats. Moyle (1976) suggested using amphibians in northern California streams because of their sensitivity to silvicultural impacts. This also may be a promising metric in Appalachian streams which may naturally support few fish species. Steedman (1988) found that the presence of brook trout had the greatest correlation with IBI score in Ontario streams. The number of sensitive and intolerant species increases with stream size in small and medium sized streams but is unaffected by size of large (e.g., non-wadeable) rivers.

Metric 6. Proportion of individuals as green sunfish. Substitutes (Table 8-1): Proportion of individuals as common carp, white sucker, tolerant species, creek chub, and dace.

This metric is the reverse of Metric 5. It distinguishes low from moderate quality waters. These species show increased distribution or abundance despite the historical degradation of surface waters, and they shift from incidental to dominant in disturbed sites. Green sunfish are appropriate in small midwestern streams; creek chubs were suggested for central Appalachian streams; common carp were suitable for a coolwater Oregon river; white suckers were selected in the northeast and Colorado where green sunfish are rare to absent; and dace (*Rhinichthys* species) were used in southern Ontario. To avoid weighting the metric on a single species, Karr et al. (1986) and Ohio EPA (1987) suggest using a small number of highly tolerant species (e.g., alternative Metric 6— percent abundance of tolerant species).

8.3.2 Trophic Composition Metrics

These three metrics assess the quality of the energy base and trophic dynamics of the fish assemblage. Traditional process studies, such as community production and respiration, are time consuming to conduct and the results are equivocal; distinctly different situations can yield similar results. The trophic composition metrics offer a means to evaluate the shift toward more generalized foraging that typically occurs with increased degradation of the physicochemical habitat.

Metric 7. Proportion of individuals as omnivores. Substitutes (Table 8-1): Proportion of individuals as generalist feeders.

The percent of omnivores in the community increases as the physical and chemical habitat deteriorates. Omnivores are defined as species that consistently feed on substantial proportions of plant and animal material. Ohio EPA (1987) excludes sensitive filter feeding species such as paddlefish and lamprey ammocoetes and opportunistic feeders like channel catfish. In areas where few species fit the true definition of omnivore, the proportion of generalized feeders may be substituted (Leonard and Orth 1986).

Metric 8. Proportion of individuals as insectivorous cyprinids. Substitutes (Table 8-1): Proportion of individuals as insectivores, specialized insectivores, insectivorous species, and number of juvenile trout.

Invertivores, primarily insectivores, are the dominant trophic guild of most North American surface waters. As the invertebrate food source decreases in abundance and diversity due to habitat degradation (e.g., anthropogenic stressors), there is a shift from insectivorous to omnivorous fish species. Generalized insectivores and opportunistic species, such as blacknose dace and creek chub were excluded from this metric by Ohio EPA (1987). This metric evaluates the midrange of biological condition, i.e., low to moderate condition.

Metric 9. Proportion of individuals as top carnivores. Substitutes (Table 8-1): Proportion of individuals as catchable salmonids, catchable wild trout, and pioneering species.

The top carnivore metric discriminates between systems with high and moderate integrity. Top carnivores are species that feed, as adults, predominantly on fish, other vertebrates, or crayfish. Occasional piscivores, such as creek chub and channel catfish, are not included. In trout streams, where true piscivores are uncommon, the percent of large salmonids is substituted for percent piscivores. These species often represent popular sport fish such as bass, pike, walleye, and trout. Pioneering species are used by Ohio EPA (1987) in headwater streams typically lacking piscivores. Pioneering species predominate in unstable environments that have been affected by temporal desiccation or anthropogenic stressors, and are the first to reinvade sections of headwater streams following periods of desiccation.

8.3.3 Fish Abundance and Condition Metrics

The last 3 metrics indirectly evaluate population recruitment, mortality, condition, and abundance. Typically, these parameters vary continuously and are time consuming to estimate accurately. Instead of such detailed population attributes or estimates, general population parameters are evaluated. Indirect estimation is less variable and much more rapidly determined.

Metric 10. Number of individuals in sample. Substitutes (Table 8-1): Density of individuals.

This metric evaluates population abundance and varies with region and stream size for small streams. It is expressed as catch per unit effort, either by area, distance, or time sampled. Generally sites with lower integrity support fewer individuals, but in some nutrient poor regions, enrichment increases the number of individuals. Steedman (1988) addressed this situation by scoring catch per minute of sampling greater than 25 as a 3, and less than 4 as a 1. Unusually low numbers generally indicate toxicity, making this metric most useful at the low end of the biological integrity scale. Hughes and Gammon (1987) suggest that in larger streams, where sizes of fish may vary in orders of magnitude, total fish biomass may be an appropriate substitute or additional metric.

Metric 11. Proportion of individuals as hybrids. Substitutes (Table 8-1): Proportion of individuals as introduced species, simple lithophils, and number of simple lithophilic species.

This metric is an estimate of reproductive isolation or the suitability of the habitat for reproduction. Generally as environmental degradation increases the percent of hybrids and introduced species also increases, but the proportion of simple lithophils decreases. However, minnow hybrids are found in some high quality streams, hybrids are often absent from highly impacted sites, and hybridization is rare and difficult to detect. Thus, Ohio EPA (1987) substitutes simple lithophils for hybrids. Simple lithophils spawn where their eggs can develop in the interstices of sand, gravel, and cobble substrates without parental care. Hughes and Gammon (1987) and Miller et al. (1988) propose using percent introduced individuals. This metric is a direct measure of the loss of species segregation between midwestern and western fishes that existed before the introduction of midwestern species to western rivers.

THE INDEX OF WELL-BEING (IWB)

The Iwb (Gammon 1976, 1980, Hughes and Gammon 1987) incorporates two abundance and two diversity measures in an approximately equal fashion, thereby representing fish assemblage quality more realistically than a single diversity or abundance measure. The Iwb is calculated using the formula:

$$Iwb = 0.51nN + 0.5\ 1nB + \bar{H}_N + \bar{H}_B$$

where

N = number of individuals caught per unit distance sampled
B = biomass of individuals caught per unit distance
$\bar{H}$ = Shannon diversity index, calculated as:

$$\bar{H} = -\Sigma \frac{n_i}{N}\ 1n\ (\frac{n_i}{N})$$

where

n_i = relative number or weight of the ith species
N = total number or weight of the sample

THE MODIFIED INDEX OF WELL-BEING (MIWB)

The MIwb (Ohio EPA 1987) retains the same formula as the Iwb; however, highly tolerant species, hybrids, and exotic species are eliminated from the abundance (i.e., number and biomass) components of the formula. This modification increases the sensitivity of the index to a wider array of environmental disturbances.

Metric 12. Proportion of individuals with disease, tumors, fin damage, and skeletal anomalies

This metric depicts the health and condition of individual fish. These conditions occur infrequently or are absent from minimally impacted reference sites but occur frequently below point sources and in

areas where toxic chemicals are concentrated. They are excellent measures of the subacute effects of chemical pollution and the aesthetic value of game and nongame fish.

Metric 13. Total fish biomass (optional).

Hughes and Gammon (1987) suggest that in larger (e.g., non-wadeable) rivers where sizes of fish may vary in orders of magnitude this additional metric may be appropriate. Gammon (1976, 1980) and Ohio EPA (1987) developed an Index of Well-Being (Iwb) and Modified Index of Well-Being (MIwb), respectively, based upon both fish abundance and biomass measures. The combination of diversity and biomass measures is a useful tool for assessing fish assemblages in larger rivers (Yoder and Rankin 1995b). Ohio EPA (1987) found that the additional collection of biomass data (i.e., in addition to abundance information needed for the IBI) required to calculate the MIwb does not represent a significant expenditure of time, providing that subsampling techniques are applied (see Field Sampling Procedures 8.1.1).

Because the IBI is an adaptable index, the choice of metrics and scoring criteria is best developed on a regional basis through use of available publications (Karr et al. 1986, Ohio EPA 1987, Miller et al. 1988, Steedman 1988; Simon 1991, Lyons 1992a, Simon and Lyons 1995, Hall et al. 1996, Lyons et al. 1996, Roth et al. 1997, Simon 1999). Several steps are common to all regions. The fish species must be listed and assigned to trophic and tolerance guilds. Scoring criteria are developed through use of high quality historical data and data from minimally-impaired regional reference sites. This has been done for much of the country, but continued refinements are expected as more ecological data become available for the fish community.

8.4 TAXONOMIC REFERENCES FOR FISH

The following references are provided as a list of taxonomic references currently being used around the United States for identification of fish. Any of these references cited in the text of this document will also be found in Chapter 11 (Literature Cited).

Naval Air Station Oceana – Aeropines Golf Course Pond Assessment

December 2014

Prepared by:

Chris Petersen, Paul Block and Scott Chappell
Naval Facilities Engineering Command, Atlantic

Table of Contents

Table of Figures

Table of Tables

Introduction

This report summarizes the survey results of a wildlife (amphibians, reptiles, birds, and fish), vegetation and water quality assessment at the Aeropines Golf Course ponds located on Naval Air Station (NAS) Oceana. The study was conducted by natural resource specialists Chris Petersen, Paul Block, and Scott Chappell of Naval Facilities Engineering Command Atlantic (NAVFAC Atlantic) with assistance from Lawrence McGrogan (Navy Game Warden) and Chad Boyce (Virginia Department of Game and Inland Fisheries). The study occurred from February to August 2013.

The overall objective of the surveys was to collect baseline data regarding the use of the ponds by wildlife and collect data on the water quality and vegetation of the ponds. Data collected from the this investigation will provide baseline data for the Integrated Natural Resource Management Plan (INRMP) and be used for environmental planning, natural resource management, and conservation in support of the military missions of the installation.

Project Location

NAS Oceana encompasses approximately 5,700 acres and is located in the City of Virginia Beach in Princess Ann County, Virginia. It currently serves as the Navy's East Coast Master Jet Base, home to the F/A-18 Hornets and Super Hornets. The primary mission of the Naval Air Station Oceana is as a Shore-Based Readiness Integrator, providing the facilities, equipment and personnel to support shored-based readiness, total force readiness and maintain operational access of Oceana-based forces.

The Aeropines Golf Course was built in 1985 and is located on the southeastern side of the installation (Figure 1). Aeropines Golf Course has two 18-hole courses: the Hornet Course and the Tomcat Course. It also has a practice facility that includes a driving range featuring a 60,000-square-foot hitting area, two putting greens, chipping green and a practice bunker area. The golf course contains eight manmade ponds ranging in size from 0.67 acres (pond 7) to 3.16 acres (pond 1). The ponds were once likely barrow pits for soil to construct the course. Scattered areas of forested habitat (mostly pine trees) separate the various courses.

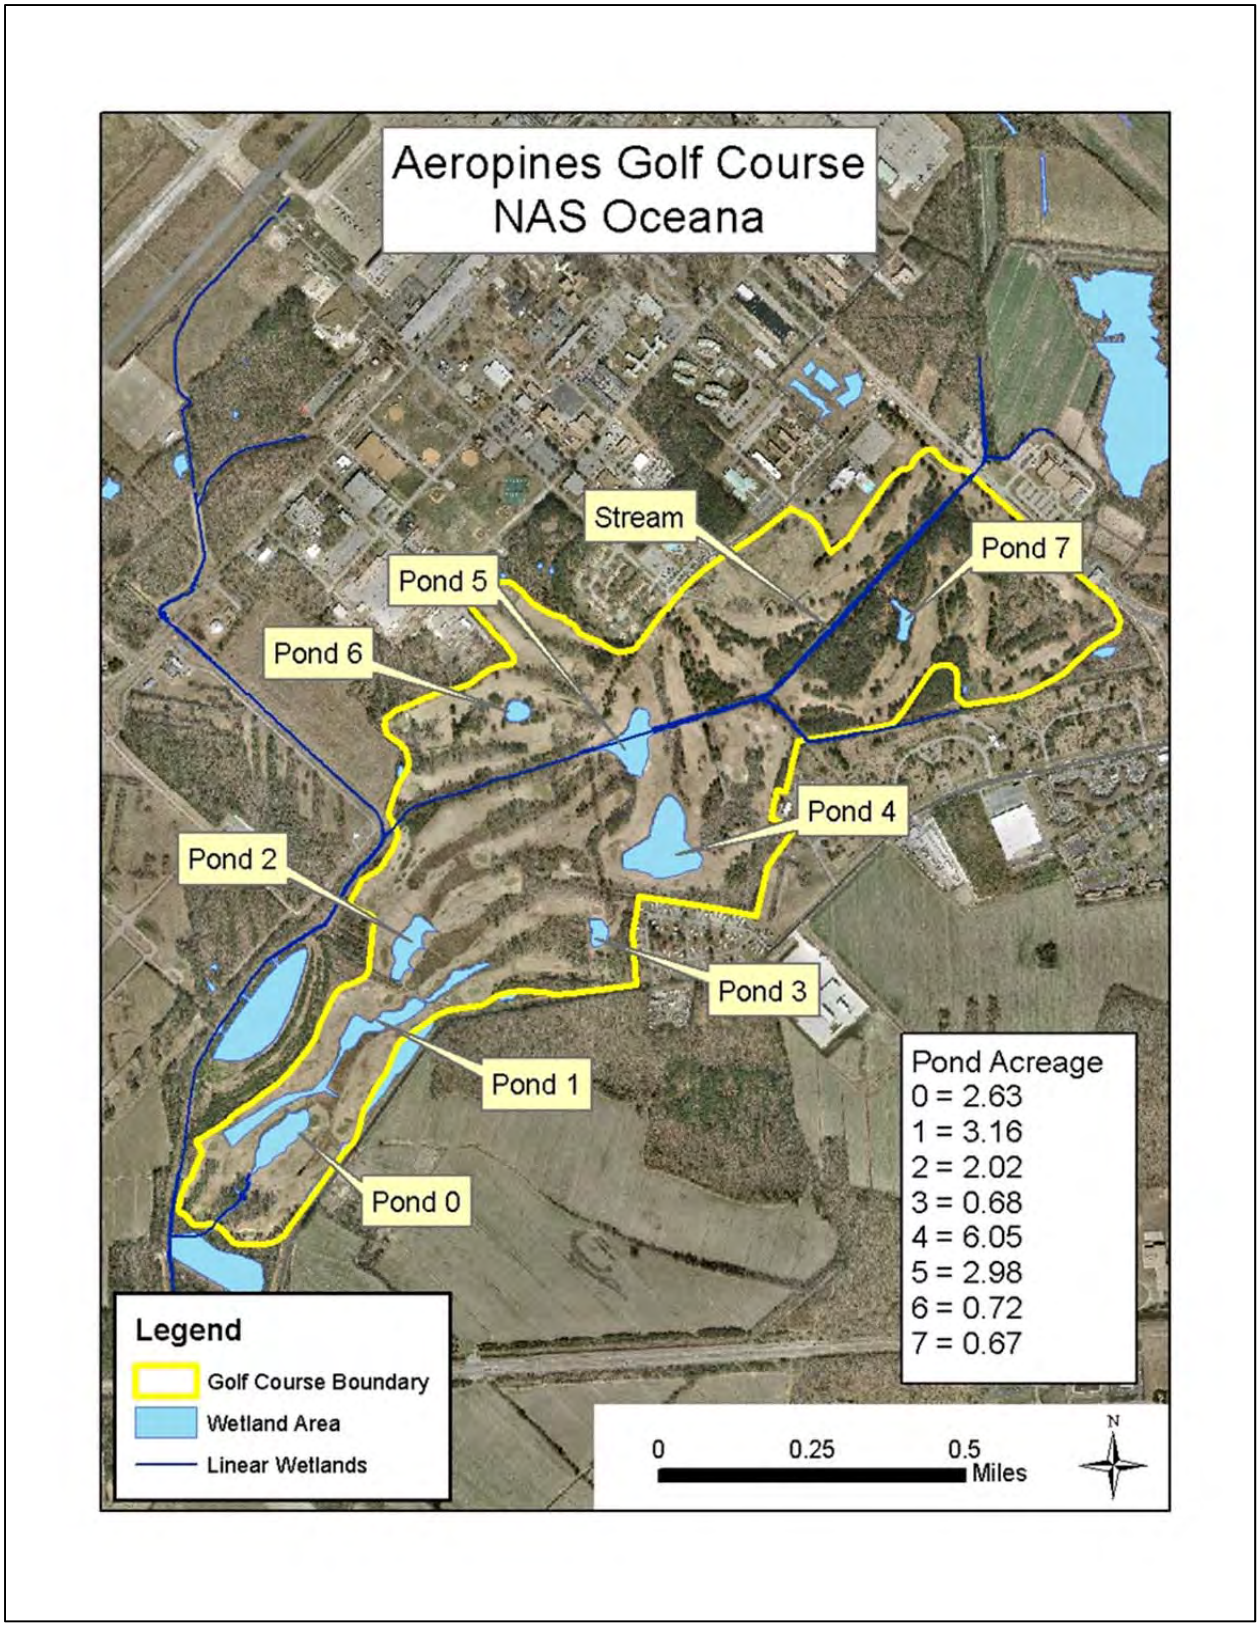

Figure 1. Aeropines Golf Course Ponds

Survey Dates

The following table 1 summarizes the dates and primary purpose of each field survey. However, Incidental field observations of wildlife were recorded during every field visit.

Table 1. Purpose and date of field surveys at Aeropines golf course.

Purpose of Field Visit	Date
Bird Survey	2/6/2013
Spring Amphibian Breeding Survey	3/12/2013
Fish Shocking/Water Quality Sampling	4/9/2013
Amphibian, Reptile and Bird Survey/Water Quality Sampling/Invertebrates	5/9/2013
Turtle Trapping/ Fish Seine/Vegetation/Wildlife Observations	6/20/2013
Water Quality Sampling	8/6/2013

Aquatic Organisms (Fish, Invertebrates and Vegetation)

Fish sampling was conducted in seven ponds and two stream locations on Aeropines Golf Course on 9 April and 20 Jun, 2013 (Figure 1). The Golf Course is located in the highly developed headwaters of the West Neck Creek watershed in southeastern Virginia (Figure 2). The ponds are connected to more perennial waters of the West Neck Creek watershed through ditches or channelized headwater streams. Numerous culverts and other obstructions downstream of the ponds limit

immigration from downstream fish populations. Either by human introductions or immigration events, the ponds do have assemblages of fish. The species of fish and incidental aquatic invertebrates encountered in the streams and ponds are listed in Table 2.

Table 2. Fish and invertebrate species collected in Aeropines Golf Course during stream and pond sampling on April 9 and June 9, 2013. Note: "12x" means dozens were collected, "?" means collection may be counted in unidentified species (spp.) rows, and "S" refers to stream samples.

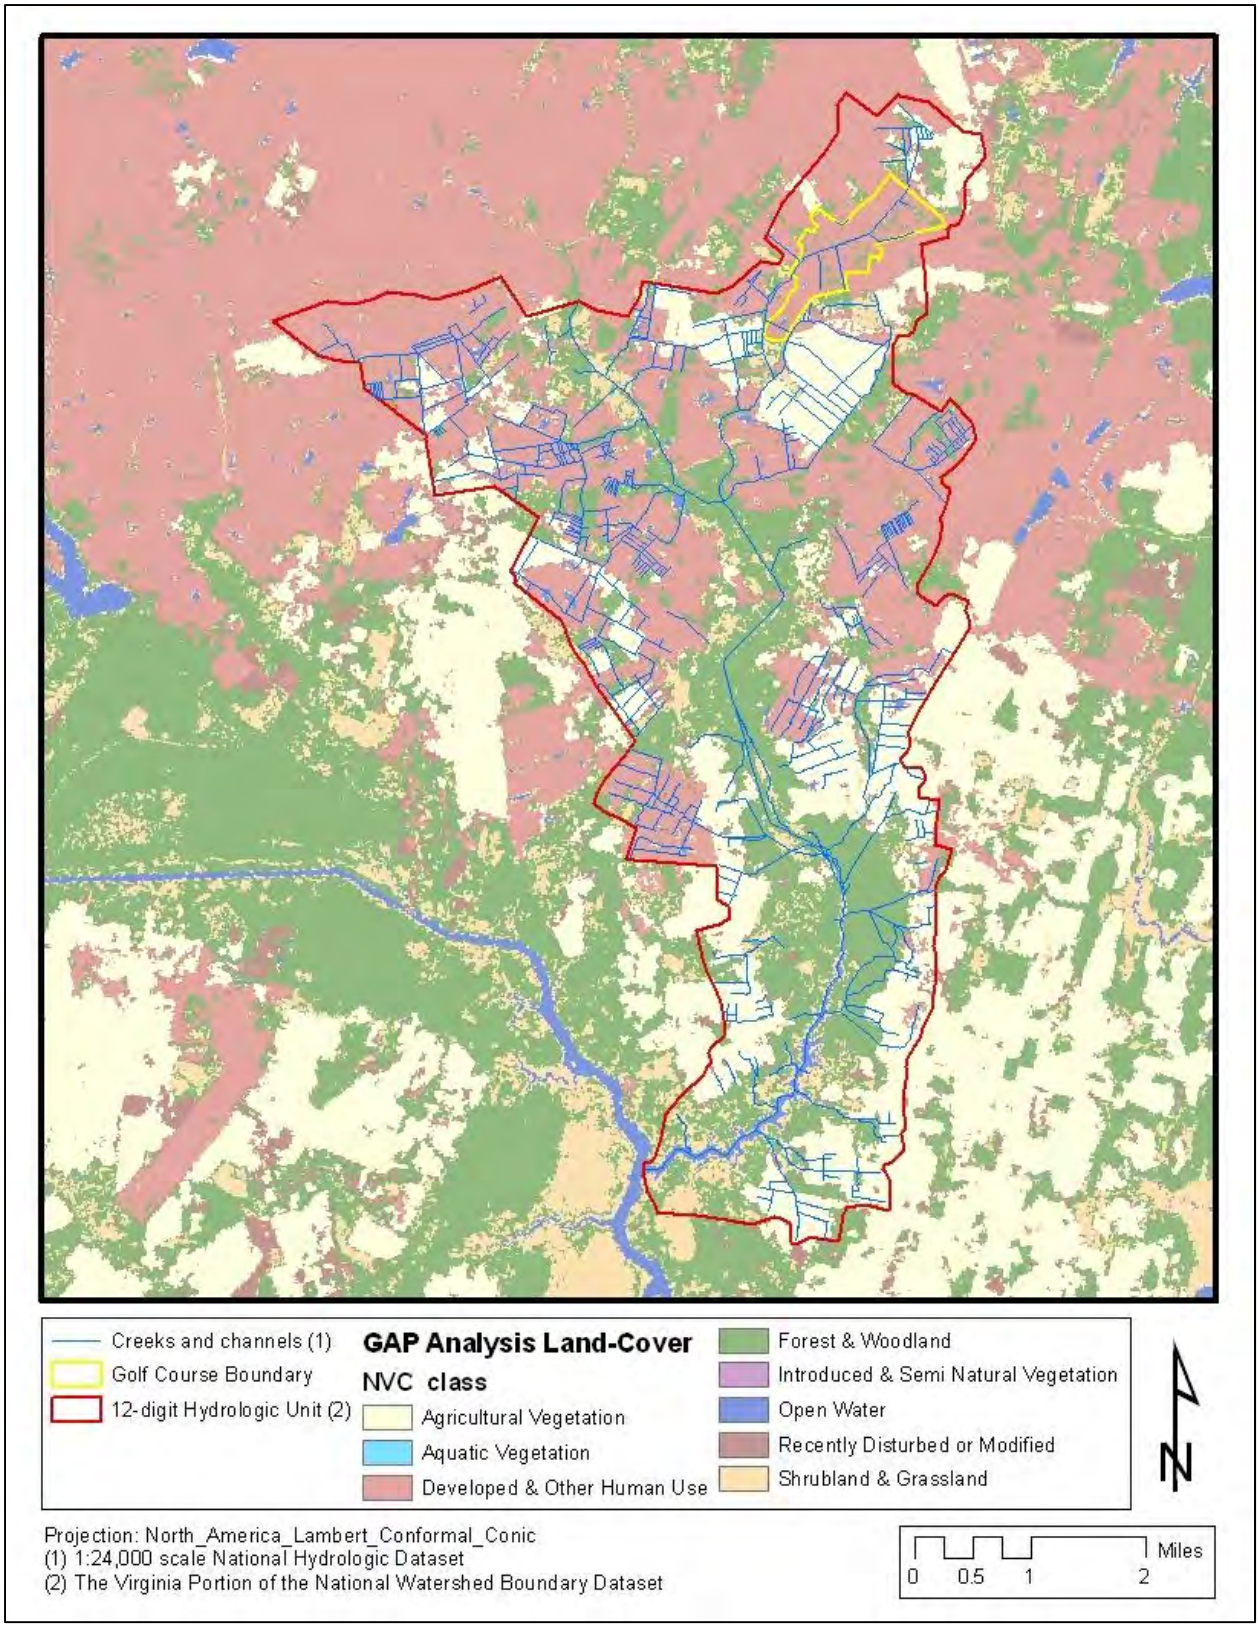

Figure 2. Hydrology and land-cover (Southeast Gap Analysis Project 2001) in and around the West Neck Creek watershed

There were no state or federally threatened or endangered fish species collected during surveys of the golf course water bodies. The only species collected with candidate ESA status was the American eel (*Anguilla rostrata*). Another likely candidate, the anadromous river herrings (*Alosa* spp.) are possible but unlikely to occur this far upstream in the West Neck Creek watershed (Jenkins and Burkhead 1994); North Carolina and Virginia-identified anadromous fish spawning areas do not include West Neck Creek (Kohler and Hubert 1993). The presence of river herring (*Alosa pseudoharengus*) in the Oceana watershed was documented by an installation fish and stream assessment in 2014 (Wright 2014). The species was found in the stream below the Aeropines Mitigation Site. However, the presence of river herring in the Aeropines Golf Course ponds is highly unlikely given the presence of a riprap dam just downstream from Pond 5 (Figure 1). And, a stream draining Pond 0 intersects the stream below the mitigation site. However, the culvert at the south end of Pond 0 would be a barrier to herring migration and other obstructions in the streambed such as vegetation debris (e.g. leaves, branches, etc.) could also disrupt potential migration pathways. The relative abundance of river herring in the Oceana watershed is likely very low given that current VDGIF-identified anadromous fish spawning areas (VDGIF 2014) and state fish collection records (Jenkins and Burkhead 1994) do not suggest their presence this far up in the West Neck Creek watershed.

The species present are typical of freshwater creeks and ponds in developed watersheds of coastal Virginia (e.g., largemouth bass, sunfish, crappie, bullheads, carp). As such, the ponds have numerous undesirable species that discourage a productive fishery for bass and bluegill (NCDMF 2013). In artificial ponds, the number of species is more a reflection of fishery degradation than ecosystem resilience with diversity. The streams had a subset of species collected in ponds, except for the presence of blue-spotted sunfish which did not occur in ponds. In total, there were 16 fish species collected on the Aeropines Golf Course during two sampling days in late spring and early summer.

Not accounting for differences in sampling effort, pond 5 had the highest number of species (11) followed by pond 2 (10). Pond 5 intersects the primary conduit of water on the Golf Course, and may explain the relatively high number of species. The number of species in pond 2 is unexplained by obvious water connections, though the pond is lower in the watershed than most other ponds on the Golf Course. The low number of species in ponds 3 (5) could be explained by the relative upstream position. Pond 6 had no water connection to account for the presence of largemouth bass (one of only 2 species collected). No fish sampling was conducted in pond 7 because it was covered with duckweed and registered nearly 0 mg/l of dissolved oxygen. The following subsections describe each of the ponds sampled in terms of size, average depth, water source/drainage, shoreline habitat, relative abundance of species size classes, and fishery potential.

PONDS

Pond 0

1.1.1. Description

Pond 0 is 2.63 acres in size, and drains via a linear wetland on the southern end. The pond may receive inflow from upstream via linear wetland drainage along the northwestern shore (Figure 3). The linear wetland connects upstream ponds 1 with downstream pond 0. A narrow margin of vegetation typically occupies the banks of the pond but herbicide application has removed the vegetation in an approximately three foot border around the entire pond (Figure 2A). Many areas of the pond shoreline are eroding with sections of the shoreline collapsing into the pond. This erosion is likely caused or expedited by the herbicide application removing the vegetation at the pond shoreline. The brushy banks

are bordered by patches of alligator weed (*Alternanthera philoxeroides*) in the shallow margins of the pond.

Vegetation control border at pond 0 and associated erosion.

Figure 3. Aeropines Golf Course Pond 0.
(Source: Services.arcgisonline.com/arcgis/services/)

1.1.2. Water Quality

Water quality measurements were acquired on 9 April, 9 May, and 7 August 2013. Oxygen concentrations ranged from 6.5 - 12.76 mg/l in water temperatures ranging from 19.8 - 28°C (daytime measurements). The pH of the water was 6.5-7.0, which is neutral. Though not measured, water clarity was estimated at less than 1 ft. of visibility. The water quality measurements are documented in Table 3.

Table 3. Water quality measurements in pond 0

Date	Parameter	Measurement
4/9/2013	Water Temperature (°C)	19.8
	Dissolved O^2 (mg/l)	12.76
	Specific Conductivity (µS)	1002
5/9/2013	Water Temperature (C)	20.0
	Dissolved O^2 (mg/l)	8.2
	Ammonia Nitrogen (ppm)	0.4
	pH	6.5
8/7/2013	Water Temperature (°C)	28
	Dissolved O^2 (mg/l)	6.5
	Ammonia Nitrogen (ppm)	0.2
	pH	7.0

1.1.3. Fish

Fish sampling was conducted in conjunction with water quality measurements on 9 April 2013. The method used was an electrofishing boat owned and operated by the Virginia Department of Game and Inland Fisheries (VDGIF; Chad Boyce). The boat surveyed the shoreline for 735 seconds of effort and collected 9 species (Table 4). Based on electrofishing results, the top predatory gamefish in pond 0 is the largemouth bass (up to 19 inches) followed by a small number of large white perch (up to 13 inches). The primary panfish and forage species for largemouth bass in this pond are pumpkinseed and bluegill. The sunfish ranged from 2 to 7 inches, which includes some quality sizes. However, due to competition from pelagic, mud-sucking planktivores (gizzard shad) and large mud-sucking omnivores (common carp), sunfish populations are not as abundance as they could be. The bass population is also affected because the shad and carp get too large, too quickly, for most bass consumption. These species may also stir up fine bottom sediments and reduce water clarity for the visual feeding bass. White perch tend to overpopulate and stunt in small ponds and may serve only to compete with smaller size classes of bass.

Table 4. Electrofishing results from 9 April 2013 in pond 0 (effort = 735 sec). Note: Captured most fish except eels

Species	Number	Avg. Length (mm)	Min. Length (mm)	Max. Length (mm)
American eel	6	272	230	330
Bluegill	7	79	50	125
Brown bullhead	1	297	297	297
Common carp	7	596	552	684
Gizzard shad	3	334	299	367
Largemouth bass	16	356	82	492
Pumpkinseed	41	121	76	175
White perch	9	154	96	336

Considering an electrofishing method is biased toward collected larger fish, a second method (seine haul) was employed on 20 June 2013 in pond 0. No water quality measurements were taken in conjunction with the seine haul sampling. Two hauls of a 20ft seine collected 5 species in the smaller size classes (Table 5). The results suggest spawning of bluegill, gizzard shad, largemouth bass, and white perch. There must also be some larger crappie in the pond to produce the 4 small crappie collected in the seine hauls. This species is yet another undesirable species for small pond because they tend to overpopulate and stunt; providing only competition for smaller size classes of bass.

Table 5. Seine haul results from 20 June 2013 in pond 0 (effort = 2 hauls).

	Size classes (inches)						
Species	**1**	**2**	**2.5**	**3**	**4**	**7.5**	**Total**
Black crappie	4	0	0	0	0	0	4
Bluegill	2	5	1	4	1	1	14
Gizzard shad	0	1	2	7	0	0	10
Largemouth bass	0	7	0	0	0	0	7
White perch	0	13	0	0	0	0	13
Total	**6**	**26**	**3**	**11**	**1**	**1**	**48**

Relative to the other ponds sampled, pond 0 was the closest to achieving a desirable pond fishery. However, non-fishery species degrade the sportfishing potential of the pond like so many other ponds on the golf course.

Pond 1

1.1.4. Description

Pond 1 is 3.16 acres in size, and drains via a linear wetland on the southern end. The pond may receive inflow from upstream via linear wetland drainage along the northeastern shore (Figure 4). A narrow margin of brush occupies the banks of the pond along over half of the shoreline.

Figure 4. Aeropines Golf Course Pond 1
(Source: Services.arcgisonline.com/arcgis/services/)

1.1.5. Water Quality

Water quality measurements were acquired on 9 April (Table 6). The oxygen concentration ranged from 4.8 to 7.0 mg/l in a water temperature of 21 to 26°C (daytime measurements). The pH of the water was 6.0 - 6.5, which is at the acidic end of the neutral range. Though not measured, water clarity was estimated at less than 1 foot of visibility. The ammonia concentration in this pond was measured at 0.4 – 1.0 mg/l.

Table 6. Water quality measurements in pond 1.

Date	Parameter	Measurement
4/9/2013	Water Temperature (°C)	21
	Dissolved O^2 (mg/l)	7.0
	Ammonia Nitrogen (ppm)	0.4
	pH	6.0
8/7/2013	Water Temperature (°C)	26
	Dissolved O^2 (mg/l)	4.8
	Ammonia Nitrogen (ppm)	1.0
	pH	6.5

1.1.6. Fish

Though electrofishing was not conducted on this pond, a turtle trap night and a couple of seine hauls were made on 20 June 2013. No water quality measurements were taken in conjunction with the seine haul sampling. Two hauls of a 20ft seine collected 8 species in the smaller size classes (Table 7). The results suggest spawning of black crappie, bluegill, Mosquitofish, golden shiner, gizzard shad, largemouth bass, pumpkinseed, and white perch. The turtle trap captured an adult American eel (24 inches) and three bluegills (5-6 inches). Though not captured by seining or turtle trap, common carp are likely present in this pond like so many others on the Golf Course; they can easily avoid small seine nets.

Table 7. Seine haul results from 20 June 2013 in pond 1 (effort = 2 hauls).

	Size Classes (inches)												
Species	**1**	**2**	**2**	**3**	**3**	**3.5**	**4**	**4.5**	**5**	**5.5**	**6**	**6.5**	**Total**
Black crappie	47	0	0	0	0	0	0	0	1	0	2	1	51
Bluegill	0	1	8	6	9	3	4	1	3	1	2	1	39
Mosquitofish	7	0	0	0	0	0	0	0	0	0	0	0	7
Golden shiner	2	0	0	0	0	0	0	0	0	0	0	0	2
Gizzard shad	8	1	7	1	2	0	0	0	0	0	0	0	19
Largemouth bass	1	0	0	0	0	0	0	0	0	0	0	0	1
Pumpkinseed	0	0	0	0	0	1	1	0	0	0	0	0	2
White perch	0	0	0	0	0	0	0	0	1	0	0	0	1
Grand Total	**56**	**2**	**15**	**7**	**11**	**4**	**5**	**1**	**5**	**1**	**4**	**2**	**122**

Based on seine haul and turtle trap results, the top predatory gamefish in pond 1 is the largemouth bass followed by white perch and black crappie. The primary panfish and forage species for largemouth bass in this pond are pumpkinseed and bluegill. The sunfish ranged from 2 to 6 inches, which includes some quality sizes. However, due to competition from pelagic, mud-sucking planktivores (gizzard shad), sunfish populations are not as abundance as they could be. The bass population is also affected because the shad and carp get too large, too quickly, for most bass consumption. These species may also stir up fine bottom sediments and reduce water clarity for the visual feeding bass. White perch and black crappie tend to overpopulate and stunt in small ponds and may serve only to compete with smaller size classes of bass.

In summary, pond 1 has some quality largemouth bass and sunfish to support a pond fishery. However, non-fishery species degrade the sportfishing potential of the pond like so many other ponds on the golf course.

Pond 2

1.1.7. Description

Pond 2 is 2.02 acres in size, and appears to drains via a linear wetland on the southern end. The pond may receive inflow from upstream via linear wetland drainages along the northeastern and southeastern shores (Figure 5). A narrow margin of brush occupies the banks of the pond along over half of the shoreline. The brushy banks are bordered by patches of alligator weed (*Alternanthera philoxeroides*) in the shallow margins of the pond.

Figure 5. Aeropines Golf Course Pond 2
(Source: Services.arcgisonline.com/arcgis/services/)

1.1.8. Water Quality

Water quality measurements were acquired on 9 April, 9 May, and 7 August 2013. Oxygen concentrations ranged from 6.5 to 11.65 mg/l in water temperatures ranging from 22.0 to 27°C (daytime measurements). The pH of the water was 6.5, which is at the acidic end of the neutral range. Though not measured, water clarity was estimated at less than 1 foot of visibility. The water quality measurements are documented in Table 8.

Table 8. Water quality measurements in pond 2

Date	Parameter	Recording
4/9/2013	Water Temperature (°C)	22.3
	Dissolved oxygen (mg/l)	11.65
	Specific Conductivity (µS)	707
	Salinity (ppt)	0.3
5/9/2013	Water Temperature (°C)	22.0
	Dissolved oxygen (mg/l)	8.4
	Ammonia Nitrogen (ppm)	0.2
	pH	6.5
8/7/2013	Water Temperature (°C)	27.0
	Dissolved oxygen (mg/l)	6.5
	Ammonia Nitrogen (ppm)	0.2
	pH	6.5

1.1.9. Fish

Fish sampling was conducted in conjunction with water quality measurements on 9 April 2013. The method used was an electrofishing boat owned and operated by the Virginia Department of Game and Inland Fisheries (VDGIF; Chad Boyce). The boat surveyed the shoreline for 625 seconds of effort and collected 9 species (Table 9). Based on electrofishing results, the top predatory gamefish in pond 2 is the largemouth bass (up to 17 inches) followed by black crappie (up to 14 inches). The primary panfish and forage species for largemouth bass in this pond are bluegill, pumpkinseed, and other sunfish species. The sunfish ranged from 3 to 7 inches, which includes some quality sizes. However, due to competition from pelagic, mud-sucking planktivores (gizzard shad), large mud-sucking omnivores (common carp), and a large minnow species (golden shiner), sunfish populations are not as abundance as they could be. The bass population is also affected because the shad, carp, and shiners get too large, too quickly, for most bass consumption. The shad and carp may also stir up fine bottom sediments and reduce water clarity for the visual feeding bass. Black crappies tend to overpopulate and stunt in small ponds and may serve only to compete with smaller size classes of bass.

Table 9. Electrofishing results from 9 April 2013 in pond 2 (effort = 625 sec). Note: Missed large eel

Species	Number	Avg. Length (mm)	Min. Length (mm)	Max. Length (mm)
American eel	4	309	220	465
Black crappie	1	368	368	368
Bluegill	13	100	50	167
Common carp	5	514	471	555
Golden shiner	3	-	-	-
Gizzard shad	1	310	310	310
Largemouth bass	1	429	429	429
Pumpkinseed	7	89	69	125
Redear sunfish	1	130	130	130
Warmouth	1	86	86	86
Grand Total	**34**	**208**	**50**	**555**

Considering an electrofishing method is biased toward collected larger fish, a second method (seine haul) was employed on 20 June 2013 in pond 2. No water quality measurements were taken in conjunction with the seine haul sampling. Two hauls of a 20ft seine collected 4 species in the smaller size classes (Table 10). The results suggest spawning of black crappie, bluegill, largemouth bass, and pumpkinseed. The seine also collected some dragonfly larvae and a mussel (2 inches).

Table 10. Seine haul results from 20 June 2013 in pond 2 (effort = 2 hauls)

Species	Size Classes (inches)								Total
	1	1.5	2	2.5	3	3.5	4.5	5	
Black crappie	29							1	30
Bluegill	42				1	1	2	2	48
Largemouth bass		4	63						67
Pumpkinseed				1		1			2
Grand Total	**71**	**4**	**63**	**1**	**1**	**2**	**2**	**3**	**147**

In summary, pond 2 has some quality largemouth bass and sunfish to support a pond fishery. However, non-fishery species degrade the sportfishing potential of the pond like so many other ponds on the golf course.

Pond 3

1.1.10. Description

Pond 3 is 0.68 acres in size, and drains via a linear wetland on the eastern side. The pond does not appear to receive any inflow from linear wetlands (Figure 6). A narrow margin of brush occupies the banks of the pond along over half of the shoreline.

Figure 6. Aeropines Golf Course Pond 3
(Source: Services.arcgisonline.com/arcgis/services/)

1.1.11. Water Quality

Water quality measurements were acquired on 9 April (Table 11). The oxygen concentration was 6.4 to 9.8 mg/l in a water temperature of 23 to 27°C (daytime measurements). The pH of the water was 8.0 to 9.0, which is at the alkaline end of the neutral range. Though not measured, water clarity was estimated at less than 1 foot of visibility. The ammonia concentration measured in this pond was 0.4 mg/l.

Table 11. Water quality measurements in pond 3

Date	Parameter	Recording
5/9/2013	Water Temperature (°C)	23.0
	Dissolved oxygen (mg/l)	9.8
	Ammonia Nitrogen (ppm)	0.4
	pH	9.0
8/7/2013	Water Temperature (°C)	27.0
	Dissolved oxygen (mg/l)	6.4
	Ammonia Nitrogen (ppm)	0.4
	pH	8.0

1.1.12. Fish

Though electrofishing was not conducted on this pond, a couple of seine hauls were made on 20 June 2013. No water quality measurements were taken in conjunction with the seine haul sampling. Two hauls of a 20ft seine collected 8 species in the smaller size classes (Table 12). The results suggest spawning of black crappie, bluegill, golden shiner, and largemouth bass in pond 3. A common carp was also observed in this pond, apart from the sampling effort.

Table 12. Seine haul results from 20 June 2013 in pond 3 (effort = 2 hauls)

	Size classes (inches)					
Species	**1**	**2**	**3**	**4**	**5**	**Total**
Black crappie	158	0	0	0	0	158
Bluegill	13	19	9	1	1	43
Golden shiner	18	0	0	0	0	18
Largemouth bass	2	1	1	0	0	4
Grand Total	**173**	**20**	**10**	**1**	**1**	**223**

Based on seine haul results, the top predatory gamefish in pond 3 is the largemouth bass followed by black crappie. The primary panfish and forage species for largemouth bass in this pond is bluegill. The bluegill ranged from 1 to 5 inches, which does not include quality sizes. However, due to competition from a large mud-sucking omnivore (common carp) and large minnow species (golden shiner), the bluegill population is not as abundance as it could be. The bass population is also affected because the shiners and carp get too large, too quickly, for most bass consumption. The carp may also stir up fine bottom sediments and reduce water clarity for the visual feeding bass. Black crappie tend to overpopulate and stunt in small ponds and may serve only to compete with smaller size classes of bass.

In summary, pond 3 has some largemouth bass that could support a pond fishery. However, non-fishery species degrade the sportfishing potential of the pond like so many other ponds on the golf course.

Pond 4

1.1.13. Description

Pond 4 is 6.05 acres in size, and appears to drains to pond 5 via a culvert pipe (Figure 7). The banks did not even have a narrow margin of brushy vegetation. Many areas of the pond shoreline are eroding with sections of the shoreline collapsing into the pond. This erosion is likely caused or expedited by the lack of shoreline vegetation at the pond. Patches of alligator weed (*Alternanthera philoxeroides*) were observed in the shallow margins of the pond.

Figure 7. Aeropines Golf Course Pond 4
(Source: Services.arcgisonline.com/arcgis/services/)

1.1.14. Water Quality

Water quality measurements were acquired on 9 April, 9 May, and 7 August 2013. Oxygen concentrations ranged from 7.0 to 9.12 mg/l in water temperatures ranging from 17.5 to 27.5°C (daytime measurements). The pH of the water was between 6 and 6.5, which is at the acidic end of the neutral range. Though not measured, water clarity was estimated at less than 1 foot of visibility. The water quality measurements are documented in Table 13.

Table 13. Water quality measurements in pond 4

Date	Parameter	Recording
4/9/2013	Water Temperature (°C)	17.5
	Dissolved oxygen (mg/l)	9.12
	Specific Conductivity (µS)	1121
	Salinity (ppt)	0.6
	pH	6-6.5
5/9/2013	Water Temperature (°C)	24.0
	Dissolved oxygen (mg/l)	7.8
	Ammonia Nitrogen	0.2
	pH	6.5
8/7/2013	Water Temperature (°C)	27.5
	Dissolved oxygen (mg/l)	7.0
	Ammonia Nitrogen (ppm)	0.2
	pH	6.5

1.1.15. Fish

Fish sampling was conducted in conjunction with water quality measurements on 9 April 2013. The method used was an electrofishing boat owned and operated by the Virginia Department of Game and Inland Fisheries (VDGIF; Chad Boyce). The boat surveyed the shoreline for 923 seconds of effort and collected 10 species (Table 14). Based on electrofishing results, the top predatory gamefish in pond 4 is the largemouth bass (up to 21 inches). The primary panfish and forage species for largemouth bass in this pond are bluegill and other sunfish species. The sunfish ranged from 2 to 6 inches, which includes some quality sizes. However, due to competition from pelagic, mud-sucking planktivores (gizzard shad) and large mud-sucking omnivores (common carp), sunfish populations are not as abundance as they could be. The bass population is also affected because the shad and carp get too large, too quickly, for most bass consumption. These species may also stir up fine bottom sediments and reduce water clarity for the visual feeding bass. White perch tend to overpopulate and stunt in small ponds and may serve only to compete with smaller size classes of bass. A crayfish was also collected in this pond during the sampling event.

Table 14. Electrofishing results from 9 April 2013 in pond 4 (effort = 923 sec).
Note: Missed numerous eels

Species	Number	Avg. Length (mm)	Min. Length (mm)	Max. Length (mm)
American eel	7	207	150	320
Bluegill	10	126	60	159
Chain pickerel	1	264	264	264
Common carp	32	474	381	621
Green sunfish	1	135	135	135
Gizzard shad	2	321	308	334
Largemouth bass	4	406	275	528
Pumpkinseed	1	87	87	87
Redear sunfish	2	71	62	80
White perch	15	119	101	162
Grand Total	**75**	**301**	**60**	**621**

In summary, pond 4 has some quality largemouth bass and sunfish to support a pond fishery. However, non-fishery species degrade the sportfishing potential of the pond like so many other ponds on the golf course.

Pond 5

1.1.16. Description

Pond 5 is 2.98 acres in size, and drains via stream channel forming the western shoreline (Figure 8). The pond received drainage from the stream channel forming the eastern shoreline. The pond is also connected to pond 5 via a culvert pipe. Along most of the shoreline, the banks did not even have a narrow margin of brushy vegetation; an exception being the wooded southwestern shoreline. Many areas of the pond shoreline are eroding with sections of the shoreline collapsing into the pond. This erosion is likely caused or expedited by the lack of shoreline vegetation at the pond. Patches of alligator weed (*Alternanthera philoxeroides*) and milfoil (*Myriophyllum* spp.) were observed in the shallow margins of the pond.

Figure 8. Aeropines Golf Course Pond 5
(Source: Services.arcgisonline.com/arcgis/services/)

1.1.17. Water Quality

Water quality measurements were acquired on 9 April and 9 May, 2013. Oxygen concentrations ranged from 7.5 to 9.12 mg/l in water temperatures ranging from 17.5 to 24°C (daytime measurements). The pH of the water was 6 to 6.5, which is at the acidic end of the neutral range. Though not measured, water clarity was estimated at less than 1 foot of visibility. The water quality measurements are documented in Table 15.

Table 15. Water quality measurements in pond 5

Date	Parameter	Recorded
4/9/2013	Water Temperature (°C)	17.5
	Dissolved oxygen (mg/l)	9.12
	Specific Conductivity (µS)	1121
	Salinity (ppt)	0.6
	pH	6-6.5
5/9/2013	Water Temperature (°C)	24.0
	Dissolved oxygen (mg/l)	7.5
	Ammonia Nitrogen	0.2
	pH	6.5
8/7/2013	Water Temperature (°C)	27.0
	Dissolved oxygen (mg/l)	6.4
	Ammonia Nitrogen (ppm)	0.2
	pH	6.5

1.1.18. Fish

Fish sampling was conducted in conjunction with water quality measurements on 9 April 2013. The method used was an electrofishing boat owned and operated by the Virginia Department of Game and Inland Fisheries (VDGIF; Chad Boyce). The boat surveyed the shoreline for 900 seconds of effort and collected 7 species (Table 16). Based on electrofishing results, the top predatory gamefish in pond 5 is the largemouth bass (up to 19 inches). The primary panfish and forage species for largemouth bass in this pond are bluegill and other sunfish species. The sunfish ranged from 2 to 5 inches, which does not includes quality sizes. American eel were observed but not collected during electrofishing.

Table 16. Electrofishing results from 9 April 2013 in pond 5 (effort = 900 sec). Note: Eel observed; missed quarter of bass and sunfish

Species	Number	Avg. Length (mm)	Min. Length (mm)	Max. Length (mm)
Bluegill	8	93	57	127
Common carp	29	483	392	606
Green sunfish	1	128	128	128
Largemouth bass	6	322	115	471
Pumpkinseed	2	128	125	131
Redear sunfish	3	94	72	138
Warmouth	2	70	49	90
Grand Total	**51**	**343**	**49**	**606**

Considering an electrofishing method is biased toward collected larger fish, a second method (seine haul) was employed on 20 June 2013 in pond 5. No water quality measurements were taken in

conjunction with the seine haul sampling. Two hauls of a 20ft seine collected 5 species in the smaller size classes (Table 17). The results suggest spawning of black crappie, bluegill, golden shiner, gizzard shad, and largemouth bass. A number of grass shrimp were also collected in the seine hauls.

Table 17. Seine haul results from 20 June 2013 in pond 5 (effort = 2 hauls).

	Size Classes (inches)				
Species	**1**	**2**	**3**	**4**	**Total**
Black crappie	0	1	0	0	1
Bluegill	1	1	4	1	7
Golden shiner	8	0	0	0	8
Gizzard shad	55	0	0	0	55
Largemouth bass	1	0	0	0	1
Total	**65**	**2**	**4**	**1**	**72**

Due to competition from a pelagic, mud-sucking planktivore (gizzard shad), a large mud-sucking omnivores (common carp), and a large minnow species (golden shiner), sunfish populations are not as abundance as they could be. The bass population is also affected because the shad, carp, and shiner get too large, too quickly, for most bass consumption. The shad and carp may also stir up fine bottom sediments and reduce water clarity for the visual feeding bass. Black crappie tend to overpopulate and stunt in small ponds and may serve only to compete with smaller size classes of bass.

In summary, pond 5 has some quality largemouth bass to support a pond fishery. However, non-fishery species degrade the sportfishing potential of the pond like so many other ponds on the golf course.

Pond 6

1.1.19. Description

Pond 6 is 0.72 acres in size, and does not have an obvious drain or receiving drainage apart from overland flow (Figure 9). The banks are a mixture of trees and brush, and there are willow trees (*Salix* species) growing in the pond interior, suggesting very shallow water. Along the tree-covered eastern shoreline, the nearshore waters dropped steeply to over 4 feet deep. Dense beds of submerged vegetation (possibly musk grass; *Chara* species) were also observed in the shallower, open waters of the pond.

Figure 9. Aeropines Golf Course Pond 6
(Source: Services.arcgisonline.com/arcgis/services/)

1.1.20. Water Quality

Water quality measurements were acquired on 9 April (Table 18). The oxygen concentration was 3.9 to 5.9 mg/l in a water temperature of 21 to 24.5°C (daytime measurements). The pH of the water was 6.0, which is at the acidic end of the neutral range. Though not measured, water clarity was higher than most other ponds on the Golf Course. The water was also stained brown from the abundance of trees around the banks and interior. The ammonia concentration measured in this pond was 0.2 ppm.

Table 18. Water quality measurements in pond 6

Date	Parameter	Recorded
5/9/2013	Water Temperature (°C)	21.0
	Dissolved oxygen (mg/l)	5.9
	Ammonia Nitrogen	0.2
	pH	6.0
8/7/2013	Water Temperature (°C)	24.5
	Dissolved oxygen (mg/l)	3.9
	Ammonia Nitrogen (ppm)	0.2
	pH	6.0

1.1.21. Fish

A couple of short seine hauls in pond 6 managed to collect dozens of Mosquitofish and a 1 inch largemouth bass. The presence of a very young bass suggests spawning activity in this pond. However, the forage base and dense habitat are unsuitable for a quality bass fishery.

Pond 7

1.1.22. Description

Pond 7 is 0.67 acres in size, and does not have an obvious drain or receiving drainage apart from overland flow (Figure 10). The banks are fully tree covered, and there was duckweed (Lemnoideae sub-family) covering the entire area of surface water.

Figure 10. Aeropines Golf Course Pond 7 (Source: Google Earth)

1.1.23. Water Quality

Water quality measurements were acquired on 9 May (Table 19). The oxygen concentration was 0.02 to 0.4 mg/l in a water temperature of 18 to 27.5°C (daytime measurements). The pH of the water was 6.0, which is at the acidic end of the neutral range. Though not measured, water clarity was higher than most other ponds on the Golf Course. The water was also stained brown from the abundance of trees around the banks and interior. The ammonia concentration measured in this pond was 0.8 to 1.5 ppm. No fish sampling was conducted in this pond because of the low dissolved oxygen reading.

Table 19. Water quality measurements in pond 7

Date	Parameter	Recorded
5/9/2013	Water Temperature (°C)	18.0
	Dissolved oxygen (mg/l)	0.4
	Ammonia Nitrogen (ppm)	0.8
	pH	6.0
8/7/2013	Water Temperature (°C)	27.5
	Dissolved oxygen (mg/l)	0.02
	Ammonia Nitrogen (ppm)	1.5
	pH	6.0

Streams

1.1.24. Description

The two streams segments sampled are shown on Figure 11. The downstream location was severely degraded habitat, in terms of siltation, with an abundance of milfoil (*Myriophyllum* spp.), filamentous algae, and snags along a forested riparian zone. The upstream location was downstream from a bridge, along a stream segment whose banks were cleared of forest vegetation. The stream bottom was muddy sand and the shallow margins were choked with emergent vegetation. The water at both locations was very shallow (1-2 feet) with a thick layer of mud in pools and along the shallow margins.

Figure 11. Aeropines Golf Course stream sampling locations (left is downstream, right is upstream) (Source: Google Earth)

1.1.25. Water Quality

Water quality measurements were taken off the bridge at the downstream location on 9 May 2013. The oxygen concentration was 13.82 mg/l in a water temperature of 22°C (daytime measurements). Other water quality measurements were specific conductivity (804 µS) and salinity (0.4 ppt). Water quality at the upstream site was not measured.

1.1.26. Fish

At the downstream location, fish sampling was conducted in conjunction with water quality measurements on 9 April 2013. The method used was a backpack electrofishing unit owned and

operated by the Virginia Department of Game and Inland Fisheries (VDGIF; Chad Boyce). The backpack shocker surveyed the shoreline for 250 seconds of effort and collected 5 species. The species were bluegill (2 at 2.5 inches), bluespotted sunfish (1 at 2.6 inches), mosquitofish (10), golden shiner (1 at 3.7 inches), and pumpkinseed (1 at 3.3 inches).

At the upstream location, fish sampling was conducted using a 20 foot seine pulled upstream. The species collected were largemouth bass (6 at 2 inches), mosquitofish (7), bluespotted sunfish (4 at 2-3 inches), pumpkinseed (16 at 2-5 inches), warmouth (1 at 4.5 inches), unidentified sunfish species (2 at 3 inches), and an unidentified bullhead species (4 at 2 inches). The seine also collected a clam (5 mm), crayfish, and grass shrimp.

Conclusion and Recommendations

The ponds on the Aeropines Golf Course are populated by a mixture of desirable gamefish (e.g., largemouth bass, bluegill, redear sunfish), an ESA candidate species (American eel), and notorious undesirable species (e.g., common carp, gizzard shad, golden shiner) that were either introduced or managed to immigrate from downstream in the West Neck Creek watershed. Of course, management goals for the ponds depend on their current or prospective uses (e.g., fishing, aesthetics, pollutant storage/treatment).

The pond game fisheries could be improved by killing all the fish and starting over with a recommended ratio of largemouth bass, bluegill, redear sunfish, and channel catfish. However, there is no way to drain the ponds to achieve a population reset. There is also the potential consequence of removing the species that keep the water murky (e.g., common carp, gizzard shad), thus allowing nuisance aquatic vegetation to overwhelm the system. In any case, a reset would not prevent further immigration or introduction of undesirable species in the future. Establishing and maintaining a fishery in one or more ponds would require removing the fish (pump out or rotenone application) after blocking off both inflow and outflow for a time. Low riser pipes could then be installed to drain overflow from the ponds and prevent future immigration of fish or vegetation. However, supporting a pond fishery should be secondary considering the primary purpose of the ponds is to provide traditional golf course aesthetics and the cost of making any improvements.

Typical golf course ponds have banks devoid of bushy vegetation and water stained with dye to reduce water clarity for nuisance weed growth. However, the eroding banks of such ponds could be considered a reduction in aesthetic quality. Establishing a shoreline zone of low wetland plants could improve both aesthetics (by reducing erosion) and nutrient removal of surface runoff. The removal of excess nutrients by the wetland plants could also improve water quality in the ponds and downstream. However, an improvement in water clarity could lead to an overabundance of nuisance aquatic weeds if they are already in the pond (true for pond 5). In such cases, pond dye could be applied to reduce water clarity for the nuisance weeds.

Based on these recommendations, a comprehensive plan could be developed for each pond that maximizes the aesthetic qualities of the ponds (shoreline vegetation established and improved water quality) and improves the fishery, if desired.

Amphibians and Reptiles

Field surveys for amphibians and reptiles were conducted on 12 March, 9 April, 9 May and 20 June 2013 to species present in and around the Aeropines golf course ponds on NAS Oceana. Prior to this effort, no formal survey had been conducted with only anecdotal field observations of herpetofauna species of the golf course ponds. Prior to the field work, a list of potential species was compiled to establish field methodologies and field survey strategies based on species-specific habitat preferences. This list was created by gathering data from field guides, the National Amphibian Atlas (http://armi.usgs.gov/national_amphibian_atlas.php), and museum records (http://herpnet.org/portal.html).

Field Methods

Visual encounter surveys were the primary technique used by biologists to conduct the field work. This survey method involved searching in and around the ponds for amphibians and reptiles when the probability of encounter was high (appropriate microhabitat, weather, and time of day for the target species). This technique was conducted during daylight and nighttime hours by walking along the perimeter of the golf course ponds searching for animals within their microhabitats. A second technique using during this survey included driving and walking the golf cart paths looking for individuals crossing or resting on the roadway. A third technique used during the survey was listening for the breeding calls of frogs and toads. This technique was used to identify species and helpful at locating specific ponds where these species were breeding. Lastly, hoop net traps were used to capture and identify turtle species within the ponds. Amphibians and reptiles encountered were identified to species and a digital photograph was recorded of most captured species.

Results

1.1.27. Amphibians

In total from all survey events, five species of amphibians were observed in or near the Aeropines golf course ponds at NAS Oceana. Of the species observed, the American Bullfrog (*Lithobates catesbeianus*), Northern Green Frog (*Lithobates clamitans melanota*) and Southern Leopard Frog (*Lithobates sphenocephalus*) were present in most ponds (Table 20). The Southern Toad (*Anaxyrus terrestris*) and Spring Peeper (*Pseudacris crucifer*) were found in the least number of ponds. Five amphibian species occurred at pond 2 and 3 whereas four species were encountered at pond 6. The remaining ponds and the stream had three or less species. A chorus of Spring Peepers was heard and observed during a nighttime survey on March 12, 2013 at ponds 2 and 6 and adjacent to the golf course behind building 847. During the same survey, a Southern Leopard Frog chorus was observed at ponds 0, 2, 3 and 6. Tadpoles of the Southern Toad were observed in ponds 2 and 3 during the May 2013 survey event. These data suggest that ponds 0, 2, 3, and 6 provide important breeding habitat for several species of frogs and toads. This may be the result of these ponds having

more gently sloping banks, with shallow water with aquatic vegetation growing in areas along portions of their perimeters. In comparison, ponds 1, 4, 5, and 7 generally have steeper sloping banks with no aquatic vegetation and deeper waters along their perimeters.

No salamander species were encountered during this investigation. We did not find this surprising since the majority of salamander species that are potential to occur on the installation are forest dwelling species. Due to the lack of forested habitat around the majority of the ponds and the lack of fallen logs and braches to provide habitat for salamanders, it is unlikely that they occupy the golf course ponds. However, we believe that Pond 7 has the greatest potential for salamanders, particularly the Red-spotted newt (*Notophthalmus viridescens viridescens*), since it has forested habitat along its western edge.

Table 20. Amphibian species confired at the Aeropines Golf Course Ponds

Scientific Name	Common Name	Pond 0	Pond 1	Pond 2	Pond 3	Pond 4	Pond 5	Pond 6	Pond 7	Stream
Anaxyrus terrestris	Southern Toad			X	X	X				
Lithobates catesbeianus	American Bullfrog	X		X	X		X	X		X

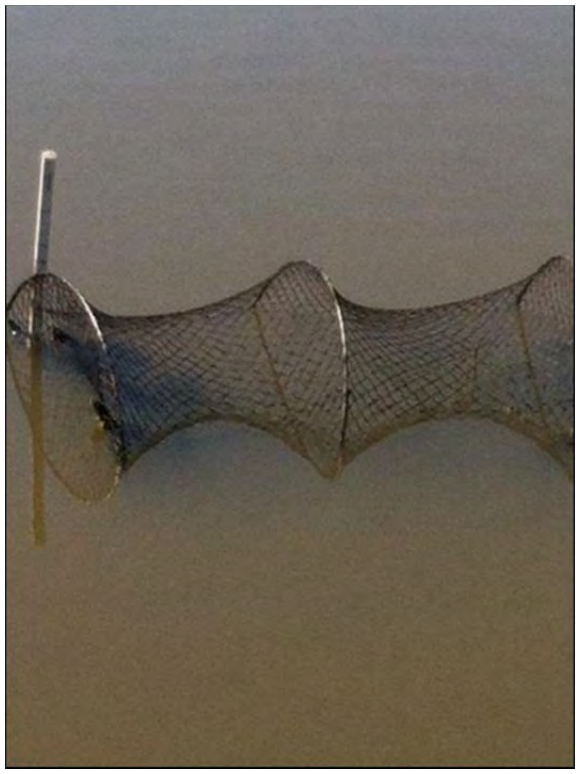
Lithobates sphenocephalus	Southern Leopard Frog	X	X	X	X	X	X	X	X	
Pseudacris crucifer	Spring Peeper			X	X			X		
Acris gryllus	Southern Cricket Frog		X							

1.1.28. Reptiles

In total from all survey events, eight species of reptiles were observed in or near the Aeropines golf course ponds at NAS Oceana (Table 21). One lizard species (Little Brown Skink [*Scincella lateralis*]) was observed in the wooded habitat near the perimeter of Pond 7 and one snake species (Northern Watersnake [*Neriodia sipedon]*) was observed on the edge of the stream west of Pond 5.

Although not observed during this investigation, observations of Eastern Ratsnakes (P*antherophis alleganiensis*) and Northern Rough Greensnakes (*Opheodrys aestivus aestivus*) were reported by



grounds maintenance personnel on the golf course.

Aquatic turtles were frequently observed basking on the edge of most of the golf course ponds and swimming in the ponds. Hoop net turtle traps were deployed in ponds 0, 2, 1, 4, and 6 on 20 June 2013. As a result of the trapping event, nearly 70 turtles of six species were captured. No turtles were captured in pond 2 whereas ponds 4 and 6 had five species each. Sixty one percent of the species captured were Yellow-bellied Sliders (*Trachemys scripta scripta*), 16% were Common Snapping turtles (*Chelydra serpentina serpentine*) and 14% were Eastern Painted Turtles (*Chrysemys picta picta*). These three species were also found in the greatest number of golf course ponds (> 4 ponds). One Eastern Musk Turtle (*Sternotherus odoratus*) was found in Pond 4, and the three Northern Red-bellied Cooters (*Pseudemys rubriventris*) were found in ponds 1 and 6. The invasive Red-eared slider (*Trachemys scripta elegans*) was observed in ponds 0, 4 and 6. All captured turtle species appeared healthy.

Table 21. Reptile species confirmed at the Aeropines Golf Course Ponds

Scientific Name	Common Name	Pond 0	Pond 1	Pond 2	Pond 3	Pond 4	Pond 5	Pond 6	Pond 7	Stream
Scincella lateralis	Little Brown Skink								X

Trachemys scripta elegans	Red-eared Slider	X				X		X		

Conclusion and Recommendations

The ponds located on the Aeropines golf course at NAS Oceana support a variety of amphibian and reptile species typical to southeastern Virginia. Based on the survey results, five amphibians and eight reptile species were document in or around the ponds and stream. The highest diversity of amphibian species was found in ponds 2 and 3, whereas the greatest reptile species diversity was found in ponds 4 and 6. Pond 6 had the highest combined amphibian and reptile species diversity (nine species). Amphibians selected ponds that contained gently sloping banks with shallow water aquatic vegetation. This habitat structure was not a selected by the turtles, which were found along the barren/steep backs of the ponds.

The following recommendations will assist with protecting and enhancing the amphibians and reptiles populations in and around the Aeropines golf course and ponds:

- Avoid mowing (or raise the mower deck height to 8 inches) adjacent to the shoreline of the ponds. Leaving a buffer of natural vegetation around the ponds will provide cover for amphibians and reptiles in addition to limit fertilizer input into the ponds.
- Follow fertilizer, herbicide and insecticide label directions carefully; use the minimum amounts needed to achieve management objectives
- Provide educational materials to maintenance personnel and golfers of the species present on the golf course and encourage them not to kill or harass them when encountered.

- If invasive/exotic plant species (such as Phragmites) begin to grow in the ponds, initiate a control program. Amphibians and reptiles are unable to live in places choked with invasive plant species.
- Consider removing the fish from one or many ponds. Fish of all kinds eat eggs, larvae, tadpoles and adult frogs.
- Consider adding basking logs in one or many of the ponds for turtles. At this time none exist and the turtles are basking on the pond banks, making them more vulnerable to predation.

Birds

Bird species observations were documented during every visit to the golf course. Bird species in around the ponds were identified using binoculars and by listening for species-specific calls. This was not a formal survey but was anecdotal observations. In total from all survey events, 28 species of birds were observed in or near the Aeropines golf course ponds (table 22). Of the species, the Double-crested Cormorant, Canada Goose, Mallard, Red-winged Blackbird, Great Blue Heron, and Great Egret were the most frequent species observed. Ponds 2 and 4 had the greatest number of species diversity (nine and eight respectfully) and ponds 1, 3, and 6 had the least species diversity (two, and three species). The observation of the eagle was recorded during the May 2013 field survey and was of an individual soaring overhead.

Table 22. Bird species observed in and around the Aeropines golf course

Common Name	Pond 0	Pond 1	Pond 2	Pond 3	Pond 4	Pond 5	Pond 6	Pond 7

Conclusion and Recommendations

Golf courses can be an oasis for wildlife within a manmade environment. Aeropines Golf Course is no exception, with a variety of habitats that include pine woodlands, mix woodlands, old fields, freshwater marsh, ponds, and streams. These habitats are fragmented and produce many ecotones in a relative

small space. Though habitat fragmentation can have a negative impact on many species with particular specialized habitat requirements, it can also be an attractant to other species that are habitat generalist and those which prefer edge type habitats. This is especially true for birds and though a formal survey was not conducted, it is apparent that the Aeropines Golf Course is habitat for a variety of bird species. The following recommendations may help improve existing and create new habitats at the golf course ponds.

- Reduce or discontinue herbicide spraying on the shoreline vegetation allowing this vegetation to reestablish and maintain vegetation buffers next to the ponds (pond 1 and 2 have areas that are good examples of shoreline vegetation). Shoreline vegetation may decrease Canada goose usage of the golf course by limiting easy access to the ponds.
- Reduce or discontinue mowing of the vegetation next to the shoreline at the ponds allowing vegetation to reestablish and maintain a vegetation buffer next to the ponds (pond 1 and 2 have areas that are good examples of shoreline vegetation). Shoreline vegetation may decrease Canada goose usage of the golf course by limiting easy access to the ponds.
- Plant native trees along the shoreline along many of the ponds. In areas that would not impede the golfers but add to the aesthetics of the pond and increase their wildlife value.
- Plant native wetlands plants in appropriate locations in the ponds to create in water habitats. Herbaceous or shrub wetlands can be excellent wildlife habitats for birds and many other species. These areas would also create areas for fish nurseries that are lacking in many of the ponds. Pond 2, 3, 5 may have areas suited for this type of vegetation management.

FIGURES

EXECUTIVE SUMMARY

This Project assessed the current condition of selected streams and floodplain wetlands at Naval Auxiliary Landing Field Fentress (NALFF). Seasonal (summer and spring) backpack electrofishing surveys were conducted in streams and floodplain wetlands. In addition to electrofishing, streams were also evaluated for current suitability of habitat (e.g., fish passage) and the potential for enhancements to habitat accessibility.

These data will be used to supplement any existing data and used in current and future environmental planning and management at NALFF. Additionally, these data were analyzed to develop improvement recommendations to habitat as well as fish populations, which are presented in this report. Survey biologists used a modified version of the U.S. Environmental Protection Agency's (EPA) Rapid Bioassessment Protocols (RBP) in order to collect a representative sample of the fish assemblage from the appropriate habitat composition in NALFF streams and floodplain wetlands (Barbour et al. 1999). Field crews used the Habitat Assessment Field Data Sheets for Low Gradient Streams, as provided in Barbour et al. (1999). The RBP protocols are included as Appendix D to this report. A "score" was assigned to each of these categories for each surveyed reach so that relative comparisons can be made between reaches and streams. Qualitative habitat surveys were also used to assess pond habitat quality. Additionally, a barrier survey using a combination of assessment protocols was used to identify potential impediments to fish migration within NALFF streams. Water quality was recorded *in situ* at every stream and floodplain wetland during each sampling event, using a hand held multi-parameter meter. Additionally, water grab samples were collected and submitted for laboratory analyses.

In accordance with EPA RBP standards, NALFF streams all fell within marginal and suboptimal categories for habitat quality. Fish surveys at NALFF steams yielded fish assemblages typical of degraded, channelized coastal plain streams. NALFF streams yielded 702 individual fish represented by 23 species. Notably, American eel, a migratory species, were present in NALFF waterbodies. Barrier survey data identified both potential and existing impediments to fish migration through the NALFF installation. Floodplain wetlands fish surveys yielded a total of 30 individual fish, all of which were eastern mudminnow. These data show that NALFF streams and floodplain wetlands offer little to no recreational value. Periodic monitoring of fish populations and evaluation/repair of some culverts is recommended.

1 INTRODUCTION

1.1 OBJECTIVES

The purpose of this survey was to assess the current condition of the biological resources and habitats of select streams and flood wetlands at Naval Auxillary Landing Field Fentress (NALFF). Assessments included seasonal backpack electrofishing surveys, habitat and water quality measurements, and the characterization of physical barriers to migratory fishes, especially American eel (*Anguilla rostrata*) and alosines, including alewife (*Alosa pseudoharengus*), blueback herring (*A. aestivalis*), American shad (*A. sapidissima*), and hickory shad (*A. mediocris*).

The results of this survey and assessment will be used to supplement any existing data and be incorporated into current and future environmental planning documents, such as the Integrated Natural Resources Management Plan (INRMP) or Environmental Assessments (EA) at NALFF.

1.2 SITE DESCRIPTION

Naval Auxillary Landing Field Fentress (NALFF) is located approximately 7 miles (mi.) (11 kilometers [km]) southwest of Naval Air Station Oceana (NASO) near the community of Fentress in what is now the City of Chesapeake. It encompasses 2,556 acres (ac.) (3,549 hectares [ha]). NALFF is generally bounded by Mount Pleasant Road to the north, Carter Road to the west, Long Ridge Road to the south, and Fentress Airfield Road to the southeast. A detailed description of the site's current and historical operations and land use can be found in the facility's Final INRMP (Navy 2014).

NALFF has an extensive network of artificial drainages and channelized streams, including a major portion of Pocaty Creek (Figure **1**). Stormwater runoff drains into Pocaty Creek, which flows east into the North Landing River/Intercoastal Waterway. NALFF property north of Mount Pleasant Road is part of the riparian forested wetland of the North Landing River and typically retains surface water year round. There are no ponds or other water bodies on NALFF.

This page intentionally left blank.

1.3 FISHERIES MANAGEMENT

Fisheries management at NALFF is focused on the natural and channelized streams of Pocaty Creek, its tributary streams, and the flooded forest tracts associated with the North Landing River. NALFF is primarily a landlocked installation, therefore the ichthyofauna is largely comprised of freshwater species. However, Pocaty Creek provides a connection to estuarine waters further downstream, so the presence of migratory fish species is possible. Fish previously observed at Pocaty Creek include pirate perch (*Aphredoderus sayanus*), redfin pickerel (*Esox americanus*), bluegill (*Lepomis macrochirus*), and largemouth bass (*Micropterus salmoides*).

No rare, threatened, or endangered fish species listed under the federal Endangered Species Act (ESA) have been identified at the Installation; however, blueback herring (*Alosa aestivalis*) and American eel (*Anguilla rostrata*) have been petitioned for listing within ranges that overlap NALFF. A 2013 status review of blueback herring by the National Marine Fisheries Service (NMFS) found that listing under the ESA was not warranted (78 FR 48943–48994), however this determination continues to be controversial and could be revisited by regulators and petitioners. The American eel was petitioned for listing under the ESA in 2010. In 2011, the U.S. Fish and Wildlife Service (USFWS) issued a finding that listing of the species may be warranted, and initiated a status review (76 FR 60431–60444), which was completed in October 2015. USFWS found that listing under the ESA was not warranted (80 FR 60834-60850).

Recommendations for the management of fish resources, such as conservation of fish diversity, cooperation with state and federal agencies, and regular monitoring of natural resources, have been included in the most recent INRMP from 2014 (Navy 2014). The Navy also supports the protection of watersheds through initiatives such as establishing or enhancing riparian forest buffers along unprotected waterways.

2 ASSESSMENT METHODS

The purpose of this study was to perform fish community assessments on targeted streams and wetlands located at NALFF. An additional goal was to qualitatively characterize habitat and identify barriers to fish movement that may affect anadromous and catadromous species by performing a walk-over survey of the streams. In total, five streams and three floodplain wetlands were surveyed in August 2014 and April 2015; habitat and barrier surveys were conducted once. The resulting data and analyses presented here will help characterize existing fish populations and habitat within these Installations; this characterization will aid in ensuring compliance with applicable federal, state, and local statutes and regulations, and with U.S. Department of Defense (DOD) policies, instructions, and guidance. For all field surveys, a Trimble GeoXH GeoExplorer 6000 Series Global Positioning System (GPS) with sub-meter capabilities collected position data.

2.1 WATERBODY SELECTION

Geographic Information System (GIS) layers were used to identify all freshwater stream reaches and wetlands within the NALFF boundaries. Identified waterbodies were cross-referenced with the U.S. Geological Survey (USGS) stream layer and the surface water course centerlines layer to focus only on freshwater streams (Figure 2) and specific wetland areas (Figure 3). A list of streams and ponds were selected based on data needs, accessibility, and scoping requirements (Table 1). Stream site NALFF-S3 (S3) was originally identified as a potential survey reach on the site map; however, it was not sampled because there was no clearly-defined stream channel at that location and no flow was observed. It is possible that the recent construction of the Chesapeake City ditch (located at S4) altered the drainage pattern of S3, causing any flow that may have previously existed in S3 to be diverted to S4. The streams and wetlands listed in Table 1 represent those selected for evaluation during this survey, and Figure 2 shows the corresponding geographic locations of the survey effort. Figure 3 shows the three wetlands sites surveyed (NALFF-W1, -W2, and -W3) within one contiguous wetland area.

Table 1: Streams and Wetlands Surveyed at Naval Auxilary Landing Field Fentress

Waterbody type	Site ID[1]	Name	Location and description
Streams	NALFF-S1	Pocaty Creek	Main Stream Channel at NALFF, flows into North Landing River.
	NALFF-S2	Unnamed	Tributary of Pocaty Creek, drains the area around NALFF runway.
	NALFF-S4	Unnamed	Tributary of Pocaty Creek, drains the agricultural fields south of Pocaty Creek.
	NALFF-S5	Unnamed	Intermittent tributary of Pocaty Creek, drains the agricultural fields north of Pocaty Creek.
	NALFF-S6	Unnamed	Tributary of Pocaty Creek, drains the agricultural fields north of Pocaty Creek.
Floodplain wetlands	NALFF-W1	Unnamed	Forested swamp north of Mt. Pleasant Rd.
	NALFF-W2		
	NALFF-W3		

[1]NALFF-S3 was originally identified as a potential survey reach on the site map; however, it was not sampled because there was no clearly-defined stream channel at that location and no flow was observed

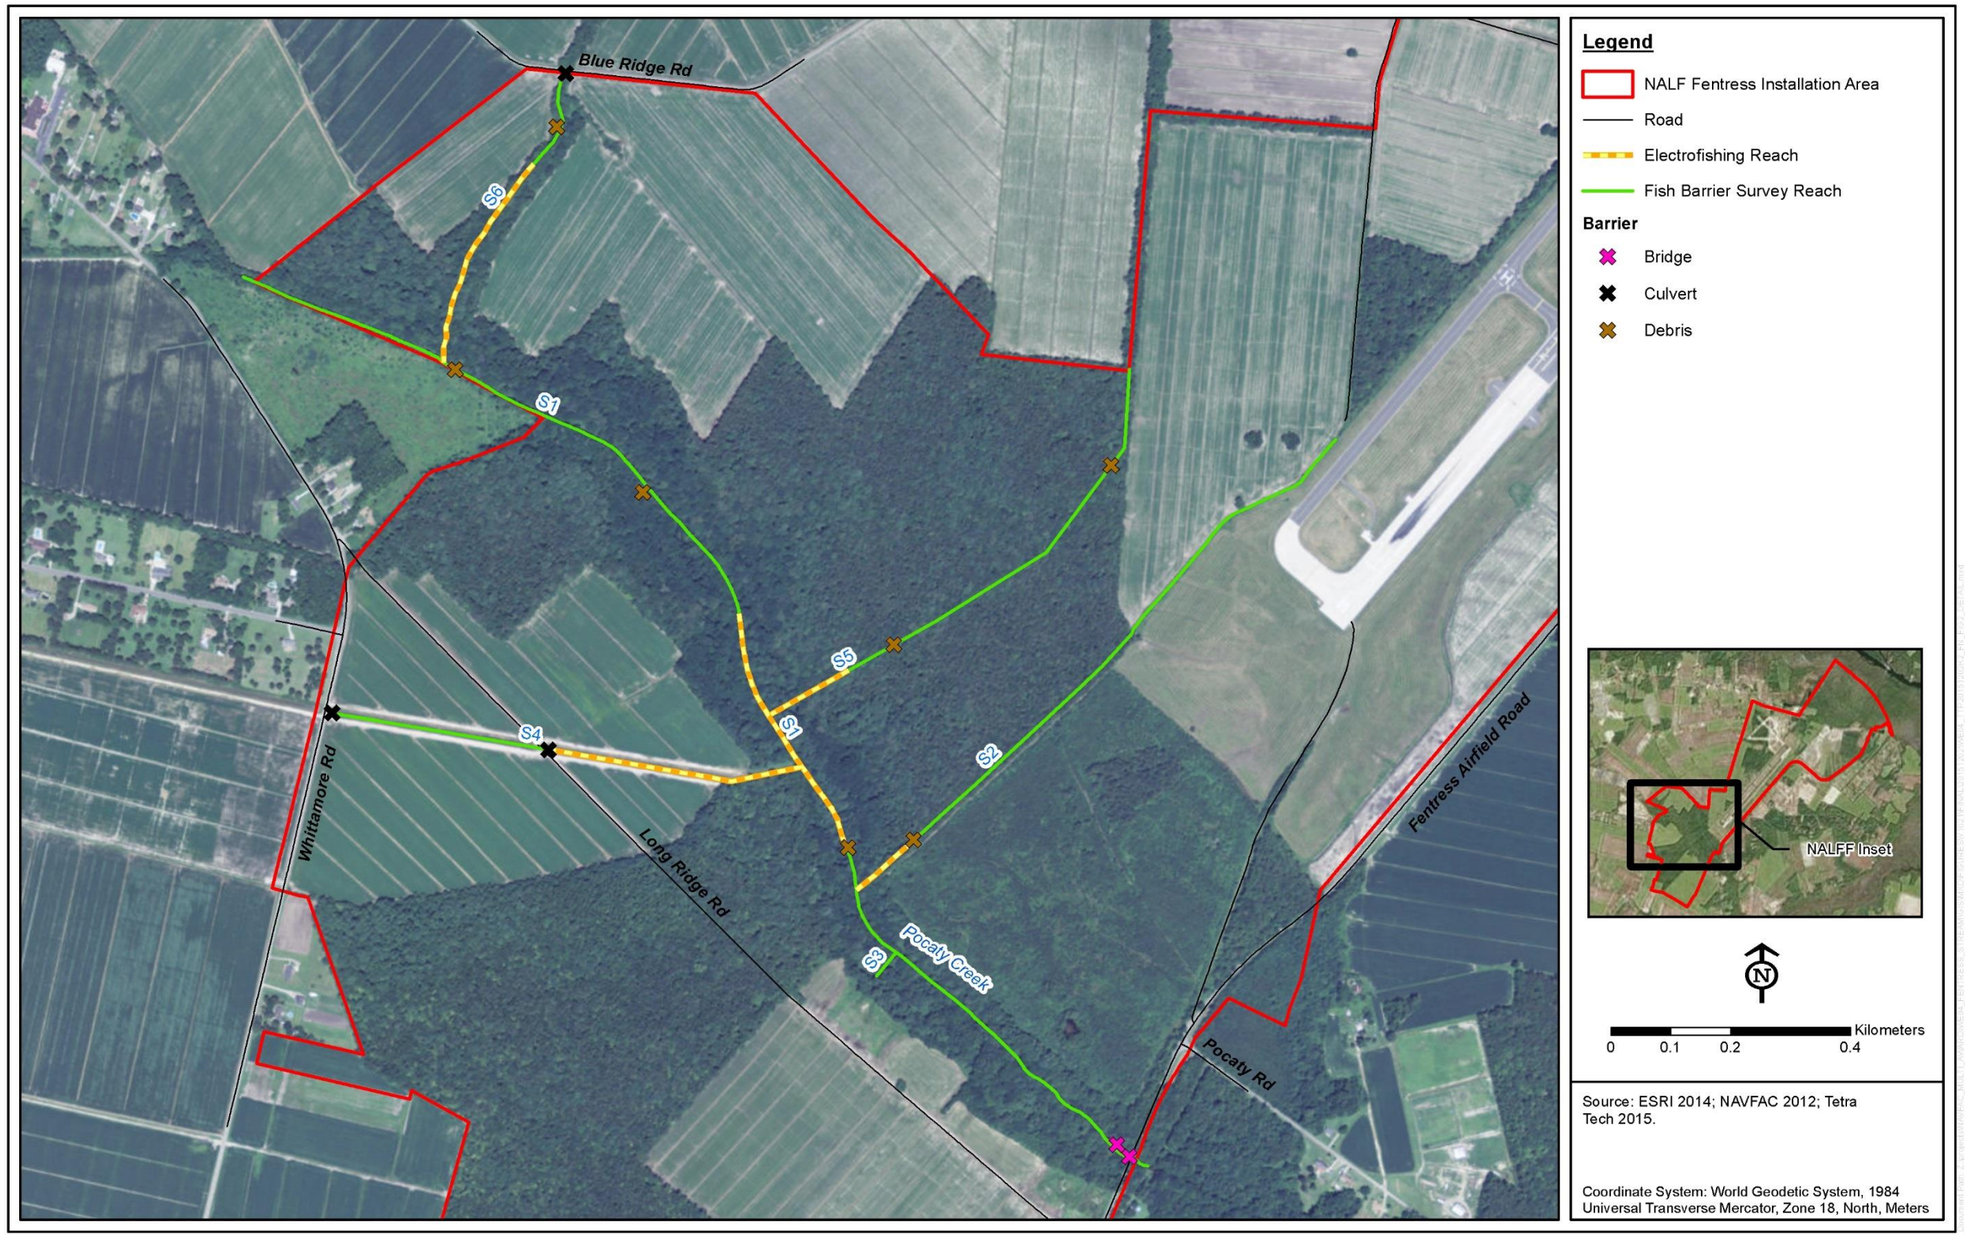

Figure 2: Selected Streams Surveyed at Naval Auxiliary Landing Field Fentress. Note that S3 stream channel is approximated and was not surveyed, as discussed in Section 2.1.

Figure 3: Selected Wetland Areas Surveyed at Naval Auxiliary Landing Field Fentress. Note that the Buffered Area Depicts an approximate 25 m Radius of the Meandering Survey Approach Discussed in Section 2.3.1.

2.2 STREAMS

The stream survey methods consisted of a biological (fish) and physical habitat assessment, as modified from the U.S. Environmental Protection Agency's (EPA) Rapid Bioassessment Protocols (RBP) developed by Barbour et al. (1999) (Appendix D). Fish surveys at all stream locations used backpack electrofishing methods in accordance with the modified RBP. The one-time habitat assessment used visual-based observations to quantify the conditions of the habitat. Water quality was collected *in situ*, as well as for laboratory analyses, with electrofishing efforts.

2.2.1 HABITAT SURVEY

Most of the stream habitat assessment parameters are based on physical characteristics; therefore, the habitat characterization was conducted as a "one-time" characterization for each stream reach. Other parameters, such as water quality (*in-situ* and grab samples) and flow are dynamic and were recorded during each visit.

The RBP habitat survey was performed once on each stream reach that was also sampled for the fish assessment during a walk-over survey. Tetra Tech biologists attempted to walk the wadeable portions of each stream, ensuring that the 150-meter (m) survey reaches would capture a representative sample of stream features (e.g., riffles, runs, pools). Where applicable, natural fish barriers or habitat breaks were used to delineate the start or end of a reach.

For this study, Tetra Tech used the Habitat Assessment Field Data Sheets for Low Gradient Streams, as provided in Barbour et al. (1999) (see Appendix B for blank data sheets). A "score" was assigned to each of these categories for each surveyed reach (NALFF-S1, -S2, -S4, -S5, and -S6) so that relative comparisons can be made between reaches and streams (Table 2). Further detail on scoring and criteria used can be found in Barbour et al. 1999.

By assigning a score and condition category to the ten visual-based habitat assessment parameters described in Table 2, a stream can be assessed and given a total score related to its condition. Scores ranging from 0 to 20 were assigned to each of the ten visual-based habitat assessment parameters, with 0 being a "poor" score and 20 being an "optimal" score. After scoring all parameters, a final score was determined for each reach. The final score can range from 0 to 200, with a score of 0 to 59 representing a "poor" condition; 60 to 112 representing a "marginal" condition; 113 to 165 representing a "sub-optimal" condition; and 166 to 200 representing an "optimal" condition. This rapid, qualitative physical habitat assessment was conducted at each NALFF stream reach that was also assessed for fish populations. Water quality sampling methods were similar between streams and wetlands, and are described in Section 2.4.

Table 2: Rapid Bioassessment Protocol (RBP) Parameters

RBP habitat parameter	Components analyzed in this survey
Physical characterization (one-time)	• Riparian and watershed land use • Stream origin and type • Riparian/canopy vegetation features • Instream parameters – channel width, depth, relative flow, high water mark, and substrate • Proportion of riffles, runs, and pools • Degree of channelization • Potential fish barriers (not part of RBP, but included in this survey)

Water quality (each visit)	• *In situ* measurements, such as water temperature, dissolved oxygen, and conductivity were collected for each stream reach.
	• Grab samples were collected to measure a total of three parameters (listed below) for each stream reach:
	  ○ Total Nitrogen (TN)
	  ○ Total Phosphorus (TPhos) & ortho-Phosphate (SRP) – Method 365.1
	  ○ Total Suspended Solids (TSS) – Method SM 2340D

Habitat features (one-time)	• Large woody debris/debris dams • Aquatic vegetation • Available cover
Visual-based habitat assessment (low gradient streams) (one-time)	• Epifaunal substrate/available cover • Pool substrate characterization • Pool variability • Sediment deposition • Channel flow status • Channel alteration • Channel sinuosity • Bank stability • Bank vegetative protection • Riparian vegetative zone width

2.2.2 BARRIER SURVEY

A combination of assessment protocols was used to identify potential barriers to fish migration within NALFF streams. Fish barrier surveys are typically implemented to assess the potential for habitat use by migratory fishes that may encounter obstacles in their migration, such as culverts, debris dams, beaver dams, or other physical blockages to migration. Additional data forms were included to facilitate the fish barrier survey as a supplement to the modified RBP survey. The fish barrier survey and accompanying data forms were adapted from state natural resource agencies (McInnch and Garman 2004, 1999; Vermont Agency of Natural Resources 2009), which were also recently applied to stream habitat surveys at other Hampton Roads Navy installations; Naval Support Activity (NSA) Northwest Annex, NASO, and the associated Dam Neck Annex (DNA) (Tetra Tech and Stell Environmental 2014; Tetra Tech 2015a, b). Copies of blank field data forms are included in Appendix B. During the modified RBP survey, each of the potential barriers to fish migration were inventoried for as much of a stream as possible within the installation boundaries, beyond the reaches assessed for habitat and fish. The stream was walked by

two field scientists starting at the downstream end of each stream (at the installation boundary, or confluence with another stream) and walking upstream until reaching an apparent habitat break or other boundary. Tetra Tech staff walked the entire wadeable length of each stream to the farthest extent practical (the installation boundary, in most cases) to record and characterize potential barriers to fish migration. Each bridge or culvert crossing and other potential barrier (e.g., beaver dam or large debris dam) was inventoried during the survey and physical measurements of the barrier were obtained in accordance with the data sheet. Photographs were also taken of representative barriers and included in the photograph log (Appendix A).

2.2.3 FISH SURVEY

Fish surveys were conducted at five stream sites within NALFF (reaches S1, S2, S4, S5, and S6). The goal was to sample all five sites during each sampling event, but dry conditions precluded the fish survey at NALFF-S5 in August. The fish sampling methods were modified from the EPA's RBP for fish (Barbour et al. 1999). Field biologists used the 150-m fixed-distance sampling as outlined in the RBP to collect a representative sample of the fish assemblage from the appropriate habitat composition (e.g., riffles, runs, pools) (further details described in USEPA 2007). Where applicable, natural fish barriers or habitat breaks were used to delineate the start or end of a reach.

The downstream start point at each surveyed reach was marked with a temporary pin flag and recorded as a GPS point. A tape measure was used to delineate the 150-m reach of the stream. The upstream end of the reach was also marked with a temporary pin flag and a GPS point. Water quality measurements, including temperature, specific conductance, dissolved oxygen, and percent oxygen saturation, were obtained at the downstream start point of each surveyed reach.

A Smith-Root LR-24 backpack electrofishing unit was used for all stream sites. The LR-24 was calibrated through the "auto-setup" function; then settings such as voltage, frequency, and duty-cycle were fine-tuned according to water parameters and operator experience to maximize the effectiveness of the electrofishing unit and safety of the fish and operator. A single-pass protocol was used. Backpack electrofishing protocols were consistent with those recommended by the U.S. Fish and Wildlife Service (USFWS 2010) and the American Fisheries Society (AFS 2008). The survey began at the downstream end of each reach. The fish survey continued upstream in a bank-to-bank sweeping technique, covering all wadeable habitats within the reach. Effort was measured in duration (seconds [s]) of active electrofishing, or "trigger" time. Variation in effort between reaches is typical due to stream width, depth, and habitat types.

A 12-ft. jon-boat owned and operated by the Virginia Department of Game and Inland Fish (VDGIF), was equipped with a Smith-Root 1.5 kVA pulse box electrofishing unit was used to sample NALFF-S1 during August surveys. In general, boat electrofishing protocols were consistent with those used by the USFWS (USFWS 2010) and the American Fisheries Society (AFS 2008). Stunned fish were captured and stored in a livewell until they were processed at the end of the survey.

At the end of the reach, fish were identified and counted. At least 30 individuals of each species were measured and weighed (total length [TL] to the nearest millimeter [mm]], mass in grams [g]), prior to being released back into the stream. All individuals were observed for any deformities, erosion, lesions, or tumors (DELT anomalies). Fish were identified to the lowest practical taxonomic level in the field based on external characteristics using taxonomic keys, including, "The Freshwater Fishes of Virginia" (Jenkins and Burkhead 1994). Page et al. (2013) was used to ensure accurate common and scientific fish names.

2.3 FLOODPLAIN WETLANDS

The methods used for wetland surveys for this study consisted of a biological (fish) assessment and water quality (*in-situ* and grab samples) collections. Surveys were within a similar framework as outlined above for streams, with the exception of the habitat and barrier survey, which were not conducted at the floodplain wetland sites.

2.3.1 FISH SURVEY

A standardized RBP or fish survey method such as those described for streams (Barbour et al. 1999) or small standing waters (Pope et al. 2009) does not exist for sampling fishes within a forested wetland. Therefore, previous surveys of this habitat type have utilized highly variable sampling designs and equipment (electrofishing, seines, lift nets, fish traps, and Rotenone) with inconsistent results due to the physical restrictions of the structured habitat (e.g., tree trunks, cypress knees, stumps, snags, etc.) (Adamus and Brandt 1990). Knight and Bain (1996) evaluated four quantitative (area-standardized electrofishing, trap nets, small-mesh gillnets, and large-mesh gillnets) and two qualitative (non-standardized electrofishing and larval dip netting) sampling techniques. They determined that non-standardized electrofishing was adequate to evaluate species composition in a rapid bioassessment approach (Knight and Bain 1996).

For consistency with the rapid bioassessment approach used for streams, non-standardized electrofishing was used to sample fishes in the forested riparian wetlands at NALFF. Fish surveys were conducted at three floodplain wetland sites within NALFF. All three sites were sampled during each sampling event. Three representative areas were surveyed using backpack electrofishing methods. Semi-protected areas were targeted in order to minimize escape of any partially-stunned fish in this otherwise open swamp. A meandering approach was used and the effort was focused on areas that were more readily accessible, within an approximate 25-m radius of the access point. These points are shown in Figure 3, with a 25-m buffer to indicate the extent of coverage. Large portions of the swamp were not wadaeble due to the water depth and soft bottom, which resulted in greater than waist deep water in most areas. Therefore, shallower areas with more solid footing was the limiting factor in locating the survey sites. All fishes collected were identified, weighed, and measured as previously described in Section 2.2.3. All starting locations were recorded with a GPS point.

2.4 WATER QUALITY

Water quality was recorded *in situ* at every stream and wetland during each sampling event, using a hand held multi-parameter meter (YSI 556). Parameters measured included water temperature (degrees Celsius [°C]), dissolved oxygen (milligrams per liter [mg/L] and percent [%] saturation), pH, and conductivity (milliSiemens per centimeter [mS/cm]).

Additionally, water grab samples were submitted for laboratory analyses at TestAmerica Laboratories Inc. in Savannah, GA. Laboratory analysis measured total nitrogen (TN), total phosphorus (TPhos), ortho-phosphate (SRP), and total suspended solids (TSS). TN was measured using EPA Method 351.2, as well as a calculated method. TPhos was analyzed in accordance with EPA Method 365.4. SRP analysis used EPA Method 365.1. TSS was measured using SM 2540D.

2.5 DATA ANALYSIS

Field data were transferred from field data sheets to a Microsoft Excel spreadsheet. Metrics calculated from the data included catch per unit effort (CPUE) and a species diversity index. CPUE allows for a

standardization of the fishing effort across streams, which enables comparisons where effort was not consistent. CPUE was calculated by dividing the total number of fish collected at each stream by the total sampling time (in seconds) of each stream. Species richness, commonly denoted as *R*, is simply the number of different species present in the dataset. A diversity index allows for comparisons of species diversity among multiple locations (streams in this case). The Simpson index (λ) measures the degree of concentration and is calculated by:

$$\lambda = \sum_{i=1}^{R} {p_i}^2$$

where p_i is the proportional abundance of each species within each sampling reach (number of individuals of species *i*, divided by the total number of individuals [*n*] in each sampling reach) and *R* is species richness. Values of λ range from 0 to 1, with lower values representing higher diversity. Another diversity parameter that is often used is the Shannon-Wiener diversity index (*H'*), which is calculated by using the proportional abundance of each species observed in the sample, as follows:

$$H' = -\sum_{i=1}^{R} p_i \cdot \ln p_i$$

In this equation, p_i is again the proportional abundance of each species and *R* is species richness. The resulting *H'* values are the Shannon-Wiener diversity index values for each sampling reach, with higher values corresponding to greater diversity.

3 RESULTS

In general, fish surveys in streams captured a wide range of species, with 23 species captured in the NALFF streams; however, in the NALFF wetlands, only eastern mudminnows were observed. A total of 732 individual fishes were captured from all sites, with the greatest numbers (702) and diversity (23 species) occurring in the streams. The most abundant species were pirate perch (*Aphredoderus sayanus*), eastern silvery minnow (*Hybognathus regius*), and redear sunfish (*Lepomis microlophus*), respectively. Only 30 individuals were captured during wetland electrofishing efforts, all of which were eastern mudminnow. All fishes captured from the NALFF stream and wetland sampling efforts are shown in Table 3.

Table 3: All Fishes Collected from the 2014/2015 NALFF Stream and Wetland Sampling

Common name	Species	*NALFF occurrence*	
		Streams	Wetlands
American eel	*Anguilla rostrata*	●	
Bluegill	*Lepomis macrochirus*	●	
Bowfin	*Amia calva*	●	
Brown bullhead	*Ameiurus nebulosus*	●	
Chain pickerel	*Esox niger*	●	
Common carp	*Cyprinus carpio*	●	
Creek chubsucker	*Erimyzon oblongus*	●	
Eastern mosquitofish	*Gambusia holbrooki*	●	
Eastern mudminnow	*Umbra pygmaea*	●	●
Eastern silvery minnow	*Hybognathus regius*	●	
Gizzard shad	*Dorosoma cepedianum*	●

Unidentified juvenile sunfish	*Centrarchidae sp.*	●	

3.1 STREAMS

3.1.1 HABITAT

The habitat and barrier surveys were conducted from 12 to 15 August 2014 and 7 to 8 April 2015. Most of the reaches were 150 m in length, with one longer and one shorter. The stream reach locations are shown in Figure 2. Table 4 highlights the physical characteristics of the stream, with full results of the habitat survey and RBP assessment provided in the raw field data sheets in Appendix C.

A majority of NALFF streams were perennial, originating as airfield or agricultural field drainage. NALFF-S5 was categorized as intermittent, because it was dry during the August survey, but not during the April survey. Although the tributary streams (S2–S6) exhibited higher water levels during the spring 2015 survey compared to the summer 2014 survey, the water level within Pocaty Creek (S1) was substantially lower during the spring survey. The coastal plain streams in this part of Virginia commonly exhibit wind-driven water levels (i.e., higher levels during easterly winds, and lower levels during westerly winds), as was likely the case for Pocaty Creek during this time (VDGIF, personal communication).

The streams were highly channelized and surrounded by forest, open field, and military airfield land, with mixed hardwood trees providing partial to full shade. Nearly all of the banks were stable with minimal erosion or scouring within the surveyed reach. None of the surveyed reaches showed signs of non-point source pollution outside of the agricultural drainage, or irregular odors. A rather unique sediment deposit was observed in NALFF-S2, which completely blocked the stream channel at observed flows (see photo #144934000 and #144948000, Appendix A), suggesting an upstream source of erosion and sediment transport (possibly either the agricultural fields or the runway).

The results of the physical habitat surveys of NALFF streams indicated that they are highly disturbed and do not offer optimal habitat for aquatic organisms (Table 5). All surveyed stream reaches fell within the “marginal” or “sub-optimal”categories. The lack of available epifaunal substrate or cover limited the quality of fish habitat for most of these streams. Most streams lacked suitable pool habitat, greatly limiting habitat variability throughout the surveyed streams. Channel sinuosity was another parameter that most surveyed reaches lacked because of the degree of channelization for each stream. This also contributed to the lack of pool habitat throughout most reaches as well. Generally, NALFF streams scored well on bank stability, falling within the “optimal” and “suboptimal” categories; although NALFF-S5 and NALFF-S6 scored in the “marginal” category (Table 5). Fish barriers also presented potential fish passage issues within some of the stream reaches (Table 6).

NALFF-S1 is Pocaty Creek, which is the primary stream channel at NALFF. S1 runs west-east along the southern portion of the installation and intersects Fentress Airfield Rd. at the installation boundary. The surveyed habitat reach extended well beyond the typical 150 m reach, to cover the entire 2,200 m length of the creek on installation property. The habitat survey began at Fentress Airfield Rd. and continued to the western installation boundary, downstream of where Pocaty Creek crosses underneath Wittamore Rd. and becomes an agricultural ditch. The width of S1 ranged from 6.0 to 8.0 m and its depth was 0.5 to 1.0 m. This reach is a natural stream channel, but with areas of channelization, and is surrounded by forest, field, and military airfield use. The dominant riparian vegetation was a mix of oak, hickory, and paw paw which provided a shaded canopy. The morphological stream types that comprised the reach were: 95% run and 5% pool. Pool formation was associated with large debris dams. The water was turbid (opaque) with floating algae and filamentous algae clusters throughout the reach. The bottom sediments were extremely soft, which made this stream unwadaeble for its entire reach, therefore the habitat survey and barrier survey were conducted by canoe. Sediments consisted of silt

(40%), clay (40%) and sand (20%). Areas of organic detritus and muck-mud were also present. NALFF-S1 scored a 114 based on the RBP, which is considered "sub-optimal" habitat.

The NALFF-S1 barrier survey reach covered from Fentress Airport Rd. up to the installation boundary downstream from the road crossing at Wittamore Rd. There were five potential fish passage barriers identified: two bridges and three debris dams. Bridges did not present any fish passage obstacles because of high clearances and minimal blockages (Photo #145023000, Appendix A). Debris dams were composed of leaf litter, trash, and small/large woody debris. Debris Dam-1 (Photo #DSCF0275, Appendix A) is large enough to potentially deter river herring from migrating past that point (VDGIF, personal communication). Additionally, five partial debris dams (which do not block the entire channel width) were observed within the surveyed reach.

NALFF-S2 is a perennial tributary of Pocaty Creek. It is in close proximity to the airfield. The average width of the stream was 1.2 m; it was 0.3 m to 1.0 m deep. This reach was a drainage channel for the runway surrounded by forest and military airfield uses. Mixed hardwoods provided shade to most of the reach, which was 100% pooled. No aquatic vegetation was present. The bottom consisted of mostly sand (65%) and clay (30%) with small portions of silt (5%). A small amout of detritus was present. NALFF-S2 scored a 123 based on the RBP, which is considered "sub-optimal" habitat.

The NALFF-S2 barrier survey revealed a large sediment deposit, which was the only barrier identified on S2. It spanned the entire stream and created a full blockage (Photo #144934000 and #144948000, Appendix A) at the observed flow conditions. Fish passage for species other than American eel is unlikely. No partial debris dams were observed within the surveyed reach.

NALFF-S4 is a perennial tributary of Pocaty Creek and is the recently created Chesapeake City ditch, which was estimated to be constructed in 2013 to improve drainage from Wittamore Rd. Most of this reach bisects an agricultural field, with access roads less than 5 m from both banks. It is highly channelized, with a width of 7 m and a depth of 0.3 m. The morphological stream types that comprised the reach were: 95% runs and 5% pools. Broadleaf cattail (*Typha latifolia*) was the dominant vegetation within the reach, which also contained rooted emergent vegetation and attached algae. The bottom consisted of silt (50%), clay (40%), and sand (10%) with some detritus. NALFF-S4 scored an 84 based on the RBP, which is considered "marginal" habitat.

The NALFF-S4 barrier survey began at the confluence of Pocaty Creek, and progressed upstream to the installation boundary at the Whittamore Rd. culvert. There were two potential fish passage barriers within the installation encountered on this stream; both were identical concrete box culvert structure (culverts #1 and 2) and were deemed to be highly passable for fish (Photo #145108000, Appendix A). No partial debris dams were observed within the surveyed reach.

NALFF-S5 is an intermittent tributary of Pocaty Creek. The reach was dry during the August 2014 survey, so it was only surveyed during the April 2015 survey. It is channelized with a width of 1 to 2 m and a depth of 0.6 m. The reach was surrounded by forest, field, and military use. The dominant riparian vegetation consisted primarily of red maple, mixed hardwoods, and briar. Aquatic vegetation was sparse, appearing in 5% of the reach length. The water was opaque with a sheen of water surface oils in spots. The bottom consisted mostly of silt (70%) and sand (20%), with abundant organic detritus and muck-mud. NALFF-S5 scored an 111 based on the RBP, which is considered "marginal" habitat.

The NALFF-S5 barrier survey began at the confluence of Pocaty Creek, and progressed upstream to the installation boundary near an agricultural field. There were two debris dams, composed of woody debris (Photo #154358598 and #154457493, Appendix A), that exhibited minimal fish passage concerns for this stream. No partial debris dams were observed within the surveyed reach.

NALFF-S6 is a perennial tributary of Pocaty Creek. The reach bisects an agricultural field. It is channelized with a width of 1 to 2 m and a depth of 0.5 m. The riparian zone consisted primarily of paw paw and mixed hardwoods. Aquatic vegetation was absent. Oyster shell hash was found in the substrate throughout the reach. NALFF-S6 scored an 85 based on the RBP, which is considered “marginal” habitat.

The NALFF-S6 barrier survey progressed from the confluence of Pocaty Creek to the upstream culvert at Blue Ridge Rd. There were two potential fish passage barriers encountered on the portion of this stream within the installation: a debris dam and a concrete culvert. The concrete culvert was a two-culvert structure (culvert #1). One culvert was dry, and the other had 5 cm of water during the August 2014 survey (Photo #145146000, Appendix A) . The lack of water makes this structure impassible for most fish species, except for the American eel. The debris dam was composed of leaf litter and small woody debris (Photo #145155000, Appendix A), that exhibited minimal fish passage concerns for this stream. Additionally, six partial debris dams were observed within the surveyed reach.

Table 4: Physical Habitat Assessment Data for Each Stream Reach Surveyed at Naval Auxiliary Landing Field Fentress

Reach	NALFF-S1	NALFF-S2	NALFF-S4	NALFF-S5	NALFF-S6
Date	4/7/2015	8/13/2014	8/12/2015	4/8/2015	8/12/2014
Weather	Clear/sunny	Clear/sunny	65% cloud cover	Intermittent showers, 100% cloud cover	Occational drizzle, 100% cloud cover
Previous 24 hours	Intermittent showers	Intermittent showers	Intermittent showers	Intermittent showers	Intermittent showers
Watershed features	Mixed hardwood forest, agricultural field, military land use, agricultural field drainage.	Mixed hardwood forest in lower watershed. Upper watershed is primarily agricultural land and airfield.	No forest canopy. Agricultural land, reach bisects a soybean field, moderate local watershed erosion.	Mixed hardwood forest in watershed. Upper watershed is primarily agricultural land.	Mixed hardwood forest in watershed riparian zone only. Most of watershed is agricultural land.
Reach length	2,200 m	106 m	150 m	150 m	150 m

Remarks	Fentress Airfield Rd. No barrier to fish migration.	Partial debris dam under collapsed arch. No barrier to fish migration.	Large debris dam; likely a barrier to migration of river herring, but not American eel.	Minimal fish passage concerns.	Minimal fish passage concerns.	Buildup of sediment creates a fish barrier to most species, passable only at high flows, except for American eel.	No barrier to fish migration.	No barrier to fish migration.	Minimal fish passage concerns.	Minimal fish passage concerns.	Minimal fish passage concerns.	One culvert dry, the other less than 0.1 m water depth. Fish barrier to most species, passable only at high flows, except for American eel,.

NOTE: Reference photographs are located in Appendix A

3.1.2 FISH

A total of 702 fishes, represented by 23 species, were collected from electrofishing the five NALFF stream reaches during two different time periods. All individuals were positively identified at the species level in the field with the exception of juvenile sunfish sp., because distinguishing traits are lacking at that size class. Pirate perch was the most abundant species, representing 13.0% of the total catch, followed by eastern silvery minnow at 11.7%, and redear sunfish at 9.8%. Fish sampling at each stream reach was an average of 934 seconds (Table 7).

Table 7: Backpack Electrofishing Effort at Naval Auxiliary Landing Field Fentress by Stream

Stream ID	Sampling duration (seconds)	
	August 2014	April 2015
NALFF-S1	989	600
NALFF-S2	1062	900
NALFF-S4	953	1117
NALFF-S5	--	946
NALFF-S6	947	891

The frequency of occurrence for each species was different in each of the five surveyed streams (Table 8; Table 9; Table 10). American eel, bluegill, pirate perch, and pumpkinseed were universally found in all five surveyed stream reaches. Eastern mosquitofish and redear sunfish occurred in four of five streams. All other species occurred in only one to three streams. The overall length distributions within-species were similar among all surveyed streams.

Table 8: Number, Relative Abundance, Frequency of Occurrence, and Length of All Fishes Collected in Naval Auxiliary Landing Field Fentress Streams

Common name	Scientific name	Number of individuals	Total relative abundance (%)	Range of total length (mm)	Range of mass (g)
Pirate perch	*Aphredoderus sayanus*	91	13.0%	34–95	1.7–30.0
Eastern silvery minnow	*Hybognathus regius*	82	11.7%	57–109	3.0–12.0
Redear sunfish	*Lepomis microlophus*	69	9.8%	31–102	1.0–20.0
Juvenile sunfish sp.	*Centrarchidae sp.*	66	9.4%	34–71	1.0–8.0
Bluegill	*Lepomis macrochirus*	65	9.3%	37–187	1.3–115.0
Eastern mosquitofish	*Gambusia holbrooki*	57	8.1%	22–51	0.2–4.0
Pumpkinseed	*Lepomis gibbosus*	57	8.1%	36–137	1.5–34.0
American eel	*Anguilla rostrata*	48	6.8%	80–475	2.0–48.0
Golden shiner	*Notemigonus crysoleucas*	32	4.6%	53–106	1.0–11.0
Largemouth bass	*Micropterus salmoides*	27	3.8%	47–255	4.0–150.0
Redfin pickerel	*Esox americanus*	21	3.0%	112–172	8.0–38.0
Green sunfish	*Lepomis cyanellus*	20	2.8%	49–116	2.1–25.0
Yellow perch	*Perca flavescens*	19	2.7%	118–204	21.0–105.0
Eastern mudminnow	*Umbra pygmaea*	13	1.9%	46–112	2.0–16.0
Warmouth	*Lepomis gulosus*	8	1.1%	73–124	11.0–38.0
Creek chubsucker	*Erimyzon oblongus*	7	1.0%	71–189	8.0–89.0
Brown bullhead	*Ameiurus nebulosus*	6	0.9%	68–126	7.0–11.0
Gizzard shad	*Dorosoma cepedianum*	4	0.5%	67–113	6.0–13.0
Bowfin	*Amia calva*	2	0.3%	205–211	75.0–98.0
Common carp	*Cyprinus carpio*	2	0.3%	124–133	29.0–36.0
Mud sunfish	*Acantharchus pomotis*	2	0.3%	114–124	29.0–37.0
Yellow bullhead	*Ameiurus natalis*	2	0.3%	74–202	9.0–103.0
Chain pickerel	*Esox niger*	1	0.1%	281	--
Rock bass	*Ambloplites rupestris*	1	0.1%	138	47.0
Total		**702**	**100.0%**	--	--

The total number of fishes collected, species richness, and resulting species diversity varied across the five reaches, with the highest total number of individuals collected at NALFF-S4 (201 individuals) during the August 2014 survey and the least number of species and individuals were collected at NALFF-S5 (20 individuals) during April 2015 surveys. The 17 species that occurred at NALFF-S6 during August 2014 surveys resulted in a species diversity index that was greater than any other surveyed stream. The following tables and summaries present results of the fish survey by stream reach to enable comparisons among streams and seasons.

NALFF-S1. A total of 77 fishes, represented by 7 species, were collected from NALFF-S1 on 15 August 2014. Bluegill was the most abundant species, representing 26.0% of the total catch, followed by creek chubsucker and eastern silvery minnow at 23.4%, and golden shiner at 19.5% (Table 9). A total of 104 fishes, represented by 10 species, were collected from NALFF-S1 on 7 April 2015. Redear sunfish was the most abundant species, representing 37.5% of the total catch, followed by pumpkinseed at 23.1%, and eastern silvery minnow at 14.4% (Table 10).

NALFF-S2. A total of 27 fishes, represented by 5 species, were collected from NALFF-S2 on 14 August 2014. Pirate perch were the most abundant species, representing 66.7% of the total catch, followed by pumpkinseed at 18.5%, and green sunfish at 11.1% (Table 9). A total of 37 fishes, represented by 10 species, were collected from NALFF-S2 on 7 April 2015. Eastern mosquitofish and pirate perch were the most abundant species, each representing 24.3% of the total catch, followed by American eel at 16.2%, and bluegill at 10.8% (Table 10).

NALFF-S4. A total of 201 fish, represented by 13 species, were collected from NALFF-S4 on 12 August 2014. Juvenile sunfish sp. was the most abundant species, representing 23.8% of the total catch, followed by eastern silvery minnow at 20.6%, and eastern mosquitofish at 17.5% (Table 9). A total of 53 fishes, represented by 5 species, were collected from NALFF-S4 on 7 April 2015. American eel were the most abundant species, representing 37.7% of the total catch, followed by pirate perch and green sunfish each at 18.9%, and eastern mosquitofish at 13.2% (Table 10).

NALFF-S6. A total of 147 fish, represented by 17 species, were collected from NALFF-S6 on 12 August 2014. Pirate perch was the most abundant species, representing 19.7% of the total catch, followed by redfin pickerel at 14.3%, and redear sunfish at 10.9% (Table 9). A total of 36 fish, represented by 8 species, were collected from NALFF-S6 on 8 April 2015. Pirate perch was the most abundant species, representing 33.3% of the total catch, followed by pumpkinseed at 25.0%, and green sunfish at 13.9% (Table 10).

3.1.3 WATER QUALITY

In-situ and laboratory analysis water quality results varied by stream and season. The NALFF-S5 reach was dry in August; therefore, water quality could not be measured. During both survey periods, the pH ranged from 6.53 to 9.13. Dissolved oxygen levels were consistently very low throughout the August survey period, and increased dramatically during the April survey events, likely due to lower water temperatures which were higher in August compared to April. Water quality results for streams are presented in Table 11; a full report of the laboratory analyses is included in Appendix E.**Error! Reference source not found.**

Table 11: In-situ and Laboratory Water Quality Analysis Results for Naval Auxiliary Landing Field Fentress Streams

Analysis	NALFF-S1		NALFF-S2		NALFF-S4		NALFF-S5		NALFF-S6	
	Aug	April	Aug	April	Aug	April	Aug	April	Aug	April

NALFF-S4	0.15	0.71
NALFF-S5	(dry)	0.04
NALFF-S6	<0.01	0.01

3.2 FLOODPLAIN WETLANDS

3.2.1 FISH

A total of 30 fishes were collected from the three NALFF wetland sites during both the August 2014 and April 2015 surveys, all of which were eastern mudminnow. All individuals were positively identified at the species level in the field and no deformities, lesions, or abnormalities were observed in any of the specimens collected. Total electrofishing sampling effort durations across all three wetlands were 2,673 and 1,029 seconds for August 2014 and April 2015, respectively (Table 13).

Table 13: Backpack Electrofishing Effort at Naval Auxiliary Landing Field Fentress

Stream ID	Sampling duration (seconds)	
	August 2014	April 2015
NALFF-W1	988	347
NALFF-W2	872	350
NALFF-W3	813	332

3.2.2 WATER QUALITY

Water quality results presented in Table 14. In general, NALFF wetlands were slightly acidic (pH 5.9 to 6.6), consistent with this type of waterbody. Dissolved oxygen levels were variable between sites, despite similar water temperatures.

4 DISCUSSION AND MANAGEMENT RECOMMENDATIONS

The discussion and management recommendations in this section include general suggestions, as well as more specific discussion based on the findings from this survey. Prior to implementing any changes to the management of natural resources at NALFF, a more thorough evaluation of all available options would be necessary to ensure the best possible outcome for the management objectives of the streams and wetlands within the context of the NALFF military mission.

4.1 RECREATIONAL FISHERIES

Recreationally important species such as bluegill and largemouth bass collected in NALFF streams were too small to demonstrate much potential for recreational fishing. Largemouth bass were typically not very abundant, with less than 30 individuals of non-harvestable size classes captured across all streams. Typically, largemouth bass between 50 and 150 mm are first-year fish, with second-year fish up to 250 mm long. They do no typically exceed 350 mm until three years of age; however, 100% are expected to reach sexual maturity at lengths of 229 mm (EPA 2000; Laarman and Schneider 1985). Therefore, all largemouth bass captured in the NALFF streams during this survey have not yet reached spawning size. Stream conditions, including seasonal water level fluctuations, limited prey species, and unfavorable water quality, may contribute to the small size and limited abundance of largemouth bass.

Bluegill typically reach sexual maturity around 100 mm at age-1, which indicates 21.5% of the individuals captured in NALFF streams were capable of reproduction (IADNR 2015; Peterson et al. 2010). It can be assumed that bluegill were successfully spawning given the numerous young-of-the-year individuals under 100 mm that were recovered from NALFF streams.

The floodplain wetlands at NALFF do not offer any recreational fishing opportunities, based on the results of this survey. Seasonal water level fluctuations and poor water quality do not provide proper habitat for a healthy recreational fish population. Furthermore, as discussed in Section 2.3.1, the survey methods for determining fish species composition are rather limited, and with variable success. The non-standardized electrofishing conducted in this survey has been shown to be the most efficient, yielding the highest proportion of fishes present (up to 57% of the total catch), compared to other sampling methods used in this habitat type (Knight and Bain 1996). Given the low dissolved oxygen found in this habitat, future fish surveys may benefit from targeting the sampling effort along the perimeter of the wetland with the North Landing River, where the water quality is likely more favorable to fish utilization of this habitat type and more traditional sampling techniques can be used, such as boat electrofishing or angling.

An installation-wide wetland survey conducted by Tetra Tech in 2012 identified 1,126 acres of wetland at NALFF (Tetra Tech 2012; Tetra Tech 2014a). The northern-most area included in the fish survey consisted of 310.41 acres. Results of the wetlands survey indicated that the portion of wetland surveyed is dominated by bald cypress, water tupelo, Alabama supplejack, and netted chain fern, and consists of small, blackwater streams and swamp forest. This was further surrounded by cypress-tupelo swamp that is semi-permanently flooded by brownwater. The entire wetland lies within a 100-year floodplain associated with the North Landing River, and is contained within the Southern Watershed Area, which covers about 325 square miles (Tetra Tech 2014a).

In general, systems that experience periodic water inundation and nutrient input have high productivity (Mitsch and Gosselink 1993). Therefore, since the NALFF wetland is continuously flooded, it is not likely to support diverse fish populations. Backwaters often have low water levels or dissolved oxygen, both of

which can stress fish. Some species (e.g., mudminnow and bowfin) are better adapted to these conditions, and in general, small fish may live in these swamps year-round while larger fish would be transient residents (Mitsch and Gosselink 1993). The lack of boundaries, or the ability to deploy a barrier net in the forested wetland makes backpack electrofishing difficult, and the presence of trees, stumps, and snags makes boat electrofishing impractical. However, as discussed earlier in this section, incorporating other available sampling methods in this habitat type is not warranted, since it likely would not yield additional fish diversity. Previous wetland assessments have been conducted at this location (Tetra Tech 2012, 2014a, 2014b), so other habitat assessments should strive to follow the same protocols. This particular swamp is known to provide migrating birds with important nesting and resting habitat, so continued monitoring is encouraged (DCR-DNH 1990).

4.2 MIGRATORY FISHERIES

NALFF is connected to coastal waters via the North Landing River, with access to Currituck Sound, a protected inlet of the Atlantic Ocean located in northeastern North Carolina and southeastern Virginia. Because of this connectivity, there is the potential access for migratory fishes. Several migratory fish species utilize freshwater stream habitat within the Mid-Atlantic coastal plain (Rhode et al. 1994), including the herrings: alewife, blueback herring, American shad, and hickory shad. River herring are anadromous, meaning that they are born in freshwater and migrate into saltwater to mature. The American eel is also a ubiquitous migratory fish within these stream systems (Rhode et al. 1994). American eel are catadromous, meaning that they are born in saltwater and migrate into freshwater to mature (Jessop et al. 2002). Alewife and blueback herring (collectively river herring) were recently candidate species for listing as endangered or threatened under the ESA. In July 2013, the NMFS determined that listing river herring as threatened or endangered under the ESA was not warranted (NMFS 2013). American eel recently underwent a status review for listing under the ESA by the USFWS because they have undergone substantial declines throughout their range (USFWS 2011a). However, in October 2015, the USFWS found that listing was not warranted at this time, because, though there are stressors that cause individual mortality, the American eel is not threatened throughout its range (80 FR 60834-60850).

River herring spawn in a variety of habitats, ranging from swift-moving rivers to small tributaries above the tidal zone (NMFS 2009). They migrate during the spring months to spawn in their natal rivers, then return to coastal waters in the summer. Juveniles mature for several years in coastal waters before making their first spawning run (NMFS 2009). River herring abundances are highly variable in Virginia coastal plain streams.

American eel migrate into freshwater streams as juveniles (i.e., elvers) where they mature into the yellow eel phase, remaining in freshwater for up to 30 years. After reaching spawning age (which varies), they migrate back to the ocean (Jessop et al. 2002; USFWS 2011b). Eels are locally common, and often abundant, in Virginia coastal plain streams (Rhode et al. 1994). The eel's body form and anguilliform swimming mode is an important aspect of its ability to access freshwater habitats. The eel propels itself in an undulating motion, which they can adapt out to surfaces out of the water as well (Helfman et al. 2009). This allows juvenile elver and yellow-eel stages to "climb" under certain conditions (e.g., rough surfaces), enabling them to pass up and over what would otherwise be a barrier to migrating fishes (USFWS 2011a; Ellerby et al. 2001). Elvers have even been documented successfully climbing large vertical concrete structures, such as dams (Devine Tarbell & Associates 2006; Kleinschmidt 2000).

No river herring were observed during this survey; however, gizzard shad, which are known to move locally between fresh and brackish waters, were observed during the August survey. American eels were

captured throughout the survey at all stream locations. The sizes observed for American eel were consistent with the yellow-phase eel life stages. Therefore, the smaller yellow-phase eels present during August 2014 likely migrated into the NALFF streams and wetlands during spring 2014 and the larger yellow-phase individuals had been residents since at least the spring 2013 migration period, when they entered the streams as elvers. Yellow-phase eels reside in freshwater systems for 2 to 6 years (sometimes up to 18 years) until they reach maturity and migrate back to the ocean to spawn as silver-phase eels (VIMS 2015).

Additional targeted surveys of migratory fish species utilizing NALFF streams to assess evidence of spawning runs of river herring or American eel would provide further evidence of migratory fish use of NALFF streams and ponds. This can be done through:

- Periodic electrofishing surveys during migration windows of adult river herring or juvenile American eel, covering late-March through mid-April
- Periodic electrofishing surveys during mid-summer, to document the presence of young-of-year river herring and juvenile/adult (yellow-phase) American eels

4.3 FISH PASSAGE

Migratory fishes may become excluded from available habitat by impediments to migration, such as dams, perched culverts, or other physical structures. Coastal plain river systems in Virginia are susceptible to loss of historical spawning and rearing habitat for migratory species because of such barriers (McInninch and Garman 1999). Many physical structures are not barriers to American eel, however, since they are capable of ascending (or “climbing”) structures such as dams, or even moving over land (Devine Tarbell & Associates 2006; Kleinschmidt 2000; USFWS 2011a).

The Navy realizes the importance of ecosystem health and therefore uses the VDGIF guidance to ensure the protection of water resources on its installations. Due to future maintenance costs associated with culverts, and the loss of riparian and aquatic habitat, the VDGIF advises that stream crossings are constructed as clear-span bridges. However, if this is not possible, the VDGIF recommends countersinking any culverts below the streambed at least 6 inches (15 cm), or to use bottomless culverts, to allow passage of aquatic organisms (VDGIF 2007). The VDGIF also recommends the installation of floodplain culverts to carry bankfull discharges. Furthermore, perched or blocked culverts impede fish accessibility to upstream habitat. Culvert-1 at NALFF-S6 was perched under the observed water conditions; therefore, although American eel may be able to pass, river herring would be restricted. Improvements to NALFF-S6 can be made through the replacement or modification of the perched culvert to improve passage potential for migratory fish. Eliminating perched culverts and maintaining culvert clearance is recommended to support fish passage within existing conditions throughout the Installation. However, some of the culverts are located on municipal roads, therefore any improvements would need to be coordinated with the City of Chesapeake.

While some of the debris dams currently in place may limit the upstream passage of river herring, their habitat value contributes to the structural habitat complexity of NALFF streams. Therefore, debris dams should be left in the stream channel, even if only partially, whenever possible. As previously recommended (Tetra Tech 2015), a routine culvert monitoring and maintenance plan would limit culvert blockages that form due to weather-related events or beaver activity. Periodic maintenance, through the removal of accumulated debris piles, downed trees, and other obstructions from these structures, may positively impact the habitat accessibility within the stream channel. However, it is important to note that debris dams are a natural habitat feature in streams and often provide high-quality structured

fish habitat. Therefore any removal of debris from the stream should be limited to within the culverts to ensure that culverts remain passable. Culvert replacement should be considered for any culverts that inhibit fish passage. A stream-wide removal of debris dams would be detrimental to the habitat quality of NALFF streams.

While the habitat quality of NALFF streams were marginal to suboptimal, fish passage is a relatively minor issue within NALFF. Any fish passage issues downstream (off-installation), however, are not clear from this survey. In general, most barriers identified during the barrier survey were passable to migratory fish, except for the large barrier (S1, Barrier-1) on Pocaty Creek. NALFF-S6 had a culvert that had low to no potential for non-eel fish passage. The culvert identified in NALFF-S6 that had no potential for fish passage was perched and prohibited fish from entering. At the outlet of the culvert, there was a change in stream elevation that the culvert outlet did not follow. NALFF-S2 had a sediment deposit that prohibited fish passage to non-eel species. It also prohibited all water flow, under observed flow conditions.

In summary, maintenance and alterations are recommended in the following tiered approach to improve habitat quality for migratory fish species within NALFF:

1. Maintain culverts clear of debris or beaver dams.
2. Conduct a targeted survey of migratory fish species utilizing NALFF streams to assess evidence of spawning runs of river herring or American eel (see Migratory Fisheries, Section 4.2).
3. Since migratory fishes are confirmed to be present, the first step at improving habitat for these fishes would be to modify the network of drainage ditches to minimize sedimentation within the stream channels.
4. Once sedimentation of the stream channel has been minimized, another step toward improving habitat quality would be to evaluate stream restoration options to include natural channel design options.
5. Determine which reach is most in need of immediate restoration by reviewing baseline information to determine if sediment removal would substantially improve migratory fish habitat.
6. Additional restoration-specific surveys would be needed to determine the appropriate restoration action and stabilization method(s) with the goal of improving fish habitat.
7. Restoration options like sediment removal, various bioengineering techniques, such as log or timber cribs, natural streambed substrate, live plantings, etc. should be given priority since they can provide enhanced habitat value.
8. Once the restoration option is determined, then the appropriate permitting application packages would be needed for submittal to state and federal agency approval, before executing the work.

4.4 CHANNELIZED STREAMS

All surveyed streams at NALFF have been channelized to some degree, with the exception of S1 which appears to have maintained its natural channel for most of its length within the installation. These modifications, likely made to improve drainage across the Installation, have had detrimental impacts on habitat quality. For example, channelization increases the streambed gradient and decreases the retention time of the water in the channel. The channelized streambed inhibits normal overbank

flooding during storm events. The floodwater abatement and water quality protection functions normally provided by the floodplain and any adjacent wetlands are significantly diminished as a result (Navy 2014). This type of channelized system can experience drastic changes in water levels over a short time period, which can limit the diversity and sustainability of the fish populations. Results from this habitat assessment of NALFF streams are consistent in characterizing them as low-quality stream habitat.

4.5 WATER QUALITY

Water quality should continue to be monitored to determine any management actions. Poor water quality can be detrimental to both the physical and biological environment, therefore it should be monitored on a routine basis. The water quality conditions at NALFF and their implications for aquatic habitat quality are summarized below.

- Nitrogen is typically not limiting to productivity in freshwater systems. However, concentrations above 3.00 mg/L can indicate pollutions from fertilizers, manures, or other nutrient-rich wastes (Swistock 2015), which may have negative impacts further downstream in estuarine waters. Laboratory water quality results showed that total nitrogen levels were not exceedingly high in streams (ranged from 0.25 mg/L to 3.80 mg/L). The highest total nitrogen reading was detected in NALFF-S5 during the April survey. Concentrations were excessively high in wetlands (ranged from 1.90 mg/L to 38.00 mg/L) compared to values of 0.60-4.7 mg/L observed in similar cypress-tupelo swamps (Mitsch and Gosselink 1993). Total nitrogen was significantly higher in NALFF-W2 than the other survey areas during each sampling event (38.00 mg/L in August and 18.00 mg/L in April), so it is possible that this site had localized pollution due to nutrient runoff from agricultural fields, or another source, in the area. Potential sources of this pollution, such as runoff and wastewater, should be identified and managed where possible.
- Phosphorus is generally the limiting nutrient in freshwater systems and levels above 0.025 mg/L can indicate a potential for nuisance algae and aquatic plant growth (Swistock 2015). Phosphorus also plays a key role in phytoplankton abundance, considered to be a more limiting nutrient with regard to freshwater algal growth. Laboratory results showed phosphorus levels in streams ranged from 0.05 mg/L to 0.37 mg/L. Levels in floodplain wetlands were excessively high (0.13 mg/L to 4.00 mg/L); a similar swamp had phosphorous concentrations of 0.17-0.47 mg/L (Mitsch and Gosselink 1993). Phosphorous levels were significantly higher in NALFF-W2 than other surveyed areas during each sampling event (4.00 mg/L in August and 1.50 mg/L in April). It is likely that the source causing high nitrogen (possibly runoff from agricultural fields, or another source, in the area) at this site is also causing high phosphorous; therefore, controlling potential pollutants should decrease both nitrogen and phosphorous.
- Temperature, pH, and specific conductance were all variable between the two sampling seasons but were within their expected ranges.
- Dissolved oxygen below 5.0 mg/L for extended periods of time may cause decreased growth and higher susceptibility to disease in fish (Boyd and Boyd 2012). Dissolved oxygen levels for streams ranged from 1.1 mg/L to 7.5 mg/L. Levels were excessively low in NALFF-S2, S6, W1, and W2 during the August survey (1.1 mg/L to 1.7 mg/L). However, the higher value at W3 (6.1 mg/L) during August suggests that there may have been an error with the dissolved oxygen sensor at that particular site, because it is unlikely that a fluctuation of that magnitude would occur between two points so close together in the same wetland. Dissolved oxygen in similar forested wetlands has been measured between 0.9 and 4.0 mg/L (Mitsch and Gosselink 1993). Dissolved oxygen levels increased in all stream and wetland sites during the April survey (6.2 mg/L to 13.0

mg/L). The higher dissolved oxygen at the wetland sites during the spring may be a seasonal effect of lower temperatures and greater connectivity with water from the adjacent North Landing River. Despite the observed low dissolved oxygen at S2 and S6 during August, a diverse array of fishes were collected at these locations, suggesting that there could be areas of refuge containing higher dissolved oxygen levels within the streams (assuming there was no error with the probe).

- High phosphorus and moderate total nitrogen levels in streams could promote excessive plant growth and could potentially create eutrophic conditions, as observed in NALFF-W2.
- Extremely low dissolved oxygen levels in streams and floodplain wetlands during summer months may cause lower growth rates and increased susceptibility to disease, which may lead to stressed fish that could result in disease or fish kills. While some individual shiners collected in S1 and S4 exhibited black spot disease (photo # DSCF0283, Appendix-A), this may not be associated with water quality (Flores-Lopes and Thomaz 2011).

One method to reduce nutrient input to the streams and floodplain wetlands is to ensure that best management practices for nutrient and sediment runoff are practiced at the agricultural fields on NALFF property. Planting appropriate native trees, shrubs, and ground cover vegetation as sediment and nutrient buffers can be an effective method of establishing effective riparian buffers. These buffers would potentially capture excess nutrients and sediment that would otherwise runoff into the stream, depleting water quality. This could be an important step for these streams since their origins are agricultural field drainages.

4.6 INVASIVE SPECIES

Invasive species that may affect waterbodies in the area include various types of aquatic algae, as well as free-floating, submergent, and emergent species. Invasive fish species, such as snakehead, are also a concern in this region, but no individuals were observed during these surveys. Common carp are also invasive, but seem to be in control at NALFF, given the low numbers captured in this survey.

Fish kills can occur when high volumes of vegetation die and decay, depleting oxygen in the process; therefore, the addition of non-native species to the plant community can further decrease levels of DO. The common reed (*Phragmites australis*) is an invasive species that could potentially affect the NALFF installation, because this plant can invade both streams and ponds, and can tolerate both fresh and salt water. Alligator weed (*Alternanthera philoxeroides*), Asian spiderwort (*Murdannia keisak*), Eurasian milfoil (*Myriophyllum spicatum*), and narrowleaf cattail (*Typha angustifolia*) have potential to become invasive species on the Installation and should be monitored for. Other invasive species to monitor include red-eared slider (*Chrysemys scripta elegans*) and Asian carp species.

The nutria (*Myocastor coypus*), a relative to the native muskrat (*Ondatra zibethicus*), is a semi-aquatic invasive species capable of negatively impacting the environment. If present, nutria may feed on vegetation and outcompete native species, stunting growth of the aquatic ecosystem. However, nutria were not observed during this survey, or during the 2013 nuisance wildlife survey (Navy 2014). Although no evidence of nutria was witnessed during these surveys, natural resource managers should respond with appropriate control measures if nutria are encountered on the Installation.

	Habitat Parameter	Condition Category			
		Optimal	**Suboptimal**	**Marginal**	**Poor**
Parameters to be evaluated in sampling reach	**1. Epifaunal Substrate/ Available Cover**	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are <u>not</u> new fall and <u>not</u> transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	4. Sediment Deposition	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
	5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
	SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach

Habitat Parameter	Condition Category			
	Optimal	**Suboptimal**	**Marginal**	**Poor**
6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
7. Channel Sinuosity	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
8. Bank Stability (score each bank)	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE ___ (LB)	Left Bank 10 9	8 7 6	5 4 3	2 1 0
SCORE ___ (RB)	Right Bank 10 9	8 7 6	5 4 3	2 1 0
9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream.	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE ___ (LB)	Left Bank 10 9	8 7 6	5 4 3	2 1 0
SCORE ___ (RB)	Right Bank 10 9	8 7 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone)	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE ___ (LB)	Left Bank 10 9	8 7 6	5 4 3	2 1 0
SCORE ___ (RB)	Right Bank 10 9	8 7 6	5 4 3	2 1 0

Parameters to be evaluated in sampling reach

Habitat Parameter	Condition Category			
	Optimal	**Suboptimal**	**Marginal**	**Poor**
1. Epifaunal Substrate/ Available Cover	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
SCORE 4	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 (4) 3 2 1 0
2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
SCORE 12	20 19 18 17 16	15 14 13 (12) 11	10 9 8 7 6	5 4 3 2 1 0
3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
SCORE 13	20 19 18 17 16	15 14 (13) 12 11	10 9 8 7 6	5 4 3 2 1 0
4. Sediment Deposition Further upstream would be closer to 3	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
SCORE 15	20 19 18 17 16	(15) 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
SCORE 13	20 19 18 17 16	15 14 (13) 12 11	10 9 8 7 6	5 4 3 2 1 0

Clay	< 0.004 mm (slick)	40			

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (FRONT)

STREAM NAME S4	LOCATION	
STATION # _____ RIVERMILE _____	STREAM CLASS	
LAT _____ LONG _____	RIVER BASIN	
STORET #	AGENCY	
INVESTIGATORS RD, EF, JC		
FORM COMPLETED BY EF	DATE 8/12/14 TIME 12:30 AM (PM)	REASON FOR SURVEY

Parameters to be evaluated in sampling reach

Habitat Parameter	Condition Category			
	Optimal	**Suboptimal**	**Marginal**	**Poor**
1. Epifaunal Substrate/ Available Cover	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 (7) 6	5 4 3 2 1 0
2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
SCORE	20 19 18 17 16	15 14 13 12 11	(10) 9 8 7 6	5 4 3 2 1 0
3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
SCORE	20 19 18 17 16	15 14 13 12 11	(10) 9 8 7 6	5 4 3 2 1 0
4. Sediment Deposition	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
SCORE	20 19 18 17 16	15 14 13 12 (11)	10 9 8 7 6	5 4 3 2 1 0
5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
SCORE	20 19 18 17 16	15 (14) 13 12 11	10 9 8 7 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 (1) 0
7. Channel Sinuosity	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 3 2 (1) 0
8. Bank Stability (score each bank)	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE ___ (LB)	Left Bank 10 9	8 7 (6)	5 4 3	2 1 0
SCORE ___ (RB)	Right Bank 10 9	8 7 (6)	5 4 3	2 1 0
9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream.	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE ___ (LB)	Left Bank 10 9	(8) 7 6	5 4 3	2 1 0
SCORE ___ (RB)	Right Bank 10 9	(8) 7 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone)	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE ___ (LB)	Left Bank 10 9	8 7 6	5 4 3	2 (1) 0
SCORE ___ (RB)	Right Bank 10 9	8 7 6	5 4 3	2 (1) 0

Total Score 84

LAT _____ LONG _____	RIVER BASIN	
STORET #	AGENCY	
INVESTIGATORS		
FORM COMPLETED BY JC	DATE 8/12 TIME 9:00 (AM) PM	REASON FOR SURVEY

Parameters to be evaluated in sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
1. Epifaunal Substrate/ Available Cover	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
SCORE 10	20 19 18 17 16	15 14 13 12 11	(10) 9 8 7 6	5 4 3 2 1 0
2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
SCORE 7	20 19 18 17 16	15 14 13 12 11	10 9 8 (7) 6	5 4 3 2 1 0
3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep; very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
SCORE 6	20 19 18 17 16	15 14 13 12 11	10 9 8 7 (6)	5 4 3 2 1 0
4. Sediment Deposition	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
SCORE 6	20 19 18 17 16	15 14 13 12 11	10 9 8 7 (6)	5 4 3 2 1 0
5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
SCORE 9	20 19 18 17 16	15 14 13 12 11	10 (9) 8 7 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
SCORE 8	20 19 18 17 16	15 14 13 12 11	10 9 (8) 7 6	5 4 3 2 1 0
7. Channel Sinuosity	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE 7	20 19 18 17 16	15 14 13 12 11	10 9 8 (7) 6	5 4 3 2 1 0
8. Bank Stability (score each bank)	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE 3 (LB)	Left Bank 10 9	8 7 6	5 4 (3)	2 1 0
SCORE 4 (RB)	Right Bank 10 9	8 7 6	5 (4) 3	2 1 0
9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream.	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE 9 (LB)	Left Bank 10 (9)	8 7 6	5 4 3	2 1 0
SCORE 9 (RB)	Right Bank 10 (9)	8 7 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone)	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE 4 (LB)	Left Bank 10 9	8 7 6	5 (4) 3	2 1 0
SCORE 7 (RB)	Right Bank 10 9	8 (7) 6	5 4 3	2 1 0

Parameters to be evaluated in sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
1. Epifaunal Substrate/ Available Cover	Greater than 50% of substrate favorable for epifaunal colonization and fish cover; mix of snags, submerged logs, undercut banks, cobble or other stable habitat and at stage to allow full colonization potential (i.e., logs/snags that are not new fall and not transient).	30-50% mix of stable habitat; well-suited for full colonization potential; adequate habitat for maintenance of populations; presence of additional substrate in the form of newfall, but not yet prepared for colonization (may rate at high end of scale).	10-30% mix of stable habitat; habitat availability less than desirable; substrate frequently disturbed or removed.	Less than 10% stable habitat; lack of habitat is obvious; substrate unstable or lacking.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 6	5 4 (3) 2 1 0
2. Pool Substrate Characterization	Mixture of substrate materials, with gravel and firm sand prevalent; root mats and submerged vegetation common.	Mixture of soft sand, mud, or clay; mud may be dominant; some root mats and submerged vegetation present.	All mud or clay or sand bottom; little or no root mat; no submerged vegetation.	Hard-pan clay or bedrock; no root mat or vegetation.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 (6)	5 4 3 2 1 0
3. Pool Variability	Even mix of large-shallow, large-deep, small-shallow, small-deep pools present.	Majority of pools large-deep, very few shallow.	Shallow pools much more prevalent than deep pools.	Majority of pools small-shallow or pools absent.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 8 7 (6)	5 4 3 2 1 0
4. Sediment Deposition	Little or no enlargement of islands or point bars and less than <20% of the bottom affected by sediment deposition.	Some new increase in bar formation, mostly from gravel, sand or fine sediment; 20-50% of the bottom affected; slight deposition in pools.	Moderate deposition of new gravel, sand or fine sediment on old and new bars; 50-80% of the bottom affected; sediment deposits at obstructions, constrictions, and bends; moderate deposition of pools prevalent.	Heavy deposits of fine material, increased bar development; more than 80% of the bottom changing frequently; pools almost absent due to substantial sediment deposition.
SCORE	20 19 18 17 16	15 14 13 12 (11)	10 9 8 7 6	5 4 3 2 1 0
5. Channel Flow Status	Water reaches base of both lower banks, and minimal amount of channel substrate is exposed.	Water fills >75% of the available channel; or <25% of channel substrate is exposed.	Water fills 25-75% of the available channel, and/or riffle substrates are mostly exposed.	Very little water in channel and mostly present as standing pools.
SCORE	20 19 18 17 16	15 14 (13) 12 11	10 9 8 7 6	5 4 3 2 1 0

HABITAT ASSESSMENT FIELD DATA SHEET—LOW GRADIENT STREAMS (BACK)

Parameters to be evaluated broader than sampling reach

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
6. Channel Alteration	Channelization or dredging absent or minimal; stream with normal pattern.	Some channelization present, usually in areas of bridge abutments; evidence of past channelization, i.e., dredging, (greater than past 20 yr) may be present, but recent channelization is not present.	Channelization may be extensive; embankments or shoring structures present on both banks; and 40 to 80% of stream reach channelized and disrupted.	Banks shored with gabion or cement; over 80% of the stream reach channelized and disrupted. Instream habitat greatly altered or removed entirely.
SCORE	20 19 18 17 16	(15) 14 13 12 11	10 9 8 7 6	5 4 3 2 1 0
7. Channel Sinuosity	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.
SCORE	20 19 18 17 16	15 14 13 12 11	10 9 (8) 7 6	5 4 3 2 1 0
8. Bank Stability (score each bank)	Banks stable; evidence of erosion or bank failure absent or minimal; little potential for future problems. <5% of bank affected.	Moderately stable; infrequent, small areas of erosion mostly healed over. 5-30% of bank in reach has areas of erosion.	Moderately unstable; 30-60% of bank in reach has areas of erosion; high erosion potential during floods.	Unstable; many eroded areas; "raw" areas frequent along straight sections and bends; obvious bank sloughing; 60-100% of bank has erosional scars.
SCORE 9 (LB)	Left Bank 10 (9)	8 7 6	5 4 3	2 1 0
SCORE 9 (RB)	Right Bank 10 (9)	8 7 6	5 4 3	2 1 0
9. Vegetative Protection (score each bank) Note: determine left or right side by facing downstream.	More than 90% of the streambank surfaces and immediate riparian zone covered by native vegetation, including trees, understory shrubs, or nonwoody macrophytes; vegetative disruption through grazing or mowing minimal or not evident; almost all plants allowed to grow naturally.	70-90% of the streambank surfaces covered by native vegetation, but one class of plants is not well-represented; disruption evident but not affecting full plant growth potential to any great extent; more than one-half of the potential plant stubble height remaining.	50-70% of the streambank surfaces covered by vegetation; disruption obvious; patches of bare soil or closely cropped vegetation common; less than one-half of the potential plant stubble height remaining.	Less than 50% of the streambank surfaces covered by vegetation; disruption of streambank vegetation is very high; vegetation has been removed to 5 centimeters or less in average stubble height.
SCORE 9 (LB)	Left Bank 10 (9)	8 7 6	5 4 3	2 1 0
SCORE 9 (RB)	Right Bank 10 (9)	8 7 6	5 4 3	2 1 0
10. Riparian Vegetative Zone Width (score each bank riparian zone)	Width of riparian zone >18 meters; human activities (i.e., parking lots, roadbeds, clear-cuts, lawns, or crops) have not impacted zone.	Width of riparian zone 12-18 meters; human activities have impacted zone only minimally.	Width of riparian zone 6-12 meters; human activities have impacted zone a great deal.	Width of riparian zone <6 meters: little or no riparian vegetation due to human activities.
SCORE 7 (LB)	Left Bank 10 9	8 (7) 6	5 4 3	2 1 0
SCORE 9 (RB)	Right Bank 10 (9)	8 7 6	5 4 3	2 1 0

5 HABITAT ASSESSMENT AND PHYSICOCHEMICAL PARAMETERS

An evaluation of habitat quality is critical to any assessment of ecological integrity and should be performed at each site at the time of the biological sampling. In general, habitat and biological diversity in rivers are closely linked (Raven et al. 1998). In the truest sense, "habitat" incorporates all aspects of physical and chemical constituents along with the biotic interactions. In these protocols, the definition of "habitat" is narrowed to the quality of the instream and riparian habitat that influences the structure and function of the aquatic community in a stream. The presence of an altered habitat structure is considered one of the major stressors of aquatic systems (Karr et al. 1986). The presence of a degraded habitat can sometimes obscure investigations on the effects of toxicity and/or pollution. The assessments performed by many water resource agencies include a general description of the site, a physical characterization and water quality assessment, and a visual assessment of instream and riparian habitat quality. Some states (e.g., Idaho DEQ and Illinois EPA) include quantitative measurements of physical parameters in their habitat assessment. Together these data provide an integrated picture of several of the factors influencing the biological condition of a stream system. These assessments are not as comprehensive as needed to adequately identify all causes of impact. However, additional investigation into hydrological modification of water courses and drainage patterns can be conducted, once impairment is noted.

The habitat quality evaluation can be accomplished by characterizing selected physicochemical parameters in conjunction with a systematic assessment of physical structure. Through this approach, key features can be rated or scored to provide a useful assessment of habitat quality.

5.1 PHYSICAL CHARACTERISTICS AND WATER QUALITY

Both physical characteristics and water quality parameters are pertinent to characterization of the stream habitat. An example of the data sheet used to characterize the physical characteristics and water quality of a site is shown in Appendix A. The information required includes measurements of physical characterization and water quality made routinely to supplement biological surveys.

Physical characterization includes documentation of general land use, description of the stream origin and type, summary of the riparian vegetation features, and measurements of instream parameters such as width, depth, flow, and substrate. The water quality discussed in these protocols are *in situ* measurements of standard parameters that can be taken with a water quality instrument. These are generally instantaneous measurements taken at the time of the survey. Measurements of certain parameters, such as temperature, dissolved oxygen, and turbidity, can be taken over a diurnal cycle and will require instrumentation that can be left in place for extended periods or collects water samples at periodic intervals for measurement. In addition, water samples may be desired to be collected for selected chemical analysis. These chemical samples are transported to an analytical laboratory for processing. The combination of this information (physical characterization and water quality) will provide insight as to the ability of the stream to support a healthy aquatic community, and to the presence of chemical and non-chemical stressors to the stream ecosystem. Information requested in this section (Appendix A-1, Form 1) is standard

to many aquatic studies and allows for some comparison among sites. Additionally, conditions that may significantly affect aquatic biota are documented.

5.1.1 Header Information (Station Identifier)

The header information is identical on all data sheets and requires sufficient information to identify the station and location where the survey was conducted, date and time of survey, and the investigators responsible for the quality and integrity of the data. The stream name and river basin identify the watershed and tributary; the location of the station is described in the narrative to help identify access to the station for repeat visits. The rivermile (if applicable) and latitude/longitude are specific locational data for the station. The station number is a code assigned by the agency that will associate the sample and survey data with the station. The STORET number is assigned to each datapoint for inclusion in USEPA's STORET system. The stream class is a designation of the grouping of homogeneous characteristics from which assessments will be made. For instance, Ohio EPA uses ecoregions and size of stream, Florida DEP uses bioregions (aggregations of subecoregions), and Arizona DEQ uses elevation as a means to identify stream classes. Listing the agency and investigators assigns responsibility to the data collected from the station at a specific date and time. The reason for the survey is sometimes useful to an agency that conducts surveys for various programs and purposes.

5.1.2 Weather Conditions

Note the present weather conditions on the day of the survey and those immediately preceding the day of the survey. This information is important to interpret the effects of storm events on the sampling effort.

5.1.3 Site Location/Map

To complete this phase of the bioassessment, a photograph may be helpful in identifying station location and documenting habitat conditions. Any observations or data not requested but deemed important by the field observer should be recorded. A hand-drawn map is useful to illustrate major landmarks or features of the channel morphology or orientation, vegetative zones, buildings, etc. that might be used to aid in data interpretation.

5.1.4 Stream Characterization

Stream Subsystem: In regions where the perennial nature of streams is important, or where the tidal influence of streams will alter the structure and function of communities, this parameter should be noted.

Stream Type: Communities inhabiting coldwater streams are markedly different from those in warmwater streams, many states have established temperature criteria that differentiate these 2 stream types.

Stream Origin: Note the origination of the stream under study, if it is known. Examples are glacial, montane, swamp, and bog. As the size of the stream or river increases, a mixture of origins of tributaries is likely.

5.1.5 Watershed Features

Collecting this information usually requires some effort initially for a station. However, subsequent surveys will most likely not require an in-depth research of this information.

Predominant Surrounding Land Use Type: Document the prevalent land-use type in the catchment of the station (noting any other land uses in the area which, although not predominant, may potentially affect water quality). Land use maps should be consulted to accurately document this information.

Local Watershed Nonpoint Source Pollution: This item refers to problems and potential problems in the watershed. Nonpoint source pollution is defined as diffuse agricultural and urban runoff. Other compromising factors in a watershed that may affect water quality include feedlots, constructed wetlands, septic systems, dams and impoundments, mine seepage, etc.

Local Watershed Erosion: The existing or potential detachment of soil within the local watershed (the portion of the watershed or catchment that directly affects the stream reach or station under study) and its movement into the stream is noted. Erosion can be rated through visual observation of watershed and stream characteristics (note any turbidity observed during water quality assessment below).

5.1.6 Riparian Vegetation

An acceptable riparian zone includes a buffer strip of a minimum of 18 m (Barton et al. 1985) from the stream on either side. The acceptable width of the riparian zone may also be variable depending on the size of the stream. Streams over 4 m in width may require larger riparian zones. The vegetation within the riparian zone is documented here as the dominant type and species, if known.

5.1.7 Instream Features

Instream features are measured or evaluated in the sampling reach and catchment as appropriate.

Estimated Reach Length: Measure or estimate the length of the sampling reach. This information is important if reaches of variable length are surveyed and assessed.

Estimated Stream Width (in meters, m): Estimate the distance from bank to bank at a transect representative of the stream width in the reach. If variable widths, use an average to find that which is representative for the given reach.

Sampling Reach Area (m^2): Multiply the sampling reach length by the stream width to obtain a calculated surface area.

Estimated Stream Depth (m): Estimate the vertical distance from water surface to stream bottom at a representative depth (use instream habitat feature that is most common in reach) to obtain average depth.

Velocity: Measure the surface velocity in the thalweg of a representative run area. If measurement is not done, estimate the velocity as slow, moderate, or fast.

Canopy Cover: Note the general proportion of open to shaded area which best describes the amount of cover at the sampling reach or station. A densiometer may be used in place of visual estimation.

High Water Mark (m): Estimate the vertical distance from the bankfull margin of the stream bank to the peak overflow level, as indicated by debris hanging in riparian or floodplain vegetation, and deposition of silt or soil. In instances where bank overflow is rare, a high water mark may not be evident.

Proportion of Reach Represented by Stream Morphological Types: The proportion represented by riffles, runs, and pools should be noted to describe the morphological heterogeneity of the reach.

Channelized: Indicate whether or not the area around the sampling reach or station is channelized (e.g., straightening of stream, bridge abutments and road crossings, diversions, etc.).

Dam Present: Indicate the presence or absence of a dam upstream in the catchment or downstream of the sampling reach or station. If a dam is present, include specific information relating to alteration of flow.

5.1.8 Large Woody Debris

Large Woody Debris (LWD) density, defined and measured as described below, has been used in regional surveys (Shields et al. 1995) and intensive studies of degraded and restored streams (Shields et al. 1998). The method was developed for sand or sand-and-gravel bed streams in the Southeastern U.S. that are wadeable at baseflow, with water widths between 1 and 30 m (Cooper and Testa 1999).

Cooper and Testa's (1999) procedure involves measurements based on visual estimates taken by a wading observer. Only woody debris actually in contact with stream water is counted. Each woody debris formation with a surface area in the plane of the water surface >0.25 m^2 is recorded. The estimated length and width of each formation is recorded on a form or marked directly onto a stream reach drawing. Estimates are made to the nearest 0.5 m , and formations with length or width less than 0.5 m are not counted. Recorded length is maximum width in the direction perpendicular to the length. Maximum actual length and width of a limb, log, or accumulation are not considered.

If only a portion of the log/limb is in contact with the water, only that portion in contact is measured. Root wads and logs/limbs in the water margin are counted if they contact the water, and are arbitrarily given a width of 0.5 m Lone individual limbs and logs are included in the determination if their diameter is 10 cm or larger (Keller and Swanson 1979, Ward and Aumen 1986). Accumulations of smaller limbs and logs are included if the formation total length or width is 0.5 m or larger. Standing trees and stumps within the stream are also recorded if their length and width exceed 0.5 m.

The length and width of each LWD formation are then multiplied, and the resulting products are summed to give the aquatic habitat area directly influenced. This area is then divided by the water

surface area (km^2) within the sampled reach (obtained by multiplying the average water surface width by reach length) to obtain LWD density. Density values of 10^3 to 10^4 m^2/km^2 have been reported for channelized and incised streams and on the order of 10^5 m^2/km^2 for non-incised streams (Shields et al. 1995 and 1998). This density is not an expression of the volume of LWD, but rather a measure of LWD influence on velocity, depth, and cover.

5.1.9 Aquatic Vegetation

The general type and relative dominance of aquatic plants are documented in this section. Only an estimation of the extent of aquatic vegetation is made. Besides being an ecological assemblage that responds to perturbation, aquatic vegetation provides refugia and food for aquatic fauna. List the species of aquatic vegetation, if known.

5.1.10 Water Quality

Temperature (°C), Conductivity or "Specific Conductance" (µohms), Dissolved Oxygen (µg/L), pH, Turbidity: Measure and record values for each of the water quality parameters indicated, using the appropriate calibrated water quality instrument(s). Note the type of instrument and unit number used.

Water Odors: Note those odors described (or include any other odors not listed) that are associated with the water in the sampling area.

Water Surface Oils: Note the term that best describes the relative amount of any oils present on the water surface.

Turbidity: If turbidity is not measured directly, note the term which, based upon visual observation, best describes the amount of material suspended in the water column.

5.1.11 Sediment/Substrate

Sediment Odors: Disturb sediment in pool or other depositional areas and note any odors described (or include any other odors not listed) which are associated with sediment in the sampling reach.

Sediment Oils: Note the term which best describes the relative amount of any sediment oils observed in the sampling area.

Sediment Deposits: Note those deposits described (or include any other deposits not listed) that are present in the sampling reach. Also indicate whether the undersides of rocks not deeply embedded are black (which generally indicates low dissolved oxygen or anaerobic conditions).

Inorganic Substrate Components: Visually estimate the relative proportion of each of the 7 substrate/particle types listed that are present over the sampling reach.

Organic Substrate Components: Indicate relative abundance of each of the 3 substrate types listed.

5.2 A VISUAL-BASED HABITAT ASSESSMENT

Biological potential is limited by the quality of the physical habitat, forming the template within which biological communities develop (Southwood 1977). Thus, habitat assessment is defined as the evaluation of the structure of the surrounding physical habitat that influences the quality of the water resource and the condition of the resident aquatic community (Barbour et al. 1996a). For streams, an encompassing approach to assessing structure of the habitat includes an evaluation of the variety and quality of the substrate, channel morphology, bank structure, and riparian vegetation. Habitat parameters pertinent to the assessment of habitat quality include those that characterize the stream "micro scale" habitat (e.g., estimation of embeddeddness), the "macro scale" features (e.g., channel morphology), and the riparian and bank structure features that are most often influential in affecting the other parameters.

EQUIPMENT/SUPPLIES NEEDED FOR HABITAT ASSESSMENT AND PHYSICAL/WATER QUALITY CHARACTERIZATION

- Physical Characterization and Water Quality Field Data Sheet*
- Habitat Assessment Field Data Sheet*
- clipboard
- pencils or waterproof pens
- 35 mm camera (may be digital)
- video camera (optional)
- upstream/downstream “arrows” or signs for photographing and documenting sampling reaches
- Flow or velocity meter
- *In situ* water quality meters
- Global Positioning System (GPS) Unit

* It is helpful to copy field sheets onto water-resistant paper for use in wet weather conditions

Rosgen (1985, 1994) presented a stream and river classification system that is founded on the premise that dynamically-stable stream channels have a morphology that provides appropriate distribution of flow energy during storm events. Further, he identifies 8 major variables that affect the stability of channel morphology, but are not mutually independent: channel width, channel depth, flow velocity, discharge, channel slope, roughness of channel materials, sediment load and sediment particle size distribution. When streams have one of these characteristics altered, some of their capability to dissipate energy properly is lost (Leopold et al. 1964, Rosgen 1985) and will result in accelerated rates of channel erosion. Some of the habitat structural components that function to dissipate flow energy are:

- sinuosity
- roughness of bed and bank materials
- presence of point bars (slope is an important characteristic)
- vegetative conditions of stream banks and the riparian zone
- condition of the floodplain (accessibility from bank, overflow, and size are important characteristics).

Measurement of these parameters or characteristics serve to stratify and place streams into distinct classifications. However, none of these habitat classification techniques attempt to differentiate the quality of the habitat and the ability of the habitat to support the optimal biological condition of the

region. Much of our understanding of habitat relationships in streams has emerged from comparative studies that describe statistical relationships between habitat variables and abundance of biota (Hawkins et al. 1993). However, in response to the need to incorporate broader scale habitat assessments in water resource programs, 2 types of approaches for evaluating habitat structure have been developed. In the first, the Environmental Monitoring and Assessment Program (EMAP) of the USEPA and the National Water-Quality Assessment Program (NAWQA) of the USGS developed techniques that incorporate measurements of various features of the instream, channel, and bank morphology (Meader et al. 1993, Klemm and Lazorchak 1994). These techniques provide a relatively comprehensive characterization of the physical structure of the stream sampling reach and its surrounding floodplain. The second type was a more rapid and qualitative habitat assessment approach that was developed to describe the overall quality of the physical habitat (Ball 1982, Ohio EPA 1987, Plafkin et al. 1989, Barbour and Stribling 1991, 1994, Rankin 1991, 1995). In this document, the more rapid visual-based approach is described. A cursory overview of the more quantitative approaches to characterizing the physical structure of the habitat is provided.

The habitat assessment matrix developed for the Rapid Bioassessment Protocols (RBPs) in Plafkin et al. (1989) were originally based on the Stream Classification Guidelines for Wisconsin developed by Ball (1982) and "*Methods of Evaluating Stream, Riparian, and Biotic Conditions*" developed by Platts et al. (1983). Barbour and Stribling (1991, 1994) modified the habitat assessment approach originally developed for the RBPs to include additional assessment parameters for high gradient streams and a more appropriate parameter set for low gradient streams (Appendix A-1, Forms 2,3). All parameters are evaluated and rated on a numerical scale of 0 to 20 (highest) for each sampling reach. The ratings are then totaled and compared to a reference condition to provide a final habitat ranking. Scores increase as habitat quality increases. To ensure consistency in the evaluation procedure, descriptions of the physical parameters and relative criteria are included in the rating form.

The Environmental Agency of Great Britain (Environment Agency of England and Wales, Scottish Environment Protection Agency, and Environment and Heritage Service of Northern Ireland) have developed a River Habitat Survey (RHS) for characterizing the quality of their streams and rivers (Raven et al. 1998). The approach used in Great Britain is similar to the visual-based habitat assessment used in the US in that scores are assigned to ranges of conditions of various habitat parameters.

A biologist who is well versed in the ecology and zoogeography of the region can generally recognize optimal habitat structure as it relates to the biological community. The ability to accurately assess the quality of the physical habitat structure using a visual-based approach depends on several factors:

- the parameters selected to represent the various features of habitat structure need to be relevant and clearly defined
- a continuum of conditions for each parameter must exist that can be characterized from the optimum for the region or stream type under study to the poorest situation reflecting substantial alteration due to anthropogenic activities

- the judgement criteria for the attributes of each parameter should minimize subjectivity through either quantitative measurements or specific categorical choices

- the investigators are experienced in or adequately trained for stream assessments in the region under study (Hannaford et al. 1997)

- adequate documentation and ongoing training is maintained to evaluate and correct errors resulting in outliers and aberrant assessments.

Habitat evaluations are first made on instream habitat, followed by channel morphology, bank structural features, and riparian vegetation. Generally, a single, comprehensive assessment is made that incorporates features of the entire sampling reach as well as selected features of the catchment. Additional assessments may be made on neighboring reaches to provide a broader evaluation of habitat quality for the stream ecosystem. The actual habitat assessment process involves rating the 10 parameters as optimal, suboptimal, marginal, or poor based on the criteria included on the Habitat Assessment Field Data Sheets (Appendix A-1, Forms 2,3). Some state programs, such as Florida Department of Environmental Protection (DEP) (1996) and Mid-Atlantic Coastal Streams Workgroup (MACS) (1996) have adapted this approach using somewhat fewer and different parameters.

Reference conditions are used to scale the assessment to the "best attainable" situation. This approach is critical to the assessment because stream characteristics will vary dramatically across different regions (Barbour and Stribling 1991). The ratio between the score for the test station and the score for the reference condition provides a percent comparability measure for each station. The station of interest is then classified on the basis of its similarity to expected conditions (reference condition), and its apparent potential to support an acceptable level of biological health. Use of a percent comparability evaluation allows for regional and stream-size differences which affect flow or velocity, substrate, and channel morphology. Some regions are characterized by streams having a low channel gradient, such as coastal plains or prairie regions.

Other habitat assessment approaches or a more rigorously quantitative approach to measuring the habitat parameters may be used (See Klemm and Lazorchak 1994, Kaufmann and Robison 1997, Meader et al. 1993). However, holistic and rapid assessment of a wide variety of habitat attributes along with other types of data is critical if physical measurements are to be used to best advantage in interpreting biological data. A more detailed discussion of the relationship between habitat quality and biological condition is presented in Chapter 10.

A generic habitat assessment approach based on visual observation can be separated into 2 basic approaches—one designed for high-gradient streams and one designed for low-gradient streams. High-gradient or riffle/run prevalent streams are those in moderate to high gradient landscapes. Natural high-gradient streams have substrates primarily composed of coarse sediment particles (i.e., gravel or larger) or frequent coarse particulate aggregations along stream reaches. Low-gradient or glide/pool prevalent streams are those in low to moderate gradient landscapes. Natural low-gradient streams have substrates of fine sediment or infrequent aggregations of more coarse (gravel or larger) sediment particles along stream reaches. The entire sampling reach is evaluated for each parameter. Descriptions of each parameter and its relevance to instream biota are presented in the following discussion. Parameters that are used only for high-gradient prevalent streams are marked with an “a”; those for low-gradient dominant streams, a “b”. If a parameter is used for both stream types, it is not marked with a letter. A brief set of decision criteria is given

for each parameter corresponding to each of the 4 categories reflecting a continuum of conditions on the field sheet (optimal, suboptimal, marginal, and poor). Refer to Appendix A-1, Forms 2 and 3, for a complete field assessment guide.

PROCEDURE FOR PERFORMING HABITAT ASSESSMENT

1. Select the reach to be assessed. The habitat assessment is performed on the same 100 m reach (or other reach designation [e.g., 40 x stream wetted width]) from which the biological sampling is conducted. Some parameters require an observation of a broader section of the catchment than just the sampling reach.

2. Complete the station identification section of each field data sheet and habitat assessment form.

3. It is best for the investigators to obtain a close look at the habitat features to make an adequate assessment. If the physical and water quality characterization and habitat assessment are done before the biological sampling, care must be taken to avoid disturbing the sampling habitat.

4. Complete the **Physical Characterization and Water Quality Field Data Sheet**. Sketch a map of the sampling reach on the back of this form.

5. Complete the **Habitat Assessment Field Data Sheet**, in a team of 2 or more biologists, if possible, to come to a consensus on determination of quality. Those parameters to be evaluated on a scale greater than a sampling reach require traversing the stream corridor to the extent deemed necessary to assess the habitat feature. As a general rule-of-thumb, use 2 lengths of the sampling reach to assess these parameters.

QUALITY ASSURANCE PROCEDURES

1. Each biologist is to be trained in the visual-based habitat assessment technique for the applicable region or state.

2. The judgment criteria for each habitat parameter are calibrated for the stream classes under study. Some text modifications may be needed on a regional basis.

3. Periodic checks of assessment results are completed using pictures of the sampling reach and discussions among the biologists in the agency.

Parameters to be evaluated in sampling reach:

1 EPIFAUNAL SUBSTRATE/AVAILABLE COVER

high and low gradient streams

Includes the relative quantity and variety of natural structures in the stream, such as cobble (riffles), large rocks, fallen trees, logs and branches, and undercut banks, available as refugia, feeding, or sites for spawning and nursery functions of aquatic macrofauna. A wide variety and/or abundance of submerged structures in the stream provides macroinvertebrates and fish with a large number of niches, thus increasing habitat diversity. As variety and abundance of cover decreases, habitat structure becomes monotonous, diversity decreases, and the potential for recovery following disturbance decreases. Riffles and runs are critical for maintaining a variety and abundance of insects in most high-gradient streams and serving as spawning and feeding refugia for certain fish. The extent and quality of the riffle is an important factor in the support of a healthy biological condition in high-gradient streams. Riffles and runs offer a diversity of habitat through variety of particle size, and, in many small high-gradient streams, will provide the most stable habitat. Snags and submerged logs are among the most productive habitat structure for macroinvertebrate colonization and fish refugia in low-gradient streams. However, "new fall" will not yet be suitable for colonization.

Optimal Range (*Mary Kay Corazalla, U. of Minn.*)

Poor Range

2a EMBEDDEDNESS

high gradient streams

Refers to the extent to which rocks (gravel, cobble, and boulders) and snags are covered or sunken into the silt, sand, or mud of the stream bottom. Generally, as rocks become embedded, the surface area available to macroinvertebrates and fish (shelter, spawning, and egg incubation) is decreased. Embeddedness is a result of large-scale sediment movement and deposition, and is a parameter evaluated in the riffles and runs of high-gradient streams. The rating of this parameter may be variable depending on where the observations are taken. To avoid confusion with sediment deposition (another habitat parameter), observations of embeddedness should be taken in the upstream and central portions of riffles and cobble substrate areas.

Optimal Range *(William Taft, MI DNR)*

Poor Range *(William Taft, MI DNR)*

2b POOL SUBSTRATE CHARACTERIZATION

low gradient streams

Evaluates the type and condition of bottom substrates found in pools. Firmer sediment types (e.g., gravel, sand) and rooted aquatic plants support a wider variety of organisms than a pool substrate dominated by mud or bedrock and no plants. In addition, a stream that has a uniform substrate in its pools will support far fewer types of organisms than a stream that has a variety of substrate types.

Poor Range

3a VELOCITY/DEPTH COMBINATIONS

high gradient streams

Patterns of velocity and depth are included for high-gradient streams under this parameter as an important feature of habitat diversity. The best streams in most high-gradient regions will have all 4 patterns present: (1) slow-deep, (2) slow-shallow, (3) fast-deep, and (4) fast-shallow. The general guidelines are 0.5 m depth to separate shallow from deep, and 0.3 m/sec to separate fast from slow. The occurrence of these 4 patterns relates to the stream's ability to provide and maintain a stable aquatic environment.

Optimal Range *(Mary Kay Corazalla, U. of Minn.)*
(arrows emphasize different velocity/depth regimes)

Poor Range *(William Taft, MI DNR)*

3b POOL VARIABILITY

low gradient streams

Rates the overall mixture of pool types found in streams, according to size and depth. The 4 basic types of pools are large-shallow, large-deep, small-shallow, and small-deep. A stream with many pool types will support a wide variety of aquatic species. Rivers with low sinuosity (few bends) and monotonous pool characteristics do not have sufficient quantities and types of habitat to support a diverse aquatic community. General guidelines are any pool dimension (i.e., length, width, oblique) greater than half the cross-section of the stream for separating large from small and 1 m depth separating shallow and deep.

Optimal Range *(Peggy Morgan, FL DEP)*

Poor Range *(William Taft, MI DNR)*

4 SEDIMENT DEPOSITION

high and low gradient streams

Measures the amount of sediment that has accumulated in pools and the changes that have occurred to the stream bottom as a result of deposition. Deposition occurs from large-scale movement of sediment. Sediment deposition may cause the formation of islands, point bars (areas of increased deposition usually at the beginning of a meander that increase in size as the channel is diverted toward the outer bank) or shoals, or result in the filling of runs and pools. Usually deposition is evident in areas that are obstructed by natural or manmade debris and areas where the stream flow decreases, such as bends. High levels of sediment deposition are symptoms of an unstable and continually changing environment that becomes unsuitable for many organisms.

5 CHANNEL FLOW STATUS

high and low gradient streams

The degree to which the channel is filled with water. The flow status will change as the channel enlarges (e.g., aggrading stream beds with actively widening channels) or as flow decreases as a result of dams and other obstructions, diversions for irrigation, or drought. When water does not cover much of the streambed, the amount of suitable substrate for aquatic organisms is limited. In high-gradient streams, riffles and cobble substrate are exposed; in low-gradient streams, the decrease in water level exposes logs and snags, thereby reducing the areas of good habitat. Channel flow is especially useful for interpreting biological condition under abnormal or lowered flow conditions. This parameter becomes important when more than one biological index period is used for surveys or the timing of sampling is inconsistent among sites or annual periodicity.

Parameters to be evaluated broader than sampling reach:

6 CHANNEL ALTERATION

high and low gradient streams

Is a measure of large-scale changes in the shape of the stream channel. Many streams in urban and agricultural areas have been straightened, deepened, or diverted into concrete channels, often for flood control or irrigation purposes. Such streams have far fewer natural habitats for fish, macroinvertebrates, and plants than do naturally meandering streams. Channel alteration is present when artificial embankments, riprap, and other forms of artificial bank stabilization or structures are present; when the stream is very straight for significant distances; when dams and bridges are present; and when other such changes have occurred. Scouring is often associated with channel alteration.

7a FREQUENCY OF RIFFLES (OR BENDS)

high gradient streams

Is a way to measure the sequence of riffles and thus the heterogeneity occurring in a stream. Riffles are a source of high-quality habitat and diverse fauna, therefore, an increased frequency of occurrence greatly enhances the diversity of the stream community. For high gradient streams where distinct riffles are uncommon, a run/bend ratio can be used as a measure of meandering or sinuosity (see 7b). A high degree of sinuosity provides for diverse habitat and fauna, and the stream is better able to handle surges when the stream fluctuates as a result of storms. The absorption of this energy by bends protects the stream from excessive erosion and flooding and provides refugia for benthic invertebrates and fish during storm events. To gain an appreciation of this parameter in some streams, a longer segment or reach than that designated for sampling should be incorporated into the evaluation. In some situations, this parameter may be rated from viewing accurate topographical maps. The "sequencing" pattern of the stream morphology is important in rating this parameter. In headwaters, riffles are usually continuous and the presence of cascades or boulders provides a form of sinuosity and enhances the structure of the stream. A stable channel is one that does not exhibit progressive changes in slope, shape, or dimensions, although short-term variations may occur during floods (Gordon et al. 1992).

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
7a. Frequency of Riffles (or bends) **(high gradient)**	Occurrence of riffles relatively frequent; ratio of distance between riffles divided by width of the stream <7:1 (generally 5 to 7); variety of habitat is key. In streams where riffles are continuous, placement of boulders or other large, natural obstruction is important.	Occurrence of riffles infrequent; distance between riffles divided by the width of the stream is between 7 to 15.	Occasional riffle or bend; bottom contours provide some habitat; distance between riffles divided by the width of the stream is between 15 to 25.	Generally all flat water or shallow riffles; poor habitat; distance between riffles divided by the width of the stream is a ratio of >25.

7b

CHANNEL SINUOSITY

low gradient streams

Evaluates the meandering or sinuosity of the stream. A high degree of sinuosity provides for diverse habitat and fauna, and the stream is better able to handle surges when the stream fluctuates as a result of storms. The absorption of this energy by bends protects the stream from excessive erosion and flooding and provides refugia for benthic invertebrates and fish during storm events. To gain an appreciation of this parameter in low gradient streams, a longer segment or reach than that designated for sampling may be incorporated into the evaluation. In some situations, this parameter may be rated from viewing accurate topographical maps. The "sequencing" pattern of the stream morphology is important in rating this parameter. In "oxbow" streams of coastal areas and deltas, meanders are highly exaggerated and transient. Natural conditions in these streams are shifting channels and bends, and alteration is usually in the form of flow regulation and diversion. A stable channel is one that does not exhibit progressive changes in slope, shape, or dimensions, although short-term variations may occur during floods (Gordon et al. 1992).

Habitat Parameter	Condition Category			
	Optimal	Suboptimal	Marginal	Poor
7b. Channel Sinuosity **(low gradient)**	The bends in the stream increase the stream length 3 to 4 times longer than if it was in a straight line. (Note - channel braiding is considered normal in coastal plains and other low-lying areas. This parameter is not easily rated in these areas.)	The bends in the stream increase the stream length 2 to 3 times longer than if it was in a straight line.	The bends in the stream increase the stream length 1 to 2 times longer than if it was in a straight line.	Channel straight; waterway has been channelized for a long distance.

8 BANK STABILITY (condition of banks)

high and low gradient streams

Measures whether the stream banks are eroded (or have the potential for erosion). Steep banks are more likely to collapse and suffer from erosion than are gently sloping banks, and are therefore considered to be unstable. Signs of erosion include crumbling, unvegetated banks, exposed tree roots, and exposed soil. Eroded banks indicate a problem of sediment movement and deposition, and suggest a scarcity of cover and organic input to streams. Each bank is evaluated separately and the cumulative score (right and left) is used for this parameter.

9 BANK VEGETATIVE PROTECTION

high and low gradient streams

Measures the amount of vegetative protection afforded to the stream bank and the near-stream portion of the riparian zone. The root systems of plants growing on stream banks help hold soil in place, thereby reducing the amount of erosion that is likely to occur. This parameter supplies information on the ability of the bank to resist erosion as well as some additional information on the uptake of nutrients by the plants, the control of instream scouring, and stream shading. Banks that have full, natural plant growth are better for fish and macroinvertebrates than are banks without vegetative protection or those shored up with concrete or riprap. This parameter is made more effective by defining the native vegetation for the region and stream type (i.e., shrubs, trees, etc.). In some regions, the introduction of exotics has virtually replaced all native vegetation. The value of exotic vegetation to the quality of the habitat structure and contribution to the stream ecosystem must be considered in this parameter. In areas of high grazing pressure from livestock or where residential and urban development activities disrupt the riparian zone, the growth of a natural plant community is impeded and can extend to the bank vegetative protection zone. Each bank is evaluated separately and the cumulative score (right and left) is used for this parameter.

10 RIPARIAN VEGETATIVE ZONE WIDTH

high and low gradient streams

Measures the width of natural vegetation from the edge of the stream bank out through the riparian zone. The vegetative zone serves as a buffer to pollutants entering a stream from runoff, controls erosion, and provides habitat and nutrient input into the stream. A relatively undisturbed riparian zone supports a robust stream system; narrow riparian zones occur when roads, parking lots, fields, lawns, bare soil, rocks, or buildings are near the stream bank. Residential developments, urban centers, golf courses, and rangeland are the common causes of anthropogenic degradation of the riparian zone. Conversely, the presence of "old field" (i.e., a previously developed field not currently in use), paths, and walkways in an otherwise undisturbed riparian zone may be judged to be inconsequential to altering the riparian zone and may be given relatively high scores. For variable size streams, the specified width of a desirable riparian zone may also be variable and may be best determined by some multiple of stream width (e.g., 4 x wetted stream width). Each bank is evaluated separately and the cumulative score (right and left) is used for this parameter.

5.3 ADDITIONS OF QUANTITATIVE MEASURES TO THE HABITAT ASSESSMENT

Kaufmann (1993) identified 7 general physical habitat attributes important in influencing stream ecology. These include:

- channel dimensions
- channel gradient
- channel substrate size and type
- habitat complexity and cover
- riparian vegetation cover and structure
- anthropogenic alterations
- channel-riparian interaction.

All of these attributes vary naturally, as do biological characteristics; thus expectations differ even in the absence of anthropogenic disturbances. Within a given physiographic-climatic region, stream drainage area and overall stream gradient are likely to be strong natural determinants of many aspects of stream habitat, because of their influence on discharge, flood stage, and stream power (the product of discharge times gradient). In addition, all of these attributes may be directly or indirectly altered by anthropogenic activities.

In Section 5.2, an approach is described whereby habitat quality is interpreted directly in the field by biologists while sampling the stream reach. This Level 1 approach is observational and requires only one person (although a team approach is recommended) and takes about 15 to 20 minutes per stream reach. This approach more quickly yields a habitat quality assessment. However, it depends upon the knowledge and experience of the field biologist to make the proper interpretation of observed of both the natural expectations (potentials) and the biological consequences (quality) that can be attributed to the observed physical attributes. Hannaford et al. (1997) found that training in habitat assessment was necessary to reduce the subjectivity in a visual-based approach. The authors also stated that training on different types of streams may be necessary to adequately prepare investigators.

The second conceptual approach described here confines observations to habitat characteristics themselves (whether they are quantitative or qualitative), then later ascribing quality scoring to these measurements as part of the data analysis process. Typically, this second type of habitat assessment approach employs more quantitative data collection, as exemplified by field methods described by Kaufmann and Robison (1997) for EMAP, Simonson et al. (1994), Meador et al. (1993) for NAWQA, and others cited by Gurtz and Muir (1994). These field approaches typically define a reach length proportional to stream width and employ transect measurements that are systematically spaced (Simonson et al. 1994, Kaufmann and Robison 1997) or spaced by judgement to be representative (Meador et al. 1993). They usually include measurement of substrate, channel and bank dimensions, riparian canopy cover, discharge, gradient, sinuosity, in-channel cover features, and counts of large woody debris and riparian human disturbances. They may employ systematic visual estimates of substrate embeddedness, fish cover features, habitat

types, and riparian vegetation structure. The time commitment in the field to these more quantitative habitat assessment methods is usually 1.5 to 3 hours with a crew of two people. Because of the greater amount of data collected, they also require more time for data summarization, analysis, and interpretation. On the other hand, the more quantitative methods and less ambiguous field parameters result in considerably greater precision. The USEPA applied both quantitative and visual-based (RBPs) methods in a stream survey undertaken over 4 years in the mid-Atlantic region of the Appalachian Mountains. An earlier version of the RBP techniques were applied on 301 streams with repeat visits to 29 streams; signal-to-noise ratios varied from 0.1 to 3.0 for the twelve RBP metrics and averaged (1.1 for the RBP total habitat quality score). The quantitative methods produced a higher level of precision; signal-to-noise ratios were typically between 10 and 50, and sometimes in excess of 100 for quantitative measurements of channel morphology, substrate, and canopy densiometer measurements made on a random subset of 186 streams with 27 repeat visits in the same survey. Similarly, semi-quantitative estimates of fish cover and riparian human disturbance estimates obtained from multiple, systematic visual observations of otherwise measurable features had signal:noise ratios from 5 to 50. Many riparian vegetation cover and structure metrics were moderately precise (signal:noise ranging from 2 to 30). Commonly used flow dependent measures (e.g., riffle/pool and width/depth ratios), and some visual riparian cover estimates were less precise, with signal:noise ratios more in the range of those observed for metrics of the EPA's RBP habitat score (<2).

The USEPA's EMAP habitat assessment field methods are presented as an option for a second level (II) of habitat assessment. These methods have been applied in numerous streams throughout the Mid-Atlantic region, the Midwest, Colorado, California, and the Pacific Northwest. Table 5-1 is a summary of these field methods; more detail is presented in the field manual by Kaufmann and Robison (1997).

Table 5-1. Components of EMAP physical habitat protocol.

Component	Description
1. Thalweg Profile	Measure maximum depth, classify habitat, determine presence of soft/small sediment at 10-15 equally spaced intervals between each of 11 channel cross-sections (100-150 along entire reach). Measure wetted width at 11 channel cross-sections and mid-way between cross-sections (21 measurements).
2. Woody Debris	Between each of the channel cross sections, tally large woody debris numbers within and above the bankfull channel according to size classes.
3. Channel and Riparian Cross-Sections	At 11 cross-section stations placed at equal intervals along reach length: • **Measure**: channel cross section dimensions, bank height, undercut, angle (with rod and clinometer); gradient (clinometer), sinuosity (compass backsite), riparian canopy cover (densiometer). • **Visually Estimate***: substrate size class and embeddedness; areal cover class and type (e.g., woody) of riparian vegetation in Canopy, Mid-Layer and Ground Cover; areal cover class of fish concealment features, aquatic macrophytes and filamentous algae. • **Observe & Record***: human disturbances and their proximity to the channel.
4. Discharge	In medium and large streams (defines later) measure water depth and velocity @ 0.6 depth (with electromagnetic or impeller-type flow meter) at 15 to 20 equally spaced intervals across one carefully chosen channel cross-section. In very small streams, measure discharge with a portable weir or time the filling of a bucket.

* Substrate size class and embeddedness are estimated, and depth is measured for 55 particles taken at 5 equally-spaced points on each of 11 cross-sections. The cross-section is defined by laying the surveyor's rod or tape to span the wetted channel. Woody

debris is tallied over the distance between each cross-section and the next cross-section upstream. Riparian vegetation and human disturbances are observed 5 m upstream and 5 m downstream from the cross section station. They extend shoreward 10 m from left and right banks. Fish cover types, aquatic macrophytes, and algae are observed within channel 5 m upstream and 5 m downstream from the cross section stations. These boundaries for visual observations are estimated by eye.

Table 5-2 lists the physical habitat metrics that can be derived from applying these field methods. Once these habitat metrics are calculated from the available physical habitat data, an assessment would be obtained from comparing these metric values to those of known reference sites. A strong deviation from the reference expectations would indicate a habitat alteration of the particular parameter. The close connectivity of the various attributes would most likely result in an impact on multiple metrics if habitat alteration was occurring. The actual process for interpreting a habitat assessment using this approach is still under development.

Table 5-2. Example of habitat metrics that can be calculated from the EMAP physical habitat data.

Channel mean width and depth
Channel volume and Residual Pool volume
Mean channel slope and sinuosity
Channel incision, bankfull dimensions, and bank characteristics
Substrate mean diameter, % fines, % embeddedness
Substrate stability
Fish concealment features (areal cover of various types, e.g., undercut banks, brush)
Large woody debris (volume and number of pieces per 100 m)
Channel habitat types (e.g., % of reach composed of pools, riffles, etc.)
Canopy cover
Riparian vegetation structure and complexity
Riparian disturbance measure (proximity-weighted tally of human disturbances)

8 FISH PROTOCOLS

Monitoring of the fish assemblage is an integral component of many water quality management programs, and its importance is reflected in the aquatic life use-support designations of many states. Narrative expressions such as “maintaining coldwater fisheries”, “fishable” or “fish propagation” are prevalent in state standards. Assessments of the fish assemblage must measure the overall structure and function of the ichthyofaunal community to adequately evaluate biological integrity and protect surface water resource quality. Fish bioassessment data quality and comparability are assured through the utilization of qualified fisheries professionals and consistent methods.

The Rapid Bioassessment Protocol (RBP) for fish presented in this document, is directly comparable to RBP V in Plafkin et al. (1989). The principal evaluation mechanism utilizes the technical framework of the Index of Biotic Integrity (IBI) — a fish assemblage assessment approach developed by Karr (1981). The IBI incorporates the zoogeographic, ecosystem, community and population aspects of the fish assemblage into a single ecologically-based index. Calculation and interpretation of the IBI involves a sequence of activities including: fish sample collection; data tabulation; and regional modification and calibration of metrics and expectation values. This concept has provided the overall multimetric index framework for rapid bioassessment in this document. A more detailed description of this approach for fish is presented in Karr et al. (1986) and Ohio EPA (1987). Regional modification and applications are described in Leonard and Orth (1986), Moyle et al. (1986), Hughes and Gammon (1987), Wade and Stalcup (1987), Miller et al. (1988), Steedman (1988), Simon (1991), Lyons (1992a), Simon and Lyons (1995), Lyons et al. (1996), and Simon (1999).

The RBP for fish involves careful, standardized field collection, species identification and enumeration, and analyses using aggregated biological attributes or quantification of the numbers (and in some cases biomass, see Section 8.3.3, Metric 13) of key species. The role of experienced fisheries scientists in the adaptation and application of the RBP and the taxonomic identification of fishes cannot be overemphasized. The fish RBP survey yields an objective discrete measure of the condition of the fish assemblage. Although the fish survey can usually be completed in the field by qualified fish biologists, difficult species identifications will require laboratory confirmation. Data provided by the fish RBP can serve to assess use attainment, develop biological criteria, prioritize sites for further evaluation, provide a reproducible impact assessment, and evaluate status and trends of the fish assemblage.

Fish collection procedures must focus on a multihabitat approach — sampling habitats in relative proportion to their local representation (as determined during site reconnaissance). Each sample reach should contain riffle, run and pool habitat, when available. Whenever possible, the reach should be sampled sufficiently upstream of any bridge or road crossing to minimize the hydrological effects on overall habitat quality. Wadeability and accessability may ultimately govern the exact placement of the sample reach. A habitat assessment is performed and physical/chemical parameters measured concurrently with fish sampling to document and characterize available habitat specifics within the sample reach (see Chapter 5: Habitat Assessment and Physicochemical Characterization).

8.1 FISH COLLECTION PROCEDURES: ELECTROFISHING

All fish sampling gear types are generally considered selective to some degree; however, electrofishing has proven to be the most comprehensive and effective *single* method for collecting stream fishes. Pulsed DC (direct current) electrofishing is the method of choice to obtain a representative sample of the fish assemblage at each sampling station. However, electrofishing in any form has been banned from certain salmonid spawning streams in the northwest. As with any fish sampling method, the proper scientific collection permit(s) must be obtained before commencement of any electrofishing activities. The accurate identification of each fish collected is essential, and species-level identification is required (including hybrids in some cases, see Section 8.3.3, Metric 11). Field identifications are acceptable; however, voucher specimens must be retained for laboratory verification, particularly if there is any doubt about the correct identity of the specimen (see Section 8.2). Because the collection methods used are not consistently effective for young-of-the-year fish and because their inclusion may seasonally skew bioassessment results, fish less than 20 millimeters total length will not be identified or included in standard samples.

ELECTROFISHING CONFIGURATION AND FIELD TEAM ORGANIZATION

All field team members must be trained in electrofishing safety precautions and unit operation procedures identified by the electrofishing unit manufacturer. Each team member must be insulated from the water and the electrodes; therefore, chest waders and rubber gloves are required. Electrode and dip net handles must be constructed of insulating materials (e.g., woods, fiberglass). Electrofishers/electrodes must be equipped with functional safety switches (as installed by virtually all electrofisher manufacturers). Field team members must not reach into the water unless the electrodes have been removed from the water or the electrofisher has been disengaged.

It is recommended that at least 2 fish collection team members be certified in CPR (cardiopulmonary resuscitation). *Many* options exist for electrofisher configuration and field team organization; however, procedures will always involve pulsed DC electrofishing and a minimum 2-person team for sampling streams and wadeable rivers. Examples include:

- Backpack electrofisher with 2 hand-held electrodes mounted on fiberglass poles, one positive (anode) and one negative (cathode). One crew member, identified as the electrofisher unit operator, carries the backpack unit and manipulates both the anode and cathode poles. The anode may be fitted with a net ring (and shallow net) to allow the unit operator to net specimens. The remaining 1 or 2 team members net fish with dip nets and are responsible for specimen transport and care in buckets or livewells.

- Backpack electrofisher with 1 hand-held anode pole and a trailing or floating cathode. The electrofisher unit operator manipulates the anode with one hand, and has a second hand free for use of a dip net. The remaining 1 or 2 team members also aid in the netting of specimens, and in addition are responsible for specimen transport in buckets or livewells.

- Tote barge (pramunit) electrofisher with 2 hand-held anode poles and a trailing/floating cathode (recommended for large streams and wadeable rivers). Two team members are each equipped with an anode pole and a dip net. Each is responsible for electrofishing and the netting of specimens. The remaining team member will follow, pushing or pulling the barge through the sample reach. A livewell is maintained within the barge and/or within the sampling reach but outside the area of electric current.

The safety of all personnel and the quality of the data is assured through the adequate education, training, and experience of all members of the fish collection team. At least 1 biologist with training and experience in electrofishing techniques and fish taxonomy *must* be involved in each sampling event. Laboratory analyses are conducted and/or supervised by a fisheries professional trained in fish taxonomy. Quality assurance and quality control must be a continuous process in fisheries monitoring and assessment, and must include all program aspects (i.e., field sampling, habitat measurement, laboratory processing, and data recording).

Tote barge (pram unit) Electrofishing

Backpack Electrofishing

FIELD EQUIPMENT/SUPPLIES NEEDED FOR FISH SAMPLING—ELECTROFISHING

- appropriate scientific collection permit(s)
- backpack or tote barge-mounted electrofisher
- dip nets
- block nets (i.e., seines)
- elbow-length insulated waterproof gloves
- chest waders (equipped with wading cleats, when necessary)
- polarized sunglasses
- buckets/livewells
- jars for voucher/reference specimens
- waterproof jar labels
- 10% buffered formalin (formaldehyde solution)
- measuring board (500 mm minimum, with 1 mm increments)[a]
- balance (gram scale)[b]
- tape measure (100 m minimum)
- fish Sampling Field Data Sheet[c]
- applicable topographic maps
- copies of field protocols
- pencils, clipboard
- first aid kit
- Global Positioning System (GPS) Unit

[a] Needed only if program/study requires length frequency information

[b] Needed only if total biomass and/or the Index of Well-Being are included in the assessment process (see Section 8.3.3, Metric 13).

[c] It is helpful to copy fieldsheets onto water-resistant paper for use in wet weather conditions.

8.1.1 Field Sampling Procedures

1. A representative stream reach (see Alternatives for Stream Reach Designation, next page) is selected and measured such that primary physical habitat characteristics of the stream are included within the reach (e.g., riffle, run and pool habitats, when available). The sample reach should be located away from the influences of major tributaries and

bridge/road crossings (e.g., sufficiently upstream to decrease influences on overall habitat quality). The exact location (i.e., latitude and longitude) of the downstream limit of the reach must be recorded on each field data sheet. (If a Global Positioning System unit is used to provide location information, the accuracy or design confidence of the unit should be noted.) A habitat assessment and physical/chemical characterization of water quality should be performed within the same sampling reach (see Chapter 5: Habitat Assessment and Physicochemical Characterization).

2. Collection via electrofishing begins at a shallow riffle, or other physical barrier at the downstream limit of the sample reach, and terminates at a similar barrier at the upstream end of the reach. In the absence of physical barriers, block nets should be set at the upstream and downstream ends of the reach prior to the initiation of any sampling activities.

ALTERNATIVES FOR STREAM REACH DESIGNATION

The collection of a representative sample of the fish assemblage is essential, and the appropriate sampling station length for obtaining that sample is best determined by conducting pilot studies (Lyons 1992b, Simonson et al. 1994, Simonson and Lyons 1995). Alternatives for the designation of stream sampling reaches include:

- **Fixed-distance designation**—A standard length of stream, e.g., a 150-200-meter reach (Ohio EPA 1987), 100-meter reach (Massachusetts DEP 1995) may be used to obtain a representative sample. Conceptually, this approach should provide a mixture of habitats in the reach and provide, at a minimum, duplicate physical and structural elements such as riffle/pool sequences.

- **Proportional-distance designation**— A standard number of stream channel "widths" may be used to measure the stream study reach, e.g., 40 times the stream width is defined by Environmental Monitoring & Assessment Program (EMAP) for sampling (Klemm and Lazorchak 1995). This approach allows variation in the length of the reach based on the size of the stream. Application of the proportional-distance approach in large streams or wadeable rivers may require the establishment of sampling program time and/or distance maxima (e.g., no more than 3 hours of electrofishing or 500-meter reach per sampling site, [Klemm et al. 1993]).

3. Fish collection procedures commence at the downstream barrier. A minimum 2-person fisheries crew proceeds to electrofish in an upstream direction using a side-to-side or bank-to-bank sweeping technique to maximize area coverage. All wadeable habitats within the reach are sampled via a single pass, which terminates at the upstream barrier. Fish are held in livewells (or buckets) for subsequent identification and enumeration.

4. Sampling efficiency is dependent, at least in part, on water clarity and the field team's ability to see and net the stunned fish. Therefore, each team member should wear polarized sunglasses, and sampling is conducted only during periods of optimal water clarity and flow.

5. All fish (greater than 20 millimeters total length) collected within the sample reach must be identified to species (or subspecies). Specimens that cannot be identified with certainty in the field are preserved in a 10% formalin solution and stored in labeled jars for subsequent laboratory identification (see Section 8.2). A representative voucher collection must be retained for unidentified specimens, very small specimens, new locality records, and/or a particular region. In addition to the unidentified specimen jar, a voucher collection of a

subsample of each species identified in the field should be preserved and labeled for subsequent laboratory verification, if necessary. Obviously, species of special concern (e.g., threatened, endangered) should be noted and released *immediately* on site. Labels should contain (at a minimum) location data (verbal description and coordinates), date, collectors' names, and sample identification code and/or station numbers for the particular sampling site. Young-of-the-year fish less than 20 millimeters (total length) are not identified or included in the sample, and are released on site. Specimens that can be identified in the field are counted, examined for external anomalies (i.e., deformities, eroded fins, lesions, and tumors), and recorded on field data sheets. An example of a "Fish Sampling Field Data Sheet" is provided in Appendix A-4, Form 1. Space is available for optional fish length and weight measurements, should a particular program/study require length frequency or biomass data. However, these data *are not required* for the standard multimetric assessment. Space is allotted on the field data sheets for the *optional* inclusion of measurements (nearest millimeter total length) and weights (nearest gram) for a subsample (to a maximum 25 specimens) of each species. Although fish length and weight measurements are optional, recording a range of lengths for species encountered may be a useful routine measure. Following the data recording phase of the procedure, specimens that have been identified and processed in the field are released on site to minimize mortality.

6. The data collection phase includes the completion of the top portion of the "Fish Sampling Field Data Sheet" (Appendix A-4, Form 1),

QUALITY CONTROL (QC) IN THE FIELD

1. Quality control must be a continuous process in fish bioassessment and should include all program aspects, from field collection and preservation to habitat assessment, sample processing, and data recording. Field validation should be conduced at selected sites and will involve the collection of a duplicate sample taken from an adjacent reach upstream of the initial sampling site. The adjacent reach should be similar to the initial site with respect to habitat and stressors. Sampling QC data should be evaluated following the first year of sampling in order to determine a level of acceptable variability and the appropriate duplication frequency.

2. Field identifications of fish *must* be conducted by qualified/trained fish taxonomists, familiar with local and regional ichthyofauna. Questionable records are prevented by: (a) requiring the presence of at least one experienced/trained fish taxonomist on every field effort, and (b) preserving selected specimens (e.g., Klemm and Lazorchak 1995 recommend a subsample of a maximum 25 voucher specimens of each species) and those that cannot by readily identified in the field for laboratory verification and/or examination by a second qualified fish taxonomist (see Section 8.2). Specimens must be properly preserved and labeled (refer to Section 8.1.1, number 5). When needed, chain-of-custody forms must be initiated following sample preservation, and must include the same information as the sample container labels.

3. All field equipment must be in good operating condition, and a plan for routine inspection, maintenance, and/or calibration must be developed to ensure consistency and quality of field data. Field data must be complete and legible, and should be entered on standardized field data forms and/or digital recorders. While in the field, the field team should possess sufficient copies of standardized field data forms and chains-of-custody for all anticipated sampling sites, as well as copies of all applicable Standard Operating Procedures (SOPs).

which duplicates selected information from the physical/chemical field sheet. Information regarding the sample collection procedures must also be recorded. This includes method of fish capture, start time, ending time, duration of sampling, maximum and mean stream widths. The percentage of each habitat type in the reach is estimated and documented on the data sheet. Comments should include sampling conditions, e.g., visibility, flow, difficult access to stream, or anything that may prove to be valuable information to consider for future sampling events or by personnel unfamiliar with the site.

8.2 LABORATORY IDENTIFICATION AND VERIFICATION

Fish records of questionable quality are prevented by preserving specimens (that cannot be readily identified in the field) for laboratory examination and/or a voucher collection for laboratory verification. Specimens must be properly preserved (e.g., 10% formalin for tissue fixing and 70% ethanol for long-term storage) and labeled (using museum-grade archival labels/paper, and formalin/alcohol-proof pen or pencil). Labels should contain (at a minimum) site location data (i.e., verbal description and site coordinates), collection date, collector's names, species identification (for fishes identified in the field), species totals, and sample identification code and/or station number. All samples received in the laboratory should be tracked using a sample log-in procedure (Appendix A-4, Form 2). Laboratory fisheries professionals *must* be capable of identifying fish to the lowest possible taxonomic level (i.e., species or subspecies) and should have access to suitable regional taxonomic references (see Section 8.4) to aid in the identification process. Laboratories that do not typically identify fish, or trained fisheries professionals that have difficulty identifying a particular specimen or group of fish, should contact a taxonomic specialist (i.e., a recognized authority for that particular taxonomic group). Taxonomic nomenclature *must* be kept consistent and current. Common and scientific names of fishes from the United States and Canada are listed in Robins et al. (1991).

QUALITY CONTROL (QC) FOR TAXONOMY

1. A representative voucher collection must be retained for unidentified specimens, small specimens, and new locality records. In addition, a second voucher jar should be retained for a subsample of each species identified in the field (e.g., Klemm and Lazorchak 1995 recommend a subsample of 25 voucher specimens of each species). The vouchers must be properly preserved, labeled, and stored in the laboratory for future reference (see Section 8.2).

2. Voucher collections should be verified by a second qualified fish taxonomist, i.e., a professional other than the taxonomist responsible for the original field identifications. The word "validated" and the name of the taxonomist that validated the identification should be added to each voucher label. Specimens sent from the laboratory to taxonomic specialists should be recorded in a "Taxonomy Validation Notebook" (see Chapter 7), noting the label information and date sent. Upon return of the specimens, the date received and findings should also be recorded in the notebook (and the voucher label), along with the name of the person who performed the validation.

3. Information on samples completed (through the identification/validation process) will be tracked in a "Sample Log" notebook, to track the progress of each sample (Appendix A-4, Form 2). Sample log entries will be updated as each step is completed (e.g., receipt, identification, validation, archive).

4. A library of taxonomic literature is essential for the aid and support of identification/verification activities, and must be maintained (and updated as needed) in the laboratory. A list of selected taxonomic references is provided in Section 8.4.

8.3 DESCRIPTION OF FISH METRICS

Through the IBI, Karr et al. (1986) provided a consistent theoretical framework for analyzing fish assemblage data. The IBI is an aggregation of 12 biological metrics that are based on the fish assemblage's taxonomic and trophic composition and the abundance and condition of fish. Such multiple-parameter indices are necessary for making objective evaluations of complex systems. The IBI was designed to evaluate the quality of small Midwestern warmwater streams but has been modified for use in many regions (e.g., eastern and western United States, Canada, France) and in different ecosystems (e.g., rivers, impoundments, lakes, and estuaries).

The metrics attempt to quantify a biologist's best professional judgment (BPJ) of the quality of the fish assemblage. The IBI utilizes professional judgment, but in a prescribed manner, and it includes quantitative standards for discriminating the condition of the fish assemblage (Figure 8-1). BPJ is involved in choosing both the most appropriate population or assemblage element that is representative of each metric and in setting the scoring criteria. This process can be easily and clearly modified, as opposed to judgments that occur after results are calculated. Each metric is scored against criteria based on expectations developed from appropriate regional reference sites. Metric values

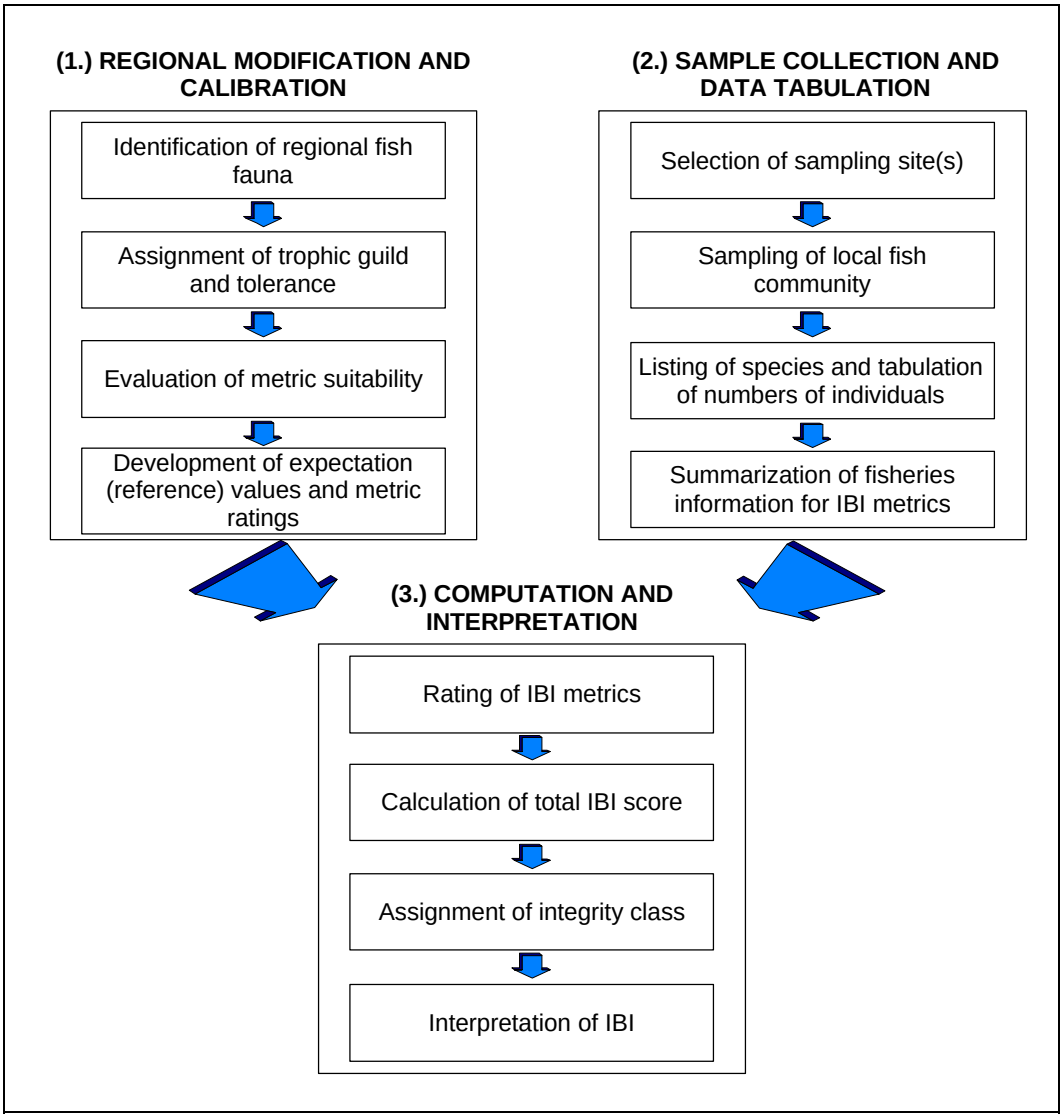

Figure 8-1. Sequence of activities involved in calculating and interpreting the Index of Biotic Integrity (adapted from Karr et al. 1986).

approximating, deviating slightly from, or deviating greatly from values occurring at the reference sites are scored as 5, 3, or 1, respectively. The scores of the 12 metrics are added for each station to give an IBI ranging from a maximum of 60 (excellent) to a minimum of 12 (very poor). Trophic and tolerance classifications of selected fish species are listed in Appendix C. Additional classifications can be derived from information in State and regional fish texts, by objectively assessing a large statewide database, or by contacting authors/originators of regional IBI programs or pilot studies. Use of the IBI by water resource agencies may result in further modifications. Many modifications have occurred (Miller et al. 1988) without changing the IBI's basic theoretical foundations.

The IBI serves as an integrated analysis because individual metrics may differ in their relative sensitivity to various levels of biological condition. A description and brief rationale for each of the 12 IBI metrics is outlined below. The original metrics described by Karr (1981) for Illinois streams are followed by substitutes used in or proposed for different geographic regions and stream sizes. Because of zoogeographic differences, different families or species are evaluated in different regions, with regional substitutes occupying the same general habitat or niche. The source for each substitute is footnoted below. Table 8-1 presents an overview of the IBI metric alternatives and their sources for various areas of the United States and Canada.

Roth et al. (1997)
Simon (1999)

8.3.1 Species Richness and Composition Metrics

These metrics assess the species richness component of diversity and the health of resident taxonomic groupings and habitat guilds of fishes. Two of the metrics assess assemblage composition in terms of tolerant or intolerant species.

Metric 1. Total number of fish species Substitutes (Table 8-1): Total number of resident native fish species and salmonid age classes.

This number decreases with increased degradation; hybrids and introduced species are not included. In coldwater streams supporting few fish species, the age classes of the species found represent the suitability of the system for spawning and rearing. The number of species is strongly affected by stream size at most small warmwater stream sites, but not at large river sites (Karr et al. 1986, Ohio EPA 1987).

Metric 2. Number and identity of darter species Substitutes (Table 8-1): Number and identity of sculpin species, benthic insectivore species, salmonid juveniles (individuals); number of sculpins (individuals); percent round-bodied suckers, sculpin and darter species.

These species are sensitive to degradation resulting from siltation and benthic oxygen depletion because they feed and reproduce in benthic habitats (Kuehne and Barbour 1983, Ohio EPA 1987). Many smaller species live within the rubble interstices, are weak swimmers, and spend their entire lives in an area of 100-400 m^2 (Matthews 1986, Hill and Grossman 1987). Darters are appropriate in most

Mississippi Basin streams; sculpins and yearling trout occupy the same niche in western streams. Benthic insectivores and sculpins or darters are used in small Atlantic slope streams that have few sculpins or darters, and round-bodied suckers are suitable in large midwestern rivers.

Metric 3. Number and identity of sunfish species. Substitutes (Table 8-1): Number and identity of cyprinid species, water column species, salmonid species, headwater species, and sunfish and trout species.

Table 8-1. Fish IBI metrics used in various regions of North America.[a]

Alternative IBI Metrics	Midwestern United States	Central Appalachians	Sacramento-San Joaquin	Colorado Front Range	Western Oregon Ohio	Ohio Headwater Sites	Northeastern United States	Ontario	Central Corn Belt Plain	Wisconsin-Warmwater	Wisconsin-Coldwater	Maryland Coastal Plain	Maryland Non-Tidal

Note: X = metric used in region. Many of these variations are applicable elsewhere.

a Taken from Karr et al. (1986), Leonard and Orth (1986), Moyle et al. (1986), Fausch and Schrader (1987), Hughes and Gammon (1987), Ohio EPA (1987), Miller et al. (1988), Steedman (1988), Simon (1991), Lyons (1992a), Barbour et al. (1995), Simon and Lyons (1995), Hall et al. (1996), Lyons et al. (1996), Roth et al. (1997).

b Metric suggested by Moyle et al. (1986) or Hughes and Gammon (1987) as a provisional replacement metric in small western salmonid streams.

c Boat sampling methods only (i.e., larger streams/rivers).

d Excluding individuals of tolerant species.

e Non-coastal Plain streams only.

f Coastal Plain streams only.

These pool species decrease with increased degradation of pools and instream cover (Gammon et al. 1981, Angermeier 1987, Platts et al. 1983). Most of these fishes feed on drifting and surface invertebrates and are active swimmers. The sunfishes and salmonids are important sport species. The sunfish metric works for most Mississippi Basin streams, but where sunfish are absent or rare, other

groups are used. Cyprinid species are used in coolwater western streams; water column species occupy the same niche in northeastern streams; salmonids are suitable in coldwater streams; headwater species serve for midwestern headwater streams; and trout and sunfish species are used in southern Ontario streams. Karr et al. (1986) and Ohio EPA (1987) found the number of sunfish species to be dependent on stream size in small streams, but Ohio EPA (1987) found no relationship between stream size and sunfish species in medium to large streams, nor between stream size and headwater species in small streams.

Metric 4. Number and identity of sucker species. Substitutes (Table 8-1): Number of adult trout species, number of minnow species, and number of suckers and catfish.

These species are sensitive to physical and chemical habitat degradation and commonly comprise most of the fish biomass in streams. All but the minnows are longlived species and provide a multiyear integration of physicochemical conditions. Suckers are common in medium and large streams; minnows dominate small streams in the Mississippi Basin; and trout occupy the same niche in coldwater streams. The richness of these species is a function of stream size in small and medium sized streams, but not in large (e.g., non-wadeable) rivers.

Metric 5. Number and identity of intolerant species. Substitutes (Table 8-1): Number and identity of sensitive species, amphibian species, and presence of brook trout.

This metric distinguishes high and moderate quality sites using species that are intolerant of various chemical and physical perturbations. Intolerant species are typically the first species to disappear following a disturbance. Species classified as intolerant or sensitive should only represent the 5-10 percent most susceptible species, otherwise this becomes a less discriminating metric. Candidate species are determined by examining regional ichthyological books for species that were once widespread but have become restricted to only the highest quality streams. Ohio EPA (1987) uses number of sensitive species (which includes highly intolerant and moderately intolerant species) for headwater sites because highly intolerant species are generally not expected in such habitats. Moyle (1976) suggested using amphibians in northern California streams because of their sensitivity to silvicultural impacts. This also may be a promising metric in Appalachian streams which may naturally support few fish species. Steedman (1988) found that the presence of brook trout had the greatest correlation with IBI score in Ontario streams. The number of sensitive and intolerant species increases with stream size in small and medium sized streams but is unaffected by size of large (e.g., non-wadeable) rivers.

Metric 6. Proportion of individuals as green sunfish. Substitutes (Table 8-1): Proportion of individuals as common carp, white sucker, tolerant species, creek chub, and dace.

This metric is the reverse of Metric 5. It distinguishes low from moderate quality waters. These species show increased distribution or abundance despite the historical degradation of surface waters, and they shift from incidental to dominant in disturbed sites. Green sunfish are appropriate in small midwestern streams; creek chubs were suggested for central Appalachian streams; common carp were suitable for a coolwater Oregon river; white suckers were selected in the northeast and Colorado where green sunfish are rare to absent; and dace (*Rhinichthys* species) were used in southern Ontario. To avoid weighting the metric on a single species, Karr et al. (1986) and Ohio EPA (1987) suggest using a small number of highly tolerant species (e.g., alternative Metric 6— percent abundance of tolerant species).

8.3.2 Trophic Composition Metrics

These three metrics assess the quality of the energy base and trophic dynamics of the fish assemblage. Traditional process studies, such as community production and respiration, are time consuming to conduct and the results are equivocal; distinctly different situations can yield similar results. The trophic composition metrics offer a means to evaluate the shift toward more generalized foraging that typically occurs with increased degradation of the physicochemical habitat.

Metric 7. Proportion of individuals as omnivores. Substitutes (Table 8-1): Proportion of individuals as generalist feeders.

The percent of omnivores in the community increases as the physical and chemical habitat deteriorates. Omnivores are defined as species that consistently feed on substantial proportions of plant and animal material. Ohio EPA (1987) excludes sensitive filter feeding species such as paddlefish and lamprey ammocoetes and opportunistic feeders like channel catfish. In areas where few species fit the true definition of omnivore, the proportion of generalized feeders may be substituted (Leonard and Orth 1986).

Metric 8. Proportion of individuals as insectivorous cyprinids. Substitutes (Table 8-1): Proportion of individuals as insectivores, specialized insectivores, insectivorous species, and number of juvenile trout.

Invertivores, primarily insectivores, are the dominant trophic guild of most North American surface waters. As the invertebrate food source decreases in abundance and diversity due to habitat degradation (e.g., anthropogenic stressors), there is a shift from insectivorous to omnivorous fish species. Generalized insectivores and opportunistic species, such as blacknose dace and creek chub were excluded from this metric by Ohio EPA (1987). This metric evaluates the midrange of biological condition, i.e., low to moderate condition.

Metric 9. Proportion of individuals as top carnivores. Substitutes (Table 8-1): Proportion of individuals as catchable salmonids, catchable wild trout, and pioneering species.

The top carnivore metric discriminates between systems with high and moderate integrity. Top carnivores are species that feed, as adults, predominantly on fish, other vertebrates, or crayfish. Occasional piscivores, such as creek chub and channel catfish, are not included. In trout streams, where true piscivores are uncommon, the percent of large salmonids is substituted for percent piscivores. These species often represent popular sport fish such as bass, pike, walleye, and trout. Pioneering species are used by Ohio EPA (1987) in headwater streams typically lacking piscivores. Pioneering species predominate in unstable environments that have been affected by temporal desiccation or anthropogenic stressors, and are the first to reinvade sections of headwater streams following periods of desiccation.

8.3.3 Fish Abundance and Condition Metrics

The last 3 metrics indirectly evaluate population recruitment, mortality, condition, and abundance. Typically, these parameters vary continuously and are time consuming to estimate accurately. Instead of such detailed population attributes or estimates, general population parameters are evaluated. Indirect estimation is less variable and much more rapidly determined.

areas where toxic chemicals are concentrated. They are excellent measures of the subacute effects of chemical pollution and the aesthetic value of game and nongame fish.

Metric 13. Total fish biomass (optional).

Hughes and Gammon (1987) suggest that in larger (e.g., non-wadeable) rivers where sizes of fish may vary in orders of magnitude this additional metric may be appropriate. Gammon (1976, 1980) and Ohio EPA (1987) developed an Index of Well-Being (Iwb) and Modified Index of Well-Being (MIwb), respectively, based upon both fish abundance and biomass measures. The combination of diversity and biomass measures is a useful tool for assessing fish assemblages in larger rivers (Yoder and Rankin 1995b). Ohio EPA (1987) found that the additional collection of biomass data (i.e., in addition to abundance information needed for the IBI) required to calculate the MIwb does not represent a significant expenditure of time, providing that subsampling techniques are applied (see Field Sampling Procedures 8.1.1).

Because the IBI is an adaptable index, the choice of metrics and scoring criteria is best developed on a regional basis through use of available publications (Karr et al. 1986, Ohio EPA 1987, Miller et al. 1988, Steedman 1988; Simon 1991, Lyons 1992a, Simon and Lyons 1995, Hall et al. 1996, Lyons et al. 1996, Roth et al. 1997, Simon 1999). Several steps are common to all regions. The fish species must be listed and assigned to trophic and tolerance guilds. Scoring criteria are developed through use of high quality historical data and data from minimally-impaired regional reference sites. This has been done for much of the country, but continued refinements are expected as more ecological data become available for the fish community.

8.4 TAXONOMIC REFERENCES FOR FISH

The following references are provided as a list of taxonomic references currently being used around the United States for identification of fish. Any of these references cited in the text of this document will also be found in Chapter 11 (Literature Cited).

1.0 INTRODUCTION

Tetra Tech, Inc., was contracted to collect information on the federally-threatened northern long-eared bat (*Myotis septentrionalis*) (NLEB) at Naval Air Station Oceana (NAS Oceana or Installation) located in Virginia Beach, Virginia. The survey concentrated on areas of interest (i.e., areas with height obstructions interfering with the airfield operations) as identified by the Navy (Figure 1-1 and 1-2). In accordance with the work plan (Tetra Tech 2015), the objective of this project was to determine the presence or absence of NLEB following protocols established by the United States Fish and Wildlife Service (USFWS) and detailed in the *Northern Long-Eared Bat Interim Conference and Planning Guidance* (USFWS 2014) and the *2015 Range-Wide Indiana Bat Summer Survey Guidelines (USFWS 2015)*. This survey included presence/absence mist-net field capture and acoustic surveys.

Mist-netting efforts were concentrated in suitable NLEB habitat within the areas of interest and nets were strategically placed in flight paths, often near drinking water, to maximize chances of catching NLEB. Mist-netting allowed both a snapshot of what species, and in what abundance, were utilizing the areas of interest and provided an opportunity to attach radio-transmitters. Species identification through mist-netting is considered more reliable than acoustic recording alone.

If NLEB had been captured, radio telemetry surveys would have been conducted to discover if these bats were using maternity roosts on the Installation. If a roost(s) had been located, data would have been collected to characterize the bats' selected site(s). If roosts had been found, emergence counts would have been performed to detect the presence of maternity colonies. Maternity colonies are of special interest because they must be protected in white-nose syndrome (WNS) areas under the threatened species 4(d) rule (USFWS 2016a). In the absence of NLEB capture, acoustic surveys were performed in suitable NLEB habitat to further detect if NLEB were utilizing the Installation. Information collected on NLEB presence can be used by natural resource managers to make informed land-use decisions on the Installation in areas occupied by this vulnerable species.

2.0 SPECIES BACKGROUND

On April 2, 2015, the USFWS announced that the NLEB was listed as threatened with an interim section 4(d) rule. The intent of the 4(d) rule was to provide the USFWS flexibility in implementing the Endangered Species Act (ESA) by modifying regulations necessary to provide for the conservation of a threatened species while not overburdening private landowners, state agencies, and others with blanket regulations that do not further the conservation of the species. A final 4(d) rule for NLEB was released on January 14, 2016 (USFWS 2016a) and became effective February 16, 2016. USFWS determined that WNS was, and continues to be the primary threat to NLEB. USFWS further determined that regulating other sources of mortality or harm, such as habitat loss, would not effectively conserve the species.

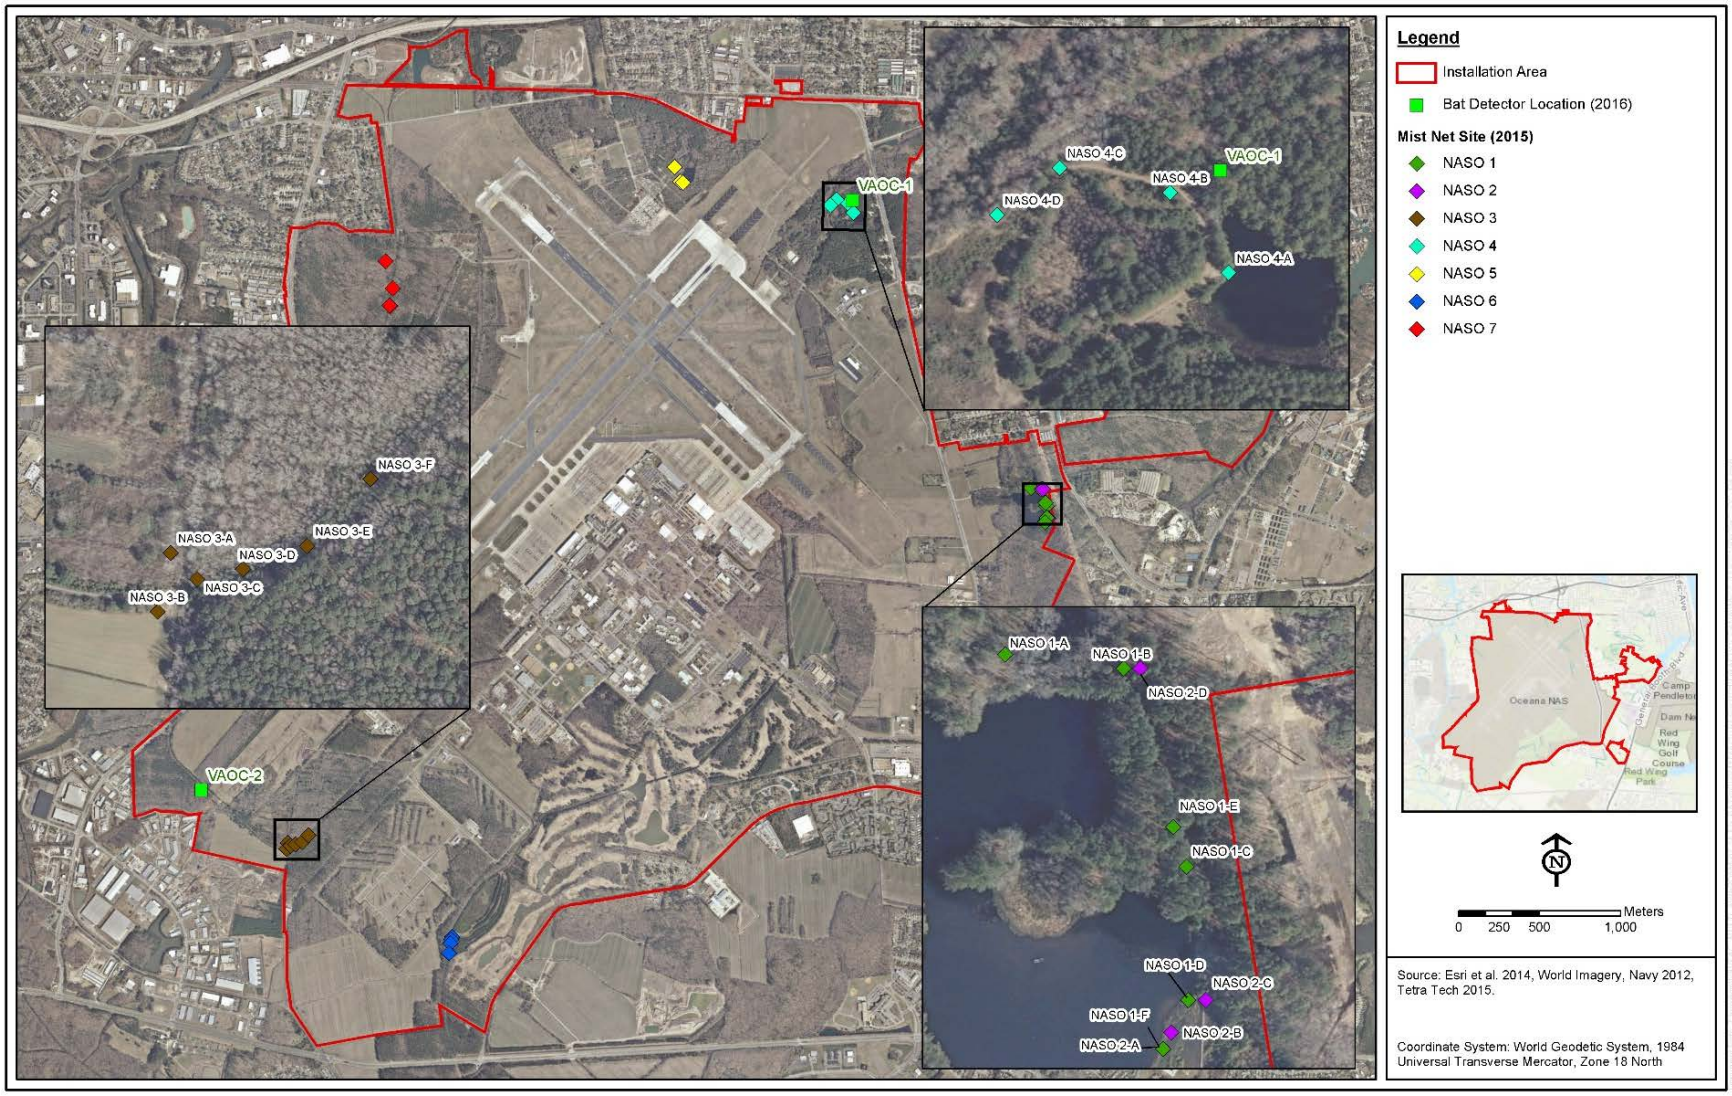

Figure 1-1. Regional Setting and Mist Netting Locations of NAS Oceana, Virginia.

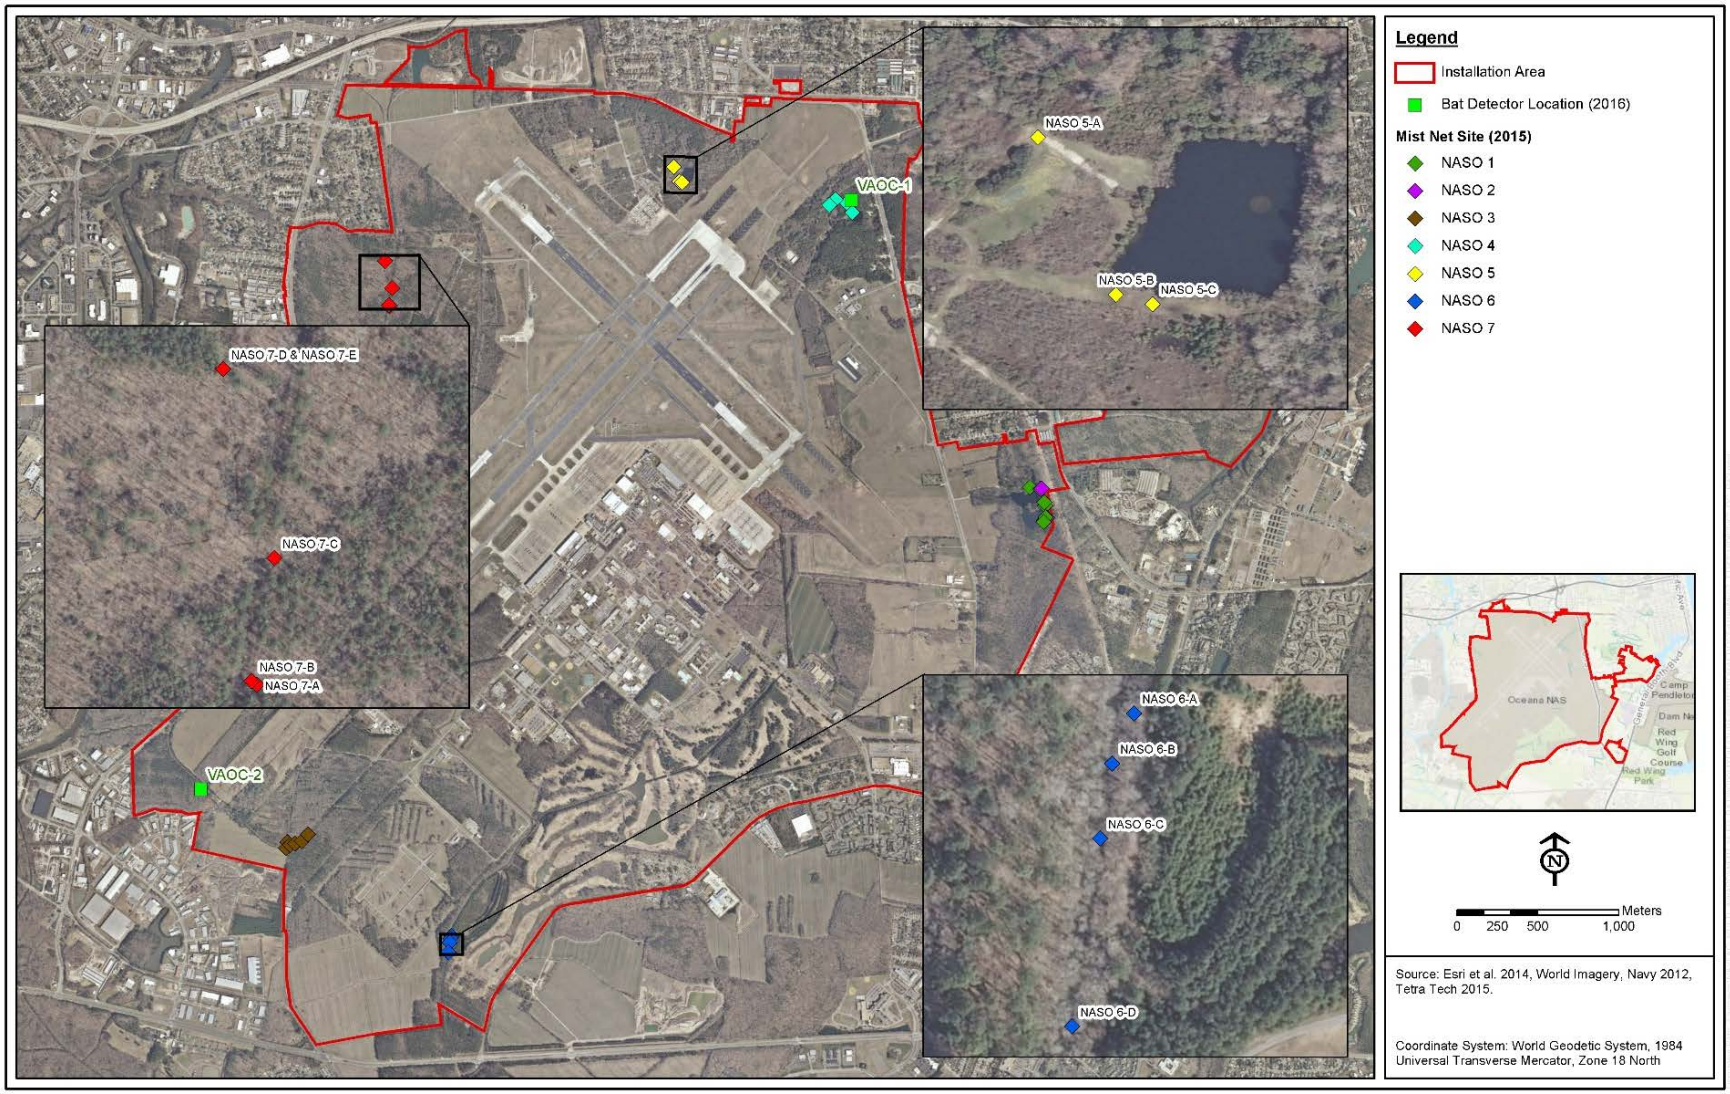

Figure 1-2. Regional Setting and Mist Netting Locations of NAS Oceana, Virginia.

The final 4(d) rule prohibits all *purposeful take*[1] within the range of NLEB except removal of NLEB from human structures, defense of human health (disease monitoring), or removal of hazardous trees for the protection of human life and property. All take incidental to otherwise lawful activities is allowed outside of the WNS zone. The WNS zone includes all counties affected by WNS and an additional 241 kilometer (150-mile) buffer around these counties which includes the Installation (USFWS 2016b). For areas within the WNS zone, *incidental take*[2] is prohibited only if it occurs within a hibernaculum[3], if tree removal activities occur within a 0.4 kilometer (quarter-mile) of a known, occupied hibernaculum at any time of year or within 46 meters (150 feet) of a known, occupied maternity roost tree from June 1 through July 31 (USFWS 2016a). If a federal project may result in prohibited tree removal described above (or if a project is authorized, funded, or permitted by a federal agency), the final 4(d) rule provides a programmatic biological opinion and optional framework for streamlining section 7 consultations. However, the USFWS may advise federal agencies when project level consultation for NLEB is required (USFWS 2016a).

NLEBs occur throughout forested portions of the northeastern United States and in eastern, central, and northern Canada (79 FR 191). Historically, the species was patchily-distributed, and less common in the southern and western portions of its range (Barbour and Davis 1969). Population density seems to have been highest in the northern portion of the species' range, which includes much of the eastern United States (Harvey 1992). NLEB were first documented in Chesapeake, VA in 2013 (Tetra Tech 2015a). NLEB have been captured during subsequent presence/absence mist-net surveys in southeastern Virginia near the Installation. NLEB were captured in 2014 and 2015 at nearby NSAHR Northwest Annex (8 and 11 NLEB respectively) and in 2015 at NALF Fentress (4 NLEB) (Tetra Tech 2014, 2015b, 2015c).

NLEB are an obligate forest-dwelling species, adapted to gleaning and hawking for insects in the sub-canopy in deciduous and mixed forests. Foraging occurs entirely within forested areas but is not restricted to mature forests. NLEB forage primarily below the canopy in the understory, or in sub-canopy shrub layers. Foraging is often concentrated in forested upland areas, but may also occur in forest clearings, above roadways and trails, or near water (79 FR 191). These habitat requirements and behavioral patterns relate directly to the potential for the Installation to support NLEB.

Summer roosts provide NLEB with a thermally-stable environment, as well as protection from the elements and predators (Owen *et al.* 2002). Day roost selection by NLEB is dependent upon

[1] "Purposeful take is when the reason for the activity or action is to conduct some form of take. For instance, conducting a research project that includes collecting and putting bands on bats is a form of purposeful take. Intentionally killing or harming bats is also purposeful take and is prohibited" (USFWS 2016c).
[2] "Incidental take is defined by the Endangered Species Act as take that is incidental to, and not the purpose of the carrying out of an otherwise lawful activity. For example, harvesting trees can kill bats that are roosting in the trees, but the purpose of the activity is not to kill bats" (USFWS 2016c).
[3] NLEB hibernaculum include caves and abandoned mines with constant, cooler temperatures and high humidity in which they spend the winter in a state of metabolic depression (USFWS 2016c).

the presence of suitable live or dead (snag) trees having cavities, crevices, or exfoliating bark for roosting, although man-made structures and caves may also be used for roosting. Throughout their range, NLEB roost in a variety of tree species, using specific trees based on their suitability to retain bark or provide cavities or crevices. Isolated trees may also be used as roosts, provided they are within 1,000 feet of another suitable roost tree or forested area (USFWS 2014). NLEB roost alone or in small maternity colonies and switch roosts often; on average, lactating females appear to switch roosts every two to five days (Menzel *et al.* 2002; Sasse and Perkins 1996).

Two studies conducted in West Virginia identified black locust (*Robinia pseudoacacia*) as a preferred roost tree for both male and female NLEB, although locust roosts accounted for only 34 percent of potential roosts (Ford *et al.* 2006 and Owen *et al.* 2002). A 2003 study of male NLEB day-roost selection in West Virginia identified 13 roosts in black locust (five snags and eight live trees), one roost in sassafras (*Sassafras albidum*) (snag), and two sugar maple (*Acer saccharum*) (live) (Ford *et al*. 2006). All of the live-tree roosts were medium–large, canopy-dominant trees characterized by substantial amounts of exfoliating bark and numerous broken limbs and cavities. Live-tree roosts tended to be larger than other trees in the vicinity. Roosts located in snags were smaller than the live trees and other snags in the vicinity. It is likely that NLEB exhibit a strong preference for selection of roosts within older forest stands that contain many large trees and snags with exfoliating or plate-like bark or cavities (Ford *et al*. 2006).

In southeastern Virginia, near the Installation, NLEB were radio tracked at both NSAHR Northwest Annex and NALF Fentress to roost sites. All known roosts of the three NLEB tracked at NALF Fentress were in red maple trees, predominantly dead (Tetra Tech 2015b). Four NLEB were tracked at NSAHR Northwest Annex in 2014 and 2015 combined. Of the seven known roosts, five were located in living and dead red maples and a single roost each in a live loblolly pine and live sweet gum tree (Tetra Tech 2014, 2015c).

Unlike true long-distance migratory bats (*Lasiurus* spp. and *Lasionycteris* spp.), NLEB do not undertake long-distance migrations between summer and winter ranges, but do make shorter distance movements between summer roosts and winter hibernacula. NLEB arrive at hibernacula in August or September, begin hibernation in October and November, and leave for summer habitats in March or April (79 FR 191). NLEB hibernate in caves and mines, as well as in man-made structures. The species prefers large hibernacula with large entrances and, although NLEB are often found with other *Myotis* species, they prefer cooler temperatures and higher humidity than little brown bats (*Myotis lucifugus*). Individuals may hibernate in cracks and crevices in hibernacula walls, and may be overlooked during winter surveys. The species has also been found in less traditional hibernacula, including dams and dry wells, and may utilize man-made structures more frequently than previously thought, especially in the northeast (USFWS 2013).

Significant decreases in populations of NLEB have occurred over the last five years, primarily as a result of WNS, a fungal pathogen responsible for unprecedented mortality of hibernating bats, with an estimated 5.7 million bats killed since the discovery of WNS in the United States. WNS was first discovered in eastern New York in February 2006 and has now been documented in at

least 19 states and four Canadian provinces. Precipitous declines have been documented for the NLEB and eastern small-footed bats (*Myotis leibii*) over the last three years with an estimated loss greater than 1 million bats. Other threats to NLEB include loss and fragmentation of forested habitat, alteration to traditional hibernacula, and anthropogenic sources of mortality including wind energy facilities (USFWS 2014).

3.0 METHODS

3.1 CAPTURE

Per USFWS guidelines, mist-net surveys were conducted within the 15 May to 15 August 2015 survey window and were completed over five nights from 11 Jun to 15 Jun 2015 for a total of 42 net-nights. The required federal (TE63633A-3) and state collection permits (VADGIF 051933) were obtained by Tetra Tech's subcontractor, Biodiversity Research Institute (BRI), for completion of these tasks (Appendix A). Safety procedures and precautions are outlined in Appendix B. During the five-night survey window, bats were captured at seven locations (Figures 1-1 and 1-2) within the areas of interest. Mist-net survey sites were typically surrounded by mature trees that potentially provide good roosting habitat and a clear path to foraging areas for bats leaving their roosts.

Site NASO 1 was an old road that had been grown over with grass and the species composition was loblolly pine (*Pinus taeda*), sweet gum (*Liquidambar styraciflua*), red maple (*Acer rubrum*), and switch grass (*Panicum virgatum*). NASO 2 nets were located across an old dirt road and on the banks of a pond with loblolly pine, sweet gum, red maple, and switch grass. NASO 3 nets were set across a dirt road and at the edge of a field with loblolly pine, sweet gum, red maple, and yellow poplar (*Liriodendron tulipifera*) trees. NASO 4 nets were spread across a dirt road, an old grassy road, as well as next to a pond with red maple, green ash (*Fraxinus pennsylvanica*), and loblolly pine. NASO 5 nets were spread across a dirt road and on the edge of a field with loblolly pine, sweet gum, and red maple trees. NASO 6 nets were spread across a water-filled drainage ditch with loblolly pine, sweet gum and red maple trees. Finally, NASO 7 nets were spread across a dirt road and in forest openings with swamp chestnut oak (*Quercus michauxii*), cherry bark oak (*Q. pagoda*), summer sweet (*Clethra alnifolia*), swamp dog laurel (*Leucothoe axillaris*), loblolly pine, sweet gum, red maple and greenbrier (*Smilax sp.*). Photos of each net site and surrounding habitat are available in Appendix C.

Two two-person teams, each operating two to three nets, conducted the mist-netting survey and one USFWS-approved biologist monitored all survey activities. A combination of triple-high (three nets stacked upon another, 7.8 meters height), double-high (two nets stacked upon another, 5.2 meters height), and single-high (2.6 meters height) nets were set up each night (Figure 3-1). Depending on the site, nets varied in length from 6 to 12 meters and were positioned to maximize coverage of flight paths, including suitable travel corridors, foraging areas, and/or drinking areas. These areas are of interest since they act as corridors and funnel bats toward the nets. Nets were set at dusk and monitored until at least 00:15 hours, for a minimum of 5 hours. If bats continued to be captured, nets were left up until as late as 01:30 hours.

Bats were live-caught in mist-nets and released unharmed near the point of capture. Nets were checked at 10-minute intervals and processing was completed within 30 minutes from the time the bat was removed from the net. Biological and morphometric data was recorded for each individual captured (e.g., time of capture, capture net, species, sex, age class, reproductive condition, mass, and forearm length) and provided in Appendix D. A juvenile bat is generally considered less than 1 year old and determined through the observation of a long smooth joint demonstrating incomplete epiphyseal ossification (fusion) of the metacarpal-phalangeal joint that are not present in the ossified knobby adult joints. Bats become reproductively active around 1 year old. Each bat was also banded on the forearm with a unique number for later identification. Wing tissue biopsies and swabs were taken from some big brown (*Eptesicus fuscus*) and little brown bats captured to aid in a USFWS funded WNS research project conducted by Stony Brook University and Grand Valley State University. The research description and protocol that was followed is available in Appendix E. Time, weather, global positioning system location of each net site and hourly weather conditions were also recorded. Data was recorded in Chiro (Aquila Services), an iPad application, for ease of tracking and compiling data and to reduce human error. Female NLEB would have been fitted with a radio transmitter, tracked to day roosts, and emergence counts performed if they had been captured.

Caution was taken during mist-net activities to minimize the potential for transmitting WNS by following the most recent decontamination protocols (USFWS 2008). For example, bats were held in paper bags until processed, and holding bags were disposed of after each use. Bats were evaluated for potential WNS infection following the *Wing-Damage Index Used for Characterizing Wing Condition of Bats Affected by White-nose Syndrome* (Reichard, no date).

Figure 3-1. Representative Photos of Net Sites at NAS Oceana, Virginia—2015.

3.2 RADIO-TELEMETRY, HOME RANGE, AND ROOSTS

If captured, female NLEB would have been targeted for attaching transmitters because they form maternity colonies during the summer months (Menzel *et al*. 2002). Male NLEB generally roost solitarily and, therefore, were not a priority for the USFWS from a radio-tracking standpoint. Female NLEB would have been fitted with Advanced Telemetry Solutions (ATS) radio-transmitters (Appendix F). Coordination with Installation tenant commands was required to obtain approval for types of transmitters/receivers and ranges of frequencies that could be utilized on the Installation due to potential conflicts with military communication requirements. The transmitters were the smallest commercially available, weighing only 0.29 grams and representing less than 5 percent of each bat's body mass. Fur would have been removed from between the scapulae and the transmitter would have been attached to the bare skin using Skin Bond surgical cement. The radio transmitter would have been tested for functionality before releasing the bat.

Female NLEB would have been tracked both by vehicle and on foot to facilitate collection of data necessary to determine home range as outlined in the USFWS *Northern Long-Eared Bat Interim Conference and Planning Guidance* (USFWS 2014). Following the night of capture, bat locations would have been identified using the homing technique specified in White and Garrot (1990). ATS R4000 receivers (Advanced Telemetry Systems, Isanti, MN) and Yagi antennas would have been used during radio-tracking efforts (Appendix F). The ATS transmitters have about a 300-meter range of detection. NLEB home ranges would have been estimated using a 3-mile buffer around a capture site if no other information was available for that individual (no radio telemetry), per USFWS guidelines. Home range for NLEB with known capture and roost site information would have been created using a buffer of 1.5 miles surrounding the mapped capture and roost site(s).

NLEB fitted with radio transmitters would have been tracked for six consecutive days post-capture according to the USFWS protocols for identifying roosting sites. If a NLEB roost was found through radio-telemetry, emergence counts would have been conducted using methods outlined in Section 3.3.

3.3 EMERGENCE COUNTS

Roosting sites identified by radio-telemetry would have been monitored for emergence counts following methodologies outlined in the USFWS protocol (USFWS 2014). A minimum of two evening-emergence counts would have been conducted at all roosts located via radio-tracking. A biologist would position themselves at the site of the roost tree around dusk each night (about 30 minutes before sunset) and count the number of bats emerging from the tree until about one hour after sunset or until it was too dark to see emerging bats. The positioning of the biologist(s) conducting the emergence counts would have been in a location suitable for observing emerging bats silhouetted against the sky. Biologists also would have positioned themselves close enough to the roost to observe emerging bats, but not so close as to influence emergence. Therefore, biologists would not have stood directly beneath the roost. Biologists would have minimized

noise and use of artificial light sources (i.e. flashlight) when in the vicinity of the roost. Emergence counts would not have been conducted if during the 30 minutes before and during the observation temperatures were below 50 degrees Fahrenheit, precipitation was occurring for at least 30 minutes or intermittently (including rain or fog), or if wind speeds exceeded 4 meters/second due to reduced activity during these conditions.

3.4 ACOUSTIC SURVEYS

3.4.1 Desktop and Field Habitat Analysis

Prior to conducting field work, a desktop land cover analysis was performed to identify suitable NLEB habitat. Specifically, aerial photography and Google Earth images were reviewed to determine areas that may be used by NLEB for foraging and roosting during the breeding and migration seasons. Determinations were based on forest patch size, proximity to closed-canopy forests, and landscape features that may be used by bats commuting between roosting and foraging habitats (e.g., forested tracts, wetlands, streams). All open water, wetlands, and relatively contiguous forested lands not highly fragmented by residential or commercial developments were considered suitable NLEB habitat, and all densely populated or developed stretches were determined to be unsuitable. The level of effort was determined based on the assumption that suitable habitat within the Installation is non-linear.

Where possible, the following habitat types were targeted in the field in order of descending priority (i.e., detector deployment in openings within interior forests will be prioritized, then within interior closed canopy forests, etc.):

- Interior forest-canopy openings.
- Closed canopy forests.
- Near water sources adjacent to forested habitat.
- Forest edges.
- Linear forested corridors, including corridors connecting forested habitat blocks.

3.4.2 Bat Detectors

Tetra Tech used Wildlife Acoustic Song Meter SM3 Monitoring Systems (bat detectors) for the duration of the acoustic monitoring survey, 6 detector nights from 24 May to 26 May 2016 (Appendix G). The SMM-U1 microphone was attached to the recording unit by a high-quality, low-loss microphone cable. To ensure that the greatest period of bat activity was surveyed, bat detectors were programmed to begin recording one hour before sunset and stop recording approximately one hour after sunrise each day because they were deployed in darker canopied areas.

Two ground-based bat detectors with microphones 1.5 meters from the ground were deployed (Figure 1-1). Sampling locations were based on representative habitats within the Installation, areas with potential for high bat activity, and areas available for access (Figure 3-2). VAOC-1 was

deployed in a small canopy opening (36.832610, -76.013793). The microphone was pointed 140 degrees southeast down a dirt road with semi-closed canopy leading to a pond 40 meters away. The habitat was a mixed forest with pine and oak including black oak (*Quercus velutina*), sweet gum, yellow poplar, wax myrtle (*Morella cerifera*), loblolly pine, and Muscadine grape (*Vitis rotundifolia*). VAOC-2 was located on the northern bank of a small stream closed canopy corridor (36.799427, -76.058382). The microphone was pointed parallel to the stream at 318 degrees northwest. The habitat is mixed forest including loblolly pine, wax myrtle, red maple, sand post oak (*Q. margarettae*), water oak (*Q. nigra*), American sycamore (*Platanus occidentalis*), Muscadine grape, Japanese honeysuckle (*Lonicera japonica*), and sweet gum. Photos of detector locations available in Appendix H.

3.4.3 Bat Pass Analysis

Tetra Tech analyzed the recorded data according to USFWS guidelines (USFWS 2016). First, Tetra Tech used Kaleidoscope Pro v 3.1.4b (Wildlife Acoustics) to convert full spectrum files to zero-crossing using a division ration of 8. Data was then scrubbed to filter noise and analyzed. All recorded data files were filtered to identify data files containing potential bat calls[4] or passes using Kaleidoscope Pro to filter out files without frequencies between 8 and 120 kHz, 2 to 500 millisecond duration, and have a minimum number of pulses of 2. The software analysis, therefore, included only files of suitable quality and duration defined as individual call pulses exhibiting the full spectrum of frequency modulation produced by a bat (i.e. sonogram consisting of sharp, distinct lines) between 8 and 120 kHz with at least two call pulses. The Kaleidoscope classifier was set to include species occurring in or near Virginia Beach, Virginia, and at the "-1 More Sensitive" setting, per USFWS recommendations (USFWS 2015b). This generates a summary of the number of bat passes of each species. Seminole bats (*Lasiurus seminolus*) are acoustically indistinguishable from eastern red bats (*Lasiurus borealis*) and not offered as a classifier within Kaleidoscope Pro. Townsend's big-eared bat (*Corynorhinus townsendii*) and Rafinesque's big-eared bat (*C. rafinesquii*) are also almost identical acoustically, so although Rafinesque's is not a Kaleidoscope Pro classifier, Townsend's is an appropriate proxy and was used as the classifier.

Second, SonoBat 4.0.6 NE (SonoBat, Inc.), with its superior spectrogram platform, was chosen for manual review so classifications could be cross-validated with an additional software program. All passes classified as Myotis were manually reviewed by Tetra Tech in full spectrum format to confirm the automated classifications due to NLEBs status as a federally threatened species. Passes classified as "High Frequency" (frequency center above 40 kHz) or "Low Frequency" (frequency center below 40 kHz) during manual review lacked detail to be identified at the species level (e.g., too far from the microphone or noise interference). Passes that can be identified as a Myotis species, but lacked detail to distinguish species were assigned to the group

[4] Each recorded event including a bat vocalization consists of individual "call pulses" that comprise a "bat call sequence" or "bat passes."

Myotis sp. To positively confirm an NLEB call there must be 3–5 call pulses that exceed 110 kHz that are not broken in the middle or oversaturated. Additionally, Rafinesque's big-eared bat and tri-colored bat (*Perimyotis subflavus*) passes were manually vetted. Results were summarized by site and night.

VAOC-1 VAOC-2

Figure 3-2. Photos of Detector Placement at NAS Oceana, Virginia—2016.

4.0 RESULTS

4.1 CAPTURE

A total of 42 bats representing three species were captured during the 11 June to 15 June 2015, 42-net-night survey conducted within the area of interest at NAS Oceana (Table 4-1, Table 4-2, and Figure 1-1). The majority of bats trapped (81 percent) were big brown bats, eastern red bats (17 percent), and little brown bats (2 percent). One bat escaped before metrics were taken.

All bats processed were adults, of which 73 percent were female and 27 percent were male. Of female bats processed, 77 percent were lactating and 23 percent were non-reproductive. Of male bats processed, 64 percent had descended testes and 36 percent were non-reproductive. No bats exhibited any noticeable wing damage (bats were 0 on Reichard Wind Damage Index).

No NLEB bats were captured during the mist-netting survey and therefore no bats were tagged and tracked to roost sites, and no emergence counts were performed.

4.2 ACOUSTIC SURVEY

During the 2016 survey, six detector-nights were sampled over the course of three calendar nights from 24 May to 26 May 2016 (Table 4-3). Weather conditions during the survey period met requirements outlined in the *2016 Range-wide Indiana Bat Summer Survey Guidelines* available in Appendix I (USFWS 2016). There was no precipitation during the survey period. 24 May nightly temperatures ranged from 72°F at sunset to a low of 68°F with wind speed up to 8 mph, but predominantly calm. 25 May nightly temperatures ranged from 75°F to 67 °F with wind speed up to 10 mph but predominantly under 5 mph. 26 May nightly temperatures ranged from 81°F to 73°F with wind speeds up to 13 mph.

A total of 650 bat calls were detected acoustically including eight species and three groups (Table 4-3). Six bat passes were auto-classified as NLEB by Kaleidoscope Pro, but manual vetting showed that they did not meet the standards to definitively classify the call as NLEB. All Myotis sp. passes were manually reviewed for false negative NLEB passes and to confirm the presence of little brown bats and southeastern bats (*Myotis austroriparius*). Of the nine southeastern myotis recordings, six were confirmed and three lacked enough detail and were designated as Myotis sp.. Of the 50 little brown bat recordings, six were confirmed and the rest were identified as eastern red bats, high frequency, Myotis sp., and southeastern bat passes. Manual review of all Rafinesque's big-eared bat and tri-colored bat passes were determined to be accurate.

Big brown bats were the most commonly recorded (50 percent of the total calls recorded), followed by silver-haired bats (*Lasionycteris noctivagans*) (24 percent), eastern red bats/ Seminole bats (11 percent), hoary bats (*Lasiurus cinereus*) (4 percent), Myotis sp. bats (4 percent). Species with 2 percent or less of the total calls were little brown bats, southeastern bats, Rafinesque's big-eared bats, evening bats (*Nycticeius humeralis*), tri-colored bats, and high frequency bats, (Table 4-3). Eastern red bats and Seminole bats were placed in the same group because their echolocation calls are indistinguishable from each other.

Activity rates were calculated for each detector and for each species by detector by dividing total bat passes by the number of detector nights (Table 4-3). Average activity rates among all detectors was 217 bat passes/detector night, with the highest rate occurring at VAOC-1, 160 bat passes per night compared to only 57 at VAOC-2.

Maximum Likelihood Estimates (MLEs) were significant (suggesting species presence) for big brown bats, silver-haired bats, eastern red bats, hoary bats, little brown bats, southeastern bats, Rafinesque's big-eared bats, and NLEB (Table 4-4). However, manual vetting is more accurate than MLE determinations and is relied upon for final determinations of species presence. Manual vetting of the four tri-colored bat passes suggests presence of tri-colored bats. Although MLE results suggested presence of NLEB, manual vetting showed that these calls were misclassified and NLEB were not detected at the Installation.

Table 4-3. Summary of bat passes and bat activity rate at NAS Oceana, Virginia—2016.

Bat Species	VAOC-1					VAOC-2					Grand Total	Total Passes/ Night
	24-May	25-May	26-May	Total	Passes/ Night	24-May	25-May	26-May	Total	Passes/ Night

Note: Maximum Likelihood Estimate (MELs) interpretation – values <0.05 indicates there is a 95 percent confidence that the species is present. **Bold** value indicates significance.

5.0 DISCUSSION

This survey documented that the federally threatened NLEB was not detected at the Installation through mist-netting or acoustic recording despite mature forest available on the Installation and in limited surrounding areas. NLEB have been previously captured during presence/absence mist-net surveys in southeastern Virginia near the Installation. NLEB were captured in 2014 and 2015 at nearby NSAHR Northwest Annex (8 and 11 NLEB respectively) and in 2015 at NALF Fentress (4 NLEB) (Tetra Tech 2014, 2015b, 2015c). These two Installations have higher connectivity to large contiguous forest tracks likely attractive to NLEB. However, it is possible that NLEB are present on NAS Oceana, but were not captured in mist-nets or recorded acoustically. The acoustic survey performed was very limited in number of nights surveyed and NLEB could have been foraging and roosting in other areas of the Installation during the acoustic surveys as NLEB often switch roosts and move about the landscape. Long-term acoustic surveys (spring, summer, and fall) are recommended to be able to more accurately depict NLEB's possible use of the Installation because there is suitable NLEB habitat on the Installation and they have been captured at nearby Installations.

All bat species are highly dependent on mature forests for foraging and/or roosting and large portions of the Installation's mature forested area is threatened for removal due to Airfield Height Obstruction concerns associated with Aviation Safety Requirements. NAS Oceana is predominantly surrounded by developed residential, commercial and agricultural areas. Further removal of forest around the airfield will significantly reduce the suitable habitat for bats in the area. Long-term acoustic surveys in these obstruction areas could provide insight into the how often bats are utilizing this suitable habitat and specifically if any of the species struggling with WNS, such as Myotis species, are detected in large numbers possibly indicating maternity roosting.

The majority of bats captured in the mist-nets were big brown bats followed by eastern red bats and little brown bats. It is important to employ two survey types because some quiet bats are more likely to be captured in mist-nets and some high flying species are more likely to be detected acoustically. In addition to the three species captured in mist-nets, Rafinesque's big-eared bat, hoary bat, silver-haired bat, southeastern bat, evening bat, and tri-colored bat were acoustically detected on the Installation. Capture data, however, can provide further information about breeding on the Installation. Including all species captured, there were more females (73 percent) than males and most females were lactating (77 percent), suggesting successful breeding of multiple species in the area.

Big brown bats, eastern red bats, silver-haired bats, and hoary bats had either high capture rates or high activity rates in contrast to low detection of Myotis sp. and tri-colored bats, which is typical for this WNS-affected area. Big brown bats are hibernators, which are most affected by WNS. Big brown bats are less affected by WNS than Myotis species, however, possibly because they are larger and thus go into hibernation later and emerge earlier in the season, giving the fungus less time to affect them. Eastern red bats, silver-haired bats, and hoary bats are migratory

and generally do not come into contact with *Pseudogymnoascus destructans* that causes WNS because they are not using hibernacula, which harbors the fungus.

Acoustic survey results did show habitat differences between the two detectors. VAOC-1 was placed near open water and had a higher species diversity with eight species detected and a higher overall activity rate (159 bat passes per detector night). The pond could be the closest large water source for bats inhabiting many different habitats. Bats, particularly reproductive females, spend the day in roosts with high temperatures causing them to lose water during the hot summer months (Johnson and Gates 2008). Species require drinking water to replenish evaporated water in addition to water provided in their insect prey (Hayes 2003). Proximity to water is often associated with better foraging habitat and therefore more frequent bat use (Carter *et al.* 2003, Grindal *et al.* 1999). Therefore, a large water source may have drawn in many different species and at high activity rates.

The forest flyway detector, VAOC-2, detected six species and had only 57 bat passes per detector night. However, this detector had the only detection of little brown bats and higher activity rates of Myotis sp. This detector was placed deeper into the forest within a closed canopy flyway that would attract Myotis species which are highly maneuverable and prefer foraging in the protected forest. This habitat is less likely to attract open area flyers that fly quickly and are less maneuverable such as hoary and silver-haired bats.

6.0 RECOMMENDATIONS

Even though NLEB were not detected in this survey they may occasionally utilize the installation or may not have been detected by the survey and are actually present. Depending on the nature and extent of activities within the areas of interest, there is the potential to directly impact NLEB summer habitat by removing forested areas or potential individual roost trees. Below are several recommendations to protect NLEB habitat as well as suggestions of ways to gain more information about potential NLEB utilization of the Installation.

1) Avoiding activity such as cutting trees during the pup season (01 June–31 July), can prevent NLEB take and curtail adverse effect. However, tree removal is prohibited under the final 4(d) rule only if it occurs within 46 meters (150 feet) of a known maternity roost tree from 1 June through 31 July (USFWS 2016)

2) Make sure snags are left during cutting or, if the area is lacking snags, girdle trees to create snags. Snags can create roosting opportunities like peeling bark and cavities for species such as NLEB. Prescribed fire may also increase the number of snags. Fire also increases the canopy gaps and therefore solar radiation reaching roosts, which can increase maximum roosting temperatures (Johnson et al. 2009). Increased roosting temperatures are associated with rapid development of young (Boyles and Aubrey 2006). However, prescribed fire may reduce roosting opportunities for foliage roosting bats such as hoary bats

3) Construct or place bat houses around the Installation to create roosting habitat

4) Each bat species has a preferred habitat for foraging, so maintaining multiple habitats on base is important. Many species prefer to feed over open water; thus protecting wetlands and both the forest around them and corridors that connect with other forest patches is vital. The larger species prefer to forage in open meadow areas and along forest edges that tend to collect insects. Finally, many species, such as NLEB, prefer to forage in forested areas that tend to be wetter and breed more insects. Forested corridors that connect the forest patches or run along streams is important to provide a sheltered environment that bats can use to move around the landscape.

5) Conduct acoustic monitoring during an entire season, spanning early spring to late fall to:

    a. Determine when bats are arriving and when bats are leaving the base. This will pertain both to bats migrating from distant areas and individuals arriving from local hibernacula. If swarms are detected in late fall they may indicate a hibernacula is nearby.

    b. Provide more opportunities to acoustically detect NLEB. The six detector night presence/absence surveys may not be long enough to accurately assess if NLEB are using the installation. NLEB may not be in the detector areas for those few days.

    c. Better assess how often bats are utilizing the large portions of the Installation's mature forested area that is threatened for removal due to Airfield Height Obstruction concerns associated with Aviation Safety Requirements. In particular, if any of the species struggling with WNS, such as Myotis species, are detected in large numbers that may indicate maternity roosting.

FEDERAL FISH AND WILDLIFE PERMIT

1. PERMITTEE

BIODIVERSITY RESEARCH INSTITUTE
652 MAIN STREET
GORHAM, ME 04038
U.S.A.

2. AUTHORITY-STATUTES
16 USC 1539(a)

REGULATIONS
50 CFR 17.22

50 CFR 13

3. NUMBER
TE63633A-3 AMENDMENT

4. RENEWABLE
☒ YES
☐ NO

5. MAY COPY
☒ YES
☐ NO

6. EFFECTIVE
04/09/2015

7. EXPIRES
04/09/2018

8. NAME AND TITLE OF PRINCIPAL OFFICER *(If #1 is a business)*
DAVID C EVERS
EXECUTIVE DIRECTOR

9. TYPE OF PERMIT
NATIVE ENDANGERED SP. RECOVERY - E WILDLIFE

10. LOCATION WHERE AUTHORIZED ACTIVITY MAY BE CONDUCTED
Alabama, Georgia, Illinois, Indiana, Kentucky, Louisiana, Massachusetts, Minnesota, Mississippi, Missouri, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Virginia, and West Virginia

11. CONDITIONS AND AUTHORIZATIONS

A. GENERAL CONDITIONS SET OUT IN SUBPART D OF 50 CFR 13, AND SPECIFIC CONDITIONS CONTAINED IN FEDERAL REGULATIONS CITED IN BLOCK #2 ABOVE, ARE HEREBY MADE A PART OF THIS PERMIT. ALL ACTIVITIES AUTHORIZED HEREIN MUST BE CARRIED OUT IN ACCORD WITH AND FOR THE PURPOSES DESCRIBED IN THE APPLICATION SUBMITTED. CONTINUED VALIDITY, OR RENEWAL, OF THIS PERMIT IS SUBJECT TO COMPLETE AND TIMELY COMPLIANCE WITH ALL APPLICABLE CONDITIONS, INCLUDING THE FILING OF ALL REQUIRED INFORMATION AND REPORTS.

B. THE VALIDITY OF THIS PERMIT IS ALSO CONDITIONED UPON STRICT OBSERVANCE OF ALL APPLICABLE FOREIGN, STATE, LOCAL, TRIBAL, OR OTHER FEDERAL LAW.

C. VALID FOR USE BY PERMITTEE NAMED ABOVE.

C. 1. Continued: the following individuals are authorized to conduct activities as authorized by this permit: Carl Anderson, Timothy Divoll, Shaylyn Hatch, Dustin Meattey, David Yates, and for Indiana bats only: Jonathan Fiely.

Trained assistants not named on this permit may work on permitted bat activities under the direct and on-site supervision of the individuals named above. However, trained assistants may not work independently at a site. Trained assistants are individuals who are considered qualified by the permitted biologist(s) to select sampling sites, deploy sampling equipment and nets, and handle bats in the field.

D. ACCEPTANCE OF THIS PERMIT SERVES AS EVIDENCE THAT THE PERMITTEE UNDERSTANDS AND AGREES TO ABIDE BY THE TERMS OF THIS PERMIT AND ALL SECTIONS OF TITLE 50 CODE OF FEDERAL REGULATIONS, PARTS 13 AND 17, PERTINENT TO ISSUED PERMITS. SECTION 11 OF THE ENDANGERED SPECIES ACT OF 1973, AS AMENDED, PROVIDES FOR CIVIL AND CRIMINAL PENALTIES FOR FAILURE TO COMPLY WITH PERMIT CONDITIONS.

☒ ADDITIONAL CONDITIONS AND AUTHORIZATIONS ALSO APPLY

12. REPORTING REQUIREMENTS
Annual reports are due by Januaty 31 following each year this permit is in effect

ISSUED BY	TITLE	DATE
Roxanna Hinzman Chief, Division of Environmental Review	CHIEF, DIVISION OF ENVIRONMENTAL REVIEW	04/09/2015

E. PERMITTEE IS AUTHORIZED TO TAKE (ENTER HIBERNACULA OR MATERNITY ROOST CAVES, SALVAGE DEAD BATS, CAPTURE WITH MIST NETS OR HARP TRAPS, HANDLE, IDENTIFY, COLLECT HAIR SAMPLES, BAND, RADIO TAG, LIGHT-TAG, AND WING-PUNCH) INDIANA BATS (Myotis sodalis), GRAY BATS (Myotis grisescens), AND NORTHERN LONG-EARED BATS (Myotis septentrionalis), FOR SCIENTIFIC RESEARCH AIMED AT RECOVERY OF THE SPECIES, SUCH AS: PRESENCE/ABSENCE SURVEYS, STUDIES TO DOCUMENT HABITAT USE, POPULATION MONITORING, AND TO EVALUATE POTENTIAL IMPACTS OF WHITE-NOSE SYNDROME OR OTHER THREATS AS CONDITIONED BELOW.

F. Activities at the following locations require written site-specific approval from the USFWS Field Supervisor in the State(s) where the project will occur (as outlined in Condition G):

F.1. Locations within Region 3 of the USFWS: Illinois, Indiana, Missouri, Minnesota, and Ohio

F.2. Locations within Region 4 of the USFWS: Alabama, Georgia, Kentucky, Mississippi, North Carolina, Louisiana, South Carolina, and Tennessee

F.3. Locations within Region 5 of the USFWS: Massachusetts, New Jersey, New York, Pennsylvania, Virginia and West Virginia

G. Permittee shall notify the USFWS Field Supervisor for the State in which activities are proposed to occur at least 15 days prior to conducting any activities. Contact information is in Condition P., below. Your request for this site-specific approval must be in writing and must indicate:

G.1. The purpose and a description of the activities proposed (e.g., surveys, radio telemetry studies, etc.).

G.2. Location of proposed activities, including project site (legal description and lat/long), county, and state.

G.3. Dates when the project is proposed to take place.

G.4. You may proceed with activities only upon receipt of written concurrence from the applicable USFWS Field Supervisor. *Your concurrence letter must be carried with this permit to authorize site-specific activities.*

H. Permittee shall adhere to the following conditions involving capture and handling of bats:

H.1. Federally listed bats may be captured (e.g., mist-nets and harp traps) following the protocol(s) provided by the USFWS, when available. Permittees must contact the USFWS FO in the State(s) in which activities are proposed to ensure correct protocol(s) are used. For example, the current Range-wide Indiana Bat Summer Survey Guidelines are available at: http://www.fws.gov/midwest/endangered/mammals/inba/inbasummersurveyguidance.html. The monitoring interval for mist nets is once every 10 minutes. Harp traps must be continually monitored.

H.2. Captured bats may be held for a maximum of 30 minutes, unless injured. If an exception is required to this prohibition, permittee must receive prior written approval from the USFWS Field Supervisor for the State in which the activities are proposed to occur.

H.3. Permittees shall carry out non-intrusive measurements on all captured bats. Data shall be recorded for all bats captured and include, but not be limited to, the data requested in any automated or species specific data form provided by the USFWS (e.g., INDIANA BAT SURVEY AND BANDING DATA form). Handling should be limited to the maximum extent practicable and should cease immediately at signs of undue stress (e.g., bat becoming unresponsive, etc.). Bats that appear stressed from handling should be placed in a dark, quiet location away from activity where it can safely fly away after recovery, and should be checked to ensure successful

recovery before leaving the study site. Photographs of the identifying characteristics for each individual federally listed species captured are encouraged. The permittee may be requested to provide individual photographs after submittal of annual reporting data.

H.4. If bands are applied, these must be lipped metal bands having a unique identifier. Bands should be applied to the forearm of captured bats prior to release. No more than one band per bat may be used. Position the band on the wing so that when the bat is hanging upside down, the band numbers are right-side up. A single band should be placed on the right forearm of each male and the left forearm of each female bat.

H.5. Radio transmitters may be applied during spring, summer, and fall roosting and migration periods via nontoxic skin bond adhesive. The total weight of the transmitter may not exceed 5% of the bat's body weight and the total weight of the package (transmitter and adhesive) may not exceed 6% of the bat's body weight. The lightest package (both transmitter and adhesive) capable of accomplishing the required task should be used, especially with pregnant females and newly volant juveniles. Bats carrying transmitters must be monitored daily for at least five days, or until the transmitter falls off, whichever occurs first.

H.6. No capture activities shall occur within 20 meters of a known or potential summer or winter roost site, either natural or artificial, of a federally listed bat. If an exception is required to this prohibition, permittee must receive prior written approval from the USFWS Field Supervisor for the State in which the activities are proposed to occur.

H.7. Permittee may collect dorsal hair samples, wing biopsy tissue samples, fungal lift tape and swab samples from captured bats for scientific study. Hair samples shall be obtained via clipping fur from between scapula from females and juvenile males. The clipped area is the same area frequently clipped for radio transmitter attachment. Wing tissue samples may be taken using a new, sterile biopsy punch (2mm) for each endangered bat sampled. No more than two samples, one from each wing, may be obtained per individual. All boards and equipment used to obtain samples must be disinfected according to the protocol cited in Condition H.9.

H.8. Cyalume light tags may be affixed to the back of unmarked bats during summer roosting period via non-toxic skin bond adhesive to aid in identification of individuals for echolocation recordings. Light tags shall not be affixed to bats carrying radio transmitters. Light tag cannot exceed 2 cm in length or 0.15 g in weight. The light tag must be resistant to tooth puncture and sealed to prevent bats from ingesting cyalume compound. Any light tag that has the potential to expose bats to the cyalume compound is prohibited; the compound is known to be toxic to bats.

H.9. Equipment used to capture and handle bats shall be cleaned and decontaminated, including personal gear such as boots and gloves, using products cited in decontamination guidelines and in compliance with label directions. The most recent decontamination guidance is found on the web at: http://whitenosesyndrome.org/

H.10. Caves, mines, or other suitable hibernation sites may be quietly searched in a manner that minimizes disturbance by utilizing the minimum number of people and time required to complete the survey. Surveys of known hibernacula conducted during the winter hibernation season shall follow the guidelines established in the recovery plans for each federally listed bat species with regards to how often a site may be visited and other species-specific requirements related to entering hibernaculum (for example, for Indiana bats, winter surveys should not be repeated more often than once every other year in any given hibernaculum; for gray bats, winter surveys should not be repeated more often than once every three years in any given hibernaculum), unless authorized by the appropriate Service Recovery Lead identified in Condition O (below).

Under no circumstances should multiple trips to the hibernation area occur within the same year without written approval of the USFWS Field Supervisor for the state in which activities are proposed.

Bats may be handled during winter surveys in order to collect band information and confirm the identification of

listed species. When possible, bands should be read without touching the bat. Banded bats should only be handled if easily accessible and removal of the bat does not disturb a large number of additional bats and is unlikely to result in injury to the bat. Detailed photographs should be taken to document the presence of listed species in previously undocumented hibernaculum. Where hibernacula area and safety conditions allow, individuals entering hibernacula are recommended to utilize night vision goggles or red-filtered light and to remain in the site no more than 90 minutes to complete the work.

H.11. Surveys of gray bat maternity roosts and their other known summer roost sites shall be conducted by observing the bats with night vision equipment and/or infrared light sources (e.g., thermal infrared) as they emerge from their roosts to avoid any possible disturbance to these bats. At previously undocumented sites for these species, the accepted method to determine if they are present is to carefully and slowly enter the potential roost site to check for evidence of presence/use, such as visual observation of bats, significant quantities or a strong smell of guano, or the audible sounds produced by bats roosting at the site. As soon as any evidence is obtained that the roost site is being used by a federally-listed bat species, survey team members shall immediately exit the roost site and make further observations from outside the entrance to the roost. All further observations shall be made from the entrance during the evening emergence.

I. Upon determination that endangered bats are present, permittee shall notify the following offices immediately (not to exceed 1 business day): the appropriate USFWS Regional Office (Condition N.), and the USFWS Field Office within the geographic location of study areas (Condition P.).

J. Permittee must carry a copy of this permit at all times when conducting the authorized activities. Shipments of collected biological materials should also be accompanied by a copy of this permit. NOTE: This permit is limited to the above activities and identified species.

K. Issuance of this permit does not constitute permission to conduct these activities on National Wildlife Refuges or any other public or private lands; such permission must be obtained separately from the appropriate landowner or land manager before beginning these authorized activities. This permit, neither directly nor by implication, grants the right of trespass.

L. Accidental mortality may not exceed one specimen. In the event that an accidental mortality occurs, cease all activities until consulting with the USFWS. Any bat mortality or serious injury must be reported immediately (not to exceed 1 business day) to the applicable office listed in condition N. and to the appropriate Field Office identified in Condition P. The USFWS will work with you to determine the cause of injury or mortality and whether such could be avoided should activities be allowed to proceed. Dead or moribund bats may be retained for further study only with the written permission of the USFWS. Any bats that are not authorized for retention are to be chilled and promptly transferred to the USFWS for potential necropsy and/or for scientific or educational purposes.

Upon locating a dead, injured, or sick bat, or any other threatened or endangered species, under circumstances not addressed in this authorization, initial notification must be made immediately (not to exceed 1 business day) to the appropriate USFWS Office identified in condition N., below, including a description of the circumstances, location information, and photo documentation. Notification should also be made at the same time to the appropriate USFWS Field Office identified in condition P., below. Care should be taken in handling sick, injured, or dead specimens to ensure effective treatment or to preserve biological materials for later analysis. In conjunction with the care of sick or injured threatened or endangered species, and the preservation of biological materials from a dead animal, the permittee should take responsible steps to ensure that the site is not unnecessarily disturbed. Prior to collecting the specimen(s), you must photograph the specimen(s) to document the conditions in which they were found. You may preserve the specimen(s) by freezing them or other suitable method to allow scientific study. Disposition of collected specimen(s) shall be determined by the USFWS Field Office.

M. Reports are due on January 31 following each year this permit is in effect. At a minimum, your report shall include:

M.1. The date, time, geographic locations (including datum and projection information).

M.2. All locations surveyed (regardless of whether federally listed bats were captured/observed).

M.3. Band numbers of all bats banded and all bats recovered/observed.

M.4. Information on any injuries and/or mortalities and disposition of specimens.

M.5. Location and characteristics of roost trees and bat colonies.

M.6. Copies of any separate reports and/or publications resulting from work conducted under the authority of this permit.

M.7. Data shall be submitted for all bats captured and include, but not be limited to, the data requested in any automated or species-specific data form provided by the USFWS (e.g., INDIANA BAT SURVEY AND BANDING DATA forms, the data collection forms found in the current Rangewide Indiana Bat Summer Survey Guidelines cited in Condition H.1., or other species specific forms). Photographs of the identifying characteristics for each individual federally-listed species captured are encouraged. The Permittee may be requested to provide individual photographs after submittal of annual reporting data.

M.8. Copies of all site specific authorization letters required under Condition G.

If no activities occurred over the course of the year, indication of such shall be submitted as an annual report.

N. Copies of your reports shall be sent to the offices listed below. When possible, electronic copies shall be submitted in lieu of hard copies in MS Word, Portable Document Format, Rich Text Format, or other file format that is compatible with the receiving office.

Under Authority of § 29.1-412, § 29.1-417, & § 29.1-418 of the Code of Virginia

Scientific Collection Permit

Permit Type: **New** Fee Paid: **$40.00** VADGIF Permit No. **051933**

Permittee: **Dave Yates**
Address: **Biodiversity Research Institute**
19 Flaggy Meadow Road
Gorham, ME 04038

Office: **(207) 839-7600**
City/County: **Out of State**

Contract Species Surveys

Authorized Collection Methods: Harp Traps for Bats/Terrestrial Mist Nets (Bats/Birds)
Authorized Waterbodies: N/A
Authorized Marking Techniques: N/A

PERMIT AMENDMENT 5/18/2015: This amendment adds the following:
Authorized Subpermittees: Amanda Bailey/Morgan Ingalls/Caroliine Byrnes/Chelsea Vosburgh
Authorized Locations: Naval Properties: Yorktown/Northwest/Norfolk/Oceana/Fentress/Fort Story/Dam Neck/Fort Eustis/Langley

Permittee MUST notify VDGIF a minimum of 7 days prior to each sampling event. Notification must be made via email to: collectionpermits@dgif.virginia.gov

Report Due: 31 January 2015, 31 January 2016

ALL PERMIT REPORTS MUST CONTAIN COORDINATES; PERMITTEE CAN USE THE VIRGINIA FISH AND WILDLIFE INFORMATION SERVICE (VAFWIS) TO OBTAIN COORDINATES BY VISITING: HTTPS://FWISWEB1.DGIF.VIRGINIA.GOV/FWIS/INDEX.HTML

STANDARD CONDITIONS ATTACHED APPLY TO THIS PERMIT.

Authorized Counties / Cities:
York
Norfolk

Authorized Species:

Description	ID Number	Scientific Name
Bats		

Annual Report Due End of Each Year

Authorized Sub-Permittees:
See Attached Sheet

Approved by: *James E. Husband*

Applicants may appeal permit decisions within 60 days of issuance. The appeal must be in writing to the Director, Department of Game and Inland Fisheries.

Title: **James E. Husband - Permits Manager** **Date:** **5/18/2015**

20 Permit Effective **7/28/2014** through **12/31/2015** **15**

PERMITTEE/LICENSEE

DAVID YATES
19 FLAGGY MEADOW RD
GORHAM, ME 04038

PERMIT NUMBER

15-SC00949

EFFECTIVE	EXPIRES
02/10/2015	**12/31/2015**

COUNTY	DISTRICT

This license authorizes the collection of the following species:

Print Date: **02/11/2015**

-Bats

CONDITIONS AND AUTHORIZATIONS

This license authorizes the capture and temporary possession of the listed species.

Methods Authorized: Mist Netting

All species captured must be immediately released unharmed at the site of capture upon completion of data collection.

Must follow all current USFWS white-nose syndrome decontamination protocols and advisories and adhere to the North Carolina White-Nose Syndrome Surveillance and Response Plan.

Must coordinate with the appropriate Wildlife Diversity Biologist at least 48 hours prior to collecting activity commencing.

The licensee must maintain a copy of this license in their possession at all times during authorized collection activities.

Issuance of this license does not constitute permission to conduct collection activities on any public or private lands; such permission must be obtained separately from the appropriate landowner or land manager before beginning authorized collection activities.

This license neither directly nor by implication grants right of trespass.

A complete report is due at the time of renewal to be eligible for renewal. The report must be submitted through the online reporting system (https://ncpaws.org/paws/). Failure to submit the report may result in the license not being renewed.

Collection Location Authorized: STATEWIDE

This permit/license is non-transferable and expires at midnight on the above specified expiration date.

ISSUED BY: Daron K. Barnes

TITLE: **Permits Supervisor**

DAVID YATES

719 Moosehead Lake Rd
Greenville, ME 04441
(207) 491-4707

EDUCATION:

Bachelor of Science, Wildlife Biology and Management
Unity College, Unity, ME
Graduated May 1999

M.Sc., Conservation Biology
Antioch University New England
Graduated May 2006

SKILLS:

- Proficient in animal tagging and release methods
- Ability to identify bats of N. and C. America in and QIBS by USFWS and PA State
- HERO training
- Collected and prepared blood samples for contaminant analyses.
- Current DEA drug license
- Analyzed water quality of ponds, rivers and streams
- Experience using tranquilizers/sedatives
- B3 and HUET certificates for low level flights
- HAZWOPR training
- Trained in CPR and First Aid

EXPERIENCE:

Biodiversity Research Institute – *Research Biologist/Mammal Director*, Gorham, ME January 1998 -present

- Certified Indiana Bat Identifier for the state of PA and USFWS
- Project Manager for Acadia National Park bat survey and tracking study
- Project manager and conducted bat surveys for US Navy in VA and NJ
- Lead Biologist Indiana bat surveys for Gas fracking and pipelines in PA
- Project Manager/Lead Biologist for Maine IF&W Eco-region Surveys for bats for 5 years
- Project Manager/Lead Biologists for bat mercury studies at superfund sites from VA to Maine involving U.S.F.&W.S.
- Project Manager/Lead Biologist at 4 U.S. Fish and Wildlife NRDAR sites for bats and furbearers
- Project Manager bat surveys at multiple National Wildlife Refuges in the northeast
- Telemetry Coordinator Gulf Oil Spill Project for USFWS NRDAR bird injury assessment
- Developed Scope of Work for USFWS NRDAR Gulf Oil Spill bird injury assessment
- Coordinated aerial and ground tracking of more than 400 birds using multiple airplanes and satellite technology
- Project Manager/Lead Biologist for FPL Maine Hydro. Beaver, muskrat, otter, and mink telemetry study
- Project Manager/Lead Biologist for live trapping mink and otter study in Maine for state DEP (Master's thesis)
- Project Manager/Lead Biologist for live trapping mink and otter study in Massachusetts for EPA and other superfund studies
- Project Manager for Maine IF&W Ecoregion for three areas in Maine, birds and small mammals
- Project Manager for common loon monitoring in northern and western Maine
- Project Manager/Lead Biologist for National Park Service survey of small and large mammals of Appalachian Trail in Maine
- Winter large carnivore tracking surveys for NPS and private landowner
- Administered schedule III drugs for mink and otter study (Ketemine & Metetomidine)
- DEA Schedule II-III license
- Researched recent trends of mercury and lead contaminants in the North American piscivorous bird's mammals.
- Captured, banded and gathered mercury and lead level data in piscivorous birds.
- Entered banding data into database for Biodiversity Research Institute data analysis.
- Compiled banding data into official banding schedules for U.S. Fish & Wildlife Services.
- Supervised banding of Common Loons, Eagles, Kingfishers and various other species.
- Surveyed reservoirs and lakes for Common Loons, Kingfishers and other piscivorous birds.
- Presented Mammal, Bat and Common Loon slide show to various organizations for educational purposes
- Wrote reports for Loon productivity on Reservoirs for state and private agencies.
- Proposed, designed and organized a mink and otter study for Maine Department of Environmental Protection.

(802) 254-2988
morgan.ingalls@briloon.org

Education:

Antioch University New England
Keene, NH
Master of Science in Environmental Studies/Conservation Biology, 2014
Thesis Title: *Estimating Little Brown Bat Winter Mortality Rates from White-Nose Syndrome at Aeolus Cave in Dorset, Vermont using PIT Tag Technology*

Marlboro College
Marlboro, VT
Bachelor of Science in Biochemistry, 2010
Thesis Title: *Mysterious Mortalities: A study of White-Nose Syndrome and G. destructans from a molecular biology perspective*

Skill Sets:

- ***Supervisory Skills:*** Teaching and overseeing others in both laboratory and field settings
- ***Animal Handling Skills:*** Removal of bats from net; Species identification and biometrics; Attachment of bands; Collection of blood samples, wing punches, hair samples, etc.
- ***Radio Telemetry Skills:*** Attachment of radio transmitters to animals; Programming of receivers; Interpretation of radio telemetry signals in difficult terrain
- ***Data Management and Analysis Skills:*** Appropriate use of statistical tests; Large data set management; Geographical Information Systems; Laboratory analysis of molecular products
- ***Project Design Skills:*** Co-designed study investigating RNA regulation in cells exposed to *Pseudogymnoascus destructans*; Co-designed study to assess over-winter survivorship of Little Brown bats at Vermont's largest hibernaculum
- ***Leadership Skills:*** Group management and logistics; Collaborative planning; Communication
- ***Caving and Outdoor Skills:*** National Cave Rescue Commission Level 1 Certification; Six years of caving experience; Familiarity with single rope technique
- ***Computer Skills:*** Familiarity with Microsoft Office, ArcGIS, JMP, and Sonobat

Relevant Work Experience:

Wildlife Biologist May 2015 - Present
Biodiversity Research Institute
Portland, ME

- Oversee field staff
- Supervise and participate in live capture of bats
- Supervise and participate in radio tracking of bats
- Analyze data and write/contribute to reports

Bat Technician July 2014 – October 2014
Biodiversity Research Institute
Portland, ME

- Set up and broke down mist-nets, removed bats from nets
- Species ID and biometrics, attachment of radio transmitters to animals
- Used radio telemetry to determine day roosts and foraging areas for target species
- Managed the data that was gathered from the project

Intern Summer 2012 – Summer 2013
Biodiversity Research Institute
Portland, ME

- Participated in several bat banding projects at Great Bay NWR, Parker River NWR, and Acadia National Park
- Identified bats by species, determined sex, age, and reproductive status, and measured hind foot, ear, tragus, and forearm
- Used radio telemetry to determine day roosts of *Myotis leibii* and *Myotis septentrionalis*
- Analysis and writing of report

Volunteer Winter 2010, 2011, & 2014
New York Department of Environmental Conservation
Albany, NY

- Helped conduct bat counts in Merlin's Cave, Dragon Bones Cave, Surprise Cave, and Haile's Cave

Volunteer Winter 2009, 2010, 2011, & 2014
Massachusetts Division of Fisheries and Wildlife
Dalton, MA

- Helped conduct bat counts in Bat's Den, Crystal Pool, and Red Bat Caves

Freshman Orientation Program Trip Leader Fall 2008, 2009, & 2010
Marlboro College
Marlboro, VT

- Designed and co-led six to nine day wilderness trips for six to eight incoming students
- Took part in extensive leadership and logistics training prior to running trips
- Led or co-led day long caving trips for students during the school year

Laboratory Assistant Fall 2008 – Summer 2010
Marlboro College
Marlboro, VT

- Helped with chemical inventory and organization of MSDS
- Assisted with general laboratory organization and upkeep
- Assisted with preparation and running of General Biology Laboratory and General Chemistry Laboratory
- Helped to implement changes to laboratory safety procedures

Research Assistant to Prof. Todd Smith, PhD. Summer 2008 & Summer 2010
Marlboro College
Marlboro, VT

- Research on anti-freeze glycoprotiens in Atlantic Cod
- Analyzed cod serum samples using SDS-PAGE
- Quantified samples using a BSA protein assay

Office Manager and Production Coordinator 2007 – 2008
Yellow Barn Music School & Festival
Putney, VT

- Processed and organized student applications
- Organized and implemented mailings
- Organized audio archives

APPENDIX B

SAFETY PLANS

This page intentionally left blank.

Unfortunately, not many health care providers are accustomed to dealing with rabies exposures in individuals who have the pre-exposure vaccination. We recommend you bring the following table with you if you need to seek treatment.

Table 1. Rabies post-exposure prophylaxis schedule – United States, 2008 (CDC 2008, 2010)

Vaccination Status	Treatment	Regime*
Not previously vaccinated	Wound cleansing	All post-exposure prophylaxis should begin with immediate thorough cleansing of all wounds with soap and water. If available, a virucidal agent such as povidine-iodine solution should be used to irrigate the wounds.
	Rabies immune globulin (RIG)	Administer 20 IU/kg body weight. If anatomically feasible, the full dose should be infiltrated around the wound(s) and any remaining volume should be administered intramuscularly (IM) at an anatomical site distant from the vaccine administration. Also, RIG should not be administered in the same syringe as the vaccine. Because RIG might partially suppress active production of antibody, no more than the recommended does should be given.
	Vaccine	Human diploid cell vaccine (HDCV) or purified chick embryo cell vaccine (PCECV) 1.0 mL, IM (deltoid area[§]), on each day of days 0[¶], 3, 7, 14, and 29.
Previously vaccinated **	Wound cleansing	All post-exposure prophylaxis should begin with immediate thorough cleansing of all wounds with soap and water. If available, a virucidal agent such as providine-iodine solution should be used to irrigate the wounds.
	RIG	RIG should not be administered.
	Vaccine	HDCV or PCECV 1.0 mL, IM (deltoid area[§]), one each on days 0[¶]and 3.

* These regimes are applicable for all age groups, including children.
** Any person with a history of a complete pre-exposure or post-exposure vaccination regime w/HDCV, PCECV, or rabies vaccine adsorbed, or previously vaccination with any other type of rabies vaccine and a documented history of antibody response to the prior vaccination.
§ The deltoid area is the only acceptable site of vaccination for adults and older children. For younger children, the outer aspect of the thigh can be used. Vaccine should never be administered in the gluteal area.
¶ Day 0 is the day the first dose of the vaccine is administered.

RABIES SPECIMEN SUBMISSION

General Information

The purpose of this appendix is to provide BRI field staff with a guideline of how to prepare and ship a suspected rabies specimen to a local laboratory for testing. Each laboratory and/or state is likely to have specific protocols, which can be addressed by asking the following questions.

- Normal business hours
- Telephone number
- Do they use a specific courier

It is extremely unlikely that a live animal will be accepted by the laboratory.

Necropsy

- The animal should be humanely euthanized without damage to the head.
    - Exception: if the suspected animal is a listed species.
        - Call the nearest U.S. Fish and Wildlife Service office.
        - Turn the LIVE animal over to them for handling.
    - Only BRI employees experienced with this procedure should perform euthanasia.
        - Contact your supervisor if you need help.
- The head must be removed from the body and submitted intact for necropsy.
    - Exception: entire body of small mammals, such as bats, mice, and squirrels may be submitted as whole carcasses for testing.

Packaging and Shipping

- A laboratory submission form may be required – ask.
    - Fill it out completely.
    - Make a copy or scan the form for BRI's records.
- All materials collected for rabies diagnosis are considered to be infectious.
    - Appropriate handling and shipping precautions should be taken in order to ensure the safety of the collector/submitter, transportation carriers, laboratory staff and the public at large in accordance with 49 CFR Department of Transportation Regulations.
- Submit specimens to the laboratory promptly and cold to reduce decomposition of the animal.
    - Use frozen cold packs only.
    - Do not use "wet" ice as it may leak through the container; leaking containers are often rejected.
    - DO NOT FREEZE the specimen as this will delay the testing and possibly alter the results.
- All specimens should be sprayed or dusted for fleas and ticks with a pesticide before packaging.
- Wear disposable gloves while packaging a rabies sample.
- Clearly label the sample with:
    - Health Department or Animal Control internal tracking number (if provided)
    - Animal Species
- Triple package the specimen:
    - Primary Container
        - Ziploc bag or heavy-duty garbage bag appropriately sized for the specimen with an absorbent material (absorbent pads, paper towels, etc.) placed in the bag to prevent blood and body fluid from leaking.

- If sharp objects protrude from the specimen, such as a shattered bone, wrap the specimen in several layers of newspaper.
- Always tightly seal or fasten the primary container to contain the specimen.
- Label this container.

- Secondary Container
  - Use a metal can, heavy plastic pail with a lid or a heavy-duty plastic garbage bag as the secondary container.
  - Seal secondary container to help prevent leakage of blood or body fluid.
  - Label this container.
- Rigid Outer Shipping Container
  - Use a cooler or thick-walled Styrofoam container with or without an exterior fiber board liner.
  - "Rabies" should be clearly labeled with permanent marker.
  - Place the secondary container inside the shipping container with sufficient frozen cool packs and cushion materials to prevent damage to the specimen during transport.
  - Clean the outside of the Outer Shipping Container with a disinfectant
  - 10% bleach (9 parts water, 2 parts household bleach)
  - Secure the lid of the container (tape) for transport
  - Place the address on the container

WNS RESEARCH DESCRIPTION AND PROTOCOL

This page intentionally left blank.

WHITE-NOSE SYNDROME RESEARCH GROUP
FUNDED THROUGH THE
US FISH AND WILDLIFE SERVICE
REQUESTS YOUR ASSISTANCE

In 2014, our research group (Stony Brook University, NY and Grand Valley State University, MI) secured an award through the USFWS to conduct white-nose syndrome (WNS) research that will help describe the nature of remnant populations in the WNS-affected region and investigate a potential mitigation for controlling the spread of WNS. To meet the goals of this important work we must include samples from bats captured in any state east of the Rocky Mountains. We have been working with many researchers across state, federal, consulting, and non-profit agencies and from academic institutions to acquire the necessary samples for this study, but we seek additional assistance to complete our collections in 2015. We only request assistance from researchers already conducting planned surveys or other projects in the field during the active season of 2015, and for whom the collection of wing biopsies from bats is already permitted. From any participant, we request that wing tissue biopsies be collected from active season bats and from up to 10 individuals of each of the species included in our study that you encounter and are permitted to handle and collect samples from (Species included: *Corynorhinus townsendii virginianus*, *Eptesicus fuscus, Myotis austroriparius*, *M. grisescens*, and *M. lucifugus*). If you are interested in participating in this study, we will provide all necessary supplies required for the tissue collections and will pay for you to return the samples. Below is a more detailed summary of our project goals should you be interested in reading further. Please contact Marianne Moore (marianne.moore@stonybrook.edu) if you are interested in participating and/or have questions.

We sincerely thank you for considering our request.

PROJECT TITLE: Uncovering skin immune proteins as predictors of resistance against WNS

Objectives: Our central aim is to test the hypothesis that the composition of bat skin immune proteins predicts resistance to white-nose syndrome (WNS) within and among species. Our goal is to discover the mechanisms underlying the survival of remnant populations in the WNS-affected area. To this end, we will characterize the diversity and relative abundance of skin immune proteins of five bat species that vary in observed rates of WNS-associated mortality, including the little brown myotis (*Myotis lucifugus*), big brown bat (*Eptesicus fuscus*), southeastern myotis (*M. austroriparius*), gray bat (*M. grisescens*), and Virginia (VA) big-eared bat (*Corynorhinus townsendii virginianus*). We will use high throughput protein sequencing (proteomics) to isolate, identify, and quantify skin immune proteins. Proteomic repertoires will then be compared across species to test the prediction that certain proteins related to anti-fungal responses are more prevalent in species that appear to suffer less from the effects of WNS, such as the gray bat and the VA big-eared bat. The little brown myotis and big brown bat will be more extensively sampled both within and outside of the WNS-affected area and their protein profiles will be compared across sites to test the prediction that proteins prevalent in survivors of more highly susceptible species are similar to those found in resistant species. Microsatellite genotyping will also be used to quantify levels of relatedness among sampled individuals, and this will allow for functional and adaptive similarity in immunological proteins to be differentiated from similarity due to common descent. We will focus on a set of proteins known as antimicrobial peptides (AMPs), which are known to kill or inhibit the growth of invading microorganisms such as fungi, but our analyses will also capture all other skin immune proteins. Our secondary aim is to investigate the potential for using host derived anti-fungal AMPs to mitigate WNS. To this end, we will select AMPs identified in resistant species, and in surviving populations of susceptible species, and will use growth-inhibition assays with cultured *Pseudogymnoascus destructans* (*Pd*) to test the ability of AMPs to kill the WNS etiologic agent.

Strengths: We focus on the skin because *Pd* invades and destroys this organ. Effective immune responses against *Pd* must be initiated in this organ. AMPs have been selected as a primary focus because, unlike effectors of the adaptive immune system, they are constitutively expressed and likely to remain functional during hibernation. Many AMPs also have direct anti-fungal properties. These peptides are associated with resistance to chytridiomycosis in amphibians and have shown therapeutic potential against human fungal skin infections. Proteomics provides an efficient method to identify all expressed proteins in skin including those that are unique to a population and/or species. By genotyping all individuals, we will be able to account for genetic relatedness when modeling the effect of the proteomic composition of the skin on survivorship. We will use a relatively non-invasive method of tissue sample collection (i.e., small wing biopsies) that will allow us to study the endangered gray and VA big-eared bats, which may provide important clues to the nature of remnant populations, but cannot be studied using the invasive methods often required for immunological studies. Furthermore, biopsies will be collected during the active season when wound healing is maximal and can be collected by other researchers in combination with sampling for other studies. This approach will protect sensitive hibernating populations, significantly reduce the total number of bats handled, and make the proposed fieldwork more cost-efficient. Our team is particularly well equipped to conduct this study. Previous research by PI Moore demonstrated that the little brown myotis attempts immunological resistance against *Pd* and that big brown bats are relatively more resistant to infection by *Pd* compared to little brown myotis. Co-PI Russell has demonstrated that a small number of microsatellite markers can successfully characterize the variation of populations of the little brown myotis. Finally, co-PI Dávalos has demonstrated the use of proteomics with very small starting samples and its application to uncovering immune responses in mammals.

Implications for Management: This study will directly relate to priorities identified in the WNS National Plan by (1) improving our understanding of why some species succumb to the disease while other appear completely resistant to the effects of WNS, and (2) by investigating anti-fungal skin proteins as a potential control method. Our approach will provide the perfect synergy between research and management since our findings will elucidate mechanisms underlying the differential impacts of WNS within and between species and help direct management efforts, while at the same time investigating a potential mitigation strategy to directly control the effects and spread of this devastating disease.

Sample Collection Protocol
Moore/Dávalos/Russell -- WNS Skin Immune Protein Study – 2014 (revised 25 July 2014)

This protocol describes steps for collecting samples that will be used in our investigation into how skin immune proteins may confer resistance to WNS in relatively resistant species (e.g. *Myotis grisescens*) and in some individuals of highly susceptible species (e.g. *Myotis lucifugus*). Please refer to our proposal or ask Marianne for details on study goals and species included. We are extremely grateful for your participation in helping us acquire the appropriate samples for this study and welcome feedback based on your experience in the field. Thank you!

Please direct any questions to Marianne at:
Email – marianne.moore@stonybrook.edu
Cell Phone – 617-259-0349
Office Phone – 631-632-1530

Once a bat is in hand, all supplies necessary for this collection protocol are provided, including:

- vials in Ziploc bags labeled with sample type and vial contents
  - -blue silica gel beads for wing biopsies
  - -RNALater for wing swab
- vial box
- sample identification labels
- nitrile gloves (S, M, L, XL)
- sterile water in 50mL conical vial labeled “Dipping Vial”
- sterile alcohol preps
- paper towels soaked in Envirocide
- Lysol wipes
- paper towels
- applicator swabs
- biopsy punches (2mm and 3mm)
- cutting surface (stainless steel sheet)
- tweezers
- Scotch tape
- protocol, data sheets (2 types with layouts for each sample category) & labels
- sharpie & pencil

There will be two categories of bats sampled for this study:

One category is bats sampled for genotyping only, and in this case you should follow instructions in (1). These samples can be collected from adults or juveniles.

The second category is bats sampled for qPCR, proteomes and genotyping simultaneously, and in this case you should follow instructions in (2) and (3). Samples in this group should be collected from **adults** with intact, non-damaged, wing membranes with no scarring.

Approximate numbers of each type of sample to be collected by your group should be determined with Marianne prior to your field trip.

For all bats sampled, fill out all available life history data requested in data sheet.

Wear nitrile gloves for each type of collection. You can wear a handling glove on one hand and nitrile on another, or preferably, have one person holding bat with handling gloves and another person wearing nitrile gloves collecting tissues. Change gloves between each bat sampled.

"GENOTYPE ONLY" SAMPLING:

(1) *Tissue Biopsy Collection for Genotyping*

****If you are sampling a bat for genotyping only (most of our samples fall into this category), this is the only sample type that needs to be collected from that individual.*

1- Prepare and clean cutting surface using alcohol prep.
2- Remove 1.8mL storage tube with blue silica gel beads from Ziploc bag and label with unique ID tag. Cover ID with Scotch tape. Vial should be ½ to ¾ full of silica gel beads and have a small piece of Kim Wipe at the top. Silica gel beads should be bright blue. If one or several beads are violet, it is ok to continue using this vial, however if most or all of the beads are violet, discard and use another vial with bright blue beads.
3- Place the matching label (there are duplicates of each) on data sheet in the row corresponding to this bat.
4- Clean ventral and dorsal sides of one wing membrane using a sterile alcohol prep. Clean on and around the area to be biopsied and allowing ethanol to evaporate from the wing.
5- Open package containing sterile 3mm biopsy punch.
6- Gently extend wing so that membrane is taut and place wing surface directly on stainless steel cutting surface.
7- Collect biopsy of wing membrane using 3mm biopsy punch. Biopsy collection should be located in the plagiopatagium away from the edge of the wing and between large muscle/elastic fibers (visible network appearing as crossed lines throughout wing). Avoid collecting biopsies across blood vessels. See white circle in Figure 1 A for suggested placement of single biopsy.
8- Use tweezers to retrieve biopsy from cutting surface, or possibly from inside of punch.
9- Insert tissue sample into uniquely labeled vial by setting it carefully inside of Kim Wipe using tweezers; screw cap on tightly.
10- Put vial into storage box.
11- Record life history data.
12- Dispose of biopsy punch after sampling each bat. An empty water bottle makes a good field sharps container. Dispose of contents safely in your institutional sharps disposal.

"PROTEIN, GENOTYPE, qPCR" SAMPLING:
(2) *qPCR Swab to Identify Presence of PD DNA*

****You only need to swab bats that are going to be sampled for proteomes.*

As soon as a bat is in hand and with as little handling as possible:

1- Remove 1.8mL storage tube labeled "Swab" from Ziploc bag and label with unique ID tag. Cover label with Scotch tape.
2- Place the matching label on the data sheet in the "qPCR ID #" field corresponding to this bat.
3- Remove swab from sterile packaging.
4- Dip swab in sterile water to moisten tip using water in vial labeled "Dipping Vial".
5- Firmly rub the swab 10 times across the ventral side of one wing membrane (back/forth=1x) twirling the swab as you move it across the membrane.
6- Repeat the procedure on the dorsal side of the same membrane and on each side of the other wing. (You will use only one swab for this whole process.)
7- Insert swab head into "Swab" vial. Break applicator handle off so that only the polyester tip remains in the vial. Close and tightly lock lid.
8- Place vial in storage box.

(3) *Tissue Biopsy Collection for Proteomics & Genotyping*

****Make sure to swab bat for qPCR before collecting biopsies.*

1- Remove four 1.8mL storage tubes with blue silica gel beads from Ziploc bag and label each with unique ID tags.
2- Place the matching labels on data sheet in the "Biopsy ID #" fields corresponding to this bat.
3- Prepare and clean cutting surface using Envirocide-soaked paper towel.
4- Clean ventral and dorsal sides of one wing membrane using a sterile alcohol prep. Clean on and around the area to be biopsied and allowing ethanol to evaporate from the wing.
5- Open package containing sterile 2mm biopsy punch.
6- Gently extend wing so that membrane is taut and place wing surface directly on cutting surface.
7- Locate an area of wing where tissues appear intact, not damaged, not inflamed and not scarred. Collect 4 biopsies using 2mm biopsy punch. Locate the biopsy collections in plagiopatagium, space biopsies apart by at least ~3cm and locate away from edge of wing. Biopsies can be collected across both wings. See white circles in Figure 1 B for suggested placement of biopsies in the case that multiple biopsies are collected from a single wing.
8- Individually retrieve biopsies with tweezers, place each one in a separate uniquely labeled vial; use tweezers to carefully place biopsies inside pieces of Kim Wipe. Screw caps on tightly.
9- Put vials into storage box.
10- Fill out life history data for individual sampled.
11- Dispose of biopsy punch after sampling each bat.

(4) *Storage and Shipment Procedures*

1- Label the top of each storage box with:
   Site name
   Collector's name and contact info
   Number of bats sampled for genotyping only
   Number of bats sampled for proteomics/qPCR/genotyping
   Range of unique IDs contained within (e.g. SIP_NY_a_001-030)
2- Store biopsy samples in Ziploc bag at ambient conditions.
3- Store box with swab samples in a refrigerator until shipment.
4- Return biopsy samples to box prior to shipment.
5- Place box in 2 Ziploc bags (double bagged).
6- Samples can be sent at ambient temperatures using 2nd day delivery to:
   Marianne Moore
   Department of Ecology and Evolution
   Stony Brook University
   650 Life Sciences Building
   Stony Brook, NY 11794-5245
7- Use our UPS shipping account: F0767F
8- Please return data sheets and any unused supplies in package with collected samples.

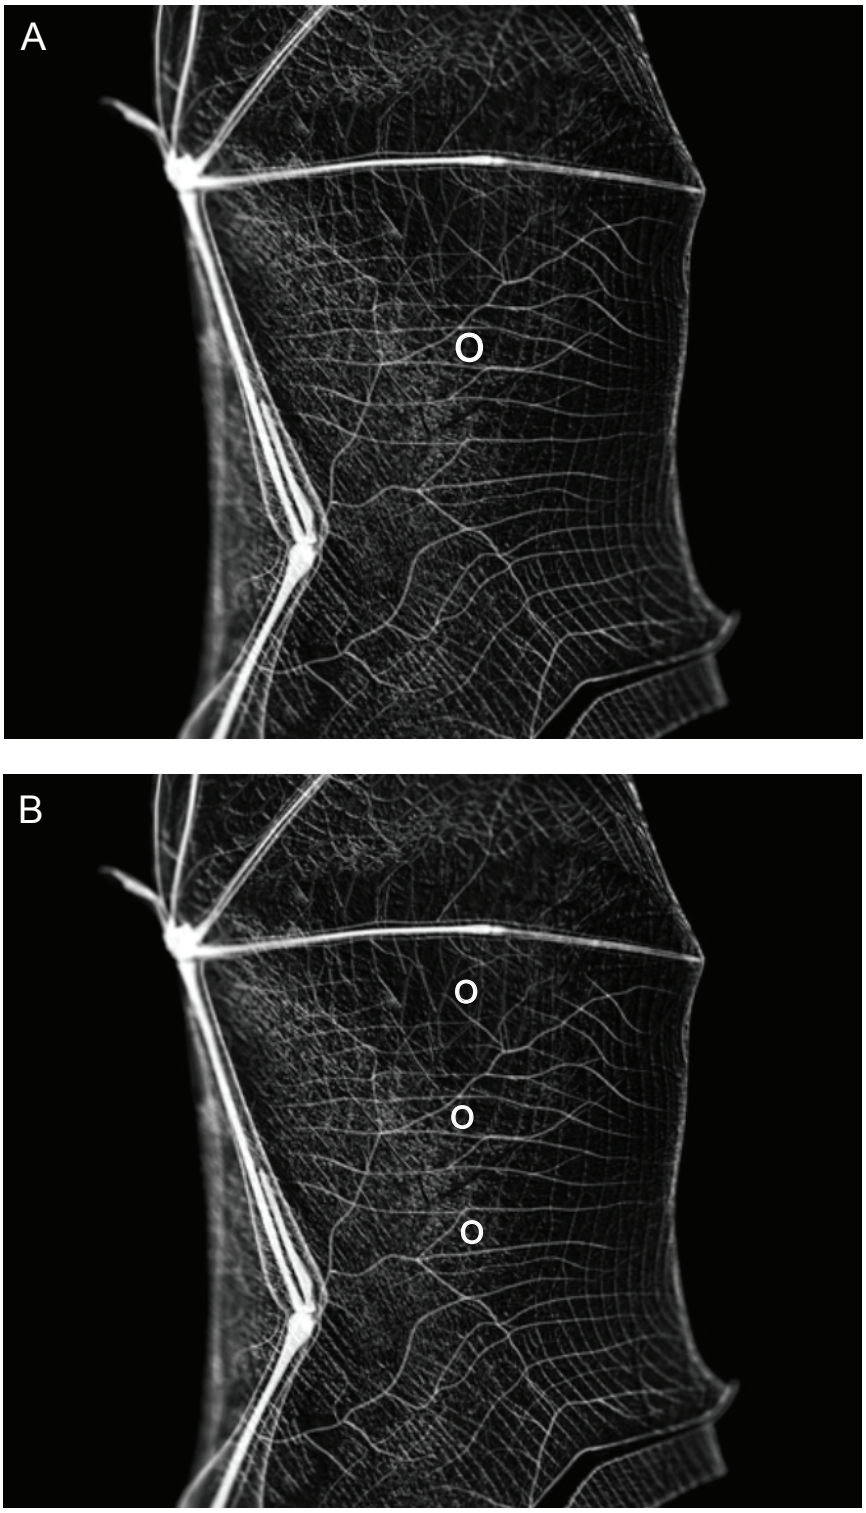

Fig 1. Bat wing membrane showing placement of biopsies in the plagiopatagium as indicated by white circles. A. Suggested location when collecting one 3mm biopsy. B. Suggested locations when collecting multiple 2mm biopsies from one wing. White lines in membrane are visible muscle and elastic fiber bundles along which blood vessels may also run. These lines should be avoided, as should areas lacking pigment, showing scarring or showing tissue damage.

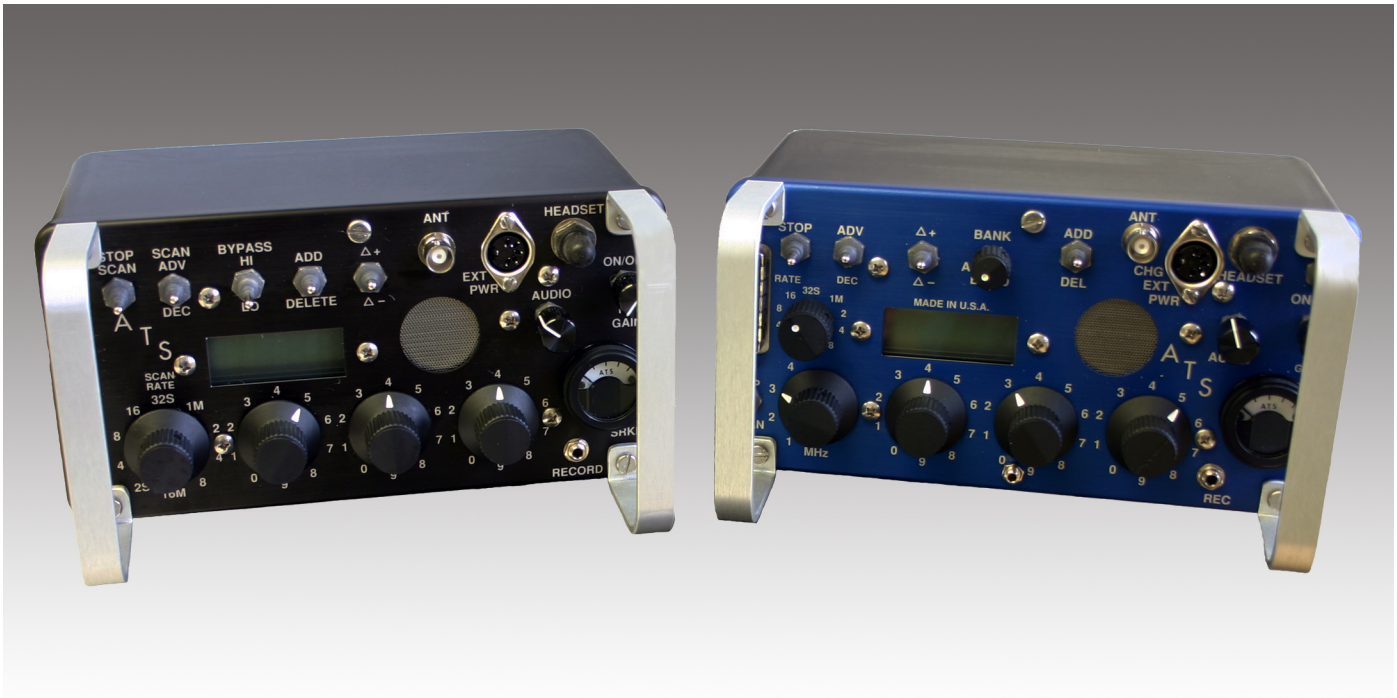
APPENDIX F

RECEIVER AND TRANSMITTER SPECIFICATIONS

This page intentionally left blank.

ATS R2000 / R4000 Scientific Receivers

Finding Solutions. Delivering Results.



With performance features and proven reliability, these receivers are an exceptional value.

ATS models R2000 and R4000 are excellent receivers for most aerial, terrestrial and aquatic studies. They offer leading edge technology and outstanding performance.

Both models feature programmable, automatic or manual scanning over a 2 MHz or 4 MHz frequency range. Their 1 kHz channel spacing tracks up to 200 or 400 targets. The user-friendly front panel gives the operator full control over all functions including scan rate, add/delete frequencies, RF gain, audio level, tone decoder threshold, and more. Both units feature state-of-the-art circuitry for exceptional sensitivity, frequency stability, and low noise.

Both receivers are designed for easy field operation. Their large 1/2" LCD display is backlit for night use. A padded Nylon case, battery charger, power cord and detailed operation manual are included with each receiver.

The R2000 and R4000 are lightweight, compact and ruggedly built to withstand heavy field use and extreme environmental conditions. Each can be powered by an external 12 volt DC battery or its own built-in NiCad battery pack for up to 8 hours of use.

ATS R2000 and R4000 receivers offer high performance with high value.

- 2 or 4 MHz Frequency Range
- 1 kHz Channel Spacing
- Improved RF Gain Control For More Precise Direction Finding
- Excellent Frequency Stability
- High Sensitivity/Low Noise
- Sensitive Signal Meter
- Ruggedly Built For Field Use
- Easy Operation
- 4 Distinct Memory Banks (R4000)
- Built-in Computer Interface (R4000)
- Delta Tune Drift Compensation
- Rechargeable NiCad Batteries
- Separate RF Gain And Audio Level Controls
- Battery-Backed Memory
- Auto-Shut Off On Low Battery For Longer Battery Life

ATS R2000 / R4000 Scientific Receivers

GENERAL

• **Frequency range:**	R2000 Any Specified 2 MHz range from 30 to 220 MHz R4000 Any Specified 4 MHz range from 140 to 220 MHz
• **Channel spacing:**	1 kHz
• **Input impedance:**	50 ohms
• **Minimum discernible signal (MDS):**	-150 dBm (0.007 uv into 50 ohms)
• **Noise figure:**	3 dB maximum
• **Speaker:**	8 ohms
• **Tone decoder detection range:**	± 2 kHz (Model R4000)
• **Tone decoder detection level:**	-120 dBm minimum (Model R4000)
• **Frequency stability:**	± 1 kHz -20°C to +50°C
• **Delta tune:**	+4 kHz; -4 kHz
• **IF frequency:**	10.7 MHz
• **IF bandwidth:**	6 dB ± 2 kHz; 80 dB ± 7 kHz
• **Image rejection:**	>150 dB
• **RF gain control range:**	>130 dB
• **Operating voltage range:**	9 to 18 volts DC
• **Dwell time (scan rate):**	Selectable, 2 sec. to 16 min. (10 positions)

CONTROLS

- Frequency selectors (4)
- Audio level
- Delta tune
- RF gain
- Increment frequency up/down
- Tone decoder threshold (R4000)
- Memory bank select (R4000)
- Auto scan/memory bypass
- Receiver on/off
- Dwell time (scan rate)
- Add-delete to memory
- Stop scan

MEMORY

- All frequencies programmable in each bank
- Four distinct banks (R4000)
- Sequentially scanned
- Battery backed
- Delete all frequencies in each bank
- Delete frequencies individually with single switch while scanning or on standby

DISPLAYS

• **Selected frequency:**	LCD (0.5" digits) with backlight for night use
• **Memory status:**	Colon in display indicates frequency stored in memory
• **Battery status:**	"Lo Bat" indicator flashes when battery voltage is low
• **Signal detection:**	"+" present in display indicates detection by tone decoder (R4000)
• **Signal level:**	0-1 mA meter

CONNECTIONS

• **Antenna:**	BNC - female
• **Headset:**	Receptacle for 0.25" phone plug
• **Signal level:**	0.125" phone receptacle for external 0.1 mA current meter
• **External power/recharge receptacle:**	5-pin DIN
• **Computer interface (R4000):**	25-pin D-sub filtered connection (socket)

POWER

• **12 volts DC nominal:**	130 mA drain nominal
• **Internal:**	1.2 amp-hour NiCad battery pack; 8-hour nominal operating time
• **External:**	9 to 18 volts, negative ground; switches automatically to external power

COMPUTER INTERFACE (R4000)

- 4 digits BCD (active high)
- Computer control select
- 5 volt DC regulated (5 mA max.)
- 12 volt DC unregulated
- Tone decoder output (active low)
- Signal strength

PHYSICAL

• Size:	11 cm wide x 21 cm long x 18 cm high (4.3" x 8.3" x 7")
• Weight:	2.3 kg (5 lbs)
• Accessories (included):	External power cord, battery charger, padded nylon case, instruction manual
• Accessories (optional):	David Clark aviation-grade headset, DC-DC charger, external battery pack

ENVIRONMENTAL

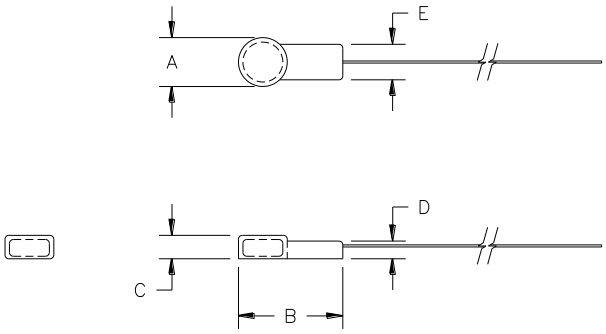
• Operating temperature:	-20°C to +50°C
• Storage temperature:	-70°C to +60°C
• Humidity:	95% non-condensing

WARRANTY

- One year parts and labor on materials and workmanship

AVIAN GLUE ON

Series A2405



Technical Specifications

Transmitter type:	Crystal controlled 2-stage
Calibration tolerance:	±2.5kHz
Frequency stability:	±2.5kHz, -20ºC to 40ºC
Pulse rate and width:	Typical on time 15ms, off time 1.5-4.0sec (controlled by astable circuit)
Pulse rate variation:	5%/volt, ± 20% for temperatures -20ºC to +40ºC
Battery:	Silver Oxide
Activation:	By removing magnet
Encapsulation:	Electrical resin, water-proof, specific gravity: 1.12

MODEL	BATTERY	BATTERY CAPACITY (days)				DIMENSIONS (mm)					WEIGHT (grams)	PRICE GROUP
	1.5V	15 ppm	24 ppm	30 ppm	40 ppm	A	B	C	D	E

Model A2405 Compliance to FCC Part 15 Regulations

This note certifies that Advanced Telemetry Systems, Inc. series A2405 transmitters in frequency range 048.00 – 167.999 comply with regulations under FCC Part15.231 for periodic operation. Periodic operation describes the pulsing mode these units use. The attached antenna may not be altered or the unit may no longer be in compliance.

Regulations under Part 15.5 also apply making them exempt from FCC licensing requirements. These in general state that these devices are secondary users and as such must accept possible interference from other authorized users of the frequency.

Regarding the power output for these transmitters: the power output is less than one milliwatt. (-0.5dBm) when operational with the magnet removed.

Larry B. Kuechle

ACOUSTIC DETECTOR SPECIFICATIONS

This page intentionally left blank.

Quick Specs

Full specifications can be found at wildlifeacoustics.com

Song Meter SM4BAT FS
Song Meter SM4BAT ZC

Recording Technology:

FS: Single-channel 16-bit .wav

ZC: Single-channel Zero-Crossing

Sample Rate:

256kHz on one channel
384kHz on one channel
500kHz on one channel

Run Time:

Alkaline batteries:

30 to 50 ten-hour nights

External power via optional SM3/SM4 Power Cable

Storage:

2 SDXC/SDHC flash card slots (Class 4 or greater)

More than 1 terabyte total capacity using 2 512GB SDXC cards

Dimensions:

Height: 8.6"/21.8 cm
Width: 5.9"/ 15.0 cm
Depth: 2.8"/7.1 cm

Weight:

1.4 lbs./.64kg without batteries
2.7 lbs./1.2kg with batteries

Enclosure Material:

Molded Polycarbonate

Operating Temperature:

-4°F to +122°F or -20°C to 50°C

Warranty:

3 years

Song Meter SM3BAT

Recording Technology:

16-bit PCM .wav or optional .wac proprietary lossless compressed format as well as zero crossing

Sample Rates:

192kHz
256kHz
384kHz (on 1 channel only)

Run Time:

Alkaline batteries:

1 channel full-spectrum:
18 ten-hour nights

1 channel zero-crossing:
20 ten-hour nights

External power via optional SM3/SM4 Power Cable

Storage:

4 SDXC/SDHC flash card slots (Class 4 or greater)

More than 2 terabytes total capacity using 4 512GB SDXC cards

Dimensions:

Height: 12.8"/32.4 cm
Width: 7.9"/ 20.0 cm
Depth: 2.5"/6.5 cm

Weight:

5.5 lbs./2.5kg without batteries
7.0 lbs./3.2kg with batteries

Enclosure Material:

Diecast Aluminum

Operating Temperature:

-4°F to +122°F or -20°C to 50°C

Warranty:

3 years

Echo Meter Touch

Device iOS Device Compatibility:

iPad:
Pro, Air, Air 2, mini 2/3/4, 4th generation
iPhone:
6s Plus, 6s, 6 Plus, 6, 5s, 5c, 5
iPod touch:
6th generation

Sample Rate:

256kHz

Run Time:*

iPad: Up to 13 hours
iPad Mini: Up to 8 hours
iPhone: Up to 4 hours
iPod touch: Up to 3 hours

Sensor Type:

Weather Resistant and Omnidirectional FG

Recording Format:

Full-spectrum

Ultrasonic Module Dimensions:

1.9"/47.6 mm wide
1.8"/46.0 mm long
2.1"/53.1 mm with lightning
.48"/12.1 mm thick

Ultrasonic Module Weight:

1.1oz/31.2g

Enclosure Material:

Anodized Aluminum

Warranty:

1 year

*Results will vary depending upon device settings like brightness and GPS.

Made for iPod iPhone iPad

Microphones & Accessories

wildlife ACOUSTICS

Song Meter SM4BAT FS and SM4BAT ZC

SMM-U1 Ultrasonic Microphone (included)

SMX Horn Attachment

GPS Accessory

SM3/SM4 Power Adapter Cable

Ultrasonic Calibrator

Cables (3m-50m lengths)

Song Meter SM3BAT

SMM-U1 Ultrasonic Microphone

SMM-A1 Acoustic Microphone

SMX Horn Attachment

SM3 Security Housing

SM3/SM4 Power Adapter Cable

SM3 GPS Option

Ultrasonic Calibrator

Cables (3m-50m lengths)

APPENDIX H

ACOUSTIC DETECTOR LOCATION PHOTO LOG

This page intentionally left blank.

VAOC-1_1 Facing southeast and pointing in the same direction as the microphone from a small canopy gap along a dirt road leading to a pond.

VAOC-1_2 Photo taken looking north at the detector across the dirt road in the middle of the small canopy gap

VAOC-1_3 Photo taken looking northeast perpendicular to microphone into the canopy gap

VAOC-1_4 Photo of pond 40 m from detector at the end of the flyway being surveyed

VAOC-1_5 Photo taken looking northwest along the dirt road flyway with the detector in the background

VAOC-2_1 Photo facing northwest in the direction the microphone is pointing, parallel with the stream corridor flyway

VAOC-2_2 Photo taken facing southeast in the opposite direction of microphone along the stream corridor flyway

VAOC-2_3 Photo facing southwest perpendicular to microphone to open understory forest across the stream

APPENDIX I

2016 RANGE-WIDE INDIANA BAT SUMMER SURVEY GUIDELINES

This page intentionally left blank.

2016
RANGE-WIDE INDIANA BAT SUMMER SURVEY GUIDELINES
April 2016

(changes from the 2015 guidelines are in **blue**)

INTRODUCTION

The Indiana bat (*Myotis sodalis*) was originally listed as being in danger of extinction under the Endangered Species Preservation Act of 1966 (32 FR 4001, March 11, 1967), and is currently listed as endangered under the Endangered Species Act (ESA) of 1973, as amended. This survey protocol provides the U.S. Fish and Wildlife Service's (USFWS) recommended guidance on survey methodology and outlines additional reporting requirements for surveyors.

The following guidance is designed to determine whether Indiana bats are present[1] or likely absent at a given site during the summer (May 15 to August 15). The phased-approach, which includes coordination with the USFWS[2], habitat assessments, and acoustic, mist-net, radio-tracking, and emergence surveys, supersedes all prior summer survey guidance. Future changes to this guidance may occur and will be posted on the USFWS Indiana bat summer survey guidance website (http://www.fws.gov/midwest/endangered/mammals/inba/inbasummersurveyguidance.html). Please check this website to ensure use of the most current version of the guidance.

These protocols may be different from those designed for general bat monitoring as part of the North American Bat Monitoring Program (NABat)[3]. NABat surveys may be thought of as similar to breeding bird surveys and are not project-specific surveys in most cases. Information from NABat surveys can be considered as part of "best available" information when assessing whether there is already some existing information on presence of Indiana bats in the vicinity of a given project. We recommend following these guidelines for presence/probable absence surveys.

NOTE: These protocols can also be used for northern long-eared bat (NLEB) presence/probable absence surveys for the 2016 field season. The only difference is our definition of suitable summer habitat for NLEBs and a weather-related exception in the northern portion of its range.

OBJECTIVES

The objectives of Indiana bat summer survey guidelines are to (1) standardize range-wide survey procedures; (2) maximize the potential for detection/capture of Indiana bats at a minimum

[1] The guidance are not intended to be rigorous enough to provide sufficient data to fully determine population size or structure.

[2] Coordinate with the appropriate state natural resource agencies and any involved federal agency(ies) whenever "USFWS" coordination is listed. USFWS FO(s) may direct project sponsors to state agencies for existing occurrence information. Coordinate with your local USFWS FO(s) to understand the process for their area of jurisdiction.

[3] Loeb et al. 2015 available at https://www.fort.usgs.gov/products/23886

acceptable level of effort;(3) make accurate presence/absence determinations; and (4) aid in conservation efforts for the species by identifying areas where the species is present.

BACKGROUND

In 2011, the USFWS developed a multi-agency team to determine whether improvements could be made to the 2007 Indiana Bat Mist-Net Protocols. The team included members of the four USFWS regions (Midwest, Northeast, Southeast, and Southwest) where Indiana bats are known to occur, representatives of state natural resource agencies from three of those four regions (Midwest, Northeast, and Southeast), and representatives from three federal agencies (U.S. Geological Survey (USGS), Department of Defense, and U.S. Forest Service). We obtained informal peer review of the draft guidelines in February 2012, gathered additional information in 2012, and made a revised version available for public comment in 2013 [78 FR 1879, January 9, 2013, and 78 FR 9409, February 8, 2013]. The USFWS implemented revised guidance in 2014. The USGS conducted initial independent testing of automated acoustic software programs during the winter of 2014-15 and continues to test new versions of available software. The USFWS made some additional revisions to the guidelines in 2015.

We considered the best available information for all aspects of the guidance. For example, please see our white paper[4] outlining the methodologies used to determine the minimum level of survey effort. The USFWS continues to work with local, State, and Federal biologists; scientific and academic institutions; commercial organizations; and other interested parties to collect additional data on the distribution, ecology, and biology of the Indiana bat and looks forward to receiving any additional pertinent information.

GENERAL PROCESS

Indiana bat surveys for some proposed projects will require modification (or clarification) of this guidance through coordination with the USFWS FO(s) responsible for the state(s) in which the project occurs[5]. If not already required by federal permit, federal action agencies and surveyors should develop a proposed survey study plan in coordination with the USFWS FO(s) so that all parties fully understand which methods will be deployed, what assumptions will be made, and what the various outcomes would be based on the results of each step. Project proponents may stop survey work at any point once an assumption or documentation of Indiana bat presence occurs. Pre-survey coordination typically will preclude the need for subsequent reviews of intermediate steps by USFWS FO(s) during the busy field season. An online directory of USFWS FO(s) is available at http://www.fws.gov/offices/. Unless otherwise agreed to by the USFWS, negative presence/probable absence survey results obtained using this guidance are

[4] Available at http://www.fws.gov/midwest/endangered/mammals/inba/inbasummersurveyguidance.html

[5] For example, project sponsors for large acreage and/or landscape-scale projects that do not result in permanent habitat loss and would not pose an ongoing threat of lethal take, especially those proposed by land management agencies, may work with local USFWS FOs to apply different scales of surveys (broad vs. project-level) or different types of surveys, such as long-term monitoring results (e.g., forest-wide acoustic transect data) and/or targeted survey efforts (e.g., sub-sampling of large project areas), to address P/A concerns.

valid for a minimum of two years[6] from the completion of the survey unless new information (e.g., other nearby surveys) suggest otherwise. If not already required by federal permit, please submit all results (negative or positive) from any phase to the USFWS FO(s). We strongly encourage this coordination as it improves the USFWS' understanding of (1) the level of survey effort underway and (2) the distribution of the species. A single report can be submitted at the end of all phases conducted for a given project.

USFWS FO(s) level coordination is also important during the survey planning process. The USFWS recognizes that there may be project-specific habitat conditions that do not lend themselves to surveying with either acoustic detectors or mist-nets even though it met the definition of suitable Indiana bat summer habitat. The guidelines that are described in this document are designed to be implemented in habitats conducive to each technique described. We strongly encourage coordination with the FO(s) prior to implementation of methodologies that may not be appropriate for site-specific habitat conditions.

Because Indiana bat surveys may result in take, such surveys should only be conducted by a qualified biologist[7]. Generally, a recovery permit for the Indiana bat authorizes the capture of bats for identification, and handling of bats for measurements, photography, and radio transmitter attachment. Following this guidance will meet standard USFWS requirements; however, surveyors also need to ensure they meet all applicable state permitting and reporting requirements. Failure to follow the survey guidance, as written, and/or failure to follow a study plan which has received concurrence from the local USFWS FO(s), may result in USFWS FO recommendations for additional survey effort.

The following provides a step-by-step outline of how Indiana bat summer surveys should be conducted in 2016. Some of these steps can occur concurrently.

PHASE 1 – INITIAL PROJECT SCREENING

Step 1. Coordinate with the U.S. Fish and Wildlife Service Field Office(s)[8] regarding existing Indiana bat summer occurrence information.
[*Projects located within known Indiana bat summer habitat will not proceed to Phase 2 of this process.*]

a) If a project (located within or outside of a known maternity colony home range) is

[6] The timeframe may be reduced if significant habitat changes have occurred in the area or increased based on local information.
[7] A qualified biologist is an individual who holds a USFWS Recovery Permit (Federal Fish and Wildlife Permit) for Indiana bats in the state/region in which they are surveying and/or has been authorized by the appropriate state agency to net and handle Indiana bats. Several USFWS offices maintain lists of qualified bat surveyors, and if working in one of those states with authorizations in lieu of a Recovery Permits, the individual will either need to be on that list or submit qualifications to receive USFWS approval prior to conducting any field work.
[8] Coordinate with the appropriate state natural resource agencies and any involved Federal Action agencies whenever "USFWS" coordination is listed. USFWS FO(s) may direct project sponsors to state agencies for existing occurrence information. Coordinate with your local USFWS FO(s) to understand the process for their area of jurisdiction.

already covered under an existing Endangered Species Act (ESA) incidental take authorization (e.g., HCP, BO), then no further summer surveys are needed, follow the procedures previously authorized by the USFWS FO(s).

b) If there are known Indiana bat summer occurrences (e.g., known roost trees, capture locations, foraging locations) within the project action area[9]; **OR**

if there are no known Indiana bat summer occurrences within the proposed project area itself, but the project area is located within a known maternity colony home range[10]; **OR**

if the project is located outside a known maternity colony home range, but is within the range of the Indiana bat (note this can change over time), then proceed to Step 2.

Step 2. Conduct Habitat Assessment (Desktop or Field-based; see Appendix A).

a) If suitable summer habitat is present within the action area, then proceed to Step 3.

b) If suitable summer habitat is absent within the action area, then no further summer surveys are necessary; however, additional coordination with the USFWS FO(s) will be necessary if Indiana bats may be present during any other season and may be affected by the proposed project.

Step 3. Assess potential for adverse effects to Indiana bats.

a) If the project is not anticipated to result in adverse effects to Indiana bats (as proposed), then no further summer surveys are necessary, coordinate with the USFWS FO(s).

b) If the project may result in adverse effects to Indiana bats but the impacts can be adequately assessed and conservation measures can be designed to minimize those effects without additional presence/absence information (this includes **all** proposed projects within known maternity colony home ranges, but may include other areas as well), then no further summer surveys are necessary, coordinate with the USFWS FO(s) regarding an assessment of the project's potential effects, development of conservation measures, and determination of the need for any ESA incidental take authorization.

c) If the project does not meet the conditions of 3a or 3b, then proceed to **Phase 2**.

[9] The "action area" is defined as all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action. [50 CFR Section 402.02]

[10] See USFWS Indiana Bat Section 7 and Section 10 Guidance for Wind Energy Projects (Questions 4 & 5) http://www.fws.gov/midwest/endangered/mammals/inba/WindEnergyGuidance.html

PHASE 2 - PRESENCE/ABSENCE SURVEYS (NETTING OR ACOUSTIC SURVEYS)[11]

During the summer of 2016, presence/probable absence (P/A) of Indiana bats may be determined by conducting either Step 4 (mist-netting; see Appendix B) or Step 5 (acoustics; see Appendix C) as outlined below. It is the project proponent's choice as to which option to use. The summer survey season is from 15 May through 15 August[12] for either survey option. If netting is chosen as the preferred P/A method and an Indiana bat(s) is captured, then surveyors may immediately begin Phase 4/radio-tracking. Project proponents must decide whether they will proceed to Phase 4 in coordination with the USFWS FO before any mist netting occurs. Submit Phase 2 study plans to USFWS FO prior to conducting surveys.

Step 4. Conduct Mist-Netting Surveys following Recovery Unit-based Protocols[13] (see Appendix B)

Northeast and Appalachian Recovery Units (CT, DE, MA, MD, NC, NJ, NY, PA, eastern TN, WV, VA, VT):

Linear projects: a minimum of 6 net nights per km (0.6 miles) of suitable summer habitat (see Appendix F).

Non-linear projects: a minimum of 42 net nights per 123 acres (0.5 km^2) of suitable summer habitat.

For example:

- 7 sites, 2 nets/site for 3 calendar nights = 42 net nights
- 7 sites, 3 nets/site for 2 calendar nights = 42 net nights
- 3 sites, 2 nets/site for 7 calendar nights* = 42 net nights

*Maximum of 3 nights of consecutive netting at any given net location. After 3 consecutive nights of netting at the same location, you must change net locations or wait at least 2 calendar nights before resuming netting at the same location.

---

[11] Note: acoustic and/or mist-net surveys should be conducted in the best suitable habitat possible for each survey type to increase the likelihood of detecting/capturing Indiana bats. In some cases, the most suitable habitat for effectively conducting surveys may occur outside a project site boundary and may be sampled if landowner permission is available. For projects with multiple survey areas (e.g., >123 acres or >1 km), survey methods may be interchanged. For example, acoustics could be used for one 123-acre survey area and netting could be used for another 123-acre area.

[12] With prior USFWS FO approval, a survey may be completed after August 15 if it was initiated in time to be completed by August 15 and extenuating weather circumstances resulted in delaying completion. Delays as a result of not meeting the acceptable weather requirements are the ONLY valid justification for surveying after August 15.

[13] The Indiana bat populations in the Northeast and Appalachian Recovery Units have been most heavily impacted by white-nose syndrome to date; therefore, we recommend higher survey effort when compared to the Midwest and Ozark-Central Recovery Units. We have no recommendations for reducing the minimum level of effort required to demonstrate probable absence for projects <123 acres in size. Level of effort is based on detection probabilities and occupancy estimates that were derived from past survey efforts that used the same acreage threshold. Level of effort is designed to reach 90% confidence in negative survey results (see Niver et al. 2013).

a) If no capture of Indiana bats, then no further summer surveys are necessary[14].

b) If capture of Indiana bat(s), then stop or proceed to **Phase 4** as previously decided in coordination with the FO.

Midwest and Ozark-Central Recovery Units (AL, AR, IA, IL, IN, GA, KY, MI, MO, MS, OH, OK, central & western TN, and Lee County, VA):

Linear projects: a minimum of 4 net nights per km (0.6 miles) of suitable summer habitat (see Appendix F).

Non-linear projects: a minimum of 9 net nights per 123 acres (0.5 km^2) of suitable summer habitat.

For Example:

- 3 sites, 1 nets/site for 3 calendar nights = 9 net nights
- 1 sites, 3 nets/site for 3 calendar nights = 9 net nights

The sampling period for each net shall begin at sunset and continue for at least 5 hours (longer survey periods may also improve success).

*Maximum of 3 nights of consecutive netting at any given net location. After 3 consecutive nights of netting at the same location, you must change net locations or wait at least 2 calendar nights before resuming netting at the same location.

a) If no capture of Indiana bats, then no further summer surveys are necessary.
b) If capture of Indiana bat(s), then stop or proceed to **Phase 4** as previously decided in coordination with the FO.

OR

Step 5. Conduct Acoustic Surveys[15] (see Appendix C)

Linear projects: a minimum of 2 detector nights per km (0.6 miles) of suitable summer habitat (see Appendix F).

Non-linear projects: a minimum of 4 detector nights per 123 acres (0.5 km^2) of suitable summer habitat.

[14] NOTE: For Phase 2 Presence/Absence Surveys, wherever the phrase "no further summer surveys are necessary" occurs within this document, the USFWS FO(s) is in affect assuming probable absence of Indiana bats.
[15] Acoustic surveys are available as a Presence/Absence option throughout the range (i.e., Northeast, Appalachian, Midwest, and Ozark-Central Recovery Units).

2 detector locations per 123 acre "site" shall be sampled until at least 4 detector nights has been completed over the course of at least 2 calendar nights (may be consecutive).

For example:

- 2 detectors for 2 nights each (can sample the same location or move within the site)
- 1 detector for 4 nights (must sample at least 2 locations)

The acoustic sampling period for each site must begin at sunset[16] and ends at sunrise each night of sampling.

Optional coarse screening - for high frequency (HF) or myotid calls (depending on available filters) or Proceed to Step 6

i) If no positive detection of HF calls (≥35 kHz) or myotid calls, no further summer surveys necessary.

ii) If positive detection of HF or myotid calls, then
(a) proceed to Step 6 for further acoustic analysis; **OR**
(b) assume presence of Indiana bats and coordinate with the USFWS FO(s); **OR**
(c) assume presence and proceed to **Phase 3**.

Step 6. Conduct Automated Acoustic Analyses for each site that had HF or Myotid calls from Step 5 or ALL sites if Step 5 was not conducted.
(NOTE: cannot skip this step and proceed directly to Step 7)

Use **one or more** of the currently available 'approved' acoustic bat ID programs[17] (use most current approved software versions available and manufacturer's recommended settings for Indiana bat P/A surveys). 'Candidate' programs are not yet approved by USFWS for stand-alone use for Indiana bat P/A surveys, but may be used in conjunction with one or more of the approved programs. Include your plans for which specific software program(s) you will use in your survey work plan and submit for USFWS FO(s) review prior to conducting surveys. Beginning with acoustic data from night one at each acoustic site, run each night's data for each site through your chosen ID program(s). Review results by site by night from each acoustic ID program used[18].

[16] Surveys may need to start a little earlier or later than official sunset times (i.e., at "dusk") in some settings such as a deep/dark forested valleys or ridge tops to avoid missing early-flying bats or capturing late-flying birds, respectively. Sunset tables for the location of survey can be found at: http://aa.usno.navy.mil/data/docs/RS_OneYear.php

[17] Approved and candidate programs are listed at http://www.fws.gov/midwest/Endangered/mammals/inba/surveys/inbaAcousticSoftware.html

[18] The approved acoustic identification programs all have implemented a maximum likelihood estimator (MLE) at this time. If the analysis of collected calls at a given site on a given night results in the probable presence of Indiana bats with high levels of certainty ($P<0.05$), then select one of the options available in Step 6b.

a) If Indiana bat presence is considered unlikely by all of the approved and candidate program(s) used in analysis, then no further summer surveys necessary.

b) If Indiana bat presence is considered likely at one or more sites on one or more nights by any approved or candidate program(s) used in analysis, then

i) proceed to Step 7 for qualitative ID; **OR**
ii) assume presence of Indiana bats and coordinate with the USFWS FO(s); **OR**
iii) assume presence and proceed to **Phase 3**.

Step 7. Conduct Qualitative Analysis of probable Indiana bat calls from Step 6.

At a minimum, for each site/night a program considered Indiana presence likely (MLE results) review all files from that site/night. Qualitative analysis[19] must also include a comparison of the results of each acoustic ID program by site and night (including: number of call files flagged as probable Indiana bats by each tool used; an evaluation of other species identified by the acoustic ID program; individual file level agreements and disagreements on Indiana bats between programs; and a qualitative analysis of ALL probable Indiana bat call sequences to further evaluate that the correct ID has been recommended by the program used).

a) If no visual confirmation of probable Indiana bats, then no further summer surveys necessary.

b) If visual confirmation of probable Indiana bats, then

i) assume presence of Indiana bats and coordinate with the USFWS FO(s); **OR**
ii) assume presence and proceed to **Phase 3**.

PHASE 3. CONDUCT MIST-NETTING SURVEYS TO CAPTURE INDIANA BATS.

If netting was not conducted as the P/A method, then netting may be conducted in Phase 3 to capture and characterize (e.g., sex, age, reproductive condition) the Indiana bats that are present in an area and to facilitate Phase 4 efforts. We encourage working with the FOs to develop Phase 3 netting plans based on best available information (e.g., positive acoustic locations). There are no minimum requirements for this phase as this is not a P/A phase.

a) If no Indiana bats are captured, then coordinate with the USFWS FO.

b) If Indiana bats are captured, then proceed to **Phase 4**.

[19] Qualitative analysis of each acoustic site and night with probable detections of Indiana bats during Step 6 must include the entire night's high-frequency call data and not just those files making it through the acoustic analysis tools as probable Indiana bats.

PHASE 4. CONDUCT RADIO-TRACKING AND EMERGENCE SURVEYS (See Appendices D and E).

APPENDIX A
PHASE 1 SUMMER HABITAT ASSESSMENTS

Summer habitat assessments are Step 2 of Phase 1- Initial Project Screening. The information below is provided to assist applicants, consultants, and/or project proponents (hereinafter termed the "applicant") in establishing whether summer surveys for Indiana bats should be conducted. As a reminder, the first step for determining presence of Indiana bats at a given site is to determine whether there is any existing occurrence data available for the vicinity of the project from the local USFWS FO. This step can be conducted remotely via a desktop analysis (e.g., use of aerial photography to assess the potential presence of suitable habitat). The applicant is responsible for developing and providing sufficient information as to whether potentially suitable summer Indiana bat habitat exists within a proposed project area. If suitable habitat is present, the applicant should calculate the amount and submit this to the USFWS FO(s) and determine the need for any presence/absence surveys (Phase 2). Note: if Indiana bats are present or assumed to be present during any phase, more detailed habitat information may be necessary to adequately assess the potential for impacts (see attached example Indiana Bat Habitat Assessment Datasheet). If no suitable habitat is present, no surveys are needed to assess risk during the summer. Habitat assessments for Indiana bats can be completed any time of year and applicants are encouraged to submit results and proposed Phase 2 study plans well in advance of the summer survey season.

PERSONNEL

Habitat assessments should be completed by individuals with a natural resource degree or equivalent work experience.

DEFINITION FOR POTENTIALLY SUITABLE INDIANA BAT SUMMER HABITAT

Suitable summer habitat for Indiana bats consists of a wide variety of forested/wooded habitats where they roost, forage, and travel and may also include some adjacent and interspersed non-forested habitats[20] such as emergent wetlands and adjacent edges of agricultural fields, old fields and pastures. This includes forests and woodlots containing potential roosts (i.e., live trees and/or snags ≥5 inches dbh[21] (12.7 centimeter) that have exfoliating bark, cracks, crevices, and/or hollows), as well as linear features such as fencerows, riparian forests, and other wooded corridors. These wooded areas may be dense or loose aggregates of trees with variable amounts of canopy closure. Individual trees may be considered suitable habitat when they exhibit the characteristics of a potential roost tree and are located within 1,000 feet (305 meters) of other forested/wooded habitat. We recommend that project proponents or their representatives

[20] Non-forested habitats typically should be excluded from acreages used to establish a minimum level of survey effort for Phase 2 surveys.

[21] While trees <5 inches (<12.7 cm) dbh that have exfoliating bark, cracks, crevices, and/or hollows may have some potential to be male Indiana bat summer roosting habitat, the USFWS does not consider early-successional, even-aged stands of trees <5 inches dbh to be suitable roosting habitat for the purposes of this guidance. Suitable *roosting* habitat is defined as forest patches with trees of 5-inch (12.7 cm) dbh or larger. However, early successional habitat with small diameter trees may be used as foraging habitat by Indiana bats. Therefore, a project that would remove or otherwise adversely affect ≥20 acres of early successional habitat containing trees between 3 and 5 inches (7.6-12.7 cm) dbh would require coordination/consultation with the USFWS FO to ensure that associated impacts would not rise to the level of take. The USFWS may request P/A surveys if >20 acres of early successional habitat were proposed for removal.

coordinate with the appropriate USFWS Field Office to more clearly define suitable habitat for their particular region as some differences in state/regional suitability criteria may be warranted (e.g., high-elevation areas may be excluded as suitable habitat in some states).

Examples of unsuitable habitat:

- Individual trees that are greater than 1,000 feet from forested/wooded areas;
- Trees found in highly-developed urban areas (e.g., street trees, downtown areas); and
- A pure stand of less than 3-inch dbh[22] trees that are not mixed with larger trees.

DEFINITION FOR POTENTIALLY SUITABLE NORTHERN LONG-EARED BAT SUMMER HABITAT

Suitable summer habitat for NLEB consists of a wide variety of forested/wooded habitats where they roost, forage, and travel and may also include some adjacent and interspersed non-forested habitats such as emergent wetlands and adjacent edges of agricultural fields, old fields and pastures. This includes forests and woodlots containing potential roosts (i.e., live trees and/or snags ≥3 inches dbh that have exfoliating bark, cracks, crevices, and/or cavities), as well as linear features such as fencerows, riparian forests, and other wooded corridors. These wooded areas may be dense or loose aggregates of trees with variable amounts of canopy closure. Individual trees may be considered suitable habitat when they exhibit characteristics of suitable roost trees and are within 1,000 feet of other forested/wooded habitat[23]. NLEB has also been observed roosting in human-made structures, such as buildings, barns, bridges, and bat houses; therefore, these structures should also be considered potential summer habitat[24]. NLEBs typically occupy their summer habitat from mid-May through mid-August each year[25] and the species may arrive or leave some time before or after this period.

Examples of unsuitable habitat:

- Individual trees that are greater than 1,000 feet from forested/wooded areas;
- Trees found in highly-developed urban areas (e.g., street trees, downtown areas); and
- A pure stand of less than 3-inch dbh trees that are not mixed with larger trees.

[22] Suitable *roosting* habitat is defined as forest patches with trees of 5-inch (12.7 cm) dbh or larger. However, early successional habitat with small diameter trees may be used as foraging habitat by Indiana bats. Therefore, a project that would remove or otherwise adversely affect ≥20 acres of early successional habitat containing trees between 3 and 5 inches (7.6-12.7 cm) dbh would require coordination/consultation with the USFWS FO to ensure that associated impacts would not rise to the level of take. The USFWS may request P/A surveys if >20 acres of early successional habitat were proposed for removal.

[23] This number is based on observations of bat behavior indicating that such an isolated tree (i.e., ≥1000 feet) would be extremely unlikely to be used as a roost. This distance has also been evaluated and vetted for use for the Indiana bat. See the "Indiana bat Section 7 and Section 10 Guidance for wind Energy Projects," question 33, found at: http://www.fws.gov/midwest/endangered/mammals/inba/WindEnergyGuidance.html

[24] Trees found in highly-developed urban areas (e.g., street trees, downtown areas) are extremely unlikely to be suitable habitat.

[25] Exact dates vary by location.

APPENDIX A
PHASE 1 SUMMER HABITAT ASSESSMENTS

SUBMISSION OF HABITAT ASSESSMENT AND PHASE 2 STUDY PLAN (IF NEEDED)

If a proposed project may affect (positively or negatively) Indiana bats and the conditions outlined in Step 3 a or b are not met, a habitat assessment report should be submitted to the appropriate USFWS FO(s) (and/or to the lead Federal Action Agency, such as the USACE, as appropriate) along with a draft study plan for the Phase 2 (acoustic or netting) survey (if suitable habitat is present). Complete reports will include the following:

1. Full names and relevant titles/qualifications of individuals (e.g., John E. Smith, Biologist II, State University, B.S. Wildlife Science 2007) completing the habitat assessment and when the assessment was conducted
2. A map and latitude/longitude or UTM clearly identifying the project location (or approximate center point) and boundaries
3. A detailed project description (if available)
4. Documentation of any known/occupied spring staging, summer, fall swarming, and/or winter habitat for Indiana bats within or near the project area
5. A description of methods used during the habitat assessment
6. A summary of the assessment findings and a completed Indiana Bat Habitat Assessment Datasheet (see attached below; use of this particular datasheet is optional)
7. Other information that may have a bearing on Indiana bat use of the project area (e.g., presence of fall or winter habitat [caves, crevices, fissures, or sinkholes, or abandoned mines of any kind], bridges and other non-tree potential summer roosts.)
8. Any other information requested by the local USFWS FO(s) related to the project

In addition, Phase 2 Study Plans should contain the following:

1. A statement as to which type of P/A surveys will be conducted (i.e., mist netting or acoustic surveys) and how the proposed survey level of effort (i.e., total # of net nights or detector nights) was calculated/determined;
2. A map depicting the proposed number of survey sites (mist netting or acoustic) and their tentative distribution throughout the project area;
3. A tentative list of surveyors names and copies of relevant federal permits (if required in the project State);
4. A tentative survey schedule (e.g., start date, duration, end date);
5. For mist netting surveys with planned Phase 4 radio-tracking – the approximate number and distribution of transmitters (e.g., prioritization of sex/age, maximum

number per site) and a request that bats targeted for tracking may be held for up to 45 minutes[26] to allow for application of transmitters; and

6. For acoustic surveys - information on which specific program(s) will be used and what level of acoustic analyses will be conducted.

[26] Current standard federal Section 10 bat permit conditions require prior written approval from the Field Supervisor in the USFWS FO(s) if capture times may exceed 30 minutes.

APPENDIX A
PHASE 1 SUMMER HABITAT ASSESSMENTS

INDIANA BAT HABITAT ASSESSMENT DATASHEET

Project Name:_____ Date:_____

Township/Range/Section:_____

Lat Long/UTM/ Zone:_____ Surveyor:_____

Brief Project Description

Project Area				
Project	Total Acres	Forest Acres		Open Acres
Proposed Tree Removal (ac)	Completely cleared	Partially cleared (will leave trees)	Preserve acres- no clearing	

Vegetation Cover Types	
Pre-Project	**Post-Project**

Landscape within 5 mile radius
Flight corridors to other forested areas?
Describe Adjacent Properties (e.g. forested, grassland, commercial or residencial development, water sources)

Proximity to Public Land
What is the distance (mi.) from the project area to forested public lands (e.g., national or state forests, national or state parks, conservation areas, wildlife management areas)?

Use additional sheets to assess discrete habitat types at multiple sites in a project area

Include a map depicting locations of sample sites if assessing discrete habitats at multiple sites in a project area
A single sheet can be used for multiple sample sites if habitat is the same

Sample Site Description
Sample Site No.(s): _____

Water Resources at Sample Site				
Stream Type (# and length)	Ephemeral	Intermittent	Perennial	Describe existing condition of water sources:
Pools/Ponds (# and size)		Open and accessible to bats?		
Wetlands (approx. ac.)	Permanent	Seasonal		

Forest Resources at Sample Site				
Closure/Density	Canopy (> 50 ')	Midstory (20-50')	Understory (<20')	1=1-10%, 2=11-20%, 3=21-40%, 4=41-60%, 5=61-80%, 6=81=100%
Dominant Species of Mature Trees				
% Trees w/ Exfoliating Bark				
Size Composition of Live Trees (%)	Small (3-8 in)	Med (9-15 in)	Large (>15 in)	
No. of Suitable Snags				

Standing dead trees with exfoliating bark, cracks, crevices, or hollows. Snags without these characteristics are not considered suitable.

IS THE HABITAT SUITABLE FOR INDIANA BATS? _____

Additional Comments:

Attach aerial photo of project site with all forested areas labeled and a general description of the habitat

Photographic Documentation: habitat shots at edge and interior from multiple locations; understory/midstory/canopy; examples of potential suitable snags and live trees; water sources

APPENDIX B
PHASE 2 or 3 MIST-NETTING

Mist-netting can be used as a presence/probable absence method (Phase 2 surveys) or it can be conducted for the purpose of attempting to capture Indiana bats after detection during acoustic presence/probable absence surveys (Phase 3 surveys). The same recommendations (e.g., season, personnel, equipment, net placement, checking nets) apply for either use of mist-netting surveys.

SUMMER MIST-NETTING SEASON: May 15[27] – August 15[28]

Capture of reproductive adult females (i.e., pregnant, lactating, or post-lactating) and/or young of the year during May 15 – August 15 confirms the presence of a maternity colony in the area. Since adult males and non-reproductive females have commonly been found summering with maternity colonies, radio-tracking results will be relied upon to help determine the presence or absence of a maternity colony or large concentrations of bats in the area when only males and/or non-reproductive females are captured.

PERSONNEL

A qualified biologist(s)[29] must (1) select/approve mist-net set-ups in areas that are most suitable for capturing Indiana bats, (2) be physically present at each mist-net site throughout the survey period, and (3) confirm all bat species identifications. This biologist may oversee other biological technicians and manage mist-net set-ups in close proximity to one another as long as the net-check timing (i.e., every 10 minutes) can be maintained while **walking** between nets.

COORDINATION WITH USFWS FO(s)

If not already required by federal permit, we recommend that applicants submit a draft study plan for all survey phases to the USFWS FO(s) for review and approval. Study plans should include a map/aerial photo identifying the proposed project area boundaries, suitable bat habitats and acreages within the project area, and the proposed number and tentative locations of net sites.

EQUIPMENT

Use the finest, lowest visibility mesh mist-nets commercially available, as practicable. Currently, the finest net on the market is 75 denier, 2 ply, denoted 75/2 (Arndt and Schaetz

[27] Due to concerns with transmission of white-nose syndrome, some USFWS FO(s) and state natural resource agencies have delayed the start of the Indiana bat summer field survey season/mist-netting until June 1. Surveyors/applicants should always coordinate with local USFWS FO(s) and state natural resource agencies before beginning surveys.

[28] With prior USFWS FO approval, a survey may be completed after August 15 if it was initiated in time to be completed by August 15 and extenuating weather circumstances resulted in delaying completion. Delays as a result of not meeting the acceptable weather requirements are the ONLY valid justification for surveying after August 15.

[29] A qualified biologist is an individual who holds a USFWS Recovery Permit (Federal Fish and Wildlife Permit) for Indiana bats in the state/region in which they are surveying and/or has been authorized by the appropriate state agency to net and handle Indiana bats. Several USFWS offices maintain lists of qualified bat surveyors, and if working in one of those states with authorizations in lieu of a Recovery Permits, the individual will either need to be on that list or submit qualifications to receive USFWS approval prior to conducting any field work.

2009); however, the 50 denier nets are still acceptable for use at this time. The finest mesh size available is approximately 1½ inches (38 millimeters).

No specific hardware is required. There are many suitable systems of ropes and/or poles to hold nets. The system of Gardner et al. (1989) has been widely used. See NET PLACEMENT for minimum net heights, habitats, and other netting requirements that affect the choice of hardware.

To minimize potential for disease transmission, any equipment that comes in contact with bats should be kept clean and disinfected, following approved protocols; this is particularly a concern relative to white-nose syndrome (WNS). Disinfection of equipment to avoid disease transmission (e.g., WNS) is required; protocols are posted at http://www.whitenosesyndrome.org/. Federal and state permits may also have specific equipment restrictions and disinfection requirements.

MINIMUM PRESENCE/ABSENCE MIST-NETTING LEVEL OF EFFORT (PHASE 2)

The number of net sites required for a non-linear project will be dependent upon the overall acreage of suitable habitat proposed to be impacted by the action. To determine the survey effort, quantify the amount of suitable summer habitat within the project area. NOTE: for projects where other impacts are likely (e.g., collision), ensure that presence/probable absence surveys are designed to cover the entire project area and NOT just the locations where tree removal is planned. Additional guidance for linear project is in Appendix F.

Conduct Mist-Netting Surveys following Recovery Unit-based protocols[30]

Northeast and Appalachian Recovery Units (CT, DE, MA, MD, NC, NJ, NY, PA, eastern TN, WV, VA, VT):

Linear projects: a minimum of 6 net nights per km (0.6 miles) of suitable summer habitat (see Appendix F).

Non-linear projects: a minimum of 42 net nights per 123 acres[31] (0.5 km^2) of suitable summer habitat.

For example:

- 7 sites[32], 2 nets[33]/site for 3 calendar nights = 42 net nights

[30] The Indiana bat populations in the Northeast and Appalachian Recovery Units have been most heavily impacted by white-nose syndrome; therefore, we recommend higher survey effort when compared to the Midwest and Ozark-Central Recovery Units.
[31] We have no recommendations for reducing the minimum level of effort required to demonstrate probable absence for projects <123 acres in size. Detection probabilities and occupancy estimates were derived from past survey efforts that used the same acreage threshold (see Niver et al. 2013).
[32] A site is defined as a geographic area to be sampled. It can include one or more nets that can be managed by one Qualified Biologist.
[33] A net is defined as any combination of individual panels and poles (e.g., single, double, triple high) to fill the area (e.g., corridor) being sampled.

- 7 sites, 3 nets/site for 2 calendar nights = 42 net nights
- 3 sites, 2 nets/site for 7 calendar nights* = 42 net nights

Maximum of 3 nights of consecutive netting at any given net location. After 3 consecutive nights of netting at the same location, you must change net locations or wait at least 2 calendar nights before resuming netting at the same location.

a) If no capture of Indiana bats, then no further summer surveys are necessary[34].
b) If capture of Indiana bat(s), then stop or proceed to **Phase 4** as previously decided in coordination with the FO(s).

Midwest and Ozark-Central Recovery Units (AL, AR, GA, IA, IL, IN, KY, MI, MO, MS, OH, OK, and central & western TN):

Linear projects: a minimum of 4 net nights per km (0.6 miles) of suitable summer habitat (see Appendix F).

Non-linear projects: a minimum of 9 net nights per 123 acres (0.5 km^2) of suitable summer habitat.

- 3 sites, 1 nets/site for 3 calendar nights = 9 net nights
- 1 sites, 3 nets/site for 3 calendar nights = 9 net nights

Maximum of 3 nights of consecutive netting at any given net location. After 3 consecutive nights of netting at the same location, you must change net locations or wait at least 2 calendar nights before resuming netting at the same location.

a) If no capture of Indiana bats, then no further summer surveys are necessary.
b) If capture of Indiana bat(s), then stop or proceed to **Phase 4** as previously decided in coordination with the FO(s).

MIST-NETTING SURVEYS TO CAPTURE INDIANA BATS AFTER ACOUSTICS WERE USED AS P/A METHOD (PHASE 3)

If netting was not conducted as the P/A method, then netting may be conducted to capture and characterize (e.g., sex, age, reproductive condition) the Indiana bats (documented through the Phase 2 acoustic P/A survey) present in an area and to facilitate radio-tracking (Phase 4) efforts. We encourage working with the FO(s) to develop Phase 3 netting plans based on best available information (e.g., positive acoustic locations). There are no

[34] NOTE: For Phase 2 Presence/Absence Surveys, wherever the phrase "no further summer surveys are necessary" occurs within this document, the USFWS FO(s) is in affect assuming probable absence of Indiana bats during the summer.

minimum requirements for this phase as this is not a P/A phase.

a) If no Indiana bats are captured, then coordinate with the USFWS FO.
b) If Indiana bats are captured, then proceed to **Phase 4** as previously decided in coordination with the FO(s).

NET PLACEMENT

Potential travel corridors (e.g., streams, logging trails) typically are the most effective places to net (although other places may also be productive; see Carroll et al. 2002). Place nets approximately perpendicular across the corridor. Nets should fill the corridor from side to side, extending beyond the corridor boundaries when possible, and from stream (or ground) level up to the overhanging canopy. Nets of varying widths and heights may be used as the situation dictates. A typical set is at least 5 m to 9 m high consisting of two or more nets stacked on top one another and from 6 m to 18 m wide. If netting over water, ensure there is enough space between the net and the water so that captured bats will not get wet.

Occasionally it may be necessary or desirable to net where a suitable corridor is lacking. The typical equipment described in the section above may be inadequate for these situations, requiring innovation on the part of the surveyor (see Humphrey et al. 1968). See Kiser and MacGregor (2005) for additional discussion about net placement.

Although no minimum spacing between mist-nets is being specified, surveyors should attempt to evenly distribute net set-ups throughout suitable habitat and must provide written justification in their report if net set-ups were not distributed throughout suitable habitat (i.e., why were they clumped?). Net set-ups can be repeatedly sampled throughout the project, but generally no more than 2-3 nights at a single location is recommended. In addition, changing locations within a project area may improve capture success (see Robbins et al. 2008; Winhold and Kurta 2008). Photo-document placement of nets.

SURVEY PERIOD

The survey period for each net shall begin at sunset[35] and continue for at least 5 hours (longer survey periods may also improve success).

CHECKING NETS

Each net set-up should be checked approximately every 10 minutes (Gannon et al. 2007). If surveyors monitor nets continuously, take care to minimize noise, lights and movement near the nets. Monitoring the net set-up continuously with a bat detector (ideally using ear phones to avoid alerting bats) can be beneficial: (a) bats can be detected immediately when they are

[35] Surveys may need to start a little earlier or later than official sunset times (i.e., at "dusk") in some settings such as a deep/dark forested valleys or ridge tops to avoid missing early-flying bats or capturing late-flying birds, respectively. Sunset tables for the location of survey can be found at: http://aa.usno.navy.mil/data/docs/RS_OneYear.php.

captured, (b) prompt removal from the net decreases stress on the bat and potential for the bat to escape (MacCarthy et al. 2006), and (c) monitoring with a bat detector also allows the biologist to assess the effectiveness of each net placement (i.e., if bats are active near the net set-up but avoiding capture), which may allow for adjustments that will increase netting success on subsequent nights. There should be no other disturbance near the nets, other than to check nets and remove bats. Biologists should be prepared to cut the net if a bat is severely entangled and cannot be safely extracted within 3 or 4 minutes (CCAC 2003; Kunz et al. 2009).

Capture and handling are stressful for bats. Emphasis should be on minimizing handling and holding bats to as short a time as possible to achieve field study objectives. Indiana bats should not be held for more than 30 minutes after capture, unless the individual is targeted for radio-tracking. Bats targeted for radio-tracking should be released as quickly as possible, but no longer than 30 minutes[36] after capture, or as allowed in federal and state permits. See Kunz and Kurta (1988) for general recommendations for holding bats.

WEATHER, LIGHTING, AND OTHER ENVIRONMENTAL CONDITIONS

Severe weather adversely affects capture of bats. Some Indiana bats may remain active despite inclement weather and may still be captured while others in the same area become inactive. Therefore, negative surveys combined with any of the following weather conditions throughout all or most of a sampling period are likely to require an additional night of mist-netting[37]: (a) temperatures that fall below 50°F (10°C)[38]; (b) precipitation, including rain and/or heavy fog, that exceeds 30 minutes or continues intermittently during the survey period; and (c) sustained wind speeds greater than 9 miles/hour (4 meters/seconds; 3 on Beaufort scale) for 30 or more minutes.

NOTE: Provided that nets are not dripping wet, surveyors can resume netting to meet the minimum 5-hour requirement after short periods of adverse weather. If nets are under good cover, light rain may not alter bat behavior. However, if no bats are being captured during marginal weather, coordinate with the USFWS FO(s).

[36] Current standard federal Section 10 bat permit conditions require prior written approval from the Field Supervisor in the USFWS FO(s) if capture times may exceed 30 minutes.
[37] With prior USFWS FO approval, a survey may be completed after August 15 if it was initiated in time to be completed by August 15 and extenuating weather circumstances resulted in delaying completion. Delays as a result of not meeting the acceptable weather requirements are the ONLY valid justification for surveying after August 15.
[38] If using this guidance for NLEB: Overnight survey temperatures may be lower in northern portions of the NLEB range, please coordinate with the local USFWS FO in the northern portion of the range for any variation in temperature requirements.

APPENDIX B
PHASE 2 or 3 MIST-NETTING

It is typically best to place net set-ups under the canopy where they are out of moonlight, particularly when the moon is half-full or greater. Net set-ups illuminated by artificial light sources should also be avoided.

The shining of lights, and noise should be kept to a minimum with no smoking around the survey sites. In addition, the use of radios, campfires, running vehicles, punk sticks, citronella candles and other disturbances will not be permitted within 300 feet of mist nets (or acoustic detectors) during surveys.

DOCUMENTATION OF INDIANA BAT CAPTURES

If an Indiana bat(s) is captured during mist-netting, protocols for radio-tracking and emergence survey requirements, as provided in Appendix D and E, respectively, should be followed. In addition, the appropriate USFWS FO(s) must be notified of the capture within 48 hours (or in accordance with permit conditions), and the sex and reproductive condition of the bat and GPS coordinates of the capture site should be provided.

Several species of bats from the genus *Myotis* share common features which can make identification difficult; Indiana bats and little brown bats (*Myotis lucifugus)* can be particularly difficult to distinguish. Photo-documentation of all bats captured and identified as Indiana bats and the first 10 little brown bats per project are requested to verify the identifications made in the field.

Photo-documentation should include diagnostic characteristics:

- a ¾-view of face showing ear, tragus, and muzzle
- view of calcar showing presence/absence of keel
- a transverse view of toes showing extent of toe hairs

If a bat from the genus *Myotis* is captured during mist netting that cannot be readily identified to the species level, then species verification may be attempted through fecal DNA analysis. Collect one or more fecal pellets (i.e., guano) from the bat in question by placing it temporarily in a holding bag (15 minutes is usually sufficient, no more than 30 minutes is recommended). The pellet (or pellets) collected should be placed in a small vial (e.g., 1.5 ml) with silica gel desiccant; pellets from each individual bat should be stored in separate vials and out of direct light. Fees charged by independent laboratories for sequencing fecal DNA samples is generally inexpensive (approx. $50 per guano sample), however, it has been challenging to identify labs willing to consistently conduct these analyses. Any additional information and a list of available laboratories will be made available on the Indiana bat webpage on the USFWS's Region 3 website (http://www.fws.gov/midwest/Endangered/mammals/inba/index.html).

APPENDIX B
PHASE 2 or 3 MIST-NETTING

SUBMISSION OF MIST-NETTING RESULTS

Provide results of netting surveys to the appropriate USFWS FO(s) in accordance with previously agreed upon[39] timeframes and formats[40]. If Indiana bats are captured, this report should also include the results of subsequent radio-tracking and emergence counts. Reports should include the following:

1. Copy of prior phase reports (if not previously provided).
2. Explanation of any modifications from original survey plan (e.g., altered net locations).[41]
3. Description of net locations (including site diagrams), net set-ups (include net heights), survey dates, duration of surveys, weather conditions, and a summary of findings.
4. Map identifying netting locations and information regarding net set-ups, including lat/long or UTM, individual net placement, net spacing (i.e., include mist-netting equipment in photographs of net locations), and adequate justification if net set-ups are not evenly distributed across suitable habitat within the project area.
5. Full names of mist-netting personnel attending each mist-net site during an operation, including the federally-permitted/qualified biologist present at each mist-net site. Indicate on the field data sheet the full name of person who identified bats each night at each site.
6. Legible copies of all original mist-netting datasheets (see example datasheet below) and a summary table with information on all bats captured during the survey including, but not limited to: capture site, date of capture, time of capture, sex, reproductive condition, age, weight, right forearm measurement, band number and type (if applicable), and Reichard's wing damage index score (Reichard and Kunz. 2009).
7. Photographs of all net set-ups, as well as **all** Indiana bats and the first 10 little brown bats captured from each project, so that the placement of netting equipment and identification of species can be verified. Photographs of bats should include all diagnostic characteristics that resulted in the identification of the bat to the species level.
8. Any other information requested by the local USFWS FO(s) related to the project.

[39] As discussed in the Introduction, we encourage coordination with USFWS FO(s) prior to implementation of any surveys to ensure that all parties agree upon the need for surveys, the methods proposed, and the decisions from various survey results.

[40] In 2016, Region 3 (R3) of the USFWS is conducting a pilot study to help standardize reporting of bat survey data. In addition to a traditional written report, R3 federal permit holders (and other regions/FOs as requested) will be required to submit their survey data using standardized permit reporting spreadsheets available on the R3 Indiana Bat Summer Survey Guidance webpage (http://www.fws.gov/midwest/Endangered/mammals/inba/inbasummersurveyguidance.html).

[41] If the USFWS previously agreed upon the study plan we need to understand whether the revised work still accomplished the agreed upon methods

APPENDIX C
PHASE 2 ACOUSTIC SURVEYS

SUMMER ACOUSTIC SURVEY SEASON: May 15 – August 15[42]

PERSONNEL[43]

Overall: Acoustic surveyors should have either completed one or more of the available bat acoustic courses/workshops (e.g., BCI, BCM, AnaBat) or be able to show similar on-the-job or academic experience.

Detector Deployment: Acoustic surveyors should have a working knowledge of the acoustic equipment and Indiana bat ecology. Surveyors should be able to identify appropriate detector placement sites and establish those sites in the areas that are most suitable for recording high-quality Indiana bat calls. Thus, it is highly recommended that all potential acoustic surveyors attend appropriate training and have experience in the proper placement of their field equipment.

Acoustic Analysis: Acoustic surveyors should have a working knowledge of the approved acoustic analysis programs. Thus, it is highly recommended that all potential acoustic surveyors attend appropriate training and have experience in the analysis of acoustic recordings.

Qualitative Analysis: Individuals qualified to conduct qualitative analysis of acoustic bat calls typically have experience: (1) gathering known calls. This provides a valuable resource in understanding how bat calls change and the variation present in them; (2) identifying bat calls recorded in numerous habitat types; (3) familiarity with the species likely to be encountered within the project area; and (4) individuals must have multiple years of experience and must have stayed current with qualitative ID skills. A resume (or similar documentation) must be submitted along with final acoustic survey reports for anyone making final qualitative identifications.

COORDINATION WITH USFWS FO(s)

If not already required by federal permit, we recommend that applicants submit a draft study plan for all survey phases to the USFWS FO(s) for review and approval. Study plans should include a map/aerial photo identifying the proposed project area boundaries, suitable bat habitats and acreages within the project area, the proposed number and tentative locations of acoustic monitoring sites, and the identification of the approved acoustic software program(s) (and version #) used for analysis of calls for the specific project. If a single software program is used for analysis, surveyors will not be allowed to switch programs from what was originally identified in their final study plan.

DETECTOR AND MICROPHONE REQUIRED CHARACTERISTICS

Full-spectrum and/or zero-crossing detectors are suitable for use in this survey protocol.

---

[42] With prior USFWS FO approval, a survey may be completed after August 15 if it was initiated in time to be completed by August 15 and extenuating weather circumstances resulted in delaying completion. Delays as a result of not meeting the acceptable weather requirements are the ONLY valid justification for surveying after August 15.

[43] Coordinate with your local FO regarding any state-specific requirements.

Directional, hemispherical, and omnidirectional microphones are acceptable for acoustic surveys. The use of external microphones on an extension cable is the preferred deployment as it further limits degradation of call quality. Recording without after-market directional horns on hemispherical and omnidirectional microphones is preferred as the addition of these systems may result in some signal degradation and directional microphones are commercially available.

Use recommended manufacturer detector settings for conducting Indiana bat P/A surveys.

ACOUSTIC SAMPLING PROTOCOL

Detector/Microphone Placement

Detector/Microphone placement is critical to the successful isolation of high-quality bat call sequences for later analysis. The following locations are likely to be suitable sites for detectors/microphones, including, but not limited to: (a) forest-canopy openings; (b) near water sources; (c) wooded fence lines that are adjacent to large openings or connect two larger blocks of suitable habitat; (d) blocks of recently logged forest where some potential roost trees remain; (e) road and/or stream corridors with open tree canopies or canopy height of more than 33 feet (10 meters); and (f) woodland edges (Britzke et al. 2010). Of equal importance to acoustic site selection is the surveyor's working knowledge of the sampling volume and area of highest sensitivity within the zone of detection around a given microphone, which helps to ensure that detector placement as well as microphone selection and orientation are best suited for a particular site. Detection distance, placement (e.g., location, orientation, height of microphone), and specific features (e.g., vegetation, water, and other obstructions) at the sample site should dictate whether a directional, hemispherical, or omnidirectional microphone is used. If detectors/microphones are placed in unsuitable locations, effective data analysis may be impossible, and the results of the sampling effort will likely be invalid.

Many features (e.g., vegetation, water, wind turbines, high-tensile power-lines, micro-wave towers) can obstruct and reflect call sequences recorded in the field and thereby reduce the surveyor's ability to record high-quality bat call sequences. The following recommendations are provided to aid surveyors in their selection of acoustic sites (also see Chenger and Tyburec 2014). If surveyors choose acoustic sites outside of these recommendations, then adequate justification for doing so should be provided with the acoustic survey report provided to the USFWS FO(s); otherwise, results from these sites will not be accepted. Surveyors should deploy microphones: (a) at least 10 feet (3 meters) in any direction from vegetation or other obstructions (Hayes 2000; Weller and Zabel 2002; Chenger and Tyburec 2014); (b) in areas without, or with minimal[44], vegetation within 33 feet (10 meters) from the microphone; (c) parallel to woodland edges; and (d) at least 49 feet (15 meters) from known or suitable roosts[45] (e.g., trees/snags, buildings, bridges, bat houses, cave or mine portal entrances).

[44] If necessary, surveyors can remove small amounts of vegetation (e.g., small limbs, saplings) from the estimated detection cone at a site, much like what is done while setting up mist-nets. Deployment of detectors/microphones in closed-canopy locations that typically are good for mist-netting are acceptable as long as the area sampled below the canopy does not restrict the ability of the equipment's detection cone to record high-quality calls (i.e., the vegetation is outside of the detection cone).

[45] If the surveyor discovers a potential roost and wishes to document bat use, please refer to Appendix E for guidance on conducting emergence surveys and contact the USFWS FO(s).

Elevating a detector greater than 3 meters above ground level (AGL) vegetation dramatically improves recording quality. Microphones can be attached horizontally to a pole to listen out into flight space, rather than just listening up from the ground. This will serve to increase the volume of airspace sampled and avoid the distortion effect of recording near the ground.

Surveyors should distribute acoustic sites throughout the project area or adjacent habitats. In most cases, acoustic sites should be at least 656 feet (200 meters) apart. If closer spacing is determined to be necessary or beneficial (e.g., multiple suitable habitats and acoustic sites immediately adjacent to each other), sufficient justification must be provided in the acoustic survey report submitted to USFWS FO(s).

Verification of Deployment Location

It is recommended to temporarily attach GPS units to each detector (according to manufacturer's instructions) to directly record accurate location coordinates for each acoustic site that is paired with the acoustic data files. Regardless of technique used, accurate GPS coordinates must be generated and reported for each acoustic survey site.

Verification of Proper Functioning

It is highly recommended that surveyors ensure acoustic detectors are functioning properly through a periodic verification of performance to factory specifications (a service currently offered or in development by several manufacturers). It may be possible that independent service bureaus would be willing to perform this service, providing that a standard test/adjustment procedure can be developed.

It is also recommended to ensure equipment is working during set-up in the field. This can be done simply by producing ultrasound (e.g., finger rubs, calibrator, or follow the equipment manufacturer's testing recommendations) in front of the microphone at survey start and survey finish. These tests document that the equipment was working when deployed and when picked up (and by assumption throughout the entire period). Detector field settings (e.g., sensitivity, frequency, etc.) should follow the recommendations provided by the manufacturer. Surveyors should also save files produced by detectors (e.g., log files, status files, sensor files) as an excellent way to provide documentation when equipment was functioning within the survey period. Many types of detectors allow for setting timers that initiate and end recording sessions. This saves battery life as well as reducing the number of extraneous noise files recorded. However, if the units are visited when the timer is on (i.e., unit is in standby mode), the surveyor cannot verify that the unit is functioning properly. This is particularly important in areas where no bat activity is recorded for the entire night or during the last portion of the night. In these cases, if the surveyor cannot demonstrate that the detector was indeed functioning properly throughout the survey period, then the site will need to be re-sampled, unless adequate justification can be provided to the USFWS FO(s).

Selection of acoustic sites is similarly important. Suitable set-up of the equipment should result in high-quality call sequences that are adequate for species identification. Nights of sampling at individual sites that produce no bat calls may need to be re-sampled unless adequate justification (e.g., areas with significant bat population declines due to WNS) can be provided to the USFWS

FO(s). Modifications of the equipment (e.g., changing the orientation and/or microphone type) at the same location on subsequent nights may improve quantity and quality of call sequences recorded, which can be determined through daily data downloads. If modifications of the equipment do not improve call identification, then the detectors will need to be moved to a new location.

Orientation

Detectors deployed with directional microphones should be aimed to sample the majority of the identified flight path/zone. Omnidirectional microphones deployed on a pole in the center of the flight path/zone should be oriented horizontally. In some circumstances (e.g., forest openings, understory corridors, etc.), it might be desirable to aim a directional microphone vertically or at an angle between horizontal and vertical. Hemispherical microphones should be aimed vertically, creating a dome-like detection field. Hemispherical microphones are best suited for open areas where deploying at heights greater than 3 meters AGL is problematic because of the lack of structure to hide the microphone and prevent it from becoming a novel item of interest to bats. Vertical orientation, however, precludes the use of weatherproofing for protection of the microphone, since no currently-approved weatherproofing system will adequately protect the microphone of a detector aimed vertically. Once acoustic sites are identified, photographs documenting the orientation, detection cone (i.e., "what the detector is sampling"), and relative position of the microphone should be taken for later submittal to the USFWS FO(s) as part of the acoustic survey report (See Submission of Acoustic Survey Results for additional description).

Weather Conditions

If any of the following weather conditions exist at a survey site during acoustic sampling, note the time and duration of such conditions, and repeat the acoustic sampling effort for that night[46]: (a) temperatures fall below 50°F (10°C) during the first 5 hours of survey period; (b) precipitation, including rain and/or fog, that exceeds 30 minutes or continues intermittently during the first 5 hours of the survey period; and (c) sustained wind speeds greater than 9 miles/hour (4 meters/second; 3 on Beaufort scale) for 30 minutes or more during the first 5 hours of the survey period. At a minimum, nightly weather conditions for survey sites should be checked using the nearest NOAA National Weather Service station and summarized in the survey reports.

Weatherproofing

Most bat detectors are not weatherproof when delivered from the factory. Recording without after-market weatherproofing is preferred as the addition of these systems may result in some signal degradation. **The decision to weatherproof detectors or not should be determined nightly based on the likelihood of precipitation in the survey area.** If necessary, detectors should be placed in after-market weatherproof containers and an external microphone, attached by an extension cable should be deployed greater than 3 meters AGL.

[46] With prior USFWS FO approval, a survey may be completed after August 15 if it was initiated in time to be completed by August 15 and extenuating weather circumstances resulted in delaying completion. Delays as a result of not meeting the acceptable weather requirements are the ONLY valid justification for surveying after August 15.

For directional microphones, the use of a polyvinyl chloride (PVC) tube[47], generally in the form of a 45-degree elbow the same diameter as the microphone (Britzke et al. 2010) is acceptable, if the situation requires the use of after-market weatherproofing. Attach the elbow to a weatherproof box that houses the main portion of the detector. Place the microphone into the enclosed end of the elbow and aim the open end of the elbow approximately 40-degrees below the area to be monitored (Corben & Livengood 2014). Again, the preferred option for weatherproofing detectors is to detach the microphone from the detector so that the detector can be placed in a weatherproof container but the microphone (tethered by a cable) remains unobstructed.

Other after-market weatherproofing systems may become available and approved by the USFWS provided they show that call quality and the number of calls recorded are comparable to those without weatherproofing.

MINIMUM LEVEL OF EFFORT

The number of acoustic survey sites required for a project will be dependent upon the overall acreage of suitable habitat proposed to be impacted by the action. To determine the acoustic survey effort, quantify the amount of suitable summer habitat within the project area. NOTE: for projects where other impacts are likely (e.g., collision), ensure that presence/probable absence surveys are designed to cover the entire project area and NOT just the locations where tree removal is planned.

Linear projects: a minimum of 2 detector nights per km (0.6 miles) of suitable summer habitat (See Appendix F).

At least 1 detector location for at least 2 calendar nights.

Non-linear projects: a minimum of 4 detector nights per 123 acres (0.5 km^2) of suitable summer habitat.

2 detector locations per 123 acre "site" shall be sampled until at least 4 detector nights has been completed over the course of at least 2 calendar nights (may be consecutive).

For example:

- 2 detectors for 2 nights each (can sample the same location or move within the site)
- 1 detector for 4 nights (must sample at least 2 locations)

[47] The PVC option has only been tested with AnaBat detectors and directional microphones. It may not perform as well with other detector microphone combinations.

The acoustic sampling period for each site must begin at sunset[48] and ends at sunrise each night of sampling.

ANALYSIS OF RECORDED ECHOLOCATION CALLS

Step 5. Optional coarse screening - for high frequency (HF) or myotid calls (depending on available filters) or Proceed to Step 6.

a) If no positive detection of HF calls (≥35 kHz) or myotid calls, no further summer surveys necessary.

b) If positive detection of HF or myotid calls, then
   i) proceed to Step 6 for further acoustic analysis; **OR**
   ii) assume presence of Indiana bats and coordinate with the USFWS FO(s); **OR**
   iii) assume presence and proceed to **Phase 3**.

Step 6. Conduct Automated Acoustic Analyses for each site that had HF or Myotid calls from Step 5 or ALL sites if Step 5 was not conducted.

Use **one or more** of the currently available 'approved' acoustic bat ID programs[49] (use most current approved software versions available and manufacturer's recommended settings for Indiana bat P/A surveys). 'Candidate' programs are not yet approved by USFWS for stand-alone use for Indiana bat P/A surveys, but may be used in conjunction with one or more of the approved programs. Include your plans for which specific software program(s) you will use in your survey work plan and submit for USFWS FO(s) review prior to conducting surveys. Beginning with acoustic data from night one at each acoustic site, run each night's data for each site through your chosen ID program(s). Review results by site by night from each acoustic ID program used[50].

a) If Indiana bat presence is considered unlikely by the approved and candidate program(s) used in analysis, then no further summer surveys necessary.

b) If Indiana bat presence is considered likely at one or more sites on one or more nights by any approved or candidate program(s) used in analysis, then
   i) proceed to Step 7 for qualitative ID; **OR**

[48] Surveys may need to start a little earlier or later than official sunset times (i.e., at "dusk") in some settings such as a deep/dark forested valleys or ridge tops to avoid missing early-flying bats or capturing late-flying birds, respectively. Sunset tables for the location of survey can be found at: http://aa.usno.navy.mil/data/docs/RS_OneYear.php

[49] Approved and candidate programs are listed at http://www.fws.gov/midwest/Endangered/mammals/inba/surveys/inbaAcousticSoftware.html

[50] The approved acoustic identification programs all have implemented a maximum likelihood estimator (MLE) at this time. If the analysis of collected calls at a given site on a given night results in the probable presence of Indiana bats with high levels of certainty ($P<0.05$), then select one of the options available in Step 6b.

ii) assume presence of Indiana bats and coordinate with the USFWS FO(s); **OR**
iii) assume presence and proceed to **Phase 3**.

Step 7. Conduct Qualitative Analysis of probable Indiana bat calls from Step 6.

At a minimum, for each site/night a program considered Indiana presence likely, review all files from that site/night. Qualitative analysis[51] must also include and present within a written report a comparison of the results of each acoustic ID program by site and night (including: number of call files flagged as probable Indiana bats by each tool used; an evaluation of other species identified by the acoustic ID program; individual file level agreements and disagreements on Indiana bats between programs; and a qualitative analysis of ALL probable Indiana bat call sequences to further evaluate whether the correct ID has been made by the program(s) used).

a) If no visual confirmation of probable Indiana bats, then no further summer surveys necessary.

b) If visual confirmation of probable Indiana bats, then

i) assume presence of Indiana bats and coordinate with the USFWS FO(s); **OR**
ii) assume presence and proceed to **Phase 3**.

SUBMISSION OF ACOUSTIC SURVEY RESULTS

NOTE: All raw data, including log files, MUST be maintained for a period of 7 years and be made available to the USFWS FO(s), if requested. Failure to do so may result in invalidation of survey results.

Provide results of acoustic surveys to the appropriate USFWS FO(s) within 10 days of completing the survey unless otherwise agreed upon with the local USFWS FO(s)[52]. Each acoustic survey report should include the following[53] (also, see checklist at end of this appendix):

1. Copy of habitat assessment (if not previously provided)

[51] Qualitative analysis of each acoustic site and night with probable detections of Indiana bats during Step 6 should include the entire night's high frequency call data and not just those files making it through the acoustic analysis tools as probable Indiana bats in Step 6.
[52] As discussed in the Introduction, we encourage coordination with USFWS FO(s) prior to implementation of any surveys to ensure that all parties agree upon the need for surveys, the methods proposed, and the decisions from various survey results.
[53] In 2016, Region 3 (R3) of the USFWS is conducting a pilot study to help standardize reporting of bat survey data. In addition to a traditional written report, R3 federal permit holders (and other regions/FOs as requested) will be required to submit their survey data using standardized permit reporting spreadsheets available on the R3 Indiana Bat Summer Survey Guidance webpage (http://www.fws.gov/midwest/Endangered/mammals/inba/inbasummersurveyguidance.html).

2. Explanation of any modifications from original survey plan (e.g., altered site locations)[54]
3. Full names of all personnel conducting acoustic surveys, including those that selected acoustic sites and deployed detectors
4. Full name and resume of individual(s) conducting qualitative acoustic analyses (if applicable)
5. Description of acoustic monitoring sites, survey dates, duration of survey, weather conditions, and a summary of findings
6. Table with information on acoustic monitoring and resulting data, including but not limited to: detector GPS coordinates, survey dates, survey hours
7. Map identifying acoustic monitoring locations and a corresponding table including the GPS coordinates. Include arrow(s) showing direction(s) of microphone(s).
8. Photographs of each acoustic site documenting the location of the detector, the orientation of the detector, and the detection cone (i.e., what the detector sampled). Please include detector and something for scale (e.g., vehicle, person) in photographs of acoustic sites.
9. Description of acoustic detector brand(s) and model(s) used, microphone type, use of weatherproofing, acoustic monitoring equipment settings (e.g., sensitivity, audio and data division ratios), deployment data (i.e., deployment site, habitat, date, time started, time stopped, orientation), and call analysis methods used
10. A description of how proper functioning of bat detectors was verified
11. Discussion of what software program(s) was/were used (including settings).
12. Acoustic analysis software program output/summary results by site by night (i.e., number of calls detected, species composition, MLE results)
13. Discussion for any site/nights with zero bat calls (were additional nights added?, was detector functioning?, was placement appropriate?).
14. If manual vetting was used, discussion of how this was done (e.g., what keys were used?). Detailed analysis and results of any qualitative acoustic analysis conducted on those projects where a program(s) considered Indiana bat presence likely, including justification for rejecting any program MLE results (if applicable).
15. Any other information requested by the local USFWS FO(s) related to the project

REFERENCES

[54] If the USFWS previously agreed upon the study plan we need to understand whether the revised work still accomplished the agreed upon methods.

General Checklist for Acoustic Surveys of Indiana Bats

The following items should be documented and clearly presented within acoustic bat survey reports submitted to the Service

.

ACOUSTIC SURVEY INFO

- ☐ Project Name
- ☐ Site ID No./Name
- ☐ State and County
- ☐ Site Lat./Long. Coordinates (e.g., decimal degrees, NAD83)
- ☐ Approx. accuracy of Lat./Long. Coordinates
- ☐ Survey Date(s)
- ☐ Person who Selected Acoustic Site(s)
- ☐ Person who Deployed Detector(s)
- ☐ Detector Brand & Model
- ☐ Microphone Brand & Model
- ☐ Microphone Type: Directional/Hemispherical/Omnidirectional
- ☐ Type of Weatherproofing (if any)
- ☐ Microphone Height above Ground-level Vegetation(m)
- ☐ Distance from Nearest Vegetation or other Obstruction (m)(apart from veg. on ground)
- ☐ Horizontal Orientation of Microphone (1-360°)
- ☐ Vertical Orientation of Microphone (assuming 0° is parallel with horizon)
- ☐ Photographs of Detector Set-up at each Site
- ☐ Detector Settings (all settings used for each brand/model of detector. For example, sensitivity, gain, data division, 16k high filter, sample rate, min./max. duration, min. trigger freq., trigger level, etc.)
- ☐ Survey Start Time (military)
- ☐ Survey End Time (military)
- ☐ Methods used to Field-test proper Functioning of Detector
- ☐ Were calls collected in Full Spectrum or Zero Crossing?
- ☐ Habitat Type and/or Feature Surveyed
- ☐ Weather Conditions during Survey Period

.

ACOUSTIC ANALYSIS INFO

- ☐ Program used to convert Full Spectrum to Zero Cross (if applicable)?
- ☐ Filter(s) used (if any) and parameters used (e.g., CFRead, noise, bug, etc.)
- ☐ Name of Service-approved Bat ID Software Program(s) and Version(s) used and Candidate program(s)(if used)
- ☐ Program Settings (if applicable):
  - o Min. # of pulses for species ID
  - o Min. # of pulses per group ID
  - o Min. discrim. prob. for species ID
  - o Other relevant settings affecting ID
  - o Suite of species/groups included in program analysis
- ☐ Table summarizing Number of Calls ID'd for each Species/Site/Night/Program (including MLE p-values)
- ☐ If Qualitative Analysis was conducted, include Number of Calls Confirmed through Qualitative ID for each Species/Site/Night
- ☐ Full Name of Person(s) who conducted Qualitative Analysis
- ☐ Additional Survey Reporting Requirements
- ☐ Acoustic Report Appendices:
  - o data sheets and maps,
  - o photographs of detector set-ups,
  - o computer screen captures of representative bat species identified during acoustic analyses, and
  - o resume(s) highlighting relevant qualifications of person(s) who conducted qualitative analysis (e.g., experience visually identifying *Myotis*, certificates of training, publications etc.)

APPENDIX D
PHASE 4 RADIO-TRACKING

PERSONNEL

Transmitter Attachment: A qualified biologist[55] who is experienced in handling Indiana bats and attaching radio transmitters must perform transmitter attachments, as further explained in the protocol below.

Tracking: Biological technicians and/or a qualified biologist who is experienced in tracking transmittered bats must be present and actively involved in all tracking activities for Indiana bats as further explained in the protocol below.

METHODS

If one or more Indiana bats are captured, the following radio-tracking protocols will be applicable:

1. Biologists should coordinate in advance with USFWS FO(s) regarding recommendations for the number and distribution of transmitters (e.g., prioritization of sex/age, maximum number per site) and whether foraging data would be beneficial to collect. Also, professional judgment should be used to determine whether attachment of transmitters could compromise the health of a bat. Since the maximum holding times for Indiana bats targeted for radio-tracking is 30 minutes[56], or as allowed in federal and state permits, surveyors should be prepared to place transmitters on bats immediately following their capture to minimize holding times.

2. The radio transmitter, adhesive, and any other markings (e.g., wing bands) should weigh less than 5% of pre-attachment body weight (Aldridge and Brigham 1988, American Society of Mammalogists 1998), the total weight of the package (transmitter and adhesive) may not exceed 6% of the bat's body weight, and must comply with any USFWS and state permits. In all cases, the lightest transmitters capable of the required task should be used, particularly with pregnant females and volant juveniles. With pregnant bats, biologists should always use the lightest transmitter possible but no more than 5% of their expected non-pregnant weight.

3. Proposed radio telemetry equipment (e.g., receivers, antennas, and transmitters) and frequencies should be coordinated with the appropriate state natural resource agency and USFWS FO(s).

4. The qualified biologist or biological technician(s) should track all radio-tagged bats captured to diurnal roosts in accordance with permit requirements. We generally

[55] A qualified biologist is an individual who holds a USFWS Recovery Permit (Federal Fish and Wildlife Permit) for federally-listed bats in the state/region in which they are surveying and/or has been authorized by the appropriate state agency to mist-net for Indiana bats. Several USFWS offices maintain lists of qualified bat surveyors, and if working in one of those states with authorizations in lieu of a Recovery Permits, the individual will either need to be on that list or submit qualifications to receive USFWS approval prior to conducting any field work.
[56] Current standard federal Section 10 bat permit conditions require prior written approval from the Field Supervisor in the USFWS FO(s) if capture times may exceed 30 minutes

recommend tracking until the transmitter fails, fall off, or cannot be located for at least 7 days and should conduct a minimum of 2 evening emergence counts at each identified roost (See Appendix E for Emergence Survey Protocols). However, biologists are encouraged to continue radio-tracking efforts for the life of the transmitter. Biologists should contact the USFWS FO(s) immediately if they plan to cease tracking efforts before the 7-day tracking period ends. If landowner access is denied, approximate roost locations (i.e., coordinates) should be determined using triangulation.

5. Daily radio telemetry searches for roosts must be conducted during daylight hours and should be conducted until the bat(s) is located or for a minimum of 4 hours of ground or 1 hour of aerial-searching effort per tagged bat per day for 7 days. However, multiple bats captured at the same net location or nearby may be tracked simultaneously. Once a signal is detected, tracking should continue until the roost is located. At a minimum, biologists should document all ground and aerial-searching effort for all bats not recovered during radio-tracking for submittal with the survey report. For each roost identified during tracking, the biologist should complete a "USFWS Indiana Bat Roost Datasheet".

6. To minimize potential for disease transmission, any equipment that comes in contact with bats should be kept clean and disinfected, following approved protocols; this is particularly a concern relative to WNS. Protocols are posted at http://www.whitenosesyndrome.org/. Federal and state permits may also have specific equipment restrictions and disinfection requirements.

SUBMISSION OF RADIO-TRACKING RESULTS

Phase 4 radio-tracking results should be included with the Phase 2 or 3 mist-netting report and submitted to the appropriate USFWS FO(s). Each report should include the following information related to radio-tracking efforts[57]:

1. Copy of prior phase reports (if not previously provided)
2. Explanation of any modifications from original survey plan (e.g., number of transmitters used, frequency of transmitters changed)[58]
3. Map and narrative detailing all ground and aerial searching effort for all bats not recovered during radio-tracking and relative to the negotiated or agreed effort as determined by the appropriate USFWS FO(s)
4. Map summarizing Indiana bat data collected from summer surveys for the proposed project (e.g., project area boundary and results from the site habitat assessment, acoustic survey, mist-net survey, radio-tracking, and emergence surveys)

[57] In 2016, Region 3 (R3) of the USFWS is conducting a pilot study to help standardize reporting of bat survey data. In addition to a traditional written report, R3 federal permit holders (and other regions/FOs as requested) will be required to submit their survey data using standardized permit reporting spreadsheets available on the R3 Indiana Bat Summer Survey Guidance webpage (http://www.fws.gov/midwest/Endangered/mammals/inba/inbasummersurveyguidance.html).

[58] If the USFWS previously agreed upon the study plan we need to understand whether the revised work still accomplished the agreed upon methods

5. Full names and permit numbers of personnel who attached transmitters to Indiana bats and full names of all personnel conducting radio-tracking efforts
6. Photographs of all roosts identified during radio-tracking
7. Legible copies of all original USFWS Indiana Bat Roost Datasheets
8. Any other information requested by the local USFWS FO(s) where work was conducted

APPENDIX E
PHASE 4 EMERGENCE SURVEYS

PERSONNEL

Qualified biologists[59], biological technicians, and any other individuals deemed qualified by a local USFWS FO may conduct emergence surveys for Indiana bats by following the protocols below.

EMERGENCE SURVEYS FOR KNOWN INDIANA BAT ROOSTS

The following protocols should begin as soon as feasible after identification of a diurnal roost (ideally that night):

1. Bat emergence surveys should begin one half hour before sunset[60] and continue until at least one hour after sunset or until it is otherwise too dark to see emerging bats. The surveyor(s) should be positioned so that emerging bats will be silhouetted against the sky as they exit the roost. Tallies of emerging bats should be recorded every few minutes or as natural breaks in bat activity allow. There should be at least one surveyor per roost. Surveyors must be close enough to the roost to observe all exiting bats but not close enough to influence emergence. That is, do not stand directly beneath the roost, do not make noise or carry on a conversation, and minimize use of lights (use a small flashlight or similar to record data, if necessary). Do not shine a light on the roost as this may prevent or delay bats from emerging. Use of an infra-red, night vision, or thermal-imaging video camera or spotting scope is encouraged but not required. Likewise, use of an ultrasonic bat detector may aid in identifying the exact timing of bats emerging and may be used to help differentiate between low- and high-frequency bats species, and therefore, is strongly recommended. If multiple roosts are known within a colony, then simultaneous emergence surveys are encouraged to estimate population size. [Note: If a roost cannot be adequately silhouetted, then the local USFWS FO(s) should be contacted to discuss alternative survey methods].

2. Bat activity is affected by weather; therefore emergence surveys should not be conducted when the following conditions exist: (a) temperatures that fall below 50°F (10°C); (b) precipitation, including rain and/or fog, that exceeds 30 minutes or continues intermittently during the survey period; and (c) sustained wind speeds greater than 9 miles/hour (4 meters/second; 3 on Beaufort scale).

3. Surveyors should use the attached (or similar) “Bat Emergence Survey Datasheet”.

[59] A qualified biologist is an individual who holds a USFWS Recovery Permit (Federal Fish and Wildlife Permit) for federally-listed bats in the state/region in which they are surveying and/or has been authorized by the appropriate state agency to mist-net for Indiana bats. Several USFWS offices maintain lists of qualified bat surveyors, and if working in one of those states with authorizations in lieu of a Recovery Permits, the individual will either need to be on that list or submit qualifications to receive USFWS approval prior to conducting any field work.

[60] Surveys may need to start a little earlier or later than one half hour before official sunset times (i.e., before “dusk”) in some settings such as deep/dark forested valleys or ridge tops, respectively. Sunset tables for the location of survey can be found at: http://aa.usno.navy.mil/data/docs/RS_OneYear.php

4. Surveyors should also complete an "Indiana Bat Roost Datasheet" for each roost known to be used by one or more Indiana bats (see Appendix D for an example).

5. Completed datasheets should be included in reports prepared for the USFWS.

EMERGENCE SURVEYS FOR POTENTIAL INDIANA BAT ROOSTS

In some limited cases (e.g., individual hazard tree removal during the active season), surveyors may have the option of conducting emergence surveys for individual potential Indiana bat roosts to determine use prior to removal. The following protocol applies to these surveys:

1. Consult with the local USFWS FO(s) to determine whether a tree(s) that needs to be felled/ cleared may be potential roosting habitat for Indiana bats and whether conducting an emergence survey is an appropriate means of avoiding take of Indiana bats[61]. In general, the USFWS only approves of conducting emergence surveys as a means of avoiding direct take of bats for projects that only affect a very small number of potential roosts (e.g., less than or equal to 10)[62] in relatively small project areas. An online directory of USFWS offices is available at: http://www.fws.gov/offices/.

2. If the USFWS FO(s) approves/concurs with Step 1, then follow the emergence guidelines for Emergence Surveys for Known Indiana Bat Roosts (above) to determine if any bats are roosting in the tree(s).

3. At the conclusion of the emergence survey:

    a. If **no** bats were observed emerging from the potential roost(s), then it maybe felled immediately. If safety concerns dictate that a tree cannot be felled immediately (i.e., in the dark), then the tree(s) should be felled as soon as possible after sunrise on the following day. If a tree is not felled during the daytime immediately following an emergence survey, then the survey has to be repeated, because bats may switch roosts on a nightly basis. Immediately after the tree is felled, a visual inspection of the downed tree must be completed to ensure that no bats were present, injured, or killed. The USFWS FO(s) should be contacted immediately, if bats are discovered during this inspection.

    b. If **1 or more** bats (regardless of species, because species identification cannot reliably be made during visual emergence counts alone) are observed emerging from the roost, then it should **not** be felled, and the USFWS FO(s) should be contacted the next working day for further guidance.

[61] If a potential bat roost tree poses an imminent threat to human safety or property, then emergency consultation procedures should be followed as appropriate. (50 CFR §402.05). If a hazard tree does not pose an imminent threat, then the USFWS requests that it be felled during the bat's inactive season (i.e., generally from October – March, but contact the FO for specific dates for your area.) When possible, felling of potential roost/hazard trees should be avoided during the primary maternity period (June – July) to avoid potential adverse effects to non-volant pups.
[62] Areas containing >10 hazard trees will be assessed by the USFWS on a case-by-case basis with the project proponent.

APPENDIX E
PHASE 4 EMERGENCE SURVEYS

SUBMISSION OF EMERGENCE SURVEY RESULTS

Emergence survey results should be included with the mist-netting survey report, unless the survey was completed as an evaluation of potential roosts, and should be submitted to the appropriate USFWS FO(s) for review. Each survey report should include the following information related to emergence survey efforts[63]:

1. Copy of prior phase reports (if not previously provided)
2. Explanation of any modifications from the Phase 4 emergence count study plan (e.g., number of potential roosts surveyed), if applicable
3. Summary of roost emergence data
4. Map identifying location of roost(s) identified during radio-tracking and/or emergence surveys for Indiana bat(s) including GPS coordinates
5. Full names of personnel present during emergence survey efforts and who conducted emergence surveys of roosts
6. Photographs of each identified roost
7. Copies of all "Emergence Survey" and "Indiana Bat Roost" datasheets
8. Any other information requested by the local USFWS FO(s) where work was conducted
9. Copy of the pre-approved site-specific written authorization from USFWS and/or state natural resource agency (if required)

[63] In 2016, Region 3 (R3) of the USFWS is conducting a pilot study to help standardize reporting of bat survey data. In addition to a traditional written report, R3 federal permit holders (and other regions/FOs as requested) will be required to submit their survey data using standardized permit reporting spreadsheets available on the R3 Indiana Bat Summer Survey Guidance webpage (http://www.fws.gov/midwest/Endangered/mammals/inba/inbasummersurveyguidance.html).

APPENDIX F
LINEAR PROJECT GUIDANCE

For linear projects (e.g., pipelines and roadways), surveyors have the option to use either mist nets or acoustic detectors in any given 1-km segment of suitable habitat. A survey site may also cover other associated linear project facilities (e.g., access roads) that are located within a pre-determined distance of each segment. When possible, surveyors should seek out the best available survey sites located within the footprint of the project alignment, and directly adjacent to, or near, the alignment if no suitable sites are available within the footprint. Because the best survey sites for capturing/detecting bats may fall outside of a project footprint, the surveyor and project proponent should coordinate with the appropriate USFWS FO to establish a project-specific maximum distance from the centerline or project boundary prior to initiating surveys.

Tentative survey site locations along linear projects should be included in a proposed study plan to be reviewed and approved by the USFWS FO. One site should be surveyed within each approximate 1-km segment that contains suitable forested habitat along the proposed workspace. It is not appropriate to cumulatively add up each habitat block crossed until 1km of habitat has been traversed. Segments along a linear project that do not contain suitable habitat should be skipped until the next patch of suitable habitat is encountered (Figure 1). Establishing exactly how many survey sites are needed for presence/absence surveys along a linear project often involves some give and take particularly in fragmented habitat areas (Figure 1, rows B and C). The final number of survey sites could be greater than the minimum number of sites prescribed in the protocol in order to adequately cover the areas of suitable habitat to be impacted. When available, habitat quality and quantity (e.g., size and location of suitable maternity roost trees) from on-the-ground habitat assessments can be used to fine tune and guide the placement of survey sites. In some marginal habitat areas, the quality and quantity of the existing habitat may be low enough to justify skipping some survey segments (e.g., Figure 1, Site 11). Likewise, some isolated woodlots, fencelines or individual trees may be considered too isolated and/or small to independently support bats and may be skipped if the USFWS FO concurs. Habitat suitability in fragmented areas should be assessed on a site-specific basis and consider habitat configuration and connectivity to other suitable habitat patches. In general, we recommend surveying a few more sites for a project than the absolute minimum required.

In instances where a mist netting survey has been proposed, but no suitable mist net sites can be found or accessed within a particular segment, biologists should contact the USFWS FO for further guidance or ideally agree in advance as to how such situations will be handled when encountered in the field (e.g., an acoustic survey may be substituted). Similarly, if an area of forest habitat that seemed suitable from aerial photography appears to be unsuitable or of particularly low quality upon field inspection, then you should coordinate with the USFWS FO to determine if an area may be exempted from surveys. To avoid problems, any significant departures from previously agreed to survey plans should be justified and coordinated with the USFWS FO prior to leaving the field.

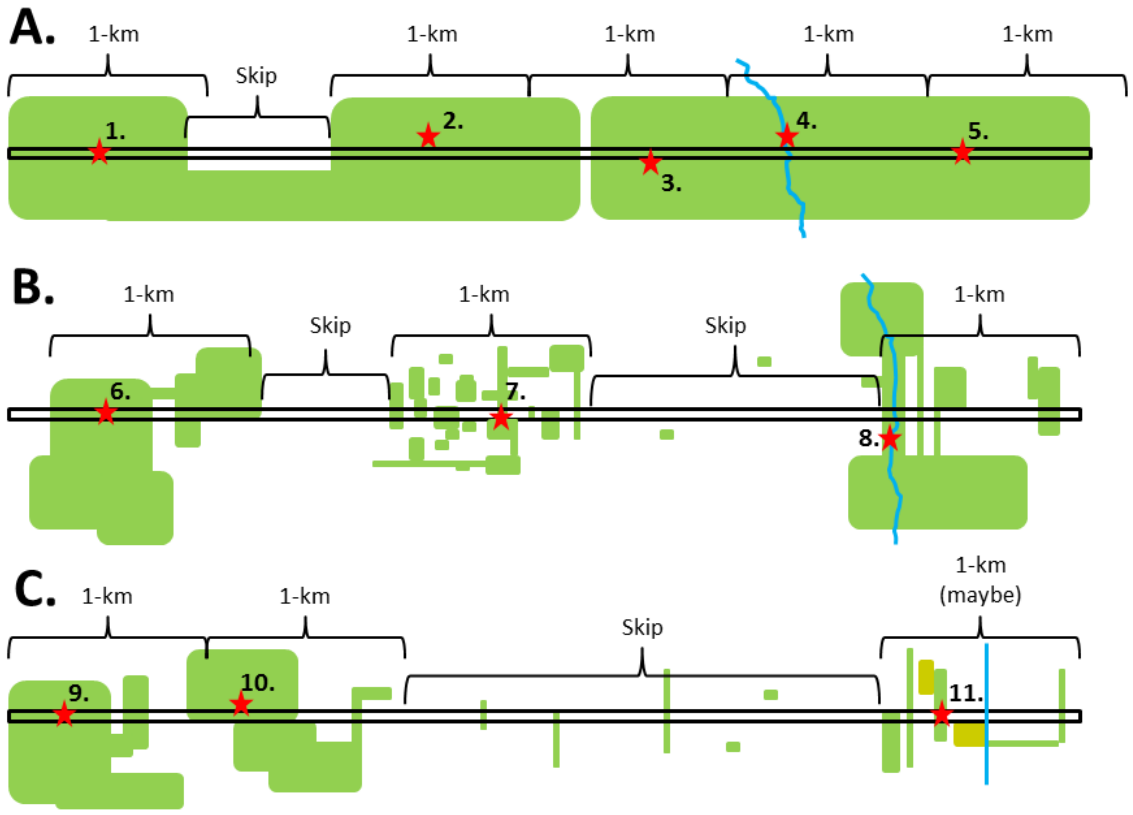

FIGURE 1. Conceptual linear project (black double lines) through relatively contiguous (A.) and fragmented (B. and C.) forested habitats (green patches) delineated into approximate 1-km survey sections. Numbered red stars represent suitable survey sites (1-11) on or near the project boundaries. Blue lines represent natural streams (A. and B.) and a ditch (C.). Yellow-green patches near Site 11 represent low-quality habitat.

1.0 INTRODUCTION

Tetra Tech, Inc., was contracted to collect information on the federally-threatened northern long-eared bat (*Myotis septentrionalis*) (MYSE) at Naval Auxiliary Landing Field Fentress (NALF Fentress or Installation) near Chesapeake, Virginia. The survey concentrated on areas of interest as identified by the Navy, including forested area threatened for removal due to Airfield Height Obstruction concerns associated with Aviation Safety Requirements (Figure 1-1). In accordance with the work plan (Tetra Tech 2015), the objective of this project was to determine the presence or absence of MYSE following protocols established by the United States Fish and Wildlife Service (USFWS) and detailed in the *Northern Long-Eared Bat Interim Conference and Planning Guidance* (USFWS 2014a) and the *2014 Range-Wide Indiana Bat Summer Survey Guidelines (USFWS 2014b)*. This survey included presence/absence mist-net field capture, radio-tracking, delineating home range or known habitat, and roost emergence surveys.

Mist-netting efforts were concentrated in suitable MYSE habitat within the areas of interest and nets were strategically placed in flight paths, often near drinking water, to maximize chances of catching MYSE. Mist-netting allows both a snapshot of what species, and in what abundance, are utilizing the areas of interest and provides an opportunity to attach radio-transmitters. Species identification through mist-netting is also more reliable then acoustic recording alone.

Female MYSE were targeted for radio-telemetry to discover if these bats were using maternity roosts on the Installation and, if so, to characterize their roost choices. Once the roosts were found, emergence counts were performed to detect the presence of maternity colonies. Maternity colonies are of special interest because they must be protected in white-nose syndrome areas under the threatened species 4(d) rule (USFWS 2016). The compilation of capture sites and multiple roost sites enabled a home range, or known habitat, analysis to determine what areas of the Installation were being utilized by MYSE. Information collected on MYSE presence and range can be used by natural resource managers to make informed land-use decisions on the Installation in areas occupied by this vulnerable species.

2.0 SPECIES BACKGROUND

In July 2011, the USFWS was petitioned to list MYSE and the eastern small-footed bat (*Myotis leibii*) on the federal Endangered Species List as Endangered or Threatened, and to designate critical habitat, under the Endangered Species Act (ESA) of 1973 (76 Federal Register [FR] 125). On 02 October 2013 USFWS released the results of their 12-Month Finding on the 2011 petition, which concluded that listing for the MYSE was warranted, and the species was proposed for federal listing as endangered (79 FR 191). The USFWS published their final listing of MYSE, however, as a threatened species and issued an interim 4(d) rule in the *Federal Register* on 02 April, 2015. The rule went into effect on 04 May, 2015. The interim rule was replaced by the final rule on 14 Jan 2016 (USFWS 2016).

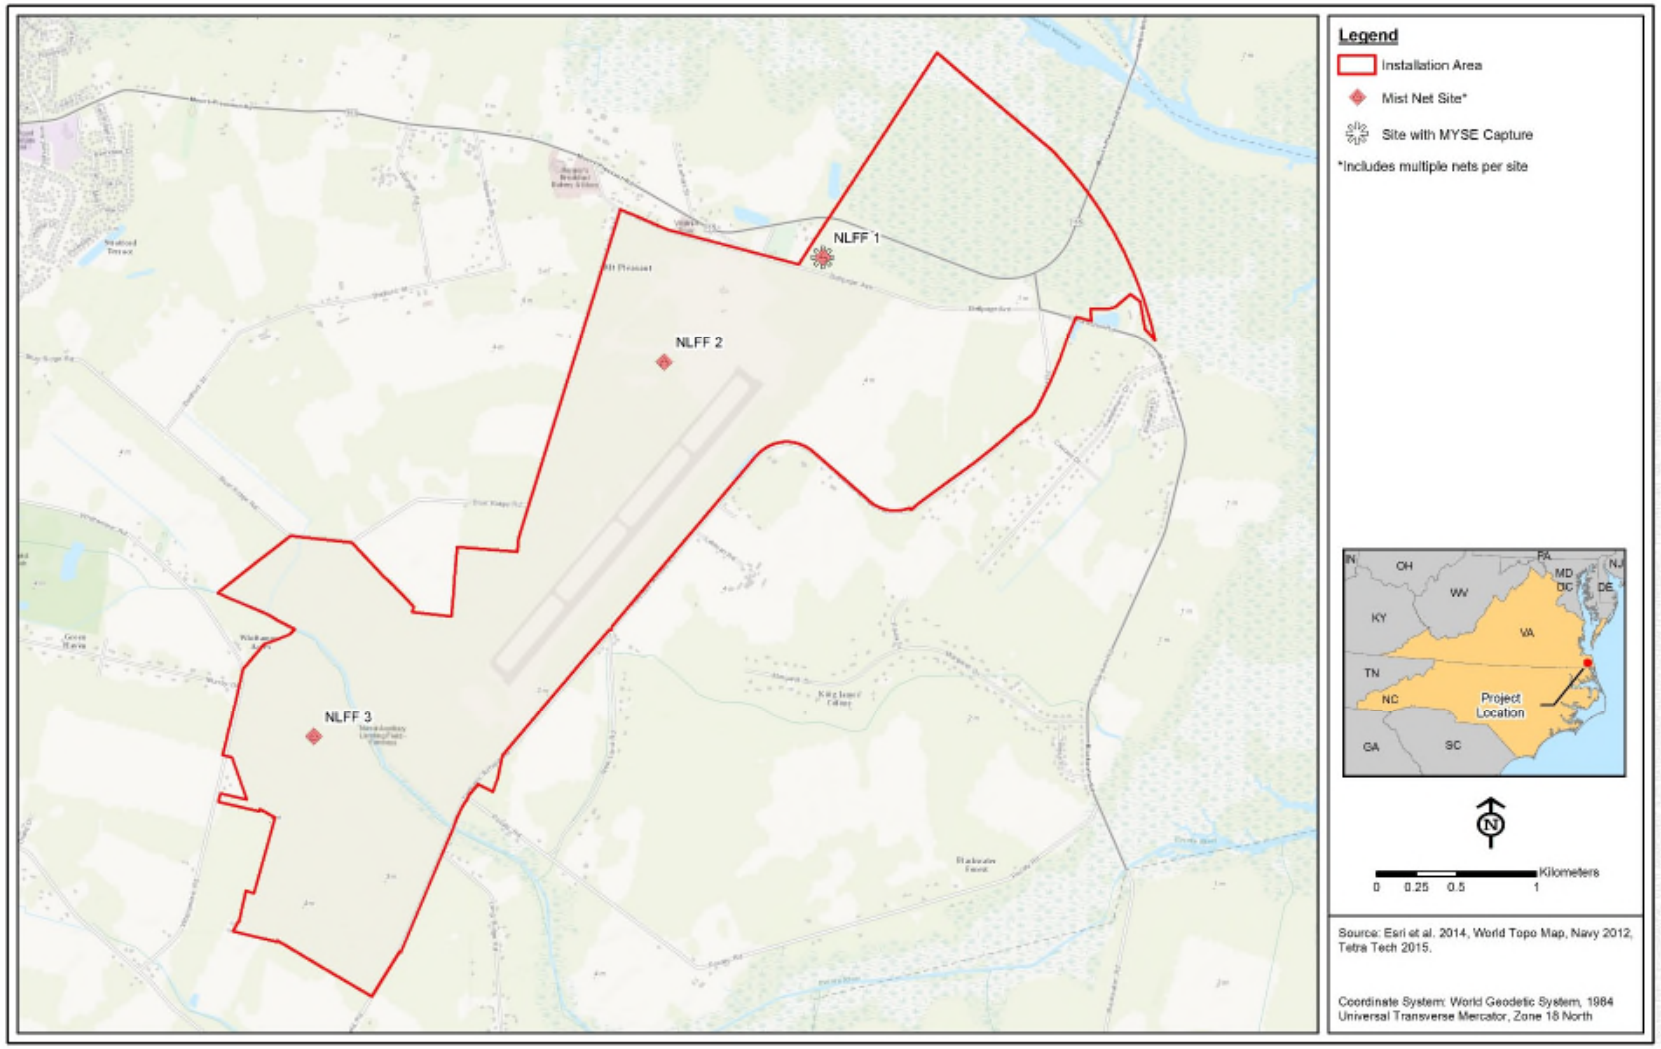

Figure 1-1. Regional Setting and Mist Netting Locations of NALF Fentress, Virginia.

MYSEs occur throughout forested portions of the northeastern United States and in eastern, central, and northern Canada (79 FR 191). Historically, the species was patchily-distributed, and less common in the southern and western portions of its range (Barbour and Davis 1969). Population density seems to have been highest in the northern portion of the species' range, which includes much of the eastern United States (Harvey 1992).

MYSE are an obligate forest-dwelling species, adapted to gleaning and hawking for insects in the sub-canopy in deciduous and mixed forests. Foraging occurs entirely within forested areas but is not restricted to mature forests. MYSE forage primarily below the canopy in the understory, or in sub-canopy shrub layers. Foraging is often concentrated in forested upland areas, but may also occur in forest clearings, above roadways and trails, or near water (79 FR 191). These habitat requirements and behavioral patterns relate directly to the potential for the Installation to support MYSE.

Summer roosts provide MYSE with a thermally-stable environment, as well as protection from the elements and predators (Owen *et al.* 2002). Day roost selection by MYSE is dependent upon the presence of suitable live or dead (snag) trees having cavities, crevices, or exfoliating bark for roosting, although man-made structures and caves may also be used for roosting. Throughout their range, MYSE roost in a variety of tree species, using specific trees based on their suitability to retain bark or provide cavities or crevices. Isolated trees may also be used as roosts, provided they are within 1,000 feet of another suitable roost tree or forested area (USFWS 2014a). MYSE roost alone or in small maternity colonies and switch roosts often; on average, lactating females appear to switch roosts every two to five days (Menzel *et al.* 2002; Sasse and Perkins 1996).

Two studies conducted in West Virginia identified black locust (*Robinia pseudoacacia*) as a preferred roost tree for both male and female MYSE, although locust roosts accounted for only 34% of potential roosts (Ford *et al.* 2006 and Owen *et al.* 2002). A 2003 study of male MYSE day-roost selection in West Virginia identified 13 roosts in black locust (five snags and eight live trees), one roost in sassafras (*Sassafras albidum*) (snag), and two sugar maple (*Acer saccharum*) (live) (Ford *et al*. 2006). All of the live-tree roosts were medium–large, canopy-dominant trees characterized by substantial amounts of exfoliating bark and numerous broken limbs and cavities. Live-tree roosts tended to be larger than other trees in the vicinity. Roosts located in snags were smaller than the live trees and other snags in the vicinity. It is likely that MYSE exhibit a strong preference for selection of roosts within older forest stands that contain many large trees and snags with exfoliating or plate-like bark or cavities (Ford *et al*. 2006).

Unlike true long-distance migratory bats (*Lasiurus* spp. and *Lasionycteris* spp.), MYSE do not undertake long-distance migrations between summer and winter ranges, but do make shorter distance movements between summer roosts and winter hibernacula. MYSE arrive at hibernacula in August or September, begin hibernation in October and November, and leave for

summer habitats in March or April (79 FR 191). MYSE hibernate in caves and mines, as well as in man-made structures. The species prefers large hibernacula with large entrances and, although MYSE are often found with other *Myotis* species, they prefer cooler temperatures and higher humidity than little brown bats (*Myotis lucifugus*). Individuals may hibernate in cracks and crevices in hibernacula walls, and may be overlooked during winter surveys. The species has also been found in less traditional hibernacula, including dams and dry wells, and may utilize man-made structures more frequently than previously thought, especially in the northeast (USFWS 2013).

Significant decreases in populations of MYSE have occurred over the last five years, primarily as a result of White-Nose Syndrome (WNS), a fungal pathogen responsible for unprecedented mortality of hibernating bats, with an estimated 5.7 million bats killed since the discovery of WNS in the United States. WNS was first discovered in eastern New York in February 2006 and has now been documented in at least 19 states and four Canadian provinces. Precipitous declines have been documented for the MYSE and eastern small-footed bats over the last three years with an estimated loss greater than 1 million bats. Other threats to MYSE include loss and fragmentation of forested habitat, alteration to traditional hibernacula, and anthropogenic sources of mortality including wind energy facilities (USFWS 2014a).

3.0 METHODS

3.1 CAPTURE

Per the USFWS Guidelines, mist-net surveys were conducted within the 15 May – 15 August 2015 survey window and were completed over six nights from 18 Jun 2015 to 23 Jun 2015 for a total of 42 net-nights. The required federal (TE63633A-3) and state collection permits (VADGIF 051933) were obtained by Tetra Tech's subcontractor, Biodiversity Research Institute (BRI), for completion of these tasks (Appendix C). During the six-night survey window, bats were captured at three locations within the areas of interest (Figure 1-1). Coordinates for each mist-net are provided in Appendix E and photos in Appendix F. Mist-net survey sites were typically surrounded by mature trees that potentially provide good roosting habitat and a clear path to foraging areas for bats leaving their roosts. Two two-person teams, each operating two to three nets, conducted the mist-netting survey and one USFWS-approved biologist monitored all survey activities.

A combination of triple-high (three nets stacked upon another, 7.8 meters height), double-high (two nets stacked upon another, 5.2 meters height), and single-high (2.6 meters height) nets were set up each night (Figure 3-1). Depending on the site, nets varied in length from 6 to 12 meters and were positioned to maximize coverage of flight paths, including suitable travel corridors, foraging areas, and/or drinking areas. These areas are of interest since they act as corridors and funnel bats toward the nets. Nets were set at dusk and monitored until at least 00:15 hours, for a minimum of 5 hours. If bats continued to be captured, nets were left up until as late as 01:30 hours.

Bats were live-caught in mist-nets and released unharmed near the point of capture. Nets were checked at 10-minute intervals and processing was completed within 30 minutes from the time the bat was removed from the net. Biological and morphometric data was recorded for each individual captured (e.g., time of capture, capture net, species, sex, age class, reproductive condition, mass, and forearm length) and provided in Appendix E. A juvenile bat is generally considered less than 1 year old and determined through the observation of a long smooth joint demonstrating incomplete epiphyseal ossification (fusion) of the metacarpal-phalangeal joint that are not present in the ossified knobby adult joints. Bats become reproductively active around 1 year old. Each bat was also banded on the forearm with a unique number for later identification. Representative photographs of various individuals were taken as per the federal guidelines (2014a) (Figure 3-2) (Appendix G). Time, weather, global positioning system location of each net site and hourly weather conditions were also recorded. Data was recorded in Chiro, an IPad application, for ease of tracking and compiling data and to reduce human error. Captured female MYSE were fitted with a radio transmitter.

Caution was taken during mist-net activities to minimize the potential for transmitting WNS by following the most recent decontamination protocols (USFWS 2008). For example, bats were held in paper bags until processed, and holding bags were disposed of after each use. Bats were evaluated for potential WNS infection following the *Wing-Damage Index Used for Characterizing Wing Condition of Bats Affected by White-nose Syndrome* (Reichard, no date).

3.2 RADIO-TELEMETRY, HOME RANGE, AND ROOSTS

Female MYSE were targeted for attaching transmitters because they form maternity colonies during the summer months (Menzel *et al*. 2002). Male MYSE generally roost solitarily and, therefore, were not a priority for the USFWS from a radio-tracking standpoint. Female MYSE were fitted with Advanced Telemetry Solutions (ATS) radio-transmitters (Appendix D). Coordination with Installation tenant commands was required to obtain approval for types of transmitters/receivers and ranges of frequencies that could be utilized on the Installation due to potential conflicts with military communication requirements. The transmitters were the smallest commercially available, weighing only 0.29 grams and representing less than 5% of each bat's body mass. Fur was removed from between the scapulae and the transmitter was attached to the bare skin using Skin Bond surgical cement. The radio transmitter was tested for functionality before releasing the bat.

Female MYSE were tracked both by vehicle and on foot to facilitate collection of data necessary to determine home range as outlined in the USFWS *Northern Long-Eared Bat Interim Conference and Planning Guidance* (USFWS 2014a). Following the night of capture, bat locations were identified using the homing technique specified in White and Garrot (1990). ATS R4000 receivers (Advanced Telemetry Systems, Isanti, MN) and Yagi antennas were used during radio-tracking efforts (Appendix D). The ATS transmitters have about a 300-meter range of detection. MYSE home ranges were estimated using a 3-mile buffer around a capture site if no other information was available for that individual (no radio telemetry), per USFWS guidelines. Home range for MYSE with known capture and roost site information were created using a buffer of 1.5 miles surrounding the mapped capture and roost site(s).

MYSE fitted with radio transmitters were tracked for six consecutive day's post-capture according to the USFWS protocols for identifying roosting sites. Once a MYSE roost was found through radio-telemetry, emergence counts were conducted using methods outlined in Section 3.3.

3.3 EMERGENCE COUNTS

Roosting sites identified by radio-telemetry were monitored for emergence counts following methodologies outlined in the USFWS protocol (USFWS 2014b). A minimum of two evening-emergence counts were conducted at all roosts located via radio-tracking. A biologist would position themselves at the site of the roost tree around dusk each night (about ½ hour before sunset) and count the number of bats emerging from the tree until about one hour after sunset or until it was too dark to see emerging bats. The positioning of the biologist(s) conducting the emergence counts was in a location suitable for observing emerging bats silhouetted against the sky. Biologists also positioned themselves close enough to the roost to observe emerging bats, but not so close as to influence emergence. Therefore, biologists did not stand directly beneath the roost. Biologists minimized noise and use of artificial light sources (i.e. flashlight) when in the vicinity of the roost. Emergence counts were not conducted if during the 30 minutes before and during the observation temperatures were below 50 degrees Fahrenheit, precipitation was occurring for at least 30 minutes or intermittently (including rain or fog), or if wind speeds exceeded 4 meters/second due to reduced activity during these conditions.

4.0 RESULTS

4.1 CAPTURE

A total of 89 bats representing seven species were captured during the 18 June 2015 to 23 June 2015, 42-net-night survey conducted within the area of interest at NALF Fentress (Table 4-1 and Figure 1-1). Four MYSE were captured. The majority of bats trapped (*61%*) were evening bats (*Nycticeius humeralis*) followed by big brown bats (*Eptesicus fuscus*) *(15%*) and southeastern bats (*Myotis austroriparius)* (11%). Also captured were Rafinesque's big-eared bat (*Corynorhinus rafinesquii*), eastern red bat (*Lasiurus borealis*), and little brown bats (*Myotis lucifugus*). One bat

escaped before metrics were taken and one was released immediately because it had a broken or dislocated leg.

All bats caught were adults (over 1 year in age) of which 61% were female and 39% were male. Of female bats caught, 98% were lactating and 2% were non-reproductive. Of male bats caught, 83% had descended testes and 11% were non-reproductive. No bats exhibited any noticeable wing damage (bats were 1 or 0 on Reichard Wing Damage Index).

The three adult female MYSE and one adult male were captured at mist-net Site 1 in multiple nets (Table 4-2). The three females were equipped with a radio-transmitter for radio-tracking. Habitat associated with the capture sites included mixed mature forest (red maple [*Acer rubrum*], sweet gum [*Liquidambar styraciflua*], and loblolly pine [*Pinus taeda*]).

4.2 RADIO-TELEMETRY, HOME RANGE, AND ROOSTS

During capture, three female MYSE were fitted with an ATS radio transmitter. Following the initial night of capture, the three radio-tagged bats were tracked for six consecutive days and all were subsequently picked up by the radio-telemetry equipment (Table 4-3). The radio-transmitters may have fallen off prematurely due to glue melt from the heat and high humidity.

The first lactating female (Freq. 148.642) was radio-tracked for three non-consecutive days back to its respective roosts on 19, 21, and 24 June 2015. The female used the same roost twice and showed a preference for red maple roosts, both live and dead. A bark roost was used in the dead tree that had 10% canopy cover. The live tree had 80% canopy cover and the largest roost tree diameter at breast height (30 cm) observed in this survey.

Since multiple roosts were documented via radio-telemetry, the home range of MYSE 148.642 was delineated by first drawing a polygon around the three roosts. Secondly, since the capture site was within 1.5 miles of the multi-roost polygon, the known home range was defined as all suitable habitat within a 1.5-mile radius of the multi-roost polygon (Figure 4-2). The farthest distance between two known locations, however, was actually under 1,800 ft. Approximately 4,956 acres fall within the 1.5-mile radius, 1,501 acres of which is inside the Installation boundary. After extracting unsuitable, non-forested habitat, 30% of the habitat in this female's home range is within NALF Fentress.

The second lactating female (Freq. 148.672) was successfully radio-tracked for three consecutive nights from 19 June to 21 June 2015 (Table 3-3). This female chose dead red maples (Figure 3-1) with 80% of bark remaining in close proximity of each other and one unknown tree. These trees had varying canopy cover (10, 30, and 70%). Roost A was found in a downed red maple lying almost horizontal suspended over the water. Home range was similarly calculated as above for MYSE 149.823 (Figure 4-3). Approximately 5,092 acres fall within the 1.5-mile radius; however, 2,509 acres of this is not considered suitable habitat (i.e., non-forested habitat). Again, only 30% of suitable habitat within the female's home range is within the Installation boundary. Although the calculated suitable habitat is large, the farthest distance between two known bat locations was only approximately 1,200 ft.

The third non-reproductive female (Freq. 148.813) was tracked for one night on 25 June 2015 (Figure 3-4). The exact tree was unable to be located due to the difficult terrain, although triangulation on the radio signal revealed that it was roosting in a red maple swamp. Home range was similarly calculated as above for MYSE 149.837 (Figure 4-4). The longest distance between know bat locations was 4,300 ft. Approximately 4,521 acres fall within the 1.5-mile radius; however, only 61% of this is considered suitable habitat (i.e., forested habitat). Much of this suitable habitat (77%) does not fall within the Installation boundary.

All known roosts were in red maple trees, predominantly dead, with more than 50% of bark remaining. These trees were all 18-30-cm diameter at breast height with large variation in heights (7-37m). There was no pattern in percent canopy cover, which ranged from 10 to 70%. (Table 4-3). Roost trees were predominantly found in a red maple and green ash (*Fraxinus pennsylvanica*) forest with a few loblolly pines.

The lone male MYSE was not fitted with a radio-transmitter (figure 4-5). In the absence of roost site locations, home range was calculated as a 3-mile buffer from capture location based on USFWS guidelines. Approximately 18,080 acres fall within the 3-mile radius, but only 55% of this is considered suitable habitat, of which 1,067 is within the Installation boundaries or 11%.

4.3 EMERGENCE COUNTS

Emergence counts were conducted at the known MYSE roosts of two of the three female radio-tagged bats between 19 and 22 June 2015 (Table 4-4). The observed emergence counts were typical of this species with a maximum of 8 bats emerging in one evening. Maternity groups of less than 100 individuals and with a mean colony size of 11 bats, for example, were found at a study in New Hampshire (Sasse and Perkins 1996).

Emergence counts were unable to be performed on the female 148.813 because the roost location was only triangulated and not visually found. The roost tree was deep inside a maple swamp that was deemed a human health and safety hazard for travel during the night without the proper safety gear.

Table 4-4. Summary of Emergence Counts at Northern Long-Eared Bat Roost Tree at NALF Fentress, Virginia – 2015.

Frequency	Date	Time of Emergence	Total # of Bats
148.642	19-Jun-15	20:45	1
	21-Jun-15	20:43	1
	22-Jun-15	20:48	1
148.672	20-Jun-15	20:39	8
	21-Jun-15	20:48	1

5.0 DISCUSSION

This survey documented that MYSE are present at the Installation likely due to the large contiguous area of mature forest available on the Installation and the surrounding areas. All four MYSE were captured at mist net site 1, which is surrounded by hardwood swamps and large acreage of continuous forest that extends off the Installation and connects the North Landing River, a large river system, towards the northeast. The capture and roost locations are consistent with past studies that found preferred habitat of MYSE includes continuous mature forest and specifically wetland habitat with a closed canopy (Yates and Muzika 2006, Henderson and Broder 2008).

The majority of bats captured in the mist-nets were evening bats followed by big brown bats and southeastern bats, which is typical for this white-nose affected area. Evening bat are migratory and generally do not come into contact with *Pseudogymnoascus destructans* because they are not using hibernacula, which harbors the fungus. Big brown bats and southeastern bats are hibernators, which are most affected by WNS. Big brown bats are less affected than Myotis species, however, by WNS possibly because they are larger and thus go into hibernation later and emerge earlier in the season, giving the fungus less time to affect them. Southeastern bats have been found with the fungus, but have not been confirmed with diagnostic symptoms of white-nose syndrome that lead to mortality. Including all species captured, there were more females (61%) than males and all but one female was lactating, suggesting successful breeding of multiple species in the area.

The MYSE sex ratio was skewed toward females and included two lactating females, suggesting that there are successful maternity colonies in the area. During the radio-tracking period, only one of the bats used the same roost. This is typical for the species and during the lactation period females often switch roosts every two to five days (Foster and Kurta 1999). The single roost type identified was under bark on a dead red maple, which is similar to roost site selection reported from the central Appalachians (Menzel *et al.* 2002, Ford *et al*. 2006). Contrary to the black locust specialization found by Ford *et al*. (2006), however, these females specialized in red maples (100% of the known trees used). This does align with the findings of Thompson (2006), who documented variability in roost tree preference across MYSE range. Roosts were often in swampy areas because in roost tree selection, particularly for lactating females, proximity to a water source is an important factor (Sasse and Perkins 1996).

Roost trees were all 18-30-cm diameter at breast height with large variation in heights (7-37 m). There was no pattern in percent canopy cover, which ranged from 10 to70%. This is not consistent with many studies in Kentucky and West Virginia, which found canopy covers of 90% or higher (Owen 2002, Silvis 2015, Johnson 2008). MYSE, however, have been known to use roosts near small canopy gaps where solar radiation can raise the roost temperature, which is particularly good for maternity roosts and can increase insect abundance and activity (Owen *et a*l. 2003).

Many bats are known to share roost trees, or use the same tree over successive days (Owen *et al.* 2002). MYSE emerge at dusk to forage on insects in upland and lowland woodlands and tree-lined corridors to feed on insects that are caught in flight using echolocation, or by gleaning from vegetation and water surfaces (USFWS 2014a). Emergence counts conducted at the roost locations identified, at most, 8 bats emerging from a single roost tree on 20 June, including the lactating female. This suggests that there are maternity colonies in the area because females with young roost together, for safety and increased warmth, and male MYSE tend to roost alone (Broders and Forbes 2004). The next night one bat was seen leaving that same roost tree. This could suggest that there are multiple suitable roosts in the area that the bats are able to relocate to or the bats didn't emerge due to environmental conditions.

The Installation is considering removing a large portion of forested area south of Mt. Pleasant Road due to Airfield Height Obstruction concerns associated with Aviation Safety Requirements. Two thirds of the MYSE roosts found were within this forested area slated for removal and all MYSE captures were from the net site on the edge of that forested area. This demonstrates that the forest patch offers multiple roosting opportunities including likely maternity colonies. Although only the area immediately surrounding the roost tree (46 meters) is protected from tree removal during pup season (01 June -31 July) under the 4(d) rule, MYSE appear to be using this area and it might be important to retain (USFWS 2016).

The home range, or "known habitat" as calculated using the USFWS protocol, of MYSE is larger than was reported for female MYSE in the central Appalachians using the 95% adaptive kernel method, in which the mean home range was 65 acres (Owen *et al*. 2002). This is likely attributable to the coarse assessment of home range following the USFWS protocol (USFWS 2014a). Two sampling components have a strong relationship on measurement of space use and home range size: number of radio marked animals and number of locations for each animal, which is small for this survey (Kernohan *et al*. 2001). Home range varied from 2,554 to 9,915 acres, using only suitable habitat, and overlapped with the areas of interest provided by the Navy. The Installation's resident population of MYSE are using this suitable habitat for both breeding and foraging. The area in consideration for tree removal for aviation safety is within the home range of all MYSE captured.

6.0 RECOMMENDATIONS

Depending on the nature and extent of activities within the areas of interest, there is the potential to directly impact MYSE or its summer habitat by removing forested areas or individual roost trees. Below are several recommendations to protect MYSE and their habitat as well as suggestions of ways to gain more information about MYSE utilization of the Installation.

1) Avoiding activity such as cutting trees during the pup season (01 June -31 July), can prevent NLEB take and curtail adverse effect. However, tree removal is prohibited under

the final 4(d) rule only if it occurs within 46 meters (150 feet) of a known maternity roost tree from 1 June through 31 July (USFWS 2016)

2) Make sure snags are left during cutting or if the area is lacking snags, girdle trees to create snags. Snags can create roosting opportunities like peeling bark and cavities for species such as MYSE. Prescribed fire may also increase the number of snags. Fire also increases the canopy gaps and therefore solar radiation reaching roosts, which can increase maximum roosting temperatures (Johnson et al. 2009). Increased roosting temperatures are associated with rapid development of young (Boyles and Aubrey 2006). However, prescribed fire may reduce roosting opportunities for foliage roosting bats such as hoary bats
3) The tracked female MYSE appeared to prefer roosting in dead red maple trees between 18 and 30cm DBH. Consider maintain stands of trees that contain this type of tree structure
4) Each bat species has a preferred habitat for foraging so maintaining multiple habitats on base is important. Many species prefer to feed over open water, thus protecting wetlands and both the forest around them and corridors that connect with other forest patches is vital. The larger species prefer to forage in open meadow areas and along forest edges that tend to collect insects. Finally, many species, such as MYSE, prefer to forage in forested areas that tend to be wetter and breed more insects. Forested corridors that connect the forest patches or run along streams is important to provide a sheltered environment that bats can use to move around the landscape.
5) Construct or place bat houses around the facility to create roosting habitat
6) Conduct a true home range (95% adaptive kernel method) or core utilization study to determine bats true use of Installation, which requires 30-50 radio-telemetry re-location points
7) For future radio-tracking efforts, success can be improved through the use of aircraft to locate bats that have left the immediate area, or have roosted in areas that are unsafe to be travelled by vehicle or on foot. This method was employed at Naval Support Activity Northwest Annex to find bats that may have left the Installation. Kayaks and proper safety equipment may also aid the search in swamp areas during the night. Surgical glue used for attaching radio-transmitters must be new and consider conducting the survey early in the season when temperatures are cool to inhibit glue melt
8) Conduct acoustic monitoring during an entire season, spanning early spring to late fall, to determine when bats are arriving and when bats are leaving the base. This will pertain both to bats migrating from distant areas and individuals arriving from local hibernacula. If swarms are detected in late fall it may indicate a hibernacula nearby

APPENDIX C

RESUMES AND PERMITS FOR FIELD CREWS

This page intentionally left blank.

DEPARTMENT OF THE INTERIOR
U.S. FISH AND WILDLIFE SERVICE
Endangered Species Permit Office
1875 Century Boulevard, Suite 200
Atlanta, GA 30345
permitsR4ES@fws.gov

FEDERAL FISH AND WILDLIFE PERMIT

1. PERMITTEE

BIODIVERSITY RESEARCH INSTITUTE
652 MAIN STREET
GORHAM, ME 04038
U.S.A.

2. AUTHORITY-STATUTES
16 USC 1539(a)

REGULATIONS
50 CFR 17.22

50 CFR 13

3. NUMBER
TE63633A-3 AMENDMENT

4. RENEWABLE ☒ YES ☐ NO

5. MAY COPY ☒ YES ☐ NO

6. EFFECTIVE
04/09/2015

7. EXPIRES
04/09/2018

8. NAME AND TITLE OF PRINCIPAL OFFICER *(If #1 is a business)*
DAVID C EVERS
EXECUTIVE DIRECTOR

9. TYPE OF PERMIT
NATIVE ENDANGERED SP. RECOVERY - E WILDLIFE

10. LOCATION WHERE AUTHORIZED ACTIVITY MAY BE CONDUCTED
Alabama, Georgia, Illinois, Indiana, Kentucky, Louisiana, Massachusetts, Minnesota, Mississippi, Missouri, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Virginia, and West Virginia

11. CONDITIONS AND AUTHORIZATIONS

A. GENERAL CONDITIONS SET OUT IN SUBPART D OF 50 CFR 13, AND SPECIFIC CONDITIONS CONTAINED IN FEDERAL REGULATIONS CITED IN BLOCK #2 ABOVE, ARE HEREBY MADE A PART OF THIS PERMIT. ALL ACTIVITIES AUTHORIZED HEREIN MUST BE CARRIED OUT IN ACCORD WITH AND FOR THE PURPOSES DESCRIBED IN THE APPLICATION SUBMITTED. CONTINUED VALIDITY, OR RENEWAL, OF THIS PERMIT IS SUBJECT TO COMPLETE AND TIMELY COMPLIANCE WITH ALL APPLICABLE CONDITIONS, INCLUDING THE FILING OF ALL REQUIRED INFORMATION AND REPORTS.

B. THE VALIDITY OF THIS PERMIT IS ALSO CONDITIONED UPON STRICT OBSERVANCE OF ALL APPLICABLE FOREIGN, STATE, LOCAL, TRIBAL, OR OTHER FEDERAL LAW.

C. VALID FOR USE BY PERMITTEE NAMED ABOVE.

C. 1. Continued: the following individuals are authorized to conduct activities as authorized by this permit: Carl Anderson, Timothy Divoll, Shaylyn Hatch, Dustin Meattey, David Yates, and for Indiana bats only: Jonathan Fiely.

Trained assistants not named on this permit may work on permitted bat activities under the direct and on-site supervision of the individuals named above. However, trained assistants may not work independently at a site. Trained assistants are individuals who are considered qualified by the permitted biologist(s) to select sampling sites, deploy sampling equipment and nets, and handle bats in the field.

D. ACCEPTANCE OF THIS PERMIT SERVES AS EVIDENCE THAT THE PERMITTEE UNDERSTANDS AND AGREES TO ABIDE BY THE TERMS OF THIS PERMIT AND ALL SECTIONS OF TITLE 50 CODE OF FEDERAL REGULATIONS, PARTS 13 AND 17, PERTINENT TO ISSUED PERMITS. SECTION 11 OF THE ENDANGERED SPECIES ACT OF 1973, AS AMENDED, PROVIDES FOR CIVIL AND CRIMINAL PENALTIES FOR FAILURE TO COMPLY WITH PERMIT CONDITIONS.

☒ ADDITIONAL CONDITIONS AND AUTHORIZATIONS ALSO APPLY

12. REPORTING REQUIREMENTS
Annual reports are due by Januaty 31 following each year this permit is in effect

ISSUED BY	TITLE	DATE
Roxanna Hinzman Chief, Division of Environmental Review	CHIEF, DIVISION OF ENVIRONMENTAL REVIEW	04/09/2015

E. PERMITTEE IS AUTHORIZED TO TAKE (ENTER HIBERNACULA OR MATERNITY ROOST CAVES, SALVAGE DEAD BATS, CAPTURE WITH MIST NETS OR HARP TRAPS, HANDLE, IDENTIFY, COLLECT HAIR SAMPLES, BAND, RADIO TAG, LIGHT-TAG, AND WING-PUNCH) INDIANA BATS (Myotis sodalis), GRAY BATS (Myotis grisescens), AND NORTHERN LONG-EARED BATS (Myotis septentrionalis), FOR SCIENTIFIC RESEARCH AIMED AT RECOVERY OF THE SPECIES, SUCH AS: PRESENCE/ABSENCE SURVEYS, STUDIES TO DOCUMENT HABITAT USE, POPULATION MONITORING, AND TO EVALUATE POTENTIAL IMPACTS OF WHITE-NOSE SYNDROME OR OTHER THREATS AS CONDITIONED BELOW.

F. Activities at the following locations require written site-specific approval from the USFWS Field Supervisor in the State(s) where the project will occur (as outlined in Condition G):

F.1. Locations within Region 3 of the USFWS: Illinois, Indiana, Missouri, Minnesota, and Ohio

F.2. Locations within Region 4 of the USFWS: Alabama, Georgia, Kentucky, Mississippi, North Carolina, Louisiana, South Carolina, and Tennessee

F.3. Locations within Region 5 of the USFWS: Massachusetts, New Jersey, New York, Pennsylvania, Virginia and West Virginia

G. Permittee shall notify the USFWS Field Supervisor for the State in which activities are proposed to occur at least 15 days prior to conducting any activities. Contact information is in Condition P., below. Your request for this site-specific approval must be in writing and must indicate:

G.1. The purpose and a description of the activities proposed (e.g., surveys, radio telemetry studies, etc.).

G.2. Location of proposed activities, including project site (legal description and lat/long), county, and state.

G.3. Dates when the project is proposed to take place.

G.4. You may proceed with activities only upon receipt of written concurrence from the applicable USFWS Field Supervisor. *Your concurrence letter must be carried with this permit to authorize site-specific activities.*

H. Permittee shall adhere to the following conditions involving capture and handling of bats:

H.1. Federally listed bats may be captured (e.g., mist-nets and harp traps) following the protocol(s) provided by the USFWS, when available. Permittees must contact the USFWS FO in the State(s) in which activities are proposed to ensure correct protocol(s) are used. For example, the current Range-wide Indiana Bat Summer Survey Guidelines are available at: http://www.fws.gov/midwest/endangered/mammals/inba/inbasummersurveyguidance.html. The monitoring interval for mist nets is once every 10 minutes. Harp traps must be continually monitored.

H.2. Captured bats may be held for a maximum of 30 minutes, unless injured. If an exception is required to this prohibition, permittee must receive prior written approval from the USFWS Field Supervisor for the State in which the activities are proposed to occur.

H.3. Permittees shall carry out non-intrusive measurements on all captured bats. Data shall be recorded for all bats captured and include, but not be limited to, the data requested in any automated or species specific data form provided by the USFWS (e.g., INDIANA BAT SURVEY AND BANDING DATA form). Handling should be limited to the maximum extent practicable and should cease immediately at signs of undue stress (e.g., bat becoming unresponsive, etc.). Bats that appear stressed from handling should be placed in a dark, quiet location away from activity where it can safely fly away after recovery, and should be checked to ensure successful

recovery before leaving the study site. Photographs of the identifying characteristics for each individual federally listed species captured are encouraged. The permittee may be requested to provide individual photographs after submittal of annual reporting data.

H.4. If bands are applied, these must be lipped metal bands having a unique identifier. Bands should be applied to the forearm of captured bats prior to release. No more than one band per bat may be used. Position the band on the wing so that when the bat is hanging upside down, the band numbers are right-side up. A single band should be placed on the right forearm of each male and the left forearm of each female bat.

H.5. Radio transmitters may be applied during spring, summer, and fall roosting and migration periods via nontoxic skin bond adhesive. The total weight of the transmitter may not exceed 5% of the bat's body weight and the total weight of the package (transmitter and adhesive) may not exceed 6% of the bat's body weight. The lightest package (both transmitter and adhesive) capable of accomplishing the required task should be used, especially with pregnant females and newly volant juveniles. Bats carrying transmitters must be monitored daily for at least five days, or until the transmitter falls off, whichever occurs first.

H.6. No capture activities shall occur within 20 meters of a known or potential summer or winter roost site, either natural or artificial, of a federally listed bat. If an exception is required to this prohibition, permittee must receive prior written approval from the USFWS Field Supervisor for the State in which the activities are proposed to occur.

H.7. Permittee may collect dorsal hair samples, wing biopsy tissue samples, fungal lift tape and swab samples from captured bats for scientific study. Hair samples shall be obtained via clipping fur from between scapula from females and juvenile males. The clipped area is the same area frequently clipped for radio transmitter attachment. Wing tissue samples may be taken using a new, sterile biopsy punch (2mm) for each endangered bat sampled. No more than two samples, one from each wing, may be obtained per individual. All boards and equipment used to obtain samples must be disinfected according to the protocol cited in Condition H.9.

H.8. Cyalume light tags may be affixed to the back of unmarked bats during summer roosting period via non-toxic skin bond adhesive to aid in identification of individuals for echolocation recordings. Light tags shall not be affixed to bats carrying radio transmitters. Light tag cannot exceed 2 cm in length or 0.15 g in weight. The light tag must be resistant to tooth puncture and sealed to prevent bats from ingesting cyalume compound. Any light tag that has the potential to expose bats to the cyalume compound is prohibited; the compound is known to be toxic to bats.

H.9. Equipment used to capture and handle bats shall be cleaned and decontaminated, including personal gear such as boots and gloves, using products cited in decontamination guidelines and in compliance with label directions. The most recent decontamination guidance is found on the web at: http://whitenosesyndrome.org/

H.10. Caves, mines, or other suitable hibernation sites may be quietly searched in a manner that minimizes disturbance by utilizing the minimum number of people and time required to complete the survey. Surveys of known hibernacula conducted during the winter hibernation season shall follow the guidelines established in the recovery plans for each federally listed bat species with regards to how often a site may be visited and other species-specific requirements related to entering hibernaculum (for example, for Indiana bats, winter surveys should not be repeated more often than once every other year in any given hibernaculum; for gray bats, winter surveys should not be repeated more often than once every three years in any given hibernaculum), unless authorized by the appropriate Service Recovery Lead identified in Condition O (below).

Under no circumstances should multiple trips to the hibernation area occur within the same year without written approval of the USFWS Field Supervisor for the state in which activities are proposed.

Bats may be handled during winter surveys in order to collect band information and confirm the identification of

listed species. When possible, bands should be read without touching the bat. Banded bats should only be handled if easily accessible and removal of the bat does not disturb a large number of additional bats and is unlikely to result in injury to the bat. Detailed photographs should be taken to document the presence of listed species in previously undocumented hibernaculum. Where hibernacula area and safety conditions allow, individuals entering hibernacula are recommended to utilize night vision goggles or red-filtered light and to remain in the site no more than 90 minutes to complete the work.

H.11. Surveys of gray bat maternity roosts and their other known summer roost sites shall be conducted by observing the bats with night vision equipment and/or infrared light sources (e.g., thermal infrared) as they emerge from their roosts to avoid any possible disturbance to these bats. At previously undocumented sites for these species, the accepted method to determine if they are present is to carefully and slowly enter the potential roost site to check for evidence of presence/use, such as visual observation of bats, significant quantities or a strong smell of guano, or the audible sounds produced by bats roosting at the site. As soon as any evidence is obtained that the roost site is being used by a federally-listed bat species, survey team members shall immediately exit the roost site and make further observations from outside the entrance to the roost. All further observations shall be made from the entrance during the evening emergence.

I. Upon determination that endangered bats are present, permittee shall notify the following offices immediately (not to exceed 1 business day): the appropriate USFWS Regional Office (Condition N.), and the USFWS Field Office within the geographic location of study areas (Condition P.).

J. Permittee must carry a copy of this permit at all times when conducting the authorized activities. Shipments of collected biological materials should also be accompanied by a copy of this permit. NOTE: This permit is limited to the above activities and identified species.

K. Issuance of this permit does not constitute permission to conduct these activities on National Wildlife Refuges or any other public or private lands; such permission must be obtained separately from the appropriate landowner or land manager before beginning these authorized activities. This permit, neither directly nor by implication, grants the right of trespass.

L. Accidental mortality may not exceed one specimen. In the event that an accidental mortality occurs, cease all activities until consulting with the USFWS. Any bat mortality or serious injury must be reported immediately (not to exceed 1 business day) to the applicable office listed in condition N. and to the appropriate Field Office identified in Condition P. The USFWS will work with you to determine the cause of injury or mortality and whether such could be avoided should activities be allowed to proceed. Dead or moribund bats may be retained for further study only with the written permission of the USFWS. Any bats that are not authorized for retention are to be chilled and promptly transferred to the USFWS for potential necropsy and/or for scientific or educational purposes.

Upon locating a dead, injured, or sick bat, or any other threatened or endangered species, under circumstances not addressed in this authorization, initial notification must be made immediately (not to exceed 1 business day) to the appropriate USFWS Office identified in condition N., below, including a description of the circumstances, location information, and photo documentation. Notification should also be made at the same time to the appropriate USFWS Field Office identified in condition P., below. Care should be taken in handling sick, injured, or dead specimens to ensure effective treatment or to preserve biological materials for later analysis. In conjunction with the care of sick or injured threatened or endangered species, and the preservation of biological materials from a dead animal, the permittee should take responsible steps to ensure that the site is not unnecessarily disturbed. Prior to collecting the specimen(s), you must photograph the specimen(s) to document the conditions in which they were found. You may preserve the specimen(s) by freezing them or other suitable method to allow scientific study. Disposition of collected specimen(s) shall be determined by the USFWS Field Office.

M. Reports are due on January 31 following each year this permit is in effect. At a minimum, your report shall include:

M.1. The date, time, geographic locations (including datum and projection information).

M.2. All locations surveyed (regardless of whether federally listed bats were captured/observed).

M.3. Band numbers of all bats banded and all bats recovered/observed.

M.4. Information on any injuries and/or mortalities and disposition of specimens.

M.5. Location and characteristics of roost trees and bat colonies.

M.6. Copies of any separate reports and/or publications resulting from work conducted under the authority of this permit.

M.7. Data shall be submitted for all bats captured and include, but not be limited to, the data requested in any automated or species-specific data form provided by the USFWS (e.g., INDIANA BAT SURVEY AND BANDING DATA forms, the data collection forms found in the current Rangewide Indiana Bat Summer Survey Guidelines cited in Condition H.1., or other species specific forms). Photographs of the identifying characteristics for each individual federally-listed species captured are encouraged. The Permittee may be requested to provide individual photographs after submittal of annual reporting data.

M.8. Copies of all site specific authorization letters required under Condition G.

If no activities occurred over the course of the year, indication of such shall be submitted as an annual report.

N. Copies of your reports shall be sent to the offices listed below. When possible, electronic copies shall be submitted in lieu of hard copies in MS Word, Portable Document Format, Rich Text Format, or other file format that is compatible with the receiving office.

(804) 367-1000 (V/TDD)
Under Authority of § 29.1-412, § 29.1-417, & § 29.1-418 of the Code of Virginia

Scientific Collection Permit

Permit Type: **New** Fee Paid: **$40.00** VADGIF Permit No. **051933**

Permittee: **Dave Yates**
Address: **Biodiversity Research Institute**
19 Flaggy Meadow Road
Gorham, ME 04038

Office: **(207) 839-7600**
City/County: **Out of State**

Contract Species Surveys

Authorized Collection Methods: Harp Traps for Bats/Terrestrial Mist Nets (Bats/Birds)
Authorized Waterbodies: N/A
Authorized Marking Techniques: N/A

PERMIT AMENDMENT 5/18/2015: This amendment adds the following:
Authorized Subpermittees: Amanda Bailey/Morgan Ingalls/Caroliine Byrnes/Chelsea Vosburgh
Authorized Locations: Naval Properties: Yorktown/Northwest/Norfolk/Oceana/Fentress/Fort Story/Dam Neck/Fort Eustis/Langley

Permittee MUST notify VDGIF a minimum of 7 days prior to each sampling event. Notification must be made via email to: collectionpermits@dgif.virginia.gov

Report Due: 31 January 2015, 31 January 2016

ALL PERMIT REPORTS MUST CONTAIN COORDINATES; PERMITTEE CAN USE THE VIRGINIA FISH AND WILDLIFE INFORMATION SERVICE (VAFWIS) TO OBTAIN COORDINATES BY VISITING: HTTPS://FWISWEB1.DGIF.VIRGINIA.GOV/FWIS/INDEX.HTML

STANDARD CONDITIONS ATTACHED APPLY TO THIS PERMIT.

Authorized Counties / Cities:
York
Norfolk

Authorized Species:

Description	ID Number	Scientific Name
Bats		

Annual Report Due End of Each Year

Authorized Sub-Permittees:
See Attached Sheet

Approved by: *James E. Husband*

Applicants may appeal permit decisions within 60 days of issuance. The appeal must be in writing to the Director, Department of Game and Inland Fisheries.

Title: **James E. Husband - Permits Manager** **Date:** **5/18/2015**

20 Permit Effective **7/28/2014** through **12/31/2015** **15**

Virginia Department of Game and Inland Fisheries

4010 West Broad Street, P.O. Box 11104, Richmond, VA 23230-1104
(804) 367-1000 (V/TDD)

Under Authority of § 29.1-412, § 29.1-417, & § 29.1-418 of the Code of Virginia

Scientific Collection Permit

Permit Type: **New**	FeePaid:	**$40.00**	VADGIF Permit No.	**051933**

Authorized Sub-Permittees:

Tim Divoll, Biodiversity Research Institute
Dustin Meattey, Biodiversity Research Institute
Carl Anderson, Biodiversity Research Institute
Lauren Gilpatrick, Biodiversity Research Institute
Amanda Bailey, Biodiversity Research Institute
Morgan Ingalls, Biodiversity Research Institute
Caroline Byrne, Biodiversity Research Institute
Chelsea Vosburgh, Biodiversity Research Institute

DAVID YATES

719 Moosehead Lake Rd
Greenville, ME 04441
(207) 491-4707

EDUCATION:

Bachelor of Science, Wildlife Biology and Management
Unity College, Unity, ME
Graduated May 1999

M.Sc., Conservation Biology
Antioch University New England
Graduated May 2006

SKILLS:

- Proficient in animal tagging and release methods
- Ability to identify bats of N. and C. America in and QIBS by USFWS and PA State
- HERO training
- Collected and prepared blood samples for contaminant analyses.
- Current DEA drug license
- Analyzed water quality of ponds, rivers and streams
- Experience using tranquilizers/sedatives
- B3 and HUET certificates for low level flights
- HAZWOPR training
- Trained in CPR and First Aid

EXPERIENCE:

Biodiversity Research Institute – *Research Biologist/Mammal Director*, Gorham, ME January 1998 -present

- Certified Indiana Bat Identifier for the state of PA and USFWS
- Project Manager for Acadia National Park bat survey and tracking study
- Project manager and conducted bat surveys for US Navy in VA and NJ
- Lead Biologist Indiana bat surveys for Gas fracking and pipelines in PA
- Project Manager/Lead Biologist for Maine IF&W Eco-region Surveys for bats for 5 years
- Project Manager/Lead Biologists for bat mercury studies at superfund sites from VA to Maine involving U.S.F.&W.S.
- Project Manager/Lead Biologist at 4 U.S. Fish and Wildlife NRDAR sites for bats and furbearers
- Project Manager bat surveys at multiple National Wildlife Refuges in the northeast
- Telemetry Coordinator Gulf Oil Spill Project for USFWS NRDAR bird injury assessment
- Developed Scope of Work for USFWS NRDAR Gulf Oil Spill bird injury assessment
- Coordinated aerial and ground tracking of more than 400 birds using multiple airplanes and satellite technology
- Project Manager/Lead Biologist for FPL Maine Hydro. Beaver, muskrat, otter, and mink telemetry study
- Project Manager/Lead Biologist for live trapping mink and otter study in Maine for state DEP (Master's thesis)
- Project Manager/Lead Biologist for live trapping mink and otter study in Massachusetts for EPA and other superfund studies
- Project Manager for Maine IF&W Ecoregion for three areas in Maine, birds and small mammals
- Project Manager for common loon monitoring in northern and western Maine
- Project Manager/Lead Biologist for National Park Service survey of small and large mammals of Appalachian Trail in Maine
- Winter large carnivore tracking surveys for NPS and private landowner
- Administered schedule III drugs for mink and otter study (Ketemine & Metetomidine)
- DEA Schedule II-III license
- Researched recent trends of mercury and lead contaminants in the North American piscivorous bird's mammals.
- Captured, banded and gathered mercury and lead level data in piscivorous birds.
- Entered banding data into database for Biodiversity Research Institute data analysis.
- Compiled banding data into official banding schedules for U.S. Fish & Wildlife Services.
- Supervised banding of Common Loons, Eagles, Kingfishers and various other species.
- Surveyed reservoirs and lakes for Common Loons, Kingfishers and other piscivorous birds.
- Presented Mammal, Bat and Common Loon slide show to various organizations for educational purposes
- Wrote reports for Loon productivity on Reservoirs for state and private agencies.
- Proposed, designed and organized a mink and otter study for Maine Department of Environmental Protection.

Education:

Antioch University New England
Keene, NH
Master of Science in Environmental Studies/Conservation Biology, 2014
Thesis Title: *Estimating Little Brown Bat Winter Mortality Rates from White-Nose Syndrome at Aeolus Cave in Dorset, Vermont using PIT Tag Technology*

Marlboro College
Marlboro, VT
Bachelor of Science in Biochemistry, 2010
Thesis Title: *Mysterious Mortalities: A study of White-Nose Syndrome and G. destructans from a molecular biology perspective*

Skill Sets:

- *Supervisory Skills:* Teaching and overseeing others in both laboratory and field settings
- *Animal Handling Skills:* Removal of bats from net; Species identification and biometrics; Attachment of bands; Collection of blood samples, wing punches, hair samples, etc.
- *Radio Telemetry Skills:* Attachment of radio transmitters to animals; Programming of receivers; Interpretation of radio telemetry signals in difficult terrain
- *Data Management and Analysis Skills:* Appropriate use of statistical tests; Large data set management; Geographical Information Systems; Laboratory analysis of molecular products
- *Project Design Skills:* Co-designed study investigating RNA regulation in cells exposed to *Pseudogymnoascus destructans*; Co-designed study to assess over-winter survivorship of Little Brown bats at Vermont's largest hibernaculum
- *Leadership Skills:* Group management and logistics; Collaborative planning; Communication
- *Caving and Outdoor Skills:* National Cave Rescue Commission Level 1 Certification; Six years of caving experience; Familiarity with single rope technique
- *Computer Skills:* Familiarity with Microsoft Office, ArcGIS, JMP, and Sonobat

Relevant Work Experience:

Wildlife Biologist — May 2015 - Present
Biodiversity Research Institute
Portland, ME

- Oversee field staff
- Supervise and participate in live capture of bats
- Supervise and participate in radio tracking of bats
- Analyze data and write/contribute to reports

Bat Technician — July 2014 – October 2014
Biodiversity Research Institute
Portland, ME

- Set up and broke down mist-nets, removed bats from nets
- Species ID and biometrics, attachment of radio transmitters to animals
- Used radio telemetry to determine day roosts and foraging areas for target species
- Managed the data that was gathered from the project

Intern — Summer 2012 – Summer 2013
Biodiversity Research Institute
Portland, ME

- Participated in several bat banding projects at Great Bay NWR, Parker River NWR, and Acadia National Park
- Identified bats by species, determined sex, age, and reproductive status, and measured hind foot, ear, tragus, and forearm
- Used radio telemetry to determine day roosts of *Myotis leibii* and *Myotis septentrionalis*
- Analysis and writing of report

Volunteer — Winter 2010, 2011, & 2014
New York Department of Environmental Conservation
Albany, NY

- Helped conduct bat counts in Merlin's Cave, Dragon Bones Cave, Surprise Cave, and Haile's Cave

Volunteer — Winter 2009, 2010, 2011, & 2014
Massachusetts Division of Fisheries and Wildlife
Dalton, MA

- Helped conduct bat counts in Bat's Den, Crystal Pool, and Red Bat Caves

Freshman Orientation Program Trip Leader — Fall 2008, 2009, & 2010
Marlboro College
Marlboro, VT

- Designed and co-led six to nine day wilderness trips for six to eight incoming students
- Took part in extensive leadership and logistics training prior to running trips
- Led or co-led day long caving trips for students during the school year

Laboratory Assistant — Fall 2008 – Summer 2010
Marlboro College
Marlboro, VT

- Helped with chemical inventory and organization of MSDS
- Assisted with general laboratory organization and upkeep
- Assisted with preparation and running of General Biology Laboratory and General Chemistry Laboratory
- Helped to implement changes to laboratory safety procedures

Research Assistant to Prof. Todd Smith, PhD. — Summer 2008 & Summer 2010
Marlboro College
Marlboro, VT

- Research on anti-freeze glycoprotiens in Atlantic Cod
- Analyzed cod serum samples using SDS-PAGE
- Quantified samples using a BSA protein assay

Office Manager and Production Coordinator — 2007 – 2008
Yellow Barn Music School & Festival
Putney, VT

- Processed and organized student applications
- Organized and implemented mailings
- Organized audio archives

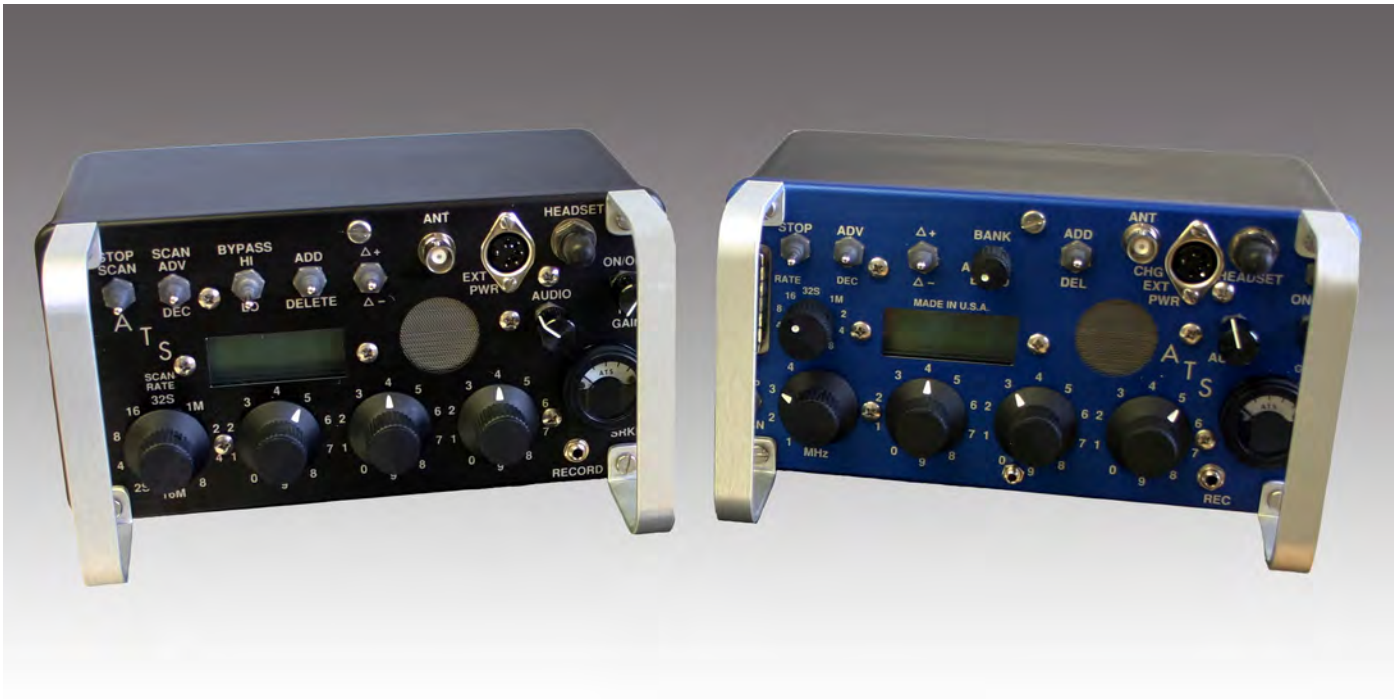
APPENDIX D

RECEIVER AND TRANSMITTER SPECIFICATIONS

This page intentionally left blank.

ATS R2000 / R4000 Scientific Receivers

Finding Solutions. Delivering Results.



With performance features and proven reliability, these receivers are an exceptional value.

ATS models R2000 and R4000 are excellent receivers for most aerial, terrestrial and aquatic studies. They offer leading edge technology and outstanding performance.

Both models feature programmable, automatic or manual scanning over a 2 MHz or 4 MHz frequency range. Their 1 kHz channel spacing tracks up to 200 or 400 targets. The user-friendly front panel gives the operator full control over all functions including scan rate, add/delete frequencies, RF gain, audio level, tone decoder threshold, and more. Both units feature state-of-the-art circuitry for exceptional sensitivity, frequency stability, and low noise.

Both receivers are designed for easy field operation. Their large 1/2" LCD display is backlit for night use. A padded Nylon case, battery charger, power cord and detailed operation manual are included with each receiver.

The R2000 and R4000 are lightweight, compact and ruggedly built to withstand heavy field use and extreme environmental conditions. Each can be powered by an external 12 volt DC battery or its own built-in NiCad battery pack for up to 8 hours of use.

ATS R2000 and R4000 receivers offer high performance with high value.

- 2 or 4 MHz Frequency Range
- 1 kHz Channel Spacing
- Improved RF Gain Control For More Precise Direction Finding
- Excellent Frequency Stability
- High Sensitivity/Low Noise
- Sensitive Signal Meter
- Ruggedly Built For Field Use
- Easy Operation
- 4 Distinct Memory Banks (R4000)
- Built-in Computer Interface (R4000)
- Delta Tune Drift Compensation
- Rechargeable NiCad Batteries
- Separate RF Gain And Audio Level Controls
- Battery-Backed Memory
- Auto-Shut Off On Low Battery For Longer Battery Life

ATS R2000 / R4000 Scientific Receivers

GENERAL

• **Frequency range:**	R2000 Any Specified 2 MHz range from 30 to 220 MHz R4000 Any Specified 4 MHz range from 140 to 220 MHz
• **Channel spacing:**	1 kHz
• **Input impedance:**	50 ohms
• **Minimum discernible signal (MDS):**	-150 dBm (0.007 uv into 50 ohms)
• **Noise figure:**	3 dB maximum
• **Speaker:**	8 ohms
• **Tone decoder detection range:**	± 2 kHz (Model R4000)
• **Tone decoder detection level:**	-120 dBm minimum (Model R4000)
• **Frequency stability:**	± 1 kHz -20°C to +50°C
• **Delta tune:**	+4 kHz; -4 kHz
• **IF frequency:**	10.7 MHz
• **IF bandwidth:**	6 dB ± 2 kHz; 80 dB ± 7 kHz
• **Image rejection:**	>150 dB
• **RF gain control range:**	>130 dB
• **Operating voltage range:**	9 to 18 volts DC
• **Dwell time (scan rate):**	Selectable, 2 sec. to 16 min. (10 positions)

CONTROLS

- Frequency selectors (4)
- Audio level
- Delta tune
- RF gain
- Increment frequency up/down
- Tone decoder threshold (R4000)
- Memory bank select (R4000)
- Auto scan/memory bypass
- Receiver on/off
- Dwell time (scan rate)
- Add-delete to memory
- Stop scan

MEMORY

- All frequencies programmable in each bank
- Four distinct banks (R4000)
- Sequentially scanned
- Battery backed
- Delete all frequencies in each bank
- Delete frequencies individually with single switch while scanning or on standby

DISPLAYS

• **Selected frequency:**	LCD (0.5" digits) with backlight for night use
• **Memory status:**	Colon in display indicates frequency stored in memory
• **Battery status:**	"Lo Bat" indicator flashes when battery voltage is low
• **Signal detection:**	"+" present in display indicates detection by tone decoder (R4000)
• **Signal level:**	0-1 mA meter

CONNECTIONS

• **Antenna:**	BNC - female
• **Headset:**	Receptacle for 0.25" phone plug
• **Signal level:**	0.125" phone receptacle for external 0.1 mA current meter
• **External power/recharge receptacle:**	5-pin DIN
• **Computer interface (R4000):**	25-pin D-sub filtered connection (socket)

POWER

• **12 volts DC nominal:**	130 mA drain nominal
• **Internal:**	1.2 amp-hour NiCad battery pack; 8-hour nominal operating time
• **External:**	9 to 18 volts, negative ground; switches automatically to external power

COMPUTER INTERFACE (R4000)

- 4 digits BCD (active high)
- Computer control select
- 5 volt DC regulated (5 mA max.)
- 12 volt DC unregulated
- Tone decoder output (active low)
- Signal strength

PHYSICAL

• Size:	11 cm wide x 21 cm long x 18 cm high (4.3" x 8.3" x 7")
• Weight:	2.3 kg (5 lbs)
• Accessories (included):	External power cord, battery charger, padded nylon case, instruction manual
• Accessories (optional):	David Clark aviation-grade headset, DC-DC charger, external battery pack

ENVIRONMENTAL

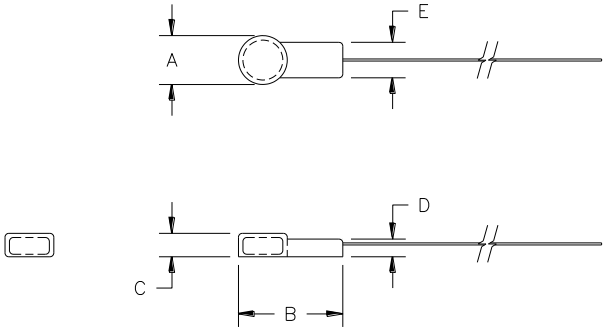
• Operating temperature:	-20°C to +50°C
• Storage temperature:	-70°C to +60°C
• Humidity:	95% non-condensing

WARRANTY

- One year parts and labor on materials and workmanship

AVIAN GLUE ON

Series A2405



Technical Specifications

Transmitter type:	Crystal controlled 2-stage
Calibration tolerance:	±2.5kHz
Frequency stability:	±2.5kHz, -20ºC to 40ºC
Pulse rate and width:	Typical on time 15ms, off time 1.5-4.0sec (controlled by astable circuit)
Pulse rate variation:	5%/volt, ± 20% for temperatures -20ºC to +40ºC
Battery:	Silver Oxide
Activation:	By removing magnet
Encapsulation:	Electrical resin, water-proof, specific gravity: 1.12

MODEL	BATTERY	BATTERY CAPACITY (days)				DIMENSIONS (mm)					WEIGHT (grams)	PRICE GROUP
	1.5V	15 ppm	24 ppm	30 ppm	40 ppm	A	B	C	D	E		
A2412	410	22	15	12	9	5	12	1.5	2.5	4	0.20	F
A2414	337	45	30	24	18	5	12	3	2.5	4	0.30	C
A2415	337	45	30	24	18	5	13	3	4	5	0.50	A
A2426	317	68	45	36	28	6	14	3	4	5	0.65	A
A2435	319	90	60	48	37	6	14	4	4	5	0.75	A
A2445	377	135	89	72	55	7	15	4	4	5	0.90	A
A2455	392	216	143	116	88	8	16	5	4	5	1.20	A

Above models available only in 48.00-50.66MHz, 144.06-151.98MHz, and 164.00-167.99MHz ranges.

Warranty life is 50% of battery capacity.

04/05/12

Model A2405 Compliance to FCC Part 15 Regulations

This note certifies that Advanced Telemetry Systems, Inc. series A2405 transmitters in frequency range 048.00 – 167.999 comply with regulations under FCC Part15.231 for periodic operation. Periodic operation describes the pulsing mode these units use. The attached antenna may not be altered or the unit may no longer be in compliance.

Regulations under Part 15.5 also apply making them exempt from FCC licensing requirements. These in general state that these devices are secondary users and as such must accept possible interference from other authorized users of the frequency.

Regarding the power output for these transmitters: the power output is less than one milliwatt. (-0.5dBm) when operational with the magnet removed.

Larry B. Kuechle

APPENDIX H

SAFETY PLANS

This page intentionally left blank.

INCIDENT PREVENTION PLAN

1. GENERAL INFORMATION

Client Name:	U.S. Department of the Navy		
Project Location:	Various Navy installations located in New Jersey, Virginia, and North Carolina	Project Number:	194-8480
Project Manager:	Derek Hengstenberg	Estimate Dates for Field Work	Spring and fall of 2015, 2016, and 2017

All incidents including near misses involving Tt personnel or Tt subcontractors under Tt's immediate direction ***must be reported*** *to the Project Manager within 24 hours. Incidents may include any injury, illness, potential exposure to hazardous chemicals or biological agents, property damage, theft or motor vehicle damage/accident.*

2. Work Scope

Tetra Tech CES biologists will conduct field work at several U.S. Department of the Navy (Navy) NAVFAC Mid-Atlantic installations located in New Jersey, Virginia, and North Carolina, including Naval Weapons Station (NWS) Earle (Colts Neck, New Jersey); NWS Yorktown (including Cheatham Annex), Naval Station Norfolk, Naval Air Station Oceana Dam Neck Annex, Joint Expeditionary Base Fort Story, Naval Air Station Oceana, and Naval Auxiliary Landing Field Fentress located in Virginia; and Naval Support Activity Hampton Roads, Northwest Annex located in Virginia and North Carolina. Field surveys include bat acoustic surveys to be conducted between 15 March and 15 November 2015, and mist netting surveys to be conducted during the summer of 2015. These presence/absence surveys will be conducted in accordance with federal protocols established for northern long-eared bat (NLEB) (*Myotis septentrionalis*). Tetra Tech has teamed with Biodiversity Research Institute to complete the field work and data analysis for this work. Deployment, retrieval and period downloading of acoustic monitoring equipment will occur during normal, daylight hours. Mist-netting surveys will be conducted during nighttime hours. This IPP will be revised prior to Mist-netting activities in order to more fully outline the control measures to be implemented to mitigate the risks of this activity.

All field survey personnel will be provided with project-specific training, maps and GPS data, indicating the locations and survey limits of their respective survey areas, and restricted access locations prior to mobilization. Due to the presence of explosive ordnance at NWS Earle and NWS Yorktown, lead staff conducting field work at these locations are required to take the Navy's Hazards of Electromagnetic Radiation to Ordnance (HERO) training. The project manager for this project, Derek Hengstenberg, received this required training from the Navy in 2014. Coordination to obtain security access approval to all the installations for all field staff involved will be required in advance of conducting the field efforts, and the project manager will notify each installation Natural Resources Manager (NRM) of the proposed field survey schedule ahead of the field effort. Daily check in/out with the project manager Derek Hengstenberg (cell: 908.616.0436 or office: 207.358.2401) will be conducted by field staff via phone call or text message, to let him known times and locations of where the field work at the start and end of each field effort.

3. PROJECT TASKS, POTENTIAL HAZARDS, AND CONTROL MEASURES (Or Attach Relevant AHA)

3a. TASK(S)	3b. POTENTIAL SAFETY AND HEALTH HAZARD(S)	3c. CONTROL MEASURE(S) (Medical or Training Qualifications, Work Practices, PPE*, etc.)
All field tasks (acoustic monitoring and mist-net surveys)	Slip/Trip/Fall Hazards	▪ Be careful and alert when walking and driving around the installation for overhead wires and objects protruding from the ground (i.e., stumps, anchors, wires)
	Poisonous Plants	▪ The most common poisonous plants that will be encountered are poison ivy (*Toxicodendron radicans*), poison sumac (*T. vernix*), and poison oak (*T. diversilobum*). The best way to avoid the effects caused by urushiol oil produced by these plants is to avoid coming into contact with any part of the

3. PROJECT TASKS, POTENTIAL HAZARDS, AND CONTROL MEASURES (Or Attach Relevant AHA)		
3a. TASK(S)	3b. POTENTIAL SAFETY AND HEALTH HAZARD(S)	3c. CONTROL MEASURE(S) (Medical or Training Qualifications, Work Practices, PPE*, etc.)
		plant. These plants are easily identifiable, and all field staff should become familiar with their identification and any known locations on the installations being surveyed. If contact is made, immediately wash contact area with water and soap or use soaps or washes designed for these plants available in drug stores (e.g., Technu). Avoid touching the face and eyes areas and be careful when handling materials and/or equipment that may have come into contact with the plants. Calamine or Caladryl lotion may be effective in relieving the irritation.
	Ticks/Biting Insects	▪ Applying good bug spray and sealing the bottom of your pants (by tucking into boots or socks) will reduce exposure. It is also extremely important to *thoroughly* check yourself for ticks at the end of each field day. The deer tick is (*Ixodes scapularis)* prevalent on East Coast and transmits Lyme disease. Chiggers or mites from the family Trombiculidae live in forests and grasslands and are also found in the vegetation of low, damp areas such as woodlands, berry bushes, orchards, along lakes and streams, and even in drier places where vegetation is low, such as lawns, golf courses, and parks. They are most numerous in early summer when grass, weeds and other vegetation are heaviest. In their larval stage, they attach to various animals, including humans, and feed on skin, often causing itching. These relatives of ticks are nearly microscopic, measuring 0.4 mm and have a chrome-orange hue. Field workers should be able to identify the deer tick and chiggers.
	Inclement Weather	▪ Prepare clothing and field gear by checking weather forecasts often. Develop work plans that account for the weather (drastic storms forecasted = work in non-remote areas). Anticipate and prepare for drastic weather noted for the season and region. Seek shelter as necessary. ▪ Do not work during lightning storms.
	Heat and Cold Stress	▪ It is important to be aware of climate conditions and related health effects, such as heat stress and heat stroke, or cold-related conditions such as hypothermia and frostbite. Heat stress can result in serious injury or death. Become familiar with the following heat-related warning signs and symptoms: ▪ Heat Fatigue—Impaired performance on skilled sensory-motor, mental, or vigilance work. ▪ Heat Cramps—Cramping of the muscles because of loss of salt through sweat

3. PROJECT TASKS, POTENTIAL HAZARDS, AND CONTROL MEASURES (Or Attach Relevant AHA)		
3a. TASK(S)	3b. POTENTIAL SAFETY AND HEALTH HAZARD(S)	3c. CONTROL MEASURE(S) (Medical or Training Qualifications, Work Practices, PPE*, etc.)
		▪ Heat Exhaustion—Skin is pale, cool, and moist; heavy sweating; dizziness; fainting; headache; nausea; weakness. It is important to cool a person down quickly should they experience these symptoms ▪ Heat Stroke—Red, hot, dry skin with a lack of perspiration. (Note: Use of PPE can prevent the evaporation of sweat and cause high body temperature, rapid pulse, dizziness, confusion, delirium, coma, or death). Heat stroke is characterized by a cessation of sweating and is considered a medical emergency. 911 should be contacted if someone exhibits the symptoms of heat stroke ▪ Pre-Existing Conditions may impair your ability to tolerate heat. Acclimate yourself to working in hot environments over an approximate 6-day period. (Fit workers may acclimate more quickly.) ▪ Heat stress preventive measures include the following: o Drinking plenty of replacement fluids. You can lose 2-3 gallons (8-12 liters) of water per shift when the weather is hot. Water works just as well as non-carbonated flavored drinks. o Follow the appropriate work/rest regimen whenever working in a high temperature and humidity environment. o Take breaks out of direct sunlight and in areas cooler than where you've been working. o If you feel ill, notify the field team lead or the project manager. o Do not work alone in extreme heat stress conditions; always use the Buddy System. o Field personnel will be trained about signs and symptoms of heat stress and hypothermia. o Proper clothing shall be worn.
	Hunting Seasons	▪ Check with Navy Technical Representative, installation NRM, project manager, and/or field escorts regarding hunting seasons, area restrictions, and safety requirements. Wear hunter orange vests and hats during applicable hunting seasons.
	Interaction with Public/Strangers	▪ Encounters with the public or strange and/or threatening individuals may occur at any time; however, since work will occur on military installations, the chance of these encounters are

3. PROJECT TASKS, POTENTIAL HAZARDS, AND CONTROL MEASURES (Or Attach Relevant AHA)		
3a. TASK(S)	3b. POTENTIAL SAFETY AND HEALTH HAZARD(S)	3c. CONTROL MEASURE(S) (Medical or Training Qualifications, Work Practices, PPE*, etc.)
		low. If they do occur, the majority of the time it is friendly and curious individuals. Questions and comments from the public should be directed to the project manager Derek Hengstenberg (cell: 908.616.0436 or office: 207.358.2401) and the installation NRM.
	Water Quality/Water Safety Hazards	▪ Personnel shall refrain from drinking directly from rivers, streams, lakes, and ponds. A minimum of one quart of potable fresh water shall be carried by each person for a field day. Water purification tablets shall be carried for emergency use. If absolutely necessary for drinking, water from rivers, streams, lakes, and ponds should be boiled for at least 5 minutes and then cooled prior to use. In-water surveys should be conducted when water levels are low to prevent injuries or accidents. If current is too swift to safely survey, personnel should not conduct the survey. ▪ Standard Safety Equipment: (1) Waders – All crew members must wear chest or hip waders when conducting in-water survey work. Suitable waders are generally constructed of neoprene, PVC, silicon, and should be breathable for work conducted during high temperatures. (2) Footwear - All footwear must have non-slip soles. ▪ Terrain - Common hazards encountered during sampling activities in streams, rivers, and other waterbodies include slippery surfaces, unstable footing, and strong currents. Use caution to avoid falls, cuts, and injuries.
	Vehicle travel, including parking along public/private roadways and getting stuck.	▪ Wear seat belts at all times. ▪ Park only where there is enough room to pull completely off roadway, pull completely off roadway to park. ▪ Wear High Visibility Clothing. ▪ Do not leave vehicle unattended with the engine running. ▪ Check parking area for soft or unstable surfaces. ▪ Plan ahead to leave the installation before dark (not applicable to mist-netting surveys, which will occur during nighttime hours) as required by security requirements.
	Scratches/cuts/other injuries from vegetation.	▪ Always wear long pants and long-sleeved shirts; carry a first aid kit.

3. PROJECT TASKS, POTENTIAL HAZARDS, AND CONTROL MEASURES (Or Attach Relevant AHA)		
3a. TASK(S)	3b. POTENTIAL SAFETY AND HEALTH HAZARD(S)	3c. CONTROL MEASURE(S) (Medical or Training Qualifications, Work Practices, PPE*, etc.)
	General site requirements	▪ Wear hard hats and safety vest when working in active construction areas, or on/near roadways. ▪ Where applicable, do not enter restricted areas, ordnance storage areas, or active range areas (typically a flag is raised and flown when the range is active).
Mist-netting surveys	Contact with live or dead animals that have the potential to carry rabies.	▪ The rabies virus is present in the saliva and neural tissue of infected mammals and the most widely known route of exposure occurs from the bite of a rabid animal. However, exposure to rabies may also occur when the virus, from the saliva or other potentially infectious material (neural tissue) is introduced into the handler. Direct exposure routes consist of: o Bites – even those that do not cause bleeding o Existing open cuts in the handler's skin o Mucus membranes of the handler (i.e., rubbing one's eyes, mouth or nose after handling) ▪ Bats (and other small mammals) should never be handled by untrained and unvaccinated field staff. Field staff who handle bats will have received pre-exposure vaccinations and a current antibody check (titer level). ▪ Use appropriately sized PPE, including face shields/masks, eye protection, gloves, gowns, and laboratory coats when handling small mammals (bats) to prevent blood or other potentially infectious materials to pass through to or reach clothes, skin, eyes, mouth, or mucous membranes under normal conditions for the full duration of use. If necessary, provide training to field staff on proper use of PPE. ▪ All reusable equipment must be kept clean and repaired/replaced, and/or disposed of when necessary to maintain its intended protective use. ▪ Properly dispose of used PPE. ▪ When handling live bats, field staff will wear Kevlar lined deer skin gloves, or similar deer skin gloves for protection. ▪ Hypoallergenic gloves, glove liners, powderless gloves, or other similar alternatives should be made available for field staff that are allergic to standard gloves. ▪ Wash hands or use sanitizer gel or wipes after handling bats. ▪ Properly dispose of any dead animal carcasses.

3. PROJECT TASKS, POTENTIAL HAZARDS, AND CONTROL MEASURES (Or Attach Relevant AHA)		
3a. TASK(S)	3b. POTENTIAL SAFETY AND HEALTH HAZARD(S)	3c. CONTROL MEASURE(S) (Medical or Training Qualifications, Work Practices, PPE*, etc.)
		▪ If suspected exposure to rabies or other infectious diseases occur, the mammal should be retained for testing, the bitten/scratched area should be thoroughly cleansed, and the individual should seek medical counsel and possible vaccination regardless of their previous vaccination history. If the animal is a listed species, the local USFWS Game Warden office will be contacted to take control of the animal[RL1]. Refer to the CDC website http://www.cdc.gov/mmwr/preview/mmwrhtml/rr5902a1.htm
Safety meetings	General site risks and hazards, and emergency protocols	▪ Conduct tail-gate safety meetings at the beginning of each field effort for a new site/location to discuss safety related topics, including site-specific health and safety risks, hazards, and procedures and medical emergency locations in the event of an accident or emergency. If new staff join the field effort after the site-specific, tail-gate safety meeting was conducted, they will be provided the information prior to conducting the field effort (by the field team lead). Any near misses or injuries that have occurred specific to the nature of work or location, and to prevent future incidents should also be discussed at these safety meetings. Documentation of the name and date personnel receive the training, and a summary of topics discussed should be retained by the field team lead and project manager. Any near misses or injuries/emergencies need to be reported to the Tetra Tech Health and Safety Officer as soon as possible after the incident, but no more than 24 hours after the incident.

* PPE identified in this Plan was selected in accordance with 29 CFR 1910.132 and additional TtCES requirements.

4. EMERGENCY INFORMATION (Or attach Client—or other—plans that meet requirements)
4a. Procedure to account for field staff: Field team lead will call or text project manager (or designee) before the beginning of the day's/night's field work. Once field work is completed for the day/night, field team lead will call or text project manager (or designee) to let them know that all field staff are safe and off the project site.
4b. First aid/CPR trained individual's name and first aid kit location: Derek Hengstenberg will ensure all field teams contain at least one person that is CPR/First Aid certified, and that a stocked first aid kit is available for use during all field survey work.

4c. Location of urgent care facilities: Locations and contact information for medical facilities located both on and off the installations covered by this plan are provided below. Most of the installations where the work will take place will have a medical clinic; however, these may not be equipped to handle life-threatening emergencies. For life-threatening emergencies, proceed to the nearest emergency facility noted in this section.

NWS Earle, Colts Neck New Jersey
On-Installation
Branch Health Clinic NWS Earle
201 Highway 34 South, Bldg. C-3,
Colts Neck, NJ 07722
732-866-2300 or 732-866-7493

The NWS Earle Branch Medical Clinic provides outpatient ambulatory care by appointment only, between the hours of 0730 – 1600 Monday – Thursday, and 0730 – 1100 on Friday, excluding holidays.

Off-Installation
Monmouth Medical Center
300 2nd Avenue
Long Branch, New Jersey 07740
(732) 222-5200

NWS Yorktown (including Cheatham Annex)
On-Installation
Branch Health Clinic NWS Yorktown
160 Main Road, Bldg. 1806
Yorktown, VA 23691
(757) 953-8454

The NWS Yorktown Branch Health Clinic is open Monday – Friday, 0730 – 1530; close weekends and federal holidays
Clinic is located at the intersection of Longfellow Rd and Jefferson Ave, in Newport News, VA. From Base Gate #1, take the first Right at Fullinwinder Lane. At the end of this road, make another Right. Thereafter, the road will come to a "Y"-section. Take the Left fork of the "Y". The clinic is the second building on the Right.

Off-Installation
Riverside Doctors' Hospital
1500 Commonwealth Avenue
Williamsburg, VA 23185
(757) 585-2200

Naval Station Norfolk
On-Installation
Branch Health Clinic NAVSTA Norfolk
1721 Admiral Taussig Blvd.
Norfolk, VA 23511-2899
(757) 953-9000

The NAVSTA Norfolk Branch Health Clinic is open Monday – Friday 0700-1600

Off-Installation
Bon Secours DePaul Medical Center
150 Kingsley Lane
Norfolk, VA 23505
(757) 889-5000

Naval Air Station Oceana Dam Neck Annex
Off-Installation
Sentara Virginia Beach General Hospital
1060 First Colonial Rd
Virginia Beach, VA 23454
(757) 395-8000 or (757) 395-8890 (emergency department)

Joint Expeditionary Base Fort Story
On-Installation
Medical Clinic
Bldg. 649 New Guinea Road, Fort Story, VA 23451
(757) 422-7851

Hours: 0630-1500 Mon-Fri

Off-Installation
Sentara Virginia Beach General Hospital
1060 First Colonial Rd
Virginia Beach, VA 23454
(757) 395-8000 or (757) 395-8890 (emergency department)

Naval Air Station Oceana
On-Installation
Oceana Branch Medical Clinic
1550 Tomcat Blvd. Suite 150
Virginia Beach, VA 23460
(757) 953-3933

Off-Installation
Sentara Virginia Beach General Hospital
1060 First Colonial Rd
Virginia Beach, VA 23454
(757) 395-8000 or (757) 395-8890 (emergency department)

Naval Auxiliary Landing Field Fentress
Off-Installation
Chesapeake Regional Medical Center
736 North Battlefield Boulevard
Chesapeake, Virginia 23320

(757) 312-8121

Naval Support Activity Hampton Roads, Northwest Annex
Off-Installation
Chesapeake Regional Medical Center
736 North Battlefield Boulevard
Chesapeake, Virginia 23320

(757) 312-8121

4d. Evacuation routes and rally point(s):

Return to parked vehicle at start of field work. Consult attached medical facility information. Drive to nearest hospital identified for the installation, if necessary.

4e. Emergency contact information

WorkCare Phone: 800-455-6155 (24 hour)
Project Manager: **Derek Hengstenberg**
(908) 616-0436 (cell)
(207) 358-2401 (office)
Safety Manager: **Tami Froelich**
(509) 372-5827 (office)
(509) 392-9080 (cell)
Local Tt Personnel: **Emily Cowperthwaite**
(207) 358-2397 (office)
(207) 329-7381 (cell)
Local Client Reps: **Michael Wright** – Natural Resources Manager for NSAHR NWA, NASO DNA, NAS Oceana, and NALF Fentress; (757) 433-3461 (work) or (757) 373-8531 (cell)
JOHN PULVER **~~Melanie Frisch~~** – Natural Resources Manager for NWS Yorktown; (757) ~~462~~-5351 ~~(Work) or~~ (757) ~~544-4796~~ 887-4952 Jennifer Podlesek 322-4782
Patricia Chizmadia – Natural Resources Manager for NWS Earle; (732) 866-2254 (work)
Emmett Caraway **~~Melanie Frisch~~** –for Naval Station Norfolk; ~~(757) 462-5351 (Work) or (757) 544-4796~~ (757) 341-0495
Roger White **~~Michael Wright~~** – Natural Resources Manager for JEB Fort Story; (757) ~~433-3461~~ ~~(work)~~ or (757) ~~373-8531~~ ~~(cell)~~. 462-5361 462-5350 Sharon Waligora

On-site emergencies should call 911

What do I do in an emergency situation?

1. Call 911 or your local emergency responder for initial employee evaluation and transport to the hospital.
2. Administer first aid to minimize the injury effects.
3. Call WorkCare at 800-455-6155 for a triage call/discussion with an occupational health nurse or physician. Please mention as soon as possible that the call is regarding an emergency injury. At this point, the nurse or physician will assist the field staff to determine the best treatment plan.
4. Call your Project Manager: (See 4e).
5. Call your Safety Manager, Tami Froelich (See 4e).

What do I do in a non-emergency situation?

1. Administer first aid as soon as possible to minimize the injury effects
2. Follow steps 3 thru 5 above.
3. Call the local clinic identified above to notify them that you are bringing an injured worker in for evaluation.
   - You may transport the injured employee to the local clinic in a privately owned vehicle. A designated Tetra Tech employee must accompany the injured worker to the local clinic. Encourage the clinic, with WorkCare support, to consider first aid measures first.

5. INCIDENT PREVENTION PLAN SIGNOFFS

*This Training Record should be retained as part of the original project files.

ATTACHMENT A – PERSONAL PROTECTIVE EQUIPMENT

The Personal Protective Equipment (PPE) specified for this project is based on the hazard analysis. Because no chemical hazards are anticipated, the initial PPE will be Level D. Level D PPE includes the following:

- Hard hats – Required in active construction areas (if applicable)
- Safety boots –Sturdy boots are required but steel toe or composite toed boots are not necessary, but are recommended if working in active construction zones
- Footwear - All footwear must have non-slip soles
- Puncture-resistant gloves and face masks- Wear face masks and Kevlar lined deer skin gloves, or similar deer skin gloves are required for protection when handling live bats
- High visibility vest – Required when working around traffic and in/near construction zones
- Safety glasses – Not required but recommended for work in dense vegetation
- Long pants – Required
- Leather gloves –Recommended if working in dense and thorny vegetation
- Sunscreen – Not required, but is recommended
- Insect repellant – Not required, but is recommended for ticks and biting insects. DEET is an effective repellent that typically must be applied every 5 hours. Perform tick self-inspections after exiting wooded areas and tall grasses. Inspect areas for insects and spiders before entering or before placing hands near the ground
- Water or other hydrating fluids – Not required, but should be consumed throughout the day to stay hydrated
- Hip or chest waders – waders should be worn when conducting in-water survey work. Suitable waders are generally constructed of neoprene, PVC, silicon, and should be breathable for working high temperatures
- A first aid kit containing medical supplies (bandages, dressing, antibiotic ointment, first aid manual, etc.), Technu, Caladryl or similar lotion, sunscreen, insect repellent, and emergency water purification tablets shall be available during all aspects of field survey work

Safety and Accident Prevention Plan

Table of Contents

1.0 INTRODUCTION

Biodiversity Research Institute (BRI) places a high value on its employees, and is committed to providing a safe and healthy workplace. BRI believes that its employees have a right to know about health hazards associated with work environment, and it's every ones responsibility to become familiar with, have knowledge of, and take responsibility for potential safety risks.

The Safety and Accident Prevention Program seeks to prevent injury before it happens by involving all staff in identifying and eliminating hazards that before they develop, and minimize the impact if an injury should occur. BRI will always have to prepare for, respond to, and recover from disasters resulting from natural, human-based, or technology-based events. The key to success is in adopting a standardized approach that provides common program elements, techniques, and processes. This plan applies to all BRI employees and provides customizable forms to incorporate into field projects.

This plan hinges on employees adopting three essential values:

1) No task is so important that employees must risk their safety in order to get the job done.

BRI employees often work in challenging environments that require quick thinking and innovative problem solving. However, despite timeline pressures, inclement weather, or the desire to "get the job done", BRI expects its employees to always put safety first while doing their job.

2) Accidents expose all BRI Employees to risk.

Recall the old saying "haste makes waste" and consider the impact when decision to shortcut safety results in a serious injury that takes a key researcher out of commission. This incident affects more than the injured employee. Not only will the research be compromised as the team scrambles to find a replacement, but BRI may be faced with increased insurance premiums and/or penalty fines. Additional costs eventually are passed on to all employees. Loss of revenue for the company could result in layoffs. A good safety record may make the difference between BRI being selected by a funding agency over an equal competitor.

3) Accidents happen to good people.

Whether tethered to a desk, skimming on the water, or flying in the clouds, every BRI employee is exposed to safety-related issues every day. For those who live by "it can never happen to me" – think again. The laws of probability are working against this tenet since accidents will occur without warning despite preventative measures.

ABOUT THIS PLAN

This plan is divided alphabetically into several sections with accompanying appendices for field staff to use on a project-by-project basis. Please familiarize with the information

contained within this plan, ask questions, and consider how various aspects are applicable to your specific work.

It is the intention of BRI to comply with all applicable Occupational Safety and Health Administration (OSHA) regulations. This plan describes the processes and procedures used to mange occupational safety and health issues at BRI, and identify the most critical regulatory requirements.

AUTHORITIES

In the development of this plan, several authorities were consulted.

- U.S. Fish and Wildlife Service (USFWS)
- U.S. Coast Guard (USCG)
- American Canoe Association (ACA)
- Occupational Safety and Health Administration (OSHA)
- National Institute for Occupational Safety and Health (NIOSH)
- Centers for Disease Control and Prevention (CDC)
- National Fire Protection Association (NFPA)

2.0 RESPONSIBILITIES

BRI's Leadership Team holds the authority and responsibility for the over-all implementation of this program, and is assisted by Program Directors, the HR Manager, and the Risk and Compliance Advisor in its implementation. This section identifies who is responsible for implementing each element of BRI's Safety and Accident Prevention Program. The actual performance of activities described in this section may be delegated to other, but ultimate responsibility for ensuring that each program element is implemented correctly remains with the individuals identified below.

PERFORM FORMAL SAFETY WORKPLACE INSPECTIONS

Conduct Safety Inspections using the "Walk-Through Inspection Checklist" (see Appendix 1). The inspections must be performed quarterly. File the completed checklists in the Safety Inspections folder.

BRI Leadership Team and appointed staff

TRACK CORRECTIVE ACTIONS TO BE COMPLETED

A need for action to correct workplace safety or health deficiencies may be identified and reported through formal workplace inspections, suggestions by management or employees, and accident investigations. BRI will ensure that the person responsible for completing each corrective action is clearly documented and reports to the Leadership Team any required corrective actions that are not completed in a timely manner.

BRI Leadership Team and appointed staff

INJURY REPORTING AND RECORDING

Injuries and illnesses are recorded in accordance to OSHA requirements. If a work related injury or illness occurs, the Program Director should immediately inform the HR Director and complete the Report of Injury or Illness form (Appendix 1) within 24 hours of the incident. Sharps related injuries are noted so they can be separated out if necessary. The OSHA Form 300-A form from February 1 – April 30 is posted in common work areas as required by law. Note: if the work-related injury or illness involves a fatality or hospitalization of an employee, BRI may be required to notify OSHA within 8 hours.

Program Directors, HR Department

ACCIDENT INVESTIGATIONS

Accident investigations for work related injuries, illnesses, and near miss accidents are conducted as soon as possible following the event. These investigations are required by this program and must be completed with 24 hours of the incident. See Appendix 1 for the Accident/Injury and Near Miss Incident Review form. To ensure proper documentation, completed investigations are filed in the Accident Investigations folder of the Safety Program files. Additional guidance on how to perform accident investigations is provided in Appendix 8.

Program Directors, HR Department

CONDUCT SAFETY MEETINGS

Safety meetings to discuss safety related topics are conducted quarterly, at the beginning of each project and/or field season, or with the addition of new staff. An initial safety meeting that covers all potential hazards and expected response is required for new employees. Subsequent meetings should include discussion of injuries and near misses that have occurred since the last meeting, and how to prevent future incidents.

Meetings need to have a written agenda, date, names of employees who attend, and notes of any decisions. To ensure that any safety issues that were brought up during the meeting are forwarded to the correct person for resolution, file documentation of all safety meetings in the Safety Meeting folder for review by the Leadership Team.

Program Directors, Field Team Leaders, Leadership Team and appointed staff

EMPTY SAFETY SUGGESTION BOX

BRI has provided a Safety Suggestion Box at each facility (in the lunch area) and it will be checked at least weekly. An online version of the Safety Suggestion Box is located on BRI's intranet website. The Leadership Team reviews and determines the appropriate action on all suggestions received. All suggestions, and subsequent actions, will be filed in the Safety Suggestions folder.

Leadership Team and appointed staff

SUPERVISOR and MANAGER SAFETY TRAINING

All supervisors and managers must be aware of their responsibilities under the Safety Program, and all supervisors and managers must be aware of the hazards to which their employees may be exposed and the controls necessary for their employees to work safety.

Leadership Team and appointed staff

SUPERVISOR HEAT STRESS TRAINING

All supervisors with employees working in hot environments must receive training on the hazards of heat stress and, understand the procedures they are to follow if one of their employees develops a heat related illness. This training will be documented in the Safety Training folder.

Leadership Team and appointed staff

NEW EMPLOYEE TRAINING

All new employees are supplied with a copy of the Code of Safety Practices (Appendix 2) and any additional training specific to their work assignment(s). All BRI employees also receive additional training when they are given new job assignments with additional hazards, when new substances, processes, procedures or equipment are introduced into the work area, and when new workplace hazards are recognized. The employee must date and sign a copy of the safety training certification, which is placed the completed form in the employee's personnel file.

Program Directors and their appointed staff

PROJECT SPECIFIC TRAINING

Each Program Director is responsible for ensuring the safety of his/her crew. Each employee shall receive a safety orientation by his/her immediate supervisor when:

- First hired
- First drafted to work and a specific project

Each safety orientation shall cover the following points:

- A description of potential hazards associated with the project and related prevention strategies;
- How and when to report injuries;
- Where first aid supplies are located;
- How to report unsafe conditions and/or practices;
- What to do in an emergency;
- Identification of hazardous animals, plants or chemicals;
- Use and care of required personal protection equipment (PPE).

It is advisable that Program Directors take time to develop project job assessment plans (JSAs). This may be a requirement of the funding agency, and template is presented in Appendix 1, which may be modified for a specific project. See Appendix 6 for additional directions on how to complete a JSA.

Project Directors

START-UP SAFETY TRAINING

Ensure that all employees receive initial safety training when this Safety and Accident Program is first established.

Leadership Team

PROVIDE PERSONAL PROTECTIVE EQUIPMENT

BRI is committed to providing adequate supplies of the personal protective equipment listed in the Code of Safe Practices (Appendix 6) and making sure they are readily available for use by employees.

BRI is required to protect employees from exposure to potentially infectious material, and provide PPE in the appropriate sizes at no cost to employees. The equipment provided should not permit blood or other potentially infectious materials to pass through to or reach the employee's work clothes, street clothes, undergarments, skin, eyes, mouth, or other mucous membranes under normal conditions for the full duration of use. The types of equipment which may be provided include, but are not limited to gloves, gowns, laboratory coats, face shields, masks, eye protection, mouthpieces, resuscitation bags, pocket masks, or other ventilation devices. The equipment must be kept clean and be repaired, replaced, and/or disposed of when necessary at no cost to the employee. Hypoallergenic gloves, glove liners, powderless gloves, or other similar alternatives are available for employees who are allergic to the standard gloves.

Project Directors

SHARPS CONTAINER DISPOSAL

Ensure that sharps containers are replaced and properly disposed of as necessary.

Program Directors, Lab Manager

HAZARD, CONTROL, and PERSONAL PROTECTIVE EQUIPMENT CHANGES

This Safety Program shall be updated to reflect any changes in the hazards to which employees are exposed, the engineering controls used to protect them from those hazards, or personal protective equipment they use.

Leadership Team and their appointed staff

PERFORM ANNUAL REVIEW

Review the effectiveness of this program every year by completing the "Safety Program Review Checklist" (Appendix 1). Results are presented to the Leadership Team, and placed the completed checklist in the Safety Program Reviews file.

Leadership Team's appointed staff

MAINTAIN SAFETY PROGRAM FILES

Ensure that all the documentation generated by this program is properly filed.

In addition, BRI's Leadership Team has the responsibility of:

- Approving this Safety and Accident Prevention Plan.
- Providing adequate resources.

- Setting a good example.
- Assign staff to monitor safety conditions.
- Follow-up on unsafe condition reports.
- Report all work-related injuries and illnesses.
- Enforce Code of Safe Practices

DISCPLINE

Discipline for employees who do not comply with the Code of Safety Practices (Appendix 2) or behave unsafely includes:

- Verbal warning and retraining for first offense
- Written warning for second offense (copy placed in employees' personnel file)
- Suspension without pay or termination for subsequent offenses.

3.0 SAFETY COMMUNICATION

BRI uses the following methods to communicate with employees regarding safety related issues. Safety communication will be in a form that is understandable to every employee.

- Safety Meeting
  - Presented quarterly during regular staff meetings
  - All staff are required to attend
- Safety Suggestion Box
  - Located in the lunch room at each building and online
  - Staff are encouraged to submit suggestions
  - Suggestions may be made anomalously if desired
- Safety Training
  - All employees will receive safety training prior to starting work
- Safety Inspection
  - All supervisors must continuously (daily) observe their work area for unsafe actions and/or conditions and correct any deficiencies.
  - Formal safety inspections using checklists provided in Appendix 1 are conducted quarterly.

4.0 PERSONAL PROTECTIVE EQUIPMENT

Employees must be trained on the proper use of all personal protective equipment (PPE) they use when they are first given an assignment that requires PPE. If they are observed using the equipment incorrectly, it is the responsibility of ALL BRI employees to instruct them on the correct usage. While most PPE is specific to programs and managed by the Program Director, some PPE is communal and viewed as a shared resource.

5.0 ANNUAL REVIEW

BRI will review the effectiveness of this Safety Program at least annually and correct any deficiencies noted during the review.

6.0 RECORDS RETENTION

Records documenting the administration of this Safety Program will be retained for at least three (3) years.

The following will be retained for at least five (5) years:

- Training documentation
- Accident investigation records
- Safety inspection
- OSHA 300 log, summary and incident reports

Vaccination and post-exposure follow up records will be retained for the duration of employment plus 30 years. All records containing employee medical information will be kept strictly confidential.

7.0 LIST OF APPENDICES

Appendix 1 FORMS
- Employee Training Form
- Float Plan
- Field Check-Out/Check-In Procedures
- Report of Injury or Illness
- Accident/Injury and Near Miss Incident Review
- General Hazard Identification and Risk Assessment

Appendix 2 CODE OF SAFETY PRACTICES
- Code of Safety Practices
- Basic Safety
- Personal Protective Equipment
- Office and Shop Safety
- Field Safety

Appendix 3 CHEMICAL HYGINE PLAN
- Overview
- Hazard Determination
- MSDS
- Labels and Warnings
- Training
- Written Hazard Communication Plan
- Trade Secrets

Appendix 4 EMERGENCY ACTION PLAN
- Emergencies
- Incident Command System
- Fire Emergency
- Medical Emergency

APPENDIX 1

FORMS

Table of Contents

EMPLOYEE TRAINING FORM

Employee Training Requirements, Biodiversity Research Institute

Employee Name:	
Primary Trainer:	
Item	**Date Completed**
Code of Safe Practices – Provide the employee with a copy of the Code of Safe Practices (Appendix 2). Explain every item in the Code of Safe Practices to the employee and answer any questions they have. Remind them that their signature below is affirmation that they read the Code of Safe Practices.	
First Aid – Show employee the location of the first aid kit, and explain the procedure for calling outside help in the event of an emergency.	
Evacuation Plan – Show employee how to leave their work area in an emergency. Explain the system used to notify employees of an emergency. Show the employee where to assemble in the event of a building evacuation. Review the emergency action plan (Appendix 4) with the employee.	
Assignment Specific Hazards and Safety Procedures – Train employee on any additional hazards and safety procedures required for their specific work assignment.	

I certify that I have received all of the training indicated above:

Signature	Printed Name	Date

Note to employee: Cross out and initial any items you have not yet been trained on.

FIELD CHECK-OUT/CHECK-IN PROCEDURES

All biologists involved in this project are required to adhere to this check-out/check-in procedure each and every time they embark on field work. Please read and understand the following directions, and ask questions of your supervisor on points that you find unclear. The Check-OUT/Check-In list should be posted in a common area and made visible to all staff.

Date: Please use mm/dd/yy format.

Name(s): List the full name(s) of all biologists in your party, use multiple lines if necessary.

Departure: This is the time you'll depart; use 2400 hr time format.

Destination: Briefly describe your destination. This could be a transect number, trail name, etc. BRI in Gorham Maine should have a copy on file (with details) of such destinations, and a copy should be posted onsite for reference by other team members.

Transport: List the vessel/vehicle you'll be using for the day.

Communications: List the forms of communication you'll be carrying (cell phone numbers, SPOT number, etc.).

Return: This is the time you expect to return; use 24 hour time format.

Checked In: Place a check in this column once you've returned.

Date	Name(s)	Departure	Destination	Transport	Communications	Return	Checked In
5/15/12	Jonny on the Spot	0800	Sebago Lake – south end	Boat #3	205.752.3366 (cell)	1400	

REPORT OF INJURY OR ILLNESS

Employee Name (Last, First, MI)			Incident Number	
Mailing Address		City	State	Zip Code
Phone		E-mail	DOB	
Job Title		Current Supervisor	Hire Date	
Incident Location	Incident Date	Time of Incident	State Incident Occurred In	

Description of Incident (*describe sequence of events, object or exposure that directly caused injury or illness*)

Form Completed By	**Date**

Release of Medical Information: I certify that the above information is true to the best of my knowledge and I authorize the release to my employer and workers' compensation company all records relevant to my disability and my claim for disability or workers' compensation benefits, including but not limited to medical diagnosis, prognosis, treatment, and periods of hospitalization. It is understood that the company will use the information to verify my disability and determine my eligibility of appropriate benefits. This authorization applies to physicians and other health care providers, hospitals, clinics, insurance companies, workers' compensation carriers, and organizations administering benefit programs. This authorization will remain in effect throughout my claim for workers' compensation benefits. I understand that I have the right to revoke this authorization in writing. A photocopy of this authorization will be as valid as the original.

Risk Assessment Matrix

PRIORITISING HAZARDS AND RISKS (SEE EXAMPLE ON PAGE 13)

Probability	**Consequence**			
	Negligible	**Marginal**	**Critical**	**Catastrophic**
Certain	High	High	Extreme	Extreme
Likely	Moderate	High	High	Extreme
Possible	Low	Moderate	High	Extreme
Unlikely	Low	Low	Moderate	Extreme
Rare	Low	Low	Moderate	High

HAZARD CONSEQUENCE RATING TABLE

Catastrophic	Multiple deaths
Critical	One death or multiple minor injuries
Marginal	One severe injury or multiple minor injuries.
Negligible	One minor injury

PROBABILITY RATING TABLE

Certain	Exposure to hazard likely to occur frequently (91-100%)
Likely	Exposure to hazard likely to occur but **not** frequently (90-76%)
Possible	Exposure to hazard may occur, but probably is low (75-24%)
Unlikely	Exposure to hazard unlikely to occur (25-2%)
Rare	Exposure to hazard so unlikely that it can be assumed that it will not happen (<1%)

RISK PRIORITY TABLE

Risk Priority	Definitions Of Priority	Suggested Time Frame
High	Situation critical, stop work immediately or consider cessation of work process. Must be fixed today, consider short term and/or long term actions.	***Now***
Medium	Is very important, must be fixed this week, consider short term and/or long term actions.	**This Week**
Low	Is still important but can be dealt with through scheduled maintenance or similar type programming. However, if solution is quick and easy then fix it today. Review and/or manage by routine procedures.	**1 - 3 Months**

Risk Assessment Matrix Example

Risk is the amount of harm that can be expected to occurring during a given time period due to specific harm event, such as an accident. The level of risk can be statistically calculated by multiplying the probability that harm could occur, by the severity of the harm. A risk matrix (as seen on page 11) defines the various levels of risk as the product of harm probably categories and harm severity categories. Project managers should tailor each risk matrix to their own project and ensure the job assessment is signed. An example for a BRI bird mist netting project would be:

Probability	**Consequence**			
	Negligible	**Marginal**	**Critical**	**Catastrophic**
Certain	Stub toe on trail			
Likely		Cut hand setting up nets, Twist ankle on trails,		
Possible		Minor car accident on way to site		
Unlikely			Major car accident on way to site	
Rare				Tornado hits site while working

APPENDIX 2

CODE OF SAFE PRACTICES

Table of Contents

CODE OF SAFETY PRACTICES

BASIC SAFETY

Follow all Safety Rules – All employees must work safely and follow all safety rules.

Safety Program – BRI's Safety and Accident Prevention Program describes the policies and procedures BRI uses to provide you with a safe workplace.

Report Unsafe Conditions or Actions – All employees must immediately report unsafe conditions or near misses to Program Managers, Field Coordinators, the Executive Director, Deputy Director, or the Science Operations Director. A near miss is an incident where someone could have been hurt but wasn't this time. It is important to correct unsafe conditions or procedures before someone is hurt.

Report all Injuries – Employees must report all injuries (no matter how minor) to their supervisor so that arrangements can be made for medical or first aid treatment. This includes illness or aches and pains that employees think may be work related and that don't go away normally. Needle sticks or contact of your broken skin or mucous membranes with potentially infectious materials counts as "injuries" which must be reported.

Do not disturb or clean-up the scene of a serious accident (except to aid injured people or make the area safe) until an accident investigation has been completed.

Don't Work When Impaired – Employees shall not work when impaired by fatigue, illness, medication, or intoxicating substances such as alcohol. The use of illegal drugs is strictly prohibited.

Housekeeping – Keep your work area tidy and free from unnecessary clutter and trip hazards. Clean up spills as soon as possible. Keep solvent waste, oily rags, and flammable liquids in labeled fire resistant covered containers until removed from the work-site.

No Horseplay – Horseplay is forbidden.

Threats and Violence are Prohibited – Violence, threats of violence, and physical intimidation are prohibited.

Employees who feel that a BRI employee or client is potentially violent should immediately report their concerns to any manager or supervisor. Employees who experience violence on the job, or are threatened or experience physical or verbal intimidation should report this to their supervisor immediately.

PERSONAL PROTECTIVE EQUIPMENT

The personal protective equipment (PPE) used in your work area is listed below. Do not perform any tasks which require the use of PPE until you've been shown how to use it correctly. During your initial safety training you will be told which work tasks require the use of PPE and how to obtain the equipment you need.

- U.S. Coast Guard (USCG) approved flotation vests – employees are expected to wear USCG approved life vests when in a boat for work-related activities.
- USCG approved survival suits – supervisors will determine if conditions require USCG approved survival suits when boating in colder weather or on the ocean.
- Safety glasses with side protection (ANSI Z87.1)
- Safety goggles (ANZI Z87.1) – wear as required.
- Ultra-violet safety glasses (ANSI Z87.1) – are required with using UV florescence torches
- Latex disposable gloves – when handling, or expecting to handle, potentially infectious materials.
- Nitrile disposable gloves – when handling, or expecting to handle, potentially infectious materials; an alternative when employees are allergic to latex.

Eyesight is Precious – Always wear your eye protection when required. There are many types of eye protection available, tell your supervisor if your eye protection distorts your vision or gives you headaches.

Chemical Protective Gloves – Each kind of glove only provides protection against certain chemicals; always make sure that the chemicals you are using can't go through the kind of gloves you are wearing. No glove provides a perfect chemical barrier; always try to minimize the amount of chemicals that gets on your gloves. Avoid touching your skin or clothes with contaminated gloves. Never touch or allow others to touch objects with bare hands after handling them with contaminated gloves. Decontaminate objects which you have handled with contaminated gloves as soon as possible.

Latex Allergy – Some people may become allergic to latex rubber. Alternative gloves are available, and the allergy usually gets worse if you continue using latex gloves. For these reasons, inform your supervisor immediately and switch to another type of glove if you have any reaction to latex gloves.

Disposable Gloves – Do not re-use disposable gloves. Use the following technique to remove gloves without contaminating your hands.

1. Pinch one of the gloves at the cuff of the glove near the wrist.
2. Peel the glove off by pulling it off our hand turning it inside out.
3. Place the glove you just removed in the hand that still has a glove on, taking care to touch only the clean inner side of the just removed glove.
4. Slide your index finger under the remaining glove, and use your finger to turn the glove inside out over the previously removed glove. Take care to touch only the clean inner side of the glove with your bare hand.
5. Dispose of the gloves and wash your hands with soap and warm water.

BRI employees may be exposed to blood or other potentially infectious materials. Exposure with human blood and/or pathogens may occur through:

- Accidental needle sticks while drawing blood from wildlife.
- Tactile exposure with body fluids through an open wound of a coworker while providing first aid.

All body fluids should be considered potentially infectious materials and to avoid/minimize exposure, BRI staff must take the following precautions:

1. Always wash your hands immediately or as soon as possible after removing gloves or other PPE. Always wash your hands or any other skin with soap and water, or flush mucous membranes (e.g., eyes, mouth, and nose) with water immediately or as soon as possible following contact with a potentially infectious material. If you can't wash or flush immediately, use antiseptic hand cleaners or towelettes and wash as soon as possible.
    a. Antiseptic soap is provided in the restrooms of every BRI facility.
    b. Antiseptic hand cleansers or towelettes are provided in each field first-aid kit, and hands should be washed with soap and running water as soon as feasible.

2. Do not bend, recap or remove needles or sharps. Always place used sharps in an appropriate sharps container immediately or as soon as possible after use. Never reach into a sharps container for any reason. Securely close sharps containers before moving them. Report or replace sharps containers which are nearly full as instructed by your supervisor.

3. Eating, drinking, smoking, applying cosmetics or lip balm, and handling contact lenses are prohibited in work areas where you may be exposed to potentially infectious materials and while providing first aid. Never place food or drink in or on refrigerators, freezers, shelves, cabinets, or counter-tops where potentially infectious materials are stored or handles.

4. Always minimize splashing, spraying, spattering, and generation of droplets when performing procedures involving potentially infectious materials. Mouth pipetting/suctioning of blood or other potentially infectious materials is prohibited.

5. Always place specimens of potentially infectious materials in closable, puncture resistant, labeled or color-coded containers. If the outside of the primary container becomes contaminated or the specimen may puncture the primary container, place the primary container in a second, labeled or color-coded container.

6. Always decontaminate equipment you have used with potentially infectious materials before giving it to another employee or releasing it for servicing. If it is not possible to decontaminate the equipment, put an easily visible label that describes what parts remain contaminated on the equipment.

7. Always wear PPE when required. All PPE will be provided to you at no cost.

8. Gloves must be worn when it can be reasonably anticipated that you may have hand contact with potentially infectious materials, mucous membranes, or non-intact skin, are drawing blood, if you will be handling or touching contaminated items or surfaces, or if you are handling potentially contaminated laundry or waste.

9. Masks in combination with eye protection devices are required whenever you may be exposed to splashes, sprays, spatter, or droplets of potentially infectious materials and eye, nose, or mouth contamination can be reasonably anticipated.

10. Appropriate protective clothing (e.g. gowns, aprons, lab coats) may be required depending on the task and degree of exposure anticipated. Always immediately remove garments soiled by potentially infectious materials as soon as possible and place them in the designated container.

11. Change disposable glove immediately or as soon as possible if they are contaminated with potentially infectious materials, are torn or punctured, or lose the ability to function as an effective barrier. Remove all PPE before leaving the work area. Place PPE in the designated area or container for storage, washing, decontamination, or disposal. Never wash or reuse disposable gloves or any disposable equipment.

12. Clean equipment or surfaces which are overtly contaminated with potentially infectious materials immediately or as soon as possible.

13. Never clean up broken glassware by hand; use a brush and dust pan, tongs, forceps or other mechanical means.

14. Inform your supervisor immediately if potentially infectious material contacts your eyes, gets in your nose or mouth, or gets on your skin where there is a cut, rash, or any other skin problem. Inform your supervisor immediately if you are stuck or cut with a sharp that is contaminated with potentially infectious materials. The incident must be

documented, investigated, and you are entitled to receive confidential medical follow-up at no cost.

Sharps Safety – Always use all available safety covers built into sharps. Dispose of used sharps promptly in appropriate sharps disposal containers. Do not re-cap used needles. Report all needle sticks and other sharps-related injuries promptly to your supervisor.

Vaccinations and Boosters – If conditions prevail, BRI employees are eligible for vaccinations and/or boosters (i.e., Hepatitis B, rabies) at no cost to the employee.

Ticks and Lyme disease – Field biologists, especially those working in the northeast, should take precautions against being bitten by deer ticks. Black-legged and western black-legged ticks transmit Lyme Disease, an infection caused by *Borrelia burgdorferi*, a type of bacterium called a spirochete. When bitten, the bacterium travels through the bloodstream, establishes itself in various body tissues, and can cause a number of symptoms. Report tick bites and seek medical attention if the following occur:

- An expanding rash radiates from the site of a tick bite.
- A bull's-eye rash appears around the site of the tick bite.
- Swelling of the lymph glands occurs near the tick bite.
- Headaches occur.

If in doubt, always have a tick bit investigated by a medical professional. BRI's Workers Compensation plan covers the expenses if the tick bite occurred while working for BRI.

Plan Updates – BRI's Potentially Infectious Materials Exposure Control Plan will be reviewed and updated annually. Each employee will subsequently receive an updated copy electronically.

Records – Medical records relating to blood borne pathogens and/or potentially infectious materials (and any other medical issue) will be kept in BRI's medical files (locked) for 30 years. Medical records are kept under lock and key separate from other personnel files.

Training – BRI provides training on potentially infectious materials when:

- Employee is first hired, with retraining within a year.
- Employee is assigned to a project where exposure is likely.

Training is documented via BRI's Employee Training Documentation Form, and this form will reside in the employees personnel file for three years.

OFFICE and SHOP SAFETY

Computer Ergonomics – Employees should take the time to set up their computer comfortably. The keyboard and monitor should be directly in front of them so that they can work without twisting. The keyboard should be just below elbow height when sitting with their shoulders and

arms relaxed at their sides. The top of the monitor should not be above eye level. If necessary, employees should raise their seats and use a foot rest if their feet don't rest flat on the ground.

Employees should request a split keyboard or alternative mouse if their existing equipment generates wrist or arm discomfort.

Employees should arrange their work space so that there is not excessive glare on their monitor screen from lights and windows.

Food – Eating, drinking, smoking, applying cosmetics or lip balm, and handling contact lenses are prohibited in work areas where potentially hazardous or biological samples are stored or handled. Food and drink is not kept in refrigerators, freezers, shelves, cabinets, or on countertops or bench tops where biological materials are stored or handled.

Safe Lifting – Use mechanical devices, such as carts, to lift and carry heavy objects whenever possible. If necessary, have another person help lift a heavy item. Bend your legs (instead of your back) and avoid twisting your neck and back while lifting. Store heavy objects at waist level, not on the floor or overhead.

Keep Hand Tools in Good Condition – Replace chisels, punches and other impact tools with mushroomed shafts. Replace hammers with loose heads and any tool with loose handles. Keep tools reasonably clean to prevent your hands from slipping while using them. Do not use wrenches when the jaws are worn to the point that slippage occurs. Wooden handles should be free of splinters and cracks. Keep cutting tools sharp.

Guarding – never use any machine or portable power-operated tool unless all guards are in place and fully operational.

Electrical Safety

While most BRI staff will not encounter electrical issues during the course of their work, electricity can be a serious work place hazard, capable of causing both employees injury (shocks, electrocution, fires, and explosions) as well as serious property damage. By providing awareness training, BRI hopes to minimize the risk for such incidents.

BRI employees must be trained and authorized to perform electrical work. Evidence of their training must reside in their personnel file. All other BRI employees (most) who have not been trained to perform electrical work are not authorized.

Safe electrical work safety practices include:

- Make sure all electrical distribution panels, breakers, disconnects, switches, and junction boxes are completely enclosed. Shut the breaker panel door when finished.

- Always assume a circuit and/or piece of equipment is energized (whether it is or not).

- Move work and tools away from such circuits/equipment, which may be energized, thereby reducing the risk of shock or injury. For example, work benches should be located away from the breaker panel.

- Minimum approach distance, for qualified employees only, are:
  300 V and less – avoid contact
  Over 300V, but not over 750V – 1'-0"
  Over 750V, but not over 2kV – 1'-6"
  Over 2kV, but not over 15kV – 2'-0"
  Over 15kv, but not over 37kV – 3'-0"
  Over 37kV, but not over 87.5kV – 3'-6"
  Over 87.5kV, but no over 121kV – 4'-0"
  Over 121kV, but not over 140kV – 4'6"

- When working in an enclosed area, BRI will provide the necessary insulating materials or barriers to ensure employees are not exposed to potential electrical hazards.

- Always assume parts of electrical equipment are energized and treat them as live, unless otherwise noted.

- If a part is locked out or tagged by an electrician, do not touch it.

- If a repair or alteration is needed and no qualified and authorized employee is available, contact a qualified electrician using BRI's normal procurement procedures.

- Be aware of overhead lines – especially when working in the field. This includes vehicles, boats, mist nets, and all other equipment.
  - Keep a minimum distance of 10 feet for 50kV lines, and an additional 4" for every additional 10kV.
  - Scout bat sites in the daylight prior to selecting sites for mist nets and avoid areas with overhead lines and/or electrical equipment.
  - Always illuminate the area when setting up nets.
  - Always illuminate dark areas before touching, operating, or assessing electrical equipment or devices.

- Do not wear jewelry or other apparel that is capable of conducting electricity when working near energized equipment. Always wear non-conductive apparel, or render conductive apparel non-conductive by wrapping or insulating it (i.e., gloves of fingers with rings).

- Inspect Power Cords – Never use electrical equipment unless the power cord and ground plug (if present) are in good order. Never use equipment that shocks you, even the small shock from a minor short will get worse with time. Never use the electrical cord to

hoist, carry, or pull electrical equipment. Report all problems with electrical equipment to your supervisor.

Ladders

The following rules apply when using step and portable extension ladders while conducting BRI business.

Ladder Condition and Design

- Step ladders (self-supporting) and extension portable ladders (not self-supporting) – must be capable of supporting at least four times the maximum intended load.
- The rungs, cleats and steps on all ladders must be parallel, level, and uniformly spaced when the ladder is in use.
- Steps should be spaced not less than 10 inches apart, and no more than 14 inches apart.
- Ladders should be inspected regularly and maintained free of oil, grease, and other slipping hazards. They should also be free of defects that may snag clothing of the person climbing the ladder. Any ladder that is defective should be tagged and placed out of service.
- All portable ladders will have non-conductive side rails.

Ladder Use

- Do not use a ladder for any other purpose other than the one for which is was designed, and make sure it is securely placed on level ground away from hazards.
    - Do not use it in a horizontal position (scaffolding)
    - Do not place it on top of barrels or other unstable platforms
    - Keep ladders well away from electrical service and other energized parts.
    - Do not place ladders on slippery or slanted surfaces.
- Ladders should not be loaded beyond the maximum intended load for which they were built, or beyond the manufacturer's rated capacity.
- Do not stand on the top two rungs of a ladder. If the ladder is too short to accommodate the job, get a different ladder. The top of the ladder should extend three feet above the upper landing surface.
- Always face the ladder when ascending and descending.
- Use at least one hand to grasp the ladder when progressing up and/or down the ladder.
- Do not carry any object or load that could cause you to lose balance and fall.
- Place extension ladders such that the horizontal distance from the top support to the foot of the ladder is approximately one-quarter of the working length of the ladder.

FIELD SAFETY

Check-out/Check-In Procedures

All field activities should develop and adhere to a check-out/check-in procedure each and every time they embark into the field. While this form can be customized (see Appendix 1 for an

example), they must be written and readily available to all staff. A Check-out/Check-in form should include:

- Date (mm/dd/yy)
- Name(s) of staff
- Departure time (2400 time)
- Destination (route #, coordinates, local name)
- Transport (boat #, canoe #, kayak #, truck #, aircraft tail #, or on-foot)
- Communications (cell phone #, radio, SPOT #)
- Expected return time (2400 time)
- Actual return time (2400 time)

Working Alone

For any employee working alone, a job hazard assessment (Appendix 1) must be conducted to evaluate the risk of working alone and measures in place to assure additional safety. This plan must address check measures, such as those listed above, to be in place before work begins.

Communications

BRI field staff should carry at least one form of communication with them while in the field. Type and associated contact information (phone number, device number) must be entered onto the "Check-out/Check-in" form. Various forms of communication devices include:

- Personal cell phone –many staff use their personal cell phones and must submit a request for monthly reimbursement to the Deputy Director before reimbursement can be issued via your paycheck.
- SPOT Tracker – BRI maintains three (3) SPOT Trackers, a GPS-based device equipped with a SOS feature that when triggered, notifies GEOS, a 24/7 monitoring company. SPOTS are also programmed by project to send predetermined messages (e.g. "Scoter crew is on the water" and "Scoter crew is done for the day") that are sent to specific staff. SPOTS are used by field teams in remote locations where cell service is non-existent, in a marine environment where the boat is not equipped with alternative tracking equipment, and while conducting field work outside of the U.S. See the Risk & Compliance Advisor to reserve your SPOT.

Project Directors and their field crew leader(s) should develop a communication plan specific to their project that covers:

- Frequency of check-ins
- Contingency plan(s) if field crew fails to return by the prearranged time

Boating

BRI owns several Class A (less than 16 feet) and Class 1 (16' to less than 26') vessels; some are equipped with outboard motors. Much of BRI's field work involves operating a boat, canoe or kayak, and it's important that the operator be familiar with how to operate, maintain, and

repair their vessel well in advance of launching it into the water on the first day of their field season.

Training

BRI biologists, even seasoned professionals, working on Maine waters should thoroughly review Maine Boater's Guide, an online publication published by the Maine Department of Inland Fisheries and Wildlife.

Visit: http://www.boat-ed.com/maine/handbook/book.html

While there are no required mandatory boating or water safety course educational requirements for the State of Maine, other states may have requirements.

Visit: http://www.americasboatingcourse.com/abc_website/state_boating_law.htm#me

Complete any necessary boating and/or water safety courses (most are online) well in advance of deploying into the field.

Float Plan

BRI advises crews operating boats, canoes, and/or kayaks to file a float plan. This simple act may be the one determining factor between others finding and assisting crews in the field when an emergency occurs. Do not underestimate the importance of leaving a float plan with are responsible person who remains on shore. An example of a float plan is presented in Appendix 1. If field work is routine, BRI should have a basic float plan on file, and the field staff should maintain an onsite check-out/check-in procedure. Carrying and using a functional SPOT Tracker may act as a substitute for filing a float plan.

PPE

When working on the water, in a boat, canoe, or kayak, BRI employees are expected to wear a USGC approved life vest. USCG approved survival suits are available when working in colder weather or on the ocean. Your supervisor will determine if conditions require that they be worn.

Boat Supplies

All BRI boats are equipped with first id and emergency kits including flares and air horns. These items are housed in water tight boxes. Each boat should also have a suitable anchor, spare prop, basic tool kit, and two paddles. It is the operator's responsibility to make sure these items are present and in good order. Leaving shore without any of these safety items in good working order is the responsibility of the operator.

Operation and Maintenance

These vessels and their associated equipment (trailers, radios, batteries, PFD's, etc.) are an investment that can generate costly repairs if not operated and maintained correctly. Since

these vessels are a resource shared by all BRI programs, Project Directors are ultimately responsible for the care and maintenance of them and the associated equipment while in their possession. It is advisable that Program Directors adopt the approach that every crew member is responsible, properly trained, and take an active role in the care of each vessel. At a minimum, the following should be reviewed by all members of the crew before deploying into the field.

- Pre-departure check
  - Steering and throttle controls – are they working properly?
  - Bilge water – drain if present, making sure plug is replaced securely
  - Fuel – are tanks full?
  - Lights – are they working properly?
  - Oil/Fuel leaks – any present? If so, fix immediately.
  - Hose connections/clamps – check for leaks/cracks and replace/tighten if needed
  - Fire extinguishers – are they fully charged?
  - Radio/GPS – are they operating correctly?
  - Batteries – are they fully charged?
  - First Aid Kit – is it restocked and onboard?
  - PFD's – are there enough and are they in good condition?
  - Emergency Kit – is it restocked and onboard?
  - Float Plan – FILL ONE OUT AND LEAVE WITH A RESPONSIBLE PERSON

- Towing
  - Check seating of trailer hitch on the ball
    - Make sure the ball and trailer hitch is within the limits recommended by the trailer/boat/and vehicle manufacturer.
    - Make sure the trailer hitch is locked onto the ball
    - Use a padlock or tailoring pin
  - Check lights – are they operating correctly?
  - Check for a license plate on the trailer
  - Check wheel bearings – are they full of grease or oil?
  - Secure load
    - Check bow strap, stern straps and transom cover
    - Make sure nothing will fly out of the boat while in transit
      - Check paddles, boat bumpers and ropes
      - Arrange cooler so lid opening faces back of boat
  - Adjust mirrors as needed

Working Over Water

If a project requires BRI employees to work over water, at a minimum, the following safety precautions must be taken:

- Include the hazards of working over water as part of the project safety meeting.

- Be sure each employee has read and signed a description of the tasks to be performed while working over water. This documentation will be kept for 3 years.
- Have available, ring buoys with at least 90 feet of line, placed no more farther than 200' apart
- Provide U.S. Coast Guard-approved life jacket or buoyant work vest.
- Have a small boat available onshore in case an employee falls into the water and a water rescue is needed.
- Working over water, or near water alone where the possibility of drowning exists is prohibited.

Weather Conditions

Consult the weather forecast BEFORE leaving shore. Do not operate a boat in foggy conditions were you lose sight of the shoreline unless you have the appropriate navigation equipment that allows you to see your location and oncoming traffic. If hazardous wind and waves develop, if possible, boat close to the shoreline least exposed to the wind. If conditions deteriorate, immediately put to shore and wait for the wind to subside. Boating early in the morning and toward evening is the best practice when trying to avoid choppy conditions. Monitor thunder closely as lightening can strike 10-20 miles from the center of a storm cell. When you hear thunder, proceed immediately to shore and seek shelter (away from trees if possible). Delay your boating trip when a storm or front is predicted to move through your area. In all cases where your trip is interrupted by foul weather and you are forced to "wait it out" notify your base camp of your status, especially if you will fail to make your check-in time. Be aware, do not key hand-held 2-way communications during a thunderstorm.

Fuel

When departing, check that there is adequate fuel for your planned travel time and distance, including a generous reserve in case it's needed.

Vehicles

Drivers Safety Policy

The safety and well-being of our employees are of critical importance to the organization; therefore, we each have a responsibility not only to protect ourselves when on the road but also to do our part to protect those around us. Employees who are required to drive on company business at any time will be expected to consistently follow all the procedures noted in this policy.

1. Employees are expected to wear seat belts at all times while in a moving vehicle being used for company business, whether they are the driver or passenger.
2. Employees are prohibited from driving while under the influence of alcohol, drugs, or other substances that in anyway impair driving ability.

3. Employees are expected to follow all driving laws and safety rules, such as adherence to posted speed limits and directional signs, use of turn signals, and avoidance of confrontational or offensive behavior while driving. The allowable use of cell phones while driving varies by state.
4. Employees who drive commercial vehicles or who are otherwise subject to separate rules and regulations such as those dictated by state or federal laws are expected to adhere to all policies and regulations associated with the appropriate law or regulation that applies.
5. Employees must promptly report any accidents in accordance with established procedures. Employees must also appraise their supervisors of any damages to BRI vehicles.
6. Employees must inspect their vehicle prior to use. Report any malfunction to your supervisor. If the malfunction involves the clutch, braking system, lighting, or control system, the vehicle may be locked-out/tagged out until repaired. For vehicles equipped with backup warning signal alarm, make sure it is working properly before taking the vehicle. All BRI vehicles must be maintained and safe to operate.

Vehicle Usage

The purpose of this policy is to ensure the safety of those individuals who drive company vehicles and to provide guidance on the proper use of company vehicles. The term "*vehicle*," as used in this policy, includes, but is not limited to, cars, trucks, snowmobiles, and boats. This policy also applies to rental vehicles, which may have additional requirements. BRI expects each driver to drive in a safe and courteous manner pursuant to the Driver and Boating safety rules, as well as follow any applicable rental agreement. Employees who need a vehicle for an extended field assignment may be assigned a company vehicle for their use. All other employees needing transportation for company business may use vehicles from the pool.

BRI and rental vehicles should only be operated in the manner in which they were designed and intended for, and loads should not exceed the manufacturer's recommendations or local load limits. All loads will be secured safely before the vehicle is underway.

When fueling, the engine should be shut off. Make sure the filler nozzle is in contact with the tank to reduce to the possibility of a spark. Never smoke or have an open flame nearby when fueling a vehicle. To avoid the chance of ignition from smoking by others do not have other individuals in the back of the truck or, if hauling, the boat or trailer while fueling. Use of cell phones may increase the chance of sparks, so keep cell phones out of operation while fueling.

BRI vehicles are intended solely for company use. With the exception of extended field assignments, where a BRI vehicle is your only source of transportation, BRI vehicles are not for personal use.

Employees are required to wear eye protection when operating snowmobiles.

Driver Criteria & Administration

Employees must have a valid and current driver's license to operate a company vehicle. Employees holding jobs requiring regular driving for business as an essential job function must, as a condition of employment, be able to meet the driver approval standards of this policy at all times. For all other jobs, driving is considered only an incidental function of the position. Employees are expected to drive in a safe and responsible manner and to maintain a good driving record. Criteria that may indicate an unacceptable record includes, but is not limited to:

- Three or more moving violations in a three-year period.
- Recurring chargeable accidents. Chargeable means that the driver is determined to be the primary cause of the accident through speeding, inattention, etc.
- Any combination of accidents and/or moving violations.

Driver Guidelines and Reporting Requirements

1. Company vehicles are to be driven by authorized employees only, or in case of repair testing, by a mechanic. Spouses, other family members, or other non-employees, including independent contractors, are *not* authorized to drive company vehicles. In no case should subcontractors or their employees drive BRI vehicles. Volunteers may drive BRI vehicles in cases of special exceptions dictated by BRI business needs.
2. Passengers are generally limited to those individuals who need to ride in the vehicle to conduct employer business, such as other employees, independent contractors, volunteers, collaborators, etc. In the event of an emergency, non-employee family members may be passengers. If this occurs, please understand the following: Employees who use the vehicle to transport non-employees (for example, to pick up a child from day care) must understand that they are liable for any damages, payments, or costs that exceed the limits of employer insurance coverage, and such use indicates acceptance of any liability not covered by company insurance. **NOTE: Children age 12 and under should never ride in a front passenger seat.** If an employee's child, age 12 or under, is transported in a company vehicle, the child should ride buckled up in the rear seat. They should use child safety seats, booster seats, or safety belts appropriate to their age and size. Passengers should ride only in seats equipped to accommodate passengers.
3. Any employee who has a driver's license revoked or suspended shall immediately notify his or her supervisor and Human Resources, and immediately discontinue operation of any company vehicle, if applicable.

4. Accident Procedures:
    a. Accidents are to be reported as soon as possible, in all cases, without fail. All accidents in company vehicles, regardless of severity, must be reported to supervisor, Executive Director, Deputy Director, and the Science Operations Director.

b. Accidents involving other vehicles, people or property must also be reported to the police by the employee.

c. Accidents involving personal injury to an employee must be reported to Human Resources for Worker's Compensation purposes.

d. To help staff in a stressful situation, we are providing a vehicle accident form for your benefit. It will guide you in obtaining all the critical information BRI and its insurance companies need in the event of an accident. In the event of an accident, complete the form located in the glove compartment.

e. Do not discuss the accident with anyone at the scene except the police. Do not accept any responsibility for the accident. Don't argue with anyone.

f. Provide the other party with your name, address, driver's license number and insurance information.

g. Accidents in personal vehicles while on company business* ***must*** follow these same accident procedures

5. Drivers must report all ticket violations received during the operation of a company vehicle, or while driving a personal vehicle on company business* to their supervisor and Human Resources as soon as possible. Employees are responsible for any driving infractions or fines as a result of their driving.

6. Motor Vehicle Records will be obtained on all drivers upon hire. A driving record that fails to meet the criteria stated in this policy, or is considered to be in violation of the intent of this policy by the Leadership Team, will result in a loss of the privilege of driving a company vehicle.

* *Company business is defined as driving at the direction, or for the benefit, of employer. It does not include normal commuting to and from work.*

General Rules and Regulations for the Use of Company and Rental Vehicles

1. It is the responsibility of the assigned driver to inform the Office Administrator of any vehicle maintenance needs or safety problems.

2. Employees will be held accountable for maintaining proper fluid levels and tire air pressure. If you have checked out the vehicle for a longer period of time, present the vehicle for repair, service, or adjustment whenever such is needed, and preventative maintenance when time is due.

3. Employees will be held accountable for consulting the manufacturer specifications, securing loads within legal limits, and making sure vehicles are of the correct size and design for the intended use.

4. An updated copy of the employee's driver's license must be kept on file at all times with Human Resources.

5. Copies of the Vehicle Registration, a Copy of the Insurance Card, and a Vehicle Accident Report Form must be kept in the vehicle at all times.

6. Pool vehicles are to be left with no less than a half a tank of fuel when returned. If there is less than half a tank when returning, please fill the vehicle.

7. Vehicles are to be kept reasonably clean. It is the responsibility of the driver to clean out the vehicle upon return and run it through the car wash if needed. Any costs for cleaning the interior/exterior of a vehicle are reimbursable.

8. Smoking is not allowed in BRI vehicles.

Extreme Environmental Condition Safety

Heat

Heat illness prevention applies to field crews working out-of-doors, and requires Project Managers to consider the following regarding their projects:

- Training for themselves and their employees
- Providing potable water on the worksite
- Providing access to shade
- Having local procedures in place to handle a heat-related illness

Prior to the field season, Project Managers should undergo heat-related illness training and:

- Assess weather conditions at their intended field sites
- Take note of high humidity
- Try to schedule outdoor work during the cooler part of the day
- For strenuous tasks, rotate staff.

Prior to working in warm weather, Project Managers, field supervisors and field employees will review the following heat illness prevention procedures:

- Review the environmental and personal risk factors for heat illness;
- Discuss the importance of consuming water throughout the work day;
- The importance of acclimatization to conditions at the worksite;
- Discuss common signs/symptoms of heat illness;

- Discuss the importance of reporting signs/symptoms of heat illness to the field supervisor;
- Emergency response procedures specific to their worksite.

Risk Factors include:

- Environmental
  - Weather conditions
    - Temperature
    - Humidity
    - Air movement
    - Radiant heat (sunshine)
    - Conductive het (ground)
  - High intensity and/or duration of physical activity
  - PPE/clothing
- Personal
  - Poor physical conditions
  - Age
  - Degree of acclimatization
  - Water consumption
  - Some medications
  - Alcohol/drugs

Water Consumption - Drink plenty of water when working in hot environments. It's best to drink small amounts frequently (up to four (4) cups/hour). Take it easy when you first start working in a hot environment. It takes your body at least a week to get used to working in elevated temperatures. BRI provides potable water in coolers for field staff.

Acclimatization – It takes 4-14 days for people to adapt to outdoor conditions. BRI employees, when working in environmental conditions that are not standard should do the following:

- Start slowly – do not overexert yourself until you've adjusted.
  - Supervisors should adjust work schedules and intensities during the first two weeks of each new or returning employee begin work date.
- As needed, take frequent breaks in the shade (or in shade that's provided), especially when ambient temperatures rise above 85^0F
- Drink plenty of water

Common Signs –

- Heat Exhaustion – caused by excessive loss of water and salt through sweat
  - Headaches, dizziness, lightheadedness or fainting
  - Weakness and moist skin
  - Muscle cramps

    - Mood changes such as irritability or confusion
    - Upset stomach or vomiting
- Heat Stroke – caused by a total breakdown of the body's cooling system
    - Sweating stops – skin is hot, red, and dry
    - Mental confusion, losing consciousness
    - Fainting
    - Seizures or convulsions
    - This is a medical emergency – can be life threatening

Reporting signs/symptoms - All BRI field supervisors are trained on how to recognize and prevent heat exposure as part of their first aid training, and will be monitoring the condition of field employees. Tell your s**u**pervisor if you or a co-worker experiences extreme weakness or fatigue, giddiness, nausea, or headache or if your face becomes pale or flushed. These are symptoms of **heat exhaustion** and anyone with these symptoms should rest in a shady or cool area. If shade is not available, ask your supervisor and they will provide shade. You will not be punished in any way if you experience heat stress and must rest. Watch out for your coworkers; sometimes a person with heat stress does not realize it themselves.

If you or a co-worker stops sweating and experiences mental confusion, delirium, loss of consciousness, convulsion, or coma this may be heat stroke. Immediately soak the person in cool water and fan them. The person must go to the hospital or medical clinic as soon as possible. A person with **heat stoke** may die without medical attention.

Local Emergency Response - Field supervisors, as part of their morning tail-gate review of the workday, will remind employees of what to do when a heat-related illness occurs. At a minimum, the following should be reviewed:

- Identify employees carrying cell phones (for calling 911)
- The location of the nearest hospital or clinic
- While waiting for help:
    - Move the affected individual to a cooler area.
    - Give them a small cup of water (if conscious and not nauseous).
    - Loosen and/or remove clothing.
    - Fan and mist the individual with water.
    - Apply a water-soaked towel (or ice-pack wrapped in towel) to head and ice pack to arm pits.
- Call the field supervisor immediately.
- Do not let anyone with any of these symptoms return home or to the field camp unattended without a medical evaluation.
- Supervisors must report each incident on BRI's Report of Injury or Illness form (see Appendix 1)

Cold

If you or a co-worker experiences uncontrollable shivering and the sensation of coldness, a slower heartbeat and weak pulse, slurred speech, memory lapses, or extreme sleepiness, you may be suffering from hypothermia (low body temperature). Anyone suffering from hypothermia should rest in a warm environment right away.

When working in cold environments for extended periods of time, watch for the symptoms of frostbite in your hands, feet and face. These include burning, numbness, tingling, itching, or cold sensations. Skin with superficial frostbite may appear white and frozen, but it retains some resistance when pressed. Skin with deep frostbite is hard.

Ice

In cold environments, be sure to watch for ice on walkways and floors. Do not walk on slippery ice. Remove ice build-up from floors and walkways if necessary.

Sun

Protect your skin and eyes from the sun by using hats, sunglasses, sunscreens, and covering you skin with clothing. Ultraviolet light in sunlight causes skin cancer.

Project Specific Safety

Additional Information

Your supervisor will provide additional information regarding hazards or working procedures specific to your work area.

Never start working on a task until you have been fully trained on the safety requirements and your supervisor has cleared you to begin.

Fit for Duty

For each BRI position, the physical requirements necessary to complete the tasks related to the position are clearly stated in each employee's hiring documents. Should the employee's position title change, or the demands of his/her current position change, BRI will review the position's written description and the new physical requirements with the employee and provide training if necessary.

Drug-Free Workplace Policy

In compliance with the federal Drug-Free Workplace Act of 1988, BRI employees, including those working on a Federal Grant, must abide by the following statement. The unlawful manufacture, distribution, dispensation, possession or use of controlled substances is prohibited in the workplace, in the field, or at any BRI activity.

Employees are prohibited from working while under the influence of drugs, and are expected to report to the workplace with no alcohol or illegal substances in their body. In addition, any drug or alcohol activity that adversely affects job performance or job safety, or that discredits BRI is prohibited.

Use of legally prescribed drugs on the job is allowable only if they do not impair the employee's ability to perform the essential functions of their job effectively and safely without endangering themselves or others. BRI may request to do an evaluation of safety for the effects of some prescribed drugs.

> Note: Some funding agencies may require drug and alcohol screening as part of their contractual agreement with BRI. In such cases, BRI employees may be required to undergo pre-project, post-accident, or random testing as required by the funding agency.

Any violation of the above provisions will result in the employee being subject to disciplinary action, up to and including termination for misconduct. BRI also reserves the right to request that any employee undertake either drug counseling or a full rehabilitation program if a violation of the above provision occurs. Any employee exhibiting observed behaviors suggesting a violation of this policy may also reassigned or sent home.

In addition there are conditions that must be met if the employee is convicted of, or pleads "No contest" to a drug related criminal charge. The employee must, within five days, notify BRI of this. BRI will then take appropriate action, up to and including termination, or require the employee to participate in a recognized drug rehabilitation program.

If questions arise about this policy or issues related to drug or alcohol use at work, employees are encouraged to speak with the Executive Director or Deputy Director without fear of reprisal.

SAFETY AND ACCIDENT PREVENTION

APPENDIX 3

CHEMICAL HYGIENE PLAN

Table of Contents

OVERVIEW

While BRI's Mercury Laboratory may be the first location that comes to mind when referencing chemicals, there are other areas, such as the garage and museum, where chemicals are present. In order to comply with OSHA's 29 CFR 1910.1450, or what is also known as the Laboratory Standard, the following guidelines should be followed. The laboratory standard applies to labs that:

- Use hazardous chemicals
- Serve as a workplace where relatively small amounts of hazardous chemicals are used on a nonproduction basis
- Hazardous chemicals are manipulated on a laboratory scale
- Use of multiple chemical procedures or chemicals
- Have procedures that are not part of a production process
- Use protective practices and equipment to minimize the potential exposure to hazardous chemicals

OSHA's Hazard Communication Standard (29 CFR 1910.1200), also known as the Right-to-Know Law ensures that chemical hazards in the workplace are identified and evaluated, and that information concerning these hazards are shared with employers and employees. This is accomplished through a hazard communication program that includes:

- Determination of hazards
- Container labeling and other forms of warning
- Material Safety Data Sheets (MSDS)
- Training
- Written hazard communication plan
- Trade secrets

HAZARD DETERMINIATION

The hazard determination requires employers to identify and evaluate all chemicals used in the workplace. All Project Managers need to conduct this hazard determination for their work area and/or project. This evaluation falls into two categories:

- Listed hazards – those included in one of the following references: OSHA 29 CFR 1910.1000 tables, American Conference of Governmental Industrial Hygienists Threshold Limit Values (TLV), The National Toxicology Program, or the International Agency for Research on Cancer (see Appendix B).
- Defined hazards – physical or health hazards, such as combustible liquids, oxidizers, corrosives, and reproductive toxins and non-toxins.

MSDS

Once all the chemicals have been evaluated and identified, document them in an inventory list and obtain an MSDS for each of them. MSDS are available from the chemical supplier or manufacturer. They contain specific chemical hazard information, such as health hazard, routes of entry, exposure limits, safe handling precautions, spill clean-up, personal protective equipment, emergency and first-aid procedures, and the name, address and telephone number of the chemical manufacture. All information must be in English, collected alphabetically in a binder, and displayed in highly visible place accessible to all employees. If this collection of MSDS sheets is moved, all BRI employees should be informed of its new location via an email.

The inventory list of hazardous chemicals will be posted at each work area where it occurs, with directions of where the MSDS binder is currently located.

LABELS AND WARNINGS

Hazardous chemicals in the workplace need to be clearly labeled. The label should contain the identity of the materi3al, appropriate hazard warnings, and the name and address of the manufacturer. Again, all labels should be in English.

If a container is unlabeled, automatically assume it contains a hazardous material and contact the local transfer station on guidance on how to dispose of it. Hazardous chemicals are sometimes present in unlabeled areas, such a hoses (antifreeze). If unsure, please consult your Project Manager a certified mechanic.

When working on a site where other subcontractors are working, inquire if they have hazardous materials onsite and ask for a copy of their written chemical hygiene plan. Inform them that the work BRI performs does not include the use of hazardous chemicals.

TRAINING

BRI is obligated, by law, to provide employees with the necessary information and train them in the use and handling of hazardous chemicals in their work area at the time of their initial assignment or whenever a new physical or health hazard is introduced. Training includes:

- Methods and observations used to detect the presence or release of the chemical
- Associated physical and health hazards
- Protective measures
- Labeling
- MSDS information

BRI will achieve this training through the quarterly staff meetings and project-specific meetings.

WRITTEN HAZARD COMMUNICATION PLAN

The written hazard communication plan must fully documents the actions BRI has taken to comply with OSHA regulations pertaining to chemical hazards. It should list the responsible person(s) for each area of the program, and a copy made available to all staff. The written plan will be updated annually, or when a significant change has occurred. Updated plans will be shared with staff electronically. If a new hazard is identified, the plan will be updated, staff notified electronically, the MSDS binder will be updated, and the inventory list updated. Non-routine activities that may subject employees to hazardous chemicals will be reviewed with the affected employees prior to implementation, and added to the written chemical hygiene plan for future reference.

TRADE SECRETS

This final category involves manufacturer Trade Secrets. A chemical manufacturer may withhold the chemical identity, including the chemical name or other specific information, from the MSDS. However, under special conditions, this secret information may be obtained by health care professionals. BRI needs to be aware of the possibility of trade secrets.

APPENDIX 4

EMERGENCY ACTION PLAN

Table of Contents

EMERGENCIES

Emergencies vary from urgent situations to disaster and tragedy. While the latter is unlikely, there is a high probability that BRI staff will encounter and need to respond to less critical emergencies. Emergencies are just as likely to occur in the office as they do in the field, and this section contains strategies for both. Being prepared is the best defense, and knowing in advance the details on where to gather, who to call, and what to do will help mitigate the negative consequences of an emergency.

INCIDENT COMMAND SYSTEM

The Incident Command System (ICS) is a standardized, on scene, all-hazard incident management concept adopted by the United States in the 1970s in response to massive wildfires in California. Due to its flexibility, the ICS is used at any scale (local to federal) to provide a common framework for a standard response and operation procedures to reduce problems and the potential for miscommunications during incidents.

First on the Scene

The ICS is based on a "first-on-scene" concept where the first responder on the scene is in until the incident is resolved, or the initial responder transitions incident command to an arriving, more qualified individual.

So what does this mean? When a BRI employee is the first on the scene of an emergency, he/she is essentially the Incident Commander until someone more qualified or an agency, such as the fire department, emergency medical transport (EMT), U.S. Coast Guard, or law enforcement, arrives and takes over making the decisions. If multiple BRI staff members are present, the one with the most experience and/or training (not necessarily the supervisor or field crew leader) assumes the role of incident commander.

FIRE EMERGENCY

Fires are generally categorized as:

- Structural – fire that involves a building
- Wildfire – vegetation catches on fire through several sources of ignition, including lighting strikes, arson, accidental (discarded cigarette), or intentional (prescribed fire out of control).
- Vehicular – a piece of machinery, usually a car or truck, is on fire.

Sometimes the only indication of fire is heat or smoke. Do not ignore these early warning signs of a potentially deadly situation. In structures, explosions sometimes start or can accompany

fires. Explosions are a rapid and powerful combustion that feature a loud bang, blast waves, and flying debris.

Structural Fires

When a fire occurs within a building or structure, the plan is to evacuate occupants in a save, controlled, and efficient manner. Prior planning is the key to avoiding irrational behavior during a structural fire.

Alarms – In the event of a fire emergency, employees will be alerted by:

- Verbal announcement (shouting)
- In case of fire, shout: "Fire, fire, everyone out" as you make your way to the nearest exit.

Facilities

- 19 Flaggy Meadow Road, Gorham, ME 04038
- 652 Main Street, Gorham, ME 04038
- Other rented facilities (field housing)

Evacuation – In the event of fire or other emergency, ALL employees shall evacuate immediately by means of the nearest available marked exit.

- Always keep exits clear
- Move to the "Designated Area of Assembly" (see below)

Small Fires

- Portable fire extinguishers are provided in the workplace for employee use.
- Small fires are those that can be quickly controlled with little risk to staff. An example of a small fire it one occurring in a wastebasket.
- A small fire becomes a substantial fire that requires evacuation when ONE fire extinguisher is not enough to put the fire out.
- In the event of a small fire, any employee may use the extinguishers to extinguish the fire before evacuating.

Fully Involved Fires

- Fully involved fires are those that cannot be controlled by ONE fire extinguisher.
- Evacuate the building immediately while shouting a verbal announcement to other staff.
  - Stay low to the floor if smoke and flames are present.
  - Hot air can scorch lungs.
  - Smoke may contain toxic fumes.

  - Take short breaths.
  - Cover face with damp cloth.
  - Breathe through your nose.
- Check doors before opening.
  - Place your hand on the door face or handle.
  - If hot, DO NOT OPEN.
  - If cool, open door slowly, keeping your heard to one side to avoid any blast of hot air.

Critical Operations/Equipment – Critical operations shutdown procedures are NOT required, and no employees are authorized to delay evacuation for this purpose or to delay evacuation for the purpose of gathering up equipment.

Designated Area of Assembly - After an emergency evacuation, employees are to gather in the following locations:

- BRI West – gather in the side yard (off of Flaggy Meadow Road) to await further instructions and roll call.
- BRI East – gather in the front yard to await further instructions and roll call.

Vehicles - You may move your vehicle to a location away from the building.

- Park it such that it will NOT interfere with emergency response vehicles.
- DO NOT DRIVE AWAY.
- Report to your designated area of assembly to await further instructions and roll call.

Roll Call - will be conducted at the staging area.

- The fire monitor (see list below) will conduct roll call.
- The location of staff not present will be verified via cell phone.
- A list of names and possible location within the building of all unaccounted-for staff will be given to the responding fire department.

Fire Monitors - For further assistance with emergency evacuation procedures, the following individuals may be contacted:

- BRI West – TBD
- BRI East – Cathy Flegel (727.267.1854), Lynn Marchilli (207.450.6287)

Wildfires

Fire is a natural component in many ecosystems. However, these unplanned fires can pose a threat to life and property. When a wildfire occurs close to a BRI field site, the primary directive is to evacuate and/or cease field work until the area has been deemed safe by the Incident Commander. Wildfires display unusual behaviors that hard for even seasoned veterans to anticipate. BRI field staff DO NOT carry the appropriate safety gear to work in and around a wildfire.

If, while working in the field, you notice large amounts of smoke or see uncontained flames:

- Evacuate the area immediately.
- Call authorities (911) when you are in a safe place.

Vehicle Fires

Most vehicle fires begin through a mechanical or electrical failure, and usually the risk of death is low. Fires can also start during vehicular collisions or rollovers. The risk of death is higher since additional injuries and/or obstructed means of egress often accompany these types of accidents. Arson is the third way vehicles can catch on fire.

Although automobile manufacturers have engineered safety features into cars and trucks, the risk of an explosion still exists. Also, if a burning vehicle is parked off pavement, the surrounding vegetation could catch on fire, resulting in a wildfire.

Please follow these guidelines:

- Never leave a vehicle parked with the engine running over dry vegetation.
- Try to park on a mineral soil surface.

Boat Fires

All BRI boats are equipped outboard engines and BRI employee using the boats are responsible for making sure the onboard BRI-supplied Marine-grade fire extinguishers are operational and charged.

Fire Extinguishers

BRI provides portable fire extinguishers in the offices, in vehicles, and on boats. These extinguishers are visually inspected monthly, maintained annually, and are replaced as needed. At a minimum, BRI provides an annual training program for staff to familiarize them with:

1. The location of fire extinguishers
2. General usage of fire extinguishers

This topic will also be covered in Project specific training for field staff, conducted by the Project Manager at the beginning of each field season.

In general, follow these guidelines when using a fire extinguisher:

1. Do not use a fire extinguisher to fight a fire unless you are very confident the extinguisher will safely put the fire out. Instead, evacuate the building notifying others as you leave and summon the fire department if necessary.

2. When using a fire extinguisher, remember PASS

a. **P**ull the pin – this will allow you to discharge the extinguisher.
b. **A**im at the base of the fire – if you aim at the flames, the extinguishing agent will fly right through and do no good. You will want to hit the fuel base, which is located at the bottom of the flame.
c. **S**queeze the handle – depress the button that releases the pressurized extinguishing agent in the extinguisher.
d. **S**weep from side to side – until the fire is completely out. Start using the fire extinguisher from a safe distance away, then move forward. Once the fire is out, keep an eye on the area in case it re-ignites.

Do not use a fire extinguisher to fight a fire unless you are very confident the extinguisher will safely put the fire out. Instead, evacuate the building notifying others as you leave and summon the fire department if necessary.

MEDICAL EMERGENCY

A medical emergency is an unforeseen event that requires a prompt response. A victim's health and/or live may be at risk in the event of an injury or medical emergency. Your ability to respond promptly, make quick decisions, and attend to the victim until medical personnel arrive may make the difference between life and death. When you recognize an emergency, you must be prepared to take action, preferable with an overall plan in mind. The following guidelines are designed to help you "plan in advance" of an actual emergency.

If you experience a medical emergency and someone is injured, contact your supervisor once help has arrived and the victim is well attended by an emergency responder.

At the beginning of each field season, BRI requires Project Managers to identify remote field sites where access by 911 emergency responders or access to a clinic, hospital or physician is limited. For these projects, at least one BRI employee with valid first-aid training will be part of the field team, and will be available to provide basic first aid. Training, equivalent to training provided by the American Red Cross, will be provided to BRI employees at no cost.

Life-threatening Medical Emergencies

CALL 911 IMMEDIATELY

Life-threatening signs include when a victim:

- Is or was unconscious
- Has chest pains or pressure
- Is bleeding severely
- Has difficulty breathing
- Has pain or pressure in the abdomen
- Is passing blood or vomiting

- Has slurred speech, severe headache or seizures
- Has a head, neck or back injury
- Has a possible broken bone(s)
- Has been poisoned

Assess, Alert, Attend

When someone is hurt, the natural tendency is to rush in and assist. However, the first step is to **assess** the scene to determine if it is safe for you to help. Just a few things to look for include:

- Downed wires that may be a source of electricity
- Presence of a venomous snake and or rabid animal
- Unsafe substrate that could give way under your weight

Once you've assess that the area is safe, **attend** to the victim by gathering the following information:

If unconscious:

- Is the victim breathing?
- Does the victim have a pulse
- Is the victim severely bleeding?

If conscious - same questions as above plus:

- What happened?
- Where do they hurt?
- Do they know their name?
- What is their age?
- Do they have any medical conditions?

NOTE:

- **NEVER** administer CPR or First-Aid unless you are **CERTIFIED**.
- **NEVER** administer First Aid unless you obtain the **PERMISSION** of the victim.

Alert 911 if you determine the extent of their injuries warrants immediate help, and stay with the victim until medical help arrives.

First Aid Kits

All BRI field crews will have in their possession a first aid kit supplied with items relevant to the work they are performing. Prior to each field season, the Project Managers will appoint an

employee to review each kit and replace missing and/or outdated items. All first-aid kits will be watertight and clearly labeled.

Portable Eye-wash Station

If a project involves a risk of BRI employees being exposed to corrosive materials, then BRI will provide a portable eye-wash station at no cost to the employees.

WEATHER RELATED EMERGENCY

Lightening

While thunder and lightning storms occur year round, they are most common during the summer months. Since lightning often strikes well in advance of heavy rain, sometimes as far as 10-20 miles from the center of the storm, it's important to take action when you….

…first hear thunder:

- Look for shelter inside a home, large building, or hard-topped vehicle.
- If on the open water, go to land and seek shelter immediately.
- DO NOT seek shelter under tall trees.
- DO NOT key portable radios.
- Wait at least 30 minutes after the last thunder before leaving your shelter.

…feel your hair stand on end:

- Lightning is about to strike.
- Squat low to the ground on the balls of your feet.
- Place your hands over your ears and your head between your legs.
- DO NOT lie flat on the ground.
- This is a last resort when a building or hard-topped vehicle is not available.

…are with someone who is struck by lightning:

- Call 911
- Attend to victim (who carries no electrical charge)
- Check their breathing, heartbeat, and pulse.
- CPR may be needed.

Tornado

The National Weather Service issues two tornado messages:

- Tornado Watch – issued when conditions are favorable for a tornado

- Tornado Warning – issued when a tornado has been sighted and reported. The warning provides the last known location of the tornado, its speed, and its direction of movement.

During a tornado watch or warning:

- Monitor outside conditions.
- Cease outside activities if the wind picks up or the sky darkens.

If a tornado is seen or heard:

- If indoors:
  - Move away from windows.
  - Assemble in the most secure part of the building, generally an interior room with no windows.
  - Try to get under heavy pieces of furniture.
  - A corner of the room (even if it has a window) provides more protection than the middle span of a wall.
- If outside:
  - Do not stay in your vehicle.
  - Seek shelter inside a building.
  - Do not try to outrun the tornado.
    - Falling limbs/trees and downed power lines often occur before a tornado strikes.
  - Seek refuge in a ditch or culvert as a last resort.
    - Cover your head with your arms.

Communicating and Updating this Plan

This written plan will be updated annually, and updates shared with employees electronically. A copy of the plan will reside at each office, on BRI's server under PROGAMS, and on ADP, BRI's online payroll system. A review of plan will occur during at least one of BRI's quarterly staff meetings annually, and this plan is part of the new employee orientation.

APPENDIX 5

TRAVEL SAFETY

Table of Contents

FIELD ITINERARY

While each field project is unique, they all contain certain basic elements such as start and end dates, big ticket equipment, safety gear and a communication plan. Before entering the field, the Project Managers should share field itinerary details including, but not limited to:

- Project funding code
- Dates the field team will be deployed
- Names of all BRI field crew members
- A list of equipment (trucks, boats, trailers) that will be used
- Forms of communication (Spot Trackers, marine radio, personal cell phones)
- Additional safety equipment (i.e., Mustang suits, first aid kits, flares)
- A description of the field work
- Check-in/Check-out policy

Send this information to the Finance Administrator and the Science Operations Director. Finance will keep a copy of the information with all the financial records associated with the project as verification of participating staff and the correct contract code. The Science Operations Director will review and may request additional insurance, particularly for international field-oriented work, and request the field team use a SPOT Tracker and/or the information that is linked the MMSI number programmed into the boat radios.

Finally, the Executive Director or Deputy Director will use this information if BRI is contacted by an outside agency on your behalf, such as the U.S. Coast Guard or local law enforcement, while the BRI team is deployed in the field, or if the BRI field staff fails to check-in as agreed.

COMMUNICATIONS

While phone calls and emails help administrative staff in Gorham with logistics and billing, some projects require the field staff to remain connected to Gorham during the course of their travel via prearranged check-ins. The projects most likely to require this extra step include:

- International travel – where field work is required
- Travel into remote areas where cell phone service is spotty or nonexistent
- Solo field work
- Field work is of a dangerous nature

MULTIPLE FORMS OF COMMUNICATIONS

BRI staff in the field should not rely on just one form of communication. Cell phones, SPOT Trackers, and other communication devices should be housed in watertight containers while in the field. Communicating with your supervisor can be done in a variety of ways:

- Phone call – be sure to leave a message if your supervisor fails to answer
- Text message – use to notify a group of people
- Email – use to notify a group of people
- SPOT Tracker – can prearrange notifications by text and/or emails
- Rented satellite phone – use 2-stage calling; include contact numbers on field itinerary

BRI maintains a cell phone reimbursement policy for biologists who use their personal phones.

CHECK-IN POLICY

A daily check-in, usually at the end of the day, is preferred, but negotiable between the field staff and their supervisor. It is the supervisor's responsibility to have a check-in protocol established, preferably in writing, with their field staff BEFORE they enter the field.

Failure to check-in will trigger a series of responses from your supervisor, the Executive Director and the Deputy Director.

1) 12 hours after a failed check-in the supervisor must make multiple attempts to contact the employee/team.
    a. Given the emergency contact information obtained at the beginning of the project, the supervisor begins contacting BRI staff or other researchers working in the last known area where the missing employee/team were working.
    b. Direct them to look for, make contact with, and call back on the status of the missing employee/team.

2) 24 hours after a failed check-in, the supervisor must notify the Executive Director and Deputy Director.
    a. If no additional BRI staff or other researchers are working in the area, the Executive Director and Deputy Director will contact the nearest law enforcement and/or U.S. Coast Guard station and request assistance.
    b. If the missing employee/team is traveling internationally, the appropriate U.S. Embassy will be contacted. Family members will be notified.

3) After 48 hours, the Executive Director, Deputy Director, or their appointee will make arrangements to travel to the last known location of the missing employee/team. Family members will be kept informed.
    a. Searching will continue until the authorities discontinue search and rescue operations.

Note: in addition to the emotional toll, steps 4-6 will likely result in a financial cost to BRI. Search and rescue operations expenses are often passed on to the employer and/or family. Therefore, field biologists who disregard the check-in policy established between them and their supervisor for their field work may face disciplinary action.

RENTAL VEHICLES

BRI employees renting vehicles are covered under BRI's automobile insurance policy. There is no need to purchase additional insurance through the rental agency. A copy of a rental insurance card is available upon request from the Science Operations Director.

APPENDIX 6

PERSONAL PROTECTIVE EQUIPMENT

Table of Contents

AUTHORITIES

Personal protective equipment (PPE) is governed by the following authorities:

- 29 CFR 1910.132-133 and 135-138, Occupational Safety and Health Administration
- American National Standards Institute (ANSI) standards incorporated in the Occupational Safety and Health Act (29 CFR 1910).
- National Institute for Occupational Safety and Health (NIOSH) Personal Protective Equipment Guidance

JOB HAZARD ASSESSMENTS

Program Managers are responsible for conducting a thorough assessment to make sure all job hazards on their projects are identified, and take action to eliminate or reduce them. A job hazard assessment is a process of identifying real or potential safety and occupational health risks for specific jobs within the workplace that might require the use of PPE to protect employees. If the scope of work changes, the job hazard assessment must be revisited, re-evaluated, and employees retrained if necessary. These requirements also extend to subcontractors. Hazards must be ranked on basis of severity (see example in Appendix 1).

Program Managers should use the General Hazard and Risk Assessment form (see Appendix 1) when preparing a job hazard assessment. A copy of this form completed form will reside with the contract documents in BRI's Finance Office. If the project includes subcontractors, they will receive a copy of the job hazard assessment. BRI will provide training for Project Managers and others involved in preparing job hazard assessments.

Purchase of necessary PPE should be a budgetary consideration for both Program Managers (when developing a proposal and/or annual budget) and the Executive Team (when approving the annual budget). It is the Program Manager's responsibility to make sure their employees have proper PPE to protect them from workplace hazards, and are trained on how to select, use, maintain and clean the PPE.

Types of PPE that may be required are:

- **Electrical protective equipment** – e.g. insulating blankets, matting, covers, line hose, gloves, and sleeves made of rubber when exposed to electrical hazards.

- **Eye and Face Protection** – All persons must wear ANSI Z87.1 approved protective eyewear when there is a hazard from flying objects. ANSI Z87.1 approved UV protective eyewear is necessary when using a Ultra-violet light.

- **Foot Protection** – All persons must wear safety shoes or boots with impact protection when the work involves carrying or handling materials such as packages, objects, parts

or heavy tools which could be dropped, and for other activities where objects might fall onto the feet and cause injury.

- **Hand Protection** – Hand protection (gloves) are required whenever working with equipment or materials likely to be hazardous to the hands, such as:
    - Skin absorption of harmful substances
    - Severe cuts or scrapes
    - Punctures
    - Chemical or thermal burns
    - Harmful temperature extremes

- **Head Protection** – Head protection that resists penetration and absorbs the shock of a blow are required when working in an environment where there is a danger of head injuries from falling objects or other hazards.

- **Leg Protection** – When working where injury to legs is possible, special equipment is required to prevent injury. For example:
    - Working with chain saws – wear leg chaps
    - Working in areas where you may encounter venomous snakes – wear leg guards

- **Other Special Types of Protection** – includes protective aprons, waders, U.S. Coast Guard approved life vests, Mustang jackets.

COMMON HAZARDS

- Employees may work around vehicle traffic.
- Employees may work in the rain.
- Employees may work in wet conditions.
- Employees may work on ice or snow.
- Employees may work while kneeling.
- Employees may work over or near water (risk of drowning)
- Employees may work at elevated heights (climbing gear required)

PPE TRAINING

Project Managers must train employees, who in turn must comply with all PPE requirements including:

- Wearing PPE as required
- Completing PPE training
- Cleaning and maintenance to keep PPE in serviceable condition
- Notifying supervisors when PPE needs to be repaired or replaced

Training should include:

- When PPE is necessary.
- What PPE is necessary for which job task(s).
- How to properly put on, remove, adjust and wear PPE.
- The limitation of the PPE, and its proper care/maintenance/disposal.

Project Managers will provide retaining when either the type of PPE or workplace changes making earlier training obsolete or an employee illustrates a lack of knowledge concerning how to use the PPE or is observed using it incorrectly.

RECORD KEEPING

Project Managers should keep written records of PPE training for all employees. At a minimum, training records should include:

- Name of the person trained.
- Date of the training.
- Type of training provided.

PPE for STANDARDIZED BRI ACTIVITIES

Boating

- Required PPE
    - Employees are expected to wear a U.S. Coast Guard approved life vest when in a boat for work-related activities.
        - BRI will provide lightweight, self-inflatable personal flotation devices for this purpose.
    - When boating in cold weather or on the ocean, when the water temperature could cause hypothermia, BRI will provide USGC approved survival suits.
        - These suits are required to be in the boat.
        - The onsite Project Manager will determine if conditions require that they be worn.
- Other recommended PPE
    - Water-activated personal strobe light
    - Whistle

APPENDIX 7

SPOT TRACKER

Table of Contents

WHEN TO USE A SPOT

BRI has purchased three (3) SPOT Trackers for staff to use in the field. It is just one device that helps keeps field staff and BRI Maine in contact with each other and is viewed as an additional safety measure. It comes equipped with a SOS feature that, when triggered, notifies a 24/7 monitoring operation (GEOS) who will arranges emergency response(s) regardless of where you are at. The SPOT works globally, and BRI expects the following teams to carry (and use) a SPOT who are:

1. Working in remote locations were cell phone coverage is very sparse or nonexistent
2. Working in a marine environment in a boat that is not equipped with alternative tracking equipment
3. Conducting field work outside of the U.S.

While exceptions may apply, if your field work falls into one of the above categories, verify with your Director on the need to carry a SPOT.

If you are asked to carry a SPOT, information from the TRAVEL ITINERARY will be used to update the information GEOS will need in case of an emergency.

SPOT OPERATING DIRECTIONS

POWER

To turn SPOT on simply press and hold the ON/OFF button until the button blinks green.

- SPOT performs a self-diagnostic test.
- When power is ON, the button will blink green every 3 seconds.
    - This is helpful for making SPOT more visible in the dark.
- To turn SPOT off, press and hold the ON/OFF button until the light stops blinking.

AUTOMATIC SELF TEST

SPOT performs a self-test when you initially turn on your SPOT. If all visible lights flash red, the SPOT self-test has found a failure, and SPOT will not send a message. If the On/Off light, GPS light and Message Sending light all blink red, SPOT has a GPS failure, but SPOT may still be able to transmit an SOS or Help/SPOT Assist message without your GPS location

INITIAL TEST BEFORE GOING INTO THE FIELD:

Perform an initial system test to evaluate your entire messaging system, from the operational condition of the SPOT to the readiness of those you've chosen to receive your messages.

1) Go outside to where SPOT has a **clear view of the sky** in all directions.
2) Press and hold the **ON/OFF** button until the function light blinks green.
3) Press and hold the **Check-In/OK** button until the function light blinks green.
4) Leave SPOT outdoors. The GPS indicator light blinks green as SPOT acquires a GPS fix.
    a. Once SPOT acquires your GPS location, the Message Sending light and GPS light will blink green in unison for ~15 seconds to notify you that your message is being transmitted with GPS location.
    b. The Message Sending light will continue to blink green over the remainder of the 20 minute message cycle and for one (1) hour after the end of the message cycle (this is to provide you with additional time to check if your most recent message was transmitted).
    c. The Check-In/OK function light will turn off once the message cycle is complete.
5) Verify that the message was received in the email or SMS account(s) that you set up during activation in your Check-In/OK contact list.
6) You can also view your messages in your account at findmeSPOT.com

7) If the GPS light blinks red, SPOT does not have a clear view of the GPS satellites and you must move to an area with a clearer view of the sky for proper operation. Then repeat steps 2 through 5.
8) You can update the names and contact information anytime via your account on the SPOT website.

SPOT BUTTONS

SOS: Use this function in the event of a life threatening or other critical emergency to notify emergency services of your GPS location and that you need assistance.

- The GEOS International Emergency Response Center alerts the appropriate agencies worldwide – for example contacting 9-1-1 responders in North America and 1-1-2 responders in Europe.
- SPOT will again look for a GPS signal prior to sending the next scheduled message to GEOS Rescue Coordination Center (~4-5 minutes after the first message)
- SOS will repeat the entire message cycle until cancelled (or batteries are depleted) with updated location.
- SOS messages will be sent even if GPS location cannot be determined.
- SOS overrides Check-In/Ok, Custom Message, and Track Progress.

Help: In the event of a non-life threatening emergency, you can use this function to notify your personal contacts that you need assistance.

- Messages scheduled every 5 minutes for one hour with updated location to your friends or coworkers.
- SPOT sends Help/SPOT Assist messages even without a GPS location.
- SPOT will again look for a GPS signal prior to sending the next scheduled message (~4-5 minutes), and repeat the entire message cycle.
- Overrides Check-In/OK, Custom Message, and Track Progress.

Check-in/OK: This feature allows you to let your friends and family know that all is OK with a pre-programmed message along with your GPS location.

- **BRI biologists** – use this feature at the **BEGINNING** of your field day to notify BRI Gorham that your activities are underway.
- With a push of a button a message is sent via email or SMS to up to 10 pre-determined contacts and your waypoint is stored in your SPOT account for later reference.
- Messages scheduled 3 times over 20 minutes to contacts on your contact list.
- SPOT must get a GPS signal before sending your Check-In/OK or Custom Message.
- If no GPS signal is found, the GPS light blinks red and SPOT deactivates the function without sending any messages.
- Suspends Track Progress until message is sent, then Track Progress resumes automatically.

Custom Message: This feature allows you to let your friends and family now receive a custom message along with your GPS location with a push of a button.

- **BRI Biologists** – use this feature at the **END** of your field day to notify BRI Gorham that all is ok and your field day is done.
- SPOT must get a GPS signal before sending your Check-In/OK or Custom Message.
- If no GPS signal is found, the GPS light blinks red and SPOT deactivates the function without sending any messages.

Track Progress: Start/stop tracking at any time using your SPOT device.

- You can also mark a Reference Point or send Check-in/OK messages from specific locations while in Track Progress mode.
- SPOT will schedule an update to a transmission to your account every 10 minutes for 24 hours.
- Message not sent if GPS location cannot be determined.
- SPOT must get a GPS signal before sending your waypoint.
- SPOT will stay in the Track Progress function, and again look for a GPS signal at the next scheduled message interval.

Light indicators

SPOT uses lights to tell you what it's doing. Take a moment to become familiar with these lights. Function lights Each button has a backlight that blinks when that button is active. To activate (or if applicable, cancel) any function, you must press and hold the button until the function light starts blinking (approximately 3 seconds).

GPS Light

The GPS light notifies you whether SPOT is able to see the GPS satellites and obtain your GPS location.

• Green – The GPS light blinks green while SPOT sees the GPS satellites and is looking for a GPS location. Once the GPS location is obtained, the GPS light and Message Sending light blink green approximately 15 seconds to notify you that your message was sent with your GPS location.
• Red – The GPS light blinks red if SPOT doesn't see the GPS satellites and /or can't find your GPS location. You should move to a location with a clearer view of the sky.

Message Sending Light

The Message Sending light notifies you whether or not your most recent message was transmitted.

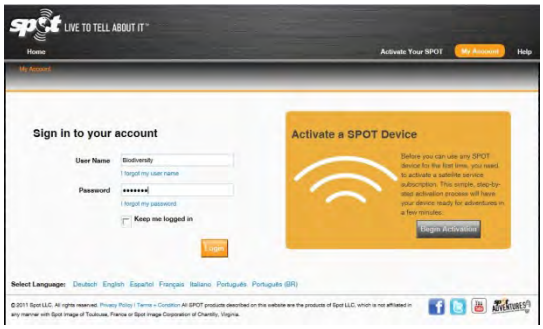
• Green – The Message Sending light blinks green after SPOT transmits the most recent message.
• Red – The Message Sending light blinks red if SPOT didn't send the most recent message.
The Message Sending Light will continue to blink as appropriate for each function – until the next scheduled message (Track Progress, Help/SPOT Assist, SOS) and/or until one (1) hour after themessage cycle is complete (Check-In/OK, Custom Message, Track Progress, Help/SPOT Assist).

VIEWING TRACK PROGRESS ONLINE

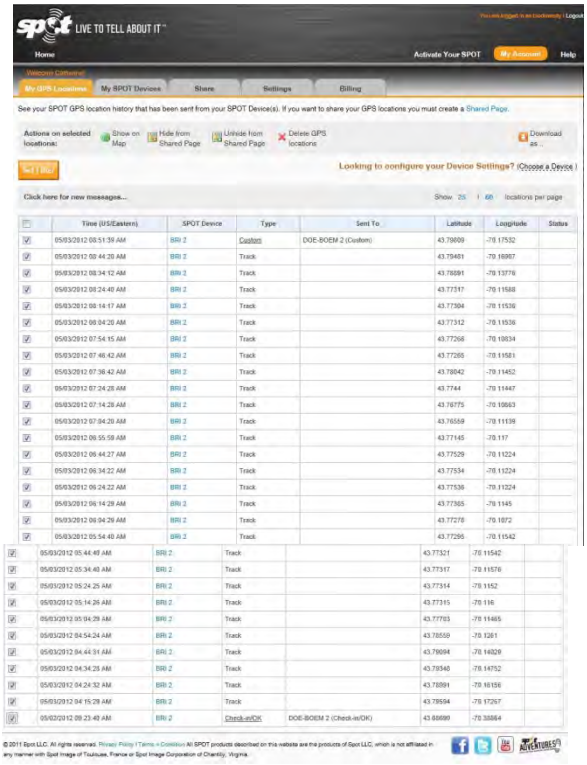
When the TRACK PROGRESS option button is pressed, the SPOT will locate your position every 10 minutes. To view your progress (or a history of it):

- Log onto http://www.findmespot.com
- Select **My Account** in the upper right-hand menu bar

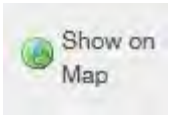
- User Name = **Biodiversity**
- Password = **gavia19**



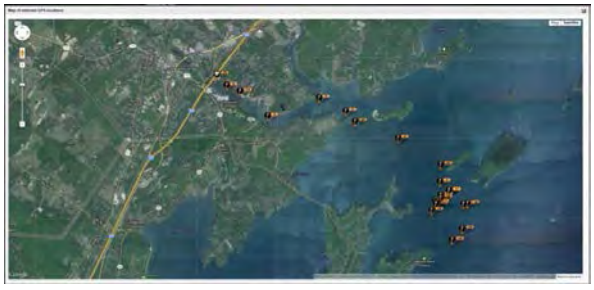
- Under the **My GPS Locations** tab
- Use **Set Filter** to your SPOT number (see back of carrying case), **Apply**
- Click each message – your page should look like this:



- Select **Show on Map** icon
- Map view appears



- Click the **Satellite** button in the upper right-hand corner of the map to see the map in satellite view



APPENDIX 8

ACCIDENT and NEAR MISS INVESTIGATIONS

Table of Contents

ACCIDENTS and NEAR MISSES

Accident and near miss incident investigation is a critical part of every Safety Program. The purpose of these investigations is to determine why the incident occurred and then prevent similar incidents in the future.

DEFINITIONS

Accident	An unintended injury, illness, death or property damage.
Near Miss Incident	An event which could have resulted in an accident but didn't (e.g. "that was a close one…."

ACCIDENT CAUSATION

It's important to report and investigate every accident and incident especially minor accidents and near misses incidents. Often, many minor incidents occur before a major accident; investigating and preventing minor incidents can also be prevent major accidents. For example, many people may slip on an oil puddle before someone falls and is injured. By finding and fixing the oil lead after someone slips (the "near miss incident") we also prevent someone from falling (the "accident").

Most accidents have more than one cause; the accident occurs because of a combination of factors which by themselves might not have caused the accident. Usually, the most underlying causes of an accident are in fact symptoms of underlying problems.

When conducting an accident or near miss investigation it is important to understand all of the causal factors in order to identify the most effective corrective actions.

STEP-BY-STEP INVESTIGATION

The following steps should be used as a guideline when investigating and evaluating an accident or near miss incident.

- Make the area safe
- Care for the injured
- Cordon off the accident area
- Assemble others to help assess (if necessary)
- Gather necessary investigative tools
    - Pen and paper for documentation
    - Digital camera
    - Tape measure

    - Marking tools (flagging)
- Investigate
    - Examine and describe the area
    - Take photographs
    - Review personal protective equipment
    - Interview others
    - Document finding in writing
- Analyze and identify the underlying problems
- Devise corrective actions
    - Present suggestions to the Executive Team
- Follow-up
    - Executive Team implements solution
    - Original accident investigator should also follow up on corrective actions

REPORTING

Project Managers should appoint an employee responsible for reporting and conducting an investigation on their project before an incident occurs. The Science Operations Director will review the investigation/reporting process with the identified employee prior to them embarking on their field season. The Science Operations Director is responsible for reporting and investigating incidents that occur at BRI's main offices in Gorham, ME. A form is provided in Appendix 1 to assist with this process.

Near miss and accidents must be reported in a timely manner.

- For incidents that involve an injury, notify the Executive Director, Deputy Director or Science Operations Manager within 8 hours. Upon notification, BRI will contract Chartis Insurance, BRI's Workers Compensation carrier, to establish a case file. Depending on the severity of the injury, other regulatory agencies (i.e., OSHA) will be notified. If working on a funded project, BRI is also obligated to inform the funding agency of the incident within 24 hours.
- For near miss incidents, the incident needs to be reported to the above BRI employees within 24 hours.

SUBCONTRACTORS

Each subcontractor working on BRI projects is obligated to comply with all Federal, State and Local safety requirements as well as project-specific requirements of the funding client. These combined safety requirements constitute a minimum level of performance expected from each subcontractor and his/her employees, or their agents, throughout the project's period of performance.

As part of the contracting agreement, subcontractors will supply BRI with a copy of their safety plan, and agree to be solely responsible for implementing their safety plan. They will also have their insurance carrier provide BRI with a copy of their Experience Modification Rate (EMR) for the past three years. The EMR is a metric that gauges both the past cost of injuries and the future chances of risk.

Before work begins, the subcontractor will be required to attend BRI's project orientation meeting where safety is discussed. Their attendance will be documented by the Project Manager, and this documentation will reside in the Finance Department's contract folder. Attendance is also required at subsequent job meetings where safety, hazard assessments, and inspections are discussed. It's highly advisable to include the subcontractor in the development of the job hazard assessment, however the level of their involvement may vary by project.

If an accident or near miss incident occurs, subcontractors must inform the BRI Project Manager within eight hours, who will then inform the appropriate agencies and/or clients within 24 hours.

Subcontractors should also be part of post-job performance reviews and include a safety review.

APPENDIX 10

BATS AND RABIES

Table of Contents

OVERVIEW

Rabies is a fatal viral zoonotic disease of public health significance (CDC 2011). It is a viral disease caused by RNA viruses in the family *Rhabdoviridae*, genus *Lyssavirus* (Lyles and Rupprecht 2007) that affect the brain and spinal cord. In humans, it generally takes many weeks and in rare cases even a few years before symptoms appear. Most often people show signs of the disease within one to three months after exposure to the virus. Unfortunately, once people show signs of the disease it is nearly always fatal. Even though tens of thousands of people are successfully vaccinated each year after being bitten by a mammal that may have rabies, a few die each year because they do not recognize the risk of rabies from the bite of a wild mammal or they do not seek medical advice once bitten (CDC, 2001). Rabid animals (wild and un-vaccinated pets and farm animals) have been recorded in every county in Maine (ME CDC, 2010).

Early signs of rabies in humans may include:

- Fever
- Headache
- Unclear thinking
- Sleepiness
- Excessive worry
- Numbness or tingling around the wound

Mammals with rabies may (or may not) show the following:

- Act strangely once the virus reaches their brains
- Seem shy or fearful
- Seem overly friendly or aggressive
- May stumble as drunk
- May appear lame

Rabies in Bats

Bats, like all mammals, are susceptible to contracting rabies. The literature cites that some bat species seem more susceptible to contracting rabies and the disease in bat populations is not thought to be increasing (Brass 1993). The occurrence of the disease in bats in North America has been estimated to be less than ½ of 1 percent (Constantine 1988), and the traditional view that bats are asymptomatic carriers of rabies, immune to its progression, has been debunked (Brass 1994).

The U.S. Department of Health and Human Services' Center for Disease Control and Prevention (CDC), and most State CDC offices maintain rabies is more common among certain mammals, including:

- Bats
- Raccoons
- Skunks
- Foxes, coyotes

They also report that rabies is very rare among small rodents, mice and chipmunks. While all of this is encouraging, given the lethalness of the virus and the inability to confirm diagnosis except through testing saliva or neural tissue, rabies remains a threat that must be approached with much caution.

The need for caution is further justified because the recent human rabies cases in the United States have been caused by the rabies virus from bats (CDC 2001), and the most common rabies virus variants responsible for human rabies in the United States are bat-related (CDC 2008). During 1990-2007, 34 naturally acquired bat-associated human cases of rabies were reported in the United States. Actual bites were reported in 18% of the case while contact with a probable bite represented 6%. The majority (44%) reported contact with a bat but no suspected bite, while 32% reported no bat interaction at all (CDC 2008). Laboratory data supports the hypothesis that the bat rabies virus variant associated with the silver-haired bat (*Lasionycteris noctivagans*) and the eastern tricolored bat (*Perimyotis subflavus*) have biological characteristics that might allow for a higher likelihood of infection (Morimoto et al. 1996).

The CDC (2008) recommends bats should never be handled by untrained and unvaccinated individuals (CDC 2008). If an exposure does occur, the mammal should either be tested or the bitten individual should seek medical counsel and possible vaccination regardless of their previous vaccination history. No studies exist on the effectiveness of rabies pre-exposure prophylaxis in preventing rabies deaths in humans (CDC 2008). While some studies on animals receiving pre-exposure vaccinations report complete protection from the street rabies virus isolates (Brookes, et al. 2005), when challenged with five (5) other lyssavirus variants survival rates ranged from 44% to 89% (Halon et al. 2005). These study results support the usefulness of the pre-exposure vaccinations, but also emphasize the variation in effectiveness between the vaccine and its phylogentic relatedness with the particular lyssavirus isolate. Approximately 94% of bats submitted for testing are not rabid (CDC 2011). The Advisory Committee on Immunization Practices (ACIP) (CDC 1999) and the World Health Organization (WHO) (WHO 1992) also recommend that prophylaxis for the prevention of rabies in humans exposed to the rabies virus should include thorough wound cleansing followed by vaccination

BRI recognizes that CDC data may be biased toward the infrequent interactions between the general public and bats. However, given the inability to look at an animal and definitively diagnose if it is infected with the rabies virus or not, the probability of a lethal outcome if exposures go untreated, the knowledge that 6% of all tested bats are rabid, and the high likelihood of exposure due to the nature of our work, BRI has adopted a cautious and conservative approach for BRI biologists who work with bats as part of their job. While BRI recognizes that some bat species are more likely to carry the virus, BRI maintains that all species of bats are a suspect rabid animal - an animal that is susceptible to rabies but in which the disease cannot be ruled out – and rabies is ruled out by testing which is performed via necropsy of a euthanized or dead animal. To that end, BRI has adopted the Standard Operating Procedures (SOPs) outlined throughout this document that staff must follow when handling bats.

EXPOSURE ROUTES

Exposure

The rabies virus is present in the saliva and neural tissue of infected mammals and the most widely known route of exposure occurs from the bite of a rabid animal. However, exposure to rabies might also occur when the virus, from the saliva or other potentially infectious material (neural tissue) is introduced into the handler. Direct exposure routes consist of (CDC 2011):

- Bites – even those that do not cause bleeding
- Existing open cuts in the handler's skin
- Mucus membranes of the handler – i.e., rubbing one's eyes, mouth or nose after handling

Bite Exposures

Any bite, regardless of body site or severity, constitutes an exposure to the rabies virus (CDC 2008). Although the risk for transmission varies with the anatomical location of the bite and the severity of the wound (98), rabies transmission can occur from bites that inflict minor injury (e.g., bats) resulting in lesions that are difficult to detect under certain circumstances (CDC 2005, Messenger et al. 2002).

Nonbite Exposures

While nonbite exposures from mammals rarely cause rabies, there is evidence that suggests such exposures require assessment to determine if there are sufficient reasons to consider post-exposure prophylaxis (Afshar 1979). The contamination of open cuts/abrasions or mucous membranes of the handler with the saliva or other infectious material (e.g., neural tissue) of a rabid animal is the nonbite exposure route BRI staff are most likely to encounter.

Indirect Contact

Indirect contact and activities do not constitute exposure. The rabies virus is inactivated by desiccation, ultraviolet irradiation and other factors and it does not persist in the environment (CDC 2008). However BRI strongly recommends using precautions with these indirect routes, which include (CDC 2011):

- Petting or handling an animal (without getting bitten)
- Contact with blood
- Contact with urine
- Contact with feces
- Contact of wet saliva with intact skin
- Touching dried saliva

There is a possibility that another animal may have saliva and/or neural tissue from rabies infected prey item present on its teeth, beak or talons. Given the lack of published research on this topic, BRI biologists need to be aware of this potential risk and take precautions when handling other animals. BRI supports consultation with medical experts and recommended rabies treatment for any staff who suspects they were exposed to the rabies virus.

VACCINATIONS

Pre-Exposure Management

The CDC recommends all individuals in high risk occupations, such as veterinarians, veterinary assistants, and wildlife handlers receive a series of pre-exposure vaccinations to boost the antibody level in the event of an exposure (CDC 2011). The pre-exposure vaccinations do not provide immunity to contracting

rabies; they are designed only to boost antibody titer and to improve the response to treatment that is still required following all possible exposures (CDC 2011).

BRI employees who handle bats must complete the pre-exposure prophylaxis vaccinations BEFORE they can handle bats. Pre-exposure management includes (CDC 2008):

1) Pre-exposure vaccines followed by serology and vaccine boosters
2) Promptly reporting and treating ALL potential exposures to the virus
3) Wearing protective gloves when handling mammals

Pre-exposure Vaccinations

BRI will arrange with a local medical care provider for the pre-exposure vaccinations. Pre-exposure vaccinations from human diploid cell vaccine (HDCV) or purified chick embryo cell vaccine (PCECV) are administered in a series of three (3) intra-muscular (IM) injections. The series starts at day 0, and continue with boosters at day 7 and day 21. The timing of the injections cannot be deviated from, so BRI biologist seeking pre-exposure should adjust their availability to accommodate the vaccination schedule.

- Only BRI biologists who have pre-exposure vaccinations and a current antibody check (titer level) shall handle bats.
  - A record of your vaccination schedule and subsequent titer test(s) must be in your medical file at BRI in Gorham, ME.
- Annual titer level tests are mandatory.
  - How long the antibodies remain active varies by individual.
  - The titer level test assesses the level of antibodies in your system.
  - Depending on test results, a booster shot may be required.
  - If you continue to be in a high risk category for exposure to rabies, you should plan on having your levels tested annually.
- No BRI biologist will be allowed on a bat project without proof of an annual titer test.
  - Test results can take weeks to obtain.
- As the field season approaches, plan ahead.
  - BRI covers the cost for any employee needing the pre-exposure vaccinations and titer test due to their work at BRI.
  - Contact the Science Operations Director with your request

EXPOSURE MANAGEMENT

Exposure management begins before BRI biologists are deployed into the field. It's important to think through the steps, research and obtain important local contact information, and review protocols with others – all before handling the first bat.

Handling Bats

As a conservation-research organization, BRI fully appreciates current threats faced by populations' wild species and to that end none of us wish to contribute to the loss of a wild animal. However, BRI has a responsibility to their employees to provide them with the safest environment within which to work,

and endorse policies that have the health and welfare of the staff as a priority. To help insure no bat must be euthanized for rabies testing, please exercise the following handling guidelines.

- Wear gloves at all times (see Appendix A)
  - High Risk Biters (generally the larger species with bigger teeth) require leather gloves on both hands at all time.
  - Low Risk Biters require latex gloves at all times, and it is recommended that handlers were one leather glove and one latex glove.
- Do not allow ungloved or unvaccinated staff to "help" you remove the animal from the mist/harp net
  - Assign them tasks that keep them out of contact with the bats.
  - Volunteers must sign a pre-waiver form and this form must be in the possession of BRI ME before the volunteer may join BRI staff in the field.
  - Not handling a possibly infected bat will reduce the risk of contracting rabies to nearly zero.

Isolate the Animal

The unfortunate happens – you get bitten by a bat. But you are mentally prepared because you know that rabies prevention should be forefront in all handlers' minds, even before they begin handling a bat.

- Come prepared with a clearly marked container to humanely house an animal that bites.
  - If bit, put the bat in the container immediately, do not continue handling it.
  - Make sure others at the site are aware of the container and its contents.
- Try to identify the species of bat before you handling it.
  - Flinging off a biting animal is often an automatic response.
  - Identifying an animal to species level before handling it will help in determining the final treatment if this automatic response results in the bat escaping.
- If it's a listed species…
  - Contact the nearest USFWS Game Warden.
  - Allow him/her to take over the fate of the live animal.

Wound Treatment

Regardless of the risk of rabies, when bitten by a mammal, the optimal medical treatment includes recognition of the wound and prompt treatment. For most types of bites, immediate irrigation with water or a dilute water povidone-iodine solution markedly reduces the risk for bacterial infection (Callaham 1978). When treating a wound, take care to not add further damage to the skin or tissues (CDC 2008). Studies with animals (not human studies) have shown that wound cleansing is especially important in rabies prevention because through wound cleansing alone, without other post-exposure prophylaxis, there is a marked reduction in the likelihood of rabies (Dean et al. 1963, Kaplan et al. 1962).

- Keep the first aid kit stocked with fresh water, soap and povidone iodine
- Always have the first aid kit onsite
- Supervisors need to remind staff daily of its presence and importance of wound care

Testing

In the event of a possible rabies exposure, BRI biologists are encouraged to have the animal tested for rabies even though testing is fatal to the animal.

- DO NOT euthanize a listed species.
  - Call the nearest USFWS Game Warden.
  - Allow him/her to take possession of the live bat.
- Euthanize non-listed species via cervical dislocation
  - Only staff skilled in this procedure should perform it.
  - Contact your supervisor if you need help.
- Keep carcass cool – do not freeze it.
  - Freezing will interfere with subsequent testing.
  - Never place biological samples in the same refrigerator with food consumed by humans.
- Contact the local health department and arrange for shipping.
  - Follow shipping instructions listed in the Rabies Specimen Submission section (below).

Reporting Exposures

BRI biologists must report a bat exposure to their supervisor(s) and BRI in Gorham, ME within 24 hours of the event. There are strict state laws regarding timelines in which BRI and its insurance carrier must report injuries to the state workers' compensation board. Any delay subject BRI to potential fines by the state.

- REPORT ALL EXPOSURES IMMEDATELY
  - Failure to report a bat bite or other exposure puts both the affected individual and BRI at great risk
  - Peer-pressure to NOT report an exposure will not be tolerated
- Employee (and/or their supervisor) is responsible for:
  - Completing BRI's Report of Injury Form
  - Answering basic questions for Workers' Compensation insurance/OSHA reporting
- Cost of the follow-up and testing will be covered by Worker's Compensation insurance.
  - Hospitals, Public Health Departments, and local pharmacies will need Worker's Compensation policy numbers.
  - Policy Number
    - You will be supplied with this number in advance.
    - Keep it with you at all times.
    - If you lose this number, you may still seek treatment – it can be provided later.
  - Claim Number
    - Available about 24 hours after the incident is reported to the insurance carrier.

Post-Exposure Treatment

BRI biologists should mentally prepare themselves for the steps involved with treatment following exposure to the rabies virus. Given the nature of BRI's bat work, there always remains a high probability that staff will encounter an exposure to the rabies virus. Bats tend to defend themselves (attempt to bite) during removal after being ensnared in mist and harp nets. Since the epidemiology and pathogenesis of rabies is complex, recommendations regarding post-exposure prophylaxis are dependent on associated risks which must be assessed by the attending medical professional (CDC 2008). These risks include:

1) Type of exposure
2) Epidemiology of animal rabies in the area where the contact occurred
3) Species of animal involved
4) Circumstances of the exposure incident

Clinicians should seek assistance from local or state public health officials for evaluating post-exposure management in situations that are not routine. State and local officials have access to CDC rabies experts for difficult decisions (CDV 2008). As the affected individual, this dialogue may seem confusing and unsettling. Remain calm and keep in mind that when and unvaccinated person is exposed the administration of the rabies post-exposure prophylaxis is a medical urgency, not a medical emergency (CDC 2011).

BRI has adopted the following protocols if a staff member experiences an exposure to the rabies virus. Please keep in mind that the actual decision to administer the post-exposure prophylaxis may differ between cases and is dependent on the affected individual's vaccination status (Table 1).

- Supervisors should provide staff, in advance of going into the field, with the contact information for:
  - Local hospital(s)
  - Local and State Public Health Facilities
- Consult with the local medical health care provider and the local/state public health officials
  - Keep notes on their recommendations
  - Ask questions
  - Use Table 1 as a guide to post-exposure treatment
  - Rabies vaccines are not always readily available, so the Emergency Room is the typical place to seek treatment.
    - In Portland, ME, Concentra may be a treatment option
- If the animal is available for testing
  - You most likely will be instructed to wait for the results before receiving the post-exposure prophylaxis
  - Employees are encouraged to seek medical treatment/advice if they feel they are at risk in waiting
- Keep BRI Gorham ME apprised of your progress.

Unfortunately, not many health care providers are accustomed to dealing with rabies exposures in individuals who have the pre-exposure vaccination. We recommend you bring the following table with you if you need to seek treatment.

Table 1. Rabies post-exposure prophylaxis schedule – United States, 2008 (CDC 2008, 2010)

Vaccination Status	Treatment	Regime*
Not previously vaccinated	Wound cleansing	All post-exposure prophylaxis should begin with immediate thorough cleansing of all wounds with soap and water. If available, a virucidal agent such as povidine-iodine solution should be used to irrigate the wounds.
	Rabies immune globulin (RIG)	Administer 20 IU/kg body weight. If anatomically feasible, the full dose should be infiltrated around the wound(s) and any remaining volume should be administered intramuscularly (IM) at an anatomical site distant from the vaccine administration. Also, RIG should not be administered in the same syringe as the vaccine. Because RIG might partially suppress active production of antibody, no more than the recommended does should be given.
	Vaccine	Human diploid cell vaccine (HDCV) or purified chick embryo cell vaccine (PCECV) 1.0 mL, IM (deltoid area[§]), on each day of days 0[¶], 3, 7, 14, and 29.
Previously vaccinated **	Wound cleansing	All post-exposure prophylaxis should begin with immediate thorough cleansing of all wounds with soap and water. If available, a virucidal agent such as providine-iodine solution should be used to irrigate the wounds.
	RIG	RIG should not be administered.
	Vaccine	HDCV or PCECV 1.0 mL, IM (deltoid area[§]), one each on days 0[¶]and 3.

* These regimes are applicable for all age groups, including children.
** Any person with a history of a complete pre-exposure or post-exposure vaccination regime w/HDCV, PCECV, or rabies vaccine adsorbed, or previously vaccination with any other type of rabies vaccine and a documented history of antibody response to the prior vaccination.
§ The deltoid area is the only acceptable site of vaccination for adults and older children. For younger children, the outer aspect of the thigh can be used. Vaccine should never be administered in the gluteal area.
¶ Day 0 is the day the first dose of the vaccine is administered.

RABIES SPECIMEN SUBMISSION

General Information

The purpose of this appendix is to provide BRI field staff with a guideline of how to prepare and ship a suspected rabies specimen to a local laboratory for testing. Each laboratory and/or state is likely to have specific protocols, which can be addressed by asking the following questions.

- Normal business hours
- Telephone number
- Do they use a specific courier

It is extremely unlikely that a live animal will be accepted by the laboratory.

Necropsy

- The animal should be humanely euthanized without damage to the head.
    - Exception: if the suspected animal is a listed species.
        - Call the nearest U.S. Fish and Wildlife Service office.
        - Turn the LIVE animal over to them for handling.
    - Only BRI employees experienced with this procedure should perform euthanasia.
        - Contact your supervisor if you need help.
- The head must be removed from the body and submitted intact for necropsy.
    - Exception: entire body of small mammals, such as bats, mice, and squirrels may be submitted as whole carcasses for testing.

Packaging and Shipping

- A laboratory submission form may be required – ask.
    - Fill it out completely.
    - Make a copy or scan the form for BRI's records.
- All materials collected for rabies diagnosis are considered to be infectious.
    - Appropriate handling and shipping precautions should be taken in order to ensure the safety of the collector/submitter, transportation carriers, laboratory staff and the public at large in accordance with 49 CFR Department of Transportation Regulations.
- Submit specimens to the laboratory promptly and cold to reduce decomposition of the animal.
    - Use frozen cold packs only.
    - Do not use "wet" ice as it may leak through the container; leaking containers are often rejected.
    - DO NOT FREEZE the specimen as this will delay the testing and possibly alter the results.
- All specimens should be sprayed or dusted for fleas and ticks with a pesticide before packaging.
- Wear disposable gloves while packaging a rabies sample.
- Clearly label the sample with:
    - Health Department or Animal Control internal tracking number (if provided)
    - Animal Species
- Triple package the specimen:
    - Primary Container
        - Ziploc bag or heavy-duty garbage bag appropriately sized for the specimen with an absorbent material (absorbent pads, paper towels, etc.) placed in the bag to prevent blood and body fluid from leaking.

        - If sharp objects protrude from the specimen, such as a shattered bone, wrap the specimen in several layers of newspaper.
        - Always tightly seal or fasten the primary container to contain the specimen.
        - Label this container.
    - Secondary Container
        - Use a metal can, heavy plastic pail with a lid or a heavy-duty plastic garbage bag as the secondary container.
        - Seal secondary container to help prevent leakage of blood or body fluid.
        - Label this container.
    - Rigid Outer Shipping Container
        - Use a cooler or thick-walled Styrofoam container with or without an exterior fiber board liner.
        - "Rabies" should be clearly labeled with permanent marker.
        - Place the secondary container inside the shipping container with sufficient frozen cool packs and cushion materials to prevent damage to the specimen during transport.
        - Clean the outside of the Outer Shipping Container with a disinfectant
        - 10% bleach (9 parts water, 2 parts household bleach)
        - Secure the lid of the container (tape) for transport
        - Place the address on the container

1.0 INTRODUCTION

This document identifies policies and provides direction for the Regional Navy Conservation Law Enforcement Program (CLEP) in accordance with Department of Defense Instruction (DODI) 5525.17. This CLEP Needs Assessment applies to the following four facilities: Naval Air Station Oceana (NASO), Naval Air Station Oceana-Dam Neck Annex (NASO-DNA), Naval Auxiliary Landing Field Fentress (NALFF), and Naval Support Activity Hampton Roads- Northwest Annex (NSAHR-NWA).

The Sikes Act Improvement Act (SAIA) requires that Conservation Law Enforcement (CLE) be provided on military lands, and that each military department ensure that professionally trained natural resources and CLE personnel are assigned responsibility to protect and manage natural resources found on Department of Defense (DOD) installations, including implementation of Integrated Natural Resource Management Plans (INRMP) and Integrated Cultural Resources Management Plans (ICRMP, DOD Legacy Program 2009). DOD installations must coordinate with the appropriate agencies to support CLE and enforce federal and applicable state laws and regulations that pertain to the management and use of the natural resources under their jurisdiction. This has included a variety of law enforcement options including employment of Conservation Law Enforcement Officers (CLEOs), game wardens, military police, or combinations of civilian CLEOs and military police. The DOD utilizes a combination of support options including cooperative agreements with State, other DOD Departments, and other federal partners to provide such oversight. DODI 5525.17 establishes overall policy and provides guidance for the DOD CLEP, in accordance with National Resources Conservation Program Policy (DODI 4715.03).

The Navy currently has one regional Biological Science Technician (BST), whose position also includes CLEO duties. The BST/CLEO has the authority to enforce federal laws and state laws at the four facilities where there is no corresponding federal law. The BST/CLEO currently does not maintain state credentials, so all other state laws must be enforced by a state commissioned officer, unless a Memorandum of Agreement (MOA) is put in place to authorize enforcement of both federal and state regulations (CEMML 2015). CLE responsibility at NASO, NASO-DNA, NSAHR-NWA and NALFF is jointly held by state commissioned officers and the Navy.

Currently the installations predominantly fall under either concurrent or proprietary jurisdiction. However, jurisdictional boundaries are being revised, which will likely change many installation parcels to concurrent and/or exclusive law-enforcement oversight (Personal communication, M. Wright, March 2016). Navy enforcement personnel cooperate with state and federal CLEOs, as needed, to enforce state and federal wildlife laws. The BST/CLEO is required to be trained in law enforcement and federal and state wildlife regulations, and must attend annual wildlife law enforcement refresher training in order to stay current on changes in regulations and enforcement policies.

1.1 PURPOSE

The purpose of the CLEP is to ensure the enforcement of federal conservation statutes set forth in DODI 5525.17 and applicable state and installation laws (described in Section 2.0 of this document), and to protect sensitive natural and cultural resources in order to sustain use of military lands for readiness activities. The CLEOs conduct a range of complex law enforcement activities to enforce natural and cultural resources laws, including but not limited to the following:

conducting field checks of individuals; investigating fish and wildlife crimes; patrolling; surveillance; interviewing witnesses; interrogating suspects; searching for physical evidence and clues; seizing wildlife or archaeological contraband, equipment, and vehicles; searching and serving warrants; making arrests; and testifying in federal and when authorized, state courts, for violations of any of the federal conservation laws provided in DODI 5525.17, state and installation laws described in section 2.0 of this instruction, and other applicable laws not listed in this instruction.

1.2 POLICY

The Navy does not have a formal guidance document dedicated to the implementation of CLEPs on Navy installations. However, the U.S. Marine Corps (USMC) Guide to Conservation Law Enforcement Program (NAVMC DIR 5090.4A) outlines the procedural guidance, directions, and details to establish and implement a CLEP, and to implement the provisions of a current MOA between the USMC and the U.S. Fish and Wildlife Service (USFWS). This directive outlines duties, position descriptions, procedures, training, equipment, etc., and was useful towards the development of this document. Other notable and successful DOD CLEPs that may be useful guides towards the development of a Navy or regional CLEP include: Joint Base Elmendorf-Richardson CLEP, Vandenberg Air Force Base CLEP, and Fort Carson CLEP. Additional information regarding these programs is available in the 2015 CLE Vulnerability Assessment for Front Range Air Force Bases (CEMML 2015).

In accordance with DODI 5525.17, it is Navy policy that the protection of property and natural and cultural resources under Navy control is accomplished through the enforcement of all applicable federal, state, and local/installation laws and regulations. The CLEP is used to support decisions and management actions by the Navy's natural and cultural resources managers regulating the users of these resources to achieve specific goals and objectives. Navy Component law enforcement officials exercise functional oversight over the CLEP and the CLEO(s) carrying out the program. A CLEO assigned to Navy Component law enforcement elements may be co-located with the conservation program manager at the installation.

The Navy Component's law enforcement and conservation functions will establish, and mutually support, an implementation method which defines roles, internal and external support agreements, funding responsibilities, accountability, command and control, and expectations which will provide for an effective and efficient CLEP. CLEP roles and responsibilities will be integrated into an installation's INRMP and ICRMP. The implementation method(s) for each installation CLEP should be proportionate to the CLE needed at the installation. Although the specific implementation methods at installations can vary, those details should be clearly defined at the appropriate command level and address at a minimum, consistent with DODI 5525.17, roles and responsibilities, internal and external support agreements, funding responsibilities, accountability, and command and control. Mutual assistance agreements with other agencies and organizations may be used to maximize enforcement capabilities, when authorized by law. To the extent practicable using available resources, the Navy shall ensure that sufficient numbers of professionally trained natural resource management personnel and natural resources law enforcement personnel are available and assigned the responsibility to perform tasks necessary to execute the requirements of Title 16 U.S.C. (Conservation) and DODI 5525.17. Enforcement of laws primarily aimed at protecting cultural/natural resources is an integral part of a cultural/natural

resource program and shall be coordinated with or be under the direction of the cultural/natural resources manager for the affected area.

2.0 STATUTORY AND REGULATORY AUTHORITY

Per DODI 5525.17, the protection of property and natural and cultural resources under Navy control is accomplished through the enforcement of all applicable federal and state laws and regulations. Federal natural and cultural resources laws that may be applicable to the CLEP are listed and briefly described below. A list of relevant state and installation laws/regulations is also provided.

Federal Cultural Resource Statutes, Executive Orders, and Laws

- Abandoned Shipwreck Act; *Title 43 U.S.C. §2101-§2106*. Establishes government ownership over the majority of abandoned shipwrecks located in waters of the United States of America and creates a framework within which shipwrecks are managed. State governments have authority to claim and manage abandoned shipwrecks on State submerged lands. There are no shipwrecks at any of the installations, so this is unlikely to apply to the regional CLEP.
- American Indian Religious Freedom Act; *Title 42 U.S.C. §1996.* Restored religious rights to Indian religions which include, but are not limited to, access to sacred sites, freedom to worship through ceremonial and traditional rights, and use and possession of objects considered sacred.
- Antiquities Act; *Subchapter LXI of chapter 1 of Title 16 U.S.C., beginning with §431.* The Act requires that a permit be obtained for examination of ruins, excavation of archaeological sites and the gathering of objects of antiquity on lands under the jurisdiction of the Secretaries of Interior, Agriculture, and Army, and provided penalties for violations.
- Archaeological Resources Protection Act; *Chapter 1B of Title 16 U.S.C., beginning with §470aa.* This Act established detailed requirements for issuance of permits for any excavation for or removal of archaeological resources from federal or Indian lands. It also established civil and criminal penalties for the unauthorized excavation, removal, or damage of any such resources; for any trafficking in such resources removed from federal or Indian land in violation of any provision of federal law; and for interstate and foreign commerce in such resources acquired, transported or received in violation of any State or local law.
- Archaeological and Historic Preservation Act; *Subchapter I of chapter 1A of Title 16 U.S.C., beginning with §461.* Declares it a national policy to preserve historic sites and objects of national significance, including those located on refuges. It provided procedures for designation, acquisition, administration and protection of such sites.
- Curation of Federally Owned and Administered Archeological Collections; *(36 CFR 79).* Provides minimum standards for the long-term management and care of archeological collections, including the associated records and reports. The regulation considers actions that need to be taken for both new and existing collections. This act is unlikely to apply directly to the CLEP, as there is no Law Enforcement aspect of the law.
- Executive Order (EO) 13287; Preserve America. Provides leadership in preserving America's heritage by actively advancing the protection, enhancement, and contemporary use of the historic properties owned by the federal government, and promotes

intergovernmental cooperation and partnerships for the preservation and use of historic properties.

- Executive Order 11593; Protection and Enhancement of the Cultural Environment. Mandates that all Executive Branch agencies, bureaus, and offices compile an inventory of the cultural resources (archaeological, architectural and historical properties, sites and districts) for which they are trustee; nominate all eligible government properties to the National Register of Historic Places; preserve and protect their cultural resources; and insure that agency activities contribute to the preservation and protection of non-federally owned cultural resources.
- Executive Order 13007; Indian Sacred Sites. Intended to accommodate access to and ceremonial use of Indian sacred sites by Indian religious practitioners and to avoid adversely affecting the physical integrity of such sacred sites on federal lands.
- National Historic Preservation Act (NHPA); *Subchapter II of chapter 1A of Title 16 U.S.C., beginning with §470.* This act created the National Register of Historic Places, the list of National Historic Landmarks, and the State Historic Preservation Offices, in order to continue the preservation of historic resources. Federal agencies are directed to take into account the effects of their actions on items or sites listed or eligible for listing in the National Register. This law provides guidance to federal land managers, but does not have any role for law enforcement; instead, it is enforced primarily through recourse to the Advisory Council on Historic Preservation (ACHP).
- Native American Graves Protection and Repatriation Act; *Title 25 U.S.C. §3001.* Requires any agency, which receives federal funding, to return Native American cultural items to lineal descendants and culturally affiliated Indian tribes and Native Hawaiian organizations. This law provides guidance to federal land managers, but does not have any role for law enforcement; instead, it is enforced primarily through recourse to the ACHP.
- Paleontological Resources Preservation Act; *P.L. 111-011 §6301-§6312 (components are applicable to both NR and CR programs, as such Navy requires coordination between both program managers when such resources are found).* Directs the Secretaries of the Interior and Agriculture to implement a comprehensive paleontological resource management program on federal lands.

State, Installation, and DOD Cultural Resource Laws and Regulations

- The Cave Protection Act *(§ 10.1-1000 through 10.1-1008 Code of Virginia).* Secures, protects, and preserves significant caves on federal lands for the perpetual use, enjoyment, and benefit of all people.
- The Virginia Antiquities Act *(§ 10.1-2302 through 10.1-2306).* Prohibits damage to or removal of objects of antiquity from archaeological sites on all state-controlled land.
- Permit Required for the Archaeological Excavation of Human Remains *(§ 10.1-2305)*
- Trespass at night upon any cemetery *(§ 18.2-125)*
- Violation of sepulture; defilement of dead human body *(§ 18.2-126)*
- Injuries to churches, church property, cemeteries, burial grounds, etc. *(§ 18.2-127)*
- DODD 4165.06; Real Property. Provides DOD policy on the acquisition, management, and disposal of real property, and delegates statutory and regulatory authorities and responsibilities relating to the acquisition, management, and disposal of real property.

- DODI 4165.70; Real Property Management. Implements policy and assigns responsibility, for managing real property and re-delegates various statutory and regulatory authorities and responsibilities relating to real property management.
- DODI 4715.03; Natural Resources Conservation Program. Implements policy for the integrated management of natural resources (including biological and earth resources) on property and lands managed and/or controlled by the DOD.
- DODI 4715.16; Cultural Resources Management. Establishes DOD policy and assigns responsibilities to comply with applicable federal statutory and regulatory requirements, EO's, and Presidential memorandums for the integrated management of cultural resources on DOD-managed lands.
- DODI 4715.9; Environmental Planning and Analysis. Implements policy and assigns responsibilities for integration of environmental considerations into DOD activity and operational planning.
- OPNAV Instruction 5090.1D; Environmental Readiness Program Manual. Discusses requirements, delineates responsibilities, and issues implementing policy guidance for the management of the environmental, natural, and cultural resources for all Navy ships and shore activities.
- SECNAV Instruction 4000.35A; Department of the Navy Cultural Resources Program.

CLEOs support the Cultural Resources Program (CRP) by overseeing and enforcing applicable federal, state, and local laws and regulations pertaining to the protection of archaeological sites and other cultural resources. Cultural resources, including archaeological sites, historic structures, buildings, landscapes, objects, and districts are nonrenewable resources that illustrate the historical development of the U.S. federal facilities. As stewards of cultural resources; this responsibility is recognized in the National Historic Preservation Act (NHPA) of 1966 as amended; EO 11593 Protection and Enhancement of the Cultural Environment, and EO 13287 Preserve America; in other federal laws and regulations (listed above), and other DOD and Navy policies (OPNAVINST 5090.1B, Environmental and Natural Resources Program Manual, Chapter 23, Historic and Archeological Resources Protection; SECNAVINST 4000.35, Department of the Navy Cultural Resources Program).

Under the NHPA each federal agency is tasked with the responsibility of establishing a preservation program to identify and evaluate cultural resources that may be eligible for listing on the National Register of Historic Places (NRHP). Properties under a federal agency's jurisdiction that are listed or eligible for listing on the National Register of Historic Places shall be managed and maintained in a way that considers the preservation of their historic, archaeological, architectural, and cultural values.

Archaeological sites on all four installations are protected under the Archaeological Resources Protection Act (ARPA). ARPA built on the Antiquities Act of 1906, which required permitting before ruins could be examined, archaeological sites could be excavated, or "objects of antiquity" could be gathered on lands administered by the DOD or by other federal agencies. However, "objects of antiquity" was not clearly defined, which lead to the passage of ARPA. ARPA "prohibits the unauthorized excavation, removal, or damage of archaeological resources on federal and Indian lands" (King 2013), and defines "archaeological resource" as "any material remains of past human life or activities which are of archaeological interest" (National Center for Cultural Resources 2006). These include, but are not limited to "pottery, basketry, bottles, weapons,

weapon projectiles, tools, structures or portions of structures, pit houses, rock paintings, rock carvings, intaglios, graves, human skeletal materials, or any portion or piece of any of the foregoing items … that are at least 100 years old" (King 2013). ARPA is the law most directly relevant to law enforcement, and it protects all archaeological resources that are over a century old, regardless of their significance or NRHP eligibility. The NHPA and other federal laws largely provide guidance to federal mangers, and are enforced primarily through recourse to the ACHP.

In Virginia, further protection of archaeological and cultural resources is provided by various state laws that apply to all lands within the Commonwealth, including federal and federally-managed lands. The Cave Protection Act (§ 10.1-1000 through 10.1-1008 Code of Virginia) requires permitting before the excavation or removal of archaeological, paleontological, prehistoric, or historic features in any "naturally occurring void, cavity, recess, or system of interconnecting passages beneath the surface of the earth or within a cliff or ledge including natural subsurface water and drainage systems, but not including any mine, tunnel, aqueduct, or other man-made excavation, which is large enough to permit a person to enter," while various cemetery laws prohibit the excavation of human remains, damage to cemeteries or burial grounds, and trespass at night upon cemeteries. In North Carolina, no state laws applicable on federal lands were found that add additional protection to cultural resources.

Federal Natural Resources Statutes, Executive Orders, and Laws

- Airborne Hunting; *Title 16 U.S.C. §742j-l*. Prohibits shooting or attempting to shoot or harassing any bird, fish, or other animal from aircraft except for certain specified reasons, including protection of wildlife, livestock, and human life as authorized by a federal or state issued license or permit.
- Animal Damage and Control Act; *Title 7 U.S.C., beginning with § 426*. Provided broad authority for investigation, demonstrations and control of mammalian predators, rodents and birds.
- Bald and Golden Eagle Act; *Subchapter II of Chapter 5A of Title 16 U.S.C., beginning with §668.* Prohibits the take, sell, and other derivative actions in regards to Bald and Gold Eagles unless provided exemption (science, exhibition, and religion) by the Secretary of the Interior. Enforceable with maximum fine and/or imprisonment.
- Cave Resources Protection Act; *16 U.S.C. §4301*. Secures, protects, and preserves significant caves on federal lands for the perpetual use, enjoyment, and benefit of all people.
- Coastal Barrier Resources Act; Chapter 55 of *Title 16 U.S.C., beginning with §3501*. Designated various undeveloped coastal barrier islands for inclusion in the Coastal Barrier Resources System (System). Areas so designated were made ineligible for direct or indirect federal financial assistance that might support development.
- Coastal Zone Management Act (CZMA); *Chapter 33 of Title 16 U.S.C., beginning with §1451.* Provides for the management of the nation's coastal resources through development of regulating entities.
- Clean Water Act of 1977; *33 U.S.C. §1251 - §1376, P.L.* 95-217. Extensive series of regulations that guide federal agencies in the regulating of water, water quality, and commerce based water courses. This includes testing for water contamination and preservation of wetlands.

- Data Quality Act; *44 U.S.C. §3504.* Provides policy and procedural guidance to federal agencies for ensuring and maximizing the quality, objectivity, utility, and integrity of information (including statistical information) disseminated by federal agencies.
- Endangered Species Act; *Chapter 35 of Title 16 U.S.C., beginning with § 1531.* Provides a program in which endangered and threatened species can be designated and defines prohibited acts. It is unlawful to import or export; deliver, receive, carry, transport, or ship in interstate or foreign commerce in the course of a commercial activity; sell or offer for sale in interstate or foreign commerce; take (includes harm, harass, pursue, hunt, shoot, wound, kill, trap, capture, or collect any wildlife within the United States); take on the high seas; possess, ship, deliver, carry, transport, sell, or receive unlawfully taken wildlife; remove and reduce to possession any plant from areas under federal jurisdiction; maliciously damage or destroy an endangered plant on areas under federal jurisdiction; and remove, cut, dig up, or damage or destroy any endangered plant in knowing violation of any State law or regulation or in the course of a violation of a State criminal trespass law. These prohibitions apply to live or dead animals or plants, their progeny (seeds in the case of plants), and parts or products derived from them. Certain actions (scientific research, incidental take are exempt with a permit through the USFWS. Criminal violations can be met with maximum fines and/or imprisonment.
- Estuary Protection Act; *Chapter 26 of Title 16 U.S.C., beginning with §1221.* Authorizes the Secretary of the Interior, in cooperation with other federal agencies and the states, to study and inventory estuaries of the United States, including land and water of the Great Lakes, and to determine whether such areas should be acquired by the Federal Government for protection.
- EO 12962; Recreational Fisheries. Mandates that federal agencies, to the extent permitted by law and where practicable, improve the quality, function, and sustainable productivity and distribution of U.S. aquatic resources for increased recreational fishing opportunities. It also established the National Recreational Fisheries Coordination Council.
- EO 13186; Migratory Birds. Directs federal agencies that take actions that either directly or indirectly effect on migratory birds to develop a Memorandum of Understanding (MOU), and to work with the U.S. Fish & Wildlife Service, and other federal agencies to promote the conservation of migratory bird populations.
- Federal Insecticide, Fungicide, and Rodenticide Act; *Chapter 6 of Title 7 U.S.C., beginning with §136.* Regulates the sale and distribution of pesticides, described specifically within this act.
- Federal Land Policy and Management Act; *Chapter 35 of Title 43 U.S.C., beginning with §1701.* Allows for the use of federally owned lands for public access while simultaneously preserving natural resources tied to said lands.
- Fish and Wildlife Conservation Act; *Chapter 49 of Title 16 U.S.C., beginning with §2901.* Promotes the continued protection of non-game species by agencies, to the extent of their jurisdiction. Deals largely with development of conservation plans.
- Forest and Rangeland Renewable Resources Planning Act; *Chapter 36 of Title 16 U.S.C., beginning with §1601.* Authorizes planning and development of management plans that ensure the future supply of forest resources while maintaining a quality environment.
- Forest Management Act*; 10 U.S.C. §2665.* Allows for the regulation of sale of lumber or forest products from lands leased to the Federal Government or military.

- Forest Resource Conservation and Shortage Relief Act of 1990/Domestic Allotment Act; *16 U.S.C. §620.* Promotes the conservation of forest resources in conjunction with State and federal resources management plans, and other actions or decisions, affecting the use of forest resources while also promoting the use and acquisition of timber vital to the United States, particularly in the West.
- Game, Fur-Bearing Animals, and Fish Act; *Subchapter I of chapter 5A of Title 16 U.S.C., beginning with §661.* Directs federal agencies that have programs and activities that have a measurable effect on public land management, outdoor recreation, and wildlife management to facilitate the expansion and enhancement of hunting opportunities and the management of game species and their habitat.
- Hunting, Fishing, and Trapping on Military Installations; *Title 10 U.S.C. § 2671.* Establishes that the DOD require all hunting, fishing, and trapping at an installation or facility be in accordance with the fish and game laws of the State in which it is located, require that an appropriate license for hunting, fishing, or trapping on that installation or facility be obtained, and develop, subject to safety requirements and military security, and in cooperation with the Governor (or his designee) of the State in which the installation or facility is located, procedures under which designated fish and game or conservation officials of that State may, at such time and under such conditions as may be agreed upon, have full access to that installation or facility to effect measures for the management, conservation, and harvesting of fish and game resources.
- Lacey Act; Chapter 53 of *Title 16 U.S.C., beginning with §3371.* Prohibits the trade, sell, or reception of illegally acquired wild life and acts in congruence with already established protection acts. Enforceable powers are consistent with suspected felony offenses.
- Magnuson-Stevens Fishery Conservation and Management Act; *16 U.S.C. §1801.* Substantial Act that allows for the conservation of marine fisheries through prevention of overfishing, via development of regional councils over bodies of water.
- Marine Mammal Protection Act; Chapter 31 of *Title 16 U.S.C., §1361 – §1384 and §1401-§1407.* Establishes an increased need for protection and understanding in regards to Marine Mammals. Establishes regulations and enforcement protocol for the taking of marine mammals.
- Migratory Bird Treaty Act (MBTA); *Subchapter II of chapter 7 of Title 16 U.S.C., beginning with §703.* Makes the taking, killing, or possession of migratory birds an unlawful act, barring exceptions provided in this act. Enforceable with maximum fine and/or imprisonment.
- Migratory Bird Conservation Act; *Subchapter III of chapter 7 of Title 16 U.S.C., beginning with §715.* Establishes a Migratory Bird Conservation Commission to approve areas recommended by the Secretary of the Interior for acquisition with Migratory Bird Conservation Funds.
- Migratory Bird Hunting and Conservation Stamps Act; *Subchapter IV of chapter 7 of Title 16 U.S.C., beginning with §718.* Clarifies the distribution, validation, requirements, and enforcement of hunting stamps used in conjunction with taking of migratory waterfowl.
- Military reservations and facilities: hunting, fishing, and trapping*; 10 U.S.C. §2671.* Establishes general requirements for hunting, fishing, and trapping on military installations.

- Multiple Use Sustained Yield of Forests Act; Title 16 U.S.C. §§ 528-531. Development of natural resources for the presence and establishment of resources such as range, timber, outdoor recreation, watershed protection, and wildlife and fish purposes.
- National Environmental Policy Act; *Chapter 55 of Title 42 U.S.C., beginning with § 43421.* Requires that all federal agencies prepare detailed environmental impact statements for "every recommendation or report on proposals for legislation" and other major federal actions significantly affecting the quality of the human environment.
- National Forest Management Act; *Chapter 36 of Title 16 U.S.C., beginning with §1600.* Act requires that the Secretary of Agriculture shall develop, maintain, and, as appropriate, revise land and resource management plans for units of the National Forest System, coordinated with the land and resource management planning processes of State and local governments and other federal agencies.
- National Invasive Species Act; *16 U.S.C. §4701.* Identifies the problematic introduction on non-indigenous life forms through ship ballasts, particularly in reference to lake systems.
- National Marine Sanctuaries Act; *33 U.S.C. §1431.* Regulates the transport of materials for the purpose of ocean dumping and establishes a permitting system to override said prohibited acts.
- National Wildlife Refuge System Improvement Act; *16 U.S.C. §668dd - §668cc.* Amends the National Wildlife Refuge System Administration Act of 1966, ensuring that the Refuge System is managed as a national system of related lands, waters, and interests for the protection and conservation of the Nation's wildlife resources.
- National Trails System Act; *Chapter 26 of Title 16 U.S.C., beginning with §1241.* Provides for establishment of National Recreation and National Scenic trails.
- Noxious Weeds Act; *Chapter 61 of Title 7 U.S.C., beginning with §2809.* Provides authority to inspect, seize and destroy products, and to quarantine areas, if necessary to prevent the spread of noxious weeds. Established federal program to control spread of noxious weeds.
- Recreational Hunting Safety Act; *Chapter 72 of Title 16 U.S.C., beginning with §5201.* Makes it unlawful to physical hinder a lawful hunt, enforceable via maximum fine.
- Rivers and Harbors Act of 1899; *Title 33 U.S.C.* §401 and §403. Prohibits the construction of any bridge, dam, dike or causeway over or in navigable waterways of the U.S. without Congressional approval.
- Refuge Recreation Act; *Subchapter LXVIII of chapter 1 of Title 16 U.S.C., §§ 460-460k-4*. Authorizes the Secretary of the Interior to administer refuges, hatcheries and other conservation areas for recreational use, when such uses do not interfere with the area's primary purposes.
- Sikes Act; *Subchapter I of chapter 5C of Title 16 U.S.C., beginning with §670.* Provides for cooperation by the Departments of the Interior and Defense with State agencies in planning, development and maintenance of fish and wildlife resources on military reservations throughout the United States.
- Soil and Water Conservation Act; *Chapter 40 of Title 16 U.S.C., beginning with §2001.* Requires planning and development of plans in regards to conservation of water, soil, and relatable natural resources.
- Taylor Grazing Act; *Chapter 8A of Title 43 U.S.C., beginning with §315.* Regulates the overgrazing and deterioration of public lands, in order to improve rangeland conditions.

- Wild and Scenic Rivers Act; *Chapter 28 of Title 16 U.S.C., beginning with §1274.* Establishes a National Wild and Scenic Rivers System and prescribes the methods and standards through which additional rivers may be identified and added to the system.
- Wild Bird Conservation Act; *Chapter 69 of Title 16 U.S.C., beginning with §4901.* Law prohibits the removal of wild birds for trade, particularly when due harm is caused to wild bird populations, and endeavors to improve conservation of wild bird populations.
- Wild Horses and Burros Act; *Chapter 30 of Title 16 U.S.C., beginning with §1331.* Provides for protection of wild, free-roaming horses and burros.
- Wilderness Act; *Chapter 23 of Title 16 U.S.C., beginning with §1131*. Provides for the designation, protection, and administration of "wilderness areas."

State, Installation, and DOD Natural Resource Laws and Regulations

- Game, Inland Fisheries and Boating*; §29.1-100 through §29.1-829 Code of Virginia.* Establishes the VDGIF as the regulatory authority for fish and game in Virginia.
- Virginia Department of Game and Inland Fisheries (VDGIF) Regulations; *4 V.A.C. beginning with* §15. Establishes hunting and fishing regulations for Virginia, with the VDGIF as the regulatory authority.
- Virginia Marine Resources Commission (VMRC); *Code of Virginia beginning with §28.2-100.* Establishes the VMRC as the regulatory authority for marine fisheries in Virginia.
- Virginia Marine Resources Commission; *4 V.A.C. beginning with §20.* Establishes regulations for marine fisheries in Virginia.
- North Carolina Wildlife Resources Commission (NCWRC); *15A N.C.A.C. §10A-10K.* Establishes hunting and fishing regulations for North Carolina, with the NCWRC as the regulatory authority.
- CNRMA Instruction 11015.1; *Fishing.* Establishes policy and rules for regional installation fishing programs. Contents subject to change.
- CNRMA Instruction 11015.2A; *Hunting and Trapping Program.* Establishes regulations for hunting and trapping on regional installations. Contents subject to change.
- CNRMA Instruction 11015.3; *Natural Resources Management for Fish and Wildlife, Feral Animals, Invasive Species, and Certain Pests.* Establishes policy and assigns responsibility for management of fish and wildlife, feral animals, invasive species, and pest response for regional installations.
- NASO Instruction 5090.2E; Establishes procedures for cutting firewood and use of tree products on NASO.
- NASO SOP for Sea Turtles; (*Appendix F, 2015 NASO INRMP*). Establishes SOP for sea turtle stranding response and nest monitoring.
- Northwest Annex Instruction 11015.1; Establishes procedures for cutting firewood and use of tree products on NSAHR-NWA.

The regional CLEO(s) supports the Natural Resources Program (NRP) by overseeing and enforcing federal, state, and local laws and regulations pertaining to installation hunting & fishing programs, the protection of rare, threatened and endangered species (RT&E) and significant ecological communities, and in some cases assistance with the management of nuisance wildlife. Many of the federal, state, and installation laws/regulations provided in the above lists may be applicable to the duties and responsibilities of the regional CLEO(s). In accordance with DODI

5525.17, one objective of the CLEP is to clearly define areas to prevent hunting, fishing, and other outdoor recreational activities in unauthorized areas.

The SAIA requires that military installations provide for the sustainable multipurpose use of resources, to include hunting, fishing, trapping, and recreational access, as consistent with the military mission, the INRMP, and installation security and safety requirements. The Natural Resources Manager is responsible for direction and oversight of hunting and fishing programs, and multiple other natural resources programs. Current permits sold by the installations requiring enforcement include: Hunting, Trapping, Archery, Fishing, and Firewood Collection. Installations may institute General Wildlife Recreation Permits (trail use, wildlife observation, etc.) in the future, similar to other installations, which would warrant additional enforcement permit checks.

Installation hunting and fishing programs are subject to all state and installation laws and regulations as contained in the Code of Virginia, the VDGIF as referenced in the Virginia Administrative Code (V.A.C.), NCWRC regulations (for NC portions of NSAHR-NWA), CNRMA Instruction 11015.2B (subject to change), Installation INRMPs, OPNAVINST M-5090.1B, and the annual installation hunting rules and regulations (Navy 2015a, subject to change). It is important to note that all hunting, fishing, and trapping on an installation are to be in accordance with the laws of the State in which it is located, and according to Title 10 U.S.C. §2671, "Offenders who are guilty of a like offense are subject to a like punishment for an act or omission on the installation that would be punishable if committed within the jurisdiction of the state." Game management on installations is also subject to the Game and Fish Act, the Lacey Act, the Migratory Bird Act, and the Migratory Bird Hunting and Conservation Stamps Act. Policy and procedures for the registration, transportation, and storage of private firearms for hunting (or other purposes) on the installations is provided in COMNAVREGMIDLANTINST 5820.2.

Recreational fisheries management on the four installations is also governed by several authorities including EO 12962 Recreational Fisheries, CNRMA Instruction 11015.1 (subject to change), and the 1996 DOD Addendum to the National Recreational Fisheries Resources Management Plan. For installations with access to marine fisheries (NASO and NASO-DNA), the regulatory authority is the VMRC, and installations are subject to all VMRC rules and regulations as contained in the V.A.C. and Code of Virginia. In accordance with these authorities, Navy installations must improve the quantity, function, sustainable productivity, and distribution of aquatic resources for increased recreational fishing opportunities by restoring degraded habitat, fostering conservation, and providing access to and awareness of opportunities for recreational fishing.

The primary regulatory protection for threatened and endangered species on military installations is the Federal Endangered Species Act (ESA). The Federal ESA requires all federal agencies to ensure that any action undertaken is not likely to jeopardize the continued existence of a federally listed threatened or endangered species. Section 9 of the ESA prohibits the taking of any endangered species without special exemption. The ESA is administered by the USFWS and the Commerce Department's National Marine Fisheries Service, part of the National Oceanic and Atmospheric Administration (NOAA-NMFS). The USFWS has primary responsibility for terrestrial and freshwater organisms, while the responsibilities of NMFS are mainly marine wildlife.

The Virginia ESA grants the VDGIF regulatory authority over federally or state-listed fish or wildlife species in Virginia, and the North Carolina ESA grants the NCWRC regulatory authority over federally or state-listed fish or wildlife species in North Carolina. Therefore, coordination

with the USFWS, NOAA NMFS, VDGIF and/or NCWRC (in NSAHR-NWA) is required when actions have the potential to affect federal and state listed species. The CLEO may also serve to ensure that Navy units that are training comply with requirements of Biological Opinions (BOs) issued by the USFWS, in accordance with consultation requirements in Section 7 of the ESA. BOs are provided in installation INRMPs. Bald eagles, marine mammals, migratory birds, and other wildlife that are present or that may occur on installations are also protected through the enforcement of the Lacey Act, MBTA, Bald and Golden Eagle Act and the Marine Mammal Protection Act.

Migratory birds are a large, diverse group of birds that utilize breeding grounds in the U.S. and Canada, and overwinter in southern North America, Central and South America, the West Indies, and the Caribbean. The MBTA (16 USC §703–711) is the primary legislation in the U.S. established to conserve migratory birds. The MBTA prohibits the taking, killing, or possessing of migratory birds, their eggs, parts, and nests unless permitted by regulation. The Final Rule on Take of Migratory Birds by the Armed Forces (50 CFR Part 21) allows for the incidental take of migratory birds by DOD during military readiness activities, provided a permit authorizing such activities has been received. To address the unintentional take of migratory birds as a result of activities necessary to support the military mission, a MOU was adopted between the DOD and the USFWS, as required by EO 13186, Migratory Birds, on 31 July 2006. This MOU allows the military to obtain permits for the "unintentional take" of a migratory bird if it is in support of a military readiness operation.

Per CNRMA Instruction 11015.3, some of the regional CLEOs responsibilities are tied into nuisance wildlife and pest management, through the use of depredation trapping, pesticide application, and responding to complaints about nuisance wildlife. Applicable federal, state, and local regulations for pesticide application apply, as detailed in the installation Integrated Pest Management Plans. The current BST/CLEO is a Navy Certified Pesticide Applicator, and also has surveying and data recording responsibilities for various species. Appropriate permits must be acquired before trapping game and non-game wildlife.

Nuisance wildlife is defined in 4 V.A.C. §15-20-160, and lists those species that are considered by Virginia as nuisance species; however feral pets, Canada goose and other waterfowl are not considered nuisance wildlife by this code. The code further states that "It shall be unlawful to take, possess, transport, or sell all other wildlife species not classified as game, furbearer or nuisance, or otherwise specifically permitted by law or regulation." To ensure compliance with this law, any nuisance wildlife removal or control activities performed by the environmental staff will be coordinated with VDGIF or NCWRC as necessary, to make certain that methods employed do not violate Virginia or North Carolina law.

3.0 INSTALLATION DESCRIPTIONS

A brief description of each of the four installations and the natural and cultural resources they contain is provided in the sections below. Additional information is contained in each installation INRMP and ICRMP (Navy 2014 a-c, Sadler & Whitehead Architects 2012). A location map containing all four installations is included in Figure 1.

3.1 NASO

NASO is approximately 5,800 acres (ac) (2,347 hectares [ha]), and is located in the Tidewater region of southeastern Virginia, also referred to as the Hampton Roads area. NASO is located within the bounds of the City of Virginia Beach near what was formerly the Village of Oceana, Virginia. NASO is bounded by the Norfolk and Southern Railroad to the north, Oceana Boulevard to the east, Harper's Road to the south, and London Bridge Road to the west. Several additional parcels lie north of the railroad tracks, east of Oceana Boulevard, and west of London Bridge Road (Midway Manor Housing parcel).

Approximately one third of the installation consists of maintained airfield and urban areas. The rest of the installation consists of maintained open areas, agricultural areas, forested areas, open water and recreational areas. Many natural resources worthy of protection exist at NASO, including wetlands, coastal resources, and wildlife/plant species of concern and their habitat.

Outdoor recreational opportunities supported at NASO including hiking, nature trails, picnicking, horseback riding, golfing, tennis, swimming, athletic field sports, skeet and trap shooting, archery, hunting, fishing, and trapping. The NRP manages the hunting and fishing programs. Both MWR and the NRP provide management oversight of facilities/programs that provide wildlife viewing/watching opportunities. Because of mission constraints, there are limited opportunities for public access to outdoor recreational programs at NALFF. The hunting program is open to active duty and retired military personnel and their dependents, current civilian employees of NALFF and their dependents, and reservists.

NASO land ownership falls mostly under concurrent jurisdiction, whereby both state and federal officers have authority to enforce regulations on the site. The commissary and Owl's Creek parcels are under propriety jurisdiction, whereby state and local law enforcement officers handle calls for service as if the land were privately owned. Appropriate state or federal law enforcement authorities are contacted and consulted when an incident occurs, per federal and state regulations.

Cultural Resources

The CRP at NASO is the responsibility of NAVFAC Mid-Atlantic (Code EV2) under the Regional Historic Preservation Officer (RHPO). There are 54 archaeological sites on NASO, all of which are protected under ARPA. Of the 54 sites, 37 are not eligible for National Register of Historic Places (NRHP) listing and are not managed by the CR Program, but remain protected under ARPA. The additional 17 have not been assessed for eligibility but are managed by the CRP.

An architectural survey and assessment was conducted at NASO in 1996 (Navy 2014a). With the exception of the Bell House, there are no historic properties at NASO eligible for listing in the NRHP. The Bell House is considered to be an important historic resource; however, the property was transferred from the Navy to the Mid-Atlantic Military Family Communities, LLC as part of a family housing project. The property is included in a 2005 Programmatic Agreement between

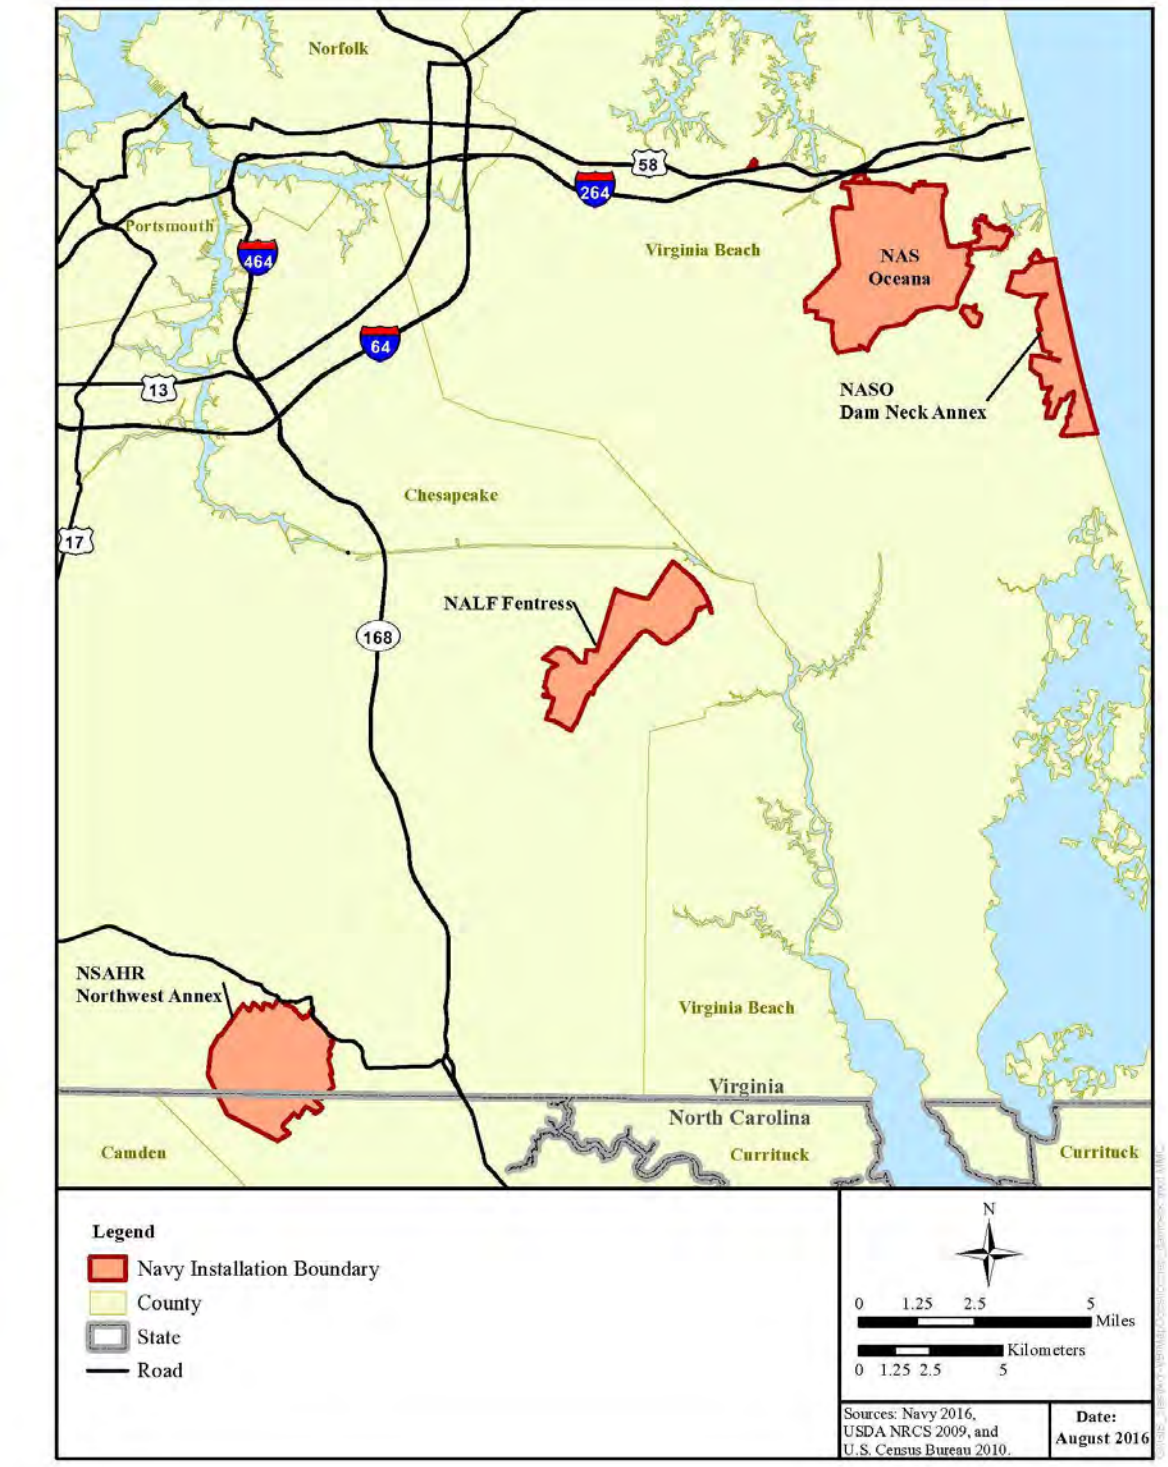

Figure 1. Location of NASO, NASO-DNA, NALFF, and NSAHR-NWA. NASO Midway Manor Parcel not included.

the Navy, SHPO, and Mid-Atlantic Military Family Communities, LLC, which establishes a process for considering effects on historic properties after conveyance.

The survey confirmed the presence of five previously identified architectural resources predating development of NASO, including the early 19th century Bell-Taylor house, an early 20th century agricultural complex, the circa 1929 Oceana High School and circa 1920s gymnasium, and the Old Bowmans Building. None of the additional pre-1940s resources are listed, or have been determined eligible for listing in the NRHP. The survey determined that World War II-era buildings located at NASO do not represent architectural, engineering, technological, or scientific examples significant for their period, style, or method of construction. Although the Cold War-era buildings evaluated during this survey were not yet 50 years old, the survey did not anticipate that any resources built from 1947–1959 would possess qualities of significance applying NRHP criteria when they reached 50 years of age (Sadler & Whitehead Architects, PLC 2012). No formal architectural survey has been conducted on the Owls Creek parcel at NASO; however all buildings on this parcel were constructed by the Navy after 1992, and are assumed to be ineligible for listing in the NRHP (Sadler & Whitehead Architects, PLC 2012).

While there is a small possibility of artifacts washing up along Owl's Creek, this would be a rare occurrence. Nevertheless, such artifacts are protected by ARPA and other regulations described in Section 2.0 of this document. Each installation should have as part of its ICRMP a monitoring program for cultural resources and should also provide coordination requirements if such artifacts are discovered. Beach combing or collection of such artifacts by the general public is prohibited.

The cultural resources information identified in Figure 2 is not reflective of all known cultural resources at NASO. To protect the integrity of archaeological sites in accordance with the guidance provided by the RHPO and as dictated by ARPA, specific cultural resources information is not shown. The figure shown does not include all of the archaeological sites on the installation and the sensitive areas are comprised of both identified cultural resources and unsurveyed areas. Because NRHP-ineligible sites are still protected under ARPA, if CLEOs encounter illicit digging in areas outside the sensitive areas on the maps there may still be an ARPA violation. The Cultural Resource Manager maintains a record of their locations in a Geographic Information Systems (GIS) format. CLEOs will coordinate directly with the installation Cultural Resources Manager to address conservation law enforcement and protection of archaeological and cultural sites. NASO was included in the 2012 regional ICRMP prepared for Naval Installations in Hampton Roads (Sadler & Whitehead Architects, 2012), and this document provides additional information and guidance on cultural resources management.

Natural Resources

Hunting and Fishing

Hunting opportunities are available at NASO through a regional deer and small game recreational hunting program shared by NASO, NASO-DNA, NALFF, and NSAHR-NWA, though the regional instruction is out of date and does not accurately reflect current SOPs. The most current information available to the public is the NAS Oceana/NASO Dam Neck Annex/NALF Fentress/NSAHR Northwest Annex Deer Hunting Rules and Regulations 2015-2016 season (Navy 2015). Various additional educational outreach brochures and materials are contained in the installation INRMP. All hunting areas/stands, parking locations, and access roads are subject to change, and hunters are required to obtain the most current maps before any hunt (available at the Natural Resources Center on Oceana Blvd., Bldg. 78). In accordance with Title 10 U.S.C. § 2671,

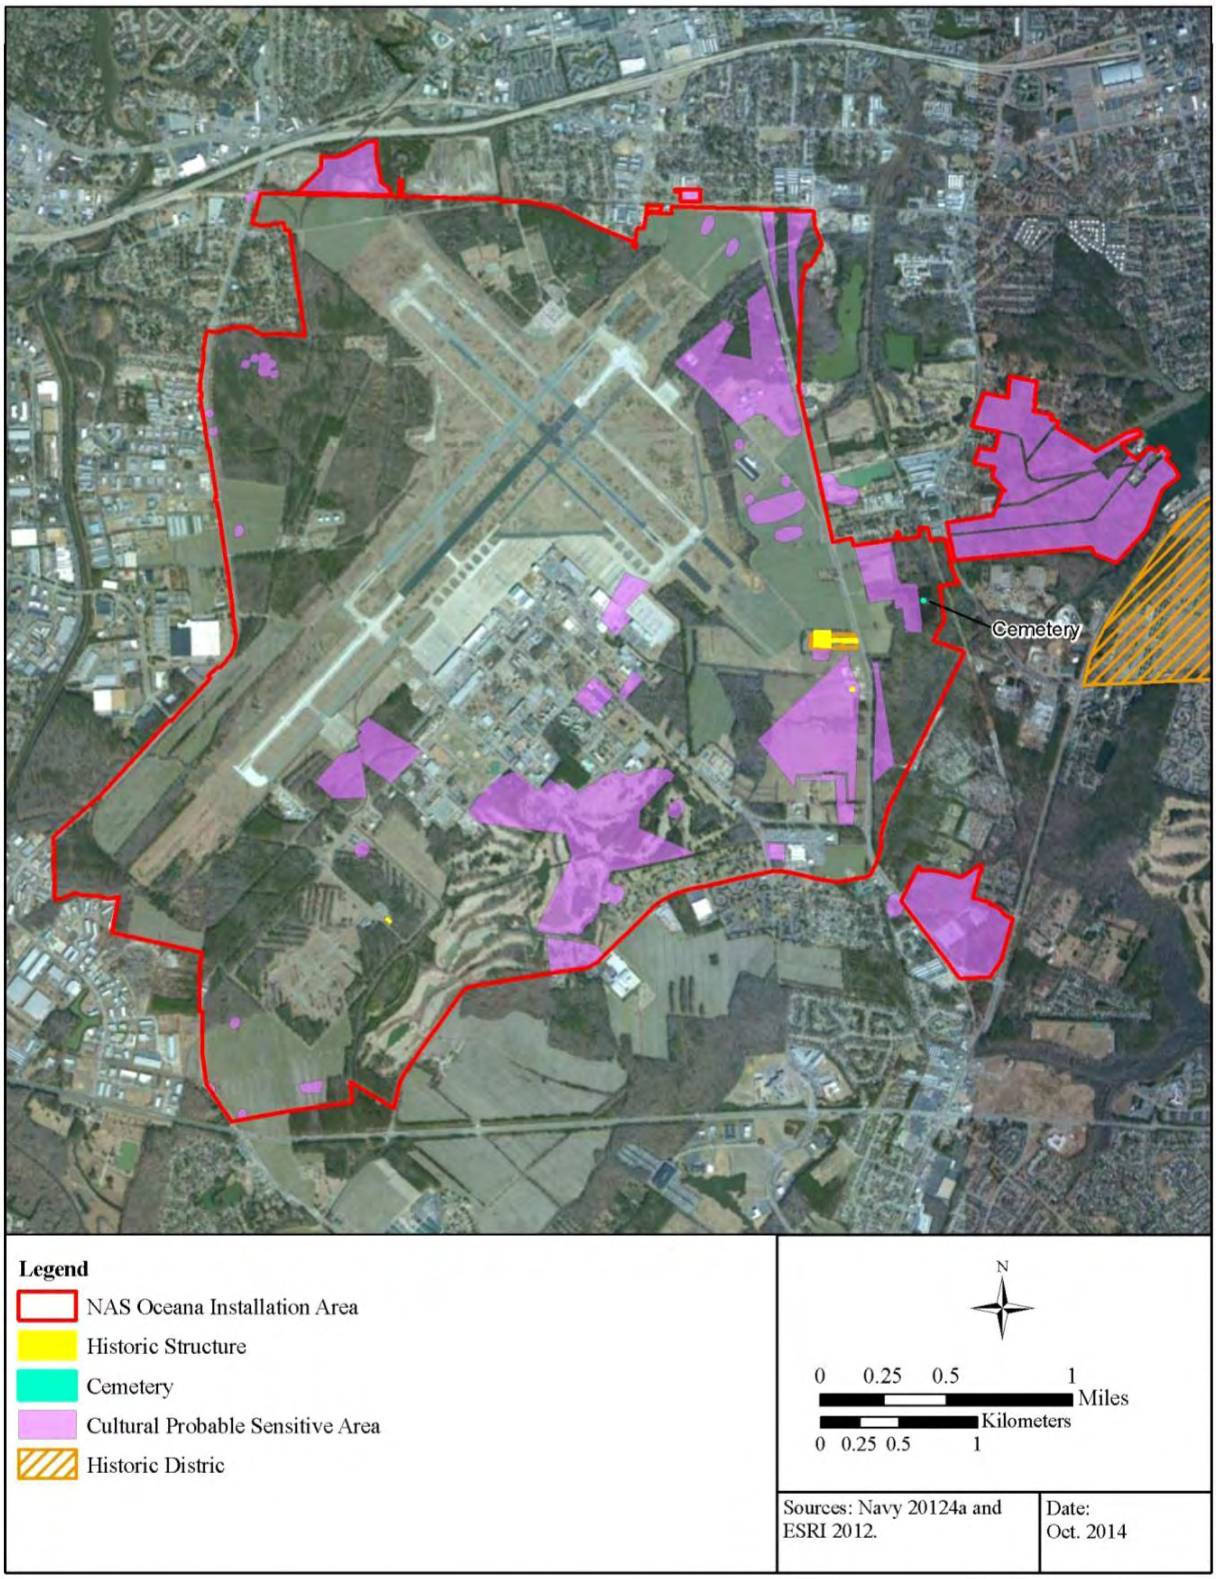

Figure 2. NASO Cultural Resources Sensitive Areas. From NASO INRMP. Not all cultural resource areas are depicted, map is subject to annual updates.

all hunting, fishing, and trapping on military installations are to comply with the federal and state laws and regulations (See Section 2.0 of this document).

At NASO, approximately 1,157 ac (469 ha) are available for muzzleloader and archery hunting, though this is subject to change (Figure 3). The provided map (Figure 3) may not reflect current hunting type designations, as changes are typically made during annual INRMP updates. Small game hunting areas, in which the use of shotguns is permitted, are also present, but not shown in Figure 2. Small game hunters may hunt during the appropriate season on most of the agricultural fields and woodlands. Game species at NASO include a variety of small mammals, furbearers, birds, and whitetail deer. Whitetail deer are the most popular game species. Other small game species that occur, but are not intensively hunted, are eastern cottontail, raccoon, Virginia opossum, red fox, gray fox, northern bobwhite, and mourning dove.

Shotguns may be used for small game hunting at NASO. Muzzleloading firearms and bow hunting are permitted. Handheld and hand drawn equipment must be used. Waterfowl hunting is prohibited due to shot size restrictions that are necessary to ensure aircraft and personnel safety, and to reduce the potential for user conflicts. Trapping is generally not pursued as a recreational activity, but is used to control populations of invasive and nuisance wildlife species. Typically one recreational trapper is authorized per installation annually. If more than one trapper request is received for a particular installation a random lottery selection is conducted to select the trapper who will trap that installation for the year.

At NASO, fishing is currently authorized at Oceana Pond only, although providing access to other ponds is under consideration. One boat ramp is currently available for non-motorized boating at Oceana Pond, and parking is permitted in the designated cul-de-sac area, and requires an additional parking permit that is issued along with the NASO fishing permit. Installation permits can be purchased at the NASO MWR ticket office. NASO fishing permits are valid at all of the regional Navy installations that participate in the fishing program. The outdoor recreational and hunting areas map for NASO is provided in Figure 3, and all areas are subject to change. The boy scout hunting area is located to the south of Archery Only area 43 on Figure 3.

The regional CLEO serves as a game warden and has the authority to apprehend and arrest all violators of federal, state, or installation fish and game laws and regulations on NASO. The presence of trained CLEOs is an important component of the hunting and fishing programs as it greatly reduces the potential for fish and game violations on the Installation. Routinely the CLEO patrols fishing and hunting areas of the installation to ensure people recreating are complying with natural resources regulations and policies. All firearm users must demonstrate weapons utilization competency by completing weapons qualifications administered by the NRP staff/CLEO, show proof of completion of a state-certified hunter safety course, attend a hunter indoctrination. In addition, all bowhunters must show proof of completion of an International Bowhunter Education Program and demonstrate competence through a qualification test with natural resources staff.

Rare, Threatened, and Endangered Species

Rare, threatened, and endangered species surveys of NASO have not identified any species that are listed under the federal ESA (Navy 2014a, Navy 2014d, Derge and Belden 2002, VDCR–DNH 1990a and VDCR–DNH 1990b). The installation supports populations of one state-listed threatened species, the upland sandpiper (*Bartramia longicauda*). Eight plants and two wildlife species that are considered rare in Virginia are known to occur at NASO.

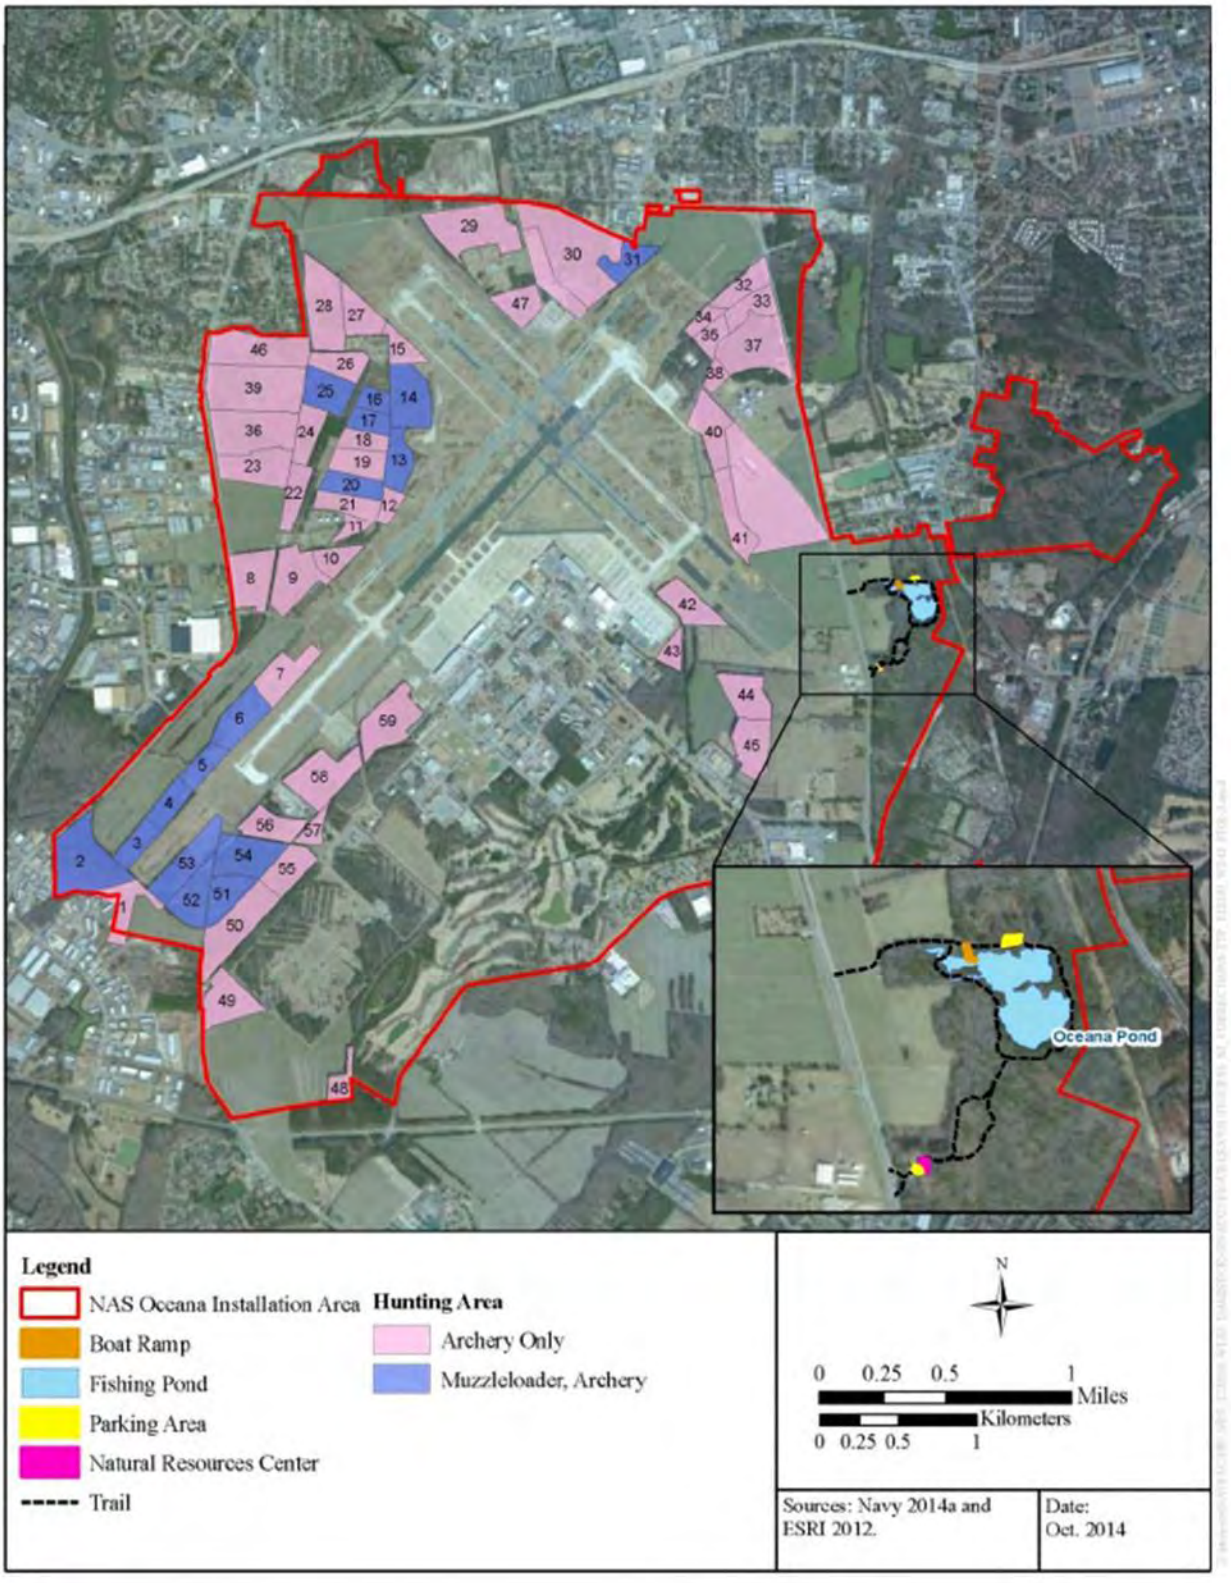

Figure 3. Outdoor Recreation Facilities and Hunting Areas of NASO. From NASO INRMP. Small game areas not depicted. Map is subject to annual updates

In addition, six bird species that are considered rare in Virginia, and four bird species that are listed as USFWS Birds of Conservation Concern (BCC) are known to occur at the installation.

There were no state or federally threatened or endangered fish species collected during stream and fish surveys in 2014. Federally endangered Atlantic sturgeon (*Acipenser oxyrinchus oxyrinchus*) and shortnose sturgeon (*Acipenser brevirostrum*) have the potential to occur in the nearshore environment off of NASO's Owls Creek parcel and within the Rudee Inlet area; however, this is not considered ideal habitat for these species.

Neither the federally threatened Northern long-eared bat (*Myotis septentrionalis*) nor the state endangered Rafinesque's big-eared bat (*Corynorhinus rafinesquii macroti*s) were captured in 2015 during mist net surveys; however, suitable habitat for both are located on the installation and both species have been documented west and east of the installation on other Naval installations (NALFF and NASO-DNA). Acoustic monitoring was competed in 2016 and results are pending.

Designated rare species and species of concern are granted no special legal protection. Tables listing all RT&E species that have been observed on the installation can be found in the NASO INRMP (Navy 2014a). NASO has one confirmed eagle nest recorded fall 2014, along the Owl's Creek waterway, and bald eagles have been observed flying over the airfield and golf course. Additionally, numerous birds regulated under the MBTA are present or known to occur on the installation (Avian Species List Study, Navy 2014e), and marine mammals and other protected marine species such as sea turtles may occasionally enter the nearshore environment of the installation.

Wetlands and Coastal Zone Management

NASO contains wetlands which are conserved and/or mitigated based on impact through installation activities. Results of the wetland delineations for which a preliminary jurisdictional determination has been received from USACE identified approximately 572 ac (231 ha) of wetlands at NASO. In addition to the 572 ac (231 ha) of jurisdictional wetlands identified at NASO, an additional 1,115 ac (451 ha) of National Wetlands Inventory wetlands have been mapped at NASO. Natural Resources Personnel on the Installation are trained in wetland delineation and permitting in regards to wetland conservation. Wetland maps are provided in the NASO INRMP (Navy 2014a).

As a federal installation, NASO is exempted from inclusion in the state-designated coastal zone; however management of coastal zone resources does occur across the installation. Although federal lands are excluded from state-designated coastal resources management areas, activities on federal lands that are reasonably likely to affect land or water use or natural resources of coastal zones must be consistent, to the maximum extent practicable, with the enforceable policies of the Virginia's Coastal Zone Management Program (CZMP). All installation activities are reviewed for their potential impact to coastal zone resources and their compliance with the state's enforceable policies of the CZMA. The Navy strives to avoid and minimize impacts to coastal zone resources to the extent practicable when conducting activities that have the potential to impact these resources. Management actions include monitoring non-point source pollution, marine fish and wildlife species and habitat, and wetlands. The installation has implemented numerous management practices that benefit the coastal zone and nearshore environment, including protection of stormwater quality, erosion and sediment controls, and measures to protect marine resources. These management techniques directly and indirectly benefit plant and wildlife species,

water resources, and habitat that exist in the watershed and nearshore environments of the installation.

Special Interest Areas

Special Interest Areas (SIA) that are present at NASO provide habitat for several of the RT&E species and species of special concern that occur at the Installation. As specified in the facility INRMP, with the exception of the select management actions, little active management of the SIAs at NASO is conducted, as these areas are allowed to persist naturally. However, on a case-by-case basis, active management of these may be implemented to address issues such as erosion or invasive species. The SIAs at NASO include Aeropines Mitigation SIA, Oceana Ponds SIA, Owl Creek SIA, VACAPES Restoration SIA, and Northwest Woods SIA. The SIA locations, boundaries, and descriptions are provided in the 2014 Natural Heritage Inventory Report for NASO and NALFF (Navy 2014d).

3.2 NASO-DNA

NASO-DNA is located in the southeastern portion of the City of Virginia Beach, Virginia, and encompasses approximately 1,900 ac. The installation is bounded by the community of Sandbridge to the south; the Atlantic Ocean to the east; Hampton Roads Sanitation Division, City of Virginia Beach Properties, and private properties to the west; and Virginia Army National Guard - Camp Pendleton to the north. A majority of the area immediately surrounding the installation includes industrial, commercial, residential, recreational, and agricultural land uses. However, most of the agricultural lands are rapidly being converted to residential and recreational developments.

The installation contains 1,115 ac of natural areas, 271 ac of beaches and dunes, and 444 ac of urban areas. The northern portion of NASO DNA remains largely undeveloped and is dominated by forested wetlands. The southern portion of NASO-DNA contains a large portion (approximately 386 ac) of developed and urban landscape that consists of impermeable surface, mowed lawn, shade trees, and ornamental trees and shrubs.

Recreational opportunities at NASO-DNA include camping, swimming, surfing, hunting, fishing, various sports fields and courts, wildlife viewing, and recreational trails. NR personnel are consulted on issues pertaining to natural resources management and environmental regulation. MWR provides instructions and maps for users of recreational facilities of the installation that describe accepted and prohibited uses, and identify approved recreational areas. Because of mission constraints, there are limited opportunities for public access to outdoor recreational programs at NASO-DNA. The hunting program is open to active duty and retired military personnel and their dependents, current civilian employees of NASO-DNA and their dependents, and reservists.

NASO-DNA land ownership is mostly under concurrent jurisdiction, whereby both state and federal officers have authority to enforce regulations on the site. One parcel located on the southwestern portion of the installation (Ethel Kesler property), is under propriety jurisdiction, whereby state and local law enforcement officers handle calls for service as if the land were privately owned. Appropriate state or federal law enforcement authorities are contacted and consulted when an incident occurs, per federal and state regulations.

Cultural Resources

The CRP at NASO-DNA is the responsibility of NAVFAC Mid-Atlantic (Code EV2) under the RHPO. There are 14 archaeological sites on NASO-DNA, all of which are protected under ARPA. One of those sites have been determined eligible for listing in the National Register of Historic Places, and this site is managed by the CRP. The remaining 13 sites are not eligible for NRHP listing and are not managed by the CR Program, but remain protected under ARPA.

Several cultural resources surveys were conducted at NASO-DNA during the 1980s (Navy 1983a, 1983b, 1983c, 1987a, 1987b, and 1987c). These surveys were conducted in the southern portion of NASO DNA and did not include the northern portion of the installation. In October 2008, the Navy performed an additional archaeological survey, prepared by Southeastern Archaeological Research Inc. The Virginia Department of Historic Resources, also known as the State Historic Preservation Office (SHPO), concurred with the findings of the report in a letter dated 11 December 2007. Additionally in January 2010, the southern area of the installation was surveyed and two archaeological sites were evaluated.

An archaeological survey of the northern portion of NASO-DNA found no archaeological sites and recommended no further investigation (Navy 1987d). However, formal concurrence on this finding has not been obtained from the Virginia SHPO. The most recent architectural survey, Phase I Architectural Survey of Potentially Significant Cold War Era Resources (1948–1962) at Navy Hampton Roads Bases, identified a potential historic district associated with the Surface Launched Guided Missile School. The potential historic district consists of three buildings: Buildings 586, 543 and 572. The findings of the Phase 1 Architectural Survey are currently under review by Virginia Department of Historic Resources (Sadler & Whitehead Architects, 2012). The northern-most portion of NASO-DNA, adjacent to Camp Pendleton, has not yet been surveyed for cultural resources (Personal communication, R. Hobgood, 28 April 2016).

While there is a small possibility of shipwrecks, artifacts, or archaeological resources washing ashore along the beaches at NASO-DNA (due to storm erosion or wave action), this would likely be a rare occurrence. Nevertheless, such artifacts are protected under ARPA and other regulations described in Section 2.0 of this document. Each installation should have as part of its ICRMP a monitoring program for cultural resources and should also provide coordination requirements if such artifacts are discovered. Beach combing or collection of such artifacts by the general public is prohibited.

The cultural resources information identified in Figure 4 is not reflective of all known cultural resources at NASO-DNA, and is subject to annual updates and modifications. To protect the integrity of archaeological sites in accordance with the guidance provided by the RHPO some cultural resources information is not shown. The figure shown does not include all of the archaeological sites on the installation and the sensitive areas are comprised of both identified cultural resources and unsurveyed areas. Because NRHP-ineligible sites are still protected under ARPA, if CLEOs encounter illicit digging in areas outside the sensitive areas on the maps there may still be an ARPA violation.

The Cultural Resource Manager maintains a record of culturally sensitive resource locations in a GIS format. Two cemeteries are located at NASO-DNA, and any proposed action located within or adjacent to the boundaries of a cemetery shall be coordinated with the installation facilities management division and the RHPO. CLEOs will coordinate directly with the installation Cultural Resources Manager to address conservation law enforcement and protection of archaeological and cultural sites. NASO-DNA was included in the 2012 regional ICRMP prepared for Naval

Figure 4. NASO-DNA Cultural Resources Sensitive Areas. From NASO-DNA INRMP. Not all cultural resource areas are depicted, map is subject to annual updates.

installations in Hampton Roads (Sadler & Whitehead Architects, 2012), and this document provides additional information and guidance on cultural resources management.

Natural Resources

Hunting and Fishing

Hunting opportunities are available at NASO-DNA through a regional deer and small game recreational hunting program shared by NASO, NASO-DNA, NALFF, and NSAHR-NWA, though the regional instruction is out of date and does not accurately reflect current SOPs. The most current information available to the public is the NAS Oceana/NASO Dam Neck Annex/NALF Fentress/NSAHR Northwest Annex Deer Hunting Rules and Regulations 2015-2016 season (Navy 2015). Various additional educational outreach brochures and materials are contained in the installation INRMP. All hunting areas/stands, parking locations, and access roads are subject to change, and hunters are required to obtain the most current maps before any hunt (available at the Natural Resources Center on Oceana Blvd., Bldg. 78). In accordance with Title 10 U.S.C § 2671, all hunting, fishing, and trapping on military installations are to comply with the federal and state laws and regulations (See Section 2.0 of this document).

Hunting opportunities at NASO-DNA include hunting for deer and waterfowl. Hunting is permitted in three separate areas of the Installation; the north end, which includes the wooded area north of the firing ranges; the central area of the installation, which includes South Marsh and the adjacent forested areas; and within the southern-most portion of the installation. The hunting areas map provided in Figure 5 may not reflect current hunting type designations, as changes are typically made during annual INRMP updates. Natural Resources Educational Trails are not shown. Approximately 535 ac (217 ha) are included in the hunting areas. The hunting areas are divided into approximately 60 compartments that can accommodate one to two hunters each depending on the type of hunting and size of the compartment, however, some areas have been closed. Most forested land on the installation is considered huntable land. Hunting Areas north of Dam Neck Blvd. are designated “Restricted Area Recreational Hunting.” These are hunted by recreational hunters, though additional access restrictions are required compared to the "Open" Recreation Hunting Areas. The area to the north of hunting area 35 (see Figure 5) is also currently hunted, but is an escorted managed hunt area. It is being considered for being opened to unescorted recreational hunting opportunities. Authorized hunting areas change annually and sometimes seasonally. Hunting area 25 was closed to hunting in 2014. It will be reopened to hunting once approval has been obtained indicating sufficient UXO clean-up has been completed.

Popular recreational activities include saltwater fishing along the shoreline and freshwater fishing at the freshwater lakes of NASO-DNA. Saltwater shore fishing is allowed between Labor Day weekend and Memorial Day weekend at designated locations, and a beach utilization map is provided by MWR that identifies areas approved for these activities. Freshwater fishing is permitted at Sadler Pond, and fishing also is allowed in the ditches that drain the installation. Appropriate state licenses and an installation permit for freshwater fishing are required for fishing at NASO-DNA. Installation permits can be purchased at the NASO MWR ticket office.

The Regional CLEO serves as a game warden and has the authority to apprehend and arrest all violators of federal, state, or Installation game laws and regulations on NASO-DNA. The presence of a trained CLEO is an important component of the hunting and fishing programs as it greatly reduces the potential for fish and game violations on the installation. Routinely the CLEO patrols fishing and hunting areas of the installation to ensure people recreating are complying with natural

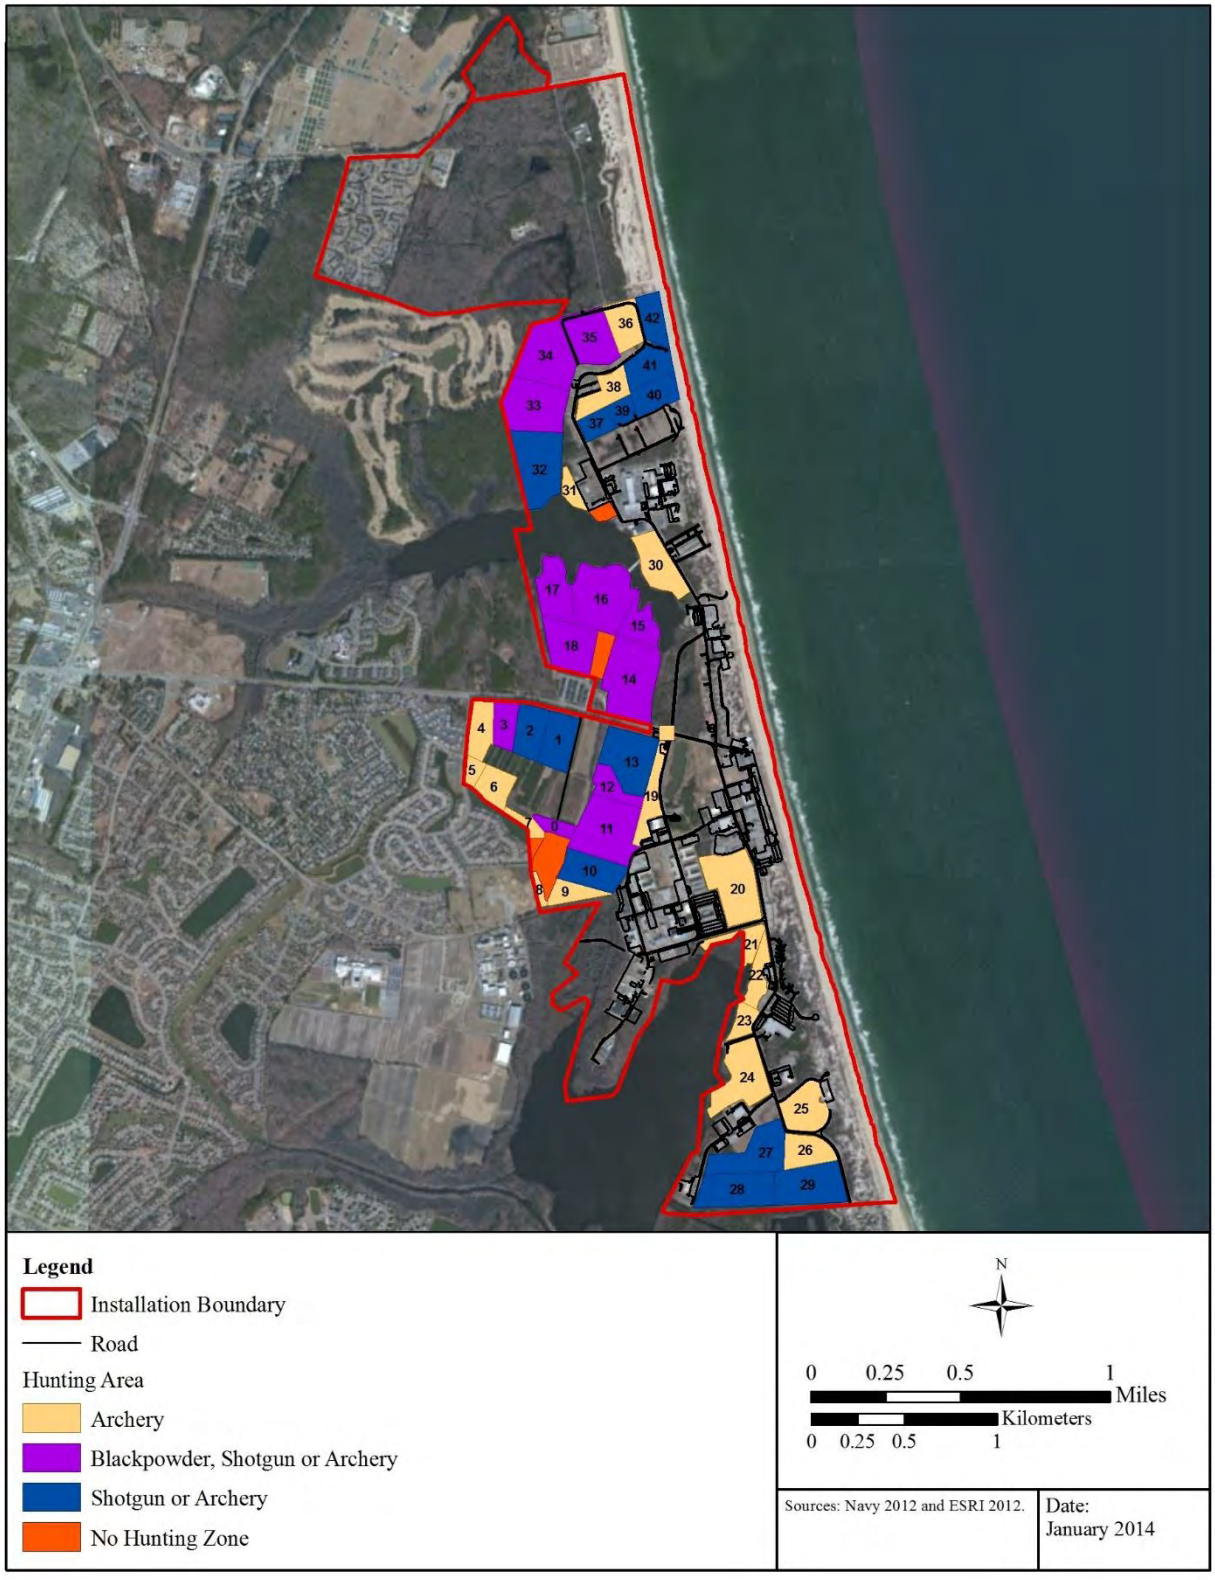

Figure 5. NASO-DNA Hunting Map. From NASO-DNA INRMP. Map is subject to annual updates, and all hunting areas subject to change.

resources regulations and policies. All firearm users must demonstrate weapons utilization competency by completing weapons qualifications administered by the NRP staff/CLEO, show proof of completion of a state-certified hunter safety course, attend a hunter indoctrination. In addition, all bowhunters must show proof of completion of an International Bowhunter Education Program and demonstrate competence through a qualification test with natural resources staff.

Rare, Threatened and Endangered Species

NASO-DNA supports 40 rare plant occurrences, and 10 rare animals, including the state-listed least bittern (*Ixobrychus exilis*), state-listed canebrake rattlesnake (*Crotalus horridus* ssp. *atricaudatus*), state-listed eastern glass lizard (*Ophisaurus ventralis*), federally listed piping plover (*Charadrius melodus*), federally-listed loggerhead sea turtle (*Caretta caretta*), and federally-listed Kemp's ridley sea turtle (*Lepidochelys kempii*). These species were identified during several inventories of rare, threatened, and endangered species conducted at NASO-DNA from 1968 through 2010 (Buhlmann et al. 1992, Corning 1968, Evans and Belden 2010, Galvez and Swihart 2000, Geo-Marine Inc. 2003, Swihart 1982, USFWS, Office of Fishery Assistance 1985 and 1988, Van Alstine et al. 2001, and VDCR-DNH 1990). RT&E species tables can be found in the NASO-DNA INRMP (Navy 2014b).

Through survey and research efforts conducted in 2015, a number of additional protected species were identified as occurring or historically occurring on the installation, including the federally threatened northern long-eared bat, state endangered Rafinesque's big-eared bat, state threatened peregrine falcon (*Falco peregrinus*), state threatened gull-billed tern (*Gelochelidon nilotica*), and species of concern Brimley's assassin bug, *Pnirontis brimlyii* (Navy 2015b, Navy 2016). Designated rare species and species of concern are granted no special legal protection. Federally listed Atlantic Sturgeon (*Acipenser oxyrinchus oxyrinchus*) have been known to strand on the beaches of NASO-DNA (Personal communication with Michael Wright, March 2016). The installation also supports habitat that may be utilized by the federally threatened red knot (*Calidris canutus rufa*) as a winter stop-over.

Numerous birds regulated under the MBTA are present or known to occur on the installation (Navy 2015b), and marine mammals/other marine species that are protected may occasionally enter the nearshore environment of the installation. While no longer federally listed, bald eagles (*Haliaeetus leucocephalus*) have been observed on the installation, and are protected by the Bald and Golden Eagle Protection Act.

Significant and Rare Natural Communities

Several of the ecological communities that occur on NASO-DNA are considered significant, rare natural communities in Virginia. The maritime wet grasslands, maritime upland forests, maritime dune woodlands, and interdune swales that occur in the beach and dune area are rare natural communities that are severely threatened by coastal development throughout their natural range. VDCR-DNH descriptions of the ecological community groups identified at NASO DNA in surveys conducted in 1992, 2001, and 2010 (Buhlmann et al. 1992, Van Alstine et al. 2001, and Evans and Belden 2010) are provided in the NASO-DNA INRMP (Navy 2014b).

The primary dunes located at NASO-DNA are an important protected natural resource. Dune utilization activities within this unit should be consistent with the state's Coastal Zone Management Program. NR staff will review proposed projects for coastal consistency. Routinely the CLEO patrols the beaches to ensure people recreating are complying with natural resources

regulations and policies. Recreational beach users are limited to use of pedestrian walkways, which were constructed to minimize unauthorized access and erosion of the dunes. Installation residents and volunteers also are encouraged to participate in habitat conservation efforts in the beaches and dunes area. Education and outreach regarding the importance of dunes and what is or is not authorized in dune areas, coupled with increased security and CLE patrols of this area are needed to stop/minimize the unauthorized dune access contributing to the degradation and destabilization of the dunes.

Special Interest Areas (SIA) that are present at NASO-DNA provide habitat for several of the RT&E species and species of special concern that occur at the Installation. As specified in the installation INRMP, with the exception of the select management actions, little active management of the SIAs at NASO-DNA is conducted, as these areas are allowed to persist naturally. However, on a case-by-case basis, active management of these may be implemented to address issues such as erosion or invasive species. SIAs at NASO-DNA include: Lovetts Marsh SIA, Southeast Redwing Lake Wetlands SIA, Middle Beach Dunes Special Interest Area, Helicopter Pad Wetlands SIA, and Interdunal Swales, Dune, and Freshwater Marsh SIA. The SIA locations, boundaries, and descriptions are provided in the 2015 Listed Species Surveys at NASO-DNA (Navy 2015b).

Wetlands, Coastal Zone Management, and Marine Species Conservation

A large portion of the installation consists of undeveloped forested wetlands and marshes. Wetland delineations were recently completed at NASO DNA, for which preliminary jurisdictional determinations were received in 2011 and 2012. Wetland delineations identified approximately 922 ac (373 ha) of wetland habitats. Of the 922.0 ac (373.0 ha) of wetland habitat that have been mapped at NASO DNA, approximately 254.5 ac (102.9 ha) of wetlands are located at the northern portion of NASO DNA, and approximately 667.5 ac (270.1 ha) of wetlands are located at the southern portion of NASO DNA.

As a federal facility NASO-DNA is exempted from inclusion in the state-designated coastal zone; however management of coastal zone resources does occur across the installation. All Installation activities are reviewed for their potential impact to coastal zone resources and their compliance with the state's enforceable policies of the Coastal Zone Management Act (CZMA).

A large number of saltwater species also are known to occur in the coastal waters offshore of NASO-DNA. Because the area is in a transition zone between temperate and subtropical regions, fish fauna is extremely diverse, with approximately 685 species known to occur (Navy 2003). The NOAA-NMFS has designated essential fish habitat (EFH) for fish species of particular economic or ecological importance in the area. The Magnuson-Stevens Fishery Conservation and Management Act requires that EFH be identified for all fish which are federally managed.

It is not uncommon to observe marine mammals, reptiles, fishes, and birds along NASO-DNA beaches and within the Navy's defined nearshore environment. Marine mammals are protected under the Marine Mammal Protection Act, and any marine animal (e.g., mammal, bird, fish, herpetofauna) sighted on NASO-DNA beaches must be reported to NR staff, who will respond, as appropriate, to the site and report the sighting to the Virginia Aquarium and Marine Science Center and additional points of contact.

3.3 NALFF

NALFF is approximately 2,600 ac (1,052 ha), and is located in the Tidewater region of southeastern Virginia, also referred to as the Hampton Roads area. NALFF is located approximately 7 miles (mi) (11 kilometers [km]) southwest of NASO near the community of Fentress in what is now the City of Chesapeake. NALFF is generally bounded by Mount Pleasant Road to the north, Carter Road to the west, Long Ridge Road to the south, and Fentress Airfield Road to the southeast.

The installation consists of an airfield and small developed area on the North side of the installation, and the rest of NALFF is made up of large agricultural and forested areas. Vegetation in agricultural and urban areas primarily include mowed turf grasses and row crops, and support very limited natural communities. The remaining undeveloped areas, however, support a variety of vegetation communities including forests, early successional habitat, and emergent and scrub-shrub wetlands.

Recreational opportunities at NALFF primarily consist of hunting. Because of mission constraints, there are limited opportunities for public access to outdoor recreational programs at NALFF. The hunting program is open to active duty and retired military personnel and their dependents, current civilian employees of NALFF and their dependents, and reservists.

NALFF land ownership is entirely under concurrent jurisdiction, whereby both state and federal officers have authority to enforce regulations on the site. Appropriate state or federal law enforcement authorities are contacted and consulted when an incident occurs, per federal and state regulations.

Cultural Resources

The CRP at NASO is the responsibility of NAVFAC Mid-Atlantic (Code EV2) under the RHPO (Navy 2014a). There are 23 archaeological sites on NALFF, all of which are protected under ARPA. One of those sites have been determined eligible for listing in the National Register of Historic Places, while 21 have not been assessed for eligibility; these 22 sites are managed by the CRP. The remaining site is not eligible for NRHP listing and is not managed by the CR Program, but remains protected under ARPA.

An architectural survey and assessment was conducted at NALFF in 1996. The 1996 architectural survey concluded that the major buildings constructed at NALFF during the World War II- and Cold War-eras were not directly associated with nationally important identified themes, critical events, or persons with exceptional significance. The survey did not anticipate that any resources built from 1947–1959 would possess qualities of significance applying NRHP criteria when they reached 50 years of age (Sadler & Whitehead Architects, PLC 2012).

The cultural resources information identified in Figure 6 is not reflective of all known cultural resources at NASO DNA, and are subject to annual updates and modifications. Several archeological sites are located at NALFF; to protect the integrity of archaeological sites in accordance with the guidance provided by the RHPO and as dictated by ARPA, some cultural resources information is not shown. The figure shown does not include all of the archaeological sites on the installation and the sensitive areas are comprised of both identified cultural resources and unsurveyed areas. Because NRHP-ineligible sites are still protected under ARPA, if CLEOs encounter illicit digging in areas outside the sensitive areas on the maps there may still be an ARPA violation.

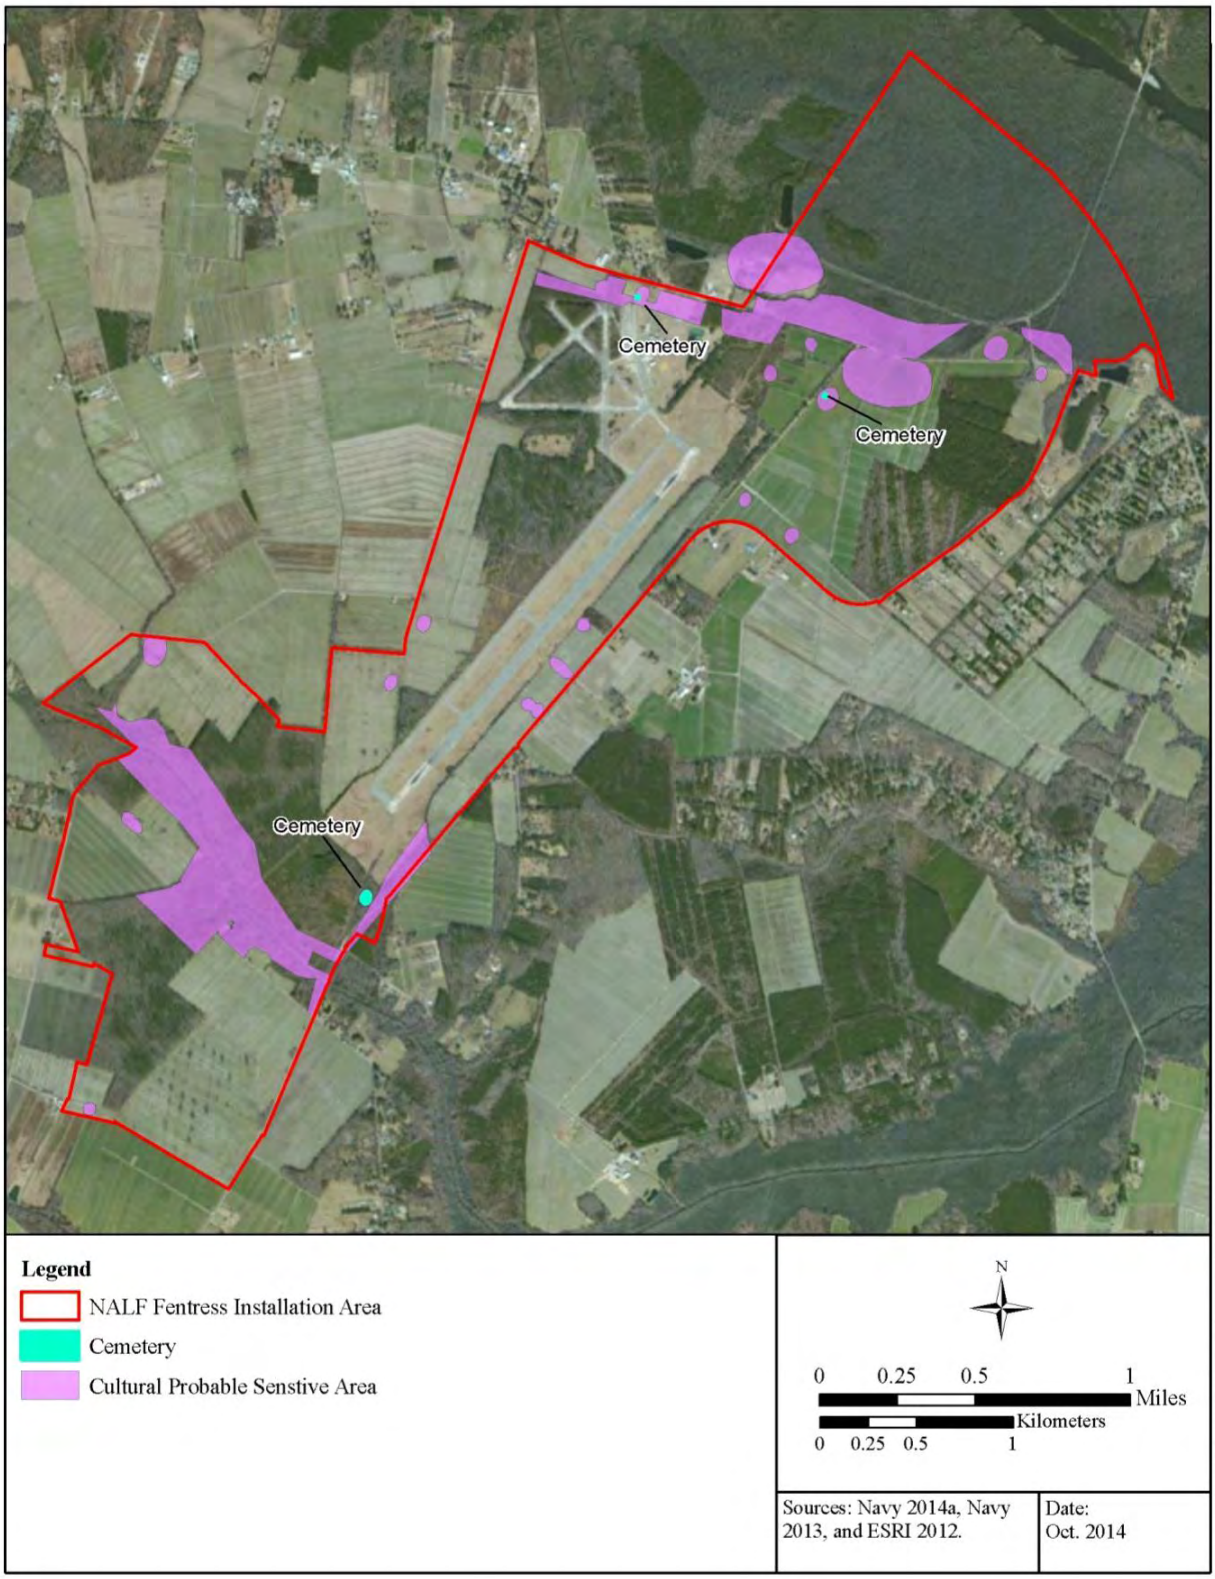

Figure 6. NALFF Cultural Resources Sensitive Areas. From NALFF INRMP. Not all cultural resource areas are depicted, map is subject to annual updates.

The Cultural Resource Manager maintains a record of cultural resource locations in a GIS format. CLEOs will coordinate directly with the installation Cultural Resources Manager to address conservation law enforcement and protection of archaeological and cultural sites.

Four cemeteries are located at NALFF, and any proposed action located within or adjacent to the boundaries of a cemetery shall be coordinated with the Installation facilities management division and the NAVFAC Mid-Atlantic RHPO. NALFF was included in the 2012 regional ICRMP prepared for Naval Installations in Hampton Roads (Sadler & Whitehead Architects, PLC 2012), and this document provides additional information and guidance on cultural resources management.

Natural Resources

Hunting opportunities are available at NASO through a regional deer and small game recreational hunting program shared by NASO, NASO-DNA, NALFF, and NSAHR-NWA, though the Regional Instruction is out of date and does not accurately reflect current SOPs. The most current information available to the public is the NAS Oceana/NASO Dam Neck Annex/NALF Fentress/NSAHR Northwest Annex Deer Hunting Rules and Regulations 2015-2016 season (Navy 2015). Various additional educational outreach brochures and materials are contained in the Installation INRMP. All hunting areas/stands, parking locations, and access roads are subject to change, and hunters are required to obtain the most current maps before any hunt (available at the Natural Resources Center on Oceana Blvd., Bldg. 78). In accordance with Title 10 U.S.C § 2671, all hunting, fishing, and trapping on military installations are to comply with the federal and state laws and regulations (See Section 2.0 of this document).

Approximately 2,481 ac (1,004 ha) are available for hunting at NALFF (Figure 7). The hunting areas map provided in Figure 7 may not reflect current hunting type designations, as changes are typically made during annual INRMP updates. The woods between B-6 and B-3 cannot currently be hunted at NALFF due to UXO status, but once cleared hunting will likely resume in this area. Natural Resources Educational Trails are not shown. Archery areas are closed on a rotational basis during small game season. Game species at NASO and NALFF include a variety of small mammals, furbearers, birds, and whitetail deer. Whitetail deer are the most popular game species. Other small game species that occur, but are not intensively hunted, are eastern cottontail, raccoon, Virginia opossum, red fox, gray fox, northern bobwhite, and mourning dove. In support of conserving and managing the timber (canebrake) rattlesnake population on the installation, the hunting program does not authorize the take of squirrels as this prey is one of the primary diet sources of these snakes on the Installation.

Shotguns may be used for small game hunting and for deer hunting in designated areas at NALFF. Muzzleloading firearms and bow hunting are permitted. Handheld and hand drawn equipment must be used. Waterfowl hunting is prohibited due to shot size restrictions that are necessary to ensure aircraft and personnel safety, and to reduce the potential for user conflicts. Trapping is generally not pursued as a recreational activity, but is used to control populations of invasive and nuisance wildlife species. Typically one recreational trapper is authorized per installation annually. If more than one trapper request is received for a particular installation a random lottery selection is conducted to select the trapper who will trap that installation for the year.

NALFF is primarily landlocked, and the installation does not support recreational fishing. Potential fisheries exist via the natural and channelized stream courses of Pocaty Creek, drainage ditches, and the flooded forest tracts associated with the North Landing River. Fishing is not currently

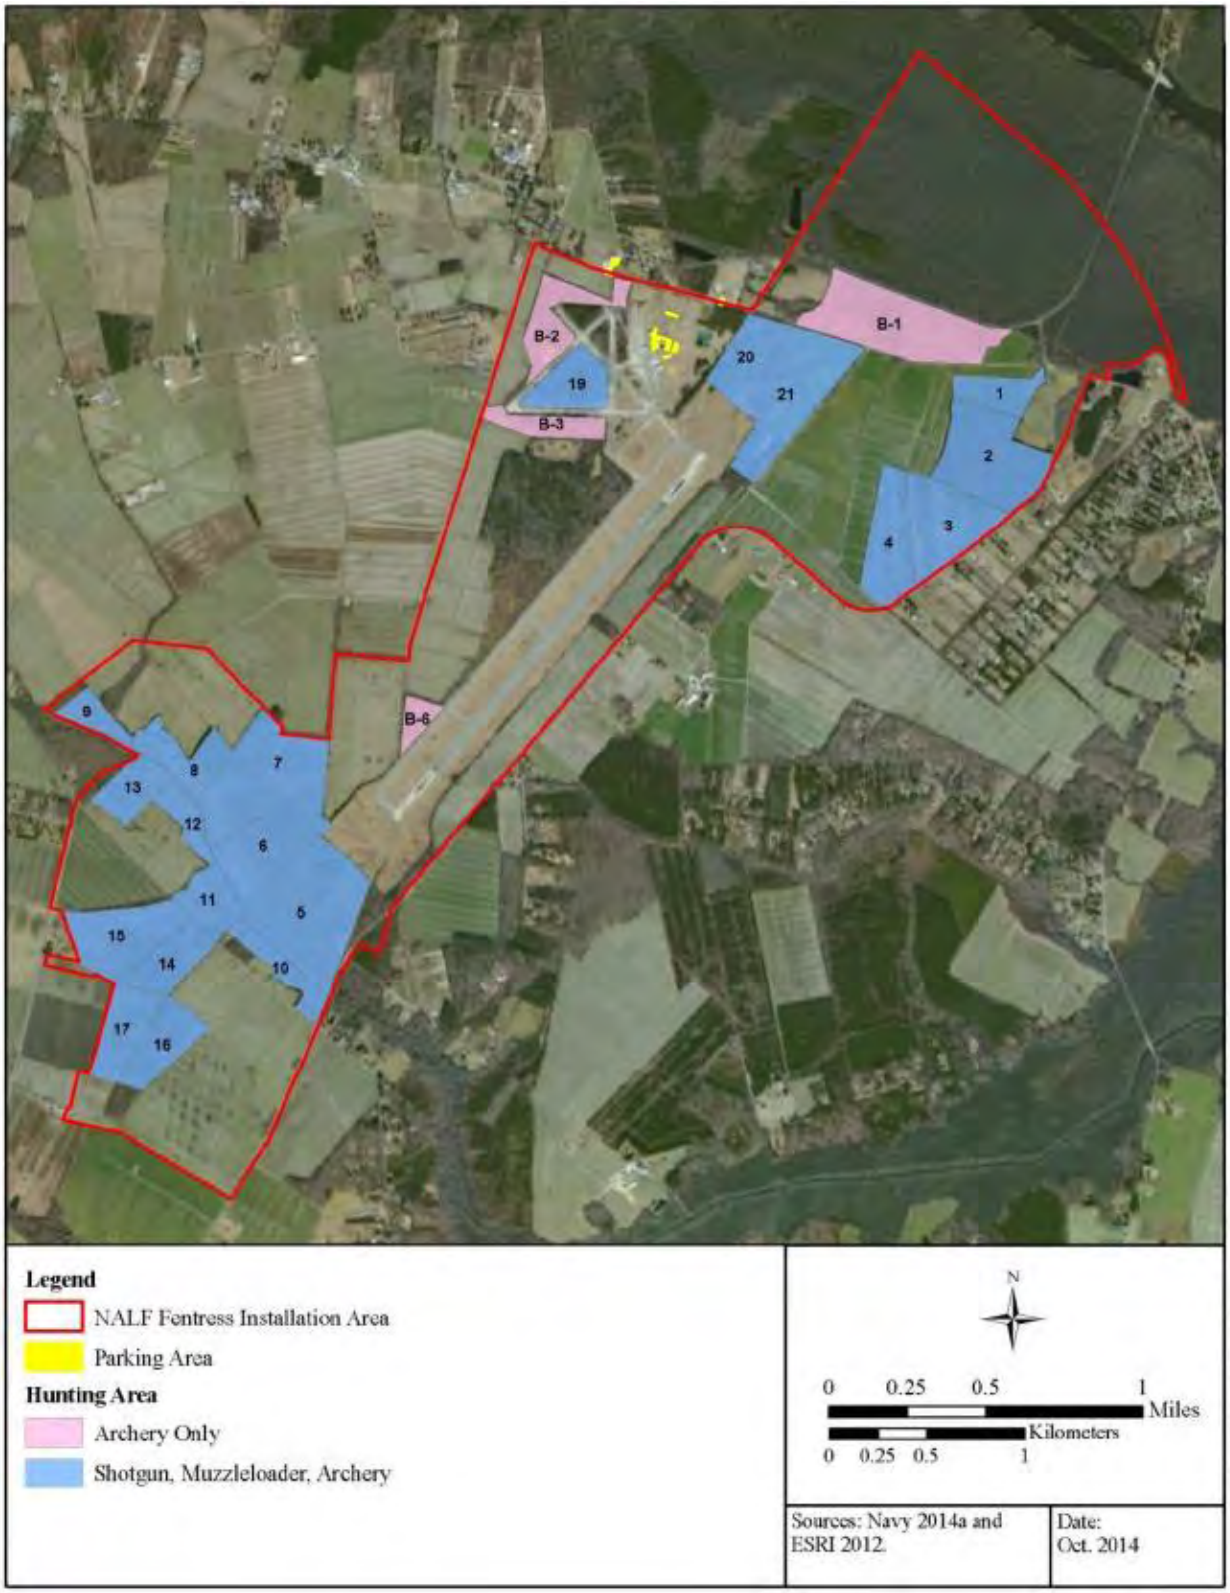

Figure 7. NALFF Hunting Map. From NALFF INRMP. Map is subject to annual updates, and all hunting areas are subject to change.

authorized in these areas, though poaching/unauthorized fishing occurs in these areas, and as such, require CLE oversight and response (Personal communication, Michael Wright, NRS, March 2016).

The Regional CLEO serves as a game warden and has the authority to apprehend and arrest all violators of federal, state, or installation game laws and regulations on NALFF. The presence of a trained CLEO is an important component of the hunting and fishing programs as it greatly reduces the potential for fish and game violations on the installation. Routinely the CLEO patrols fishing and hunting areas of the installation to ensure people recreating are complying with natural resources regulations and policies. All firearm users must demonstrate weapons utilization competency by completing weapons qualifications administered by the NRP staff/CLEO, show proof of completion of a state-certified hunter safety course, attend a hunter indoctrination. In addition, all bowhunters must show proof of completion of an International Bowhunter Education Program and demonstrate competence through a qualification test with natural resources staff.

Rare, Threatened, and Endangered Species

Past rare, threatened, and endangered species surveys of NALFF did not identify any species listed under the Federal ESA occurring on the installation (Navy 2014a, Derge and Belden 2002, VDCR–DNH 1990a and VDCR–DNH 1990b). However, the federally threatened northern long-eared bat was discovered on the installation as a result of mist- netting surveys conducted in summer 2015. One plant, silky camellia (*Stewartia malacodendron*), and two wildlife species, Tri-colored bat (*Perimyotis subflavus*) and Southeastern myotis (*Myotis austroriparus*), are considered rare in Virginia and are known to occur at NALFF. The installation supports populations of two state listed wildlife species, Rafinesque's big-eared bat, and canebrake rattlesnake (Navy 2015b). In addition, three bird species considered rare in Virginia, and three bird species that are listed as USFWS Birds of Conservation Concern (BCC) are known to occur at the installation. Designated rare species and species of special concern are granted no special legal protection. RT&E species tables can be found in the NALFF INRMP (Navy 2014a).

Wetlands and Coastal Zone Management

Results of the wetland delineations for which a preliminary jurisdictional determination has been received from USACE identified approximately 1,126 ac (456 ha) at NALFF. Of the 1,126.1 (456 ha) of jurisdictional wetlands delineated at NALFF, a majority (94.4%) are classified as palustrine forested, approximately 3.0% were not classified in the Navy GIS dataset (uncoded), and approximately 2.6% were classified as palustrine emergent. In addition to jurisdictional wetlands, approximately 738.0 ac (298.7 ha) of National Wetlands Inventory wetlands have been mapped at NALFF.

The installation has implemented numerous management practices that benefit the coastal zone and nearshore environment, including protection of stormwater quality, erosion and sediment controls, and measures to protect marine resources. These management techniques directly and indirectly benefit plant and wildlife species, water resources, and habitat that exist in the watershed and nearshore environments of NALFF.

Special Interest Areas and Ecological Reserve Area

The SIAs that are present at NALFF provide habitat for several of the rare, threatened, and endangered fauna that occur at the installation. With the exception of the management actions described in this section, little active management of the SIAs of NASO and NALFF is conducted,

as these areas are allowed to persist naturally. However, on a case-by-case basis, active management of these may be implemented to address issues such as erosion or invasive species.

The SIAs at NALFF include the Pocaty Creek SIA, Tip-of-Runway SIA, and North Landing Swamp SIA. The designations of conservation sites and/or SIA are not legal definitions tied to specific federal or state regulations but do provide valuable information to NRMs in regards to the extent and locations of significant ecological areas. The SIA locations, boundaries, and descriptions are provided in the 2014 Natural Heritage Inventory Report for NASO and NALFF (Navy 2014d).

3.4 NSAHR-NWA

NSAHR-NWA is approximately 3,600 ac (1,457 ha) and is located along the border of Southeastern VA and Northeastern North Carolina. Three-quarters of the installation is in Chesapeake, Virginia, and one-quarter is in Currituck County, North Carolina. The area immediately surrounding NSAHR-NWA is largely undeveloped and is comprised of agricultural land and forested wetlands. In the last several years, however, residential development has expanded along the Ballahack Road corridor to the northeast of the installation. NSAHR-NWA is located within the historic boundaries of the Great Dismal Swamp, which once extended from the James River to the Albemarle Sound.

The installation consists of a few developed and urban areas (271 ac), including ROTHR arrays and several training and operational facilities. The majority of NSAHR-NWA is made up of agricultural outlease parcels (750 ac), forested communities (2,345 ac; bottomland forest, loblolly pine forest, mesic mixed hardwood forests, pine-hardwood forest, and swamp forest), and early successional communities or maintained open areas (295 ac).

Recreational opportunities at NSAHR-NWA include hunting, picnicking, wildlife watching, hiking, jogging, and camping; and may include fishing in future years. The MWR Department administers picnicking and camping activities. The Installation also provides access to a 1-mile (2-km) long boardwalk through a portion of the Great Dismal Swamp that offers a self-guided educational wetlands tour. The NRP manages the hunting program. Both MWR and the NRP provide management oversight of facilities/programs that provide wildlife viewing/watching opportunities. The hunting program is available to active duty and retired military personnel and their dependents, civilian employees of the Installation and their dependents, reservist military personnel, and one sponsored guest for each of the aforementioned.

NSAHR-NWA land ownership is entirely under proprietary jurisdiction, whereby state and local law enforcement officers handle calls for service as if the land were privately owned. Appropriate state or federal law enforcement authorities are contacted and consulted when an incident occurs, per federal and state regulations.

Cultural Resources

The CRP at NSAHR-NWA is the responsibility NAVFAC Mid-Atlantic (Code EV2) under the RHPO (Navy 2014c). There are 54 archaeological sites on NSAHR-NWA, all of which are protected under ARPA. Eight of those sites have been determined eligible for listing in the National Register of Historic Places, while one has not been assessed for eligibility; these 9 sites are managed by the CRP. The remaining 45 sites are not eligible for NRHP listing and are not managed by the CR Program, but remain protected under ARPA.

A phased survey is being conducted of resources at the Installation constructed from 1948–1962 to determine if any resources are eligible for listing on the NRHP. Several areas have been identified as potential historic districts that warrant additional evaluation, although no potentially significant properties have been identified. Several resources were identified which were constructed after the study period but may be of interest for later studies, including the relocatable over-the horizon radar (ROTHR) antenna system and satellite reception, and transmission equipment related to important technological developments during the later years of the Cold War era. A report has been submitted to the Virginia SHPO for review and concurrence is pending (Sadler & Whitehead Architects 2012).

Archaeological surveys were conducted at NSAHR-NWA between the early 1980s and 2000. Several Phase I surveys were performed on proposed construction sites, and though some artifacts were found, no sites were determined to be eligible for the NRHP (Couch and Cottrell 1994, Fesler and Luccketti 1992, and Morehead et al. 1987). Subsequent surveys determined there are seven sites at NSAHR NWA that are eligible for the NRHP and two additional sites that require Phase II surveys (Lowthert et al. 2000, McDonald et al. 1999, and Sheehan et al. 1999). No additional archaeological testing is necessary unless land disturbance is proposed in (1) areas that require additional Phase II testing, (2) areas of eligible sites, or (3) along Mill Stream (Anderson 2004). Any proposed ground-disturbing activities in previously undisturbed areas should be coordinated with the RHPO to ensure there is no potential to affect archaeological resources. An architectural survey completed in 1996 concluded no architectural resources at NSAHR-NWA are eligible for listing on the NRHP, but recommended that Installation buildings and structures be re-evaluated when they reached the 50-year criteria (R. Christopher Goodwin & Associates 1997).

The cultural resources information identified in Figure 8 is not reflective of all known cultural resources at NSAHR-NWA, and is subject to annual updates and modifications. To protect the integrity of archaeological sites in accordance with the guidance provided by the RHPO and as dictated by ARPA, some cultural resources information is not shown. The figure shown does not include all of the archaeological sites on the installation and the sensitive areas are comprised of both identified cultural resources and unsurveyed areas. Because NRHP-ineligible sites are still protected under ARPA, if CLEOs encounter illicit digging in areas outside the sensitive areas on the maps there may still be an ARPA violation.

The Cultural Resource Manager maintains a record of cultural resource locations in a GIS format. CLEOs will coordinate directly with the installation Cultural Resources Manager to address conservation law enforcement and protection of archaeological and cultural sites. Five cemeteries are located at NSAHR-NWA, and any proposed action located within or adjacent to the boundaries of a cemetery shall be coordinated with the Installation facilities management division and the NAVFAC Mid-Atlantic RHPO. NSAHR-NWA was included in the 2012 regional ICRMP prepared for Naval Installations in Hampton Roads (Sadler & Whitehead Architects 2012), and this document provides additional information and guidance on cultural resources management.

Natural Resources

Hunting opportunities are available at NSAHR-NWA through a regional deer and small game recreational hunting program shared by NASO, NASO-DNA, NALFF, and NSAHR-NWA, though the Regional Instruction is out of date and does not accurately reflect current SOPs. The most current information available to the public is the NAS Oceana/NASO Dam Neck Annex/NALF Fentress/NSAHR Northwest Annex Deer Hunting Rules and Regulations 2015-

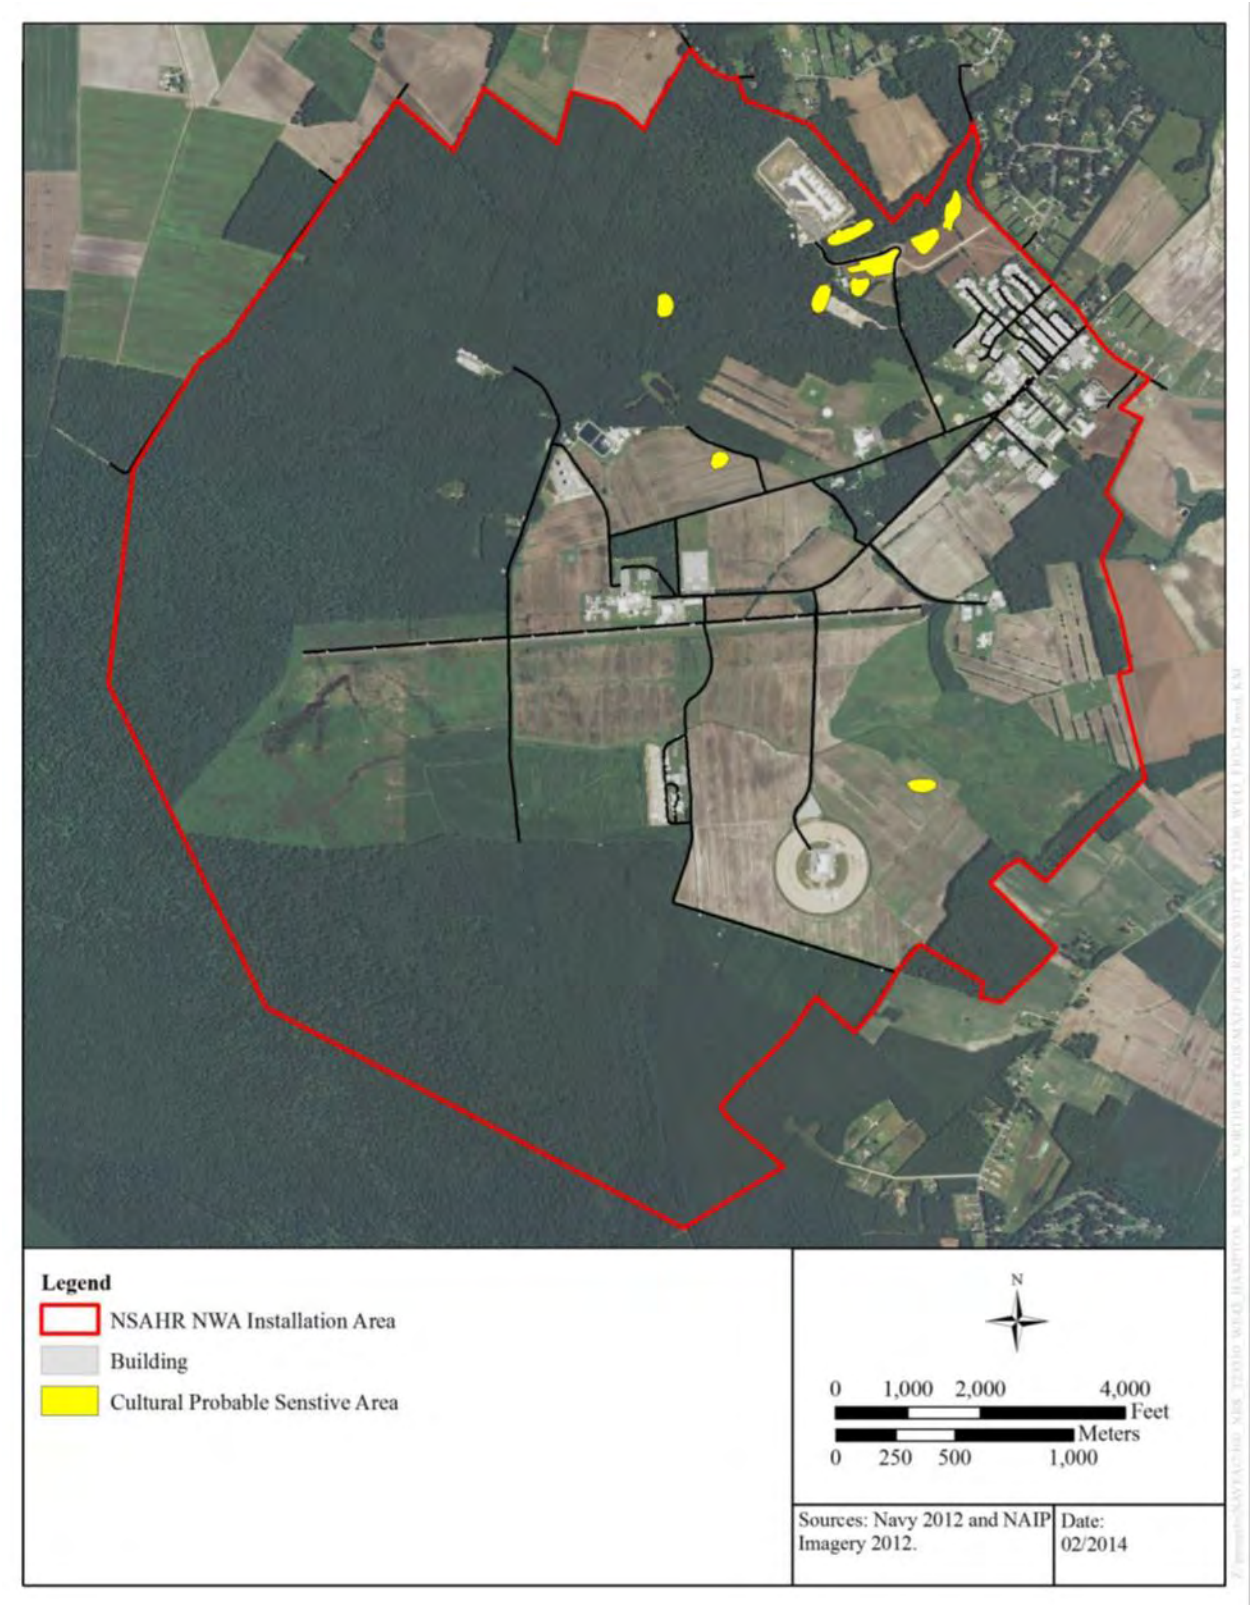

Figure 8. NSAHR-NWA Cultural Resources Sensitive Areas. From NSAHR-NWA INRMP. Not all cultural resource areas are depicted, map is subject to annual updates

2016 season (Navy 2015). Various additional educational outreach brochures and materials are contained in the Installation INRMP. All hunting areas/stands, parking locations, and access roads are subject to change, and hunters are required to obtain the most current maps before any hunt (available at the Natural Resources Center on Oceana Blvd., Bldg. 78). In accordance with Title 10 U.S.C § 2671, all hunting, fishing, and trapping on military installations are to comply with the federal and state laws and regulations (See Section 2.0 of this document).

Hunting is permitted throughout the undeveloped portions of the Installation. Deer hunting is the most popular sport, with between 350 and 500 permits sold annually for the region and daily use of NSAHR-NWA by 10–30 hunters. In support of conserving and managing the timber (canebrake) rattlesnake population on the Installation, the hunting program does not authorize the take of squirrels as this prey is one of the primary diet sources of these snakes on the installation.

The hunting areas map provided in Figure 9 may not reflect current hunting type designations, as changes are typically made during annual INRMP updates. Authorized hunting areas change annually and sometimes seasonally. Natural Resources Educational Trails are not shown. NR staff and volunteers maintain 113 permanent tree stands. Eighty-two (82) tree stands exist on the Virginia portion of the Installation and 31 are on the North Carolina portion of the Installation. In addition to these stands, bowhunters are permitted to use personal temporary tree stands. Barracks Woods and Supply Woods are designated only as bowhunting areas, whereas bowhunting, black powder, and shotgun are permitted in the remaining hunting areas. While the INRMP does not provide specific fishing details for the Installation, Lunker Lake is currently being investigated for inclusion as a recreation fishing area (Personal communication, Michael Wright, NRS, March 2016).

The Regional CLEO serves as a game warden and has the authority to apprehend and arrest all violators of federal, state, or installation game laws and regulations on NSAHR-NWA. The presence of a trained CLEO is an important component of the hunting and fishing programs as it greatly reduces the potential for fish and game violations on the Installation. Routinely the CLEO patrols fishing and hunting areas of the Installation to ensure people recreating are complying with natural resources regulations and policies. All firearm users must demonstrate weapons utilization competency by completing weapons qualifications administered by the NRP staff/CLEO, show proof of completion of a state-certified hunter safety course, attend a hunter indoctrination. In addition, all bowhunters must show proof of completion of an International Bowhunter Education Program and demonstrate competence through a qualification test with natural resources staff.

Rare, Threatened, and Endangered Species

Two rare plants and 41 wildlife species have been identified at the Installation that are considered rare, threatened, or endangered under federal or state ESAs, or global or state conservation rankings. The federally endangered northern long-eared bat is known to occur on the installation as a result of mist- netting surveys conducted in summer 2013, 2014, and 2015 (Navy 2015c). The Virginia state endangered Rafinesque's big-eared bat, the state endangered canebrake rattlesnake, and the state threatened Dismal Swamp southeastern shrew (*Sorex longirostris fisheri*) were also observed on the Installation during 2013 surveys. Two plants listed as rare (S1S2) in Virginia have been observed on the Installation (Wright 2013a and Belden 1993): highland dog-hobble (*Leucothoe fontanesiana*) and Spanish moss (*Tillandsia usneoides*). Designated rare species and species of special concern are granted no special legal protection, though their habitat is maintained and/or enhanced to the maximum extent practicable by the NRP.

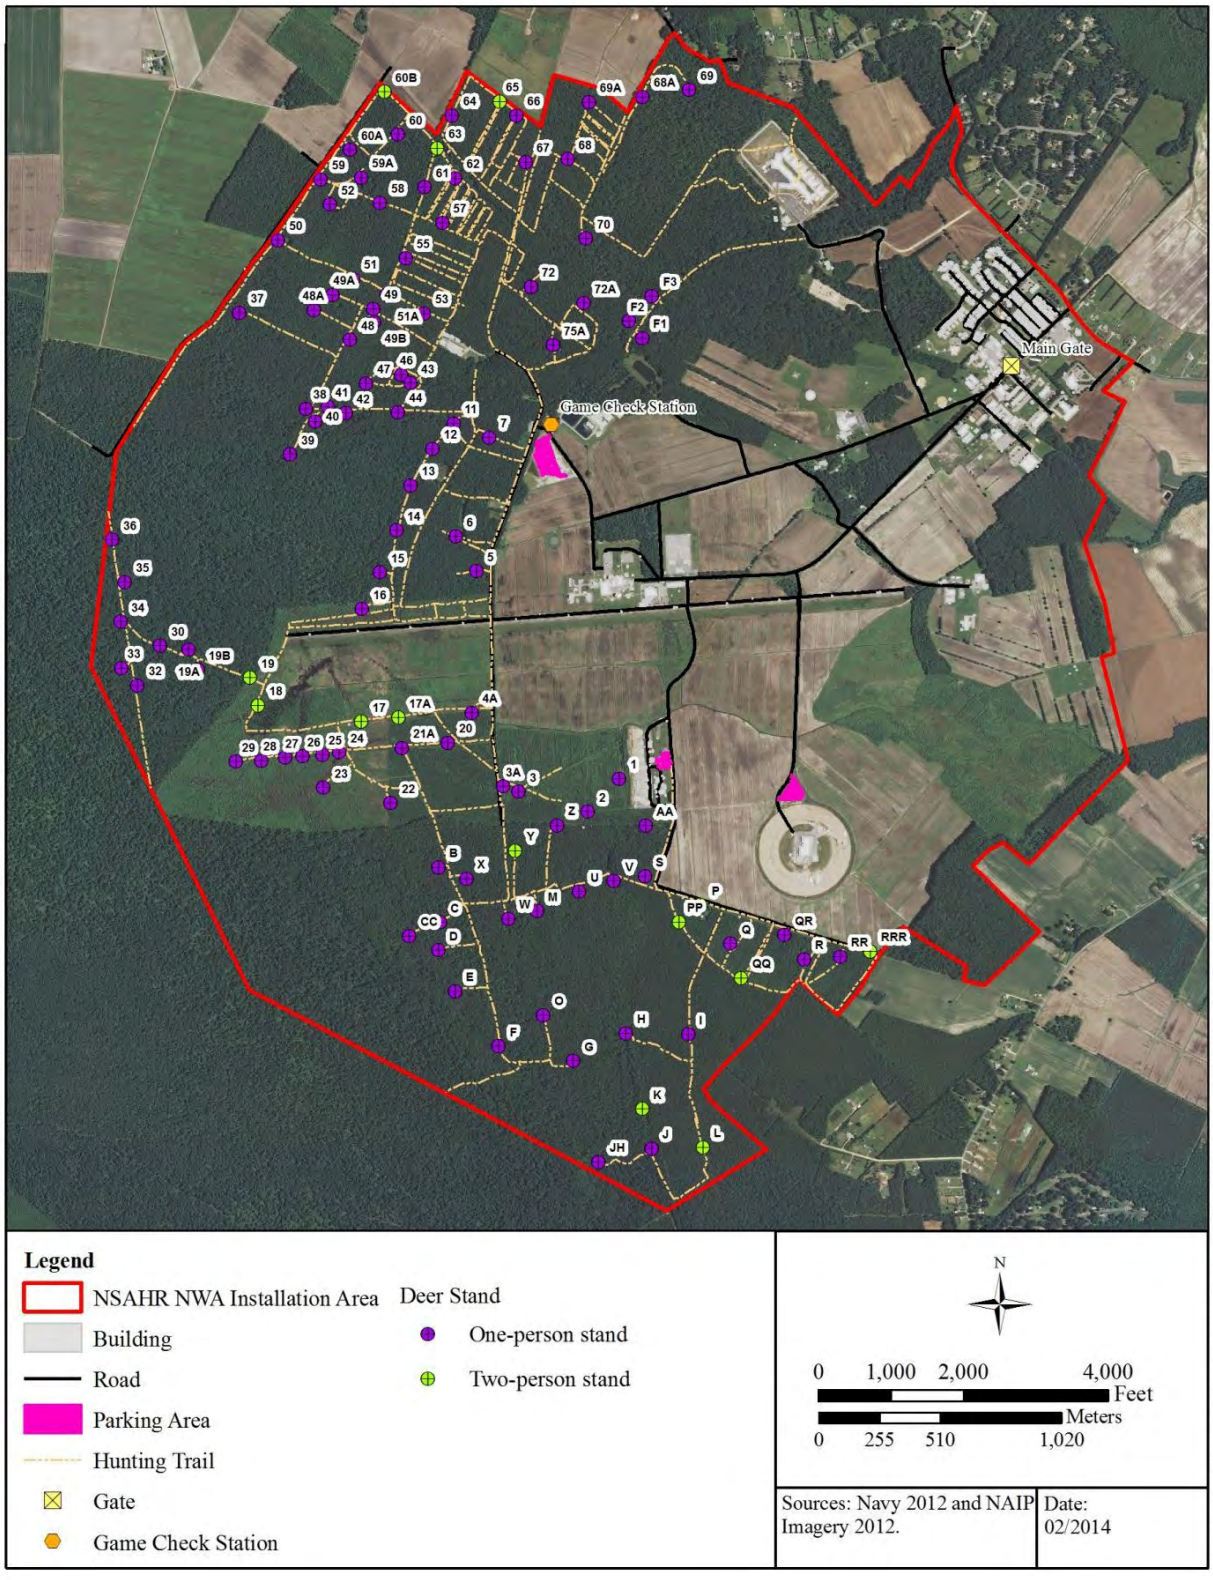

Figure 9. NSAHR-NWA Hunting Map. From NSAHR-NWA INRMP. Subject to annual updates, and all hunting areas subject to change. Lunker Lake not shown.

Observations and identification of rare species for the Installation is based on data collected during rare, threatened and endangered plant and animal surveys, and significant ecological communities surveys completed at the Installation (Rose et al. 1988, Belden 1993, Schwab 2003a, Schwab 2003b, Quillen 2013, and Watts 2013). RT&E species location maps can be found in the NSAHR-NWA INRMP (Navy 2014c). Numerous birds regulated under the MBTA are present or known to occur on the installation (Navy 2014e).

Wetlands and Coastal Zone Management

An Installation-wide wetland delineation was completed in May 2012 for NSAHR-NWA (Navy 2014c). A preliminary jurisdictional determination received from USACE in 2012 identified 2,203.98 ac (891.92 ha) of wetlands at NSAHR-NWA, of which 127.82 ac (51.73 ha) are located in North Carolina. Wetland delineations were completed pursuant to methods outlines in the 1987 Corps of Engineers Wetland Delineation Manual and The Regional Supplement to the Wetland Delineation Manual: Atlantic and Gulf Coastal Plan Region.

NSAHR-NWA must comply with the state Coastal Zone Management requirements of Virginia and/or North Carolina, where applicable. All Installation activities are reviewed for their potential impact to coastal zone resources and their compliance with the state's enforceable policies of the CZMA. The Navy strives to avoid and minimize impacts to coastal zone resources to the extent practicable when conducting activities. All development or other activities that are likely to impact land or water use or natural resources within state coastal management areas (coastal zones) require a coastal consistency determination. Federal lands, the use of which is by law subject solely to the discretion of or which is held in trust by the federal government, its officers or agents, are excluded from state coastal zone requirements. However, activities on federal lands with any reasonably foreseeable effects to state-designated coastal zone areas must be consistent to the maximum extent practicable with the state's coastal zone management program.

NR staff must review plans and proposed actions at the installation to ensure consistency with the Virginia and North Carolina coastal zone management programs and help obtain a consistency determination when required. Management actions include monitoring nonpoint source pollution, marine fish and wildlife species and habitat, and wetlands. The installation has implemented numerous management practices that benefit the coastal zone environment, including protection of stormwater quality, erosion and sediment controls, and riparian buffer restoration. These management techniques directly and indirectly benefit plant and wildlife species, water resources, and habitat that exist in the coastal zone at NSAHR-NWA.

Invasive/Feral Communities

Feral pigs that have existed in the region since early European settlement are a problem species for native habitats and wildlife. Feral pigs (or Eurasian feral hogs) were first identified on the installation in October 2012 (Navy 2014c). One pig was removed from the installation in 2012 and additional removal efforts were completed by VDGIF on their Cavalier Wildlife Management Area. In March of 2013 the NRS and VDGIF partnered to conduct a helicopter survey of the VDGIF Cavalier Property and NSAHR-NWA to identify any active sign of the pig. It appeared from the helicopter survey effort and the lack of sightings by Installation NR staff, volunteers, hunters, and military personnel in 2013 that the Rapid Response and Removal efforts by the Navy and VDGIF personnel removed the immediate threat from feral pigs at the installation. The Navy continues to coordinate with VDGIF to determine the presence of the species on the installation

and its rapid removal. The installation NRS actively participated in VDGIF's September 2013 Feral Hog Stakeholder's meeting.

Special Interest Areas

The SIAs that are present at NSAHR-NWA provide habitat for several of the rare, threatened, and endangered fauna that occur at the installation. With the exception of the management actions described in this section, little active management of the SIAs of NSAHR-NWA is conducted, as these areas are allowed to persist naturally. However, on a case-by-case basis, active management of these may be implemented to address issues such as erosion or invasive species.

The SIAs at NSAHR-NWA include the Great Dismal Swamp Natural Heritage Resource Area and the Potential Dismal Swamp Southeastern Shrew Habitat. The designations of conservation sites and/or SIA are not legal definitions tied to specific federal or state regulations but do provide valuable information to NRMs in regards to the extent and locations of significant ecological areas. The SIA locations, boundaries, and descriptions are provided in the 2015 Natural Heritage Inventory Report for NSAHR-NWA (Navy 2015c).

4.0 PROCEDURES

4.1 OBJECTIVE AND PLANS

The objectives of the CLEP in accordance with DODI 5525.17 are to:

- Conserve and direct the use of natural and cultural resources in accordance with the INRMP and ICRMP.
- Ensure installations and military and public users remain in compliance with appropriate environmental, natural, and cultural resource laws and regulations.
- Provide specialized law enforcement expertise regarding natural and cultural resource matters and protection of government property.
- Improve inter-jurisdictional conservation law enforcement among the military departments, federal, state, tribal, and local law enforcement and land management agencies, and
- Collect and track data on violations.

Each installation that is required to prepare an INRMP or ICRMP in accordance with DODI 4715.03 will incorporate within the INRMP or ICRMP the methods, techniques, and strategies that will be utilized to provide law enforcement services to the federal lands, complementing the resource management objectives of the installation.

The CLEP section will provide specific goals and objectives to ensure compliance with laws and regulations; to support the overarching goals of the INRMP and ICRMP; and to integrate with other installation security and emergency services plans. These objectives will include:

- Providing education and training to the installation populace, workforce, and general public to prevent inadvertent violation of natural resource and cultural resource laws;
- Defining areas clearly to prevent hunting, fishing, and other outdoor recreational activities in unauthorized areas.
- Reporting non-compliance with laws and regulations in accordance with military service criminal data reporting procedures.
- Encouraging coordination with the USFWS and NMFS.
- Reporting and tracking natural and cultural resources crimes and their disposition (both military and civil).

CLEPs and personnel may be co-located with the installation Conservation Program Manager. This best serves the installation commanders in implementing the INRMP and ICRMP and promoting the maximum availability of land, waters, and airspace to accomplish mission and training requirements.

Frequency of reporting criminal activity to the installation Security/Law Enforcement Office will be determined at the installation level and identified in the respective installation order or standard operating procedure (SOP). Normally, incidents will be reported to Security within 24 hours. Communication between conservation officers and the military police is paramount. The installation Law Enforcement Office shall provide continuous access to the Security first responder communication to the conservation officers. The rapport between conservation officers and military police must be fostered to ensure proper support and safety for all agencies (Base Police, Chesapeake Police, Virginia Beach Police, animal control, and the NCWRC). CLEOs will be responsible for investigating and arresting anyone suspected of violating the Federal Statues listed in DODI 5525.17.

4.2 CLEO AUTHORITY AND POWER

Title 10 U.S.C. §2671 requires that all hunting, fishing, and trapping on an installation be in accordance with the laws of the state in which it is located. It also states that offenders are guilty of a like offense and subject to a like punishment for an act or omission on the installation that would be punishable if committed within the jurisdiction of the state. On installations under either proprietary or concurrent legislative jurisdiction, state laws may be directly enforceable under state authority. Per the Assimilative Crimes Act, 18 U.S.C §13, in areas of exclusive or concurrent federal jurisdiction, state law may be used where no federal law governs the particular conduct on involved federal lands, and where there is an applicable state law. Under the act, the state law is adopted and used to prosecute the defendant in federal court as a federal offense. Currently all four of these installations fall within proprietary or concurrent jurisdictions, though jurisdictional boundaries may be subject to change.

The Secretary of Defense may enforce all natural resources management laws, pursuant to the authority of Title 16 U.S.C. §670e-l and cultural resources management laws, pursuant to the authority of §470ff on military installations within the United States. Although Title 16 U.S.C. provides authority to enforce natural and cultural resources laws, it does not expressly grant powers to search, seize, or arrest with regard to each statute. Military and civil service law enforcement personnel may temporarily detain civilian offenders until civilian law enforcement authorities arrive. The natural and cultural resource management laws are numerous and are listed in Section 2.0 for informational purposes.

The United States District Court Violation Notice is used as the charging document to notify the magistrate court of misdemeanor offenses that occur within its jurisdiction; however, felonies committed on Navy lands are referred to the local United States Attorney's Office. Felony violations on the installation are within the investigative purview of the Navy Criminal Investigation Services (NCIS). Coordination will be conducted with both the NCIS and the USFWS before proceeding beyond the preliminary stages of a felony investigation so that appropriate coordination can be made with the responsible assigned Assistant United States Attorney. For paleological resources violations, coordination with U.S. Bureau of Land Management (BLM) is required. For marine resources violations, coordination with the National Oceanic and Atmospheric Administration National Marine Fisheries Service (NOAA-NMFS) is required. For cultural resources violations, coordination with the SHPO is required. Each installation should have as part of its ICRMP a monitoring program for cultural resources and also provides coordination requirements.

Title 16 U.S.C. §3375 allows the Secretaries of Interior and Commerce to use (via agreement) Navy personnel, services, and facilities to the extent necessary for enforcement of any laws relating to fish and wildlife. The agreements are accomplished at the local level under the guidance of the responsible Navy Component. Navy Component heads may enter into standard agreements with the USFWS for CLEOs to exercise authority under USFWS commission for those laws for which the USFWS is the regulating authority.

In accordance with CNRMA Instruction 11015.3, management and control of fish and wildlife, feral animals, invasive species, and certain pests within Commander, Navy Region, Mid-Atlantic Area of Responsibility is assigned to the Regional Environmental Program Manager, and may be sub-delegated to a properly trained Regional Natural Resources Program Manager, under the supervision of the Regional Environmental Group Head. Under the direction of the Regional

Natural Resource Program Manager, the installation Natural Resource Specialist (NRS) uses integrated management practices and procedures to manage fish and wildlife and control certain feral, nuisance, and invasive species. CLEOs enforce fish and wildlife and other natural and cultural resource laws and regulations under the direction of the installation NRS, in addition to conducting field inspections and approved species control methods, wildlife forensic investigations, and responding to wildlife damage complaints.

The CLEOs draw their powers, when delegated, from the installation commander's authority to protect or secure an installation in accordance with the authority in Title 50 U.S.C. §797. A CLEO may use necessary and appropriate force to apprehend suspects in accordance with DODD 5210.56 and OPNAVINST 5530.14E (Navy Physical Security and Law Enforcement Program). The primary consideration in the use of force is the timely and effective application of an objectively reasonable level of force required to establish and maintain lawful control. A paramount consideration is the preservation of life and prevention of bodily injury.

Conservation law enforcement positions are generally posted under the following job series: GS-0025 – Park Ranger Series, GS-0083 – Police Series, GS-1801 – General Inspection, Investigation, Enforcement, and Compliance Series, and GS-1811 – Criminal Investigation Series (CEMML 2015). In certain cases, CLEO duties may be included in the position description of a GS-0404 – Biological Science Technician position. As such, the billet/position description is not classified as a 100% law-enforcement position (Personal communication, M. Wright, March 2016).

The Navy has not yet officially decided whether the CLEP should reside under Environmental or Security Forces. Currently it is implied that the program should be housed under Security/Law-enforcement and officers should be co-located with the installation Conservation Managers (Personal communication, M. Wright, March 2016). According to a recent CEMML study, implementing a CLEP under Security Forces has the advantage of equipping the position more easily, though a disadvantage is that natural and cultural resources rank lower in security priority and programs might suffer a loss of focus on natural and cultural resource protection (CEMML 2015). Regardless of where the CLEP resides, ongoing and consistent collaboration between Security Forces and Environmental are necessary for an effective program.

4.3 LAW ENFORCEMENT AGREEMENTS

Per DODI 5525.17, installations may enter into appropriate agreements, when authorized by law, with local law enforcement agencies, state fish and game agencies, sheriff's offices, or other federal agencies, on a reimbursable basis for the purpose of CLEP support. Appropriate agreements are available for use on installations and ranges that require Navy CLEOs and contain complex natural and cultural resource issues such as endangered species, coastal resources, or cultural resources, such that the installation(s) require an INRMP and ICRMP. Installation-specific agreements may be developed to address complex or multi-jurisdictional issues such as border patrol, coastal zone management, and shared land use.

Three types of agreements may be used by the DOD to implement and/or support CLE. MOA are commonly used to issue a special commission to confer authority to an appropriate agency, such as the USFWS, with the purpose being to clarify and avoid confusion regarding jurisdiction and authority over many federal wildlife statutes. Because the language of the Sikes Act does not adequately define which statutes are considered "related to the management of natural resources," some interpret the phrase as referring only to statutes that address land management, while others

believe it refers to statutes addressing wildlife management (CEMML 2015). MOAs are also used to define enforcement responsibilities among agencies. For instance, a MOA may be used to confer state and federal authority from other agencies to NAVY CLEOs, or to confer DOD/Navy authority to commissioned CLEOs from other federal agencies such as the USFWS, or commissioned CLEOs from state agencies such as the VDGIF and NCWRC.

Memorandum of Understanding (MOU) typically establish a cooperative relationship (authorized by the CO) between a DOD component and an agency such as the USFWS, VDGIF, or NCWRC for a specific purpose, such as personnel providing CLEP support on DOD installations. An Interagency Agreement (IA) is used in conjunction with an appropriate MOU to facilitate the transfer of funds between agencies (for example, a DOD component and the VDGIF) in order for CLE support position(s) to be funded.

These agreements should identify the roles and responsibilities of the installation and the cooperating agency or agencies where the cooperating agency is the lead in all CLE activities. An example of an installation agreement template is provided in Appendix A (DODI 5525.17) and a copy of the 2003 Memorandum of Agreement (MOA) between the USMC and the USFWS can be found in NAVMC DIR 5090.4A (Appendix B).

5.0 TRAINING, CREDENTIALS, EQUIPMENT, AND USE OF FORCE

5.1 TRAINING AND CREDENTIALS

The SAIA (16 U.S.C. §670e-2) requires sufficient numbers of professionally trained natural resources personnel and CLE personnel to be available and assigned responsibility to perform tasks necessary to carry out Title I of the SAIA, including the preparation and implementation of INRMPs.

The Federal Law Enforcement Training Center (FLETC) provides training for CLEOs. Basic training requirements for a federally certified CLEO are identified in DODI 5525.17 and are provided through the FLETC Land Management Police Training Program (LMPT). The DOD also developed a CLEO Pilot Training Course in 2007, which tailors the BLM law enforcement managers course to meet DOD CLEP policy and guidance. Additional training opportunities include, but are not limited to, the following:

- NEC 9545 Navy Law Enforcement Specialist Phase I (Base Police Law-enforcement training);
- NEC 9545 Navy Law Enforcement Specialist Phase II (Command Specific Law-enforcement training;
- NEC 9575 Correctional Custody Specialist Ashore;
- FLETC Criminal Investigation Training Program (CITP);
- State Police Academies
- National Military Fish and Wildlife Association (NMFWA) Conservation Officer Refresher Training; and
- Weapons qualifications biannually with the Navy Security Department.

Per DODI 5525.17, the CLEO should complete at least 40 hours of annual refresher training specialized to CLE, in addition to having first completed the FLETC LMPT. Annual refresher training is also available through FLETC for CLEOs. Annual firearm familiarization training, live-fire training, and use-of-force training are required yearly per DODD 5210.56.

Seasonal hires assigned to the CLEP are not required to have completed the FLETC LMPT training, but they must be supervised by and receive on the job training specific to CLE by a full-time, fully certified, and FLETC LMPT trained CLEO. Non-law-enforcement seasonal/temporary CLEP personnel may assist conservation officers with case-specific investigations and education and awareness activities, but they may not carry out direct law enforcement duties (unless their core personnel document or position description includes law enforcement duties and they have completed LMPT at FLETC or equivalent), or carry weapons in performance of this duty (unless so authorized and provided by the ICO after individuals have received appropriate training and are qualified with the authorized weapon).

In accordance with DODI 5525.17, all full-time conservation officers must complete LMPT at the FLETC or equivalent training as required by the DOD Peace Officers Standards and Training (POST) Commission within 1 year of being hired. The DOD POST Commission, in accordance with the authority in DODI 5525.17, are responsible for certifying CLEP equivalent training standards. The USMC CLEP detailed in NAVMC DIR 5090.4A also provides a "grandfather clause," for CLEOs who were trained, qualified, and authorized to carry firearms at their installation as of 6 Oct 2003 (before the NAVMC DIR 5090.4 or DODI 5525.17 requirements took

effect). In accordance with the NAVMC 5090.4A, these individuals should be considered fully qualified and issued credentials, however, those who have not yet completed the FLETC LMPT are highly encouraged to do so. Grandfathered CLEO must complete FLETC LMPT in order to meet position requirements to receive a promotion in the conservation officer field. While USMC requirements are not necessarily consistent with Navy CLEP requirements, the NAVMC DIR 5090.4 is a useful resource since the Navy has not yet issued formal CLEP direction.

DOD CLEO officers have highly specialized duties, and as such, require specialized training to develop the required knowledge and expertise in environmental laws and natural and cultural resource protection and use, troop training and outreach for compliance with environmental laws and regulations, and specialized investigative responsibilities beyond basic law enforcement patrol.

5.1.1 Natural and Cultural Resources Training

CLEOs must be trained to enforce natural resource laws including the Marine Mammal Protection Act, ESA, MBTA, and any other laws identified in section 2.0 as applicable to resources found on the installations described in Section 3.0. As a result of specialized knowledge and training, CLEOs should serve to ensure that Navy units that are training comply with requirements of BOs issued by USFWS, in accordance with the ESA (and as described in Section 2.0). NOAA-NMFS, U.S. BLM, and other State Agencies may also provide recommended training courses. Officers may need training for additional skills associated with equipment utilization for wildlife capture and/or removal, which may warrant training from the U.S. Department of Agriculture (USDA) or other agency/educational institution.

Installations that have cultural resources that warrant resource protection and enforcement under the ARPA (Title 16 U.S.C. § 470aa-mm) shall ensure CLEOs receive applicable training to enforce these laws. The CLEO should be familiar with provisions of the Native American Graves and Repatriation Act of 1990 and the American Antiquities Act of 1906, as amended, and other applicable State and local cultural resource protection laws (described in Section 2.0) for the identification of illegal trafficking of Native American human remains or unauthorized excavation activities, to be reported to the Installation Cultural Resource Manager for administrative action. The CLEO should be familiar with the NHPA of 1966, as amended, to identify vandalism to protected historic resources on the base, for reporting to the Cultural Resources Manager for administrative action. Installations shall determine the frequency and type of training courses for the CLEO to meet historic and archaeological resource protection requirements.

Additional suggested agency offered training courses include, but are not limited to:

- CECOS – Civil Engineer Corps Officer School (CECOS), Natural Resources Compliance, Environmental Law, Environmental Negotiation, CZMA, Cultural Resources, and other courses as applicable to the installation(s).
- Department of Interior – National Conservation Training Center, fish, wildlife and archaeological resources courses.
- USFWS National Conservation Training Center Courses.
- FLETC Courses: ARPA, NHPA Council, Introduction to Federal Projects, and Historic Preservation Law.

5.1.2 Use of Firearms and Training

Use of firearms by law enforcement personnel on DOD Installations is governed by 10 U.S.C. §1585 (Carrying of firearms), which is implemented by DODD 5210.56 (Carrying of Firearms and the Use of Force by DoD Personnel Engaged in Security, Law and Order, or Counterintelligence Activities). DODD 5210.56 states that qualified personnel shall be armed when required for assigned duties and there is reasonable expectation that DOD installations, property, or personnel lives or DOD assets will be jeopardized if personnel are not armed. DOD Components must also comply with provisions in DOD 5200.2-R (Personnel Security Program) and 18 U.S.C. §922, to ensure appropriate background investigation and screening procedures.

In accordance with DODD 5210.56, CLEOs and other law enforcement personnel who routinely engage in duties or activities where firearms proficiency is required shall satisfactorily complete DOD Component-approved training at least every 12 months, including firearms familiarization (classroom academic), live-fire qualification, and use-of-force training. In addition, DOD Components will consider periodic sustainment training for personnel to maintain firearms familiarization and proficiency. Regional CLEOs must maintain weapons qualifications biannually with the Navy Security department. Navy small arms training and qualification requirements can be found in OPNAVINST 3591.1F. Navy small arms and weapons management policy and guidance may be found in NAVSEA Instruction 8370.2D.

CLEOs and NR staff also require a letter of authorization from the Installation Commanding Officer (ICO) to carry firearms on installations in performance of official duties. In accordance with DODD 5210.56, all arming authorizations shall be in writing and signed (e.g., ink or digitally) by the appropriate authorizing official(s) before a firearm is issued to an individual. Written authorization is not required to be maintained by the individual carrying a firearm, unless determined necessary or appropriate by the issuing authority. Current individual qualification results, including authorized extensions, are to be documented and retained by the issuing authority for as long as the individual has authorization to be armed.

In accordance with DODD 5210.56, DOD personnel shall carry only Government-issued firearms and ammunition when performing official duties. The carrying of personal firearms and ammunition while on duty are prohibited from use by a CLEO. Individuals who are authorized to be armed must comply with DOD Component implementing safeguards to prevent loss, theft, and unauthorized use of firearms and ammunition. Personnel must return firearms to a designated armory or secure storage area for accountability and safekeeping upon completion of their official duties or training, in accordance with DOD Component procedures, or as specified in written authorization letters.

Per DODD 5210.56, the Heads of the DOD Components, or their designees, may authorize DOD personnel to carry and retain a Government-issued firearm off DOD property for official purposes, and shall prescribe specific guidance governing DOD jurisdiction, authority, and lawful use of force. The Heads of the DOD Components, or their designees, may authorize personnel to retain, transport, and store Government-issued firearms at Government or non-government locations for situations that warrant immediate action to protect DOD assets or person's lives.

In accordance with DODD 5210.56, personnel authorized to retain, transport, and store Government-issued firearms at Government or non-government locations must be provided a safety-lock device and instructions for its proper use. DOD Components are responsible for providing guidance and procedures to prevent loss, theft, and unauthorized carrying or use of

firearms. A CLEO must safely and securely store all firearms assigned. Government firearms that are not routinely carried should be stored at base facilities in a vault, gun locker, or other location that is secured in such a manner as to substantially reduce the possibility of theft or unauthorized removal and that meets physical security requirements.

Firearms must be returned or retrieved for DOD Component accountability and safekeeping when, at any time, the security of the firearm could be compromised. Firearms and ammunition accountability and losses must be reported in accordance with DOD 5100.76-M (Physical Security of Sensitive Conventional Arms, Ammunition, and Explosives). Immediately upon the loss or theft of any government firearm, the CLEO must verbally inform his or her immediate supervisor, the Installation Security, the Naval Criminal Investigation Service, and the pertinent local police jurisdictions. The firearm make, model number, serial number, and caliber will be provided and a memo for the record will be prepared within 48 hours.

5.1.3 Credentials

The Navy will issue an official CLEO identification card and a Federal badge of commission to new hire conservation officers who have completed FLETC LMPT. Supervisors of the qualified CLEO shall submit a request letter for badges and identification card to be issued to each qualifying CLEO at the installation. The full name, GS series, grade, date of birth, color of eyes, hair, weight, two standard passport photos 1 inch by 1 inch in size, and a copy of the FLETC LMPT certificate shall be included with the letter. The Navy shall send the badges and identification card to the installation, or present them to the CLEO during the FLETC graduation ceremony. The Navy will keep records of all personnel, badges, and identification cards issued and returned for 5 years following employment termination of the CLEO. The Navy will issue three badges to each qualified conservation officer.

The installation will also issue an identification card to the CLEO using a template provided to the installations by the Navy which is not shown in this document for security purposes. The purpose of the installation identification card is to permit conservation officers to enter restricted areas on installations that require such authorization. Although the installation identification card is written to grant authority to enforce installation regulations and applicable federal and state laws under the Uniform Code of Military Justice, 10 U.S.C. 807.(b), U.S.C. Title 16, Chapter 5C, Subchapter 1, §670e-1, and the Assimilative Crimes Act, 18 U.S.C. §13 and those pertaining to the federal laws set forth in DODI 5525.17, the CLEO shall carry the installation identification card at all times when on official duty and whenever armed. Additional credentials may be required by CLEO personnel, dependent on terms and requirements negotiated in applicable MOA or MOU. For instance, under the terms of a MOA between the USMC and the USFWS (NAVMC DIR 5090.4A), USMC CLEO are also issued a USFWS Law Enforcement Officer identification card.

Both federal and state credentials may be required by Navy CLEOs, as many state laws may only be enforced by a state commissioned officer unless a Memorandum of Agreement (MOA) is put in place to authorize enforcement of both federal and state regulations (CEMML 2015). If a CLEO is commissioned from a state agency (VDGIF, NCWRC), an MOA may need to be put in place to confer DOD/Navy/Federal authority.

Upon termination from a CLEO position, that individual will surrender all badges and identification cards to his or her supervisor who shall return the badges to the Navy within 30 days by certified mail and return receipt.

5.2 EQUIPMENT

Title 10 U.S.C. §1585 and DODD 5210.56 authorize a CLEO to carry firearms. In accordance with DODI 5525.17, no CLEO will be issued a firearm until he or she has completed FLETC LMPT (unless so authorized and provided by the commander after individuals have received appropriate training and are qualified with the authorized weapon). The NAVMC DIR 5090.4A provides additional direction regarding equipment, which has been adapted below to be relevant to the regional CLEP:

> A CLEO who has completed FLETC LMPT [or other equivalent training] shall be issued vehicles, a radio; a cellular telephone; firearms; ammunition; and support equipment 24 hours a day, seven days per week, to meet routine surveillance, duty, and emergency response requirements. CLEOs are authorized to have access to and use standard Government issued equipment, firearms, and ammunition to perform duty requirements and for their safety.
>
> For required weapons that are not standard issue with the Navy Safety Center, a letter of authorization by the ICO is required. When the installation utilizes equipment such as watercraft, all-terrain vehicles (ATV), chainsaws, radios, batons, oleoresin capsicum (OC) spray, etc., the chief CLEO or Installation Component Law Enforcement Official shall ensure applicable training, instruction, certification and recertification requirements are met for such equipment. Each installation will have a directive reflecting SOP in the proper and safe use of such equipment, to include vehicle pursuit, boat pursuit, ATV use, etc. These SOPs are coordinated and/or developed through or in coordination with the Installation Safety Office.

Table 1 provides details on equipment requirements for the CLEP (adapted from NAVMC DIR 5090.4A). Ammunition that the installation CLEP is currently using is presented in Appendix C.

5.2.1 Firearms

The Navy is authorized to procure firearms, ammunition, and equipment through the Navy Munitions Command in Crane, Indiana. The Navy complies with standards set by the Navy Safety Center, in accordance with OPNAVINST 5530.14E. The Navy Safety Center has not made all of the weapons and ammunition required for CLEP/INRMP implementation available for acquisition, as it typically focuses on non-conservation law enforcement firearm requirements. For this reason, the CLEP currently utilizes all donated weapons that have cleared background checks and have been authorized by the ICO for use on installation, and purchasing required ammunition is problematic (Personal communication, M. Wright, August 2016). The Chief CLEO or the designated Certified Firearm Instructor (CFI) for each installation is responsible for reporting expended rounds and qualification sheets to the designated office. Expenditures of ammunition shall be reported within three working days after shooting, so that accurate records of ammunition balances can be maintained.

The standard issue firearm for the CLEP shall be assigned based on regional department need and accessibility. There are currently no existing Navy guidelines for designating CLEP firearm specifications. According to a FY04/05 DOD Legacy Project to standardize the DOD Conservation Law Enforcement Program (Rogers 2004), the most common service sidearm is a 9mm. The USMC lists the preferred standard issue firearms for their CLEP in NAVMC DIR 5090.4A, which are detailed below:

Table 1. Authorized CLEP Equipment

Firearm	Model	Caliber
Safe action system. Polymer frame. Magazine capacity 15 rounds with 1 in chamber	Glock 22 Corrosive resistant/tenifer finish	0.40 cal
Shotgun - 12 guage	Semi-automatic 18 to 21 inch barrel length	00 buck or rifled slugs
Rifle - Colt M-4 carbine or M16-A2	Semi-automatic 18 to 21 inch barrel length	0.223 (5.56mm)
Safe action system, polymer frame. Small capacity secondary handgun, magazine capacity 6 rounds, with 1 in chamber	Glock 27 Corrosive resistant/tenifer finish	0.40 cal
Rifle- short action, hunting		0.308
Ammunition		
Metal jacketed or semi-jacketed expanding bullets (0.40 cal hollow points)	12 Gauge Shot, #1, #2, #6	0.177 caliber pellets
12 Gauge Bangers (shell crackers, birdfrite scare cartridges, etc.)	0.22 caliber pellets 0.22 caliber shot shell	7mm rifle cartridges 0.308 rifle cartridges
Vehicles		
4-wheel drive truck	All-terrain vehicle (ATV)	Canoe, John-boat with motor
Equipment		
Handcuffs, flex-cuffs, leg cuffs and body chains to control, restrain, and transport persons	Black nylon tactical gear with level 2 or 3 security holster and magazine pouches	Batons, belts, holsters which are required to carry and transport firearms and ammo
Storage safe unit/container with locking mechanisms	Brackets or safety rack for securing firearms inside government vehicles	Night sight, rifle sight, or optical/electronic sight
Vehicle emergency code lights	Radios, cell phones	Chemical agent Oleoresin Capsicum (OC)
field cameras; remote access lap-top computers	*various sized noose poles; various snake hooks; various sized capture nets	*various sized animal transport crates/cases/bags; various sized animal traps
bean bags, noise makers/bangers/flash-bangs, pellets, starter caps, screamers etc.		
**animal trapping and capture equipment may be owned by the NR program and checked out by the CLE program, if such supplies do not exist within the CLE program.*		

> "The standard issue sidearm (primary weapon) for a CLEO shall be a Glock model 22, which is of a composite constructed (steel alloy and or polymer frames) safe action, or semi-automatic pistol of 0.40 caliber. The semi-automatic sidearm has a magazine capacity of 15 rounds with one in the chamber; a magazine release mounted on the side of the frame; no external safety, which would require manipulation prior; and no magazine disconnect that would prevent the weapon from being fired with the magazine removed. Due to environmental conditions, the firearm is made of a high corrosive resistant tenifer finish and of a composite lower receiver. Black accessory gear required to carry and transport sidearms and ammunition, such as magazine pouch, holster and belt, are considered equipment items that will be purchased by the CLEO using funds provided by the installation.
>
> A CLEO will have a secondary handgun available, to be issued by the Conservation Law Enforcement Office. The firearm will be a Glock 27, safe action system, polymer frame, magazine capacity six rounds with one in the chamber, 0.40 caliber.
>
> The standard issue shotgun shall be a 12-gauge semi-automatic police type weapon with a barrel length of 18 to 21 inches, and fitted with rifle sights or optical/electronic sights. After market replacement barrels are authorized. The standard issue rifle for law enforcement purposes shall be an M-16A2 or M-4 colt type semi-automatic in 0.223 caliber (5.56 mm). For non-law enforcement application, such as depredation and predator control, use of other weapons, and other caliber ammunition is advised and authorized through the local purchase procedure and/or through the installation contract office."

Contracts awarded for nuisance animal control or bird-aircraft strike reduction on the installation may authorize contract staff to utilize firearms. Only those weapons that are needed to meet contract objectives are to be authorized, and any weapon brought onto the installation shall meet federal, state, and installation orders/SOP requirements, as applicable. Contract personnel must meet credentials and training requirements of their employer and the Navy.

Additional weapons policies can be found in OPNAVINST 5530.14E (Navy Physical Security and Law Enforcement Program).

5.2.2 Ammunition

Only government issued ammunition is authorized by DODD 5210.56. There are currently no existing Navy guidelines for designating CLEP firearm/ammunition specifications. The USMC lists the ammunition specifications for their CLEP in NAVMC DIR 5090.4A, which are detailed below:

> Only new, commercial factory, or military arsenal manufactured, center-fire rifle ammunition of full metal jacket or jacketed mushrooming or expanding design will be carried or used for law enforcement purposes. Ammunition shall be loaded with metal jacketed or semi-jacketed mushrooming or expanding bullets (hollow-points), 0.40 caliber. Ball ammunition may be used for practice, but not when firing a qualification or requalification score for record, nor may it be carried for duty purposes.
>
> A CLEO will qualify and requalify with the same or ballistically equivalent ammunition, which they normally carry on duty. Shotgun ammunition utilized for CLEO duty purposes shall be factory manufactured 12 gauge, number 00 buck, rifled slugs, or other suitable rounds, as recommended by the training officer, and ultimately chosen by the CLEO. Less

lethal or specialty rounds needed for non-law enforcement purposes, such as wildlife damage control, are authorized to be purchased by the installation chief CLEO, or his/her designee, and stored in the same conditions as other ammunition.

To ensure that a CLEO remains proficient with his/her weapons, each officer should be provided with an appropriate number of rounds to meet all requalification requirements and to practice with each weapon carried. This ammunition should be in addition to any ammunition provided to the officer for the annual 4-hour firearms training, bi-annual requalification, and once every 3 years for the CFI, for each weapon used. It shall be the responsibility of the training officer to ensure that this ammunition is provided and fired on an annual basis.

5.2.3 Standard Issue Equipment and Uniform

In accordance with DODD 5210.56, DOD personnel will have available and use appropriate personal protective equipment commensurate with the duty or task assigned for individual safety and mission assurance. There are currently no existing Navy guidelines for designating CLEP standard issue equipment or uniform specifications. Equipment requirements will vary by installation, based on existing natural and cultural resources, available programs, and frequency of infractions. The USMC lists standard issue equipment for their CLEP in NAVMC DIR 5090.4A, provided below:

> A CLEO shall be authorized to obtain at government expense, carry, and store the following equipment: handcuffs, flex-cuffs, leg cuffs, and body chains to control, restrain, and transport persons; chemical agent OC, cuff case, magazine pouch, keepers, badge wallet, pancake holster, batons, belts, and holsters required to carry and transport firearms and ammo; storage-safe unit/container with locking mechanisms; brackets or safety rack for securing firearms inside Government vehicles; night sight, rifle sight, or optical/electronic sight; and emergency code lights for vehicles. Associated firearms black gear required, such as holsters, belts, magazine cases, and cuff cases, shall be considered authorized equipment to be purchased using installation operations and maintenance program funds. When standard motor vehicles are not adequate to safely support monitoring, patrolling, and enforcement duties in remote locations, a CLEO is authorized to obtain all-terrain vehicles or watercraft through the local purchase procedure and/or through the installation contract office.

The USMC lists standard issue uniform requirements for their CLEP in NAVMC DIR 5090.4A, provided below:

> The badge of commission shall be worn on the exterior of the left side of the uniform shirt. If a uniform jacket is worn, the second badge shall be worn on the exterior left side. The third badge will be concealed in a wallet or similar type leather holder for identification purposes. A patch signifying CLEO status of the local installation(s) shall be worn on the left shoulder of the shirt. The patch may be an existing one currently in use by all base CLEOs, or may be a new one prepared for the natural resource enforcement program. Patches will be designed to represent the local or regional natural resource or outdoor programs at the installation and may be different for each installation.
>
> Shirts will be a stone color, with a collar, of a standard style for law enforcement. Shirts may be short or long sleeved and with or without pockets, depending on preference and

climate needs. Installations may select a polo shirt or tee shirt to be worn while conducting fieldwork. The field shirt will depict a badge, embroidered or ink-printed, of the installation patch on the upper left hand side. Pants will be a hunter green or dark brown color. Style of pants as to number of pockets, cuffs or no cuffs will depend on CLEO staff preference.

A separate set of field pants may be worn which are designed for field conditions and not suitable for professional work environments. Shorts may be worn if desired in warmer climates. Shorts will be dark, hunter green, or dark brown in color. A CLEO hat will be worn that has the conservation logo patch on the front. The installation personnel will choose hat style or design preference. Any other accessories will be chosen by preference of the CLEO at the installation.

The type of dress shirt, pants, field clothes, and overall uniform will be chosen by the chief CLEO with concurrence from his or her supervisor and based on preference, climate needs, and field conditions at the installation. Once the uniform style and color are selected, all CLEOs at the installation will wear it. An initial uniform issue cost allowance and an annual uniform maintenance cost allowance shall be given to each CLEO and funded by the installation.

5.3 USE OF FORCE POLICY

Use of force policy on DOD Installations is governed by DODD 5210.56 (Carrying of Firearms and the Use of Force by DoD Personnel Engaged in Security, Law and Order, or Counterintelligence Activities), and 10 U.S.C. 1585 (Carrying of Firearms). CLEOs should only use the amount of force reasonably necessary to carry out their duties, and must complete use-of-force training every 12 months.

In accordance with DODD 5210.56, employment of 'less-lethal force" may be used with a reasonable amount of force necessary to overcome resistance in a lawful arrest or apprehension, or to accomplish the lawful performance of duties. Less-lethal force and use of non-lethal weapons can cause severe injury or death. Individual(s) subject to less-lethal force must receive immediate medical attention. DODD 3000.3 establishes DOD policy for the development and employment of non-lethal weapons.

In accordance with DODD 5210.56, a CLEO may use deadly force only under conditions of necessity and may only be used when lesser means cannot reasonably be employed or have failed. An oral warning shall be given prior to the use of deadly force if the situation permits and does not increase the danger to the CLEO or others. There is no requirement to delay force or sequentially increase force to resolve a situation or threat. CLEOs will attempt to de-escalate applied force if the situation and circumstances permit. CLEOs will warn persons and give the opportunity to withdraw or cease threatening actions when the situation or circumstances permit.

Deadly force is justified when the officer reasonably believes that the officer or another individual is in imminent danger of death or serious bodily injury. A CLEO must use only that degree of force that is legally permissible; reasonably necessary to perform their duties; and is required to protect themselves and others. The level of force used by an officer must not be excessive or unjustified. A CLEO may not use deadly force to stop a fleeting suspect who is unarmed and who presents no immediate threat of harm to the CLEO or to another person.

Deadly force may also be directed against vicious animals, when necessary in self-defense or in defense of others.

6.0 NEEDS ASSESSMENT

This section provides information relative to a needs assessment for the CLEP on NASO, NASO-DNA, NALFF, and NSAHR-NWA. This document performs a comparative assessment of the existing installation resources and CLEO duties and responsibilities to identify the needs of the CLEP and generate recommendations for development of a fully functioning CLEP.

6.1 EXISTING CONDITIONS

6.1.1 Methodology

The purpose for this needs assessment is to identify the levels of CLE needed for each of the installations. Because there is currently no formal Navy guidance for the determination of CLEP manpower, training, equipment, and policy requirements, the installation NRS and the Regional BST/CLEO were consulted to help determine CLE needs based on current program conditions. A similar assessment was recently conducted for six Front Range Air Force installations (CEMML 2015), the results of which were used to generate staffing recommendations.

Natural/cultural resources information from installation INRMPs/ICRMPs (Section 3.0) and applicable CLE relevant laws and regulations (Section 2.0) were reviewed and summarized, with an emphasis on resources that may routinely impact CLE (archaeological sites, artifacts, historic buildings, installation hunting/fishing programs, species of special concern, special interest areas, nuisance wildlife, wetlands, coastal zone requirements, etc.)

This document assesses current CLEP conditions, identifies needs, and considers multiple factors in order to provide recommendations for development of a more fully functioning CLEP. Factors assessed include: manpower and safety; training and equipment; installation CLE demands; and installation size/location/response time. These factors, once considered, are the basis for staffing, training, and equipment recommendations.

6.1.2 Manpower and Safety

One Biological Science Technician (BST), whose position description also includes CLEO duties, is currently responsible for providing CLE for the NAVFAC Hampton Roads IPT. The BST/CLEO services a total of 11 installations in Southeast Virginia and Northeast North Carolina. The regional BST/CLEO has arrest authority at these installations associated with the enforcement of federal, state, and installation natural and cultural resources laws and regulations, as defined in Section 2.0. The BST/CLEO is currently the only CLEP employee at these facilities, and as such, is on-call 24 hours a day, 7 days a week, and accumulates a great deal of overtime (Personal communication, M. Wright, 3 March 2016). The current CLEP has a total of 2,503 work-hours per year dedicated to law enforcement, according to installation INRMP annual metrics.

Per CNRMA Instruction 11015.4, under the direction of the NRS the BST/CLEO enforces fish and wildlife and other natural resources laws and regulations (as described in Section 2.0). The BST/CLEO may conduct field inspections and employ approved control methods for certain species. Control measures include, but are not limited to, live trapping, relocation, and lethal methods. CLEOs also perform wildlife forensic investigations and respond to wildlife damage complaints. NR personnel (including the current BST/CLEO) manage fish and wildlife and control certain feral, nuisance, and invasive species. Per NASOCEANAINST 3750.2 (series), NR personnel (including the current BST/CLEO) develop and execute depredation and dispersal

procedures for Bird Animal/Aircraft Strike Hazard (BASH) purposes, and personally supervise these actions when lethal methods are required.

Although the regional BST/CLEO enforces natural and cultural resources laws, the bulk of his duties are tied into traditional game warden tasks and feral/nuisance/invasive species control. He also conducts emergency wildlife response, nuisance wildlife response, and assists with surveys, maintenance, and implementation of various NRPs. Because there is only one BST/CLEO available for all four installations, except in the case of emergency, response to calls and reported violations is on a "first-come, first served" basis (Personal communication, M. Wright, 3 March 2016).

While on duty, for health and safety reasons the BST/CLEO is required to be accompanied by another NR employee or Security Officer for any anticipated weapons discharge (Personal communication, M. Wright, 3 March 2016). The BST/CLEO may request support if needed from Base Security, though this support is not necessarily timely (due to remote access and availability of personnel and equipment), nor have the Security Officers received specialized training, on-the-job training, or equipment for CLE (described in Section 2.0) to meet the requirements of DODI 5525.17. Installation Security Officers sometimes are the first reponders to emergency wildlife complaints and service requests during "after-hours" until support arrives from the NRS, the BST/CLEO, and/or pest management personnel as appropriate.

The use of state and federal conservation officers or an interagency MOU (as recommended by DODI 5525.17) for CLEP support may be pursued in the future, but dedicated support would be needed to provide sufficient assistance on military installations. There are three state/federal conservation officers that work in Southeast Virginia and are available for CLEP assistance on military installations. However, the personnel may be too widely distributed to be effective in timely responses (Personal communication, M. Wright, March 3 2016).

6.1.3 Training and Equipment

A regional CLEO is required to be trained in CLE and state and federal wildlife regulations, and attend annual CLE NASO and NALFF Integrated Natural Resources refresher training to remain current on changes in regulations and enforcement policies (see Section 5.0). The current BST/CLEO has completed specialized training, including: EC 9545 Navy Law Enforcement Specialist Phase I (Base Police Law-enforcement training), NEC 9545 Navy Law Enforcement Specialist Phase II (Command Specific Law Enforcement Training), NEC 9575 Correctional Custody Specialist Ashore, MBTA training for DOD, a variety of CECOS and ECATTS environmental courses, and the NMFWA Conservation Officer Refresher Training (when offered and travel approved), and qualifies on his weapons biannually with the Navy Security department. Annual use-of-force training is also required per DODD 5210.56.

Per DODI 5525.17, all conservation officers (regardless of previous law enforcement training) must successfully complete LMPT at the FLETC or equivalent natural resource training as required by the DoD POST Commission within 1 year of being hired. However, the current BST/CLEO was hired before DODI 5525.17 was signed into effect, and while he has not completed FLETC LMPT training, he has been working in law-enforcement for 16 years (between military police and the Natural Resource CLEP), 13 of which have been as a BST/CLEO for the installations.

The current CLEO has not yet had an opportunity to participate in cultural resources specific training, though is planning to attend such training when available (Personal Communication M. Wright, March 2016).

While the Navy procures firearms and ammunition from the Navy Safety Center, currently weapons and ammunition used in the CLEP are not authorized by the Navy Safety Center. The result has been a shortage of ammunition available for the CLEO program. The military armory is not available for CLEO program support. The current CLEP utilizes donated weapons that have cleared background checks and obtained ICO approval for use on installation. (Personal communication, M. Wright, 3 March, 2016). Per CNRMA instruction 11015.3, Installation Security Officers assist NR personnel in obtaining required weapons qualifications. The establishment of procedures for procurement of firearms and ammunition to fulfill CLE duties has been identified as a need for the CLEP.

6.1.4 Conservation Law Enforcement Demand

Existing installation natural and cultural resources described in Section 3.0 identify the need for a fully functioning CLEP to adequately protect such resources, and to support implementation and regulation of applicable programs (hunting and fishing, outdoor recreation, etc). The installations all have a need for CLE, based on deterrence and detection. For instance, installations with higher levels of recreational use can have negative impacts on resources, thus conservation education and constant monitoring of recreational use is necessary to ensure permanent damage to natural and cultural resources does not occur at installations with higher demand.

During interviews conducted via email, the current BST/CLEO provided an observational estimate of demand for standard patrol per installation, based on his 13 years of experience performing CLE on the installations (L. McGrogan, April 25, 2016). For NASO and NASO-DNA, the estimated minimum time commitment for standard patrol is 2 days, or 16 hours per week, for each installation. For NALFF the estimated minimum time commitment for standard patrol is 2.5 days, or 20 hours per week. For NSAHR-NWA, the estimated minimum time commitment for standard patrol time is 3.5 days, or 28 hours per week, due to high user demand on the hunting program. These estimates assume a standard 8-9 hour work day.

Additional responsibilities that require a considerable amount of CLEO time and effort include, but are not limited to, administrative duties (estimated at around 10 to 30 hours per week), Annual training (40 hours annually per CLEO), maintenance training and qualification renewal (20 hours annually per CLEO), ticket/summons processing (depends, but approximately 30-40 hours a year), nuisance animal control (16 hours per week, with two officers/NRP personnel required), and after hours/weekend calls (approximately 2-4 hours per week).

With these estimated time commitments in mind, the CLEO predicts the need for a minimum of three full-time officers, with an optimum of 5-6 officers, to adequately and safely perform at a professional level.

6.1.5 Installation Size, Location, and Response Time

While NASO, NASO-DNA, and NALFF contain a relatively small acreage (5,800 ac, 1,900 ac, and 2,600 ac, respectively), because they are located in a densely populated urban area, this increases the likelihood of violations such as trespassing and poaching on these installations. NSAHR-NWA (3,600 ac) is located in a more rural area, but it does not have contiguous perimeter

fencing to prevent trespassing, and poaching is still an issue at this installation. (Personal communication, M. Wright, 3 March 2016).

The distance between installations and increased response time for the BST/CLEO due to travel between facilities should be considered to develop minimum staffing requirements. The current BST/CLEO is based out of NASO, which is approximately 14 miles driving distance from NALFF (approximately 30 minutes driving time), approximately 33 miles from NSAHR-NWA (approximately 45-60 minutes driving time), and approximately 8 miles from NASO-DNA (approximately 15-20 minutes driving time). Local traffic patterns and delays have the potential to add a great deal of variability in travel time between facilities, with the potential to increase BST/CLEO response time to reported violations.

6.2 RECOMMENDATIONS

From the summary of existing conditions above, needs for the current CLEP were identified and recommendations to address these needs are provided below:

Based on the information contained in section 3.0 and section 6.1 of this document, it was determined that the current CLEP is understaffed. Because only one BST/CLEO is available for the four target Installations, a health and safety risk exists for the current officer when back-up is not available from Installation Security or NR Personnel. Increased staffing/manpower is recommended for the CLEP at these installations. Ideally, a two-man team is recommended to be on duty at all times in order to ensure adequate back-up and increased safety for all CLEP personnel. To ensure an adequate staffing rotation, this would require a minimum of three available CLEP personnel (at least two of which being full time and fully certified), such that two officers would be on duty or on call at all times, with a rotational schedule allowing for one officer to be off-duty (for scheduled time off, sick leave, etc.). This also promotes a healthy work-life balance for CLEP personnel.

A recent CLEP vulnerability study/needs assessment conducted by Colorado State University Center for Environmental Management of Military Lands (CSU CEMML) for six Air Force installations in Colorado and Wyoming concluded that those installations containing significant natural resources such as wetlands, species of special concern, natural areas, cultural resources, and recreational opportunities should be provided with the placement of a CLEO (CEMML 2015).

One of the installations assessed in CEMML's study, F.E. Warren Air Force Base, contains 5,866 ac, and is similar to NASO in size and available natural resources. CEMML concluded that F.E. Warren should receive a dedicated CLEO based on presence of significant natural and cultural resources. Other assessed installations (Buckley Air Force Base, Cheyenne Mountain Air Force Station, Peterson Air Force Base, and Schriever Air Force Base) containing a combination of fewer natural/cultural resources and less recreational access were determined to not require a dedicated CLEO, and instead it was recommended that they receive support on an as-needed basis from the placement of full-time CLEOs at F.E. Warren and at the U.S. Air Force Academy. It was also recommended that the Air Force implement a job-sharing situation with environmental programs or cooperating agencies.

Taking CEMML's method for assessing manpower need into consideration, the recommendation for placement of at least two dedicated full-time CLEO to be shared between the four installations assessed in this document is reasonable, with the additional option of a cooperative agreement with the USFWS, VDGIF, and/or NCWRC to meet staffing needs or provide additional support. Ideally,

Navy CLEO personnel would be hired under the GS-1801 or GS-1811 series, as the position descriptions are best suited for CLEO responsibilities (Personal Communication, Michael Wright, March 2016). According to CEMML's study, the hiring of full-time CLEO officers is preferred, as part-time employment of a CLEO is not as conducive to a career-focused professional program and retention becomes problematic if a trained CLEO can find full-time employment elsewhere (CEMML 2015).

The use of seasonal law-enforcement employees (military conservation agents, security forces, master-at-arms, component civilian police, or other law enforcement personnel) to augment the CLEP during times of increased demand (such as during the hunting season) would be another option to help meet staffing recommendations. However, per DODI 5525.17, personnel temporarily or seasonally assigned to CLEPs are not required to complete FLETC LMPT but should be supervised by a fully certified conservation officer and receive on-the-job training specific to conservation law enforcement, and are not to be used to fulfill the full-time CLEO requirement.

It is important to note that, per DODI 5525.17, non-law-enforcement personnel (including General Services 400 series civilians and active duty personnel) may assist conservation officers with case-specific investigations and education and awareness activities, but are not permitted to perform direct law enforcement duties (unless their core personnel document or position description includes law enforcement duties and they have completed LMPT at FLETC) nor are they permitted to carry weapons (unless so authorized and provided by the commander after having received appropriate training and qualification with the authorized weapon).

Clarification regarding requirements for a conservation officer to be considered "fully certified" has been identified as a need for the CLEP. Because the current BST/CLEO has been a CLEP employee prior to DODI 5525.17 being signed into effect, he was not required to receive the FLETC LMPT, and therefore does not currently meet requirements to be considered a designated CLEO. However, he has received additional highly specialized training in natural resources management and CLE, and has served as the BST/CLEO on these installations for 13 years. A grandfather clause is currently in place for the USMC CLEP, which allows for CLEOs hired before DODI 5525.17 and NAVMC DIR 5090.4A to be issued and maintain CLEO credentials. It is recommended that the Navy adopt a similar clause for their CLEP.

This also highlights a need for identification in regards to what trainings qualify as equivalent to the FLETC LMPT, when funding and availability do not allow for completion. This may impact whether an officer may be considered a "fully certified" CLEO to meet the full-time requirements of DODI 5525.17. Per DODI 5525.17, equivalent basic natural resources management training must meet the standards of the natural resources management program of instruction of FLETC LMPT. The DOD POST Commission, in accordance with the authority in DODI 5525.17, are responsible for certifying CLEP equivalent training standards.

Additional cultural resources training has been determined a need for the CLEP based on feedback from the installation NRS. It is recommended that all CLEOs receive cultural resources specific training in order to enforce applicable cultural resources laws and regulations identified in Section 2.0 of this document.

A cooperative agreement with additional federal or state agencies has been identified as an additional resource with which to supplement the CLEP, and is recommended to increase CLEP effectiveness, jurisdictional authority, and manpower requirements. Installations under proprietary

or concurrent jurisdiction may require an MOA in place to authorize enforcement of both federal and state regulations. An MOU could provide increased manpower support and increase jurisdictional authority using outside agency personnel. For instance, an MOA with the VDGIF and NCWRC could provide state authority to full-time NAVY CLEOs, or alternatively, provide state commissioned CLEOs with DOD/Navy law enforcement authority.

Because the Navy has not yet provided a formal instruction or regional CLEP that identifies CLEO training requirements and specific CLEP obligations, the development of such a document is recommended in order to define and clarify the roles and responsibilities for CLE at regional installations, and for incorporation into INRMPs/ICRMPs as directed by DODI 5525.17. This needs assessment provides necessary background information and framework helpful towards the development of a regional instruction.

APPENDIX A

(DODI 5525.17)

Department of Defense
INSTRUCTION

NUMBER 5525.17
October 17, 2013

USD(P&R)

SUBJECT: Conservation Law Enforcement Program (CLEP)

References: See Enclosure 1

1. PURPOSE. This instruction:

a. Establishes policy, assigns responsibilities, and provides direction for the CLEP in accordance with the authority in DoD Directive (DoDD) 5124.02 (Reference (a)).

b. Defines the organization and authorities of CLEP.

2. APPLICABILITY. This instruction applies to OSD, the Military Departments, the Office of the Chairman of the Joint Chiefs of Staff and the Joint Staff, the Combatant Commands, the Office of the Inspector General of the Department of Defense, the Defense Agencies, the DoD Field Activities, and all other organizational entities within the DoD (referred to collectively in this instruction as the "DoD Components").

3. POLICY. It is DoD policy that:

a. The protection of property and natural and cultural resources under DoD control is accomplished through the enforcement of all applicable federal and State laws and regulations.

b. The CLEP is used to support decisions and management actions by DoD's natural and cultural resources managers regulating the users of these resources to achieve specific goals and objectives.

c. DoD Component law enforcement officials exercise functional oversight over the CLEP and the conservation law enforcement officers (CLEOs) carrying out the program.

d. CLEOs assigned to DoD Component law enforcement elements may be co-located with the conservation program manager at the installation.

e. CLEP Officers conducting criminal investigations will comply with the policies and procedures of DoD Instructions (DoDIs) 5505.07, 5505.11, 5505.14, 5505.16, and 5505.17 (References (b) through (f)).

f. The DoD Component's law enforcement and conservation functions will establish, and mutually support, an implementation method which defines roles, internal and external support agreements, funding responsibilities, accountability, command and control, and expectations which will provide for an effective and efficient CLEP.

g. CLEP roles and responsibilities will be integrated into an installation's Integrated Natural Resources Management Plan (INRMP) and Integrated Cultural Resources Management Plan (ICRMP), where conservation law enforcement is required.

h. The implementation method(s) for each installation CLEP should be proportionate to the conservation law enforcement needed at the installation; therefore, several implementation methods are provided for within this instruction. Although the specific implementation methods at installations can vary, those details should be clearly defined at the appropriate command level and address at a minimum, consistent with this instruction, roles and responsibilities, internal and external support agreements, funding responsibilities, accountability, and command and control.

i. Mutual assistance agreements with other agencies and organizations may be used to maximize enforcement capabilities, when authorized by law.

j. Primary (basic) training for personnel who serve as DoD CLEO is the Federal Law Enforcement Training Center (FLETC) Land Management Police Training (LMPT) Program. Equivalent basic natural resources management training must meet the standards of the natural resources management program of instruction of FLETC LMPT.

k. The DoD Peace Officers Standards and Training (POST) Commission, in accordance with the authority in DoDD 5525.15 (Reference (g)), will certify CLEP equivalent training standards.

4. RESPONSIBILITIES. See Enclosure 2.

5. PROCEDURES. See Enclosure 3.

6. RELEASABILITY. **Unlimited**. This instruction is approved for public release. Copies may be obtained through the Internet from the DoD Issuances Web Site at http://www.dtic.mil/whs/directives.

7. EFFECTIVE DATE. This instruction:

a. Is effective October 17, 2013.

b. Must be reissued, cancelled, or certified current within 5 years of its publication to be considered current in accordance with DoDI 5025.01 (Reference (h)).

c. Will expire effective October 17, 2023 and be removed from the DoD Issuances Website if it hasn't been reissued or cancelled in accordance with Reference (h).

Jessica L. Wright
Acting Under Secretary of Defense for
Personnel and Readiness

ENCLOSURE 2

RESPONSIBILITIES

1. UNDER SECRETARY OF DEFENSE FOR PERSONNEL AND READINESS (USD (P&R)). The USD(P&R):

a. Establishes overall policy and provides guidance for the DoD CLEP.

b. Monitors implementation of the DoD CLEP.

c. Serves as the central point of contact for CLEP policy issues.

d. Coordinates with other federal agencies on conservation law enforcement matters of national or regional scope.

e. Identifies opportunities for efficiencies in providing CLEP training through increased interagency and DoD Component cooperation.

f. Serves as the CLEP authority for and manages the partnership agreement with the FLETC, known as the Department of Defense Conservation Law Enforcement Consortium (DoDCLEC).

2. UNDER SECRETARY OF DEFENSE FOR ACQUISITION, TECHNOLOGY, AND LOGISTICS (USD(AT&L)). The USD(AT&L):

a. Establishes and monitors Natural Resources Conservation Program policy, in accordance with DoDI 4715.03 (Reference (i)).

b. Ensures that the CLEP is integrated into DoD Natural Resources Conservation Programs and cultural resources management policy and guidance in accordance with DoDI 4715.16 (Reference (j)).

3. DoD COMPONENT HEADS. The DoD Component heads responsible for DoD installations or sites:

a. Establish policies and procedures to implement CLEP within their Component.

b. Integrate CLEP into the Component law enforcement programs.

c. Ensure that, to the extent practicable using available resources, sufficient numbers of natural resources law enforcement personnel are available and assigned responsibility to perform tasks necessary to carry out the CLEP in accordance with chapter 5C of Title 16, United States

Code (U.S.C.) (Reference (k)), including the preparation and implementation of the law enforcement portions of the integrated natural resources management plans.

d. Ensure sufficient levels of conservation law enforcement planning are incorporated into installation INRMPs and ICRMPs where necessary, and to the extent practicable using available resources, and that these plans are fully coordinated with appropriate installation offices.

e. Establish agreements with other agencies and organizations to facilitate mutual working relationships and to maximize enforcement capabilities, when authorized by law.

ENCLOSURE 3

CLEP PROCEDURES

1. OBJECTIVES. CLEP will:

a. Conserve and direct the use of natural and cultural resources in accordance with the INRMP and ICRMP.

b. Ensure installations and military and public users remain in compliance with appropriate environmental, natural, and cultural resource laws and regulations.

c. Provide specialized law enforcement expertise regarding natural and cultural resource matters and protection of government property.

d. Improve inter-jurisdictional conservation law enforcement among the Military Departments, federal, State, tribal, and local law enforcement and land management agencies.

e. Collect and track data on violations.

2. PLANS

a. General. Each installation that is required to prepare an INRMP or ICRMP in accordance with Reference (i) will incorporate within the INRMP or ICRMP the methods, techniques, and strategies that will be utilized to provide law enforcement services to the federal lands, complementing the resource management objectives of the installation.

b. Plan Goals and Objectives. The CLEP section will provide specific goals and objectives to ensure compliance with laws and regulations; to support the overarching goals of the INRMP and ICRMP; and to integrate with other installation security and emergency services plans. These objectives will include:

(1) Providing education and training to the installation populace, workforce, and general public to prevent inadvertent violation of natural resource and cultural resource laws.

(2) Defining areas clearly to prevent hunting, fishing, and other outdoor recreational activities in unauthorized areas.

(3) Reporting non-compliance with laws and regulations in accordance with Military Service criminal data reporting procedures.

(4) Encouraging coordination with the United States Fish and Wildlife Service (USFWS) and National Marine Fisheries Service.

(5) Reporting and tracking natural and cultural resources crimes and their disposition (both military and civil).

c. Tiering CLEP to the INRMP and ICRMP

(1) Reference (i) and sections 670-670f of Reference (k) require installations that have significant natural or cultural resources to prepare and implement an INRMP or ICRMP that provides for adequate management and enforcement.

(2) The CLEP should provide the maximum feasible protection of military lands and resources under the jurisdiction of the Department of Defense within the funding and manpower levels allocated to support the mission.

(3) The INRMP provides the overall framework for implementing conservation and management activities and enforcement on DoD installations.

(4) The ICRMP provides the overall framework for implementing cultural resources management activities and enforcement on DoD installations.

(5) The conservation law enforcement plan should be an attachment to the INRMP and ICRMP.

3. PERSONNEL AND TRAINING

a. All conservation officers (regardless of previous law enforcement training) must successfully complete LMPT at the FLETC or equivalent natural resource training as required by the DoD POST Commission (Reference (g)) within 1 year of being hired.

b. Military police, security forces, master-at-arms, component civilian police, or other law enforcement personnel who are temporarily or seasonally assigned to CLEPs. These personnel are not required to complete LMPT but should be supervised by a fully certified conservation officer and receive on-the-job training specific to conservation law enforcement. Personnel augmenting CLEPs are only to be used for temporary or seasonal assignment and are not to be used to fulfill the full-time CLEO requirement.

c. DoD Component heads may authorize exceptions for smaller installations or bases that do not require the services of a full-time CLEO year-round to assign CLEP duties to specially trained, dual-function police officers.

d. DoD Components may augment CLEP forces with the following personnel and under the following restrictions:

(1) Military police, security forces, master-at-arms, component civilian police, or other law enforcement personnel who are temporarily or seasonally assigned to CLEPs are not required to complete LMPT but should be supervised by a fully certified conservation officer and

receive on-the-job training specific to conservation law enforcement. Augmented personnel are only to be used for temporary or seasonal assignment and are not to be used to fulfill the full-time CLEO requirement.

(2) Non-law-enforcement personnel, including General Services 400 series civilians and active duty personnel, may assist conservation officers with case-specific investigations and education and awareness activities. They may not:

(a) Carry out direct law enforcement duties unless their core personnel document or position description includes law enforcement duties and they have completed LMPT at FLETC.

(b) Carry weapons in performance of this duty (unless so authorized and provided by the commander after individuals have received appropriate training and are qualified with the authorized weapon).

e. The DoD is a partner organization with the FLETC for conservation law enforcement training including basic training, LMPT Program, and advanced training requirements. The partner organization status is managed through the DoDCLEC. The DoDCLEC consists of the USD(P&R) Office of Law Enforcement Policy and Support and the Military Departments.

f. DoD CLEO should complete a minimum of 40 hours of annual refresher training, specialized to conservation law enforcement. This refresher training is after completion of FLETC LMPT and is not to be considered a replacement for it.

g. DoD CLEO position descriptions, grades, and series should be developed and filled at a level of expertise and professionalism commensurate with other federal agency standards and the specialized duties of the DoD CLEO officers. These responsibilities include, but are not limited to, knowledge and expertise in environmental laws and natural and cultural resource protection and use, troop training and outreach for compliance with environmental laws and regulations, and specialized investigative responsibilities beyond basic law enforcement patrol.

4. AUTHORITY, POWERS, AND JURISDICTION

a. Conservation Officer Authority

(1) Section 2671 of Title 10, U.S.C. (Reference (l)) requires that all hunting, fishing, and trapping on an installation be in accordance with the laws of the State in which it is located. It also states that offenders are guilty of a like offense and subject to a like punishment for an act or omission on the installation that would be punishable if committed within the jurisdiction of the State. On installations under either proprietary or concurrent legislative jurisdiction, State laws may be directly enforceable under State authority.

(2) The Secretary of Defense may enforce all natural resources management laws, pursuant to the authority of section 670e-1 of Reference (k) and cultural resources management laws, pursuant to the authority of sections 470ff of Reference (k) on military installations within

the United States. Although Reference (k) provides authority to enforce natural and cultural resources laws, it does not expressly grant powers to search, seize, or arrest with regard to each statute. Military and civil service law enforcement personnel may temporarily detain civilian offenders until civilian law enforcement authorities arrive. The natural and cultural resource management laws are numerous and are listed in the Table for informational purposes.

Table. Natural and Cultural Resources Laws

NATURAL AND CULTURAL MANAGEMENT	ASSOCIATED LAWS
Airborne Hunting	Section 742j-1 of Reference (k)
American Indian Religious Freedom	Section 1996 of Title 42, U.S.C. (Reference (m))
Antiquities Act	Subchapter LXI of chapter 1 of Reference (k) beginning with section 431
Archaeological and Historic Preservation	Subchapter I of chapter 1A of Reference (k) beginning with section 461
Archaeological Resources Protection	Chapter 1B of Reference (k) beginning with section 470aa
Bald and Golden Eagle Protection	Subchapter II of Chapter 5A of Title 16, U.S.C., beginning with section 668 of Title 16, U.S.C. (Reference (k))
Coastal Barrier Resources	Chapter 55 of Reference (k) beginning with section 3501
Coastal Zone Management	Chapter 33 of Reference (k) beginning with section 1451
Endangered Species	Chapter 35 of Reference (k) beginning with section 1531
Estuary Protection	Chapter 26 of Reference (k) beginning with section 1221
Federal Insecticide, Fungicide, and Rodenticide	Chapter 6 of Title 7 U.S.C., beginning with section 136 (Reference (n))
Federal Land Policy and Management	Chapter 35 of Title 43, U.S.C., beginning with section 1701 (Reference (o))
Noxious Weeds	Chapter 61 of Reference (n) beginning with section 2809

Table. Natural and Cultural Resources Laws, Continued

Fish and Wildlife Conservation	Chapter 49 of Reference (k) beginning with section 2901
Game, Fur-Bearing Animals, and Fish	Subchapter I of chapter 5A of Reference (k) beginning with section 661
Forest and Rangeland Renewable Resources Planning	Chapter 36 of Reference (k) beginning with section 1601
Lacey Act	Chapter 53 of Reference (k) beginning with section 3371
Marine Mammal Protection	Chapter 31 of Reference (k) beginning with section 1361
Migratory Birds	Subchapter II of chapter 7 of Reference (k) beginning with section 703
Migratory Bird Conservation	Subchapter III of chapter 7 of Reference (k) beginning with section 715
Migratory Bird Hunting and Conservation Stamps	Subchapter IV of chapter 7 of Reference (k) beginning with section 718
Multiple Use Sustained Yield of Forests	Sections 528-531 of Reference (k)
National Environmental Policy	Chapter 55 of Reference (m) beginning with section 43421
National Forest Management	Chapter 36 of Reference (k) beginning with section 1600
National Historic Preservation	Subchapter II of chapter 1A of Reference (k) beginning with section 470
National Trails Systems	Chapter 26 of Reference (k) beginning with section1241
Native American Graves Protection and Repatriation	Section 3001 of Title 25, U.S.C. (Reference (p))
Recreational Hunting Safety	Chapter 72 of Reference (k) beginning with section 5201
Rivers and Harbors Act of 1899	Sections 401 and 403 of Title 33, U.S.C. (Reference (q))

Table. Natural and Cultural Resources Laws, Continued

NATURAL AND CULTURAL MANAGEMENT	ASSOCIATED LAWS
Sikes Act	Subchapter I of chapter 5C of Reference (k) beginning with section 670
Soil and Water Conservation	Chapter 40 of Reference (k) beginning with section 2001
Taylor Grazing Act	Chapter 8A of Reference (o) beginning with section 315
Wild and Scenic Rivers	Chapter 28 of Reference (k) beginning with section 1274
Wild Exotic Bird Conservation	Chapter 69 of Reference (k) beginning with section 4901
Wild Horses and Burros	Chapter 30 of Reference (k) beginning with section 1331
Wilderness Act	Chapter 23 of Reference (k) beginning with section 1131

(3) The United States District Court Violation Notice (Reference (r)) is used as the charging document to notify the magistrate court of misdemeanor offenses that occur within its jurisdiction; however, felonies committed on military lands are referred to the local United States Attorney's Office. Felony violations on the installation are within the investigative purview of the appropriate military criminal investigative organization (MCIO). Coordination will be conducted with both the supporting MCIO and the USFWS before proceeding beyond the preliminary stages of a felony investigation so that appropriate coordination can be made with the responsible assigned Assistant United States Attorney.

(4) Section 3375 of Reference (k) allows the Secretaries of Interior and Commerce to use (via agreement) DoD personnel, services, and facilities to the extent necessary for enforcement of any laws relating to fish and wildlife. The agreements are accomplished at the local level under the guidance of the responsible DoD Component.

(5) DoD Component heads may enter into standard agreements with the USFWS for CLEOs to exercise authority under USFWS commission for those laws for which the USFWS is the regulating authority.

b. Conservation Officer Powers

(1) CLEOs draw their powers, when delegated, from the installation commander's authority to protect or secure a facility in accordance with the authority in section 797 of Title 50, U.S.C. (Reference (s)).

(2) CLEOs may use necessary and appropriate force to apprehend suspects in accordance with DoDD 5210.56 (Reference (t)). The primary consideration in the use of force is the timely and effective application of an objectively reasonable level of force required to establish and maintain lawful control. A paramount consideration is the preservation of life and prevention of bodily injury.

5. LAW ENFORCEMENT COORDINATION

a. Coordination with Other Federal and State Agencies. Each DoD Component or its designated lead office should address specific conservation law enforcement issues relevant to its component with other national headquarters offices of federal agencies such as the Departments of Interior, Homeland Security, Commerce, and Agriculture. The major command, regional office, or installation should address conservation law enforcement issues with respective regional offices of federal, State, and tribal fish and game agencies.

(1) National Level Coordination. Each DoD Component is responsible for national-level liaison and contact with the departmental law enforcement officials and all federal law enforcement, security, and intelligence agencies on all matters relating to conservation law enforcement. On national matters pertaining to DoD lands, the USD(P&R) Law Enforcement Policy and Support Office will consult with the appropriate DoD Component.

(2) International Coordination. If an international agreement permits such activity, local liaison is allowed with cooperating foreign agencies adjacent to the international border of the United States relating to matters of mutual concern and assistance. This coordination and cooperation with local foreign law enforcement officials and agencies will be in accordance with applicable legally binding international agreements between the United States and Mexico or Canada, and will be conducted in a circumspect manner to avoid violation of the sovereignty of the other country.

(3) Regional Level. The major command or regional office is the appropriate level for interagency inter-governmental coordination and environmental planning with other federal, State, and tribal agencies. The regional office or major commands should conduct all coordination and communication for regional and multi-State issues.

(4) State and Local Level. The major command or regional criminal investigative office, installation lead criminal investigator, and conservation officer are concurrently responsible for liaison with local, State, tribal, and federal agencies on matters relating to natural and cultural resource law enforcement.

(5) Individual Cooperation. Criminal investigators and conservation officers are expected to make every effort to cooperate with and assist officials of State fish and game agencies and law enforcement officials of other federal, State, tribal, and local agencies located in their geographic area of responsibility for the purpose of enforcing natural and cultural resource laws on DoD installations.

b. Law Enforcement Agreements

(1) Small Installation Agreements. Installations that do not require full-time conservation officers due to limited resources, but require periodic patrols and response as needed for enforcement of natural and cultural resource management laws, may enter into appropriate agreements, when authorized by law, with local law enforcement agencies, State fish and game agencies, sheriff's offices, or other federal agencies.

(a) Typically, these installations require an INRMP or ICRMP, but do not have large acreage or complex issues such as endangered species, coastal resources, or extensive cultural resources.

(b) These agreements should identify the roles and responsibilities of the installation and the cooperating agency or agencies where the cooperating agency is the lead in all conservation law enforcement activities. An example of an installation agreement is provided at the Figure.

(2) Large Installation Agreements. Appropriate agreements, when authorized by law, are also available for use on large installations and ranges that have DoD conservation officers. Installation-specific agreements may be developed to address complex or multi-jurisdictional issues such as border patrol, coastal zone management, and shared land use.

Figure. Sample Law Enforcement Agreement

[Date]

AGREEMENT
BETWEEN THE [*Insert Title of DoD Official*] AND THE
(*FEDERAL OR STATE AGENCY*)
FOR THE PROVISION OF NATURAL RESOURCES LAW ENFORCEMENT

This agreement, entered into this _____ day of _____ 20____, by the [*Insert DoD Component Name*] for (*INSTALLATION NAME*) and [*name of other party*] (hereinafter referred to as the parties). Witnessed that:

WHEREAS, the Secretary of Defense is authorized by the Sikes Act to enforce on DoD installations all federal laws relating to the management of natural resources, and

WHEREAS, it is the responsibility of [*Insert DoD Component Name*] to conserve natural resources and provide adequate law enforcement on its lands; and

WHEREAS, the [*Insert Name of other party*] has the authority to enforce State and local laws relating to the management of natural resources on such lands; and

Figure. Sample Law Enforcement Agreement, Continued

WHEREAS, it is in the best interests of the [*Insert DoD Component Name*] to obtain the assistance of the [*Insert Name of other party*] in the enforcement of State and local laws on [*Insert DoD Component Name*] lands.

NOW, THEREFORE, the parties hereto mutually agree as follows:

Article 1. Plan of Operation.

(a) [*Insert DoD Component Name*] and the [*Insert Name of other party*] have agreed to a plan of operation which describes the scope and extent of natural resources law enforcement to be provided to [*Insert DoD Component Name*] by the [*Insert Name of other party*] in accordance with this agreement. Such plan of operation, as concurred in by the [*Insert Name of other party*], is attached hereto as Appendix A and made a part hereof. The plan of operation will be reviewed before the beginning of each federal fiscal year and the [*Insert DoD Component Name*] will determine if it is still current and whether there are sufficient funds available to pay the [*Insert Name of other party*] charges for the next fiscal year.

(b) It is recognized and understood that the [*Insert DoD Component Name*] and the [*Insert Name of other party*] may, at the request of either, renegotiate the plan of operation. The renegotiated plan of operation will, upon written acceptance thereof by both parties, supersede Appendix A.

Article 2. Obligations of the [*Insert Name of other party*].

(a) The [*Insert Name of other party*] agrees to furnish normal, emergency, and unanticipated enforcement of State and local civil and criminal laws relating to management of natural resources on [*Insert DoD Component Name*] lands and waters in accordance with the schedules and duties described in the plan of operation, with payment by [*Insert DoD Component Name*] in accordance with Article 3 of this agreement.

(b) The [*Insert Name of other party*] agrees to provide personnel, equipment, and supplies required to provide the natural resources law enforcement requested by the [*Insert DoD Component Name*] in accordance with paragraph (a) of this article.

(c) The [*Insert Name of other party*] agrees to prepare a daily enforcement log of a format provided or approved by the [*Insert DoD Component Name*] and to submit this log to [*Insert DoD Component Name*] at least once a month throughout the effective period of the current plan of operation.

(d) The [*Insert Name of other party*] agrees to assign only those personnel who are qualified and trained pursuant to the requirements of applicable federal and State laws and regulations to undertake the law enforcement to be provided under Article 2(a) of this agreement in support of [*Insert DoD Component Name*]. Where State and local standards for the qualifications of law enforcement personnel do not exist, the [*Insert Name of other party*] will advise [*Insert DoD Component Name*] of the experience, qualifications, and training of those personnel expected to be assigned law enforcement duties under this agreement and assign such duties to them only with the approval of the [*Insert DoD Component Name*].

Article 3. Obligations of the [*Insert DoD Component Name*].

Subject to the availability of funds, the [*Insert DoD Component Name*] agrees to pay the [*Insert Name of other party*] for the total cost of the law enforcement support to [*Insert DoD Component Name*], to be provided in accordance with the obligations agreed to be undertaken by the [*Insert Name of other party*] in Article 2 of this agreement, including the costs of operation and maintenance of such equipment as is required for the provision of such support to [*Insert DoD Component Name*] identified in the plan of operation under Article l of this Agreement. At the request of the [*Insert Name of other party*], partial payments may be made as the law enforcement support to [*Insert DoD Component Name*] is performed based on billings as identified in the plan of operation under Article I of this agreement and approved by the [*Insert DoD Component Name*].

Figure. Sample Law Enforcement Agreement, Continued

Article 4. Period of [*Insert DoD Component Name*].

The period of this agreement is from the date of execution until terminated by mutual agreement, or on written notice from either party to the other, as set forth in Articles 6 and 10 of this agreement.

Article 5. Disputes.

(Insert clause from DoD 3210.6-R, "Department of Defense Grant and Agreement Regulations", April 13, 1998, with Change 2, October 24, 2001)

Article 6. Default.

In the event that either party to this agreement fails to meet any of its obligations hereunder, the other party may immediately terminate this agreement. Such termination will be effected by written notice of either party to the other.

Article 7. Exclusion of Federal Employee Benefits.

It is understood and agreed that the services to be provided by the [*Insert Name of other party*] and its employees are not considered to fall within the scope of federal employment, that the [*Insert Name of other party*] and its employees are not considered as agents or employees of the U.S. Government, and that none of the benefits of federal employment will be conferred under the terms of this agreement.

Article 8. Release of Claims.

The [*Insert Name of other party*] agrees to secure insurance in a form and amount satisfactory to the [*Insert DoD Component Name*] for liability arising from the negligence of [*Insert Name of other party*] in performing services under this agreement. Such insurance will name the United States as a named insured. The cost of such insurance may be included as a cost under Article 3 of this agreement.

Article 9. Transfer or Assignment.

The [*Insert Name of other party*] will not transfer or assign this agreement, nor any rights acquired thereunder, nor grant any interest, privilege, or license whatsoever in connection with this agreement without the approval of the [*Insert DoD Component Name*].

Article 10. Termination for Convenience.

[*Insert DoD Component Name*] or [*Insert Name of other party*] may, on 30 days written notice, terminate this agreement without cause. If this agreement is so terminated, the [*Insert DoD Component Name*] will be liable only for payment in accordance with the payment provisions of this agreement for services rendered prior to the effective date of termination.

Article 11. Equal Opportunity.

(Insert clause from DoD 3210.6-R, "Department of Defense Grant and Agreement Regulations," April 13, 1998, as amended)

Article 12. Gratuities.

(Insert clause from DoD 3210.6-R, "Department of Defense Grant and Agreement Regulations", April 13, 1998, as amended)

Figure. Sample Law Enforcement Agreement, Continued

Article 13. Examination of Records by Comptroller General.

The [*Insert Name of other party*] agrees that the Comptroller General of the United States or any of his or her duly authorized representatives will, until the expiration of 3 years after final payment under this agreement, have access to and the right to examine any directly pertinent books, documents, papers, and records of the [*Insert Name of other party*] involving transactions related to this agreement.

Article 14. Audit by the [*Insert DoD Component Name*].

Upon request, the [*Insert Name of other party*] must provide, and the [*Insert DoD Component Name*] will have the right to examine, books, records, documents, and other evidence of accounting procedures and practices, sufficient to reflect properly all direct and indirect costs of whatever nature claimed to have been incurred and anticipated to be incurred for the performance of this agreement.

Article 15. Amendments.

Any changes in the provisions of this agreement must be made by formal amendment signed by both parties.

IN WITNESS HEREOF, the parties hereto have executed this agreement, as of the day and year first written above.

GLOSSARY

PART I. ABBREVIATIONS AND ACRONYMS

CLEO	Conservation Law Enforcement Officer
CLEP	Conservation Law Enforcement Program
DoDCLEC	Department of Defense Conservation Law Enforcement Consortium
DoDD	DoD directive
DoDI	DoD instruction
FLETC	Federal Law Enforcement Training Center
ICRMP	Integrated Cultural Resources Management Plan
INRMP	Installation Natural Resources Management Plan
LMPT	Land Management Police Training
MCIO	military criminal investigative organization
POST	Peace Officers Standards and Training
U.S.C.	United States Code
USD(AT&L)	Under Secretary of Defense for Acquisition, Technology, and Logistics
USD(P&R)	Under Secretary of Defense for Personnel and Readiness
USFWS	United States Fish and Wildlife Service

PART II. DEFINITIONS

Unless otherwise noted, these terms and their definitions are for the purpose of this instruction.

Defense criminal investigative organizations. The four criminal investigative organizations of DoD: Defense Criminal Investigative Service, U.S. Army Criminal Investigation Command, Naval Criminal Investigative Service, and Air Force Office of Special Investigations.

dual-function conservation officer. A natural resources professional who is assigned law enforcement duties consisting of at least 50 percent of overall duties. Dual-function conservation officers should maintain equivalent training and qualifications as full-time conservation officers.

ICRMP. A plan that defines the process for the management of cultural resources on DoD installations by integrating the entirety of the installation cultural resources program with ongoing mission activities, to allow for ready identification of potential conflicts between the installation's mission and cultural resources, and identify compliance actions necessary to maintain the availability of mission-essential properties and acreage.

INRMP. An integrated plan focused, to the maximum extent practicable, on ecosystem management that shows the interrelationships of individual components of natural resources management (e.g., fish and wildlife, forestry, land management, and outdoor recreation) to mission requirements and other land use activities affecting an installation's natural resources. INRMPs ensure natural resource conservation programs and military operations are integrated and consistent with stewardship and legal requirements through cooperation among DoD, USFWS, and State fish and wildlife agencies.

MCIOs. The three military criminal investigative organizations of DoD: U.S. Army Criminal Investigation Command, Naval Criminal Investigative Service, and Air Force Office of Special Investigations.

APPENDIX B

(NAVMC DIR 5090.4 A, Memorandum of Agreement with the USFWS)

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

DEPARTMENT OF THE NAVY
HEADQUARTERS UNITED STATES MARINE CORPS
2 NAVY ANNEX
WASHINGTON, DC 20380-1775

IN REPLY REFER TO
5090
LPL/1
21 MAY 2003

Kevin Adams, Chief,
Office of Law Enforcement
U.S. Fish and Wildlife Service
MS-LE 3000
4401 N. Fairfax Drive
Arlington, VA 22203

Dear Mr. Adams:

Attached is a Memorandum of Agreement for cooperative law enforcement for the protection and conservation of fish, wildlife, archaeological, and natural resources on lands controlled by the Marine Corps. Please sign, keep a copy for your files, and return the original to my office.

I am pleased to enter into this cooperative agreement as the mutual benefits to be gained will allow us to better fulfill our resource protection obligations, while providing enhanced stewardship of the public lands entrusted to the Marine Corps.

Ms. Heidi Hirsh of my staff is available to answer any questions you may have regarding this matter. She may be reached at 703-695-8240.

Sincerely,

R. S. COLEMAN
Brigadier General, U.S. Marine Corps
Assistant Deputy Commandant
Installations and Logistics (Facilities)

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

MEMORANDUM OF AGREEMENT
for
Cooperative Law Enforcement
between the
U.S. Fish and Wildlife Service
and the
U.S. Marine Corps

This Memorandum of Agreement (MOA) is a cooperative agreement entered into under authority of the Fish and Wildlife Revenue Enhancement Act of 1998 (16 U.S.C. Section 742*l*(b)) between the U.S. Fish and Wildlife Service, hereinafter "Service" or "Chief, Office of Law Enforcement," and the U.S. Marine Corps, hereinafter "USMC." This cooperative agreement shall serve as a master agreement for all USMC installations and U.S. Fish and Wildlife Service law enforcement offices.

Individual installation cooperative agreements may be negotiated and signed by the appropriate Service and USMC representatives. However, individual agreements are not mandatory. Individual agreements that have been signed and are presently in effect shall be updated to reflect the requirements of this Agreement. Individual agreements must comply with this MOA.

Whereas, the Congress of the United States has found that the protection and conservation of fish, wildlife, and other natural and cultural resources is in the best interest of the public and has enacted various laws to provide for protection and conservation of wildlife and native plants.

Whereas, the United States Congress has given the Secretary of the Interior the authority to enforce certain laws dealing with the protection and conservation of fish, wildlife, and other natural resources and this authority has been delegated to the Director of the Service and to certain qualified individuals.

Whereas, the Service and the USMC recognize that mutual benefits will accrue to the law enforcement efforts of each by entering into a Memorandum of Agreement to share law enforcement expertise, training, intelligence information, equipment, and other facilities, and to designate law enforcement officers to efficiently enforce all laws administered by the Service and USMC relating to fish, wildlife, and other natural and cultural resources.

Whereas, the Service has determined that it is necessary and appropriate to utilize certain persons, services, and facilities of the USMC to assist in providing effective enforcement of Federal conservation laws on the lands and waters under USMC jurisdiction.

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

Whereas, the USMC has determined that it is necessary and appropriate to utilize certain persons, services, and facilities of the Service to assist in providing effective enforcement of Federal conservation laws on the lands and waters under USMC jurisdiction.

Therefore, the parties agree that:

A. Re-Delegation of Federal Authority

(1) Under the authority provided by 16 U.S.C. § 742*l*(b), the Chief, Office of Law Enforcement, hereby delegates to the USMC and those certain persons designated in accordance with the terms specified herein ("USMC Conservation Law Enforcement Officers") the authority to enforce the following Federal laws dealing with the protection and conservation of fish, wildlife, and natural and cultural resources of the United States and regulations issued pursuant thereto within any limitations prescribed by regulations of the Department of Defense:

Lacey Act and Lacey Act Amendments of 1981 (18 U.S.C. 42, 16 U.S.C. 3371-3378)

Migratory Bird Treaty Act (16 U.S.C. 703-712)

Archeological Resources Protection Act of 1979 (16 U.S.C. 470aa-ll)

Endangered Species Act of 1973 (16 U.S.C.1531-1544)

Marine Mammal Protection Act (16 U.S.C. 1361-1384, 1401- 1407)

Migratory Bird Hunting and Conservation Stamp Act (16 U.S.C. 718-718k)

Bald and Golden Eagle Protection Act (16 U.S.C. 668-668d)

Airborne Hunting Act (16 U.S.C. 742j-1)

National Wildlife Refuge System Improvement Act (16 U.S.C. 668dd-668ee)

This Agreement does not delegate authority to enforce the import and/or export provisions of the statutes above unless the designee is under the direct supervision of a Service special agent.

(2) The Chief, Office of Law Enforcement specifically delegates to the USMC and the USMC Conservation Law Enforcement Officers the same authority to search, seize, arrest, and exercise other law enforcement functions under the laws specified in paragraph A(1) of this Agreement, as if the USMC and the USMC Conservation Law Enforcement Officers were employed by the Department of the Interior and authorized by the Secretary of the Interior to enforce those laws.

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

(3) This Agreement between the Service and the USMC may not be used to re-delegate Federal law enforcement authority to any person convicted of a misdemeanor crime of domestic violence or otherwise prohibited from possessing firearms, within the meaning of 18 U.S.C. § 922(g).

B. Designation of Federal Authority by USMC of USMC Conservation Law Enforcement Officers

(1) The USMC, through the Installation Commanding General, may designate individuals to exercise the authority to enforce the conservation laws and regulations of the United States as specified above. This designation may only be to a person who meets criteria (a) or (b) and (c) and (d):

(a) Is presently employed and has been for at least one (1) year as a conservation law enforcement officer at a USMC installation and is trained, qualified, and authorized to carry a firearm and who is assigned conservation law enforcement duties at the installation; or

(b) Completed the Natural Resource Police Training Program, the former Land Management Police Training Program, or the Criminal Investigator Training Program, at the Federal Law Enforcement Training Center (FLETC), and completes a one (1) year probationary period; and who

(c) Is proficient in the use of firearms as demonstrated by meeting the firearms qualification and re-qualification standards required of the USMC installation, complies with the USMC Conservation Law Enforcement Program, and agrees to read, understand, and follow the Service Use of Force and Firearms policies when acting under this Agreement. These policies are attached and will be transmitted to all officers so delegated under this Agreement; and

(d) Has not been convicted of a misdemeanor crime of domestic violence or is not otherwise prohibited from possessing firearms, within the meaning of 18 U.S.C. § 922(g).

(2) The USMC shall notify the Service of the full name, address, date of birth, and social security number of each designee. This designation shall become effective upon the filing of such information with the Service's designated representative. The USMC shall issue an identification card to each designee, along with a copy of this Agreement and the Service Use of Force and Firearms policies.

If at any time, any person designated to exercise authority under this Agreement fails to meet any of the criteria set forth in paragraph B(1) above, terminates DOD employment, or is reassigned to non-law enforcement duties, the USMC shall terminate the designation

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

when the USMC becomes aware of these circumstances. The USMC will collect that person's identification card and immediately notify the Service.

Information about the addition of designated officers should be provided to the Service within 30 days. The USMC will provide a complete up-to-date list of persons holding authority under this Agreement to the Service by January 15 of each year.

(3) Designated USMC Conservation Law Enforcement Officers may exercise authority to enforce the conservation laws and regulations specified in paragraph A(1) on USMC installations and lands or waters adjacent to installations under exigent circumstances, such as to arrest or detain individuals who are suspected of committing unlawful actions on the USMC installation and then flee. They may exercise this authority anywhere within the jurisdiction of the United States when under the direct supervision of a Service special agent.

(4) The Service may, by written notice to the USMC, terminate any designation made by the USMC.

(5) The USMC shall continue to provide, as appropriate, workmen's compensation in accordance with laws and regulations applicable to USMC civilian employees for work-related injuries incurred by USMC Conservation Law Enforcement Officers while performing duties under this Agreement. Designated individuals may also be considered eligible for compensation under subchapter III of chapter 81 of Title 5, United States Code when activities are initiated and approved by the Service.

(6) While performing duties under this Agreement, USMC Conservation Law Enforcement Officers shall:

(a) Be considered investigative or law enforcement officers of the Department of the Interior for the purposes of the tort claim provisions of Title 28, United States Code and 5 U.S.C. 8401(17); and

(b) Be considered officers or employees of the United States within the meaning of section 111 and 1114 of Title 18, United States Code.

C. Procedures for Investigating Federal Offenses

The following procedures shall govern investigations or prosecutions of Federal offenses made under this Agreement:

(1) The USMC installation will refer appropriate violations of Federal law or regulation to the Service's designated representative as expeditiously as possible.

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

(2) The USMC installation shall submit in a timely manner, copies of all investigative reports to the Service's designee on law enforcement activities conducted under authority of this Agreement.

(3) All potential investigations that may result in a felony prosecution will be coordinated with the Service. All potential investigations against any person who may claim Native American treaty rights must be coordinated with the Service.

(4) Each USMC installation shall coordinate with the local Service law enforcement office to establish protocol and liaison with regard to all Federal prosecutions relating to violations of Federal laws and regulations specified in A(1), occurring on USMC installations.

D. Coordination

(1) The Service designee and the USMC representatives shall meet periodically and when necessary for the following purposes:

(a) Identifying enforcement problems in areas of concurrent jurisdiction that may require joint enforcement operations or investigations;

(b) Identifying enforcement problems that may require covert investigation;

(c) Identifying the need for specialized law enforcement equipment;

(d) Discussing new techniques and methods for the detection and apprehension of violators of conservation laws and the exchange of law enforcement information in general;

(e) Reviewing training programs and identifying the need for additional instruction in Federal laws, policies, interpretations, and other appropriate subjects; and

(f) Establishing procedures for the care, handling, identification, and storage of evidence and/or seized property.

E. Actions to be Taken by the Parties

(1) The Service will provide to the USMC, subject to available resources and manpower, copies of Federal laws and regulations and pertinent Service policy and interpretations and the assistance of special agents and equipment for specific enforcement operations.

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

(2) The USMC will provide to the Service, subject to available resources and manpower, copies of regulations applicable to USMC installations and pertinent policy and interpretations and assistance by USMC Conservation Law Enforcement Officers and use of equipment for specific enforcement operations that occur on the USMC installations.

F. Terms, Amendment, Effective Date, and Termination

(1) This Agreement shall become effective upon the date last signed and executed by the duly authorized representatives of the parties and shall remain in full force and effect until terminated in writing by either party. Representatives of the USMC and Service will review the Agreement at least every ten (10) years. The Agreement may be terminated, without cause, by either party upon thirty (30) days written notice.

(2) The Agreement may be revised or amended by consent of the parties, but such revisions or amendments shall not be effective until produced in writing and signed by both parties. Local agreements made under this master agreement cannot eliminate a requirement set by this Agreement.

(3) Before delegating authority under this Agreement, the USMC will provide the Chief, Office of Law Enforcement a roster of Marine Corp Conservation Law Enforcement Officers and installations that will be authorized to enforce the laws specified in paragraph A(1) under this Agreement. The Chief, Office of Law Enforcement will forward this information to his/her designee.

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

FISH AND WILDLIFE SERVICE
LAW ENFORCEMENT

Law Enforcement — **Part 442 Firearms and Use of Force**
Chapter 1 Firearms — **442 FW 1**

1.1 Purpose. This chapter establishes Service policy concerning firearms issued, carried, and/or used by Service law enforcement officers in the performance of their official law enforcement duties.

1.2 Scope.

A. This chapter applies to all Service Law Enforcement Officers. The term law enforcement officer includes Special Agents, Refuge Officers including both full-time and collateral duty officers, and other Service employees that have been granted Service law enforcement authority and who have met the requirements of this chapter and other applicable Service requirements.

B. Nothing in this chapter shall preclude the use of, nor govern the use of firearms in the performance of non-law enforcement activities by Service employees. Non-law enforcement activities in which a firearm may be used include dispatching of injured animals, self-defense against wildlife, predator or stray animal control, covert hunting situations, or similar situations that do not involve the use of a firearm as a force option against a person or persons.

1.3 Policy and Authority.

A. Policy. All Service law enforcement officers shall be properly trained in the use of firearms and equipped with firearms appropriate for the law enforcement duties performed, and unless restricted by the authorities section of this part, shall carry firearms in the performance of their official duties.

B. Authority. Service law enforcement officers are authorized to carry and use firearms as follows:

(1) Service law enforcement officers are authorized to carry and use firearms in the performance of their official law enforcement duties by virtue of the power to arrest contained in the statutes enforced, and as expressly authorized under the Lacey Act Amendments of 1981 [16 USC 3375(b)].

(2) Wildlife inspectors are not authorized to carry firearms in the performance of their official duties unless specifically authorized. Such authorization must have the concurrence of the Chief, Division of Law Enforcement.

(3) Notwithstanding the authority granted by statute, only those law enforcement officers who meet the training standards established by the Service are authorized to carry or utilize firearms in the performance of their official duties.

1.4 Responsibilities.

A. Regional Directors will ensure compliance with all provisions of this chapter. The Regional Director is assisted by the Assistant Regional Director (ARD) for Law Enforcement who is also referred to as the Special Agent in Charge, and the ARD for Refuges and Wildlife. Responsibilities specific to the ARDs are identified throughout the chapter.

B. The Assistant Director - Refuges and Wildlife is responsible for development and maintenance of the Service policy and procedure governing the use of firearms. The Assistant Director is assisted by the Chief, Division of Law Enforcement and the Special Agent in Charge, Branch of Training and Inspection. The Assistant Director is also authorized to develop and issue a Firearms Instructor Handbook. See paragraph 1.10.

11/22/05, FWM 472 — **LAW ENFORCEMENT**
Supersedes 445 FW 4, FWM 306, 12/31/96

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

FISH AND WILDLIFE SERVICE
LAW ENFORCEMENT

Law Enforcement — **Part 442 Firearms and Use of Force**
Chapter 1 Firearms — **442 FW 1**

1.5 Authorized Firearms and Ammunition. Only Service issued weapons may be utilized for law enforcement purposes. The carrying of personal weapons for official law enforcement purposes is prohibited. Firearms and related equipment issued to a Service law enforcement officer upon conferral of law enforcement authority shall remain with the law enforcement officer upon transfer or reassignment as long as he or she retains law enforcement authority. Upon separation from the Service or relinquishment of law enforcement authority, all firearms and related equipment will be returned to the Branch of Training and Inspection, Division of Law Enforcement.

A. Service Sidearms.

(1) The standard issue sidearm for all Service law enforcement officers shall be a stainless steel, six (6) shot, double action revolver with a barrel length of two and one half (2) to four (4) inches inclusive, in .357 magnum caliber; or a double action semi-automatic pistol in .45 ACP, .40 Smith and Wesson, .357 Sig, 9mm parabellum calibers, or other calibers that fire a .355 inch diameter or larger bullet and have been authorized by the Division of Law Enforcement. The action in the semi-automatic pistol may be in either of two configurations: (1) double action only in which all trigger pulls are in the double action mode, or (2) mixed double and single action in which the first shot is double action and subsequent shots are single action. The semi-automatic sidearm will have a magazine capacity of at least seven rounds, a magazine release mounted on the side of the frame, an external hammer with a hammer drop lever/decocking lever for the double/single action design, a firing pin safety lock which will allow it be carried safely with a round in the chamber, no external safety which would require manipulation prior to firing in the double action mode, and no magazine disconnect which would prevent the weapon from being fired with the magazine removed.

(2) Operation requirements, such as covert investigations and other special assignments or conditions, may necessitate carrying an alternate sidearm other than the standard issue pistol or revolver. Any double action, semi-automatic pistol or steel frame revolver of at least .38 Special or .380 (9mm KURZ) with a capacity of at least five cartridges owned by the Service may be issued and carried for special law enforcement purposes when authorized by the ARD for Law Enforcement/Special Agent in Charge or ARD for Refuges and Wildlife. When such authority is granted, the law enforcement officer is required to qualify or re-qualify with the alternate sidearm under the same standards applicable to the standard issue handgun.

(3) Service law enforcement officers are authorized to carry a second, concealed back-up sidearm for safety purposes. The back-up sidearm must meet the standards set in either paragraphs (1) and (2) above, and the law enforcement officer must successfully meet the qualification/re-qualification standards established by the Service for back-up sidearms.

B. Shotguns and Rifles.

(1) The standard issue shotgun shall be a 12 gauge pump or semi-automatic police type weapon with a barrel length of eighteen to twenty-one inches, and fitted with rifle sights or optical/electronic sights.

(2) The standard issue rifle for law enforcement purposes shall be a bolt action or semi-automatic in .223 (5.56) or .30 caliber. Approval from the ARD for Law Enforcement/Special Agent in Charge or Assistant Regional Director for Refuges and Wildlife shall be required if non-standard rifles are to be issued and used for law enforcement purposes.

C. Select Fire Weapons. The carrying and use of select fire (fully-automatic) weapons by Service law enforcement officers is not authorized.

Chapter 1 Firearms — **442 FW 1**

D. Ammunition.

(1) Except for training purposes, only factory manufactured new (as opposed to remanufactured) ammunition may be acquired and carried for use in sidearms used for law enforcement purposes. This ammunition shall be loaded with full metal jacketed or semi-jacketed controlled expansion bullets. Information on suitable, caliber specific, duty ammunition may be obtained from the Branch of Training and Inspection, Division of Law Enforcement.

(2) Target ammunition, reloads, or cartridges loaded with wadcutter bullets may be used for practice, but not when firing a qualification or re-qualification score for record, nor may they be carried for duty purposes. Law enforcement officers will qualify and re-qualify with the same or ballistically equivalent ammunition which normally carried on duty.

(3) Shotgun ammunition utilized for duty purposes shall be factory manufactured 12 gauge, number 00 buck or rifled slugs, or other suitable rounds as recommended by the Branch of Training and Inspection, Division of Law Enforcement.

(4) Only new, commercial factory, or military arsenal manufactured, center-fire rifle ammunition of full metal jacket or jacketed controlled expansion design will be carried or used for law enforcement purposes. For training purposes only, commercially manufactured reloads, of similar bullet design, may be substituted for duty ammunition. Specific recommendations on ammunition may be obtained from the Branch of Training and Inspection, Division of Law Enforcement.

(5) To ensure that all law enforcement officers remain proficient with their weapons, each officer shall be provided with an appropriate number of rounds to meet all re-qualification requirements and to practice with each weapon authorized to be carry. This ammunition shall be in addition to any ammunition provided to the officer for the annual 40 hour in-service training. It shall be the responsibility of the ARD for Law Enforcement/Special Agent in Charge or Assistant Director for Refuges and Wildlife to ensure that this ammunition is provided and fired on an annual basis.

1.6 Carrying and Transporting Firearms. Only Service law enforcement officers who qualify and re-qualify in accordance with this part are authorized to carry firearms for law enforcement purposes.

A. When To Carry. Special Agents and other full-time law enforcement officers are subject to call any time and, therefore, are authorized to carry firearms at all times. Other Service law enforcement officers shall carry firearms when engaged in law enforcement duties, reasonably expected to be engaged in law enforcement duties, or if specifically authorized under specific circumstances. Such specific authorization must be in writing, and signed by the officer's Project Leader or higher level management.

B. Foreign Countries. Service law enforcement officers are not authorized to possess firearms while engaged in law enforcement duties in foreign countries. However, certain conditions might arise that would necessitate that firearms be carried. If a Service law enforcement officer is cognizant of the fact that such a situation might arise, he or she must obtain written permission from the legal authority in the respective host country and from the U.S. State Department. Furthermore, the Chief, Division of Law Enforcement, must concur with this request.

C. Commercial Aircraft. Public Law 87-197, 49 USC 1472(1), provides criminal penalties for the carrying of a firearm aboard a commercial aircraft. The statute specifically states that this prohibition does not apply to agents of the Federal government who are authorized or required within their official capacities to carry firearms. Pursuant to this statute, the Department of Transportation has issued regulations regarding

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

FISH AND WILDLIFE SERVICE
LAW ENFORCEMENT

carrying firearms on commercial air carriers. These regulations (as contained in 14 CFR 108) require Federal agents meet the following conditions when it is necessary for the firearm to be carried while aboard any commercial aircraft:

(1) The Service law enforcement officer shall notify the airline at least one hour prior to departure (or in the case of an emergency, as soon as practicable) that he or she is a Federal agent who has a need to travel armed. Among other things, this allows the carrier to comply with its regulatory requirements to notify crew members and other law enforcement personnel of the presence and location of each armed person aboard the aircraft.

(2) Armed Service law enforcement officers must identify themselves by displaying their credentials to the appropriate airline and security personnel before carrying a firearm on a commercial aircraft.

(3) The armed Service officer **shall not** consume alcoholic beverages while on board the aircraft, or eight hours before the flight.

(4) In order not to cause undue alarm to any passenger or have the firearm become a target of opportunity for any person, the Service law enforcement officer will exercise the utmost discretion to ensure that the firearm is not observable while in flight status.

(5) When traveling by air on official law enforcement business, Service law enforcement officers shall determine whether the immediate requirements of the particular mission make it necessary for a firearm to be carried on their person.

(6) No firearm shall be carried aboard a commercial aircraft by a Service law enforcement officer when traveling on personal business. However, firearms may be placed in checked baggage in accordance with Paragraph (9) below.

(7) Whenever a firearm is to be carried aboard an aircraft, the Service law enforcement officer shall adhere to all of the above procedures. It should be noted that despite the fact that the Service law enforcement officer feels that the scope of the enforcement mission requires that he/she carry a firearm on board an aircraft, airlines are not required to transport armed law enforcement officers and may deny boarding to the armed officer.

(8) Except as required when checking baggage with the airlines, Service law enforcement officers will not surrender any firearm to airline personnel in order to obtain a boarding pass from the airline.

(9) When in the judgement of the Service law enforcement officer the immediate requirements of a particular law enforcement mission do not warrant the carrying of a firearm aboard the aircraft, the firearm may be placed in checked baggage in accordance with the following requirements:

(a) The Service law enforcement officer must ensure that the firearm is **unloaded**, secured within hard-sided luggage, or placed in a hard-sided container within soft-sided luggage; and placed in luggage to which only the officer transporting the firearm retains the key or combination to the lock.

(b) The Service law enforcement officer must advise the airline that the above procedures have been followed, and if requested, allow airline personnel to inspect the weapon at the ticket counter when the luggage is checked.

(c) The Service law enforcement officer shall ensure that the "firearms" tag is placed inside the shipping

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

container (luggage), and not affixed to the outside.

(10) Under no circumstances will a Service law enforcement officer carry OC-10, Cap-Stun, other pressurized Oleoresin capsicum agents, mace, tear gas, chemical agents, or other gaseous products in a pressurized container on board an aircraft, or place such items in their checked baggage or luggage.

1.7 Initial Firearms Training.

A. Service Sidearms.

(1) Permanent Personnel. Initial training in the use of an approved Service sidearm shall be accomplished by the law enforcement officer-trainee's successful completion of the Basic Criminal Investigators School (CI), or the Basic Law Enforcement Course for Land Management Agencies (LM) as administered by the Federal Law Enforcement Training Center (FLETC). All law enforcement officer-trainees must fire a minimum score of 80 percent or better on the course of fire utilized for qualification purposes during this basic training. In addition, when firearms training is incorporated into either the Special Agent Basic (SABS) or the Refuge Officer Basic (ROBS); all Service officer-trainees attending must successfully complete this training by firing a minimum score of 80 percent on al qualification courses fired for record. The inability of a Service law enforcement officer-trainee to qualify at the 80 percent or better level will result in his/her failure to successfully complete this required basic training.

(2) Seasonal Personnel. In order to meet basic training requirements for carrying Service sidearms, seasonal law enforcement officers must successfully complete 1) a law enforcement training course approved through the National Park Service Training Program for Seasonal Employees, or 2) a law enforcement training course approved by the Department of the Interior and the Service as a substitute to the Basic Law Enforcement Course for Land Management Agencies. Any waivers to 1) or 2) above must be approved by the Chief, Division of Law Enforcement. When recency of training exceeds three years, seasonal employees may retain law enforcement authority, and may continue to be authorized to carry Service firearms only if they have been actively involved in law enforcement since their initial training, and have re-qualified every six months or prior to resuming their seasonal duties.

(3) Sidearm Specific Training.

(a) The initial training referred to in paragraphs (1) and (2) above must be specific to the type of sidearm (i.e. revolver vs semi-automatic pistol) that the Service law enforcement officer will be issued upon conferral of authority. If a different type of sidearm was used during initial training, the Service law enforcement officer must successfully complete the appropriate transitional firearms program for the weapon he or she will be issued. The appropriate transitional firearms program shall be specified by the Branch of Training and Inspection.

(b) The appropriate transitional firearms training must be completed prior to the Service law enforcement officer being issued a Service approved sidearm of a different type than the one used during initial training. After receiving transitional training, the officer must be issued an appropriate weapon within ninety (90) days. If the sidearm cannot be issued within this ninety (90) day time frame, a refresher training course authorized by the Branch of Training and Inspection will have to be completed.

B. Service Shotguns. Initial training in the use of an approved Service shotgun shall be accomplished by the Service law enforcement officer-trainee's successful completion of the CI Program, or the LM Program as administered by FLETC. If this initial training has not been received by the law enforcement officer, the office must demonstrate proficiency with the shotgun by qualifying in accordance with paragraph D below

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

prior to being issued this weapon.

C. Service Rifles. Service law enforcement officers are authorized to carry approved rifles for law enforcement purposes only when they have successfully completed the required rifle training specified by the Branch of Training and Inspection.

1.8. Firearms Qualification and Requalification

A. Qualification. Initial qualification by all Service law enforcement officer-trainees is accomplished by firing a minimum score of 80 percent or better during the CI Program, the LM Program, the appropriate seasonal program as described in paragraph A(2) above or the appropriate transitional program as described in 1.7A(3)(a)above.

B. Requalification. After initial qualification, all Service law enforcement officers shall receive a minimum of four (4) hours of firearms training annually. In addition, every law enforcement officer must requalify every six (6) months, with each Service weapon they wish to carry. Re-qualification shall be accomplished by firing for record the required score of at least 80 percent on an authorized course of fire for each Service weapon which will be carried for law enforcement purposes. Law enforcement officers will also receive refresher or additional training in weapon handling, tactics, and other firearms skills necessary to effectively use their issued weapons.

(2) All Service law enforcement officers must fire an authorized reduced-light course annually with their primary sidearm.

C. Scores. All scores fired for record during initial qualification and re-qualification must be fired under the supervision of a certified range officer or certified firearms instructor.

D. Records. All firearms records shall be maintained on Form 3-2085, Firearm Training Record, Exhibit 1 and forwarded to the ARD for Law Enforcement/Special Agent in Charge or designee and shall constitute the official record. For refuge law enforcement officers, the official record shall be forwarded to the Regional Refuge Law Enforcement Coordinator or designee. This official record shall only indicate that the Service law enforcement officer passed or failed the qualification or re-qualification standard. These records must be maintained for not less than five (5) years. The records shall indicate the date of firing, time of day, weather conditions, course of fire, number of rounds, ammunition type, weapon used and range location. In addition, the records shall identify the certified range officer or certified firearms instructor under whose supervision the firing occurred, and note any specialized instructions given to individual shooters.

E. Targets. All scores fired for record shall be fired on approved targets. Approved targets are specified for each course of fire. The firing of a score for record on any target not specified in each course of fire shall require the prior approval of Branch of Training and Inspection, and shall be noted on the Firearms Training Record.

F. Authorized Courses of Fire.

(1) Except as noted below, only the courses of fire approved and maintained by the Branch of Training and Inspection may be used by Service law enforcement officers for re-qualification purposes.

(2) Other Courses of Fire. If under unusual circumstances a law enforcement officer is unable to fire an approved course of fire specified in this chapter due to a remote duty station location, no appropriate firing

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

FISH AND WILDLIFE SERVICE
LAW ENFORCEMENT

range facilities, or other limiting factor; the officer may re-qualify on any approved practical police course used by any police agency in the surrounding area. Service law enforcement officers using an alternate course of fire, however, shall obtain prior approval from their ARD or designee. All the other requirements in this chapter shall remain the same.

1.9 Certified Firearms Instructors.

A. Within each region the ARD for Law Enforcement/Special Agent in Charge and ARD for Refuges and Wildlife shall designate employees within their respective programs to serve as Service Designated Firearms Instructors (SDFI). To serve as a SDFI an employee must have graduated from a basic Firearms Instructor Training Course at the Federal Law Enforcement Training Center or an equivalent course of instructor approved by the Branch of Training and Inspection. The employee must also have served as a primary or assistant instructor at one or more Service firearms training/re-qualification sessions within the past year. Designated Firearms Instructors assist the Lead Regional Firearms Instructor.

B. Within each region the ARD for Law Enforcement/Special Agent in Charge and the ARD for Refuges and Wildlife shall designate employees within their respective programs to serve as Lead Regional Firearms Instructors. The primary role of Lead Regional Firearms Instructors is to oversee firearms training, re-qualification, and weapon familiarization at the field level for those employees with law enforcement authority. Lead Regional Firearms Instructors are responsible for planning, organizing, implementing and evaluating the firearms training program within their respective programs.

C. Certification.

(1) The Branch of Training and Inspection will maintain a list of all individuals qualified to serve as Service Designated Firearms Instructor, and a list of those persons designated as the Lead Regional Firearms Instructors for each region. Such information shall be available to the ARD for Law Enforcement/Special Agent in Charge and the ARD for Refuges and Wildlife to be considered prior to designation of Firearms Instructors. The Special Agent in Charge, Branch of Training shall be notified in writing of all designations.

(2) Service Designated Firearms Instructor designations will remain in effect until such time as an instructor fails to conduct or assist in the presentation of one training/re-qualification session in two consecutive years or the designation is changed by the responsible ARD.

(3) Reinstatement as a Service Designated Firearms Instructor must be initiated by written request to the ARD for Law Enforcement/ Special Agent in Charge or Assistant Regional Director for Refuges and Wildlife. Reinstatement will be granted only after successful completion of a Service refresher or other approved refresher course as specified by the Branch of Training and Inspection, if the individual has not maintained qualifications as indicated in paragraph (2) above.

D. Non-Service Firearms Instructors. When special circumstances exist and a Service Designated Firearms Instructor is not available to conduct re-qualification this duty may be performed by a certified range officer or certified firearms instructor employed and designated by any bona fide Federal, State, County, or Municipal police agency. The reporting requirements as contained in this chapter must still be completed for any re-qualification conducted by non-Service firearms instructors.

E. In-Service Training for Firearms Instructors. Every three years, a 24 hour in-service training session will be conducted for Service firearms instructors. The Branch of Training and Inspection shall be responsible for the development and coordination of these training sessions. The ARD for Law Enforcement/Special Agent in Charge and ARD for Refuges and Wildlife shall nominate those firearms

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

instructors who will attend this training. However, attendance is mandatory for Designated Lead Regional Firearms Instructors.

1.10 Firearms Instructors Handbook. The Branch of Training and Inspection is responsible for the development, coordination, issuance and revision of the Firearms Instructor Handbook. The Handbook will contain applicable copies of the Department and Service firearms policies and guidelines; approved courses of fire; lesson plans; re-qualification reporting procedures and formats; and other information deemed necessary for proper administration of the Service's firearm programs.

1.11 Firearms Maintenance, Inspection, and Storage.

A. Maintenance. Each law enforcement officer is responsible for the care and routine cleaning of all assigned firearms. To ensure reliability, all ammunition carried in the firearm and ammunition carriers shall be replaced semi-annually. Law enforcement officers are not authorized to disassemble any Service firearm beyond the level specified during the training received for that firearm. Nor may they or anyone else modify in any way the internal/external parts of any firearm. The addition of after-market grips to a Service sidearm is authorized with the approval of a Service Armorer. The addition of accessories or other modifications to Service owned firearms used for law enforcement purposes may only be done by Service Armorers or by the factory, or other certified armorers with the approval of a Service Armorer.

B. Inspection and Repair. Service firearms shall be inspected at least annually by a certified armorer to ensure proper functioning. Certified armorers may disassemble Service firearms as necessary to inspect and analyze problems with the mechanical functioning of the weapons. If a firearm is found to have mechanical modifications that pose a safety hazard or if malfunctions or excessive wear are observed, the firearm is to be immediately removed from service until repaired or replaced. If immediate repairs are not possible, the law enforcement officer shall be issued a replacement firearm of the same type until such time as the officer's weapon is repaired. Firearms found to be unreliable, or in need of excessive repair, must be surveyed and, if appropriate, replaced. All repairs made to any Service firearm must be documented. Records of all annual firearm inspections and repairs shall be maintained by the ARD for Law Enforcement/Special Agent in Charge or designee. For refuge Law Enforcement officers, these records shall be maintained by the Regional Refuge Law Enforcement Coordinator or designee.

C. Storage.

(1) Service officers are responsible for the safe and secure storage of all firearms assigned to them. Service firearms that are not routinely carried shall be stored at Service facilities in a vault, gun locker, or other location which is secured in such a manner as to substantially reduce the possibility of theft or unauthorized removal. These firearms shall be unloaded, with the action open (out of battery).

(2) Service law enforcement officers may leave firearms that are routinely used for law enforcement operations in Service vehicles. Care should be exercised by law enforcement officers in removing and securing the firearms so as not to draw any undue attention which might result in the theft or unauthorized removal of the firearms.

(3) Service firearms carried in vehicles must be secured in locked boxes, trunks, or other locations which will reduce the risk of theft or unauthorized removal, unless their use is imminent. Firearms shall not be stored in vehicles that are not in routine use and which are left unattended for extended periods of time.

(4) If at all possible, firearms should be stored at the law enforcement officer's duty station. However, when it is impractical to do so, or operational requirements dictate otherwise, law enforcement officers are authorized to store them at their residence, provided appropriate safeguards are taken. Family members

should be educated not to handle these firearms. Firearms stored at a residence must stored under lock and key, unloaded, actions open (out of battery) with the ammunition stored separately.

D. Loss of Firearms. Service law enforcement officers shall verbally report the loss or theft of any Service firearm to his or her immediate supervisor, the local Federal Bureau of Investigation office, and the pertinent local police jurisdictions. This report should include weapon make, model number, serial number, and caliber. These oral reports must be followed by a written report from the law enforcement officer within seventy two (72) hours. The officer's immediate supervisor shall forward a copy of the report to the ARD for Law Enforcement/Special Agent in Charge or ARD for Refuges and Wildlife for compliance with report of survey requirements in accordance with 310 FW 7, Report of Survey.

1.12 Service Designated Armorer.

A. Within each region the ARD for Law Enforcement/Special Agent in Charge and the ARD for Refuges and Wildlife shall designate employees within their respective programs to receive training and serve as Service Designated Armorers (SDA). Service Designated Armorers will perform routine inspection, maintenance, and repair of Service firearms.

B. Service Designated Armorers must have graduated from a factory sponsored training course for the specific firearm(s) for which certification is required, and must successfully meet all factory re-certification requirements.

C. The Branch of Training and Inspection shall be advised of all Service Designated Armorer designations and shall maintain a list of all Service Designated Armorers. This list shall include the name, duty location, Division identification, and what weapon certification is held by each armorer.

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

FISH AND WILDLIFE SERVICE
LAW ENFORCEMENT

Law Enforcement — **Part 442 Firearms and Use of Force**
Chapter 2 Use of Force Policy — **442 FW 2**

2.1 Purpose. This chapter establishes a uniform policy regarding the use of force by Service officers in the performance of their official law enforcement duties.

A. This policy is intended to provide Service officers with an understanding of the various force options available to them, and when the application of a particular option or level of force would be considered legally permissible and reasonably necessary to perform their duties, and to protect themselves and others.

B. For the purposes of this Part 442, the term Service law enforcement officer, Service officer, or officer means any Service employee authorized to carry and utilize firearms in the performance of their official law enforcement duties.

2.2 Policy. Service law enforcement officers will use only that force necessary and reasonable to overcome the resistance offered by a suspect or individual. The level of force used by a Service officer must not be excessive or unjustified.

2.3 Definitions. The following terms and definitions are to be used in the practical application of the use of force.

A. Force. Physical presence, action or exercise of strength to compel another to act or refrain from certain behavior. It may include physical touching of another, striking, kicking, the use of chemical agents and other intermediate force weapons, restraints, and/or firearms.

B. Non-lethal Force. Force used to control a suspect or prisoner, or other person when justified, which does not normally result in serious injury or death. This usually includes physical touching of a suspect, and may be in the form of control techniques, Oleoresin Capsicum, batons, or restraining devices.

C. Deadly Force. Force which is intended or likely to cause death or serious bodily harm. Most often, deadly force involves the use of a firearm aimed at a suspect. Deadly force actually encompasses any means or instrumentality which may inflict death or serious bodily injury.

D. Unjustified or Excessive Use of Force. Force without justification or excuse; or the application of force clearly beyond that called for given the suspect's level of resistance.

2.4 Application of Force.

A. Levels of Control/Force. The levels of control or force utilized by Service officers to overcome a suspect's/individual's resistance are categorized as follows.

(1) Officer's Presence

(2) Verbal Direction

(3) Soft, empty hand control

(4) Hard, empty hand control

(5) Chemical Agents (Oleoresin capsicum)

(6) Impact Weapons

FISH AND WILDLIFE SERVICE
LAW ENFORCEMENT

Law Enforcement — **Part 442 Firearms and Use of Force**
Chapter 2 Use of Force Policy — **442 FW 2**

(7) Deadly Force

B. Use of Restraints. Service officers may routinely use handcuffs, flex-cuffs, legcuffs and body chains to justifiably control, restrain, and transport persons. Restraining devices will be applied properly and in accordance with the training received so as to minimize the risk of unnecessary injury.

C. Avoidance of Risk. Service officers should not take undue risks that could result in death or serious bodily harm. Whenever possible, officers should attempt to defuse and stabilize any dangerous situation(s) by using communication skills and/or waiting for backup assistance. Officers are never required to take UNREASONABLE risks and may opt to disengage or withdraw if such action can be safely accomplished without further endangering themselves, other officers or the public.

D. Degree of Force. Service officers will only use that degree of force that is legally permissible; reasonably necessary to perform their duties; and is required to protect themselves and others. The degree of force applied depends on the circumstances and facts of a particular incident, and is governed by the following conditions:

(1) The degree of resistance or force threatened or exhibited by the suspect(s), including the suspect's possession or non-possession of a deadly weapon; and

(2) The officer's perception of that resistance, including the jeopardy of death or serious bodily harm to the officer or others implied by the suspect.

E. Deadly Force Policy. The use of deadly force is the highest level of force that can be employed by a Service officer. It will normally involve the aimed discharge of a firearm at a person with the intended effect to be the immediate incapacitation of that person. The following deadly force policy will apply to all Service officers:

A SERVICE OFFICER MAY ONLY DISCHARGE HIS OR HER FIREARM DIRECTLY AT ANOTHER PERSON WHEN THE OFFICER REASONABLY BELIEVES THAT THE OFFICER OR ANOTHER INDIVIDUAL IS IN IMMINENT DANGER OF DEATH OR SERIOUS BODILY INJURY.

2.5 Chemical Agents.

A. Oleoresin capsicum (OC). The only approved chemical agent that may be used by Service officers is Oleoresin capsicum. The Service recognizes OC as a non-lethal force alternative which can be used to defends or against and control actively resistant or violent offender/individuals. Based on the Service officers reasonable perception that OC is necessary to avoid a physical confrontation, OC may be used immediately PRIOR to hard, empty hand control techniques, impact weapons, or deadly force.

B. Authorization. Only those Service officers who have successfully completed Service approved training in the use of OC are authorized to carry and use this agent. Only Service owned and issued OC is authorized.

2.6 Impact Weapons. Service officers who have successfully completed the required training are authorized to use a baton (either straight or collapsible). This weapon may only be used by Service officers when the offender is engaged in physically aggressive resistance which puts the officer at risk of bodily harm. Batons may only be used in accordance with the training received.

2.7 Firearms

A. Guidelines. The following guidelines will govern the use of firearms by Service officers.

LAW ENFORCEMENT

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

FISH AND WILDLIFE SERVICE
LAW ENFORCEMENT

(1) A firearm will be fired directly at a person only with the intent of rendering the person incapable of continuing the action or activity that justified the use of deadly force. The use of deadly force will be justified based upon the circumstances known to the officer at that time, and where the immediate application of deadly force is the only reasonable means by which the person can be quickly and dependably incapacitated or stopped.

(2) Firing at a fleeing suspect is not justified unless the Service officer has reasonable cause to believe the fleeing person poses an immediate threat of serious bodily injury or death to the officer or others, has the means to carry out that threat, and manifests an intent to do so.

(3) Warning shots can pose a hazard to innocent persons, therefore their use by Service officers is not authorized.

(4) In the presence of the public, a sidearm should only be drawn when the Service officer has cause to believe it may be needed, and to leave it in the holster would place the officer at a distinct disadvantage.

(5) Shoulder weapons (shotguns and rifles) may be displayed only when appropriate and when their use may be required.

B. Authorization. Only those Service officers who have successfully completed Service approved training on the use of firearms and are currently qualified are authorized to carry and use firearms. Only Service owned and issued firearms are authorized.

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

FISH AND WILDLIFE SERVICE
LAW ENFORCEMENT

Law Enforcement — **Part 442 Firearms and Use of Force**
Chapter 3 Reporting and Board of Review — **442 FW 3**

3.1 Purpose. This chapter establishes procedures for reporting the use of force or the discharge of firearms by Service officers and for convening a Board of Review (BOR) in such instances.

3.2 Scope.

A. This chapter applies to the use of force only where serious bodily injury has occurred, or the intentional or unintentional discharge of a firearm, by Service officers while performing law enforcement duties.

B. This chapter does not apply to the discharge of a firearm for training, qualifying, or non-law enforcement purposes.

3.3 Responsibilities.

A. Assistant Director-Refuges and Wildlife. The Assistant Director ensures the development of Service policy governing the use of force and that the policy remains current. The Assistant Director is assisted by the **Chief, Division of Law Enforcement.**

B. Regional Director. The Regional Director convenes and acts on the report of a Board of Review in accordance with this chapter and provides for logistical and clerical support as needed. The Regional Director also ensures that personnel involved in use of force incidents are offered psychological counseling.

C. Deputy Director - Staff. Within the Washington Office, responsibilities identified for the Regional Director are assumed by the Deputy Director - Staff.

D. Chairperson, Board of Review. The chairperson will ensure that the BOR fulfills its duties in accordance with this chapter and submits its final report to the Regional Director within the allotted time.

3.4 Reporting Requirements.

A. Service Officer.

(1) Whenever a Service officer has been involved in a use of force incident where serious bodily injury has occurred, or has discharged a firearm, except for training or non-law enforcement purposes, the involved officer shall as soon as possible verbally notify the immediate supervisor.

(2) The officer should notify local law enforcement authorities of use of force incidents, advise them of any arrests, and request that a crime scene investigation be initiated.

(3) Within seventy-two (72) hours, the involved officer shall prepare and submit a written report detailing the circumstances that resulted in the discharge of the firearm or use of force. This report shall be submitted to the officer's immediate supervisor. It is the official report of the incident and is not considered a statement covered by section 3.6

B. Supervisory Personnel.

(1) Upon receipt of the officer's verbal notification, the immediate supervisor shall as soon as possible notify

LAW ENFORCEMENT

the appropriate Assistant Regional Director and the Chief, Division of Law Enforcement.

(2) The Chief, Division of Law Enforcement shall notify other Service/Department personnel as deemed appropriate, or as may be required by Department policy.

3.5 Other Actions Attendant to Incidents with Serious Bodily Injury or Death. Based on the initial facts known regarding the firearm discharge or other use of force, the following actions shall be taken.

A. Medical Aid. The officer should render or arrange for emergency medical aid for all injured persons when it is safe for the officer to do so.

B. On-Scene Presence. Upon receipt of the Service officer's notification, the immediate supervisor or other designated person shall:

(1) Report to the scene of the incident, or to where the involved officer is located. If the immediate supervisor is unable to report in a timely manner, the supervisor will arrange for another Service officer to immediately report to the scene or the officer's location.

(2) If the supervisor or designate deems it appropriate, take custody of all firearms that have been discharged by Service officers during the incident and retain them in the supervisor's custody until the conclusion of the BOR investigation; unless the weapons are being held by the local law enforcement agency. All such weapons shall be made available to the BOR for testing and other uses if the board deems it appropriate.

C. Administrative Leave. The officer will be placed on administrative leave with full pay pending the conclusion of the review by the BOR. The involved officer may be returned to restricted or non-restricted duties prior to the completion and submission of the BOR's final report when the Regional Director and Chief, Division of Law Enforcement concur that it is appropriate to do so.

3.6 Statements by Service Officers.

A. A Service officer should not give any oral or written statements to anyone, including the investigative agency at the scene until he/she has contacted his/her immediate supervisor. Depending on the seriousness of the incident, the involved officer may wish to wait 24 hours before making any statements regarding the incident.

B. With the exception of the official notifications and report of the incident required in section 3.4A, all statements, either oral or written, required to be made by Service officers to their supervisors or the BOR are for internal Service administrative purposes ONLY. Such statements will not be used in any criminal or civil proceeding that may result from the incident. Any officers involved in a use of force incident will be afforded up to forty-eight (48) hours to seek private legal counsel prior to making any statements. Should the officer retain private counsel, it will be at the officer's own expense. If retained, private counsel may be present during any questioning of the involved officer, and may provide assistance with the preparation of all oral and written statements.

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

LAW ENFORCEMENT

3.7 Psychological Counseling.

A. The Service shall make available to all Service officers and their immediate families, at no cost to them, professional psychological counseling whenever the officer has been involved in a use of force incident or other traumatic incident that may affect the officer or his/her family.

B. The use of this resource is entirely at the discretion of the officer or his/her family, except that the Regional Director may require such counseling when making a fitness for duty determination based on a recommendation by the BOR. The psychological counseling provided by the Service shall be of a reasonable duration and is intended to assist the officer and his/her family in dealing with the initial shock or psychological trauma that may result from the incident.

C. The offer of psychological counseling does not preclude the officer from obtaining counseling from anyone he/she desires, but at the officer's own expense.

D. Health care professionals involved in providing this service, absent a court order, will not divulge to any investigative body the contents of any discussions they have had with the officer or members of his/her family. The only exception to this will be the requirement to offer comments to the Service as to the officers fitness for duty.

3.8 Board of Review. Whenever a Service officer is involved in a use of force incident where serious bodily injury has occurred, or where the officer has discharged a firearm, either intentionally or unintentionally, excluding discharges during training and for non-law enforcement purposes; a Board of Review shall be convened to gather information and facts, conduct interviews, document, and make recommendations concerning any administrative actions that may be taken by the Service as a result of the incident.

A. Convening Authority. The Regional Director will convene the BOR as soon as practicable. Specifically, within 72 hours of being notified of an incident or discharge, the Regional Director will issue a document that impanels the members of the BOR, identifies the chair, states the purpose of the investigation, provides instructions by referencing this chapter, and specifies the date when the final report is due.

B. Composition.

(1) The BOR will consist of a special agent from the Division of Law Enforcement's Branch of Training and Inspection; a management official knowledgeable and/or experienced in the field of operation in which the incident or discharge occurred; and a field officer knowledgeable and/or experienced in the field of operation in which the incident or discharge occurred, and selected by officer involved. In the event more than one officer is involved, two field officers shall be selected by the officers involved.

(2) The BOR will be chaired by the special agent from the Branch of Training and Inspections.

(3) The management official selected must have law enforcement authority and shall not be in the direct line of supervision of the officer or officers involved in the incident or discharge being reviewed.

C. Duties. The BOR shall review the instance to:

CONSERVATION LAW ENFORCEMENT PROGRAM

APPENDIX A

MARINE CORPS AND U.S. FISH AND WILDLIFE SERVICE MEMORANDUM OF AGREEMENT

FISH AND WILDLIFE SERVICE
LAW ENFORCEMENT

(1) Determine whether the incident or discharge was appropriate. In arriving at such determination the BOR shall:

(a) consider all property damage and personal injury or death to any persons involved;

(b) consider whether officers involved complied with existing Service policy;

(c) identify any weakness or defects in exiting Service policy; and,

(d) determine whether Service policy was effectively communicated.

(2) Recommend appropriate action to reduce likelihood of recurrence of the incident or discharge.

(a) Recommendations may address the need to review or revise existing procedures; provide additional training to parties involved both directly or indirectly; or take appropriate administrative action against parties involved, both directly and indirectly.

(b) The BOR will no recommendation concerning criminal or civil action.

(c) In the event that administrative action is recommended, the BOR will not recommend a specific administrative action to be taken.
